    [nic=nic_profile] [profile=lxc_profile] \
    [nic_opts=nic_opts] [start=(True|False)] \
    [seed=(True|False)] [install=(True|False)] \
    [config=minion_config] [approve_key=(True|False)] \
    [clone_from=original] [autostart=True] \
    [priv_key=/path_or_content] [pub_key=/path_or_content] \
    [bridge=lxcbr0] [gateway=10.0.3.1] \
    [dnsservers[dns1,dns2]] \
    [users=[foo]] [password='secret'] \
    [password_encrypted=(True|False)]
```

**salt.modules.lxc.list\_** (*extra=False, limit=None, path=None*)

List containers classified by state

**extra**

Also get per-container specific info. This will change the return data. Instead of returning a list of containers, a dictionary of containers and each container's output from *lxc.info*.

**path**

path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**limit**

Return output matching a specific state (**frozen**, **running**, or **stopped**).

New in version 2015.5.0.

CLI Examples:

```
salt '*' lxc.list
salt '*' lxc.list extra=True
salt '*' lxc.list limit=running
```

**salt.modules.lxc.ls\_** (*active=None, cache=True, path=None*)

Return a list of the containers available on the minion

**path**

path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**active**

If True, return only active (i.e. running) containers

New in version 2015.5.0.

CLI Example:

```
salt '*' lxc.ls
salt '*' lxc.ls active=True
```

`salt.modules.lxc.read_conf`(*conf\_file*, *out\_format='simple'*)

Read in an LXC configuration file. By default returns a simple, unsorted dict, but can also return a more detailed structure including blank lines and comments.

**out\_format:**

set to 'simple' if you need the old and unsupported behavior. This won't support the multiple lxc values (eg: multiple network nics)

CLI Examples:

```
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf out_format=commented
```

`salt.modules.lxc.reboot`(*name*, *path=None*)

Reboot a container.

**path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Examples:

```
salt 'minion' lxc.reboot myvm
```

`salt.modules.lxc.reconfigure`(*name*, *cpu=None*, *cpuset=None*, *cpushare=None*, *memory=None*, *profile=None*, *network\_profile=None*, *nic\_opts=None*, *bridge=None*, *gateway=None*, *autostart=None*, *utsname=None*, *rootfs=None*, *path=None*, *\*\*kwargs*)

Reconfigure a container.

This only applies to a few property

**name**

Name of the container.

**utsname**

utsname of the container.

New in version 2016.3.0.

**rootfs**

rootfs of the container.

New in version 2016.3.0.

**cpu**

Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored

**cpuset**

Explicitly define the cpus this container will be bound to

**cpushare**

cgroups cpu shares.

**autostart**

autostart container on reboot

**memory**

cgroups memory limit, in MB. (0 for nolimit, None for old default 1024MB)

**gateway**

the ipv4 gateway to use the default does nothing more than lxcutils does

**bridge**

the bridge to use the default does nothing more than lxcutils does

**nic**

Network interfaces profile (defined in config or pillar).

**nic\_opts**

Extra options for network interfaces, will override

```
{ "eth0": { "mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6":
"2001:db8::ff00:42:8329" }}
```

or

```
{ "eth0": { "mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1/24", "ipv6":
"2001:db8::ff00:42:8329" }}
```

**path**

path to the container parent

New in version 2015.8.0.

CLI Example:

```
salt-call -lall mc_lxc_fork.reconfigure foobar nic_opts="{ 'eth1': { 'mac':
→ '00:16:3e:dd:ee:44' } }" memory=4
```

`salt.modules.lxc.remove` (*name*, *stop=False*, *path=None*)

This function is an alias of `destroy`.

Destroy the named container.

**Warning:** Destroys all data associated with the container.

**path**

path to the container parent directory (default: `/var/lib/lxc`)

New in version 2015.8.0.

**stop**

[False] If True, the container will be destroyed even if it is running/frozen.

Changed in version 2015.5.0: Default value changed to `False`. This more closely matches the behavior of `lxc-destroy(1)`, and also makes it less likely that an accidental command will destroy a running container that was being used for important things.

CLI Examples:

```
salt '*' lxc.destroy foo
salt '*' lxc.destroy foo stop=True
```

`salt.modules.lxc.restart` (*name*, *path=None*, *lxc\_config=None*, *force=False*)

New in version 2015.5.0.

Restart the named container. If the container was not running, the container will merely be started.

**name**

The name of the container

**path**

path to the container parent directory default: `/var/lib/lxc` (system)

New in version 2015.8.0.

#### **lxc\_config**

path to a lxc config file config file will be guessed from container name otherwise

New in version 2015.8.0.

#### **force**

[False] If True, the container will be force-stopped instead of gracefully shut down

CLI Example:

```
salt myminion lxc.restart name
```

```
salt.modules.lxc.retcode(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True,
                        output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False,
                        chroot_fallback=False, keep_env='http_proxy,https_proxy,no_proxy')
```

New in version 2015.5.0.

Run `cmd.retcode` within a container

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If the retcode is nonzero and not what was expected, try using `lxc.run_stderr` or `lxc.run_all`.

#### **name**

Name of the container in which to run the command

#### **cmd**

Command to run

#### **no\_start**

[False] If the container is not running, don't start it

#### **preserve\_state**

[True] After running the command, return the container to its previous state

#### **path**

path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

#### **stdin**

[None] Standard input to be used for the command

#### **output\_loglevel**

[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

#### **use\_vt**

[False] Use SaltStack's `utils.vt` to stream output to console `output=all`.

#### **keep\_env**

[`http_proxy,https_proxy,no_proxy`] A list of env vars to preserve. May be passed as comma-delimited list.

#### **chroot\_fallback**

if the container is not running, try to run the command using `chroot` default: `false`

CLI Example:

```
salt myminion lxc.retcode mycontainer 'ip addr show'
```

```
salt.modules.lxc.run(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True,
                    output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False,
                    chroot_fallback=False, keep_env='http_proxy,https_proxy,no_proxy')
```

New in version 2015.8.0.

Run `cmd.run` within a container

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using `lxc.run_stderr` or `lxc.run_all`.

**name**

Name of the container in which to run the command

**cmd**

Command to run

**path**

path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**no\_start**

[False] If the container is not running, don't start it

**preserve\_state**

[True] After running the command, return the container to its previous state

**stdin**

[None] Standard input to be used for the command

**output\_loglevel**

[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt**

[False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.

**chroot\_fallback**

if the container is not running, try to run the command using `chroot` default: `false`

**keep\_env**

[`http_proxy,https_proxy,no_proxy`] A list of env vars to preserve. May be passed as comma-delimited list.

CLI Example:

```
salt myminion lxc.run mycontainer 'ip addr show'
```

```
salt.modules.lxc.run_all(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True,
                        output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False,
                        chroot_fallback=False, keep_env='http_proxy,https_proxy,no_proxy')
```

New in version 2015.5.0.

Run `cmd.run_all` within a container

---

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

---

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist.

**name**  
Name of the container in which to run the command

**path**  
path to the container parent default: `/var/lib/lxc` (system default)  
New in version 2015.8.0.

**cmd**  
Command to run

**no\_start**  
[False] If the container is not running, don't start it

**preserve\_state**  
[True] After running the command, return the container to its previous state

**stdin**  
[None] Standard input to be used for the command

**output\_loglevel**  
[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt**  
[False] Use SaltStack's `utils.vt` to stream output to console `output=all`.

**keep\_env**  
[`http_proxy,https_proxy,no_proxy`] A list of env vars to preserve. May be passed as comma-delimited list.

**chroot\_fallback**  
if the container is not running, try to run the command using `chroot` default: `false`

CLI Example:

```
salt myminion lxc.run_all mycontainer 'ip addr show'
```

`salt.modules.lxc.run_stderr` (*name*, *cmd*, *no\_start=False*, *preserve\_state=True*, *stdin=None*, *python\_shell=True*, *output\_loglevel='debug'*, *use\_vt=False*, *path=None*, *ignore\_retcode=False*, *chroot\_fallback=False*, *keep\_env='http\_proxy,https\_proxy,no\_proxy'*)

New in version 2015.5.0.

Run `cmd.run_stderr` within a container

**Warning:** Many shell builtins do not work, failing with `stderr` similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed if the command being run does not exist.

**name**  
Name of the container in which to run the command

**cmd**  
Command to run

**path**  
path to the container parent default: `/var/lib/lxc` (system default)  
New in version 2015.8.0.

**no\_start**  
[False] If the container is not running, don't start it

**preserve\_state**  
 [True] After running the command, return the container to its previous state

**stdin**  
 [None] Standard input to be used for the command

**output\_loglevel**  
 [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt**  
 [False] Use SaltStack's `utils.vt` to stream output to console `output=all`.

**keep\_env**  
 [http\_proxy,https\_proxy,no\_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

**chroot\_fallback**  
 if the container is not running, try to run the command using chroot default: `false`

CLI Example:

```
salt myminion lxc.run_stderr mycontainer 'ip addr show'
```

```
salt.modules.lxc.run_stdout(name, cmd, no_start=False, preserve_state=True, stdin=None,
python_shell=True, output_loglevel='debug', use_vt=False, path=None,
ignore_retcode=False, chroot_fallback=False,
keep_env='http_proxy,https_proxy,no_proxy')
```

New in version 2015.5.0.

Run `cmd.run_stdout` within a container

**Warning:** Many shell builtins do not work, failing with `stderr` similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in `stderr` if the command being run does not exist. If no output is returned using this function, try using `lxc.run_stderr` or `lxc.run_all`.

**name**  
 Name of the container in which to run the command

**cmd**  
 Command to run

**path**  
 path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**no\_start**  
 [False] If the container is not running, don't start it

**preserve\_state**  
 [True] After running the command, return the container to its previous state

**stdin**  
 [None] Standard input to be used for the command

**output\_loglevel**  
 [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt**  
 [False] Use SaltStack's `utils.vt` to stream output to console `output=all`.

**keep\_env**  
 [http\_proxy,https\_proxy,no\_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

**chroot\_fallback**

if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.run_stdout mycontainer 'ip addr show'
```

**salt.modules.lxc.running\_systemd**(*name*, *cache=True*, *path=None*)

Determine if systemd is running

**path**

path to the container parent

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.running_systemd ubuntu
```

**salt.modules.lxc.search\_lxc\_bridge**()

Search the first bridge which is potentially available as LXC bridge

CLI Example:

```
salt '*' lxc.search_lxc_bridge
```

**salt.modules.lxc.search\_lxc\_bridges**()

Search which bridges are potentially available as LXC bridges

CLI Example:

```
salt '*' lxc.search_lxc_bridges
```

**salt.modules.lxc.set\_dns**(*name*, *dnsservers=None*, *searchdomains=None*, *path=None*)

Changed in version 2015.5.0: The *dnsservers* and *searchdomains* parameters can now be passed as a comma-separated list.

Update /etc/resolv.conf

**path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.set_dns ubuntu "['8.8.8.8', '4.4.4.4']"
```

**salt.modules.lxc.set\_parameter**(*name*, *parameter*, *value*, *path=None*)

Set the value of a cgroup parameter for a container.

**path**

path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.set_parameter name parameter value
```

**salt.modules.lxc.set\_pass**(*name*, *users*, *password*, *encrypted=True*, *path=None*)

This function is an alias of `set_password`.

Changed in version 2015.5.0: Function renamed from `set_pass` to `set_password`. Additionally, this function now supports (and defaults to using) a password hash instead of a plaintext password.

Set the password of one or more system users inside containers

**users**

Comma-separated list (or python list) of users to change password

**password**

Password to set for the specified user(s)

**encrypted**

[True] If true, `password` must be a password hash. Set to `False` to set a plaintext password (not recommended).

New in version 2015.5.0.

**path**

path to the container parent directory default: `/var/lib/lxc (system)`

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.set_pass container-name root '$6$uJ2uAyLU$KoI67t8As/
↳0fXtJ0PcHKGXmUpcoYUcVR2K6x93walnShTCQvjRwq25yIkiCB0qgbfdKQSFnAo28/
↳ek6716vEV1'
salt '*' lxc.set_pass container-name root foo encrypted=False
```

`salt.modules.lxc.set_password`(*name, users, password, encrypted=True, path=None*)

Changed in version 2015.5.0: Function renamed from `set_pass` to `set_password`. Additionally, this function now supports (and defaults to using) a password hash instead of a plaintext password.

Set the password of one or more system users inside containers

**users**

Comma-separated list (or python list) of users to change password

**password**

Password to set for the specified user(s)

**encrypted**

[True] If true, `password` must be a password hash. Set to `False` to set a plaintext password (not recommended).

New in version 2015.5.0.

**path**

path to the container parent directory default: `/var/lib/lxc (system)`

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.set_pass container-name root '$6$uJ2uAyLU$KoI67t8As/
↳0fXtJ0PcHKGXmUpcoYUcVR2K6x93walnShTCQvjRwq25yIkiCB0qgbfdKQSFnAo28/
↳ek6716vEV1'
salt '*' lxc.set_pass container-name root foo encrypted=False
```

`salt.modules.lxc.start`(*name, \*\*kwargs*)

Start the named container

**path**

path to the container parent directory default: `/var/lib/lxc (system)`

New in version 2015.8.0.

**lxc\_config**

path to a lxc config file config file will be guessed from container name otherwise

New in version 2015.8.0.

**use\_vt**

run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.start name
```

**salt.modules.lxc.state**(*name, path=None*)

Returns the state of a container.

**path**

path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.state name
```

**salt.modules.lxc.stop**(*name, kill=False, path=None, use\_vt=None*)

Stop the named container

**path**

path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**kill: False**

Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

Changed in version 2015.5.0: Default value changed to False

**use\_vt**

run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.stop name
```

**salt.modules.lxc.systemd\_running\_state**(*name, path=None*)

Get the operational state of a systemd based container

**path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.systemd_running_state ubuntu
```

**salt.modules.lxc.templates**()

New in version 2015.5.0.

List the available LXC template scripts installed on the minion

CLI Examples:

```
salt myminion lxc.templates
```

`salt.modules.lxc.test_bare_started_state`(*name*, *path=None*)

Test if a non systemd container is fully started For now, it consists only to test if the container is attachable

**path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.test_bare_started_state ubuntu
```

`salt.modules.lxc.test_sd_started_state`(*name*, *path=None*)

Test if a systemd container is fully started

**path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.test_sd_started_state ubuntu
```

`salt.modules.lxc.unfreeze`(*name*, *path=None*, *use\_vt=None*)

Unfreeze the named container.

**path**

path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**use\_vt**

run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.unfreeze name
```

`salt.modules.lxc.update_lxc_conf`(*name*, *lxc\_conf*, *lxc\_conf\_unset*, *path=None*)

Edit LXC configuration options

**path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.update_lxc_conf ubuntu \  
  lxc_conf="{['network.ipv4.ip':'10.0.3.5']}" \  
  lxc_conf_unset=["lxc.utsname"]
```

`salt.modules.lxc.version`()

Return the actual lxc client version

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.version
```

`salt.modules.lxc.wait_started(name, path=None, timeout=300)`

Check that the system has fully inited

This is actually very important for systemd based containers

see <https://github.com/saltstack/salt/issues/23847>

**path**

path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.wait_started ubuntu
```

`salt.modules.lxc.write_conf(conf_file, conf)`

Write out an LXC configuration file

This is normally only used internally. The format of the data structure must match that which is returned from `lxc.read_conf()`, with `out_format` set to `commented`.

An example might look like:

```
[
  {'lxc.utsname': '$CONTAINER_NAME'},
  {'# This is a commented line\n',
   '\n'},
  {'lxc.mount': '$CONTAINER_FSTAB'},
  {'lxc.rootfs': {'comment': 'This is another test',
                  'value': 'This is another test'}},
  '\n',
  {'lxc.network.type': 'veth'},
  {'lxc.network.flags': 'up'},
  {'lxc.network.link': 'br0'},
  {'lxc.network.mac': '$CONTAINER_MACADDR'},
  {'lxc.network.ipv4': '$CONTAINER_IPADDR'},
  {'lxc.network.name': '$CONTAINER_DEVICENAME'},
]
```

CLI Example:

```
salt 'minion' lxc.write_conf /etc/lxc/mycontainer.conf \
  out_format=commented
```

### 26.6.233 salt.modules.lxd

Module for managing the LXD daemon and its containers.

New in version 2019.2.0.

LXD(1) is a container "hypervisor". This execution module provides several functions to help manage it and its containers.

**Note:**

- `pylxd(2)` version `>=2.2.5` is required to let this work, currently only available via pip.

To install on Ubuntu:

```
$ apt-get install libssl-dev python-pip $ pip install -U pylxd
```

- you need lxd installed on the minion for the `init()` and `version()` methods.
  - for the `config_get()` and `config_set()` methods you need to have `lxd-client` installed.
- 

**maintainer**

René Jochum <rene@jochums.at>

**maturity**

new

**depends**

python-pylxd

**platform**

Linux

`salt.modules.lxd.authenticate` (*remote\_addr*, *password*, *cert*, *key*, *verify\_cert=True*)

Authenticate with a remote LXD daemon.

**remote\_addr** :

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443
```

**password** :

The password of the remote.

**cert** :

PEM Formatted SSL Certificate.

**Examples:**

```
~/.config/lxc/client.crt
```

**key** :

PEM Formatted SSL Key.

**Examples:**

```
~/.config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.authenticate https://srv01:8443 <yourpass> ~/.config/lxc/  
↳client.crt ~/.config/lxc/client.key false
```

See the [requests-docs](#) for the SSL stuff.

`salt.modules.lxd.config_get` (*key*)

Get an LXD daemon config option

**key** :

The key of the config value to retrieve

CLI Examples:

```
salt '*' lxd.config_get core.https_address
```

`salt.modules.lxd.config_set` (*key*, *value*)

Set an LXD daemon config option

CLI Examples:

To listen on IPv4 and IPv6 port 8443, you can omit the :8443 its the default:

```
salt '*' lxd.config_set core.https_address [::]:8443
```

To set the server trust password:

```
salt '*' lxd.config_set core.trust_password blah
```

`salt.modules.lxd.container_config_delete` (*name*, *config\_key*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*)

Delete a container config value

**name :**

Name of the container

**config\_key :**

The config key to delete

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

```
~/config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

`salt.modules.lxd.container_config_get` (*name*, *config\_key*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*)

Get a container config value

**name :**

Name of the container

**config\_key :**

The config key to retrieve

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

```
~/config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXN normally uses self-signed certificates.

`salt.modules.lxd.container_config_set` (*name, config\_key, config\_value, remote\_addr=None, cert=None, key=None, verify\_cert=True*)

Set a container config value

**name :**

Name of the container

**config\_key :**

The config key to set

**config\_value :**

The config value to set

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

```
~/config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXN normally uses self-signed certificates.

`salt.modules.lxd.container_create` (*name, source, profiles=None, config=None, devices=None, architecture='x86\_64', ephemeral=False, wait=True, remote\_addr=None, cert=None, key=None, verify\_cert=True, \_raw=False*)

Create a container

**name :**

The name of the container

**source :**

Can be either a string containing an image alias:

```
"xenial/amd64"
```

or an dict with type "image" with alias:

```
{"type": "image",  
 "alias": "xenial/amd64"}
```

or image with "fingerprint":

```
{"type": "image",  
 "fingerprint": "SHA-256"}
```

or image with "properties":

```
{"type": "image",  
 "properties": {  
   "os": "ubuntu", "release": "14.04", "architecture": "x86_64"}}
```

or none:

```
{"type": "none"}
```

or copy:

```
{ "type": "copy",
  "source": "my-old-container" }
```

#### profiles

[[ 'default' ]] List of profiles to apply on this container

#### config :

A config dict or None (None = unset).

Can also be a list:

```
[ { 'key': 'boot.autostart', 'value': 1 },
  { 'key': 'security.privileged', 'value': '1' } ]
```

#### devices :

A device dict or None (None = unset).

#### architecture

['x86\_64']

Can be one of the following:

- unknown
- i686
- x86\_64
- armv7l
- aarch64
- ppc
- ppc64
- ppc64le
- s390x

#### ephemeral

[False] Destroy this container after stop?

#### remote\_addr :

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

Examples:

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

#### cert :

PEM Formatted SSL Certificate.

Examples:

```
~/config/lxc/client.crt
```

#### key :

PEM Formatted SSL Key.

Examples:

```
~/config/lxc/client.key
```

#### verify\_cert

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXID normally uses self-signed certificates.

#### \_raw

[False] Return the raw pyxld object or a dict?

CLI Examples:

```
salt '*' lxd.container_create test xenial/amd64
```

See also the [rest-api-docs](#).

`salt.modules.lxd.container_delete` (*name*, *remote\_addr=None*, *cert=None*, *key=None*,  
*verify\_cert=True*)

Delete a container

**name :**

Name of the container to delete

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

`~/config/lxc/client.crt`

**key :**

PEM Formatted SSL Key.

**Examples:**

`~/config/lxc/client.key`

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

`salt.modules.lxd.container_device_add` (*name*, *device\_name*, *device\_type='disk'*, *remote\_addr=None*,  
*cert=None*, *key=None*, *verify\_cert=True*, **\*\*kwargs**)

Add a container device

**name :**

Name of the container

**device\_name :**

The device name to add

**device\_type :**

Type of the device

**\*\* kwargs :**

Additional device args

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

`~/config/lxc/client.crt`

**key :**

PEM Formatted SSL Key.

**Examples:**

`~/config/lxc/client.key`

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

`salt.modules.lxd.container_device_delete` (*name*, *device\_name*, *remote\_addr=None*, *cert=None*,  
*key=None*, *verify\_cert=True*)

Delete a container device

**name :**

Name of the container

**device\_name** :  
The device name to delete

**remote\_addr** :  
An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**  
`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert** :  
PEM Formatted SSL Certificate.

**Examples:**  
`~/.config/lxc/client.crt`

**key** :  
PEM Formatted SSL Key.

**Examples:**  
`~/.config/lxc/client.key`

**verify\_cert**  
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXN normally uses self-signed certificates.

`salt.modules.lxd.container_device_get` (*name, device\_name, remote\_addr=None, cert=None, key=None, verify\_cert=True*)

Get a container device

**name** :  
Name of the container

**device\_name** :  
The device name to retrieve

**remote\_addr** :  
An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**  
`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert** :  
PEM Formatted SSL Certificate.

**Examples:**  
`~/.config/lxc/client.crt`

**key** :  
PEM Formatted SSL Key.

**Examples:**  
`~/.config/lxc/client.key`

**verify\_cert**  
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXN normally uses self-signed certificates.

`salt.modules.lxd.container_execute` (*name, cmd, remote\_addr=None, cert=None, key=None, verify\_cert=True*)

Execute a command list on a container.

**name** :  
Name of the container

**cmd** :  
Command to be executed (as a list)

**Example** :  
`['ls', '-l']`

**remote\_addr** :

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

<https://myserver.lan:8443> /var/lib/mysocket.sock

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

~/config/lxc/client.crt

**key :**

PEM Formatted SSL Key.

**Examples:**

~/config/lxc/client.key

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.container_execute <container name> '["ls", "-l"]'
```

`salt.modules.lxd.container_file_get` (*name, src, dst, overwrite=False, mode=None, uid=None, gid=None, remote\_addr=None, cert=None, key=None, verify\_cert=True*)

Get a file from a container

**name :**

Name of the container

**src :**

The source file or directory

**dst :**

The destination file or directory

**mode :**

Set file mode to octal number

**uid :**

Set file uid (owner)

**gid :**

Set file gid (group)

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

<https://myserver.lan:8443> /var/lib/mysocket.sock

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

~/config/lxc/client.crt

**key :**

PEM Formatted SSL Key.

**Examples:**

~/config/lxc/client.key

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

`salt.modules.lxd.container_file_put` (*name, src, dst, recursive=False, overwrite=False, mode=None, uid=None, gid=None, saltenv='base', remote\_addr=None, cert=None, key=None, verify\_cert=True*)

Put a file into a container

**name :**  
Name of the container

**src :**  
The source file or directory

**dst :**  
The destination file or directory

**recursive :**  
Decent into src directory

**overwrite :**  
Replace destination if it exists

**mode :**  
Set file mode to octal number

**uid :**  
Set file uid (owner)

**gid :**  
Set file gid (group)

**remote\_addr :**  
An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!  
**Examples:**  
`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**  
PEM Formatted SSL Certificate.  
**Examples:**  
`~/.config/lxc/client.crt`

**key :**  
PEM Formatted SSL Key.  
**Examples:**  
`~/.config/lxc/client.key`

**verify\_cert**  
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.container_file_put <container name> /var/tmp/foo /var/tmp/
```

`salt.modules.lxd.container_freeze` (*name*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*)

Freeze a container

**name :**  
Name of the container to freeze

**remote\_addr :**  
An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!  
**Examples:**  
`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**  
PEM Formatted SSL Certificate.  
**Examples:**  
`~/.config/lxc/client.crt`

**key :**  
PEM Formatted SSL Key.

**Examples:**

```
~/.config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

```
salt.modules.lxd.container_get (name=None, remote_addr=None, cert=None, key=None,
                                verify_cert=True, _raw=False)
```

Gets a container from the LXD

**name :**

The name of the container to get.

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

```
~/.config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/.config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**\_raw :**

Return the pylxd object, this is internal and by states in use.

```
salt.modules.lxd.container_list (list_names=False, remote_addr=None, cert=None, key=None,
                                verify_cert=True)
```

Lists containers

**list\_names**

[False] Only return a list of names when True

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

```
~/.config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/.config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**CLI Examples:**

Full dict with all available information:

```
salt '*' lxd.container_list
```

For a list of names:

```
salt '*' lxd.container_list true
```

See also [container-attributes](#).

```
salt.modules.lxd.container_migrate(name, stop_and_start=False, remote_addr=None, cert=None,
                                     key=None, verify_cert=True, src_remote_addr=None,
                                     src_cert=None, src_key=None, src_verify_cert=None)
```

Migrate a container.

If the container is running, it either must be shut down first (use `stop_and_start=True`) or `criu` must be installed on the source and destination machines.

For this operation both certs need to be authenticated, use `lxd.authenticate` <`salt.modules.lxd.authenticate` to authenticate your cert(s).

**name :**

Name of the container to migrate

**stop\_and\_start :**

Stop the container on the source and start it on dest

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide `remote_addr` and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

```
~/.config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/.config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
# Authorize
salt '*' lxd.authenticate https://srv01:8443 <yourpass> ~/.config/lxc/
↳client.crt ~/.config/lxc/client.key false
salt '*' lxd.authenticate https://srv02:8443 <yourpass> ~/.config/lxc/
↳client.crt ~/.config/lxc/client.key false

# Migrate phpmyadmin from srv01 to srv02
salt '*' lxd.container_migrate phpmyadmin stop_and_start=true remote_
↳addr=https://srv02:8443 cert=~/.config/lxc/client.crt key=~/.config/lxc/
↳client.key verify_cert=False src_remote_addr=https://srv01:8443
```

```
salt.modules.lxd.container_rename(name, newname, remote_addr=None, cert=None, key=None,
                                     verify_cert=True)
```

Rename a container

**name :**  
Name of the container to Rename

**newname :**  
The new name of the container

**remote\_addr :**  
An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**  
`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**  
PEM Formatted SSL Certificate.

**Examples:**  
`~/.config/lxc/client.crt`

**key :**  
PEM Formatted SSL Key.

**Examples:**  
`~/.config/lxc/client.key`

**verify\_cert**  
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

`salt.modules.lxd.container_restart` (*name*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*)

Restart a container

**name :**  
Name of the container to restart

**remote\_addr :**  
An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**  
`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**  
PEM Formatted SSL Certificate.

**Examples:**  
`~/.config/lxc/client.crt`

**key :**  
PEM Formatted SSL Key.

**Examples:**  
`~/.config/lxc/client.key`

**verify\_cert**  
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

`salt.modules.lxd.container_start` (*name*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*)

Start a container

**name :**  
Name of the container to start

**remote\_addr :**  
An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**  
`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**  
PEM Formatted SSL Certificate.

**Examples:**

```
~/.config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/.config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXN normally uses self-signed certificates.

```
salt.modules.lxd.container_state (name=None, remote_addr=None, cert=None, key=None,
                                  verify_cert=True)
```

Get container state

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

```
~/.config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/.config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXN normally uses self-signed certificates.

```
salt.modules.lxd.container_stop (name, timeout=30, force=True, remote_addr=None, cert=None,
                                 key=None, verify_cert=True)
```

Stop a container

**name :**

Name of the container to stop

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

```
~/.config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/.config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXN normally uses self-signed certificates.

```
salt.modules.lxd.container_unfreeze (name, remote_addr=None, cert=None, key=None,
                                      verify_cert=True)
```

Unfreeze a container

**name :**  
Name of the container to unfreeze

**remote\_addr :**  
An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**  
`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**  
PEM Formatted SSL Certificate.

**Examples:**  
`~/.config/lxc/client.crt`

**key :**  
PEM Formatted SSL Key.

**Examples:**  
`~/.config/lxc/client.key`

**verify\_cert**  
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXN normally uses self-signed certificates.

```
salt.modules.lxd.image_alias_add(image, alias, description="", remote_addr=None, cert=None,
                                key=None, verify_cert=True)
```

Create an alias on the given image

**image :**  
An image alias, a fingerprint or a image object

**alias :**  
The alias to add

**description :**  
Description of the alias

**remote\_addr :**  
An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**  
`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**  
PEM Formatted SSL Certificate.

**Examples:**  
`~/.config/lxc/client.crt`

**key :**  
PEM Formatted SSL Key.

**Examples:**  
`~/.config/lxc/client.key`

**verify\_cert**  
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXN normally uses self-signed certificates.

CLI Examples:

```
salt '*' lxd.image_alias_add xenial/amd64 x "Short version of xenial/amd64"
→ "
```

```
salt.modules.lxd.image_alias_delete(image, alias, remote_addr=None, cert=None, key=None,
                                    verify_cert=True)
```

Delete an alias (this is currently not restricted to the image)

**image :**  
An image alias, a fingerprint or a image object

**alias :**  
The alias to delete

**remote\_addr :**  
An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**  
`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**  
PEM Formatted SSL Certificate.

**Examples:**  
`~/config/lxc/client.crt`

**key :**  
PEM Formatted SSL Key.

**Examples:**  
`~/config/lxc/client.key`

**verify\_cert**  
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```
salt '*' lxd.image_alias_add xenial/amd64 x "Short version of xenial/amd64"
↪ "
```

`salt.modules.lxd.image_copy_lxd`(*source, src\_remote\_addr, src\_cert, src\_key, src\_verify\_cert, remote\_addr, cert, key, verify\_cert=True, aliases=None, public=None, auto\_update=None, \_raw=False*)

Copy an image from another LXD instance

**source :**  
An alias or a fingerprint of the source.

**src\_remote\_addr :**  
An URL to the source remote daemon

**Examples:**  
`https://mysourceserver.lan:8443`

**src\_cert :**  
PEM Formatted SSL Certificate for the source

**Examples:**  
`~/config/lxc/client.crt`

**src\_key :**  
PEM Formatted SSL Key for the source

**Examples:**  
`~/config/lxc/client.key`

**src\_verify\_cert**  
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**remote\_addr :**  
Address of the destination daemon

**Examples:**  
`https://mydestserver.lan:8443`

**cert :**  
PEM Formatted SSL Certificate for the destination

**Examples:**  
`~/config/lxc/client.crt`

**key :**  
PEM Formatted SSL Key for the destination

**Examples:**

```
~/.config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**aliases**

[[]] List of aliases to append to the copied image

**public**

[None] Make this image public available, None = copy source

**auto\_update**

[None] Wherever to auto-update from the original source, None = copy source

**\_raw**

[False] Return the raw pylxd object or a dict of the destination image?

## CLI Examples:

```
salt '*' lxd.image_copy_lxd xenial/amd64 https://srv01:8443 ~/.config/lxc/
↪client.crt ~/.config/lxc/client.key false https://srv02:8443 ~/.config/
↪lxc/client.crt ~/.config/lxc/client.key false aliases="['xenial/amd64']"
```

`salt.modules.lxd.image_delete` (*image*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*)

Delete an image by an alias or fingerprint

**name :**

The alias or fingerprint of the image to delete, can be a obj for the states.

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide *remote\_addr* and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

```
~/.config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/.config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

## CLI Examples:

```
salt '*' lxd.image_delete xenial/amd64
```

`salt.modules.lxd.image_from_file` (*filename*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*, *aliases=None*, *public=False*, *saltenv='base'*, *\_raw=False*)

Create an image from a file

**filename :**

The filename of the rootfs

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide *remote\_addr* and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert** :  
 PEM Formatted SSL Certificate.  
**Examples:**  
 ~/.config/lxc/client.crt

**key** :  
 PEM Formatted SSL Key.  
**Examples:**  
 ~/.config/lxc/client.key

**verify\_cert**  
 [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**aliases**  
 [[]] List of aliases to append to the copied image

**public**  
 [False] Make this image public available

**saltenv**  
 [base] The saltenv to use for salt:// copies

**\_raw**  
 [False] Return the raw pylxd object or a dict of the image?

CLI Examples:

```
salt '*' lxd.image_from_file salt://lxd/files/busybox.tar.xz aliases=[
→ "busybox-amd64"]
```

`salt.modules.lxd.image_from_simplestreams` (*server, alias, remote\_addr=None, cert=None, key=None, verify\_cert=True, aliases=None, public=False, auto\_update=False, \_raw=False*)

Create an image from simplestreams

**server** :  
 Simplestreams server URI

**alias** :  
 The alias of the image to retrieve

**remote\_addr** :  
 An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**  
[https://myserver.lan:8443 /var/lib/mysocket.sock](https://myserver.lan:8443/var/lib/mysocket.sock)

**cert** :  
 PEM Formatted SSL Certificate.  
**Examples:**  
 ~/.config/lxc/client.crt

**key** :  
 PEM Formatted SSL Key.  
**Examples:**  
 ~/.config/lxc/client.key

**verify\_cert**  
 [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**aliases**  
 [[]] List of aliases to append to the copied image

**public**  
 [False] Make this image public available

**auto\_update**  
 [False] Should LXD auto update that image?

**\_raw**  
 [False] Return the raw pylxd object or a dict of the image?  
 CLI Examples:

```
salt '*' lxd.image_from_simplestreams "https://cloud-images.ubuntu.com/
↳releases" "trusty/amd64" aliases='["t", "trusty/amd64"]' auto_
↳update=True
```

`salt.modules.lxd.image_from_url` (*url*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*, *aliases=None*, *public=False*, *auto\_update=False*, *\_raw=False*)

Create an image from an url

**url :**

The URL from where to download the image

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

```
~/config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**aliases**

[[]] List of aliases to append to the copied image

**public**

[False] Make this image public available

**auto\_update**

[False] Should LXD auto update that image?

**\_raw**

[False] Return the raw pylxd object or a dict of the image?

CLI Examples:

```
salt '*' lxd.image_from_url https://dl.stgraber.org/lxd aliases='[
↳"busybox-amd64"]'
```

`salt.modules.lxd.image_get` (*fingerprint*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*, *\_raw=False*)

Get an image by its fingerprint

**fingerprint :**

The fingerprint of the image to retrieve

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

```
~/.config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/.config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**\_raw**

[False] Return the raw pylxd object or a dict of it?

**CLI Examples:**

```
salt '*' lxd.image_get <fingerprint>
```

`salt.modules.lxd.image_get_by_alias` (*alias*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*, *\_raw=False*)

Get an image by an alias

**alias :**

The alias of the image to retrieve

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

```
~/.config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/.config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**\_raw**

[False] Return the raw pylxd object or a dict of it?

**CLI Examples:**

```
salt '*' lxd.image_get_by_alias xenial/amd64
```

`salt.modules.lxd.image_list` (*list\_aliases=False*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*)

Lists all images from the LXD.

**list\_aliases :**

Return a dict with the fingerprint as key and a list of aliases as value instead.

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert** :  
 PEM Formatted SSL Certificate.  
**Examples:**  
 ~/.config/lxc/client.crt

**key** :  
 PEM Formatted SSL Key.  
**Examples:**  
 ~/.config/lxc/client.key

**verify\_cert**  
 [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```
salt '*' lxd.image_list true --out=json
salt '*' lxd.image_list --out=json
```

**salt.modules.lxd.init**(*storage\_backend='dir', trust\_password=None, network\_address=None, network\_port=None, storage\_create\_device=None, storage\_create\_loop=None, storage\_pool=None*)

Calls lxd init --auto -- opts

**storage\_backend** :  
 Storage backend to use (zfs or dir, default: dir)

**trust\_password** :  
 Password required to add new clients

**network\_address**  
 [None] Address to bind LXD to (default: none)

**network\_port**  
 [None] Port to bind LXD to (Default: 8443)

**storage\_create\_device**  
 [None] Setup device based storage using this DEVICE

**storage\_create\_loop**  
 [None] Setup loop based storage with this SIZE in GB

**storage\_pool**  
 [None] Storage pool to use or create

CLI Examples:

To listen on all IPv4/IPv6 Addresses:

```
salt '*' lxd.init dir PaSsw0rD [:::]
```

To not listen on Network:

```
salt '*' lxd.init
```

**salt.modules.lxd.normalize\_input\_values**(*config, devices*)  
 normalize config input so returns can be put into mongodb, which doesn't like .

This is not meant to be used on the commandline.

CLI Examples:

```
salt '*' lxd.normalize_input_values config={} devices={}
```

**salt.modules.lxd.profile\_config\_delete**(*name, config\_key, remote\_addr=None, cert=None, key=None, verify\_cert=True*)

Delete a profile config item.

**name :**

The name of the profile to delete the config item.

**config\_key :**

The config key for the value to retrieve.

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

`~/config/lxc/client.crt`

**key :**

PEM Formatted SSL Key.

**Examples:**

`~/config/lxc/client.key`

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.profile_config_delete autostart boot.autostart.delay
```

`salt.modules.lxd.profile_config_get` (*name, config\_key, remote\_addr=None, cert=None, key=None, verify\_cert=True*)

Get a profile config item.

**name :**

The name of the profile to get the config item from.

**config\_key :**

The key for the item to retrieve.

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

`~/config/lxc/client.crt`

**key :**

PEM Formatted SSL Key.

**Examples:**

`~/config/lxc/client.key`

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.profile_config_get autostart boot.autostart
```

`salt.modules.lxd.profile_config_set` (*name, config\_key, config\_value, remote\_addr=None, cert=None, key=None, verify\_cert=True*)

Set a profile config item.

**name :**

The name of the profile to set the config item to.

**config\_key :**

The items key.

**config\_value :**

Its items value.

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

```
~/.config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/.config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.profile_config_set autostart boot.autostart 0
```

`salt.modules.lxd.profile_create` (*name, config=None, devices=None, description=None, remote\_addr=None, cert=None, key=None, verify\_cert=True*)

Creates a profile.

**name :**

The name of the profile to get.

**config :**

A config dict or None (None = unset).

Can also be a list:

```
[[{'key': 'boot.autostart', 'value': 1},
  {'key': 'security.privileged', 'value': '1'}]
```

**devices :**

A device dict or None (None = unset).

**description :**

A description string or None (None = unset).

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

```
~/.config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/.config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXN normally uses self-signed certificates.

## CLI Examples:

```
salt '*' lxd.profile_create autostart config="{boot.autostart: 1, boot.
↳autostart.delay: 2, boot.autostart.priority: 1}"
salt '*' lxd.profile_create shared_mounts devices="{shared_mount: {type:
↳'disk', source: '/home/shared', path: '/home/shared'}}"
```

See the [lxd-docs](#) for the details about the config and devices dicts.

`salt.modules.lxd.profile_delete`(*name*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*)

Deletes a profile.

**name :**

The name of the profile to delete.

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

```
~/.config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/.config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXN normally uses self-signed certificates.

## CLI Example:

```
salt '*' lxd.profile_delete shared_mounts
```

`salt.modules.lxd.profile_device_delete`(*name*, *device\_name*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*)

Delete a profile device.

**name :**

The name of the profile to delete the device.

**device\_name :**

The name of the device to delete.

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

```
~/.config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

`~/.config/lxc/client.key`

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.profile_device_delete autostart eth1
```

`salt.modules.lxd.profile_device_get`(*name*, *device\_name*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*)

Get a profile device.

**name :**

The name of the profile to get the device from.

**device\_name :**

The name of the device to retrieve.

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide *remote\_addr* and its a TCP Address!

**Examples:**

`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

`~/.config/lxc/client.crt`

**key :**

PEM Formatted SSL Key.

**Examples:**

`~/.config/lxc/client.key`

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.profile_device_get default eth0
```

`salt.modules.lxd.profile_device_set`(*name*, *device\_name*, *device\_type='disk'*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*, *\*\*kwargs*)

Set a profile device.

**name :**

The name of the profile to set the device to.

**device\_name :**

The name of the device to set.

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide *remote\_addr* and its a TCP Address!

**Examples:**

`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

`~/.config/lxc/client.crt`

**key :**  
 PEM Formatted SSL Key.  
**Examples:**  
 ~/.config/lxc/client.key

**verify\_cert**  
 [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.profile_device_set autostart eth1 nic nictype=bridged
↳parent=lxdbr0
```

`salt.modules.lxd.profile_get`(*name*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*, *\_raw=False*)

Gets a profile from the LXD

**name :**  
 The name of the profile to get.

**remote\_addr :**  
 An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**  
 https://myserver.lan:8443 /var/lib/mysocket.sock

**cert :**  
 PEM Formatted SSL Certificate.  
**Examples:**  
 ~/.config/lxc/client.crt

**key :**  
 PEM Formatted SSL Key.  
**Examples:**  
 ~/.config/lxc/client.key

**verify\_cert**  
 [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**\_raw :**  
 Return the pylxd object, this is internal and by states in use.

CLI Examples:

```
salt '*' lxd.profile_get autostart
```

`salt.modules.lxd.profile_list`(*list\_names=False*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*)

Lists all profiles from the LXD.

**list\_names :**  
 Return a list of names instead of full blown dicts.

**remote\_addr :**  
 An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**  
 https://myserver.lan:8443 /var/lib/mysocket.sock

**cert :**  
 PEM Formatted SSL Certificate.  
**Examples:**  
 ~/.config/lxc/client.crt

**key :**

PEM Formatted SSL Key.

**Examples:**

`~/.config/lxc/client.key`

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```
salt '*' lxd.profile_list true --out=json
salt '*' lxd.profile_list --out=json
```

`salt.modules.lxd.py_lxd_client_get(remote_addr=None, cert=None, key=None, verify_cert=True)`

Get an pylxd client, this is not meant to be run over the CLI.

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr and its a TCP Address!

**Examples:**

`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

`~/.config/lxc/client.crt`

**key :**

PEM Formatted SSL Key.

**Examples:**

`~/.config/lxc/client.key`

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

See the [requests-docs](#) for the SSL stuff.

`salt.modules.lxd.py_lxd_save_object(obj)`

Saves an object (profile/image/container) and translate its exception on failure

**obj :**

The object to save

This is an internal method, no CLI Example.

`salt.modules.lxd.py_lxd_version()`

Returns the actual pylxd version.

CLI Example:

```
salt '*' lxd.py_lxd_version
```

`salt.modules.lxd.snapshots_all(container, remote_addr=None, cert=None, key=None, verify_cert=True)`

Get all snapshots for a container

**container :**

The name of the container to get.

**remote\_addr :**

An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote\_addr' is defined.

**Examples:**

`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**  
 PEM Formatted SSL Certificate.  
**Examples:**  
 ~/.config/lxc/client.crt

**key :**  
 PEM Formatted SSL Key.  
**Examples:**  
 ~/.config/lxc/client.key

**verify\_cert**  
 [True] Verify the ssl certificate. Default: True  
 CLI Examples:

```
salt '*' lxd.snapshots_all test-container
```

`salt.modules.lxd.snapshots_create` (*container, name=None, remote\_addr=None, cert=None, key=None, verify\_cert=True*)

Create a snapshot for a container

**container :**  
 The name of the container to get.

**name :**  
 The name of the snapshot.

**remote\_addr :**  
 An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote\_addr' is defined.  
**Examples:**  
[https://myserver.lan:8443 /var/lib/mysocket.sock](https://myserver.lan:8443/var/lib/mysocket.sock)

**cert :**  
 PEM Formatted SSL Certificate.  
**Examples:**  
 ~/.config/lxc/client.crt

**key :**  
 PEM Formatted SSL Key.  
**Examples:**  
 ~/.config/lxc/client.key

**verify\_cert**  
 [True] Verify the ssl certificate. Default: True  
 CLI Examples:

```
salt '*' lxd.snapshots_create test-container test-snapshot
```

`salt.modules.lxd.snapshots_delete` (*container, name, remote\_addr=None, cert=None, key=None, verify\_cert=True*)

Delete a snapshot for a container

**container :**  
 The name of the container to get.

**name :**  
 The name of the snapshot.

**remote\_addr :**  
 An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote\_addr' is defined.  
**Examples:**  
[https://myserver.lan:8443 /var/lib/mysocket.sock](https://myserver.lan:8443/var/lib/mysocket.sock)

**cert :**  
 PEM Formatted SSL Certificate.  
**Examples:**  
 ~/.config/lxc/client.crt

**key :**

PEM Formatted SSL Key.

**Examples:**

~/.config/lxc/client.key

**verify\_cert**

[True] Verify the ssl certificate. Default: True

CLI Examples:

```
salt '*' lxd.snapshots_delete test-container test-snapshot
```

`salt.modules.lxd.snapshots_get` (*container, name, remote\_addr=None, cert=None, key=None, verify\_cert=True*)

Get information about snapshot for a container

**container :**

The name of the container to get.

**name :**

The name of the snapshot.

**remote\_addr :**

An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote\_addr' is defined.

**Examples:**

<https://myserver.lan:8443> /var/lib/mysocket.sock

**cert :**

PEM Formatted SSL Certificate.

**Examples:**

~/.config/lxc/client.crt

**key :**

PEM Formatted SSL Key.

**Examples:**

~/.config/lxc/client.key

**verify\_cert**

[True] Verify the ssl certificate. Default: True

CLI Examples:

```
salt '*' lxd.snapshots_get test-container test-snapshot
```

`salt.modules.lxd.sync_config_devices` (*obj, newconfig, newdevices, test=False*)

Syncs the given config and devices with the object (a profile or a container) returns a changes dict with all changes made.

**obj :**

The object to sync with / or just test with.

**newconfig:**

The new config to check with the obj.

**newdevices:**

The new devices to check with the obj.

**test:**

Wherever to not change anything and give "Would change" message.

`salt.modules.lxd.version` ()

Returns the actual lxd version.

CLI Example:

```
salt '*' lxd.version
```

### 26.6.234 salt.modules.mac\_assistive

This module allows you to manage assistive access on macOS minions with 10.9+

New in version 2016.3.0.

```
salt '*' assistive.install /usr/bin/osascript
```

**class** salt.modules.mac\_assistive.**TccDB**(*path=None*)

**disable**(*app\_id*)

**enable**(*app\_id*)

**enabled**(*app\_id*)

**install**(*app\_id, enable=True*)

**installed**(*app\_id*)

**remove**(*app\_id*)

salt.modules.mac\_assistive.**enable\_**(*app\_id, enabled=True*)

Enable or disable an existing assistive access application.

**app\_id**

The bundle ID or command to set assistive access status.

**enabled**

Sets enabled or disabled status. Default is True.

CLI Example:

```
salt '*' assistive.enable /usr/bin/osascript
salt '*' assistive.enable com.smileonmy_mac.textexpander enabled=False
```

salt.modules.mac\_assistive.**enabled**(*app\_id*)

Check if a bundle ID or command is listed in assistive access and enabled.

**app\_id**

The bundle ID or command to retrieve assistive access status.

CLI Example:

```
salt '*' assistive.enabled /usr/bin/osascript
salt '*' assistive.enabled com.smileonmy_mac.textexpander
```

salt.modules.mac\_assistive.**install**(*app\_id, enable=True, tries=3, wait=10*)

Install a bundle ID or command as being allowed to use assistive access.

**app\_id**

The bundle ID or command to install for assistive access.

**enabled**

Sets enabled or disabled status. Default is True.

**tries**

How many times to try and write to a read-only tcc. Default is True.

**wait**

Number of seconds to wait between tries. Default is 10.

CLI Example:

```
salt '*' assistive.install /usr/bin/osascript
salt '*' assistive.install com.smileonmy_mac.textexpander
```

`salt.modules.mac_assistive.installed(app_id)`

Check if a bundle ID or command is listed in assistive access. This will not check to see if it's enabled.

**app\_id**

The bundle ID or command to check installed status.

CLI Example:

```
salt '*' assistive.installed /usr/bin/osascript
salt '*' assistive.installed com.smileonmymac.textexpander
```

`salt.modules.mac_assistive.remove(app_id)`

Remove a bundle ID or command as being allowed to use assistive access.

**app\_id**

The bundle ID or command to remove from assistive access list.

CLI Example:

```
salt '*' assistive.remove /usr/bin/osascript
salt '*' assistive.remove com.smileonmymac.textexpander
```

### 26.6.235 salt.modules.mac\_brew\_pkg

Homebrew for macOS

It is recommended for the `salt-minion` to have the `HOME BREW_PREFIX` environment variable set.

This will ensure that Salt uses the correct path for the brew binary.

Typically, this is set to `/usr/local` for Intel Macs and `/opt/homebrew` for Apple Silicon Macs.

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

`salt.modules.mac_brew_pkg.available_version(*names, **kwargs)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

Currently chooses stable versions, falling back to `devel` if that does not exist.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_brew_pkg.hold(name=None, pkgs=None, sources=None, **kwargs)`

Set package in 'hold' state, meaning it will not be upgraded.

New in version 3001.

**name**

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

**pkgs**

A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

`salt.modules.mac_brew_pkg.homebrew_prefix()`

Returns the full path to the homebrew prefix.

CLI Example:

```
salt '*' pkg.homebrew_prefix
```

`salt.modules.mac_brew_pkg.info_installed(*names, **kwargs)`

Return the information of the named package(s) installed on the system.

New in version 2016.3.1.

**names**

The names of the packages for which to return information.

CLI Example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
```

`salt.modules.mac_brew_pkg.install(name=None, pkgs=None, taps=None, options=None, **kwargs)`

Install the passed package(s) with `brew install`

**name**

The name of the formula to be installed. Note that this parameter is ignored if "pkgs" is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

**taps**

Unofficial GitHub repos to use when updating and installing formulas.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install zlib taps='homebrew/dupes'
salt '*' pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes
↳"]'
```

**options**

Options to pass to brew. Only applies to initial install. Due to how brew works, modifying chosen options requires a full uninstall followed by a fresh install. Note that if "pkgs" is used, all options will be passed to all packages. Unrecognized options for a package will be silently ignored by brew.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes
↳"]' options='["--with-fpm"]'
```

Multiple Package Installation Options:

**pkgs**

A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

`salt.modules.mac_brew_pkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation

Currently chooses stable versions, falling back to devel if that does not exist.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_brew_pkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.mac_brew_pkg.list_upgrades(refresh=True, include_casks=False, **kwargs)`

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.mac_brew_pkg.pin(name=None, pkgs=None, sources=None, **kwargs)`

Set package in 'hold' state, meaning it will not be upgraded.

New in version 3001.

**name**

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

**pkgs**

A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

`salt.modules.mac_brew_pkg.refresh_db(**kwargs)`

Update the homebrew package repository.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.mac_brew_pkg.remove` (*name=None, pkgs=None, \*\*kwargs*)

Removes packages with brew `uninstall`.

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.mac_brew_pkg.unhold` (*name=None, pkgs=None, sources=None, \*\*kwargs*)

Set package current in 'hold' state to install state, meaning it will be upgraded.

New in version 3001.

**name**

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

**pkgs**

A list of packages to unhold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.mac_brew_pkg.unpin` (*name=None, pkgs=None, sources=None, \*\*kwargs*)

Set package current in 'hold' state to install state, meaning it will be upgraded.

New in version 3001.

**name**

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

**pkgs**

A list of packages to unhold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.mac_brew_pkg.upgrade` (*refresh=True, \*\*kwargs*)

Upgrade outdated, unpinned brews.

**refresh**

Fetch the newest version of Homebrew and all formulae from GitHub before installing.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',  
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.mac_brew_pkg.upgrade_available(pkg, **kwargs)`

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.mac_brew_pkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>  
salt '*' pkg.version <package1> <package2> <package3>
```

## 26.6.236 salt.modules.mac\_desktop

macOS implementations of various commands in the "desktop" interface

`salt.modules.mac_desktop.get_output_volume()`

Get the output volume (range 0 to 100)

CLI Example:

```
salt '*' desktop.get_output_volume
```

`salt.modules.mac_desktop.lock()`

Lock the desktop session

CLI Example:

```
salt '*' desktop.lock
```

`salt.modules.mac_desktop.say(*words)`

Say some words.

**words**

The words to execute the say command with.

CLI Example:

```
salt '*' desktop.say <word0> <word1> ... <wordN>
```

`salt.modules.mac_desktop.screensaver()`

Launch the screensaver.

CLI Example:

```
salt '*' desktop.screensaver
```

`salt.modules.mac_desktop.set_output_volume`(*volume*)

Set the volume of sound.

**volume**

The level of volume. Can range from 0 to 100.

CLI Example:

```
salt '*' desktop.set_output_volume <volume>
```

### 26.6.237 salt.modules.mac\_group

Manage groups on Mac OS 10.7+

`salt.modules.mac_group.add`(*name*, *gid=None*, *\*\*kwargs*)

Changed in version 3006.0.

Add the specified group

**name**

Name of the new group

**gid**

Use GID for the new group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.mac_group.adduser`(*group*, *name*)

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

`salt.modules.mac_group.chgid`(*name*, *gid*)

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.mac_group.delete`(*name*)

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.mac_group.deluser`(*group*, *name*)

Remove a user from the group

New in version 2016.3.0.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

`salt.modules.mac_group.getent` (*refresh=False*)

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.mac_group.info` (*name*)

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.mac_group.members` (*name, members\_list*)

Replaces members of the group with a provided list.

New in version 2016.3.0.

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo'.

### 26.6.238 salt.modules.mac\_keychain

Install certificates into the keychain on Mac OS

New in version 2016.3.0.

`salt.modules.mac_keychain.get_default_keychain` (*user=None, domain='user'*)

Get the default keychain

**user**

The user to check the default keychain of

**domain**

The domain to use valid values are user|system|common|dynamic, the default is user

CLI Example:

```
salt '*' keychain.get_default_keychain
```

`salt.modules.mac_keychain.get_friendly_name` (*cert, password, legacy=False*)

Get the friendly name of the given certificate

**cert**

The certificate to install

**password**

The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

Note: The password given here will show up as plaintext in the returned job info.

**legacy**

Assume legacy format for certificate.

CLI Example:

```
salt '*' keychain.get_friendly_name /tmp/test.p12 test123
salt '*' keychain.get_friendly_name /tmp/test.p12 test123 legacy=True
```

`salt.modules.mac_keychain.get_hash(name, password=None)`

Returns the hash of a certificate in the keychain.

**name**

The name of the certificate (which you can get from `keychain.get_friendly_name`) or the location of a p12 file.

**password**

The password that is used in the certificate. Only required if your passing a p12 file. Note: This will be outputted to logs

CLI Example:

```
salt '*' keychain.get_hash /tmp/test.p12 test123
```

`salt.modules.mac_keychain.install(cert, password, keychain='/Library/Keychains/System.keychain', allow_any=False, keychain_password=None)`

Install a certificate

**cert**

The certificate to install

**password**

The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section.

Note: The password given here will show up as plaintext in the job returned info.

**keychain**

The keychain to install the certificate to, this defaults to `/Library/Keychains/System.keychain`

**allow\_any**

Allow any application to access the imported certificate without warning

**keychain\_password**

If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.install test.p12 test123
```

`salt.modules.mac_keychain.list_certs(keychain='/Library/Keychains/System.keychain')`

List all of the installed certificates

**keychain**

The keychain to install the certificate to, this defaults to `/Library/Keychains/System.keychain`

CLI Example:

```
salt '*' keychain.list_certs
```

`salt.modules.mac_keychain.set_default_keychain(keychain, domain='user', user=None)`

Set the default keychain

**keychain**

The location of the keychain to set as default

**domain**

The domain to use valid values are `user|system|common|dynamic`, the default is `user`

**user**

The user to set the default keychain as

CLI Example:

```
salt '*' keychain.set_keychain /Users/fred/Library/Keychains/login.  
→keychain
```

`salt.modules.mac_keychain.uninstall`(*cert\_name*, *keychain*='/Library/Keychains/System.keychain',  
*keychain\_password*=None)

Uninstall a certificate from a keychain

**cert\_name**

The name of the certificate to remove

**keychain**

The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

**keychain\_password**

If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.install test.p12 test123
```

`salt.modules.mac_keychain.unlock_keychain`(*keychain*, *password*)

Unlock the given keychain with the password

**keychain**

The keychain to unlock

**password**

The password to use to unlock the keychain.

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.unlock_keychain /tmp/test.p12 test123
```

### 26.6.239 salt.modules.mac\_pkgutil

Installer support for macOS.

Installer is the native .pkg/.mpkg package manager for macOS.

`salt.modules.mac_pkgutil.forget`(*package\_id*)

New in version 2016.3.0.

Remove the receipt data about the specified package. Does not remove files.

**Warning:** DO NOT use this command to fix broken package design

**Parameters**

**package\_id** (*str*) -- The name of the package to forget

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' pkgutil.forget com.apple.pkg.gcc4.2Leo
```

`salt.modules.mac_pkgutil.install`(*source*, *package\_id*)

Install a .pkg from an URI or an absolute path.

**Parameters**

- **source** (*str*) -- The path to a package.
- **package\_id** (*str*) -- The package ID

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' pkgutil.install source=/vagrant/build_essentials.pkg package_
→id=com.apple.pkg.gcc4.2Leo
```

`salt.modules.mac_pkgutil.is_installed`(*package\_id*)

Returns whether a given package id is installed.

**Returns**

True if installed, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' pkgutil.is_installed com.apple.pkg.gcc4.2Leo
```

`salt.modules.mac_pkgutil.list_`()

List the installed packages.

**Returns**

A list of installed packages

**Return type**

list

CLI Example:

```
salt '*' pkgutil.list
```

## 26.6.240 salt.modules.mac\_portspkg

Support for MacPorts under macOS.

This module has some caveats.

1. Updating the database of available ports is quite resource-intensive. However, *refresh=True* is the default for all operations that need an up-to-date copy of available ports. Consider *refresh=False* when you are sure no db update is needed.
2. In some cases MacPorts doesn't always realize when another copy of itself is running and will gleefully tromp all over the available ports database. This makes MacPorts behave in undefined ways until a fresh complete copy is retrieved.

Because of 1 and 2 it is possible to get the salt-minion into a state where *salt mac-machine pkg./something/* won't want to return. Use

*salt-run jobs.active*

on the master to check for potentially long-running calls to *port*.

Finally, ports database updates are always handled with *port selfupdate* as opposed to *port sync*. This makes sense in the MacPorts user community but may confuse experienced Linux admins as Linux package managers don't upgrade the packaging software when doing a package database update. In other words *salt mac-machine pkg.refresh\_db* is more like *apt-get update; apt-get upgrade dpkg apt-get* than simply *apt-get update*.

`salt.modules.mac_portspkg.available_version(*names, **kwargs)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

Options:

**refresh**

Update ports with `port selfupdate`

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_portspkg.install(name=None, refresh=False, pkgs=None, **kwargs)`

Install the passed package(s) with `port install`

**name**

The name of the formula to be installed. Note that this parameter is ignored if "pkgs" is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

**version**

Specify a version to pkg to install. Ignored if pkgs is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5'
```

**variant**

Specify a variant to pkg to install. Ignored if pkgs is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5' variant='+credential_
↳osxkeychain+doc+pcr'
```

Multiple Package Installation Options:

**pkgs**

A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['foo','bar']
salt '*' pkg.install pkgs=['foo@1.2','bar']
salt '*' pkg.install pkgs=['foo@1.2+ssl','bar@2.3']
```

Returns a dict containing the new package names and versions:

```
{<package>: {'old': <old-version>,
              'new': <new-version>}}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

`salt.modules.mac_portspkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation

Options:

**refresh**

Update ports with port selfupdate

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_portspkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.mac_portspkg.list_upgrades(refresh=True, **kwargs)`

Check whether or not an upgrade is available for all packages

Options:

**refresh**

Update ports with port selfupdate

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.mac_portspkg.refresh_db(**kwargs)`

Update ports with port selfupdate

CLI Example:

```
salt mac pkg.refresh_db
```

`salt.modules.mac_portspkg.remove(name=None, pkgs=None, **kwargs)`

Removes packages with port uninstall.

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.mac_portspkg.upgrade(refresh=True, **kwargs)`

Run a full upgrade using MacPorts 'port upgrade outdated'

Options:

**refresh**

Update ports with `port selfupdate`

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.mac_portspkg.upgrade_available(pkg, refresh=True, **kwargs)`

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.mac_portspkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>
```

### 26.6.241 salt.modules.mac\_power

Module for editing power settings on macOS

New in version 2016.3.0.

`salt.modules.mac_power.get_computer_sleep()`

Display the amount of idle time until the computer sleeps.

**Returns**

A string representing the sleep settings for the computer

**Return type**

str

CLI Example:

```
salt '*' power.get_computer_sleep
```

`salt.modules.mac_power.get_display_sleep()`

Display the amount of idle time until the display sleeps.

**Returns**

A string representing the sleep settings for the display

**Return type**

str

CLI Example:

```
salt '*' power.get_display_sleep
```

`salt.modules.mac_power.get_harddisk_sleep()`

Display the amount of idle time until the hard disk sleeps.

**Returns**

A string representing the sleep settings for the hard disk

**Return type**

str

CLI Example:

```
salt '*' power.get_harddisk_sleep
```

`salt.modules.mac_power.get_restart_freeze()`

Displays whether 'restart on freeze' is on or off if supported

**Returns**

A string value representing the "restart on freeze" settings

**Return type**

string

CLI Example:

```
salt '*' power.get_restart_freeze
```

`salt.modules.mac_power.get_restart_power_failure()`

Displays whether 'restart on power failure' is on or off if supported

**Returns**

A string value representing the "restart on power failure" settings

**Return type**

string

CLI Example:

```
salt '*' power.get_restart_power_failure
```

`salt.modules.mac_power.get_sleep()`

Displays the amount of idle time until the machine sleeps. Settings for Computer, Display, and Hard Disk are displayed.

**Returns**

A dictionary containing the sleep status for Computer, Display, and Hard Disk

**Return type**

dict

CLI Example:

```
salt '*' power.get_sleep
```

`salt.modules.mac_power.get_sleep_on_power_button()`

Displays whether 'allow power button to sleep computer' is on or off if supported

**Returns**

A string value representing the "allow power button to sleep computer" settings

**Return type**

string

CLI Example:

```
salt '*' power.get_sleep_on_power_button
```

`salt.modules.mac_power.get_wake_on_modem()`

Displays whether 'wake on modem' is on or off if supported

**Returns**

A string value representing the "wake on modem" settings

**Return type**

str

CLI Example:

```
salt '*' power.get_wake_on_modem
```

`salt.modules.mac_power.get_wake_on_network()`

Displays whether 'wake on network' is on or off if supported

**Returns**

A string value representing the "wake on network" settings

**Return type**

string

CLI Example:

```
salt '*' power.get_wake_on_network
```

`salt.modules.mac_power.set_computer_sleep(minutes)`

Set the amount of idle time until the computer sleeps. Pass "Never" or "Off" to never sleep.

**Parameters**

**minutes** -- Can be an integer between 1 and 180 or "Never" or "Off"

**Ptype**

int, str

**Returns**

True if successful, False if not

**Return type**

bool

CLI Example:

```
salt '*' power.set_computer_sleep 120
salt '*' power.set_computer_sleep off
```

`salt.modules.mac_power.set_display_sleep(minutes)`

Set the amount of idle time until the display sleeps. Pass "Never" or "Off" to never sleep.

**Parameters**

**minutes** -- Can be an integer between 1 and 180 or "Never" or "Off"

**Ptype**

int, str

**Returns**

True if successful, False if not

**Return type**

bool

CLI Example:

```
salt '*' power.set_display_sleep 120
salt '*' power.set_display_sleep off
```

`salt.modules.mac_power.set_hddisk_sleep(minutes)`

Set the amount of idle time until the harddisk sleeps. Pass "Never" or "Off" to never sleep.

**Parameters**

**minutes** -- Can be an integer between 1 and 180 or "Never" or "Off"

**Ptype**

int, str

**Returns**

True if successful, False if not

**Return type**

bool

CLI Example:

```
salt '*' power.set_harddisk_sleep 120
salt '*' power.set_harddisk_sleep off
```

`salt.modules.mac_power.set_restart_freeze` (*enabled*)

Specifies whether the server restarts automatically after a system freeze. This setting doesn't seem to be editable. The command completes successfully but the setting isn't actually updated. This is probably a macOS. The functions remains in case they ever fix the bug.

**Parameters**

**enabled** (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**

True if successful, False if not

**Return type**

bool

CLI Example:

```
salt '*' power.set_restart_freeze True
```

`salt.modules.mac_power.set_restart_power_failure` (*enabled*)

Set whether or not the computer will automatically restart after a power failure.

**Parameters**

**enabled** (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**

True if successful, False if not

**Return type**

bool

CLI Example:

```
salt '*' power.set_restart_power_failure True
```

`salt.modules.mac_power.set_sleep` (*minutes*)

Sets the amount of idle time until the machine sleeps. Sets the same value for Computer, Display, and Hard Disk. Pass "Never" or "Off" for computers that should never sleep.

**Parameters**

**minutes** -- Can be an integer between 1 and 180 or "Never" or "Off"

**Ptype**

int, str

**Returns**

True if successful, False if not

**Return type**

bool

CLI Example:

```
salt '*' power.set_sleep 120
salt '*' power.set_sleep never
```

`salt.modules.mac_power.set_sleep_on_power_button(enabled)`

Set whether or not the power button can sleep the computer.

**Parameters**

**enabled** (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**

True if successful, False if not

**Return type**

*bool*

CLI Example:

```
salt '*' power.set_sleep_on_power_button True
```

`salt.modules.mac_power.set_wake_on_modem(enabled)`

Set whether or not the computer will wake from sleep when modem activity is detected.

**Parameters**

**enabled** (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**

True if successful, False if not

**Return type**

*bool*

CLI Example:

```
salt '*' power.set_wake_on_modem True
```

`salt.modules.mac_power.set_wake_on_network(enabled)`

Set whether or not the computer will wake from sleep when network activity is detected.

**Parameters**

**enabled** (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**

True if successful, False if not

**Return type**

*bool*

CLI Example:

```
salt '*' power.set_wake_on_network True
```

## 26.6.242 salt.modules.mac\_service

The service module for macOS

New in version 2016.3.0.

This module has support for services in the following locations.

```
/System/Library/LaunchDaemons/
/System/Library/LaunchAgents/
/Library/LaunchDaemons/
/Library/LaunchAgents/

# As of version "2019.2.0" support for user-specific services were added.
/Users/foo/Library/LaunchAgents/
```

---

**Note:** As of the 2019.2.0 release, if a service is located in a `LaunchAgent` path and a `runas` user is NOT specified, the current console user will be used to properly interact with the service.

---

---

**Note:** As of the 3002 release, if a service name of `salt-minion` is passed this module will convert it over to its macOS equivalent name, in this case to `com.saltstack.salt.minion`. This is true for `salt-master`, `salt-api`, and `salt-syndic` as well.

---

`salt.modules.mac_service.available(name)`

Check that the given service is available.

**Parameters**

**name** (*str*) -- The name of the service

**Returns**

True if the service is available, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' service.available com.openssh.sshd
```

`salt.modules.mac_service.disable(name, runas=None)`

Disable a launchd service. Raises an error if the service fails to be disabled

**Parameters**

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

**Returns**

True if successful or if the service is already disabled

**Return type**

bool

CLI Example:

```
salt '*' service.disable org.cups.cupsd
```

`salt.modules.mac_service.disabled(name, runas=None, domain='system')`

Check if the specified service is not enabled. This is the opposite of `service.enabled`

**Parameters**

- **name** (*str*) -- The name to look up
- **runas** (*str*) -- User to run launchctl commands
- **domain** (*str*) -- domain to check for disabled services. Default is system.

**Returns**

True if the specified service is NOT enabled, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' service.disabled org.cups.cupsd
```

`salt.modules.mac_service.enable`(*name*, *runas=None*)

Enable a launchd service. Raises an error if the service fails to be enabled

**Parameters**

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

**Returns**

True if successful or if the service is already enabled

**Return type**

bool

CLI Example:

```
salt '*' service.enable org.cups.cupsd
```

`salt.modules.mac_service.enabled`(*name*, *runas=None*)

Check if the specified service is enabled (not disabled, capable of being loaded/bootstrapped).

---

**Note:** Previously this function would see if the service is loaded via `launchctl list` to determine if the service is enabled. This was not an accurate way to do so. The new behavior checks to make sure its not disabled to determine the status. Please use `service.loaded` for the previous behavior.

---

**Parameters**

- **name** (*str*) -- The name of the service to look up.
- **runas** (*str*) -- User to run launchctl commands.

**Returns**

True if the specified service enabled, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' service.enabled org.cups.cupsd
```

`salt.modules.mac_service.get_all`(*runas=None*)

Return a list of services that are enabled or available. Can be used to find the name of a service.

**Parameters**

**runas** (*str*) -- User to run launchctl commands

**Returns**

A list of all the services available or enabled

**Return type**

list

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.mac_service.get_enabled(runas=None)`

Return a list of all services that are enabled. Can be used to find the name of a service.

**Parameters**

**runas** (*str*) -- User to run launchctl commands

**Returns**

A list of all the services enabled on the system

**Return type**

list

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.mac_service.launchctl(sub_cmd, *args, **kwargs)`

Run a launchctl command and raise an error if it fails

**Parameters**

- **sub\_cmd** (*str*) -- Sub command supplied to launchctl
- **args** (*tuple*) -- Tuple containing additional arguments to pass to launchctl
- **kwargs** (*dict*) -- Dictionary containing arguments to pass to `cmd.run_all`
- **return\_stdout** (*bool*) -- A keyword argument. If true return the stdout of the launchctl command

**Returns**

True if successful, raise `CommandExecutionError` if not, or the stdout of the launchctl command if requested

**Return type**

bool, str

CLI Example:

```
salt '*' service.launchctl debug org.cups.cupsd
```

`salt.modules.mac_service.list_(name=None, runas=None)`

Run launchctl list and return the output

**Parameters**

- **name** (*str*) -- The name of the service to list
- **runas** (*str*) -- User to run launchctl commands

**Returns**

If a name is passed returns information about the named service, otherwise returns a list of all services and pids

**Return type**

str

CLI Example:

```
salt '*' service.list
salt '*' service.list org.cups.cupsd
```

`salt.modules.mac_service.loaded(name, runas=None)`

Check if the specified service is loaded.

**Parameters**

- **name** (*str*) -- The name of the service to look up
- **runas** (*str*) -- User to run launchctl commands

**Returns**

True if the specified service is loaded, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' service.loaded org.cups.cupsd
```

`salt.modules.mac_service.missing`(*name*)

The inverse of `service.available`. Check that the given service is not available.

**Parameters**

**name** (*str*) -- The name of the service

**Returns**

True if the service is not available, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' service.missing com.openssh.sshd
```

`salt.modules.mac_service.restart`(*name*, *runas=None*)

Unloads and reloads a launchd service. Raises an error if the service fails to reload

**Parameters**

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

**Returns**

True if successful

**Return type**

bool

CLI Example:

```
salt '*' service.restart org.cups.cupsd
```

`salt.modules.mac_service.show`(*name*)

Show properties of a launchctl service

**Parameters**

**name** (*str*) -- Service label, file name, or full path

**Returns**

The service information if the service is found

**Return type**

dict

CLI Example:

```
salt '*' service.show org.cups.cupsd # service label
salt '*' service.show org.cups.cupsd.plist # file name
salt '*' service.show /System/Library/LaunchDaemons/org.cups.cupsd.plist
-># full path
```

`salt.modules.mac_service.start`(*name*, *runas=None*)

Start a launchd service. Raises an error if the service fails to start

---

**Note:** To start a service in macOS the service must be enabled first. Use `service.enable` to enable the service.

---

#### Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

#### Returns

True if successful or if the service is already running

#### Return type

bool

CLI Example:

```
salt '*' service.start org.cups.cupsd
```

`salt.modules.mac_service.status`(*name*, *sig=None*, *runas=None*)

Return the status for a service.

---

**Note:** Previously this function would return a PID for a running service with a PID or 'loaded' for a loaded service without a PID. This was changed to have better parity with other service modules that return True/False.

---

#### Parameters

- **name** (*str*) -- Used to find the service from launchctl. Can be the service Label, file name, or path to the service file. (normally a plist)
- **sig** (*str*) -- Find the service with status.pid instead. Note that `name` must still be provided.
- **runas** (*str*) -- User to run launchctl commands.

#### Returns

True if running, otherwise False.

#### Return type

str

CLI Example:

```
salt '*' service.status cups
```

`salt.modules.mac_service.stop`(*name*, *runas=None*)

Stop a launchd service. Raises an error if the service fails to stop

---

**Note:** Though `service.stop` will unload a service in macOS, the service will start on next boot unless it is disabled. Use `service.disable` to disable the service

---

#### Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

#### Returns

True if successful or if the service is already stopped

**Return type**

bool

CLI Example:

```
salt '*' service.stop org.cups.cupsd
```

### 26.6.243 salt.modules.mac\_shadow

Manage macOS local directory passwords and policies

New in version 2016.3.0.

Note that it is usually better to apply password policies through the creation of a configuration profile.

**salt.modules.mac\_shadow.del\_password**(*name*)

Deletes the account password

**Parameters****name** (*str*) -- The user name of the account**Returns**

True if successful, otherwise False

**Return type**

bool

**Raises**

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.del_password username
```

**salt.modules.mac\_shadow.get\_account\_created**(*name*)

Get the date/time the account was created

**Parameters****name** (*str*) -- The username of the account**Returns**

The date/time the account was created (yyyy-mm-dd hh:mm:ss) or 0 if the value is not defined

**Return type**

str

**Raises**

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_account_created admin
```

**salt.modules.mac\_shadow.get\_change**(*name*)

Gets the date on which the password expires

**Parameters****name** (*str*) -- The name of the user account**Returns**

The date the password will expire

**Return type**

str

**Raises**

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_change username
```

`salt.modules.mac_shadow.get_expire(name)`

Gets the date on which the account expires

**Parameters**

**name** (*str*) -- The name of the user account

**Returns**

The date the account expires

**Return type**

*str*

**Raises**

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_expire username
```

`salt.modules.mac_shadow.get_last_change(name)`

Get the date/time the account was changed

**Parameters**

**name** (*str*) -- The username of the account

**Returns**

The date/time the account was modified (yyyy-mm-dd hh:mm:ss) or 0 if the value is not defined

**Return type**

*str*

**Raises**

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_last_change admin
```

`salt.modules.mac_shadow.get_login_failed_count(name)`

Get the number of failed login attempts

**Parameters**

**name** (*str*) -- The username of the account

**Returns**

The number of failed login attempts. 0 may mean there are no failed login attempts or the value is not defined

**Return type**

*str*

**Raises**

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_login_failed_count admin
```

`salt.modules.mac_shadow.get_login_failed_last(name)`

Get the date/time of the last failed login attempt

**Parameters**

**name** (*str*) -- The username of the account

**Returns**

The date/time of the last failed login attempt on this account (yyyy-mm-dd hh:mm:ss) or 0 if the value is not defined

**Return type**`str`**Raises**

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_login_failed_last admin
```

**salt.modules.mac\_shadow.get\_maxdays**(*name*)

Get the maximum age of the password

**Parameters****name** (*str*) -- The username of the account**Returns**

The maximum age of the password in days

**Return type**`int`**Raises**

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_maxdays admin 90
```

**salt.modules.mac\_shadow.info**(*name*)

Return information for the specified user

**Parameters****name** (*str*) -- The username**Returns**

A dictionary containing the user's shadow information

**Return type**`dict`

CLI Example:

```
salt '*' shadow.info admin
```

**salt.modules.mac\_shadow.set\_change**(*name*, *date*)

Sets the date on which the password expires. The user will be required to change their password. Format is mm/dd/yyyy

**Parameters**

- **name** (*str*) -- The name of the user account
- **date** (*date*) -- The date the password will expire. Must be in mm/dd/yyyy format.

**Returns**

True if successful, otherwise False

**Return type**`bool`**Raises**

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_change username 09/21/2016
```

**salt.modules.mac\_shadow.set\_expire**(*name*, *date*)

Sets the date on which the account expires. The user will not be able to login after this date. Date format is mm/dd/yyyy

**Parameters**

- **name** (*str*) -- The name of the user account
- **date** (*datetime*) -- The date the account will expire. Format must be mm/dd/yyyy.

**Returns**

True if successful, False if not

**Return type**

bool

**Raises**

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_expire username 07/23/2015
```

`salt.modules.mac_shadow.set_inactdays`(*name*, *days*)

Set the number of inactive days before the account is locked. Not available in macOS

**Parameters**

- **name** (*str*) -- The user name
- **days** (*int*) -- The number of days

**Returns**

Will always return False until macOS supports this feature.

**Return type**

bool

CLI Example:

```
salt '*' shadow.set_inactdays admin 90
```

`salt.modules.mac_shadow.set_maxdays`(*name*, *days*)

Set the maximum age of the password in days

**Parameters**

- **name** (*str*) -- The username of the account
- **days** (*int*) -- The maximum age of the account in days

**Returns**

True if successful, False if not

**Return type**

bool

**Raises**

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_maxdays admin 90
```

`salt.modules.mac_shadow.set_mindays`(*name*, *days*)

Set the minimum password age in days. Not available in macOS.

**Parameters**

- **name** (*str*) -- The user name
- **days** (*int*) -- The number of days

**Returns**

Will always return False until macOS supports this feature.

**Return type**

bool

CLI Example:

```
salt '*' shadow.set_mindays admin 90
```

`salt.modules.mac_shadow.set_password(name, password)`

Set the password for a named user (insecure, the password will be in the process list while the command is running)

**Parameters**

- **name** (*str*) -- The name of the local user, which is assumed to be in the local directory service
- **password** (*str*) -- The plaintext password to set

**Returns**

True if successful, otherwise False

**Return type**

bool

**Raises**

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' mac_shadow.set_password macuser macpassword
```

`salt.modules.mac_shadow.set_warndays(name, days)`

Set the number of days before the password expires that the user will start to see a warning. Not available in macOS

**Parameters**

- **name** (*str*) -- The user name
- **days** (*int*) -- The number of days

**Returns**

Will always return False until macOS supports this feature.

**Return type**

bool

CLI Example:

```
salt '*' shadow.set_warndays admin 90
```

## 26.6.244 salt.modules.mac\_softwareupdate

Support for the softwareupdate command on MacOS.

`salt.modules.mac_softwareupdate.download(name)`

Download a named update so that it can be installed later with the `update` or `update_all` functions

**Parameters**

**name** (*str*) -- The update to download.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' softwareupdate.download <update name>
```

`salt.modules.mac_softwareupdate.download_all` (*recommended=False, restart=True*)

Download all available updates so that they can be installed later with the `update` or `update_all` functions. It returns a list of updates that are now downloaded.

**Parameters**

- **recommended** (*bool*) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- **restart** (*bool*) -- Set this to False if you do not want to install updates that require a restart. Default is True

**Returns**

A list containing all downloaded updates on the system.

**Return type**

*list*

CLI Example:

```
salt '*' softwareupdate.download_all
```

`salt.modules.mac_softwareupdate.get_catalog`()

New in version 2016.3.0.

Get the current catalog being used for update lookups. Will return a url if a custom catalog has been specified. Otherwise the word 'Default' will be returned

**Returns**

The catalog being used for update lookups

**Return type**

*str*

CLI Example:

```
salt '*' softwareupdates.get_catalog
```

`salt.modules.mac_softwareupdate.ignore` (*name*)

Ignore a specific program update. When an update is ignored the '-' and version number at the end will be omitted, so "SecUpd2014-001-1.0" becomes "SecUpd2014-001". It will be removed automatically if present. An update is successfully ignored when it no longer shows up after `list_updates`.

**Parameters**

**name** -- The name of the update to add to the ignore list.

**Ptype**

*str*

**Returns**

True if successful, False if not

**Return type**

*bool*

CLI Example:

```
salt '*' softwareupdate.ignore <update-name>
```

`salt.modules.mac_softwareupdate.list_available` (*recommended=False, restart=False, shut\_down=False*)

List all available updates.

**Parameters**

- **recommended** (*bool*) -- Show only recommended updates.
- **restart** (*bool*) -- Show only updates that require a restart.

**Returns**

Returns a dictionary containing the updates

**Return type**

dict

CLI Example:

```
salt '*' softwareupdate.list_available
```

**salt.modules.mac\_softwareupdate.list\_downloads()**

Return a list of all updates that have been downloaded locally.

**Returns**

A list of updates that have been downloaded

**Return type**

list

CLI Example:

```
salt '*' softwareupdate.list_downloads
```

**salt.modules.mac\_softwareupdate.list\_ignored()**

List all updates that have been ignored. Ignored updates are shown without the '-' and version number at the end, this is how the softwareupdate command works.

**Returns**

The list of ignored updates

**Return type**

list

CLI Example:

```
salt '*' softwareupdate.list_ignored
```

**salt.modules.mac\_softwareupdate.reset\_catalog()**

New in version 2016.3.0.

Reset the Software Update Catalog to the default.

**Returns**

True if successful, False if not

**Return type**

bool

CLI Example:

```
salt '*' softwareupdates.reset_catalog
```

**salt.modules.mac\_softwareupdate.reset\_ignored()**

Make sure the ignored updates are not ignored anymore, returns a list of the updates that are no longer ignored.

**Returns**

True if the list was reset, Otherwise False

**Return type**

bool

CLI Example:

```
salt '*' softwareupdate.reset_ignored
```

**salt.modules.mac\_softwareupdate.schedule\_enable(*enable*)**

Enable/disable automatic update scheduling.

**Parameters**

**enable** -- True/On/Yes/1 to turn on automatic updates. False/No/Off/0 to turn off automatic updates. If this value is empty, the current status will be returned.

**Type**

bool str

**Returns**

True if scheduling is enabled, False if disabled

**Return type**

bool

CLI Example:

```
salt '*' softwareupdate.schedule_enable on|off
```

`salt.modules.mac_softwareupdate.schedule_enabled()`

Check the status of automatic update scheduling.

**Returns**

True if scheduling is enabled, False if disabled

**Return type**

bool

CLI Example:

```
salt '*' softwareupdate.schedule_enabled
```

`salt.modules.mac_softwareupdate.set_catalog(url)`

New in version 2016.3.0.

Set the Software Update Catalog to the URL specified

**Parameters**

**url** (*str*) -- The url to the update catalog

**Returns**

True if successful, False if not

**Return type**

bool

CLI Example:

```
salt '*' softwareupdates.set_catalog http://swupd.local:8888/index.
→sucatalog
```

`salt.modules.mac_softwareupdate.update(name)`

Install a named update.

**Parameters**

**name** (*str*) -- The name of the of the update to install.

**Returns**

True if successfully updated, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' softwareupdate.update <update-name>
```

`salt.modules.mac_softwareupdate.update_all(recommended=False, restart=True)`

Install all available updates. Returns a dictionary containing the name of the update and the status of its installation.

**Parameters**

- **recommended** (*bool*) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- **restart** (*bool*) -- Set this to False if you do not want to install updates that require a restart. Default is True

**Returns**

A dictionary containing the updates that were installed and the status of its installation. If no updates were installed an empty dictionary is returned.

**Return type**

dict

CLI Example:

```
salt '*' softwareupdate.update_all
```

**salt.modules.mac\_softwareupdate.update\_available**(*name*)

Check whether or not an update is available with a given name.

**Parameters**

**name** (*str*) -- The name of the update to look for

**Returns**

True if available, False if not

**Return type**

bool

CLI Example:

```
salt '*' softwareupdate.update_available <update-name>
salt '*' softwareupdate.update_available "<update with whitespace>"
```

**26.6.245 salt.modules.mac\_sysctl**

Module for viewing and modifying sysctl parameters

**salt.modules.mac\_sysctl.assign**(*name*, *value*)

Assign a single sysctl parameter for this minion

**name**

The name of the sysctl value to edit.

**value**

The sysctl value to apply.

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

**salt.modules.mac\_sysctl.get**(*name*)

Return a single sysctl parameter for this minion

**name**

The name of the sysctl value to display.

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

**salt.modules.mac\_sysctl.persist**(*name*, *value*, *config='/etc/sysctl.conf'*, *apply\_change=False*)

Assign and persist a simple sysctl parameter for this minion

**name**

The name of the sysctl value to edit.

**value**

The sysctl value to apply.

**config**

The location of the sysctl configuration file.

**apply\_change**

Default is False; Default behavior only creates or edits the sysctl.conf file. If apply is set to True, the changes are applied to the system.

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/etc/sysctl.conf
```

`salt.modules.mac_sysctl.show` (*config\_file=False*)

Return a list of sysctl parameters for this minion

**config:** Pull the data from the system configuration file instead of the live data.

CLI Example:

```
salt '*' sysctl.show
```

### 26.6.246 salt.modules.mac\_system

System module for sleeping, restarting, and shutting down the system on Mac OS X

New in version 2016.3.0.

**Warning:** Using this module will enable `atrun` on the system if it is disabled.

`salt.modules.mac_system.get_boot_arch()`

Get the kernel architecture setting from `com.apple.Boot.plist`

**Returns**

A string value representing the boot architecture setting

**Return type**

`str`

CLI Example:

```
salt '*' system.get_boot_arch
```

`salt.modules.mac_system.get_computer_name()`

Gets the computer name

**Returns**

The computer name

**Return type**

`str`

CLI Example:

```
salt '*' system.get_computer_name
```

`salt.modules.mac_system.get_disable_keyboard_on_lock()`

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

**Returns**

True if disable keyboard on lock is on, False if off

**Return type**

bool

CLI Example:

```
salt '*' system.get_disable_keyboard_on_lock
```

**salt.modules.mac\_system.get\_remote\_events()**

Displays whether remote apple events are on or off.

**Returns**

True if remote apple events are on, False if off

**Return type**

bool

CLI Example:

```
salt '*' system.get_remote_events
```

**salt.modules.mac\_system.get\_remote\_login()**

Displays whether remote login (SSH) is on or off.

**Returns**

True if remote login is on, False if off

**Return type**

bool

CLI Example:

```
salt '*' system.get_remote_login
```

**salt.modules.mac\_system.get\_restart\_delay()**

Get the number of seconds after which the computer will start up after a power failure.

**Returns**

A string value representing the number of seconds the system will delay restart after power loss

**Return type**

str

CLI Example:

```
salt '*' system.get_restart_delay
```

**salt.modules.mac\_system.get\_startup\_disk()**

Displays the current startup disk

**Returns**

The current startup disk

**Return type**

str

CLI Example:

```
salt '*' system.get_startup_disk
```

**salt.modules.mac\_system.get\_subnet\_name()**

Gets the local subnet name

**Returns**

The local subnet name

**Return type**

str

CLI Example:

```
salt '*' system.get_subnet_name
```

`salt.modules.mac_system.halt(at_time=None)`

Halt a running system

**Parameters**

**at\_time** (*str*) -- Any valid *at* expression. For example, some valid *at* expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

---

**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

---

CLI Example:

```
salt '*' system.halt
salt '*' system.halt 'now + 10 minutes'
```

`salt.modules.mac_system.list_startup_disks()`

List all valid startup disks on the system.

**Returns**

A list of valid startup disks

**Return type**

list

CLI Example:

```
salt '*' system.list_startup_disks
```

`salt.modules.mac_system.restart(at_time=None)`

Restart the system

**Parameters**

**at\_time** (*str*) -- Any valid *at* expression. For example, some valid *at* expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

---

**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

---

CLI Example:

```
salt '*' system.restart
salt '*' system.restart '12:00 PM fri'
```

`salt.modules.mac_system.set_boot_arch(arch='default')`

Set the kernel to boot in 32 or 64 bit mode on next boot.

---

**Note:** When this function fails with the error changes to kernel architecture failed to save!, then the boot arch is not updated. This is either an Apple bug, not available on the test system, or a result of system files being locked down in macOS (SIP Protection).

---

#### Parameters

**arch** (*str*) -- A string representing the desired architecture. If no value is passed, default is assumed. Valid values include:

- i386
- x86\_64
- default

#### Returns

True if successful, False if not

#### Return type

bool

CLI Example:

```
salt '*' system.set_boot_arch i386
```

`salt.modules.mac_system.set_computer_name(name)`

Set the computer name

#### Parameters

**name** (*str*) -- The new computer name

#### Returns

True if successful, False if not

#### Return type

bool

CLI Example:

```
salt '*' system.set_computer_name "Mike's Mac"
```

`salt.modules.mac_system.set_disable_keyboard_on_lock(enable)`

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

#### Parameters

**enable** (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

#### Returns

True if successful, False if not

#### Return type

bool

CLI Example:

```
salt '*' system.set_disable_keyboard_on_lock False
```

`salt.modules.mac_system.set_remote_events(enable)`

Set whether the server responds to events sent by other computers (such as AppleScripts)

**Parameters**

**enable** (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**

True if successful, False if not

**Return type**

bool

CLI Example:

```
salt '*' system.set_remote_events On
```

`salt.modules.mac_system.set_remote_login(enable)`

Set the remote login (SSH) to either on or off.

**Parameters**

**enable** (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**

True if successful, False if not

**Return type**

bool

CLI Example:

```
salt '*' system.set_remote_login True
```

`salt.modules.mac_system.set_restart_delay(seconds)`

Set the number of seconds after which the computer will start up after a power failure.

**Warning:** This command fails with the following error:

```
Error, IOServiceOpen returned 0x10000003
```

The setting is not updated. This is an apple bug. It seems like it may only work on certain versions of Mac Server X. This article explains the issue in more detail, though it is quite old.

<http://lists.apple.com/archives/macos-x-server/2006/Jul/msg00967.html>

**Parameters**

**seconds** (*int*) -- The number of seconds. Must be a multiple of 30

**Returns**

True if successful, False if not

**Return type**

bool

CLI Example:

```
salt '*' system.set_restart_delay 180
```

`salt.modules.mac_system.set_startup_disk(path)`

Set the current startup disk to the indicated path. Use `system.list_startup_disks` to find valid startup disks on the system.

**Parameters**

**path** (*str*) -- The valid startup disk path

**Returns**

True if successful, False if not

**Return type**

bool

CLI Example:

```
salt '*' system.set_startup_disk /System/Library/CoreServices
```

`salt.modules.mac_system.set_subnet_name`(*name*)

Set the local subnet name

**Parameters**

**name** (*str*) -- The new local subnet name

---

**Note:** Spaces are changed to dashes. Other special characters are removed.

---

**Returns**

True if successful, False if not

**Return type**

bool

CLI Example:

```
The following will be set as 'Mikes-Mac'  
salt '*' system.set_subnet_name "Mike's Mac"
```

`salt.modules.mac_system.shutdown`(*at\_time=None*)

Shutdown the system

**Parameters**

**at\_time** (*str*) -- Any valid *at* expression. For example, some valid *at* expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

---

**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "'14:00'"

---

CLI Example:

```
salt '*' system.shutdown  
salt '*' system.shutdown 'now + 1 hour'
```

`salt.modules.mac_system.sleep`(*at\_time=None*)

Sleep the system. If a user is active on the system it will likely fail to sleep.

**Parameters**

**at\_time** (*str*) -- Any valid *at* expression. For example, some valid *at* expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

---

**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

---

CLI Example:

```
salt '*' system.sleep
salt '*' system.sleep '10:00 PM'
```

### 26.6.247 salt.modules.mac\_timezone

Module for editing date/time settings on macOS

New in version 2016.3.0.

**salt.modules.mac\_timezone.get\_date()**

Displays the current date

**Returns**

the system date

**Return type**

str

CLI Example:

```
salt '*' timezone.get_date
```

**salt.modules.mac\_timezone.get\_hwclock()**

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

**salt.modules.mac\_timezone.get\_offset()**

Displays the current time zone offset

**Returns**

The current time zone offset

**Return type**

str

CLI Example:

```
salt '*' timezone.get_offset
```

**salt.modules.mac\_timezone.get\_time()**

Get the current system time.

**Returns**

The current time in 24 hour format

**Return type**

str

CLI Example:

```
salt '*' timezone.get_time
```

`salt.modules.mac_timezone.get_time_server()`

Display the currently set network time server.

**Returns**

the network time server

**Return type**

str

CLI Example:

```
salt '*' timezone.get_time_server
```

`salt.modules.mac_timezone.get_using_network_time()`

Display whether network time is on or off

**Returns**

True if network time is on, False if off

**Return type**

bool

CLI Example:

```
salt '*' timezone.get_using_network_time
```

`salt.modules.mac_timezone.get_zone()`

Displays the current time zone

**Returns**

The current time zone

**Return type**

str

CLI Example:

```
salt '*' timezone.get_zone
```

`salt.modules.mac_timezone.get_zonecode()`

Displays the current time zone abbreviated code

**Returns**

The current time zone code

**Return type**

str

CLI Example:

```
salt '*' timezone.get_zonecode
```

`salt.modules.mac_timezone.list_zones()`

Displays a list of available time zones. Use this list when setting a time zone using `timezone.set_zone`

**Returns**

a list of time zones

**Return type**

list

CLI Example:

```
salt '*' timezone.list_zones
```

`salt.modules.mac_timezone.set_date(date)`

Set the current month, day, and year

**Parameters**

**date** (*str*) -- The date to set. Valid date formats are:

- %m:%d:%y
- %m:%d:%Y
- %m/%d/%y
- %m/%d/%Y

**Returns**

True if successful, False if not

**Return type**

bool

**Raises**

SaltInvocationError on Invalid Date format

**Raises**

CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_date 1/13/2016
```

`salt.modules.mac_timezone.set_hwclock(clock)`

Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

`salt.modules.mac_timezone.set_time(time)`

Sets the current time. Must be in 24 hour format.

**Parameters**

**time** (*str*) -- The time to set in 24 hour format. The value must be double quoted. ie: "17:46"

**Returns**

True if successful, False if not

**Return type**

bool

**Raises**

SaltInvocationError on Invalid Time format

**Raises**

CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time "'17:34'"
```

`salt.modules.mac_timezone.set_time_server(time_server='time.apple.com')`

Designates a network time server. Enter the IP address or DNS name for the network time server.

**Parameters**

**time\_server** -- IP or DNS name of the network time server. If nothing is passed the time server will be set to the macOS default of 'time.apple.com'

**Type**

str

**Returns**

True if successful, False if not

**Return type**

bool

**Raises**

CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time_server time.acme.com
```

**salt.modules.mac\_timezone.set\_using\_network\_time**(*enable*)

Set whether network time is on or off.

**Parameters****enable** -- True to enable, False to disable. Can also use 'on' or 'off'**Type**

str bool

**Returns**

True if successful, False if not

**Return type**

bool

**Raises**

CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_using_network_time True
```

**salt.modules.mac\_timezone.set\_zone**(*time\_zone*)Set the local time zone. Use `timezone.list_zones` to list valid `time_zone` arguments**Parameters****time\_zone** (*str*) -- The time zone to apply**Returns**

True if successful, False if not

**Return type**

bool

**Raises**

SaltInvocationError on Invalid Timezone

**Raises**

CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_zone America/Denver
```

**salt.modules.mac\_timezone.zone\_compare**(*time\_zone*)

Compares the given timezone name with the system timezone name.

**Returns**

True if they are the same, False if not

**Return type**

bool

CLI Example:

```
salt '*' timezone.zone_compare America/Boise
```

## 26.6.248 salt.modules.mac\_user

Manage users on Mac OS 10.7+

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info' is not available`), see [here](#).

```
salt.modules.mac_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None,
                          fullname=None, createhome=True, **kwargs)
```

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

```
salt.modules.mac_user.chfullname(name, fullname)
```

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo 'Foo Bar'
```

```
salt.modules.mac_user.chgid(name, gid)
```

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

```
salt.modules.mac_user.chgroups(name, groups, append=False)
```

Change the groups to which the user belongs. Note that the user's primary group does not have to be one of the groups passed, membership in the user's primary group is automatically assumed.

**groups**

Groups to which the user should belong, can be passed either as a python list or a comma-separated string

**append**

Instead of removing user from groups not included in the `groups` parameter, just add user to any groups for which they are not members

CLI Example:

```
salt '*' user.chgroups foo wheel,root
```

```
salt.modules.mac_user.chhome(name, home, **kwargs)
```

Change the home directory of the user

CLI Example:

```
salt '*' user.chhome foo /Users/foo
```

```
salt.modules.mac_user.chshell(name, shell)
```

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.mac_user.chuid`(*name*, *uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.mac_user.delete`(*name*, *remove=False*, *force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.mac_user.disable_auto_login`()

New in version 2016.3.0.

Disables auto login on the machine

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' user.disable_auto_login
```

`salt.modules.mac_user.enable_auto_login`(*name*, *password*)

New in version 2016.3.0.

Configures the machine to auto login with the specified user

**Parameters**

- **name** (*str*) -- The user account use for auto login
- **password** (*str*) -- The password to user for auto login

New in version 2017.7.3.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' user.enable_auto_login stevej
```

`salt.modules.mac_user.get_auto_login`()

New in version 2016.3.0.

Gets the current setting for Auto Login

**Returns**

If enabled, returns the user name, otherwise returns False

**Return type**

str, bool

CLI Example:

```
salt '*' user.get_auto_login
```

`salt.modules.mac_user.getent` (*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.mac_user.info` (*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.mac_user.list_groups` (*name*)

Return a list of groups the named user belongs to.

*name*

The name of the user for which to list groups. Starting in Salt 2016.11.0, all groups for the user, including groups beginning with an underscore will be listed.

Changed in version 2016.11.0.

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.mac_user.list_users` ()

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.mac_user.primary_group` (*name*)

Return the primary group of the named user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.primary_group saltadmin
```

`salt.modules.mac_user.rename` (*name, new\_name*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

## 26.6.249 salt.modules.mac\_xattr

This module allows you to manage extended attributes on files or directories

```
salt '*' xattr.list /path/to/file
```

`salt.modules.mac_xattr.clear`(*path*)

Causes the all attributes on the file/directory to be removed

**Parameters**

**path** (*str*) -- The file(s) to get attributes from

**Returns**

True if successful, otherwise False

**Raises**

CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

`salt.modules.mac_xattr.delete`(*path*, *attribute*)

Removes the given attribute from the file

**Parameters**

- **path** (*str*) -- The file(s) to get attributes from
- **attribute** (*str*) -- The attribute name to be deleted from the file/directory

**Returns**

True if successful, otherwise False

**Return type**

bool

**Raises**

CommandExecutionError on file not found, attribute not found, and any other unknown error

CLI Example:

```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

`salt.modules.mac_xattr.list_`(*path*, *\*\*kwargs*)

List all of the extended attributes on the given file/directory

**Parameters**

- **path** (*str*) -- The file(s) to get attributes from
- **hex** (*bool*) -- Return the values with forced hexadecimal values

**Returns**

A dictionary containing extended attributes and values for the given file

**Return type**

dict

**Raises**

CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.list /path/to/file
salt '*' xattr.list /path/to/file hex=True
```

`salt.modules.mac_xattr.read`(*path*, *attribute*, *\*\*kwargs*)

Read the given attributes on the given file/directory

**Parameters**

- **path** (*str*) -- The file to get attributes from
- **attribute** (*str*) -- The attribute to read
- **hex** (*bool*) -- Return the values with forced hexadecimal values

**Returns**

A string containing the value of the named attribute

**Return type**

*str*

**Raises**

CommandExecutionError on file not found, attribute not found, and any other unknown error

CLI Example:

```
salt '*' xattr.read /path/to/file com.test.attr
salt '*' xattr.read /path/to/file com.test.attr hex=True
```

`salt.modules.mac_xattr.write`(*path, attribute, value, \*\*kwargs*)

Causes the given attribute name to be assigned the given value

**Parameters**

- **path** (*str*) -- The file(s) to get attributes from
- **attribute** (*str*) -- The attribute name to be written to the file/directory
- **value** (*str*) -- The value to assign to the given attribute
- **hex** (*bool*) -- Set the values with forced hexadecimal values

**Returns**

True if successful, otherwise False

**Return type**

*bool*

**Raises**

CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.write /path/to/file "com.test.attr" "value"
```

### 26.6.250 salt.modules.macdefaults

Set defaults on Mac OS

`salt.modules.macdefaults.delete`(*domain, key, user=None*)

Delete a default from the system

CLI Example:

```
salt '*' macdefaults.delete com.apple.CrashReporter DialogType
salt '*' macdefaults.delete NSGlobalDomain ApplePersistence
```

**domain**

The name of the domain to delete from

**key**

The key of the given domain to delete

**user**

The user to delete the defaults with

`salt.modules.macdefaults.read(domain, key, user=None)`

Read a default from the system

CLI Example:

```
salt '*' macdefaults.read com.apple.CrashReporter DialogType
salt '*' macdefaults.read NSGlobalDomain ApplePersistence
```

**domain**

The name of the domain to read from

**key**

The key of the given domain to read from

**user**

The user to read the defaults as

`salt.modules.macdefaults.write(domain, key, value, type='string', user=None)`

Write a default to the system

CLI Example:

```
salt '*' macdefaults.write com.apple.CrashReporter DialogType Server
salt '*' macdefaults.write NSGlobalDomain ApplePersistence True type=bool
```

**domain**

The name of the domain to write to

**key**

The key of the given domain to write to

**value**

The value to write to the given key

**type**

The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add

**user**

The user to write the defaults to

### 26.6.251 salt.modules.macpackage

Install pkg, dmg and .app applications on macOS minions.

`salt.modules.macpackage.get_mpkg_ids(mpkg)`

Attempt to get the package IDs from a mounted .mpkg file

**Parameters**

**mpkg** (*str*) -- The location of the mounted mpkg file

**Returns**

List of package IDs

**Return type**

list

CLI Example:

```
salt '*' macpackage.get_mpkg_ids /dev/disk2
```

`salt.modules.macpackage.get_pkg_id(pkg)`

Attempt to get the package ID from a .pkg file

**Parameters**

**pkg** (*str*) -- The location of the pkg file

**Returns**

List of all of the package IDs

**Return type**

list

CLI Example:

```
salt '*' macpackage.get_pkg_id /tmp/test.pkg
```

`salt.modules.macpackage.install(pkg, target='LocalSystem', store=False, allow_untrusted=False)`

Install a pkg file

**Parameters**

- **pkg** (*str*) -- The package to install
- **target** (*str*) -- The target in which to install the package to
- **store** (*bool*) -- Should the package be installed as if it was from the store?
- **allow\_untrusted** (*bool*) -- Allow the installation of untrusted packages?

**Returns**

A dictionary containing the results of the installation

**Return type**

dict

CLI Example:

```
salt '*' macpackage.install test.pkg
```

`salt.modules.macpackage.install_app(app, target='/Applications/')`

Install an app file by moving it into the specified Applications directory

**Parameters**

- **app** (*str*) -- The location of the .app file
- **target** (*str*) -- The target in which to install the package to Default is "/Applications/"

**Returns**

The results of the rsync command

**Return type**

str

CLI Example:

```
salt '*' macpackage.install_app /tmp/tmp.app /Applications/
```

`salt.modules.macpackage.installed_pkgs()`

Return the list of installed packages on the machine

**Returns**

List of installed packages

**Return type**

list

CLI Example:

```
salt '*' macpackage.installed_pkgs
```

`salt.modules.macpackage.mount`(*dmg*)

Attempt to mount a dmg file to a temporary location and return the location of the pkg file inside

**Parameters**

**dmg** (*str*) -- The location of the dmg file to mount

**Returns**

Tuple containing the results of the command along with the mount  
point

**Return type**

tuple

CLI Example:

```
salt '*' macpackage.mount /tmp/software.dmg
```

`salt.modules.macpackage.uninstall_app`(*app*)

Uninstall an app file by removing it from the Applications directory

**Parameters**

**app** (*str*) -- The location of the .app file

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' macpackage.uninstall_app /Applications/app.app
```

`salt.modules.macpackage.unmount`(*mountpoint*)

Attempt to unmount a dmg file from a temporary location

**Parameters**

**mountpoint** (*str*) -- The location of the mount point

**Returns**

The results of the hduutil detach command

**Return type**

str

CLI Example:

```
salt '*' macpackage.unmount /dev/disk2
```

### 26.6.252 salt.modules.makeconf

Support for modifying make.conf under Gentoo

`salt.modules.makeconf.append_cflags`(*value*)

Add to or create a new CFLAGS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_cflags '-pipe'
```

`salt.modules.makeconf.append_cxxflags`(*value*)

Add to or create a new CXXFLAGS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_cxxflags '-pipe'
```

`salt.modules.makeconf.append_emerge_default_opts`(*value*)

Add to or create a new EMERGE\_DEFAULT\_OPTS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_emerge_default_opts '--jobs'
```

`salt.modules.makeconf.append_features`(*value*)

Add to or create a new FEATURES in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_features 'webrsync-gpg'
```

`salt.modules.makeconf.append_gentoo_mirrors`(*value*)

Add to or create a new GENTOO\_MIRRORS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_gentoo_mirrors 'http://distfiles.gentoo.org'
```

`salt.modules.makeconf.append_makeopts`(*value*)

Add to or create a new MAKEOPTS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_makeopts '-j3'
```

`salt.modules.makeconf.append_var` (*var*, *value*)

Add to or create a new variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_var 'LINGUAS' 'en'
```

`salt.modules.makeconf.cflags_contains` (*value*)

Verify if CFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.cflags_contains '-pipe'
```

`salt.modules.makeconf.chost_contains` (*value*)

Verify if CHOST variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.chost_contains 'x86_64-pc-linux-gnu'
```

`salt.modules.makeconf.cxxflags_contains` (*value*)

Verify if CXXFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.cxxflags_contains '-pipe'
```

`salt.modules.makeconf.emerge_default_opts_contains` (*value*)

Verify if EMERGE\_DEFAULT\_OPTS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.emerge_default_opts_contains '--jobs'
```

`salt.modules.makeconf.features_contains(value)`

Verify if FEATURES variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.features_contains 'webrsync-gpg'
```

`salt.modules.makeconf.gentoo_mirrors_contains(value)`

Verify if GENTOO\_MIRRORS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.gentoo_mirrors_contains 'http://distfiles.gentoo.org'
```

`salt.modules.makeconf.get_cflags()`

Get the value of CFLAGS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_cflags
```

`salt.modules.makeconf.get_chost()`

Get the value of CHOST variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_chost
```

`salt.modules.makeconf.get_cxxflags()`

Get the value of CXXFLAGS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_cxxflags
```

`salt.modules.makeconf.get_emerge_default_opts()`

Get the value of EMERGE\_DEFAULT\_OPTS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_emerge_default_opts
```

`salt.modules.makeconf.get_features()`

Get the value of FEATURES variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_features
```

`salt.modules.makeconf.get_gentoo_mirrors()`

Get the value of GENTOO\_MIRRORS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_gentoo_mirrors
```

`salt.modules.makeconf.get_makeopts()`

Get the value of MAKEOPTS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_makeopts
```

`salt.modules.makeconf.get_sync()`

Get the value of SYNC variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_sync
```

`salt.modules.makeconf.get_var(var)`

Get the value of a variable in make.conf

Return the value of the variable or None if the variable is not in make.conf

CLI Example:

```
salt '*' makeconf.get_var 'LINGUAS'
```

`salt.modules.makeconf.makeopts_contains(value)`

Verify if MAKEOPTS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.makeopts_contains '-j3'
```

`salt.modules.makeconf.remove_var(var)`

Remove a variable from the make.conf

Return a dict containing the new value for the variable:

```
{ '<variable>': {'old': '<old-value>',  
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.remove_var 'LINGUAS'
```

`salt.modules.makeconf.set_cflags(value)`

Set the CFLAGS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_cflags '-march=native -O2 -pipe'
```

`salt.modules.makeconf.set_chost(value)`

Set the CHOST variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_chost 'x86_64-pc-linux-gnu'
```

`salt.modules.makeconf.set_cxxflags(value)`

Set the CXXFLAGS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_cxxflags '-march=native -O2 -pipe'
```

`salt.modules.makeconf.set_emerge_default_opts(value)`

Set the EMERGE\_DEFAULT\_OPTS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_emerge_default_opts '--jobs'
```

`salt.modules.makeconf.set_gentoo_mirrors(value)`

Set the GENTOO\_MIRRORS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_gentoo_mirrors 'http://distfiles.gentoo.org'
```

`salt.modules.makeconf.set_makeopts`(*value*)

Set the MAKEOPTS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_makeopts '-j3'
```

`salt.modules.makeconf.set_sync`(*value*)

Set the SYNC variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_sync 'rsync://rsync.namerica.gentoo.org/gentoo-  
→portage'
```

`salt.modules.makeconf.set_var`(*var*, *value*)

Set a variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_var 'LINGUAS' 'en'
```

`salt.modules.makeconf.sync_contains`(*value*)

Verify if SYNC variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.sync_contains 'rsync://rsync.namerica.gentoo.org/gentoo-  
→portage'
```

`salt.modules.makeconf.trim_cflags`(*value*)

Remove a value from CFLAGS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',  
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_cflags '-pipe'
```

`salt.modules.makeconf.trim_cxxflags`(*value*)

Remove a value from CXXFLAGS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_cxxflags '-pipe'
```

`salt.modules.makeconf.trim_emerge_default_opts`(*value*)

Remove a value from EMERGE\_DEFAULT\_OPTS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_emerge_default_opts '--jobs'
```

`salt.modules.makeconf.trim_features`(*value*)

Remove a value from FEATURES variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_features 'webrsync-gpg'
```

`salt.modules.makeconf.trim_gentoo_mirrors`(*value*)

Remove a value from GENTOO\_MIRRORS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_gentoo_mirrors 'http://distfiles.gentoo.org'
```

`salt.modules.makeconf.trim_makeopts`(*value*)

Remove a value from MAKEOPTS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_makeopts '-j3'
```

`salt.modules.makeconf.trim_var`(*var*, *value*)

Remove a value from a variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_var 'LINGUAS' 'en'
```

`salt.modules.makeconf.var_contains`(*var*, *value*)

Verify if variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.var_contains 'LINGUAS' 'en'
```

## 26.6.253 salt.modules.mandrill

### Mandrill

Send out emails using the [Mandrill API](#).

In the minion configuration file, the following block is required:

```
mandrill:
  key: <API_KEY>
```

New in version 2018.3.0.

`salt.modules.mandrill.send`(*message*, *asynchronous=False*, *ip\_pool=None*, *send\_at=None*, *api\_url=None*, *api\_version=None*, *api\_key=None*)

Send out the email using the details from the `message` argument.

**message**

The information on the message to send. This argument must be sent as dictionary with at fields as specified in the Mandrill API documentation.

**asynchronous: False**

Enable a background sending mode that is optimized for bulk sending. In asynchronous mode, messages/send will immediately return a status of "queued" for every recipient. To handle rejections when sending in asynchronous mode, set up a webhook for the 'reject' event. Defaults to false for messages with no more than 10 recipients; messages with more than 10 recipients are always sent asynchronously, regardless of the value of asynchronous.

**ip\_pool**

The name of the dedicated ip pool that should be used to send the message. If you do not have any dedicated IPs, this parameter has no effect. If you specify a pool that does not exist, your default pool will be used instead.

**send\_at**

When this message should be sent as a UTC timestamp in YYYY-MM-DD HH:MM:SS format. If you specify a time in the past, the message will be sent immediately. An additional fee applies for scheduled email, and this feature is only available to accounts with a positive balance.

---

**Note:** For further details please consult the [API documentation](#).

---

CLI Example:

```
salt '*' mandrill.send message="{ 'subject': 'Hi', 'from_email':
→ 'test@example.com', 'to': [ {'email': 'recv@example.com', 'type': 'to'} ] }"
→ "
```

message structure example (as YAML for readability):

```
message:
  text: |
    This is the body of the email.
    This is the second line.
  subject: Email subject
  from_name: Test At Example Dot Com
  from_email: test@example.com
  to:
    - email: recv@example.com
      type: to
      name: Recv At Example Dot Com
    - email: cc@example.com
      type: cc
      name: CC At Example Dot Com
  important: true
  track_clicks: true
  track_opens: true
  attachments:
    - type: text/x-yaml
      name: yaml_file.yml
      content: aV9hbV9zdXB1cl9jdXJpb3VzO0iB0cnVl
```

Output example:

```
minion:
  -----
  comment:
  out:
    |
    -----
    _id:
      c4353540a3c123eca112bbdd704ab6
    email:
      recv@example.com
```

(continues on next page)

(continued from previous page)

```
    reject_reason:
      None
    status:
      sent
  result:
    True
```

### 26.6.254 salt.modules.marathon

Module providing a simple management interface to a marathon cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.

**salt.modules.marathon.app**(*id*)

Return the current server configuration for the specified app.

CLI Example:

```
salt marathon-minion-id marathon.app my-app
```

**salt.modules.marathon.apps**()

Return a list of the currently installed app ids.

CLI Example:

```
salt marathon-minion-id marathon.apps
```

**salt.modules.marathon.has\_app**(*id*)

Return whether the given app id is currently configured.

CLI Example:

```
salt marathon-minion-id marathon.has_app my-app
```

**salt.modules.marathon.info**()

Return configuration and status information about the marathon instance.

CLI Example:

```
salt marathon-minion-id marathon.info
```

**salt.modules.marathon.restart\_app**(*id*, *restart=False*, *force=True*)

Restart the current server configuration for the specified app.

**Parameters**

- **restart** -- Restart the app
- **force** -- Override the current deployment

CLI Example:

```
salt marathon-minion-id marathon.restart_app my-app
```

By default, this will only check if the app exists in marathon. It does not check if there are any tasks associated with it or if the app is suspended.

```
salt marathon-minion-id marathon.restart_app my-app true true
```

The restart option needs to be set to True to actually issue a rolling restart to marathon.

The force option tells marathon to ignore the current app deployment if there is one.

`salt.modules.marathon.rm_app(id)`

Remove the specified app from the server.

CLI Example:

```
salt marathon-minion-id marathon.rm_app my-app
```

`salt.modules.marathon.update_app(id, config)`

Update the specified app with the given configuration.

CLI Example:

```
salt marathon-minion-id marathon.update_app my-app '<config yaml>'
```

### 26.6.255 salt.modules.match

The match module allows for match routines to be run and determine target specs

`salt.modules.match.compound(tgt, minion_id=None)`

Return True if the minion ID matches the given compound target

**minion\_id**

Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.compound 'L@cheese,foo and *'
```

`salt.modules.match.data(tgt)`

Return True if the minion matches the given data target

CLI Example:

```
salt '*' match.data 'spam:eggs'
```

`salt.modules.match.filter_by(lookup, tgt_type='compound', minion_id=None, merge=None, merge_lists=False, default='default')`

Return the first match in a dictionary of target patterns

New in version 2014.7.0.

CLI Example:

```
salt '*' match.filter_by '{foo*: Foo!, bar*: Bar!}' minion_id=bar03
```

Pillar Example:

```
# Filter the data for the current minion into a variable:
{% set roles = salt['match.filter_by']({
    'web*': ['app', 'caching'],
    'db*': ['db'],
}, minion_id=grains['id'], default='web*') %}

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
```

`salt.modules.match.glob`(*tgt*, *minion\_id=None*)

Return True if the minion ID matches the given glob target

**minion\_id**

Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.glob '*'
```

`salt.modules.match.grain`(*tgt*, *delimiter=':'*)

Return True if the minion matches the given grain target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.grain 'os:Ubuntu'
salt '*' match.grain 'ipv6|2001:db8::ff00:42:8329' delimiter='|'
```

**delimiter**

Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

**delim**

Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.grain_pcre`(*tgt*, *delimiter=':'*)

Return True if the minion matches the given `grain_pcre` target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.grain_pcre 'os:Fedo.*'
salt '*' match.grain_pcre 'ipv6|2001:.*' delimiter='|'
```

**delimiter**

Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

**delim**

Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.ifelse(*args, tgt_type='compound', minion_id=None, merge=None, merge_lists=False)`

New in version 3006.0.

Evaluate each pair of arguments up to the last one as a (matcher, value) tuple, returning value if matched. If none match, returns the last argument.

The `ifelse` function is like a multi-level if-else statement. It was inspired by CFEngine's `ifelse` function which in turn was inspired by Oracle's `DECODE` function. It must have an odd number of arguments (from 1 to N). The last argument is the default value, like the `else` clause in standard programming languages. Every pair of arguments before the last one are evaluated as a pair. If the first one evaluates true then the second one is returned, as if you had used the first one in a compound match expression. Boolean values can also be used as the first item in a pair, as it will be translated to a match that will always match ("\*") or never match ("SALT\_IFELSE\_MATCH\_NOTHING") a target system.

This is essentially another way to express the `filter_by` functionality in way that's familiar to CFEngine or Oracle users. Consider using `filter_by` unless this function fits your workflow.

CLI Example:

```
salt '*' match.ifelse 'foo*' 'Foo!' 'bar*' 'Bar!' minion_id=bar03
```

`salt.modules.match.ipcidr(tgt)`

Return True if the minion matches the given ipcidr target

CLI Example:

```
salt '*' match.ipcidr '192.168.44.0/24'
```

delimiter Pillar Example:

```
'172.16.0.0/12':
- match: ipcidr
- nodeclass: internal
```

`salt.modules.match.list_(tgt, minion_id=None)`

Return True if the minion ID matches the given list target

**minion\_id**

Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.list 'server1,server2'
```

`salt.modules.match.pcre(tgt, minion_id=None)`

Return True if the minion ID matches the given pcre target

**minion\_id**

Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.pcre '.*'
```

`salt.modules.match.pillar(tgt, delimiter=':')`

Return True if the minion matches the given pillar target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar 'cheese:foo'
salt '*' match.pillar 'clone_url|https://github.com/saltstack/salt.git'
→delimiter='|'
```

#### delimiter

Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

#### delim

Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.pillar_pcre` (*tgt*, *delimiter*=':')

Return True if the minion matches the given `pillar_pcre` target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar_pcre 'cheese:(swiss|american)'
salt '*' match.pillar_pcre 'clone_url|https://github\.com/.*\.git'
→delimiter='|'
```

#### delimiter

Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

#### delim

Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.search_by` (*lookup*, *tgt\_type*='compound', *minion\_id*=None)

Search a dictionary of target strings for matching targets

This is the inverse of `match.filter_by` and allows matching values instead of matching keys. A minion can be matched by multiple entries.

New in version 2017.7.0.

CLI Example:

```
salt '*' match.search_by '{web: [node1, node2], db: [node2, node]}'
```

Pillar Example:

```
{% set roles = salt.match.search_by({
    'web': ['G@os_family:Debian not nodeX'],
    'db': ['L@node2,node3 and G@datacenter:west'],
    'caching': ['node3', 'node4'],
}) %}

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
```

## 26.6.256 salt.modules.mattermost

Module for sending messages to Mattermost

New in version 2017.7.0.

### configuration

This module can be used by either passing an `api_url` and `hook` directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```
mattermost:
  hook: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_url: https://example.com
```

`salt.modules.mattermost.post_message` (*message*, *channel=None*, *username=None*, *api\_url=None*, *hook=None*)

Send a message to a Mattermost channel.

### Parameters

- **channel** -- The channel name, either will work.
- **username** -- The username of the poster.
- **message** -- The message to send to the Mattermost channel.
- **api\_url** -- The Mattermost api url, if not specified in the configuration.
- **hook** -- The Mattermost hook, if not specified in the configuration.

### Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '*' mattermost.post_message message='Build is done'
```

## 26.6.257 salt.modules.mdadm RAID

Salt module to manage RAID arrays with mdadm

`salt.modules.mdadm RAID.add` (*name*, *device*)

Add new device to RAID array.

CLI Example:

```
salt '*' RAID.add /dev/md0 /dev/sda1
```

`salt.modules.mdadm RAID.assemble` (*name*, *devices*, *test\_mode=False*, *\*\*kwargs*)

Assemble a RAID device.

CLI Examples:

```
salt '*' RAID.assemble /dev/md0 ['/dev/xvdd', '/dev/xvde']
```

---

**Note:** Adding `test_mode=True` as an argument will print out the mdadm command that would have been run.

---

**name**

The name of the array to assemble.

**devices**

The list of devices comprising the array to assemble.

**kwargs**

Optional arguments to be passed to mdadm.

**returns****test\_mode=True:**

Prints out the full command.

**test\_mode=False (Default):**

Executes command on the host(s) and prints out the mdadm output.

For more info, read the mdadm manpage.

```
salt.modules.mdadm_raid.create(name, level, devices, metadata='default', test_mode=False, **kwargs)
```

Create a RAID device.

Changed in version 2014.7.0.

**Warning:** Use with CAUTION, as this function can be very destructive if not used properly!

CLI Examples:

```
salt '*' raid.create /dev/md0 level=1 chunk=256 devices="['/dev/xvdd', '/dev/xvde']" test_mode=True
```

---

**Note:** Adding `test_mode=True` as an argument will print out the mdadm command that would have been run.

---

**name**

The name of the array to create.

**level**

The RAID level to use when creating the raid.

**devices**

A list of devices used to build the array.

**metadata**

Version of metadata to use when creating the array.

**kwargs**

Optional arguments to be passed to mdadm.

**returns****test\_mode=True:**

Prints out the full command.

**test\_mode=False (Default):**

Executes command on remote the host(s) and Prints out the mdadm output.

---

**Note:** It takes time to create a RAID array. You can check the progress in "resync\_status:" field of the results from the following command:

---

```
salt '*' raid.detail /dev/md0
```

---

For more info, read the mdadm(8) manpage

`salt.modules.mdadm_raid.destroy(device)`

Destroy a RAID device.

WARNING This will zero the superblock of all members of the RAID array..

CLI Example:

```
salt '*' raid.destroy /dev/md0
```

`salt.modules.mdadm_raid.detail(device='/dev/md0')`

Show detail for a specified RAID device

CLI Example:

```
salt '*' raid.detail '/dev/md0'
```

`salt.modules.mdadm_raid.examine(device, quiet=False)`

Show detail for a specified RAID component device

**device**

Device to examine, that is part of the RAID

**quiet**

If the device is not part of the RAID, do not show any error

CLI Example:

```
salt '*' raid.examine '/dev/sda1'
```

`salt.modules.mdadm_raid.list_()`

List the RAID devices.

CLI Example:

```
salt '*' raid.list
```

`salt.modules.mdadm_raid.save_config()`

Save RAID configuration to config file.

Same as: `mdadm --detail --scan >> /etc/mdadm/mdadm.conf`

Fixes this issue with Ubuntu REF: <http://askubuntu.com/questions/209702/why-is-my-raid-dev-md1-showing-up-as-dev-md126-is-mdadm-conf-being-ignored>

CLI Example:

```
salt '*' raid.save_config
```

`salt.modules.mdadm_raid.stop()`

Shut down all arrays that can be shut down (i.e. are not currently in use).

CLI Example:

```
salt '*' raid.stop
```

## 26.6.258 salt.modules.mdata

Module for managing metadata in SmartOS Zones

New in version 2016.3.0.

**maintainer**

Jorge Schrauwen <sjorge@blackdot.be>

**maturity**

new

**platform**

smartos

salt.modules.mdata.**delete\_**(\*keyname)

Delete metadata

**prop**

[string] name of property

CLI Example:

```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.**get\_**(\*keyname)

Get metadata

**keyname**

[string] name of key

---

**Note:** If no keynames are specified, we get all (public) properties

---

CLI Example:

```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.**list\_**()

List available metadata

CLI Example:

```
salt '*' mdata.list
```

salt.modules.mdata.**put\_**(keyname, val)

Put metadata

**prop**

[string] name of property

**val**

[string] value to set

CLI Example:

```
salt '*' mdata.list
```

## 26.6.259 salt.modules.memcached

Module for Management of Memcached Keys

New in version 2014.1.0.

**salt.modules.memcached.add**(*key, value, host='127.0.0.1', port=11211, time=0, min\_compress\_len=0*)

Add a key to the memcached server, but only if it does not exist. Returns False if the key already exists.

CLI Example:

```
salt '*' memcached.add <key> <value>
```

**salt.modules.memcached.decr**(*key, delta=1, host='127.0.0.1', port=11211*)

This function is an alias of `decrement`.

Decrement the value of a key

CLI Example:

```
salt '*' memcached.decrement <key>
salt '*' memcached.decrement <key> 2
```

**salt.modules.memcached.decrement**(*key, delta=1, host='127.0.0.1', port=11211*)

Decrement the value of a key

CLI Example:

```
salt '*' memcached.decrement <key>
salt '*' memcached.decrement <key> 2
```

**salt.modules.memcached.delete**(*key, host='127.0.0.1', port=11211, time=0*)

Delete a key from memcache server

CLI Example:

```
salt '*' memcached.delete <key>
```

**salt.modules.memcached.get**(*key, host='127.0.0.1', port=11211*)

Retrieve value for a key

CLI Example:

```
salt '*' memcached.get <key>
```

**salt.modules.memcached.incr**(*key, delta=1, host='127.0.0.1', port=11211*)

This function is an alias of `increment`.

Increment the value of a key

CLI Example:

```
salt '*' memcached.increment <key>
salt '*' memcached.increment <key> 2
```

**salt.modules.memcached.increment**(*key, delta=1, host='127.0.0.1', port=11211*)

Increment the value of a key

CLI Example:

```
salt '*' memcached.increment <key>
salt '*' memcached.increment <key> 2
```

`salt.modules.memcached.replace`(*key*, *value*, *host*='127.0.0.1', *port*=11211, *time*=0, *min\_compress\_len*=0)  
Replace a key on the memcached server. This only succeeds if the key already exists. This is the opposite of `memcached.add`

CLI Example:

```
salt '*' memcached.replace <key> <value>
```

`salt.modules.memcached.set_`(*key*, *value*, *host*='127.0.0.1', *port*=11211, *time*=0, *min\_compress\_len*=0)  
Set a key on the memcached server, overwriting the value if it exists.

CLI Example:

```
salt '*' memcached.set <key> <value>
```

`salt.modules.memcached.status`(*host*='127.0.0.1', *port*=11211)

Get memcached status

CLI Example:

```
salt '*' memcached.status
```

### 26.6.260 salt.modules.mine

The function cache system allows for data to be stored on the master so it can be easily read by other minions

`salt.modules.mine.delete`(*fun*)

Remove specific function contents of minion.

**Parameters**

**fun** (*str*) -- The name of the function.

**Return type**

bool

**Returns**

True on success.

CLI Example:

```
salt '*' mine.delete 'network.interfaces'
```

`salt.modules.mine.flush`()

Remove all mine contents of minion.

**Return type**

bool

**Returns**

True on success

CLI Example:

```
salt '*' mine.flush
```

`salt.modules.mine.get`(*tgt*, *fun*, *tgt\_type*='glob', *exclude\_minion*=False)

Get data from the mine.

**Parameters**

- **tgt** (*str*) -- Target whose mine data to get.
- **fun** (*str or list*) -- Function to get the mine data of. You can specify multiple functions to retrieve using either a list or a comma-separated string of functions.
- **tgt\_type** (*str*) -- Default glob. Target type to use with **tgt**. See *Targeting Minions* for more information. Note that all pillar matches, whether using the compound matching system or the pillar matching system, will be exact matches, with globbing disabled.
- **exclude\_minion** (*bool*) -- Excludes the current minion from the result set.

CLI Example:

```
salt '*' mine.get '*' network.interfaces
salt '*' mine.get 'os:Fedora' network.interfaces grain
salt '*' mine.get 'G@os:Fedora and S@192.168.5.0/24' network.ipaddrs
→compound
```

See also:

Retrieving Mine data from Pillar and Orchestrate

This execution module is intended to be executed on minions. Master-side operations such as Pillar or Orchestrate that require Mine data should use the *Mine Runner module* instead; it can be invoked from a Pillar SLS file using the *saltutil.runner* module. For example:

```
{% set minion_ips = salt.saltutil.runner('mine.get',
    tgt='*',
    fun='network.ip_addrs',
    tgt_type='glob') %}
```

`salt.modules.mine.get_docker` (*interfaces=None, cidrs=None, with\_container\_id=False*)

Changed in version 2017.7.8,2018.3.3: When *docker.update\_mine* is set to `False` for a given minion, no mine data will be populated for that minion, and thus none will be returned for it.

Changed in version 2019.2.0: *docker.update\_mine* now defaults to `False`

Get all mine data for *docker.ps* and run an aggregation routine. The *interfaces* parameter allows for specifying the network interfaces from which to select IP addresses. The *cidrs* parameter allows for specifying a list of subnets which the IP address must match.

**with\_container\_id**

Boolean, to expose *container\_id* in the list of results

New in version 2015.8.2.

CLI Example:

```
salt '*' mine.get_docker
salt '*' mine.get_docker interfaces='eth0'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]'
salt '*' mine.get_docker cidrs='107.170.147.0/24'
salt '*' mine.get_docker cidrs='["107.170.147.0/24", "172.17.42.0/24"]'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]' cidrs='["107.170.
→147.0/24", "172.17.42.0/24"]'
```

`salt.modules.mine.send` (*name, \*args, \*\*kwargs*)

Send a specific function and its result to the salt mine. This gets stored in either the local cache, or the salt master's cache.

**Parameters**

**name** (*str*) -- Name of the function to add to the mine.

The following parameters are extracted from kwargs if present:

**Parameters**

- **mine\_function** (*str*) -- The name of the `execution_module.function` to run and whose value will be stored in the salt mine. Defaults to `name`.
- **allow\_tgt** (*str*) -- Targeting specification for ACL. Specifies which minions are allowed to access this function. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.
- **allow\_tgt\_type** (*str*) -- Type of the targeting specification. This value will be ignored if `allow_tgt` is not specified. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.

Remaining args and kwargs will be passed on to the function to run.

**Return type**

`bool`

**Returns**

Whether executing the function and storing the information was successful.

Changed in version 3000: Added `allow_tgt`- and `allow_tgt_type`-parameters to specify which minions are allowed to access this function. See [Targeting Minions](#) for more information about targeting.

CLI Example:

```
salt '*' mine.send network.ip_addrs interface=eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs
→ interface=eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs
→ interface=eth0 allow_tgt='G@grain:value' allow_tgt_type=compound
```

`salt.modules.mine.update` (*clear=False, mine\_functions=None*)

Call the configured functions and send the data back up to the master. The functions to be called are merged from the master config, pillar and minion config under the option `mine_functions`:

```
mine_functions:
  network.ip_addrs:
    - eth0
  disk.usage: []
```

This function accepts the following arguments:

**Parameters**

- **clear** (*bool*) -- Default: `False` Specifies whether updating will clear the existing values (`True`), or whether it will update them (`False`).
- **mine\_functions** (*dict*) -- Update (or clear, see `clear`) the mine data on these functions only. This will need to have the structure as defined on <https://docs.saltproject.io/en/latest/topics/mine/index.html#mine-functions>

This feature can be used when updating the mine for functions that require a refresh at different intervals than the rest of the functions specified under `mine_functions` in the minion/master config or pillar. A potential use would be together with the `scheduler`, for example:

```
schedule:
  lldp_mine_update:
```

(continues on next page)

(continued from previous page)

```

function: mine.update
kwargs:
  mine_functions:
    net.lldp: []
hours: 12

```

In the example above, the mine for *net.lldp* would be refreshed every 12 hours, while *network.ip\_addrs* would continue to be updated as specified in *mine\_interval*.

The function cache will be populated with information from executing these functions

CLI Example:

```
salt '*' mine.update
```

`salt.modules.mine.valid()`

List valid entries in mine configuration.

CLI Example:

```
salt '*' mine.valid
```

### 26.6.261 salt.modules.minion

Module to provide information about minions

`salt.modules.minion.kill(timeout=15)`

Kill the salt minion.

**timeout**

int seconds to wait for the minion to die.

If you have a monitor that restarts `salt-minion` when it dies then this is a great way to restart after a minion upgrade.

CLI Example:

```

salt minion[12] minion.kill

minion1:
  -----
  killed:
    7874
  retcode:
    0
minion2:
  -----
  killed:
    29071
  retcode:
    0

```

The result of the salt command shows the process ID of the minions and the results of a kill signal to the minion in as the `retcode` value: 0 is success, anything else is a failure.

`salt.modules.minion.list_()`

Return a list of accepted, denied, unaccepted and rejected keys. This is the same output as `salt-key -L`

CLI Example:

```
salt 'master' minion.list
```

`salt.modules.minion.restart()`

Kill and restart the salt minion.

The configuration key `minion_restart_command` is an argv list for the command to restart the minion. If `minion_restart_command` is not specified or empty then the argv of the current process will be used.

if the configuration value `minion_restart_command` is not set and the `-d` (daemonize) argument is missing from argv then the minion *will* be killed but will *not* be restarted and will require the parent process to perform the restart. This behavior is intended for managed salt minion processes.

CLI Example:

```
salt minion[12] minion.restart

minion1:
-----
comment:
  - Restart using process argv:
  -   /home/omniture/install/bin/salt-minion
  -   -d
  -   -c
  -   /home/omniture/install/etc/salt
killed:
  10070
restart:
-----
  stderr:
  stdout:
  retcode:
  0
minion2:
-----
comment:
  - Using configuration minion_restart_command:
  -   /home/omniture/install/bin/salt-minion
  -   --not-an-option
  -   -d
  -   -c
  -   /home/omniture/install/etc/salt
  - Restart failed
killed:
  10896
restart:
-----
  stderr:
    Usage: salt-minion

    salt-minion: error: no such option: --not-an-option
```

(continues on next page)

(continued from previous page)

```

stdout:
retcode:
64

```

The result of the command shows the process ID of `minion1` that is shutdown (killed) and the results of the restart. If there is a failure in the restart it will be reflected in a non-zero `retcode` and possibly output in the `stderr` and/or `stdout` values along with addition information in the `comment` field as is demonstrated with `minion2`.

## 26.6.262 salt.modules.mod\_random

Provides access to randomness generators.

New in version 2014.7.0.

`salt.modules.mod_random.get_str` (*length=20, chars=None, lowercase=True, uppercase=True, digits=True, punctuation=True, whitespace=False, printable=False*)

New in version 2014.7.0.

Changed in version 3004: Changed the default character set used to include symbols and implemented arguments to control the used character set.

Returns a random string of the specified length.

**length**

[20] Any valid number of bytes.

**chars**

[None] New in version 3004.

String with any character that should be used to generate random string.

This argument supersedes all other character controlling arguments.

**lowercase**

[True] New in version 3004.

Use lowercase letters in generated random string. (see `string.ascii_lowercase`)

This argument is superseded by `chars`.

**uppercase**

[True] New in version 3004.

Use uppercase letters in generated random string. (see `string.ascii_uppercase`)

This argument is superseded by `chars`.

**digits**

[True] New in version 3004.

Use digits in generated random string. (see `string.digits`)

This argument is superseded by `chars`.

**printable**

[False] New in version 3004.

Use printable characters in generated random string and includes lowercase, uppercase, digits, punctuation and whitespace. (see `string.printable`)

It is disabled by default as includes whitespace characters which some systems do not handle well in passwords. This argument also supersedes all other classes because it includes them.

This argument is superseded by `chars`.

**punctuation**

[True] New in version 3004.

Use punctuation characters in generated random string. (see `string.punctuation`)

This argument is superseded by `chars`.

**whitespace**

[False] New in version 3004.

Use whitespace characters in generated random string. (see `string.whitespace`)

It is disabled by default as some systems do not handle whitespace characters in passwords well.

This argument is superseded by `chars`.

CLI Example:

```
salt '*' random.get_str 128
salt '*' random.get_str 128 chars='abc123.!()'
salt '*' random.get_str 128 lowercase=False whitespace=True
```

`salt.modules.mod_random.hash(value, algorithm='sha512')`

New in version 2014.7.0.

Encodes a value with the specified encoder.

**value**

The value to be hashed.

**algorithm**

[sha512] The algorithm to use. May be any valid algorithm supported by hashlib.

CLI Example:

```
salt '*' random.hash 'I am a string' md5
```

`salt.modules.mod_random.rand_int(start=1, end=10, seed=None)`

Returns a random integer number between the start and end number.

New in version 2015.5.3.

**start**

[1] Any valid integer number

**end**

[10] Any valid integer number

**seed :**

Optional hashable object

Changed in version 2019.2.0: Added seed argument. Will return the same result when run with the same seed.

CLI Example:

```
salt '*' random.rand_int 1 10
```

`salt.modules.mod_random.sample(value, size, seed=None)`

Return a given sample size from a list. By default, the random number generator uses the current system time unless given a seed value.

New in version 3005.

**value**

A list to be used as input.

**size**

The sample size to return.

**seed**

Any value which will be hashed as a seed for random.

CLI Example:

```
salt '*' random.sample '["one", "two"]' 1 seed="something"
```

`salt.modules.mod_random.seed`(*range=10, hash=None*)

Returns a random number within a range. Optional hash argument can be any hashable object. If hash is omitted or None, the id of the minion is used.

New in version 2015.8.0.

**hash: None**

Any hashable object.

**range: 10**

Any valid integer number

CLI Example:

```
salt '*' random.seed 10 hash=None
```

`salt.modules.mod_random.shadow_hash`(*crypt\_salt=None, password=None, algorithm='sha512'*)

Generates a salted hash suitable for /etc/shadow.

**crypt\_salt**

[None] Salt to be used in the generation of the hash. If one is not provided, a random salt will be generated.

**password**

[None] Value to be salted and hashed. If one is not provided, a random password will be generated.

**algorithm**

[sha512] Hash algorithm to use.

CLI Example:

```
salt '*' random.shadow_hash 'My5a1T' 'MyP@asswd' md5
```

`salt.modules.mod_random.shuffle`(*value, seed=None*)

Return a shuffled copy of an input list. By default, the random number generator uses the current system time unless given a seed value.

New in version 3005.

**value**

A list to be used as input.

**seed**

Any value which will be hashed as a seed for random.

CLI Example:

```
salt '*' random.shuffle '["one", "two"]' seed="something"
```

`salt.modules.mod_random.str_encode`(*value, encoder='base64'*)

New in version 2014.7.0.

**value**

The value to be encoded.

**encoder**

[base64] The encoder to use on the subsequent string.

CLI Example:

```
salt '*' random.str_encode 'I am a new string' base64
```

### 26.6.263 salt.modules.modjk

Control Modjk via the Apache Tomcat "Status" worker (<http://tomcat.apache.org/connectors-doc/reference/status.html>)

Below is an example of the configuration needed for this module. This configuration data can be placed either in *grains* or *pillar*.

If using grains, this can be accomplished *statically* or via a *grain module*.

If using pillar, the yaml configuration can be placed directly into a pillar SLS file, making this both the easier and more dynamic method of configuring this module.

```

modjk:
  default:
    url: http://localhost/jkstatus
    user: modjk
    pass: secret
    realm: authentication realm for digest passwords
    timeout: 5
  otherVhost:
    url: http://otherVhost/jkstatus
    user: modjk
    pass: secret2
    realm: authentication realm2 for digest passwords
    timeout: 600

```

salt.modules.modjk.**bulk\_activate** (*workers, lbn, profile='default'*)

Activate all the given workers in the specific load balancer

CLI Examples:

```

salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_activate ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_activate ["node1","node2","node3"] loadbalancer1
↳other-profile

```

salt.modules.modjk.**bulk\_disable** (*workers, lbn, profile='default'*)

Disable all the given workers in the specific load balancer

CLI Examples:

```

salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1 other-
↳profile

```

salt.modules.modjk.**bulk\_recover** (*workers, lbn, profile='default'*)

Recover all the given workers in the specific load balancer

CLI Examples:

```

salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_recover ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_recover ["node1","node2","node3"] loadbalancer1 other-
→profile

```

`salt.modules.modjk.bulk_stop`(*workers, lbn, profile='default'*)

Stop all the given workers in the specific load balancer

CLI Examples:

```

salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_stop ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_stop ["node1","node2","node3"] loadbalancer1 other-
→profile

```

`salt.modules.modjk.dump_config`(*profile='default'*)

Dump the original configuration that was loaded from disk

CLI Examples:

```

salt '*' modjk.dump_config
salt '*' modjk.dump_config other-profile

```

`salt.modules.modjk.get_running`(*profile='default'*)

Get the current running config (not from disk)

CLI Examples:

```

salt '*' modjk.get_running
salt '*' modjk.get_running other-profile

```

`salt.modules.modjk.lb_edit`(*lbn, settings, profile='default'*)

Edit the loadbalancer settings

Note: <http://tomcat.apache.org/connectors-doc/reference/status.html> Data Parameters for the standard Update Action

CLI Examples:

```

salt '*' modjk.lb_edit loadbalancer1 '{"v1r': 1, 'v1t': 60}"
salt '*' modjk.lb_edit loadbalancer1 '{"v1r': 1, 'v1t': 60}" other-profile

```

`salt.modules.modjk.list_configured_members`(*lbn, profile='default'*)

Return a list of member workers from the configuration files

CLI Examples:

```

salt '*' modjk.list_configured_members loadbalancer1
salt '*' modjk.list_configured_members loadbalancer1 other-profile

```

`salt.modules.modjk.recover_all(lbn, profile='default')`

Set the all the workers in lbn to recover and activate them if they are not

CLI Examples:

```
salt '*' modjk.recover_all loadbalancer1
salt '*' modjk.recover_all loadbalancer1 other-profile
```

`salt.modules.modjk.reset_stats(lbn, profile='default')`

Reset all runtime statistics for the load balancer

CLI Examples:

```
salt '*' modjk.reset_stats loadbalancer1
salt '*' modjk.reset_stats loadbalancer1 other-profile
```

`salt.modules.modjk.version(profile='default')`

Return the modjk version

CLI Examples:

```
salt '*' modjk.version
salt '*' modjk.version other-profile
```

`salt.modules.modjk.worker_activate(worker, lbn, profile='default')`

Set the worker to activate state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
```

`salt.modules.modjk.worker_disable(worker, lbn, profile='default')`

Set the worker to disable state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_disable node1 loadbalancer1
salt '*' modjk.worker_disable node1 loadbalancer1 other-profile
```

`salt.modules.modjk.worker_edit(worker, lbn, settings, profile='default')`

Edit the worker settings

Note: <http://tomcat.apache.org/connectors-doc/reference/status.html> Data Parameters for the standard Update Action

CLI Examples:

```
salt '*' modjk.worker_edit node1 loadbalancer1 '{"vwf': 500, 'vwd': 60}"
salt '*' modjk.worker_edit node1 loadbalancer1 '{"vwf': 500, 'vwd': 60}"
→other-profile
```

`salt.modules.modjk.worker_recover(worker, lbn, profile='default')`

Set the worker to recover this module will fail if it is in OK state

CLI Examples:

```
salt '*' modjk.worker_recover node1 loadbalancer1
salt '*' modjk.worker_recover node1 loadbalancer1 other-profile
```

`salt.modules.modjk.worker_status` (*worker*, *profile*='default')

Return the state of the worker

CLI Examples:

```
salt '*' modjk.worker_status node1
salt '*' modjk.worker_status node1 other-profile
```

`salt.modules.modjk.worker_stop` (*worker*, *lbn*, *profile*='default')

Set the worker to stopped state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
```

`salt.modules.modjk.workers` (*profile*='default')

Return a list of member workers and their status

CLI Examples:

```
salt '*' modjk.workers
salt '*' modjk.workers other-profile
```

### 26.6.264 salt.modules.mongodb

Module to provide MongoDB functionality to Salt

#### configuration

This module uses PyMongo, and accepts configuration details as parameters as well as configuration settings:

```
mongodb.host: 'localhost'
mongodb.port: 27017
mongodb.user: ''
mongodb.password: ''
```

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar.

`salt.modules.mongodb.collection_create` (*collection*, *user*=None, *password*=None, *host*=None, *port*=None, *database*='admin', *authdb*=None)

New in version 3006.0.

Create a collection in the specified database.

#### collection

The name of the collection to create.

#### user

The user to connect to MongoDB as. Default is None.

#### password

The password to use to connect to MongoDB as. Default is None.

**host**

The host where MongoDB is running. Default is None.

**port**

The host where MongoDB is running. Default is None.

**authdb**

The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.collection_create mycollection <user> <password> <host>
→<port> <database>
```

`salt.modules.mongodb.collection_drop`(*collection*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

New in version 3006.0.

Drop a collection in the specified database.

**collection**

The name of the collection to drop.

**user**

The user to connect to MongoDB as. Default is None.

**password**

The password to use to connect to MongoDB as. Default is None.

**host**

The host where MongoDB is running. Default is None.

**port**

The host where MongoDB is running. Default is None.

**authdb**

The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.collection_drop mycollection <user> <password> <host>
→<port> <database>
```

`salt.modules.mongodb.collections_list`(*user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

New in version 3006.0.

List the collections available in the specified database.

**user**

The user to connect to MongoDB as. Default is None.

**password**

The password to use to connect to MongoDB as. Default is None.

**host**

The host where MongoDB is running. Default is None.

**port**

The host where MongoDB is running. Default is None.

**authdb**

The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.collections_list mycollection <user> <password> <host>
→<port> <database>
```

`salt.modules.mongodb.db_exists`(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Checks if a database exists in MongoDB

**name**

The name of the database to check for.

**user**

The user to connect to MongoDB as. Default is None.

**password**

The password to use to connect to MongoDB as. Default is None.

**host**

The host where MongoDB is running. Default is None.

**port**

The host where MongoDB is running. Default is None.

**authdb**

The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.db_exists <name> <user> <password> <host> <port>
```

`salt.modules.mongodb.db_list`(*user=None, password=None, host=None, port=None, authdb=None*)

List all MongoDB databases

**user**

The user to connect to MongoDB as. Default is None.

**password**

The password to use to connect to MongoDB as. Default is None.

**host**

The host where MongoDB is running. Default is None.

**port**

The host where MongoDB is running. Default is None.

**authdb**

The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.db_list <user> <password> <host> <port>
```

`salt.modules.mongodb.db_remove`(*name, user=None, password=None, host=None, port=None, authdb=None*)

Remove a MongoDB database

**name**

The name of the database to remove.

**user**

The user to connect to MongoDB as. Default is None.

**password**

The password to use to connect to MongoDB as. Default is None.

**host**

The host where MongoDB is running. Default is None.

**port**

The host where MongoDB is running. Default is None.

**authdb**

The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.db_remove <name> <user> <password> <host> <port>
```

`salt.modules.mongodb.find`(*collection, query=None, user=None, password=None, host=None, port=None, database='admin', authdb=None*)

Find an object or list of objects in a collection

**collection**

The collection to find the objects in.

**query**

The query to use when locating objects in the collection.

**user**

The user to connect to MongoDB as. Default is None.

**password**

The password to use to connect to MongoDB as. Default is None.

**host**

The host where MongoDB is running. Default is None.

**port**

The host where MongoDB is running. Default is None.

**authdb**

The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.find mycollection '["foo": "FOO", "bar": "BAR"]' <user>
↳ <password> <host> <port> <database>
```

`salt.modules.mongodb.insert`(*objects*, *collection*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Insert an object or list of objects into a collection

**objects**

The objects to insert into the collection, should be provided as a list.

**collection**

The collection to insert the objects into.

**user**

The user to connect to MongoDB as. Default is None.

**password**

The password to use to connect to MongoDB as. Default is None.

**host**

The host where MongoDB is running. Default is None.

**port**

The host where MongoDB is running. Default is None.

**authdb**

The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.insert '["foo": "FOO", "bar": "BAR"], {"foo": "BAZ",
↳ "bar": "BAM"}]' mycollection <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.remove`(*collection*, *query=None*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *w=1*, *authdb=None*)

Remove an object or list of objects from a collection

**collection**

The collection to remove objects from based on the query.

**query**

Query to determine which objects to remove.

**user**

The user to connect to MongoDB as. Default is None.

**password**

The password to use to connect to MongoDB as. Default is None.

- host**  
The host where MongoDB is running. Default is None.
- port**  
The host where MongoDB is running. Default is None.
- database**  
The database where the collection is.
- w**  
The number of matches to remove from the collection.
- authdb**  
The MongoDB database to use for authentication. Default is None.
- CLI Example:

```
salt '*' mongodb.remove mycollection '["foo": "FOO", "bar": "BAR"], {"foo": "BAZ", "bar": "BAM"}' <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.update_one` (*objects, collection, user=None, password=None, host=None, port=None, database='admin', authdb=None*)

Update an object into a collection [http://api.mongodb.com/python/current/api/pymongo/collection.html#pymongo.collection.Collection.update\\_one](http://api.mongodb.com/python/current/api/pymongo/collection.html#pymongo.collection.Collection.update_one)

New in version 2016.11.0.

- objects**  
The objects to update in the collection, should be provided as a list.
- collection**  
The collection to insert the objects into.
- user**  
The user to connect to MongoDB as. Default is None.
- password**  
The password to use to connect to MongoDB as. Default is None.
- host**  
The host where MongoDB is running. Default is None.
- port**  
The host where MongoDB is running. Default is None.
- authdb**  
The MongoDB database to use for authentication. Default is None.
- CLI Example:

```
salt '*' mongodb.update_one '{"_id": "my_minion"} {"bar": "BAR"}' ↵
↳mycollection <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.user_create` (*name, passwd, user=None, password=None, host=None, port=None, database='admin', authdb=None, roles=None*)

Create a MongoDB user

- name**  
The name of the user to create.
- passwd**  
The password for the user that is being created.
- user**  
The user to connect to MongoDB as. Default is None.
- password**  
The password to use to connect to MongoDB as. Default is None.
- host**  
The host where MongoDB is running. Default is None.
- port**

The host where MongoDB is running. Default is None.

**database**

The MongoDB database to use when checking if the user exists. Default is admin.

**authdb**

The MongoDB database to use for authentication. Default is None.

**roles**

The roles that should be associated with the user. Default is None.

CLI Example:

```
salt '*' mongodb.user_create <user_name> <user_password> <roles> <user>
↳<password> <host> <port> <database>
```

`salt.modules.mongodb.user_exists` (*name*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Checks if a user exists in MongoDB

**user**

The user to connect to MongoDB as. Default is None.

**password**

The password to use to connect to MongoDB as. Default is None.

**host**

The host where MongoDB is running. Default is None.

**port**

The host where MongoDB is running. Default is None.

**database**

The MongoDB database to use when checking if the user exists. Default is admin.

**authdb**

The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.user_exists <name> <user> <password> <host> <port>
↳<database>
```

`salt.modules.mongodb.user_find` (*name*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Get single user from MongoDB

**name**

The name of the user to find.

**user**

The user to connect to MongoDB as. Default is None.

**password**

The password to use to connect to MongoDB as. Default is None.

**host**

The host where MongoDB is running. Default is None.

**port**

The host where MongoDB is running. Default is None.

**database**

The MongoDB database to use when looking for the user. Default is admin.

**authdb**

The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.user_find <name> <user> <password> <host> <port>
↳<database> <authdb>
```

`salt.modules.mongodb.user_grant_roles` (*name, roles, database, user=None, password=None, host=None, port=None, authdb=None*)

Grant one or many roles to a MongoDB user

**name**

The user to grant the specified roles to.

**roles**

The roles to grant to the specified user.

**database**

The database to grant the roles against for the specified user.

**user**

The user to connect to MongoDB as. Default is None.

**password**

The password to use to connect to MongoDB as. Default is None.

**host**

The host where MongoDB is running. Default is None.

**port**

The host where MongoDB is running. Default is None.

**authdb**

The MongoDB database to use for authentication. Default is None.

CLI Examples:

```
salt '*' mongodb.user_grant_roles johndoe '["readWrite"]' dbname admin
→adminpwd localhost 27017
```

```
salt '*' mongodb.user_grant_roles janedoe '[{"role": "readWrite", "db":
→"dbname" }, {"role": "read", "db": "otherdb"}]' dbname admin adminpwd
→localhost 27017
```

`salt.modules.mongodb.user_list` (*user=None, password=None, host=None, port=None, database='admin', authdb=None*)

List users of a MongoDB database

**user**

The user to connect to MongoDB as. Default is None.

**password**

The password to use to connect to MongoDB as. Default is None.

**host**

The host where MongoDB is running. Default is None.

**port**

The host where MongoDB is running. Default is None.

**database**

The MongoDB database to use when listing users. Default is admin.

**authdb**

The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.user_list <user> <password> <host> <port> <database>
```

`salt.modules.mongodb.user_remove` (*name, user=None, password=None, host=None, port=None, database='admin', authdb=None*)

Remove a MongoDB user

**name**

The name of the user that should be removed.

**user**

The user to connect to MongoDB as. Default is None.

**password**

The password to use to connect to MongoDB as. Default is None.

**host**

The host where MongoDB is running. Default is None.

**port**

The host where MongoDB is running. Default is None.

**authdb**

The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.user_remove <name> <user> <password> <host> <port>
→<database>
```

`salt.modules.mongodb.user_revoke_roles` (*name, roles, database, user=None, password=None, host=None, port=None, authdb=None*)

Revoke one or many roles to a MongoDB user

**user**

The user to connect to MongoDB as. Default is None.

**roles**

The roles to revoke from the specified user.

**database**

The database to revoke the roles from for the specified user.

**password**

The password to use to connect to MongoDB as. Default is None.

**host**

The host where MongoDB is running. Default is None.

**port**

The host where MongoDB is running. Default is None.

**authdb**

The MongoDB database to use for authentication. Default is None.

CLI Examples:

```
salt '*' mongodb.user_revoke_roles johndoe '["readWrite"]' dbname admin
→adminpwd localhost 27017
```

```
salt '*' mongodb.user_revoke_roles janedoe '[{"role": "readWrite", "db":
→"dbname" }, {"role": "read", "db": "otherdb"}]' dbname admin adminpwd
→localhost 27017
```

`salt.modules.mongodb.user_roles_exists` (*name, roles, database, user=None, password=None, host=None, port=None, authdb=None*)

Checks if a user of a MongoDB database has specified roles

**name**

The name of the user to check for the specified roles.

**roles**

The roles to check are associated with the specified user.

**database**

The database to check has the specified roles for the specified user.

**user**

The user to connect to MongoDB as. Default is None.

**password**

The password to use to connect to MongoDB as. Default is None.

**host**

The host where MongoDB is running. Default is None.

**port**

The host where MongoDB is running. Default is None.

**authdb**

The MongoDB database to use for authentication. Default is None.

CLI Examples:

```
salt '*' mongodb.user_roles_exists johndoe '["readWrite"]' dbname admin
→adminpwd localhost 27017
```

```
salt '*' mongodb.user_roles_exists johndoe ' [{"role": "readWrite", "db":
→"dbname" }, {"role": "read", "db": "otherdb"}]' dbname admin adminpwd
→localhost 27017
```

`salt.modules.mongodb.version` (*user=None, password=None, host=None, port=None, database='admin', authdb=None*)

Get MongoDB instance version

**user**

The user to connect to MongoDB as. Default is None.

**password**

The password to use to connect to MongoDB as. Default is None.

**host**

The host where MongoDB is running. Default is None.

**port**

The host where MongoDB is running. Default is None.

**authdb**

The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.version <user> <password> <host> <port> <database>
```

### 26.6.265 salt.modules.monit

Monit service module. This module will create a monit type service watcher.

`salt.modules.monit.configtest`()

New in version 2016.3.0.

Test monit configuration syntax

CLI Example:

```
salt '*' monit.configtest
```

`salt.modules.monit.id_` (*reset=False*)

New in version 2016.3.0.

Return monit unique id.

**reset**

[False] Reset current id and generate a new id when it's True.

CLI Example:

```
salt '*' monit.id [reset=True]
```

`salt.modules.monit.monitor(name)`

monitor service via monit

CLI Example:

```
salt '*' monit.monitor <service name>
```

`salt.modules.monit.reload_()`

New in version 2016.3.0.

Reload monit configuration

CLI Example:

```
salt '*' monit.reload
```

`salt.modules.monit.restart(name)`

Restart service via monit

CLI Example:

```
salt '*' monit.restart <service name>
```

`salt.modules.monit.start(name)`

CLI Example:

```
salt '*' monit.start <service name>
```

`salt.modules.monit.status(svc_name="")`

Display a process status from monit

CLI Example:

```
salt '*' monit.status
salt '*' monit.status <service name>
```

`salt.modules.monit.stop(name)`

Stops service via monit

CLI Example:

```
salt '*' monit.stop <service name>
```

`salt.modules.monit.summary(svc_name="")`

Display a summary from monit

CLI Example:

```
salt '*' monit.summary
salt '*' monit.summary <service name>
```

`salt.modules.monit.unmonitor(name)`

Unmonitor service via monit

CLI Example:

```
salt '*' monit.unmonitor <service name>
```

**salt.modules.monit.validate()**

New in version 2016.3.0.

Check all services

CLI Example:

```
salt '*' monit.validate
```

**salt.modules.monit.version()**

New in version 2016.3.0.

Return version from monit -V

CLI Example:

```
salt '*' monit.version
```

### 26.6.266 salt.modules.moosefs

Module for gathering and managing information about MooseFS

**salt.modules.moosefs.dirinfo**(*path*, *opts=None*)

Return information on a directory located on the Moose

CLI Example:

```
salt '*' moosefs.dirinfo /path/to/dir/ [-[n] [h|H]]
```

**salt.modules.moosefs.fileinfo**(*path*)

Return information on a file located on the Moose

CLI Example:

```
salt '*' moosefs.fileinfo /path/to/dir/
```

**salt.modules.moosefs.getgoal**(*path*, *opts=None*)

Return goal(s) for a file or directory

CLI Example:

```
salt '*' moosefs.getgoal /path/to/file [-[n] [h|H]]
salt '*' moosefs.getgoal /path/to/dir/ [-[n] [h|H] [r]]
```

**salt.modules.moosefs.mounts**()

Return a list of current MooseFS mounts

CLI Example:

```
salt '*' moosefs.mounts
```

## 26.6.267 salt.modules.mount

Salt module to manage Unix mounts and the fstab file

`salt.modules.mount.active` (*extended=False*)

List the active mounts.

CLI Example:

```
salt '*' mount.active
```

`salt.modules.mount.automaster` (*config=/etc/auto\_salt'*)

List the contents of the auto master

CLI Example:

```
salt '*' mount.automaster
```

`salt.modules.mount.delete_mount_cache` (*real\_name*)

New in version 2018.3.0.

Provide information if the path is mounted

CLI Example:

```
salt '*' mount.delete_mount_cache /mnt/share
```

`salt.modules.mount.filesystems` (*config=/etc/filesystems'*)

New in version 2018.3.3.

List the contents of the filesystems

CLI Example:

```
salt '*' mount.filesystems
```

`salt.modules.mount.fstab` (*config=/etc/fstab'*)

Changed in version 2016.3.2.

List the contents of the fstab

CLI Example:

```
salt '*' mount.fstab
```

`salt.modules.mount.get_device_from_path` (*path*)

Return the underlying device for a specified path.

New in version 3006.0.

**path**

The path for the function to evaluate.

CLI Example:

```
salt '*' mount.get_device_from_path /
```

`salt.modules.mount.get_mount_from_path` (*path*)

Return the mount providing a specified path.

New in version 3006.0.

**path**

The path for the function to evaluate.

CLI Example:

```
salt '*' mount.get_mount_from_path /opt/some/nested/path
```

`salt.modules.mount.is_fuse_exec(cmd)`

Returns true if the command passed is a fuse mountable application.

CLI Example:

```
salt '*' mount.is_fuse_exec sshfs
```

`salt.modules.mount.is_mounted(name)`

New in version 2014.7.0.

Provide information if the path is mounted

CLI Example:

```
salt '*' mount.is_mounted /mnt/share
```

`salt.modules.mount.mount(name, device=False, mkmnt=False, fstype="", opts='defaults', user=None, util='mount')`

Mount a device

CLI Example:

```
salt '*' mount.mount /mnt/foo /dev/sdz1 True
```

`salt.modules.mount.read_mount_cache(name)`

New in version 2018.3.0.

Provide information if the path is mounted

CLI Example:

```
salt '*' mount.read_mount_cache /mnt/share
```

`salt.modules.mount.remount(name, device, mkmnt=False, fstype="", opts='defaults', user=None)`

Attempt to remount a device, if the device is not already mounted, mount is called

CLI Example:

```
salt '*' mount.remount /mnt/foo /dev/sdz1 True
```

`salt.modules.mount.rm_automaster(name, device, config='/etc/auto_salt')`

Remove the mount point from the auto\_master

CLI Example:

```
salt '*' mount.rm_automaster /mnt/foo /dev/sdg
```

`salt.modules.mount.rm_filesystems(name, device, config='/etc/filesystems')`

New in version 2018.3.3.

Remove the mount point from the filesystems

CLI Example:

```
salt '*' mount.rm_filesystems /mnt/foo /dev/sdg
```

`salt.modules.mount.rm_fstab`(*name, device, config='/etc/fstab'*)

Changed in version 2016.3.2.

Remove the mount point from the fstab

CLI Example:

```
salt '*' mount.rm_fstab /mnt/foo /dev/sdg
```

`salt.modules.mount.rm_vfstab`(*name, device, config='/etc/vfstab'*)

New in version 2016.3.2.

Remove the mount point from the vfstab

CLI Example:

```
salt '*' mount.rm_vfstab /mnt/foo /device/c0t0d0p0
```

`salt.modules.mount.set_automaster`(*name, device, fstype, opts='', config='/etc/auto\_salt', test=False, not\_change=False, \*\*kwargs*)

Verify that this mount is represented in the auto\_salt, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:

```
salt '*' mount.set_automaster /mnt/foo /dev/sdz1 ext4
```

`salt.modules.mount.set_filesystems`(*name, device, vfstype, opts='-', mount='true', config='/etc/filesystems', test=False, match\_on='auto', not\_change=False, \*\*kwargs*)

New in version 2018.3.3.

Verify that this mount is represented in the filesystems, change the mount to match the data passed, or add the mount if it is not present on AIX

If the entry is found via *match\_on* and *not\_change* is True, the current line will be preserved.

Provide information if the path is mounted

#### Parameters

- **name** -- The name of the mount point where the device is mounted.
- **device** -- The device that is being mounted.
- **vfstype** -- The file system that is used (AIX has two fstypes, fstype and vfstype - similar to Linux fstype)
- **opts** -- Additional options used when mounting the device.
- **mount** -- Mount if not mounted, default True.
- **config** -- Configuration file, default /etc/filesystems.
- **match** -- File systems type to match on, default auto

CLI Example:

```
salt '*' mount.set_filesystems /mnt/foo /dev/sdz1 jfs2
```

```

salt.modules.mount.set_fstab(name, device, fstype, opts='defaults', dump=0, pass_num=0,
                               config='/etc/fstab', test=False, match_on='auto', not_change=False,
                               **kwargs)

```

Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via *match\_on* and *not\_change* is True, the current line will be preserved.

CLI Example:

```

salt '*' mount.set_fstab /mnt/foo /dev/sdz1 ext4

```

```

salt.modules.mount.set_vfstab(name, device, fstype, opts='-', device_fsck='-', pass_fsck='-',
                                mount_at_boot='yes', config='/etc/vfstab', test=False, match_on='auto',
                                not_change=False, **kwargs)

```

New in version 2016.3.2.

Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via *match\_on* and *not\_change* is True, the current line will be preserved.

CLI Example:

```

salt '*' mount.set_vfstab /mnt/foo /device/c0t0d0p0 ufs

```

```

salt.modules.mount.swapoff(name)

```

Deactivate a named swap mount

Changed in version 2016.3.2.

CLI Example:

```

salt '*' mount.swapoff /root/swapfile

```

```

salt.modules.mount.swapon(name, priority=None)

```

Activate a swap disk

Changed in version 2016.3.2.

CLI Example:

```

salt '*' mount.swapon /root/swapfile

```

```

salt.modules.mount.swaps()

```

Return a dict containing information on active swap

Changed in version 2016.3.2.

CLI Example:

```

salt '*' mount.swaps

```

```

salt.modules.mount.umount(name, device=None, user=None, util='mount', lazy=False)

```

Attempt to unmount a device by specifying the directory it is mounted on

CLI Example:

```
salt '*' mount.umount /mnt/foo
```

New in version 2015.5.0.

```
salt '*' mount.umount /mnt/foo /dev/xvdc1
```

`salt.modules.mount.vfstab` (*config='/etc/vfstab'*)

New in version 2016.3.2.

List the contents of the vfstab

CLI Example:

```
salt '*' mount.vfstab
```

`salt.modules.mount.write_mount_cache` (*real\_name, device, mkmnt, fstype, mount\_opts*)

New in version 2018.3.0.

Provide information if the path is mounted

#### Parameters

- **real\_name** -- The real name of the mount point where the device is mounted.
- **device** -- The device that is being mounted.
- **mkmnt** -- Whether or not the mount point should be created.
- **fstype** -- The file system that is used.
- **mount\_opts** -- Additional options used when mounting the device.

#### Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '*' mount.write_mount_cache /mnt/share /dev/sda1 False ext4 defaults,  
↪nosuid
```

## 26.6.268 salt.modules.mssql

Module to provide MS SQL Server compatibility to salt.

#### depends

- FreeTDS
- pymssql Python module

#### configuration

In order to connect to MS SQL Server, certain configuration is required in minion configs/pillars on the relevant minions. Some sample pillars might look like:

```
mssql.server: 'localhost'  
mssql.port: 1433  
mssql.user: 'sysdba'  
mssql.password: 'Some preferable complex password'  
mssql.database: ''
```

The default for the port is '1433' and for the database is '' (empty string); in most cases they can be left at the default setting. Options that are directly passed into functions will overwrite options from configs or pillars.

`salt.modules.mssql.db_create(database, containment='NONE', new_database_options=None, **kwargs)`

Creates a new database. Does not update options of existing databases. `new_database_options` can only be a list of strings

CLI Example:

```
salt minion mssql.db_create DB_NAME
```

`salt.modules.mssql.db_exists(database_name, **kwargs)`

Find if a specific database exists on the MS SQL server.

CLI Example:

```
salt minion mssql.db_exists database_name='DBNAME'
```

`salt.modules.mssql.db_list(**kwargs)`

Return the database list created on a MS SQL server.

CLI Example:

```
salt minion mssql.db_list
```

`salt.modules.mssql.db_remove(database_name, **kwargs)`

Drops a specific database from the MS SQL server. It will not drop any of 'master', 'model', 'msdb' or 'tempdb'.

CLI Example:

```
salt minion mssql.db_remove database_name='DBNAME'
```

`salt.modules.mssql.login_create(login, new_login_password=None, new_login_domain="", new_login_roles=None, new_login_options=None, **kwargs)`

Creates a new login. Does not update password of existing logins. For Windows authentication, provide `new_login_domain`. For SQL Server authentication, provide `new_login_password`. Since hashed passwords are *varbinary* values, if the `new_login_password` is 'int / long', it will be considered to be HASHED.

**new\_login\_roles**

a list of SERVER roles

**new\_login\_options**

a list of strings

CLI Example:

```
salt minion mssql.login_create LOGIN_NAME database=DBNAME [new_login_
↳password=PASSWORD]
```

`salt.modules.mssql.login_exists(login, domain="", **kwargs)`

Find if a login exists in the MS SQL server. `domain`, if provided, will be prepended to login

CLI Example:

```
salt minion mssql.login_exists 'LOGIN'
```

`salt.modules.mssql.login_remove(login, **kwargs)`

Removes an login.

CLI Example:

```
salt minion mssql.login_remove LOGINNAME
```

`salt.modules.mssql.role_create(role, owner=None, grants=None, **kwargs)`

Creates a new database role. If no owner is specified, the role will be owned by the user that executes CREATE ROLE, which is the user argument or mssql.user option. grants is list of strings.

CLI Example:

```
salt minion mssql.role_create role=product01 owner=sysdba grants='["SELECT  
→", "INSERT", "UPDATE", "DELETE", "EXECUTE"]'
```

`salt.modules.mssql.role_exists(role, **kwargs)`

Checks if a role exists.

CLI Example:

```
salt minion mssql.role_exists db_owner
```

`salt.modules.mssql.role_list(**kwargs)`

Lists database roles.

CLI Example:

```
salt minion mssql.role_list
```

`salt.modules.mssql.role_remove(role, **kwargs)`

Remove a database role.

CLI Example:

```
salt minion mssql.role_create role=test_role01
```

`salt.modules.mssql.tsql_query(query, **kwargs)`

Run a SQL query and return query result as list of tuples, or a list of dictionaries if as\_dict was passed, or an empty list if no data is available.

CLI Example:

```
salt minion mssql.tsql_query 'SELECT @@version as version' as_dict=True
```

`salt.modules.mssql.user_create(username, login=None, domain="", database=None, roles=None, options=None, **kwargs)`

Creates a new user. If login is not specified, the user will be created without a login. domain, if provided, will be prepended to username. options can only be a list of strings

CLI Example:

```
salt minion mssql.user_create USERNAME database=DBNAME
```

`salt.modules.mssql.user_exists`(*username*, *domain=""*, *database=None*, *\*\*kwargs*)

Find if an user exists in a specific database on the MS SQL server. *domain*, if provided, will be prepended to *username*

CLI Example:

```
salt minion mssql.user_exists 'USERNAME' [database='DBNAME']
```

`salt.modules.mssql.user_list`(*\*\*kwargs*)

Get the user list for a specific database on the MS SQL server.

CLI Example:

```
salt minion mssql.user_list [database='DBNAME']
```

`salt.modules.mssql.user_remove`(*username*, *\*\*kwargs*)

Removes an user.

CLI Example:

```
salt minion mssql.user_remove USERNAME database=DBNAME
```

`salt.modules.mssql.version`(*\*\*kwargs*)

Return the version of a MS SQL server.

CLI Example:

```
salt minion mssql.version
```

### 26.6.269 salt.modules.msteams

Module for sending messages to MS Teams

New in version 2017.7.0.

#### configuration

This module can be used by either passing a `hook_url` directly or by specifying it in a configuration profile in the salt master/minion config. For example:

```
msteams:
hook_url: https://outlook.office.com/webhook/837
```

`salt.modules.msteams.post_card`(*message*, *hook\_url=None*, *title=None*, *theme\_color=None*)

Send a message to an MS Teams channel. `:param message:` The message to send to the MS Teams channel. `:param hook_url:` The Teams webhook URL, if not specified in the configuration. `:param title:` Optional title for the posted card `:param theme_color:` Optional hex color highlight for the posted card `:return:` Boolean if message was sent successfully.

CLI Example:

```
salt '*' msteams.post_card message="Build is done"
```

### 26.6.270 salt.modules.munin

Run munin plugins/checks from salt and format the output as data.

`salt.modules.munin.list_plugins()`

List all the munin plugins

CLI Example:

```
salt '*' munin.list_plugins
```

`salt.modules.munin.run(plugins)`

Run one or more named munin plugins

CLI Example:

```
salt '*' munin.run uptime
salt '*' munin.run uptime,cpu,load,memory
```

`salt.modules.munin.run_all()`

Run all the munin plugins

CLI Example:

```
salt '*' munin.run_all
```

### 26.6.271 salt.modules.mysql

Module to provide MySQL compatibility to salt.

**depends**

- Python module: MySQLdb, mysqlclient, or PyMySQL

**configuration**

In order to connect to MySQL, certain configuration is required in either the relevant minion config (`/etc/salt/minion`), or pillar.

Some sample configs might look like:

```
mysql.host: 'localhost'
mysql.port: 3306
mysql.user: 'root'
mysql.pass: ''
mysql.db: 'mysql'
mysql.unix_socket: '/tmp/mysql.sock'
mysql.charset: 'utf8'
```

You can also use a defaults file:

```
mysql.default_file: '/etc/mysql/debian.cnf'
```

Changed in version 2014.1.0: 'charset' connection argument added. This is a MySQL charset, not a python one.

Changed in version 0.16.2: Connection arguments from the minion config file can be overridden on the CLI by using the arguments defined [here](#). Additionally, it is now possible to setup a user with no password.

`salt.modules.mysql.alter_db`(*name*, *character\_set=None*, *collate=None*, *\*\*connection\_args*)

Modify database using ALTER DATABASE %(dbname)s CHARACTER SET %(charset)s COLLATE %(collation)s; query.

CLI Example:

```
salt '*' mysql.alter_db testdb charset='latin1'
```

`salt.modules.mysql.db_check`(*name*, *table=None*, *\*\*connection\_args*)

Repairs the full database or just a given table

CLI Example:

```
salt '*' mysql.db_check dbname
salt '*' mysql.db_check dbname dbtable
```

`salt.modules.mysql.db_create`(*name*, *character\_set=None*, *collate=None*, *\*\*connection\_args*)

Adds a databases to the MySQL server.

**name**

The name of the database to manage

**character\_set**

The character set, if left empty the MySQL default will be used

**collate**

The collation, if left empty the MySQL default will be used

CLI Example:

```
salt '*' mysql.db_create 'dbname'
salt '*' mysql.db_create 'dbname' 'utf8' 'utf8_general_ci'
```

`salt.modules.mysql.db_exists`(*name*, *\*\*connection\_args*)

Checks if a database exists on the MySQL server.

CLI Example:

```
salt '*' mysql.db_exists 'dbname'
```

`salt.modules.mysql.db_get`(*name*, *\*\*connection\_args*)

Return a list of databases of a MySQL server using the output from the SELECT DEFAULT\_CHARACTER\_SET\_NAME, DEFAULT\_COLLATION\_NAME FROM INFORMATION\_SCHEMA.SCHEMATA WHERE SCHEMA\_NAME='dbname'; query.

CLI Example:

```
salt '*' mysql.db_get test
```

`salt.modules.mysql.db_list`(*\*\*connection\_args*)

Return a list of databases of a MySQL server using the output from the SHOW DATABASES query.

CLI Example:

```
salt '*' mysql.db_list
```

`salt.modules.mysql.db_optimize`(*name*, *table=None*, *\*\*connection\_args*)

Optimizes the full database or just a given table

CLI Example:

```
salt '*' mysql.db_optimize dbname
```

`salt.modules.mysql.db_remove`(*name*, *\*\*connection\_args*)

Removes a databases from the MySQL server.

CLI Example:

```
salt '*' mysql.db_remove 'dbname'
```

`salt.modules.mysql.db_repair`(*name*, *table=None*, *\*\*connection\_args*)

Repairs the full database or just a given table

CLI Example:

```
salt '*' mysql.db_repair dbname
```

`salt.modules.mysql.db_tables`(*name*, *\*\*connection\_args*)

Shows the tables in the given MySQL database (if exists)

CLI Example:

```
salt '*' mysql.db_tables 'database'
```

`salt.modules.mysql.file_query`(*database*, *file\_name*, *\*\*connection\_args*)

Run an arbitrary SQL query from the specified file and return the the number of affected rows.

New in version 2017.7.0.

*database*

database to run script inside

*file\_name*

File name of the script. This can be on the minion, or a file that is reachable by the fileserver

CLI Example:

```
salt '*' mysql.file_query mydb file_name=/tmp/sqlfile.sql
salt '*' mysql.file_query mydb file_name=salt://sqlfile.sql
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

`salt.modules.mysql.free_slave`(*\*\*connection\_args*)

Frees a slave from its master. This is a WIP, do not use.

CLI Example:

```
salt '*' mysql.free_slave
```

`salt.modules.mysql.get_master_status`(*\*\*connection\_args*)

Retrieves the master status from the minion.

Returns:

```
{'host.domain.com': {'Binlog_Do_DB': '',
                     'Binlog_Ignore_DB': '',
                     'File': 'mysql-bin.000021',
                     'Position': 107}}
```

CLI Example:

```
salt '*' mysql.get_master_status
```

`salt.modules.mysql.get_slave_status(**connection_args)`

Retrieves the slave status from the minion.

Returns:

```
{'host.domain.com': {'Connect_Retry': 60,
                    'Exec_Master_Log_Pos': 107,
                    'Last_Errno': 0,
                    'Last_Error': '',
                    'Last_IO_Errno': 0,
                    'Last_IO_Error': '',
                    'Last_SQL_Errno': 0,
                    'Last_SQL_Error': '',
                    'Master_Host': 'comet.scion-eng.com',
                    'Master_Log_File': 'mysql-bin.000021',
                    'Master_Port': 3306,
                    'Master_SSL_Allowed': 'No',
                    'Master_SSL_CA_File': '',
                    'Master_SSL_CA_Path': '',
                    'Master_SSL_Cert': '',
                    'Master_SSL_Cipher': '',
                    'Master_SSL_Key': '',
                    'Master_SSL_Verify_Server_Cert': 'No',
                    'Master_Server_Id': 1,
                    'Master_User': 'replu',
                    'Read_Master_Log_Pos': 107,
                    'Relay_Log_File': 'klo-relay-bin.000071',
                    'Relay_Log_Pos': 253,
                    'Relay_Log_Space': 553,
                    'Relay_Master_Log_File': 'mysql-bin.000021',
                    'Replicate_Do_DB': '',
                    'Replicate_Do_Table': '',
                    'Replicate_Ignore_DB': '',
                    'Replicate_Ignore_Server_Ids': '',
                    'Replicate_Ignore_Table': '',
                    'Replicate_Wild_Do_Table': '',
                    'Replicate_Wild_Ignore_Table': '',
                    'Seconds_Behind_Master': 0,
                    'Skip_Counter': 0,
                    'Slave_IO_Running': 'Yes',
                    'Slave_IO_State': 'Waiting for master to send event',
                    'Slave_SQL_Running': 'Yes',
                    'Until_Condition': 'None',
                    'Until_Log_File': '',
                    'Until_Log_Pos': 0}}
```

CLI Example:

```
salt '*' mysql.get_slave_status
```

`salt.modules.mysql.grant_add(grant, database, user, host='localhost', grant_option=False, escape=True, ssl_option=False, **connection_args)`

Adds a grant to the MySQL server.

For database, make sure you specify database.table or database.\*

CLI Example:

```
salt '*' mysql.grant_add 'SELECT,INSERT,UPDATE,...' 'database.*'  
→ '*' 'frank' 'localhost'
```

`salt.modules.mysql.grant_exists`(*grant, database, user, host='localhost', grant\_option=False, escape=True, \*\*connection\_args*)

Checks to see if a grant exists in the database

CLI Example:

```
salt '*' mysql.grant_exists 'SELECT,INSERT,UPDATE,...'  
→ 'database.*' 'frank' 'localhost'
```

`salt.modules.mysql.grant_revoke`(*grant, database, user, host='localhost', grant\_option=False, escape=True, \*\*connection\_args*)

Removes a grant from the MySQL server.

CLI Example:

```
salt '*' mysql.grant_revoke 'SELECT,INSERT,UPDATE' 'database.*'  
→ 'frank' 'localhost'
```

`salt.modules.mysql.plugin_add`(*name, soname=None, \*\*connection\_args*)

Add a plugin.

CLI Example:

```
salt '*' mysql.plugin_add auth_socket
```

`salt.modules.mysql.plugin_remove`(*name, \*\*connection\_args*)

Remove a plugin.

CLI Example:

```
salt '*' mysql.plugin_remove auth_socket
```

`salt.modules.mysql.plugin_status`(*name, \*\*connection\_args*)

Return the status of a plugin.

CLI Example:

```
salt '*' mysql.plugin_status auth_socket
```

`salt.modules.mysql.plugins_list`(*\*\*connection\_args*)

Return a list of plugins and their status from the SHOW PLUGINS query.

CLI Example:

```
salt '*' mysql.plugins_list
```

`salt.modules.mysql.processlist(**connection_args)`

Retrieves the processlist from the MySQL server via "SHOW FULL PROCESSLIST".

Returns: a list of dicts, with each dict representing a process:

```
{'Command': 'Query',
 'Host': 'localhost',
 'Id': 39,
 'Info': 'SHOW FULL PROCESSLIST',
 'Rows_examined': 0,
 'Rows_read': 1,
 'Rows_sent': 0,
 'State': None,
 'Time': 0,
 'User': 'root',
 'db': 'mysql'}
```

CLI Example:

```
salt '*' mysql.processlist
```

`salt.modules.mysql.query(database, query, **connection_args)`

Run an arbitrary SQL query and return the results or the number of affected rows.

CLI Example:

```
salt '*' mysql.query mydb "UPDATE mytable set myfield=1 limit 1"
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

CLI Example:

```
salt '*' mysql.query mydb "SELECT id,name,cash from users limit 3"
```

Return data:

```
{'columns': ('id', 'name', 'cash'),
 'query time': {'human': '1.0ms', 'raw': '0.001'},
 'results': ((1L, 'User 1', Decimal('110.000000')),
             (2L, 'User 2', Decimal('215.636756')),
             (3L, 'User 3', Decimal('0.040000'))),
 'rows returned': 3L}
```

CLI Example:

```
salt '*' mysql.query mydb 'INSERT into users values (null,"user 4", 5)'
```

Return data:

```
{'query time': {'human': '25.6ms', 'raw': '0.02563'}, 'rows affected': 1L}
```

CLI Example:

```
salt '*' mysql.query mydb 'DELETE from users where id = 4 limit 1'
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

Jinja Example: Run a query on mydb and use row 0, column 0's data.

```
{{ salt['mysql.query']('mydb', 'SELECT info from mytable limit 1')[
  → 'results'][0][0] }}
```

`salt.modules.mysql.quote_identifier` (*identifier*, *for\_grants=False*)

Return an identifier name (column, table, database, etc) escaped for MySQL

This means surrounded by "" character and escaping this character inside. It also means doubling the '%' character for MySQLdb internal usage.

#### Parameters

- **identifier** -- the table, column or database identifier
- **for\_grants** -- is False by default, when using database names on grant queries you should set it to True to also escape "\_" and "%" characters as requested by MySQL. Note that these characters should only be escaped when requesting grants on the database level (*my\_%db.\**) but not for table level grants (*my\_%db.`foo`*)

CLI Example:

```
salt '*' mysql.quote_identifier 'foo`bar'
```

`salt.modules.mysql.showglobal` (\*\**connection\_args*)

Retrieves the show global variables from the minion.

**Returns::**

show global variables full dict

CLI Example:

```
salt '*' mysql.showglobal
```

`salt.modules.mysql.showvariables` (\*\**connection\_args*)

Retrieves the show variables from the minion.

**Returns::**

show variables full dict

CLI Example:

```
salt '*' mysql.showvariables
```

`salt.modules.mysql.slave_lag` (\*\**connection\_args*)

Return the number of seconds that a slave SQL server is lagging behind the master, if the host is not a slave it will return -1. If the server is configured to be a slave for replication but slave IO is not running then -2 will be returned. If there was an error connecting to the database or checking the slave status, -3 will be returned.

CLI Example:

```
salt '*' mysql.slave_lag
```

`salt.modules.mysql.status` (\*\**connection\_args*)

Return the status of a MySQL server using the output from the SHOW STATUS query.

CLI Example:

```
salt '*' mysql.status
```

`salt.modules.mysql.tokenize_grant`(*grant*)

External wrapper function :param grant: :return: dict

CLI Example:

```
salt '*' mysql.tokenize_grant "GRANT SELECT, INSERT ON testdb.
→* TO 'testuser'@'localhost'"
```

`salt.modules.mysql.user_chpass`(*user*, *host*='localhost', *password*=None, *password\_hash*=None, *allow\_passwordless*=False, *unix\_socket*=None, *password\_column*=None, *\*\*connection\_args*)

Change password for a MySQL user

**host**

Host for which this user/password combo applies

**password**

The password to set for the new user. Will take precedence over the `password_hash` option if both are specified.

**password\_hash**

The password in hashed form. Be sure to quote the password because YAML doesn't like the \*. A password hash can be obtained from the mysql command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-----+
| PASSWORD('mypass') |
+-----+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-----+
1 row in set (0.00 sec)
```

**allow\_passwordless**

If True, then `password` and `password_hash` can be omitted (or set to None) to permit a passwordless login.

New in version 0.16.2: The `allow_passwordless` option was added.

CLI Examples:

```
salt '*' mysql.user_chpass frank localhost newpassword
salt '*' mysql.user_chpass frank localhost password_hash='hash'
salt '*' mysql.user_chpass frank localhost allow_passwordless=True
```

`salt.modules.mysql.user_create`(*user*, *host*='localhost', *password*=None, *password\_hash*=None, *allow\_passwordless*=False, *unix\_socket*=False, *password\_column*=None, *auth\_plugin*='mysql\_native\_password', *\*\*connection\_args*)

Creates a MySQL user

**host**

Host for which this user/password combo applies

**password**

The password to use for the new user. Will take precedence over the `password_hash` option if both are specified.

**password\_hash**

The password in hashed form. Be sure to quote the password because YAML doesn't like the \*. A password hash can be obtained from the mysql command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-----+
| PASSWORD('mypass') |
+-----+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-----+
1 row in set (0.00 sec)
```

**allow\_passwordless**

If True, then password and password\_hash can be omitted (or set to None) to permit a passwordless login.

**unix\_socket**

If True and allow\_passwordless is True then will be used unix\_socket auth plugin.

**password\_column**

The password column to use in the user table.

**auth\_plugin**

The authentication plugin to use, default is to use the mysql\_native\_password plugin.

New in version 0.16.2: The allow\_passwordless option was added.

CLI Examples:

```
salt '*' mysql.user_create 'username' 'hostname' 'password'
salt '*' mysql.user_create 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_create 'username' 'hostname' allow_passwordless=True
```

```
salt.modules.mysql.user_exists(user, host='localhost', password=None, password_hash=None,
                               passwordless=False, unix_socket=False, password_column=None,
                               **connection_args)
```

Checks if a user exists on the MySQL server. A login can be checked to see if passwordless login is permitted by omitting password and password\_hash, and using passwordless=True.

New in version 0.16.2: The passwordless option was added.

CLI Example:

```
salt '*' mysql.user_exists 'username' 'hostname' 'password'
salt '*' mysql.user_exists 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_exists 'username' passwordless=True
salt '*' mysql.user_exists 'username' password_column='authentication_
→string'
```

```
salt.modules.mysql.user_grants(user, host='localhost', **connection_args)
```

Shows the grants for the given MySQL user (if it exists)

CLI Example:

```
salt '*' mysql.user_grants 'frank' 'localhost'
```

```
salt.modules.mysql.user_info(user, host='localhost', **connection_args)
```

Get full info on a MySQL user

CLI Example:

```
salt '*' mysql.user_info root localhost
```

`salt.modules.mysql.user_list(**connection_args)`

Return a list of users on a MySQL server

CLI Example:

```
salt '*' mysql.user_list
```

`salt.modules.mysql.user_remove(user, host='localhost', **connection_args)`

Delete MySQL user

CLI Example:

```
salt '*' mysql.user_remove frank localhost
```

`salt.modules.mysql.verify_login(user, password=None, **connection_args)`

Attempt to login using the provided credentials. If successful, return true. Otherwise, return False.

CLI Example:

```
salt '*' mysql.verify_login root password
```

`salt.modules.mysql.version(**connection_args)`

Return the version of a MySQL server using the output from the `SELECT VERSION()` query.

CLI Example:

```
salt '*' mysql.version
```

### 26.6.272 salt.modules.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

#### depends

PyNaCl, <https://github.com/pyca/pynacl>

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don't advise making your pillars public regardless if they are encrypted or not.

When generating keys and encrypting passwords use `--local` when using `salt-call` for extra security. Also consider using just the salt runner `nacl` when encrypting pillar passwords.

#### configuration

The following configuration defaults can be define (pillar or config files) Avoid storing private keys in pillars! Ensure master does not have `pillar_opts=True`:

```
# cat /etc/salt/master.d/nacl.conf
nacl.config:
  # NOTE: `key` and `key_file` have been renamed to `sk`, `sk_
  ↪file`
  # also `box_type` default changed from secretbox to
  ↪sealedbox.
  box_type: sealedbox                (default)
  sk_file: /etc/salt/pki/master/nacl  (default)
  pk_file: /etc/salt/pki/master/nacl.pub (default)
  sk: None
  pk: None
```

Usage can override the config defaults:

```
salt-call nacl.enc sk_file=/etc/salt/pki/master/nacl pk_file=/
↳etc/salt/pki/master/nacl.pub
```

The nacl lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your *sk\_file* and *pk\_file* use:

```
salt-call --local nacl.keygen sk_file=/etc/salt/pki/master/nacl
# or if you want to work without files.
salt-call --local nacl.keygen
local:
-----
pk:
  /kFGX7PbWeu099702PBbKWLpG/9p06IQRswkdWHCDk0=
sk:
  SVWut5SqNpuPeNzb1b9y6b2eXg2PLIog43GBzp48Sow=
```

Now with your keypair, you can encrypt data:

You have two option, *sealedbox* or *secretbox*.

SecretBox is data encrypted using private key *pk*. Sealedbox is encrypted using public key *pk*.

Recommend using Sealedbox because the one way encryption permits developers to encrypt data for source control but not decrypt. Sealedbox only has one key that is for both encryption and decryption.

```
salt-call --local nacl.enc asecretpass pk=/kFGX7PbWeu099702PBbKWLpG/
↳9p06IQRswkdWHCDk0=
tqXzeIJnTAM9Xf0mdLcpEdklMbfBGPj2oTKmlgrm3S1DTVVHnNh9h8mU1GKllGq/
↳+cYsk6m5WhGdk58=
```

To decrypt the data:

```
salt-call --local nacl.dec data=
↳'tqXzeIJnTAM9Xf0mdLcpEdklMbfBGPj2oTKmlgrm3S1DTVVHnNh9h8mU1GKllGq/
↳+cYsk6m5WhGdk58=' sk='SVWut5SqNpuPeNzb1b9y6b2eXg2PLIog43GBzp48Sow='
```

When the keys are defined in the master config you can use them from the nacl runner without extra parameters:

```
# cat /etc/salt/master.d/nacl.conf
nacl.config:
  sk_file: /etc/salt/pki/master/nacl
  pk: 'cTIqXwnUiD1ulg4kXsbeCE7/NoeKEzd4nLeYcCFpd9k='
```

```
salt-run nacl.enc 'asecretpass'
salt-run nacl.dec data=
↳'tqXzeIJnTAM9Xf0mdLcpEdklMbfBGPj2oTKmlgrm3S1DTVVHnNh9h8mU1GKllGq/
↳+cYsk6m5WhGdk58='
```

```
# a salt developers minion could have pillar data that includes a nacl public key
↳key
nacl.config:
  pk: '/kFGX7PbWeu099702PBbKWLpG/9p06IQRswkdWHCDk0='
```

The developer can then use a less-secure system to encrypt data.

```
salt-call --local nacl.enc apassword
```

Pillar files can include protected data that the salt master decrypts:

```
pillarexample:
  user: root
  password1: {{salt.nacl.dec('DRB7Q6/X5gSRCTpZyxS6h1bWj01lUA+uaVylvou3vJ4=
→')|json}}
  cert_key: {{salt.nacl.dec_file('/srv/salt/certs/example.com/key.nacl
→')|json}}
  cert_key2: {{salt.nacl.dec_file('salt:///certs/example.com/key.nacl
→')|json}}
```

Larger files like certificates can be encrypted with:

```
salt-call nacl.enc_file /tmp/cert.crt out=/tmp/cert.nacl
# or more advanced
cert=$(cat /tmp/cert.crt)
salt-call --out=newline_values_only nacl.enc_pub data="$cert" > /tmp/cert.nacl
```

In pillars rendered with jinja be sure to include `|json` so line breaks are encoded:

```
cert: "{{salt.nacl.dec('S2uogToXkgENz9...085KYt')|json}}"
```

In states rendered with jinja it is also good practice to include `|json`:

```
{{sls}} private key:
  file.managed:
    - name: /etc/ssl/private/cert.key
    - mode: 700
    - contents: "{{pillar['pillarexample']['cert_key']|json}}"
```

Optional small program to encrypt data without needing salt modules.

```
#!/bin/python3
import sys, base64, nacl.public
pk = base64.b64decode('YOURPUBKEY')
b = nacl.public.SealedBox(pk)
data = sys.stdin.buffer.read()
print(base64.b64encode(b.encrypt(data)).decode())
```

```
echo 'apassword' | nacl_enc.py
```

```
salt.modules.nacl.dec(data, **kwargs)
```

Alias to `{box_type}_decrypt`

`box_type`: secretbox, sealedbox(default)

```
salt.modules.nacl.dec_file(name, out=None, **kwargs)
```

This is a helper function to decrypt a file and return its contents.

You can provide an optional output file using `out`

`name` can be a local file or when not using `salt-run` can be a url like `salt://`, `https://` etc.

CLI Examples:

```

salt-run nacl.dec_file name=/tmp/id_rsa.nacl
salt-call nacl.dec_file name=salt://crt/mycert.nacl out=/tmp/id_rsa
salt-run nacl.dec_file name=/tmp/id_rsa.nacl box_type=secretbox
→ sk_file=/etc/salt/pki/master/nacl.pub

```

`salt.modules.nacl.enc`(*data*, *\*\*kwargs*)

Alias to `{box_type}_encrypt`

`box_type`: secretbox, sealedbox(default)

`salt.modules.nacl.enc_file`(*name*, *out=None*, *\*\*kwargs*)

This is a helper function to encrypt a file and return its contents.

You can provide an optional output file using *out*

*name* can be a local file or when not using `salt-run` can be a url like `salt://`, `https://` etc.

CLI Examples:

```

salt-run nacl.enc_file name=/tmp/id_rsa
salt-call nacl.enc_file name=salt://crt/mycert out=/tmp/cert
salt-run nacl.enc_file name=/tmp/id_rsa box_type=secretbox
→ file=/etc/salt/pki/master/nacl.pub

```

`salt.modules.nacl.keygen`(*sk\_file=None*, *pk\_file=None*, *\*\*kwargs*)

Use PyNaCl to generate a keypair.

If no *sk\_file* is defined return a keypair.

If only the *sk\_file* is defined *pk\_file* will use the same name with a postfix `.pub`.

When the *sk\_file* is already existing, but *pk\_file* is not. The *pk\_file* will be generated using the *sk\_file*.

CLI Examples:

```

salt-call nacl.keygen
salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl
salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/
→ pki/master/nacl.pub
salt-call --local nacl.keygen

```

`salt.modules.nacl.sealedbox_decrypt`(*data*, *\*\*kwargs*)

Decrypt data using a secret key that was encrypted using a public key with `nacl.sealedbox_encrypt`.

CLI Examples:

```

salt-call nacl.sealedbox_decrypt pEXHQm6cuaF7A=
salt-call --local nacl.sealedbox_decrypt data='pEXHQm6cuaF7A=' sk_file=/
→ etc/salt/pki/master/nacl
salt-call --local nacl.sealedbox_decrypt data='pEXHQm6cuaF7A=' sk=
→ 'YmFkcGFzcwo='

```

`salt.modules.nacl.sealedbox_encrypt`(*data*, *\*\*kwargs*)

Encrypt data using a public key generated from `nacl.keygen`. The encrypted data can be decrypted using `nacl.sealedbox_decrypt` only with the secret key.

CLI Examples:

```

salt-run nacl.sealedbox_encrypt datatoenc
salt-call --local nacl.sealedbox_encrypt datatoenc pk_file=/etc/salt/pki/
→master/nacl.pub
salt-call --local nacl.sealedbox_encrypt datatoenc pk=
→'vrwQF7cNiNAVQVAiS3bvcbJUnF0cN6fU9YTZD9mBfzQ='

```

`salt.modules.nacl.secretbox_decrypt`(*data*, *\*\*kwargs*)

Decrypt data that was encrypted using `nacl.secretbox_encrypt` using the secret key that was generated from `nacl.keygen`.

CLI Examples:

```

salt-call nacl.secretbox_decrypt pEXHQM6cuaF7A=
salt-call --local nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/
→etc/salt/pki/master/nacl
salt-call --local nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk=
→'YmFkcGFzcwo='

```

`salt.modules.nacl.secretbox_encrypt`(*data*, *\*\*kwargs*)

Encrypt data using a secret key generated from `nacl.keygen`. The same secret key can be used to decrypt the data using `nacl.secretbox_decrypt`.

CLI Examples:

```

salt-run nacl.secretbox_encrypt datatoenc
salt-call --local nacl.secretbox_encrypt datatoenc sk_file=/etc/salt/pki/
→master/nacl
salt-call --local nacl.secretbox_encrypt datatoenc sk='YmFkcGFzcwo='

```

### 26.6.273 salt.modules.nagios

Run nagios plugins/checks from salt and get the return as data.

`salt.modules.nagios.list_plugins`()

List all the nagios plugins

CLI Example:

```

salt '*' nagios.list_plugins

```

`salt.modules.nagios.retcode`(*plugin*, *args=""*, *key\_name=None*)

Run one nagios plugin and return retcode of the execution

`salt.modules.nagios.retcode_pillar`(*pillar\_name*)

Run one or more nagios plugins from pillar data and get the result of `cmd.retcode` The pillar have to be in this format:

```

-----
webserver:
  Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
  Load:

```

(continues on next page)

(continued from previous page)

```

    - check_load: -w 0.8 -c 1
  APT:
    - check_apt
  -----

```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You must to group different checks(one o more) and always it will return the highest value of all the checks

CLI Example:

```
salt '*' nagios.retcode webserver
```

`salt.modules.nagios.run(plugin, args=")`

Run nagios plugin and return all the data execution with cmd.run

CLI Example:

```
salt '*' nagios.run check_apt
salt '*' nagios.run check_icmp '8.8.8.8'
```

`salt.modules.nagios.run_all(plugin, args=")`

Run nagios plugin and return all the data execution with cmd.run\_all

`salt.modules.nagios.run_all_pillar(pillar_name)`

Run one or more nagios plugins from pillar data and get the result of cmd.run\_all The pillar have to be in this format:

```

  -----
webserver:
  Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
  Load:
    - check_load: -w 0.8 -c 1
  APT:
    - check_apt
  -----

```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```
salt '*' nagios.run webserver
```

`salt.modules.nagios.run_pillar(pillar_name)`

Run one or more nagios plugins from pillar data and get the result of cmd.run The pillar have to be in this format:

```

  -----
webserver:

```

(continues on next page)

(continued from previous page)

```

Ping_google:
  - check_icmp: 8.8.8.8
  - check_icmp: google.com
Load:
  - check_load: -w 0.8 -c 1
APT:
  - check_apt
-----

```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```
salt '*' nagios.run webserver
```

### 26.6.274 salt.modules.nagios\_rpc

Check Host & Service status from Nagios via JSON RPC.

New in version 2015.8.0.

`salt.modules.nagios_rpc.host_status` (*hostname=None, \*\*kwargs*)

Check status of a particular host By default statuses are returned in a numeric format.

Parameters:

**hostname**

The hostname to check the status of the service in Nagios.

**numeric**

Turn to false in order to return status in text format ('OK' instead of 0, 'Warning' instead of 1 etc)

**Returns**

status: 'OK', 'Warning', 'Critical' or 'Unknown'

CLI Example:

```

salt '*' nagios_rpc.host_status hostname=webserver.domain.com
salt '*' nagios_rpc.host_status hostname=webserver.domain.com
→numeric=False

```

`salt.modules.nagios_rpc.service_status` (*hostname=None, service=None, \*\*kwargs*)

Check status of a particular service on a host on it in Nagios. By default statuses are returned in a numeric format.

Parameters:

**hostname**

The hostname to check the status of the service in Nagios.

**service**

The service to check the status of in Nagios.

**numeric**

Turn to false in order to return status in text format ('OK' instead of 0, 'Warning' instead of 1 etc)

**Returns**

status: 'OK', 'Warning', 'Critical' or 'Unknown'

CLI Example:

```
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service=
→'HTTP'
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service=
→'HTTP' numeric=False
```

## 26.6.275 salt.modules.namecheap\_domains

Namecheap Domain Management

New in version 2017.7.0.

### Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

### Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

`salt.modules.namecheap_domains.check(*domains_to_check)`

Checks the availability of domains

**domains\_to\_check**

array of strings List of domains to check

Returns a dictionary mapping the each domain name to a boolean denoting whether or not it is available.

CLI Example:

```
salt 'my-minion' namecheap_domains.check domain-to-check
```

`salt.modules.namecheap_domains.create(domain_name, years, **kwargs)`

Try to register the specified domain name

**domain\_name**

The domain name to be registered

**years**

Number of years to register

Returns the following information:

- Whether or not the domain was renewed successfully
- Whether or not WhoisGuard is enabled
- Whether or not registration is instant
- The amount charged for registration
- The domain ID
- The order ID

- The transaction ID

CLI Example:

```
salt 'my-minion' namecheap_domains.create my-domain-name 2
```

`salt.modules.namecheap_domains.get_info(domain_name)`

Returns information about the requested domain

returns a dictionary of information about the domain\_name

**domain\_name**

string Domain name to get information about

CLI Example:

```
salt 'my-minion' namecheap_domains.get_info my-domain-name
```

`salt.modules.namecheap_domains.get_list(list_type=None, search_term=None, page=None, page_size=None, sort_by=None)`

Returns a list of domains for the particular user as a list of objects offset by page length of page\_size

**list\_type**

[ALL] One of ALL, EXPIRING, EXPIRED

**search\_term**

Keyword to look for on the domain list

**page**

[1] Number of result page to return

**page\_size**

[20] Number of domains to be listed per page (minimum: 10, maximum: 100)

**sort\_by**

One of NAME, NAME\_DESC, EXPIREDATE, EXPIREDATE\_DESC, CREATEDATE, or CREATEDATE\_DESC

CLI Example:

```
salt 'my-minion' namecheap_domains.get_list
```

`salt.modules.namecheap_domains.get_tld_list()`

Returns a list of TLDs as objects

CLI Example:

```
salt 'my-minion' namecheap_domains.get_tld_list
```

`salt.modules.namecheap_domains.reactivate(domain_name)`

Try to reactivate the expired domain name

Returns the following information:

- Whether or not the domain was reactivated successfully
- The amount charged for reactivation
- The order ID
- The transaction ID

CLI Example:

```
salt 'my-minion' namecheap_domains.reactivate my-domain-name
```

`salt.modules.namecheap_domains.renew(domain_name, years, promotion_code=None)`

Try to renew the specified expiring domain name for a specified number of years

**domain\_name**

The domain name to be renewed

**years**

Number of years to renew

Returns the following information:

- Whether or not the domain was renewed successfully
- The domain ID
- The order ID
- The transaction ID
- The amount charged for renewal

CLI Example:

```
salt 'my-minion' namecheap_domains.renew my-domain-name 5
```

## 26.6.276 salt.modules.namecheap\_domains\_dns

Namecheap DNS Management

New in version 2017.7.0.

### Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

### Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname  
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3  
namecheap.client_ip: 162.155.30.172  
#Real url  
namecheap.url: https://api.namecheap.com/xml.response  
#Sandbox url  
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

**salt.modules.namecheap\_domains\_dns.get\_hosts**(*sld*, *tld*)

Retrieves DNS host record settings for the requested domain.

returns a dictionary of information about the requested domain

**sld**

SLD of the domain name

**tld**

TLD of the domain name

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.get_hosts sld tld
```

**salt.modules.namecheap\_domains\_dns.get\_list**(*sld*, *tld*)

Gets a list of DNS servers associated with the requested domain.

returns a dictionary of information about requested domain

**sld**

SLD of the domain name

**tld**

TLD of the domain name

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.get_list sld tld
```

`salt.modules.namecheap_domains_dns.set_custom(sld, tld, nameservers)`

Sets domain to use custom DNS servers.

returns True if the custom nameservers were set successfully

**sld**

SLD of the domain name

**tld**

TLD of the domain name

**nameservers**

array of strings List of nameservers to be associated with this domain

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_custom sld tld nameserver
```

`salt.modules.namecheap_domains_dns.set_default(sld, tld)`

Sets domain to use namecheap default DNS servers. Required for free services like Host record management, URL forwarding, email forwarding, dynamic DNS and other value added services.

**sld**

SLD of the domain name

**tld**

TLD of the domain name

Returns True if the domain was successfully pointed at the default DNS servers.

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_default sld tld
```

`salt.modules.namecheap_domains_dns.set_hosts(sld, tld, hosts)`

Sets DNS host records settings for the requested domain.

returns True if the host records were set successfully

**sld**

SLD of the domain name

**tld**

TLD of the domain name

**hosts**

Must be passed as a list of Python dictionaries, with each dictionary containing the following keys:

- **hostname**
- **recordtype** - One of A, AAAA, CNAME, MX, MXE, TXT, URL, URL301, or FRAME
- **address** - URL or IP address
- **ttl** - An integer between 60 and 60000 (default: 1800)

Additionally, the `mxpref` key can be present, but must be accompanied by an `emailtype` key.

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_hosts sld tld hosts
```

## 26.6.277 salt.modules.namecheap\_domains\_ns

Namecheap Nameserver Management

New in version 2017.7.0.

### Prerequisites

This module uses the `requests` Python module to communicate to the namecheap API.

### Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

`salt.modules.namecheap_domains_ns.create(sld, tld, nameserver, ip)`

Creates a new nameserver. Returns True if the nameserver was created successfully.

**sld**

SLD of the domain name

**tld**

TLD of the domain name

**nameserver**

Nameserver to create

**ip**

Nameserver IP address

CLI Example:

```
salt '*' namecheap_domains_ns.create sld tld nameserver ip
```

`salt.modules.namecheap_domains_ns.delete(sld, tld, nameserver)`

Deletes a nameserver. Returns True if the nameserver was deleted successfully

**sld**

SLD of the domain name

**tld**

TLD of the domain name

**nameserver**

Nameserver to delete

CLI Example:

```
salt '*' namecheap_domains_ns.delete sld tld nameserver
```

`salt.modules.namecheap_domains_ns.get_info(sld, tld, nameserver)`

Retrieves information about a registered nameserver. Returns the following information:

- IP Address set for the nameserver
- Domain name which was queried
- A list of nameservers and their statuses

**sld**  
SLD of the domain name

**tld**  
TLD of the domain name

**nameserver**  
Nameserver to retrieve

CLI Example:

```
salt '*' namecheap_domains_ns.get_info sld tld nameserver
```

`salt.modules.namecheap_domains_ns.update(sld, tld, nameserver, old_ip, new_ip)`

Deletes a nameserver. Returns True if the nameserver was updated successfully.

**sld**  
SLD of the domain name

**tld**  
TLD of the domain name

**nameserver**  
Nameserver to create

**old\_ip**  
Current ip address

**new\_ip**  
New ip address

CLI Example:

```
salt '*' namecheap_domains_ns.update sld tld nameserver old_ip new_ip
```

### 26.6.278 salt.modules.namecheap\_ssl

Namecheap SSL Certificate Management

New in version 2017.7.0.

#### Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

#### Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

`salt.modules.namecheap_ssl.activate(csr_file, certificate_id, web_server_type, approver_email=None, http_dc_validation=False, **kwargs)`

Activates a newly-purchased SSL certificate. Returns a dictionary of result values.

**csr\_file**

Path to Certificate Signing Request file

**certificate\_id**

Unique ID of the SSL certificate you wish to activate

**web\_server\_type**

The type of certificate format to return. Possible values include:

- apache2
- apacheapachessl
- apacheopenssl
- apacheraven
- apachessl
- apachessleay
- c2net
- cobaltseries
- cpanel
- domino
- dominogo4625
- dominogo4626
- ensim
- hsphere
- ibmhttp
- iis
- iis4
- iis5
- iplanet
- ipswitch
- netscape
- other
- plesk
- tomcat
- weblogic
- website
- webstar
- zeusv3

**approver\_email**

The email ID which is on the approver email list.

---

**Note:** `http_dc_validation` must be set to `False` if this option is used.

---

**http\_dc\_validation**

[False] Whether or not to activate using HTTP-based validation.

---

**Note:** For other parameters which may be required, see [here](#).

---

CLI Example:

```
salt 'my-minion' namecheap_ssl.activate my-csr-file my-cert-id apachessl
```

`salt.modules.namecheap_ssl.create` (*years*, *certificate\_type*, *promotion\_code=None*, *sans\_to\_add=None*)

Creates a new SSL certificate. Returns the following information:

- Whether or not the SSL order was successful
- The certificate ID
- The order ID

- The transaction ID
- The amount charged for the order
- The date on which the certificate was created
- The date on which the certificate will expire
- The type of SSL certificate
- The number of years for which the certificate was purchased
- The current status of the SSL certificate

**years**

[1] Number of years to register

**certificate\_type**

Type of SSL Certificate. Possible values include:

- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
- SSL Webserver EV

**promotional\_code**

An optional promo code to use when creating the certificate

**sans\_to\_add**

[0] This parameter defines the number of add-on domains to be purchased in addition to the default number of domains included with a multi-domain certificate. Each certificate that supports SANs has the default number of domains included. You may check the default number of domains included and the maximum number of domains that can be added to it in the table below.

Provi	Product name	Default number of do- mains (domain from CSR is counted here)	Maximum number of total domains	Maximum number of do- mains that can be passed in sans_to_add parameter
Co- modo	PositiveSSL Multi-Domain	3	100	97
Co- modo	Multi-Domain SSL	3	100	97
Co- modo	EV Multi- Do- main SSL	3	100	97
Co- modo	Unified Commu- nications	3	100	97
GeoT:	QuickSSL Pre- mium	1	1 domain + 4 subdomains	The only supported value is 4
GeoT:	True BusinessID with EV Multi- Domain	5	25	20
GeoT:	True Business ID Multi- Domain	5	25	20
Thaw	SSL Web Server	1	25	24
Thaw	SSL Web Server with EV	1	25	24
Thaw	SGC Supercerts	1	25	24
Syma tec	Secure Site Pro with EV	1	25	24
Syma tec	Secure Site with EV	1	25	24
Syma tec	Secure Site	1	25	24
Syma tec	Secure Site Pro	1	25	24

CLI Example:

```
salt 'my-minion' namecheap_ssl.create 2 RapidSSL
```

`salt.modules.namecheap_ssl.get_info`(*certificate\_id*, *returncertificate=False*, *returntype=None*)

Retrieves information about the requested SSL certificate. Returns a dictionary of information about the SSL certificate with two keys:

- **ssl** - Contains the metadata information
- **certificate** - Contains the details for the certificate such as the CSR, Approver, and certificate data

**certificate\_id**

Unique ID of the SSL certificate

**returncertificate**

[False] Set to True to ask for the certificate in response

**returntype**

Optional type for the returned certificate. Can be either "Individual" (for X.509 format) or "PKCS7"

---

**Note:** Required if `returncertificate` is True

---

CLI Example:

```
salt 'my-minion' namecheap_ssl.get_info my-cert-id
```

`salt.modules.namecheap_ssl.get_list(**kwargs)`

Returns a list of SSL certificates for a particular user

**ListType**

[All] Possible values:

- All
- Processing
- EmailSent
- TechnicalProblem
- InProgress
- Completed
- Deactivated
- Active
- Cancelled
- NewPurchase
- NewRenewal

**SearchTerm**

Keyword to look for on the SSL list

**Page**

[1] Page number to return

**PageSize**

[20] Total number of SSL certificates to display per page (minimum: 10, maximum: 100)

**SortBy**

One of PURCHASEDATE, PURCHASEDATE\_DESC, SSLTYPE, SSLTYPE\_DESC, EXPIREDATETIME, EXPIREDATETIME\_DESC, Host\_Name, or Host\_Name\_DESC

CLI Example:

```
salt 'my-minion' namecheap_ssl.get_list Processing
```

`salt.modules.namecheap_ssl.parse_csr(csr_file, certificate_type, http_dc_validation=False)`

Parses the CSR. Returns a dictionary of result values.

**csr\_file**

Path to Certificate Signing Request file

**certificate\_type**

Type of SSL Certificate. Possible values include:

- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL

- True BusinessID with EV Multi Domain
- Unified Communications

**http\_dc\_validation**

[False] Set to True if a Comodo certificate and validation should be done with files instead of emails and to return the info to do so

CLI Example:

```
salt 'my-minion' namecheap_ssl.parse_csr my-csr-file PremiumSSL
```

`salt.modules.namecheap_ssl.reissue`(*csr\_file*, *certificate\_id*, *web\_server\_type*, *approver\_email=None*, *http\_dc\_validation=False*, *\*\*kwargs*)

Reissues a purchased SSL certificate. Returns a dictionary of result values.

**csr\_file**

Path to Certificate Signing Request file

**certificate\_id**

Unique ID of the SSL certificate you wish to activate

**web\_server\_type**

The type of certificate format to return. Possible values include:

- apache2
- apacheapachessl
- apacheopenssl
- apacheraven
- apachessl
- apachessleay
- c2net
- cobaltseries
- cpanel
- domino
- dominogo4625
- dominogo4626
- ensim
- hisphere
- ibmhttp
- iis
- iis4
- iis5
- iplanet
- ipswitch
- netscape
- other
- plesk
- tomcat
- weblogic

- website
- webstar
- zeusv3

**approver\_email**

The email ID which is on the approver email list.

---

**Note:** `http_dc_validation` must be set to `False` if this option is used.

---

**http\_dc\_validation**

[False] Whether or not to activate using HTTP-based validation.

---

**Note:** For other parameters which may be required, see [here](#).

---

CLI Example:

```
salt 'my-minion' namecheap_ssl.reissue my-csr-file my-cert-id apachessl
```

`salt.modules.namecheap_ssl.renew`(*years, certificate\_id, certificate\_type, promotion\_code=None*)

Renews an SSL certificate if it is ACTIVE and Expires <= 30 days. Returns the following information:

- The certificate ID
- The order ID
- The transaction ID
- The amount charged for the order

**years**

[1] Number of years to register

**certificate\_id**

Unique ID of the SSL certificate you wish to renew

**certificate\_type**

Type of SSL Certificate. Possible values include:

- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard

- Secure Site Pro
- Secure Site Pro with EV

- Secure Site with EV
- True BusinessID
- True BusinessID Multi Domain
- True BusinessID Wildcard
- True BusinessID with EV
- True BusinessID with EV Multi Domain
- Unified Communications

**promotional\_code**

An optional promo code to use when renewing the certificate

CLI Example:

```
salt 'my-minion' namecheap_ssl.renew 1 my-cert-id RapidSSL
```

### 26.6.279 salt.modules.namecheap\_users

Namecheap User Management

New in version 2017.7.0.

**Prerequisites**

This module uses the requests Python module to communicate to the namecheap API.

**Configuration**

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

`salt.modules.namecheap_users.check_balances` (*minimum=100*)

Checks if the provided minimum value is present in the user's account.

Returns a boolean. Returns `False` if the user's account balance is less than the provided minimum or `True` if greater than the minimum.

**minimum**

[100] The value to check

CLI Example:

```
salt 'my-minion' namecheap_users.check_balances
salt 'my-minion' namecheap_users.check_balances minimum=150
```

`salt.modules.namecheap_users.get_balances` ()

Gets information about fund in the user's account. This method returns the following information: Available Balance, Account Balance, Earned Amount, Withdrawable Amount and Funds Required for AutoRenew.

---

**Note:** If a domain setup with automatic renewal is expiring within the next 90 days, the FundsRequired-ForAutoRenew attribute shows the amount needed in your Namecheap account to complete auto renewal.

---

CLI Example:

```
salt 'my-minion' namecheap_users.get_balances
```

## 26.6.280 salt.modules.napalm\_bgp

### NAPALM BGP

Manages BGP configuration on network devices and provides statistics.

**codeauthor**

Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

**maturity**

new

**depends**

napalm

**platform**

unix

### Dependencies

- *napalm proxy minion*

New in version 2016.11.0.

`salt.modules.napalm_bgp.config`(*group=None, neighbor=None, \*\*kwargs*)

Provides the BGP configuration on the device.

**Parameters**

- **group** -- Name of the group selected to display the configuration.
- **neighbor** -- IP Address of the neighbor to display the configuration. If the group parameter is not specified, the neighbor setting will be ignored.

**Returns**

A dictionary containing the BGP configuration from the network device. The keys of the main dictionary are the group names.

Each group has the following properties:

- type (string)
- description (string)
- apply\_groups (string list)
- multihop\_ttl (int)
- multipath (True/False)
- local\_address (string)
- local\_as (int)
- remote\_as (int)
- import\_policy (string)
- export\_policy (string)
- remove\_private\_as (True/False)

- prefix\_limit (dictionary)
- neighbors (dictionary)

Each neighbor in the dictionary of neighbors provides:

- description (string)
- import\_policy (string)
- export\_policy (string)
- local\_address (string)
- local\_as (int)
- remote\_as (int)
- authentication\_key (string)
- prefix\_limit (dictionary)
- route\_reflector\_client (True/False)
- nhs (True/False)

CLI Example:

```
salt '*' bgp.config # entire BGP config
salt '*' bgp.config PEERS-GROUP-NAME # provides detail only about BGP
→group PEERS-GROUP-NAME
salt '*' bgp.config PEERS-GROUP-NAME 172.17.17.1 # provides details only
→about BGP neighbor 172.17.17.1,
# configured in the group PEERS-GROUP-NAME
```

Output Example:

```
{
  'PEERS-GROUP-NAME': {
    'type' : 'external',
    'description' : 'Here we should have a nice description',
    'apply_groups' : ['BGP-PREFIX-LIMIT'],
    'import_policy' : 'PUBLIC-PEER-IN',
    'export_policy' : 'PUBLIC-PEER-OUT',
    'remove_private': True,
    'multipath' : True,
    'multihop_ttl' : 30,
    'neighbors' : {
      '192.168.0.1': {
        'description' : 'Facebook [CDN]',
        'prefix_limit' : {
          'inet': {
            'unicast': {
              'limit': 100,
              'teardown': {
                'threshold' : 95,
                'timeout' : 5
              }
            }
          }
        }
      }
    }
    'peer-as' : 32934,
    'route_reflector': False,
    'nhs' : True
  },
  '172.17.17.1': {
    'description' : 'Twitter [CDN]',
```

(continues on next page)

(continued from previous page)

```

        'prefix_limit' : {
            'inet': {
                'unicast': {
                    'limit': 500,
                    'no-validate': 'IMPORT-FLOW-ROUTES'
                }
            }
        }
        'peer_as'          : 13414
        'route_reflector' : False,
        'nhs'              : False
    }
}
}
}
}

```

`salt.modules.napalm_bgp.neighbors` (*neighbor=None, \*\*kwargs*)

Provides details regarding the BGP sessions configured on the network device.

#### Parameters

**neighbor** -- IP Address of a specific neighbor.

#### Returns

A dictionary with the statistics of the all/selected BGP neighbors. Outer dictionary keys represent the VRF name. Keys of inner dictionary represent the AS numbers, while the values are lists of dictionaries, having the following keys:

- up (True/False)
- local\_as (int)
- remote\_as (int)
- local\_address (string)
- routing\_table (string)
- local\_address\_configured (True/False)
- local\_port (int)
- remote\_address (string)
- remote\_port (int)
- multihop (True/False)
- multipath (True/False)
- remove\_private\_as (True/False)
- import\_policy (string)
- export\_policy (string)
- input\_messages (int)
- output\_messages (int)
- input\_updates (int)
- output\_updates (int)

- messages\_queued\_out (int)
- connection\_state (string)
- previous\_connection\_state (string)
- last\_event (string)
- suppress\_4byte\_as (True/False)
- local\_as\_prepend (True/False)
- holdtime (int)
- configured\_holdtime (int)
- keepalive (int)
- configured\_keepalive (int)
- active\_prefix\_count (int)
- received\_prefix\_count (int)
- accepted\_prefix\_count (int)
- suppressed\_prefix\_count (int)
- advertised\_prefix\_count (int)
- flap\_count (int)

CLI Example:

```
salt '*' bgp.neighbors # all neighbors
salt '*' bgp.neighbors 172.17.17.1 # only session with BGP neighbor(s)
→172.17.17.1
```

Output Example:

```
{
  'default': {
    8121: [
      {
        'up' : True,
        'local_as' : 13335,
        'remote_as' : 8121,
        'local_address' : '172.101.76.1',
        'local_address_configured' : True,
        'local_port' : 179,
        'remote_address' : '192.247.78.0',
        'router_id' : '192.168.0.1',
        'remote_port' : 58380,
        'multihop' : False,
        'import_policy' : '4-NTT-TRANSIT-IN',
        'export_policy' : '4-NTT-TRANSIT-OUT',
        'input_messages' : 123,
        'output_messages' : 13,
        'input_updates' : 123,
        'output_updates' : 5,
        'messages_queued_out' : 23,
        'connection_state' : 'Established',
```

(continues on next page)

(continued from previous page)

```

        'previous_connection_state' : 'EstabSync',
        'last_event'                 : 'RecvKeepAlive',
        'suppress_4byte_as'         : False,
        'local_as_prepend'          : False,
        'holdtime'                   : 90,
        'configured_holdtime'       : 90,
        'keepalive'                  : 30,
        'configured_keepalive'      : 30,
        'active_prefix_count'       : 132808,
        'received_prefix_count'     : 566739,
        'accepted_prefix_count'     : 566479,
        'suppressed_prefix_count'   : 0,
        'advertise_prefix_count'    : 0,
        'flap_count'                 : 27
    }
}
]
}
}

```

## 26.6.281 salt.modules.napalm\_formula

### NAPALM Formula helpers

New in version 2019.2.0.

This is an Execution Module providing helpers for various NAPALM formulas, e.g., napalm-interfaces-formula, napalm-bgp-formula, napalm-ntp-formula etc., meant to provide various helper functions to make the templates more readable.

`salt.modules.napalm_formula.container_path(model, key=None, container=None, delim=':')`

Return the list of all the possible paths in a container, down to the `config` container. This function can be used to verify that the `model` is a Python object correctly structured and respecting the OpenConfig hierarchy.

#### **model**

The OpenConfig-structured object to inspect.

#### **delim: :**

The key delimiter. In particular cases, it is indicated to use `//` as `:` might be already used in various cases, e.g., IPv6 addresses, interface name (e.g., Juniper QFX series), etc.

CLI Example:

```

salt '*' napalm_formula.container_path "'{'interfaces': {'interface': {
→ 'Ethernet1': {'config': {'name': 'Ethernet1'}}}}}"

```

The example above would return a list with the following element: `interfaces:interface:Ethernet1:config` which is the only possible path in that hierarchy.

Other output examples:

```

- interfaces:interface:Ethernet1:config
- interfaces:interface:Ethernet1:subinterfaces:subinterface:0:config
- interfaces:interface:Ethernet2:config

```

`salt.modules.napalm_formula.defaults(model, defaults_, delim='/', flipped_merge=False)`

Apply the defaults to a Python dictionary having the structure as described in the OpenConfig standards.

**model**

The OpenConfig model to apply the defaults to.

**defaults**

The dictionary of defaults. This argument must equally be structured with respect to the OpenConfig standards.

For ease of use, the keys of these support glob matching, therefore we don't have to provide the defaults for each entity but only for the entity type. See an example below.

**delim: //**

The key delimiter to use. Generally, // should cover all the possible cases, and you don't need to override this value.

**flipped\_merge: False**

Whether should merge the model into the defaults, or the defaults into the model. Default: `False` (merge the model into the defaults, i.e., any defaults would be overridden by the values from the `model`).

CLI Example:

```
salt '*' napalm_formula.defaults "{ 'interfaces': { 'interface': { 'Ethernet1
→': { 'config': { 'name': 'Ethernet1' }}} } }" "{ 'interfaces': { 'interface': {
→ '*': { 'config': { 'enabled': True }}} } }"
```

As one can notice in the example above, the `*` corresponds to the interface name, therefore, the defaults will be applied on all the interfaces.

`salt.modules.napalm_formula.dictupdate` (*dest*, *upd*, *recursive\_update=True*, *merge\_lists=False*)

Recursive version of the default `dict.update`

Merges `upd` recursively into `dest`

If `recursive_update=False`, will use the classic `dict.update`, or fall back on a manual merge (helpful for non-dict types like `FunctionWrapper`).

If `merge_lists=True`, will aggregate list object types instead of replace. The list in `upd` is added to the list in `dest`, so the resulting list is `dest[key] + upd[key]`. This behaviour is only activated when `recursive_update=True`. By default `merge_lists=False`.

`salt.modules.napalm_formula.render_field` (*dictionary*, *field*, *prepend=None*, *append=None*, *quotes=False*, *\*\*opts*)

Render a field found under the `field` level of the hierarchy in the `dictionary` object. This is useful to render a field in a Jinja template without worrying that the hierarchy might not exist. For example if we do the following in Jinja: `{{ interfaces.interface.Ethernet5.config.description }}` for the following object: `{ 'interfaces': { 'interface': { 'Ethernet1': { 'config': { 'enabled': True }}} }` it would error, as the `Ethernet5` key does not exist. With this helper, we can skip this and avoid existence checks. This must be however used with care.

**dictionary**

The dictionary to traverse.

**field**

The key name or part to traverse in the `dictionary`.

**prepend: None**

The text to prepend in front of the text. Usually, we need to have the name of the field too when generating the configuration.

**append: None**

Text to append at the end.

**quotes: False**

Whether should wrap the text around quotes.

CLI Example:

```
salt '*' napalm_formula.render_field '{"enabled': True}" enabled
# This would return the value of the `enabled` leaf key
salt '*' napalm_formula.render_field '{"enabled': True}" description
# This would not error
```

Jinja usage example:

```
{%- set config = {'enabled': True, 'description': 'Interface description'}
  -> %}
{{ salt.napalm_formula.render_field(config, 'description', quotes=True) }}
```

The example above would be rendered on Arista / Cisco as:

```
description "Interface description"
```

While on Junos (the semicolon is important to be added, otherwise the configuration won't be accepted by Junos):

```
description "Interface description";
```

`salt.modules.napalm_formula.render_fields(dictionary, *fields, **opts)`

This function works similarly to `render_field` but for a list of fields from the same dictionary, rendering, indenting and distributing them on separate lines.

**dictionary**

The dictionary to traverse.

**fields**

A list of field names or paths in the dictionary.

**indent: 0**

The indentation to use, prepended to the rendered field.

**separator: \n**

The separator to use between fields.

CLI Example:

```
salt '*' napalm_formula.render_fields '{"mtu': 68, 'description':
  ->'Interface description'}" mtu description
```

Jinja usage example:

```
{%- set config={'mtu': 68, 'description': 'Interface description'} %}
{{ salt.napalm_formula.render_fields(config, 'mtu', 'description',
  ->quotes=True) }}
```

The Jinja example above would generate the following configuration:

```
mtu "68"
description "Interface description"
```

`salt.modules.napalm_formula.setval(key, val, dict_=None, delim=':')`

Set a value under the dictionary hierarchy identified under the key. The target 'foo/bar/baz' returns the dictionary hierarchy {'foo': {'bar': {'baz': {}}}

---

**Note:** Currently this doesn't work with integers, i.e. cannot build lists dynamically.

---

CLI Example:

```
salt '*' formula.setval foo:baz:bar True
```

`salt.modules.napalm_formula.traverse`(*data*, *key*, *default=None*, *delimiter=':'*)

Traverse a dict or list using a colon-delimited (or otherwise delimited, using the `delimiter` param) target string. The target `foo:bar:0` will return `data['foo']['bar'][0]` if this value exists, and will otherwise return the dict in the default argument. Function will automatically determine the target type. The target `foo:bar:0` will return `data['foo']['bar'][0]` if data like `{'foo':{'bar':['baz']}}`, if data like `{'foo':{'bar':{'0':'baz'}}` then return `data['foo']['bar']['0']`

CLI Example:

```
salt '*' napalm_formula.traverse "{ 'foo': { 'bar': { 'baz': True } } }"
→ foo:baz:bar
```

## 26.6.282 salt.modules.napalm\_mod

### NAPALM helpers

Helpers for the NAPALM modules.

New in version 2017.7.0.

`salt.modules.napalm_mod.alive`(*\*\*kwargs*)

Returns the alive status of the connection layer. The output is a dictionary under the usual dictionary output of the NAPALM modules.

CLI Example:

```
salt '*' napalm.alive
```

Output Example:

```
result: True
out:
  is_alive: False
comment: ''
```

`salt.modules.napalm_mod.call`(*method*, *\*args*, *\*\*kwargs*)

Execute arbitrary methods from the NAPALM library. To see the expected output, please consult the NAPALM documentation.

---

**Note:** This feature is not recommended to be used in production. It should be used for testing only!

---

CLI Example:

```
salt '*' napalm.call get_lldp_neighbors
salt '*' napalm.call get_firewall_policies
salt '*' napalm.call get_bgp_config group='my-group'
```

`salt.modules.napalm_mod.compliance_report`(*filepath=None*, *string=None*, *renderer='jinja|yaml'*, *\*\*kwargs*)

Return the compliance report.

**filepath**

The absolute path to the validation file.

Changed in version 2019.2.0.

Beginning with release codename 2019.2.0, this function has been enhanced, to be able to leverage the multi-engine template rendering of Salt, besides the possibility to retrieve the file source from remote systems, the URL schemes supported being:

- salt://
- http:// and https://
- ftp://
- s3://
- swift:/

Or on the local file system (on the Minion).

---

**Note:** The rendering result does not necessarily need to be YAML, instead it can be any format interpreted by Salt's rendering pipeline (including pure Python).

---

**string**

New in version 2019.2.0.

The compliance report send as inline string, to be used as the file to send through the renderer system. Note, not all renderer modules can work with strings; the 'py' renderer requires a file, for example.

**renderer: jinja|yaml**

New in version 2019.2.0.

The renderer pipe to send the file through; this is overridden by a "she-bang" at the top of the file.

**kwargs**

Changed in version 2019.2.0.

Keyword args to pass to Salt's compile\_template() function.

CLI Example:

```
salt '*' napalm.compliance_report ~/validate.yml
salt '*' napalm.compliance_report salt://path/to/validator.sls
```

Validation File Example (pure YAML):

```
- get_facts:
  os_version: 4.17

- get_interfaces_ip:
  Management1:
    ipv4:
      10.0.2.14:
        prefix_length: 24
      _mode: strict
```

Validation File Example (as Jinja + YAML):

```
- get_facts:
  os_version: {{ grains.version }}

- get_interfaces_ip:
  Loopback0:
    ipv4:

        nested:
          False
  get_interfaces_ip:
-----
    complies:
      False
    extra:
    missing:
      - Management1
    present:
-----
  skipped:
result:
  True

```

`salt.modules.napalm_mod.config_diff_text` (*source1='candidate', candidate\_path=None, source2='running', running\_path=None*)

New in version 2019.2.0.

Return the diff, as text, between the two different configuration sources. The sources can be either specified using the `source1` and `source2` arguments when retrieving from the managed network device.

**source1: candidate**

The source from where to retrieve the configuration to be compared with. Available options: `candidate`, `running`, `startup`. Default: `candidate`.

**candidate\_path**

Absolute or remote path from where to load the candidate configuration text. This argument allows any

URI supported by `cp.get_url`), e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**source2: running**

The source from where to retrieve the configuration to compare with. Available options: `candidate`, `running`, `startup`. Default: `running`.

**running\_path**

Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by `cp.get_url`), e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv: base**

Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.config_diff_text
salt '*' napalm.config_diff_text candidate_path=https://bit.ly/2mAdq7z
# Would compare the running config with the configuration available at
# https://bit.ly/2mAdq7z
```

`salt.modules.napalm_mod.config_diff_tree` (`source1='candidate'`, `candidate_path=None`, `source2='running'`, `running_path=None`)

New in version 2019.2.0.

Return the diff, as Python dictionary, between two different sources. The sources can be either specified using the `source1` and `source2` arguments when retrieving from the managed network device.

**source1: candidate**

The source from where to retrieve the configuration to be compared with. Available options: `candidate`, `running`, `startup`. Default: `candidate`.

**candidate\_path**

Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by `cp.get_url`), e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**source2: running**

The source from where to retrieve the configuration to compare with. Available options: `candidate`, `running`, `startup`. Default: `running`.

**running\_path**

Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by `cp.get_url`), e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv: base**

Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.config_diff_text
salt '*' napalm.config_diff_text candidate_path=https://bit.ly/2mAdq7z
# Would compare the running config with the configuration available at
# https://bit.ly/2mAdq7z
```

CLI Example:

```
salt '*' napalm.config_diff_tree
salt '*' napalm.config_diff_tree running startup
```

`salt.modules.napalm_mod.config_filter_lines` (`parent_regex`, `child_regex`, `source='running'`)

New in version 2019.2.0.

Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent respects the regular expressions configured via the `parent_regex` argument, and the child matches the

`child_regex` regular expression. The result is a list of dictionaries with the following keys:

- `match`: a boolean value that tells whether `child_regex` matched any children lines.
- `parent`: the parent line (as text).
- `child`: the child line (as text). If no child line matched, this field will be `None`.

---

**Note:** This function is only available only when the underlying library `ciscoconfparse` is installed. See [ciscoconfparse module](#) for more details.

---

**parent\_regex**

The regular expression to match the parent configuration lines against.

**child\_regex**

The regular expression to match the child configuration lines against.

**source: running**

The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

CLI Example:

```
salt '*' napalm.config_filter_lines '^interface' 'ip address'
salt '*' napalm.config_filter_lines '^interface' 'shutdown'
↪ source=candidate
```

`salt.modules.napalm_mod.config_find_lines` (*regex*, *source='running'*)

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the `regex` argument. The configuration is read from the network device interrogated.

**regex**

The regular expression to match the configuration lines against.

**source: running**

The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

CLI Example:

```
salt '*' napalm.config_find_lines '^interface Ethernet1\d'
```

`salt.modules.napalm_mod.config_lines_w_child` (*parent\_regex*, *child\_regex*, *source='running'*)

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the `parent_regex` argument, having child lines matching `child_regex`. The configuration is read from the network device interrogated.

---

**Note:** This function is only available only when the underlying library `ciscoconfparse` is installed. See [ciscoconfparse module](#) for more details.

---

**parent\_regex**

The regular expression to match the parent configuration lines against.

**child\_regex**

The regular expression to match the child configuration lines against.

**source: running**

The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

CLI Example:

```
salt '*' napalm.config_lines_w_child '^interface' 'ip address'
salt '*' napalm.config_lines_w_child '^interface' 'shutdown'
→source=candidate
```

`salt.modules.napalm_mod.config_lines_wo_child`(*parent\_regex*, *child\_regex*, *source*='running')

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the *parent\_regex* argument, having the child lines *not* matching *child\_regex*. The configuration is read from the network device interrogated.

---

**Note:** This function is only available only when the underlying library `ciscoconfparse` is installed. See [ciscoconfparse module](#) for more details.

---

**parent\_regex**

The regular expression to match the parent configuration lines against.

**child\_regex**

The regular expression to match the child configuration lines against.

**source: running**

The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

CLI Example:

```
salt '*' napalm.config_lines_wo_child '^interface' 'ip address'
salt '*' napalm.config_lines_wo_child '^interface' 'shutdown'
→source=candidate
```

`salt.modules.napalm_mod.config_merge_diff`(*source*='running', *merge\_config*=None, *merge\_path*=None, *saltenv*='base')

New in version 2019.2.0.

Return the merge diff, as text, after merging the merge config into the configuration source requested (without loading the config on the device).

**source: running**

The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

**merge\_config**

The config to be merged into the initial config, sent as text. This argument is ignored when *merge\_path* is set.

**merge\_path**

Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv: base**

Salt fileserver environment from which to retrieve the file. Ignored if *merge\_path* is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.config_merge_diff merge_path=salt://path/to/merge.cfg
```

`salt.modules.napalm_mod.config_merge_text`(*source*='running', *merge\_config*=None, *merge\_path*=None, *saltenv*='base')

New in version 2019.2.0.

Return the merge result of the configuration from *source* with the merge configuration, as plain text (without loading the config on the device).

**source: running**

The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

**merge\_config**

The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

**merge\_path**

Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv: base**

Salt fileserver environment from which to retrieve the file. Ignored if `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.config_merge_text merge_path=salt://path/to/merge.cfg
```

`salt.modules.napalm_mod.config_merge_tree` (*source='running', merge\_config=None, merge\_path=None, saltenv='base'*)

New in version 2019.2.0.

Return the merge tree of the `initial_config` with the `merge_config`, as a Python dictionary.

**source: running**

The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

**merge\_config**

The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

**merge\_path**

Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv: base**

Salt fileserver environment from which to retrieve the file. Ignored if `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.config_merge_tree merge_path=salt://path/to/merge.cfg
```

`salt.modules.napalm_mod.config_tree` (*source='running', with\_tags=False*)

New in version 2019.2.0.

Transform Cisco IOS style configuration to structured Python dictionary. Depending on the value of the `with_tags` argument, this function may provide different views, valuable in different situations.

**source: running**

The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

**with\_tags: False**

Whether this function should return a detailed view, with tags.

CLI Example:

```
salt '*' napalm.config_tree
```

`salt.modules.napalm_mod.junos_call` (*fun, \*args, \*\*kwargs*)

New in version 2019.2.0.

Execute an arbitrary function from the `junos` execution module. To check what `args` and `kwargs` you must send to the function, please consult the appropriate documentation.

**fun**

The name of the function. E.g., `set_hostname`.

**args**

List of arguments to send to the `junos` function invoked.

**kwargs**

Dictionary of key-value arguments to send to the `junos` function invoked.

CLI Example:

```
salt '*' napalm.junos_fun cli 'show system commit'
```

`salt.modules.napalm_mod.junos_cli`(*command, format=None, dev\_timeout=None, dest=None, \*\*kwargs*)

New in version 2019.2.0.

Execute a CLI command and return the output in the specified format.

**command**

The command to execute on the Junos CLI.

**format: text**

Format in which to get the CLI output (either `text` or `xml`).

**dev\_timeout: 30**

The NETCONF RPC timeout (in seconds).

**dest**

Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion. To push the files to the Master, use `cp.push`.

CLI Example:

```
salt '*' napalm.junos_cli 'show lldp neighbors'
```

`salt.modules.napalm_mod.junos_commit`(*\*\*kwargs*)

New in version 2019.2.0.

Commit the changes loaded in the candidate configuration.

**dev\_timeout: 30**

The NETCONF RPC timeout (in seconds).

**comment**

Provide a comment for the commit.

**confirm**

Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

**sync: False**

When `True`, on dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines.

**force\_sync: False**

When `True`, on dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.

**full**

When `True`, requires all the daemons to check and evaluate the new configuration.

**detail**

When `True`, return commit detail.

CLI Examples:

```
salt '*' napalm.junos_commit comment='Committing via Salt' detail=True
salt '*' napalm.junos_commit dev_timeout=60 confirm=10
salt '*' napalm.junos_commit sync=True dev_timeout=90
```

`salt.modules.napalm_mod.junos_copy_file` (*src, dst, \*\*kwargs*)

New in version 2019.2.0.

Copies the file on the remote Junos device.

**src**

The source file path. This argument accepts the usual Salt URIs (e.g., `salt://`, `http://`, `https://`, `s3://`, `ftp://`, etc.).

**dst**

The destination path on the device where to copy the file.

CLI Example:

```
salt '*' napalm.junos_copy_file https://example.com/junos.cfg /var/tmp/
→myjunos.cfg
```

`salt.modules.napalm_mod.junos_facts` (*\*\*kwargs*)

New in version 2019.2.0.

The complete list of Junos facts collected by `junos-eznc`.

CLI Example:

```
salt '*' napalm.junos_facts
```

`salt.modules.napalm_mod.junos_install_os` (*path=None, \*\*kwargs*)

New in version 2019.2.0.

Installs the given image on the device.

**path**

The image file source. This argument supports the following URIs:

- Absolute path on the Minion.
- `salt://` to fetch from the Salt fileserver.
- `http://` and `https://`
- `ftp://`
- `swift://`
- `s3://`

**dev\_timeout: 30**

The NETCONF RPC timeout (in seconds)

**reboot: False**

Whether to reboot the device after the installation is complete.

**no\_copy: False**

If True the software package will not be copied to the remote device.

CLI Example:

```
salt '*' napalm.junos_install_os salt://images/junos_16_1.tgz reboot=True
```

`salt.modules.napalm_mod.junos_rpc` (*cmd=None, dest=None, format=None, \*\*kwargs*)

New in version 2019.2.0.

Execute an RPC request on the remote Junos device.

**cmd**

The RPC request to be executed. To determine the RPC request, you can check the output from the command line of the device, by executing the usual command followed by `| display xml rpc`, e.g., `show lldp neighbors | display xml rpc`.

**dest**

Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion. To push the files to the Master, use `cp.push` Execution function.

**format: xml**

The format in which the RPC reply is received from the device.

**dev\_timeout: 30**

The NETCONF RPC timeout.

**filter**

Used with the `get-config` RPC request to filter out the config tree.

**terse: False**

Whether to return terse output.

---

**Note:** Some RPC requests may not support this argument.

---

**interface\_name**

Name of the interface to query.

CLI Example:

```
salt '*' napalm.junos_rpc get-lldp-neighbors-information
salt '*' napalm.junos_rpc get-config <configuration><system><ntp/></
↳system></configuration>
```

`salt.modules.napalm_mod.netmiko_args(**kwargs)`

New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the netmiko module.

When running in a non-native NAPALM driver (e.g., `panos`, `f5`, `mos` - either from <https://github.com/napalm-automation-community> or defined in user's own environment, one can specify the Netmiko device type (the `device_type` argument) via the `netmiko_device_type_map` configuration option / Pillar key, e.g.,

```
netmiko_device_type_map:
  f5: f5_ltm
  dello10: dell_os10
```

The configuration above defines the mapping between the NAPALM `os` Grain and the Netmiko `device_type`, e.g., when the NAPALM Grain is `f5`, it would use the `f5_ltm` SSH Netmiko driver to execute commands over SSH on the remote network device.

CLI Example:

```
salt '*' napalm.netmiko_args
```

`salt.modules.napalm_mod.netmiko_call(method, *args, **kwargs)`

New in version 2019.2.0.

Execute an arbitrary Netmiko method, passing the authentication details from the existing NAPALM connection.

**method**

The name of the Netmiko method to execute.

**args**

List of arguments to send to the Netmiko method specified in `method`.

**kwargs**

Key-value arguments to send to the execution function specified in `method`.

CLI Example:

```
salt '*' napalm.netmiko_call send_command 'show version'
```

```
salt.modules.napalm_mod.netmiko_commands(*commands, **kwargs)
```

New in version 2019.2.0.

Invoke one or more commands to be executed on the remote device, via Netmiko. Returns a list of strings, with the output from each command.

**commands**

A list of commands to be executed.

**expect\_string**

Regular expression pattern to use for determining end of output. If left blank will default to being based on router prompt.

**delay\_factor: 1**

Multiplying factor used to adjust delays (default: 1).

**max\_loops: 500**

Controls wait time in conjunction with `delay_factor`. Will default to be based upon `self.timeout`.

**auto\_find\_prompt: True**

Whether it should try to auto-detect the prompt (default: True).

**strip\_prompt: True**

Remove the trailing router prompt from the output (default: True).

**strip\_command: True**

Remove the echo of the command from the output (default: True).

**normalize: True**

Ensure the proper enter is sent at end of command (default: True).

**use\_textfsm: False**

Process command output through TextFSM template (default: False).

CLI Example:

```
salt '*' napalm.netmiko_commands 'show version' 'show interfaces'
```

```
salt.modules.napalm_mod.netmiko_config(*config_commands, **kwargs)
```

New in version 2019.2.0.

Load a list of configuration commands on the remote device, via Netmiko.

**Warning:** Please remember that `netmiko` does not have any rollback safeguards and any configuration change will be directly loaded into the running config if the platform doesn't have the concept of candidate config.

On Junos, or other platforms that have this capability, the changes will not be loaded into the running config, and the user must set the `commit` argument to `True` to transfer the changes from the candidate into the running config before exiting.

**config\_commands**

A list of configuration commands to be loaded on the remote device.

**config\_file**

Read the configuration commands from a file. The file can equally be a template that can be rendered using the engine of choice (see `template_engine`).

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**exit\_config\_mode: True**

Determines whether or not to exit config mode after complete.

**delay\_factor: 1**

Factor to adjust delays.

**max\_loops: 150**

Controls wait time in conjunction with `delay_factor` (default: 150).

**strip\_prompt: False**

Determines whether or not to strip the prompt (default: False).

**strip\_command: False**

Determines whether or not to strip the command (default: False).

**config\_mode\_command**

The command to enter into config mode.

**commit: False**

Commit the configuration changes before exiting the config mode. This option is by default disabled, as many platforms don't have this capability natively.

CLI Example:

```
salt '*' napalm.netmiko_config 'set system ntp peer 1.2.3.4' commit=True
salt '*' napalm.netmiko_config https://bit.ly/2sgljCB
```

`salt.modules.napalm_mod.netmiko_fun`(*fun*, \**args*, \*\**kwargs*)

New in version 2019.2.0.

Call an arbitrary function from the *Netmiko* module, passing the authentication details from the existing NAPALM connection.

**fun**

The name of the function from the *Netmiko* to invoke.

**args**

List of arguments to send to the execution function specified in `fun`.

**kwargs**

Key-value arguments to send to the execution function specified in `fun`.

CLI Example:

```
salt '*' napalm.netmiko_fun send_command 'show version'
```

`salt.modules.napalm_mod.netmiko_multi_call`(\**methods*, \*\**kwargs*)

New in version 2019.2.0.

Execute a list of arbitrary Netmiko methods, passing the authentication details from the existing NAPALM connection.

**methods**

List of dictionaries with the following keys:

- `name`: the name of the Netmiko function to invoke.
- `args`: list of arguments to send to the `name` method.
- `kwargs`: key-value arguments to send to the `name` method.

CLI Example:

```
salt '*' napalm.netmiko_multi_call [{"name": 'send_command', 'args': [
  ↳ 'show version']}] [{"name": 'send_command', 'args': ['show interfaces']}
  ↳ ]
```

`salt.modules.napalm_mod.nxos_api_config`(*commands=None*, *config\_file=None*,  
*template\_engine='jinja'*, *context=None*, *defaults=None*,  
*saltenv='base'*, \*\**kwargs*)

New in version 2019.2.0.

Configures the Nexus switch with the specified commands, via the NX-API.

**commands**

The list of configuration commands to load on the Nexus switch.

---

**Note:** This argument is ignored when `config_file` is specified.

---

**config\_file**

The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`
- `https://`
- `ftp://`
- `s3://`
- `swift://`

**template\_engine: jinja**

The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

**context: None**

Variables to add to the template context.

**defaults: None**

Default values of the context dict.

**saltenv: base**

Salt fileserver environment from which to retrieve the file. Ignored if `config_file` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.nxos_api_config 'spanning-tree mode mstp'  
salt '*' napalm.nxos_api_config config_file=https://bit.ly/2LGLcDy  
→context="{ 'servers': ['1.2.3.4'] }"
```

`salt.modules.napalm_mod.nxos_api_rpc(commands, method='cli', **kwargs)`

New in version 2019.2.0.

Execute an arbitrary RPC request via the Nexus API.

**commands**

The RPC commands to be executed.

**method: cli**

The type of the response, i.e., raw text (`cli_ascii`) or structured document (`cli`). Defaults to `cli` (structured data).

CLI Example:

```
salt '*' napalm.nxos_api_rpc 'show version'
```

`salt.modules.napalm_mod.nxos_api_show(commands, raw_text=True, **kwargs)`

New in version 2019.2.0.

Execute one or more show (non-configuration) commands.

**commands**

The commands to be executed.

**raw\_text: True**

Whether to return raw text or structured data.

CLI Example:

```
salt '*' napalm.nxos_api_show 'show version'
salt '*' napalm.nxos_api_show 'show bgp sessions' 'show processes' raw_
→text=False
```

`salt.modules.napalm_mod.pyeapi_call`(*method*, \*args, \*\*kwargs)

New in version 2019.2.0.

Invoke an arbitrary method from the `pyeapi` library. This function forwards the existing connection details to the `pyeapi.run_commands` execution function.

**method**

The name of the `pyeapi` method to invoke.

**kwargs**

Key-value arguments to send to the `pyeapi` method.

CLI Example:

```
salt '*' napalm.pyeapi_call run_commands 'show version' encoding=text
salt '*' napalm.pyeapi_call get_config as_string=True
```

`salt.modules.napalm_mod.pyeapi_config`(*commands=None*, *config\_file=None*, *template\_engine='jinja'*, *context=None*, *defaults=None*, *saltenv='base'*, \*\*kwargs)

New in version 2019.2.0.

Configures the Arista switch with the specified commands, via the `pyeapi` library. This function forwards the existing connection details to the `pyeapi.run_commands` execution function.

**commands**

The list of configuration commands to load on the Arista switch.

---

**Note:** This argument is ignored when `config_file` is specified.

---

**config\_file**

The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- salt://
- https://
- ftp:/
- s3:/
- swift://

**template\_engine: jinja**

The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

**context: None**

Variables to add to the template context.

**defaults: None**

Default values of the context dict.

**saltenv: base**

Salt fileserver environment from which to retrieve the file. Ignored if `config_file` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.pyeapi_config 'ntp server 1.2.3.4'
```

`salt.modules.napalm_mod.pyeapi_nxos_api_args`(\*\*prev\_kwargs)

New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the `pyeapi` execution module.

CLI Example:

```
salt '*' napalm.pyeapi_nxos_api_args
```

`salt.modules.napalm_mod.pyeapi_run_commands(*commands, **kwargs)`

Execute a list of commands on the Arista switch, via the `pyeapi` library. This function forwards the existing connection details to the `pyeapi.run_commands` execution function.

**commands**

A list of commands to execute.

**encoding: json**

The requested encoding of the command output. Valid values for encoding are `json` (default) or `text`.

CLI Example:

```
salt '*' napalm.pyeapi_run_commands 'show version' encoding=text
salt '*' napalm.pyeapi_run_commands 'show ip bgp neighbors'
```

`salt.modules.napalm_mod.reconnect(force=False, **kwargs)`

Reconnect the NAPALM proxy when the connection is dropped by the network device. The connection can be forced to be restarted using the `force` argument.

---

**Note:** This function can be used only when running proxy minions.

---

CLI Example:

```
salt '*' napalm.reconnect
salt '*' napalm.reconnect force=True
```

`salt.modules.napalm_mod.rpc(command, **kwargs)`

New in version 2019.2.0.

This is a wrapper to execute RPC requests on various network operating systems supported by NAPALM, invoking the following functions for the NAPALM native drivers:

- `napalm.junos_rpc` for `junos`
- `napalm.pyeapi_run_commands` for `eos`
- `napalm.nxos_api_rpc` for `nxos`
- `napalm.netmiko_commands` for `ios`, `iosxr`, and `nxos_ssh`

**command**

The RPC command to execute. This depends on the nature of the operating system.

**kwargs**

Key-value arguments to be sent to the underlying Execution function.

The function capabilities are extensible in the user environment via the `napalm_rpc_map` configuration option / Pillar, e.g.,

```
napalm_rpc_map:
  f5: napalm.netmiko_commands
  panos: panos.call
```

The mapping above reads: when the NAPALM os Grain is f5, then call `napalm.netmiko_commands` for RPC requests.

By default, if the user does not specify any map, non-native NAPALM drivers will invoke the `napalm.netmiko_commands` Execution function.

CLI Example:

```
salt '*' napalm.rpc 'show version'
salt '*' napalm.rpc get-interfaces
```

`salt.modules.napalm_mod.scp_get`(*remote\_path*, *local\_path=""*, *recursive=False*, *preserve\_times=False*, *\*\*kwargs*)

New in version 2019.2.0.

Transfer files and directories from remote network device to the localhost of the Minion.

---

**Note:** This function is only available only when the underlying library `scp` is installed. See `scp module` for more details.

---

#### **remote\_path**

Path to retrieve from remote host. Since this is evaluated by `scp` on the remote host, shell wildcards and environment variables may be used.

#### **recursive: False**

Transfer files and directories recursively.

#### **preserve\_times: False**

Preserve `mtime` and `atime` of transferred files and directories.

#### **passphrase**

Used for decrypting private keys.

#### **pkey**

An optional private key to use for authentication.

#### **key\_filename**

The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

#### **timeout**

An optional timeout (in seconds) for the TCP connect.

#### **socket\_timeout: 10**

The channel socket timeout in seconds.

#### **buff\_size: 16384**

The size of the SCP send buffer.

#### **allow\_agent: True**

Set to `False` to disable connecting to the SSH agent.

#### **look\_for\_keys: True**

Set to `False` to disable searching for discoverable private key files in `~/ .ssh/`

#### **banner\_timeout**

An optional timeout (in seconds) to wait for the SSH banner to be presented.

#### **auth\_timeout**

An optional timeout (in seconds) to wait for an authentication response.

#### **auto\_add\_policy: False**

Automatically add the host to the `known_hosts`.

CLI Example:

```
salt '*' napalm.scp_get /var/tmp/file /tmp/file auto_add_policy=True
```

`salt.modules.napalm_mod.scp_put`(*files*, *remote\_path=None*, *recursive=False*, *preserve\_times=False*, *saltenv='base'*, *\*\*kwargs*)

New in version 2019.2.0.

Transfer files and directories to remote network device.

---

**Note:** This function is only available only when the underlying library `scp` is installed. See `scp module` for more details.

---

**files**

A single path or a list of paths to be transferred.

**remote\_path**

The path on the remote device where to store the files.

**recursive: True**

Transfer files and directories recursively.

**preserve\_times: False**

Preserve `mtime` and `atime` of transferred files and directories.

**saltenv: base**

The name of the Salt environment. Ignored when `files` is not a `salt://` URL.

**hostname**

The hostname of the remote device.

**port: 22**

The port of the remote device.

**username**

The username required for SSH authentication on the device.

**password**

Used for password authentication. It is also used for private key decryption if `passphrase` is not given.

**passphrase**

Used for decrypting private keys.

**pkey**

An optional private key to use for authentication.

**key\_filename**

The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

**timeout**

An optional timeout (in seconds) for the TCP connect.

**socket\_timeout: 10**

The channel socket timeout in seconds.

**buff\_size: 16384**

The size of the SCP send buffer.

**allow\_agent: True**

Set to `False` to disable connecting to the SSH agent.

**look\_for\_keys: True**

Set to `False` to disable searching for discoverable private key files in `~/ .ssh/`

**banner\_timeout**

An optional timeout (in seconds) to wait for the SSH banner to be presented.

**auth\_timeout**

An optional timeout (in seconds) to wait for an authentication response.

**auto\_add\_policy: False**

Automatically add the host to the `known_hosts`.

CLI Example:

```
salt '*' napalm.scp_put /path/to/file /var/tmp/file auto_add_policy=True
```

## 26.6.283 salt.modules.napalm\_netacl

### NAPALM ACL

Generate and load ACL (firewall) configuration on network devices.

New in version 2017.7.0.

```

codeauthor
    Mircea Ulinic <ping@mirceaulinic.net>

maturity
    new

depends
    capirca, napalm

platform
    unix

```

### Dependencies

The firewall configuration is generated by [Capirca](#).

To install Capirca, execute: `pip install capirca`.

To be able to load configuration on network devices, it requires [NAPALM](#) library to be installed: `pip install napalm`. Please check [Installation](#) for complete details.

`salt.modules.napalm_netacl.get_filter_pillar` (*filter\_name*, *pillar\_key='acl'*, *pillarenv=None*, *saltenv=None*)

Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

**filter\_name**

The name of the filter.

**pillar\_key**

The root key of the whole policy config.

**pillarenv**

Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**

Included only for compatibility with *pillarenv\_from\_saltenv*, and is otherwise ignored.

`salt.modules.napalm_netacl.get_term_pillar` (*filter\_name*, *term\_name*, *pillar\_key='acl'*, *pillarenv=None*, *saltenv=None*)

Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

**filter\_name**

The name of the filter.

**term\_name**

The name of the term.

**pillar\_key: `acl`**

The root key of the whole policy config. Default: `acl`.

**pillarenv**

Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**

Included only for compatibility with *pillarenv\_from\_saltenv*, and is otherwise ignored.

`salt.modules.napalm_netacl.load_filter_config`(*filter\_name*, *filter\_options=None*, *terms=None*, *prepend=True*, *pillar\_key='acl'*, *pillarenv=None*, *saltenv=None*, *merge\_pillar=True*, *only\_lower\_merge=False*, *revision\_id=None*, *revision\_no=None*, *revision\_date=True*, *revision\_date\_format='%Y/%m/%d'*, *test=False*, *commit=True*, *debug=False*, *\*\*kwargs*)

Generate and load the configuration of a policy filter.

---

**Note:** The order of the terms is very important. The configuration loaded on the device respects the order defined in the `terms` and/or inside the pillar.

When merging the `terms` with the pillar data, consider the `prepend` argument to make sure the order is correct!

---

**filter\_name**

The name of the policy filter.

**filter\_options**

Additional filter options. These options are platform-specific. See the complete list of [options](#).

**terms**

List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

**prepend: True**

When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

**pillar\_key: acl**

The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv**

Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**

Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar: True**

Merge the CLI variables with the pillar. Default: `True`.

The merge logic depends on the `prepend` argument and the CLI has higher priority than the pillar.

**only\_lower\_merge: False**

Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

**revision\_id**

Add a comment in the filter config having the description for the changes applied.

**revision\_no**

The revision count.

**revision\_date: True**

Boolean flag: display the date when the filter configuration was generated. Default: `True`.

**revision\_date\_format: %Y/%m/%d**

The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

**test: False**

Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True**

Commit? Default: `True`.

**debug: False**

Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

The output is a dictionary having the same form as `net.load_config`.

CLI Example:

```
salt 'edge01.bjm01' netacl.load_filter_config my-filter pillar_key=netacl
→debug=True
```

Output Example:

```
edge01.bjm01:
-----
already_configured:
  False
comment:
diff:
  [edit firewall]
  +   family inet {
  +     /*
  +       ** $Date: 2017/03/22 $
  +       **
  +       */
  +     filter my-filter {
  +       interface-specific;
  +       term my-term {
  +         from {
  +           source-port [ 1234 1235 ];
  +         }
  +         then {
  +           reject;
  +         }
  +       }
  +       term my-other-term {
  +         from {
  +           protocol tcp;
  +           source-port 5678-5680;
  +         }
  +         then accept;
  +       }
  +     }
  +   }
loaded_config:
  firewall {
    family inet {
      replace:
      /*
      ** $Date: 2017/03/22 $
      **
      */
      filter my-filter {
        interface-specific;
        term my-term {
```

(continues on next page)

(continued from previous page)

```

        from {
            source-port [ 1234 1235 ];
        }
        then {
            reject;
        }
    }
    term my-other-term {
        from {
            protocol tcp;
            source-port 5678-5680;
        }
        then accept;
    }
}
}
}
result:
  True

```

The filter configuration has been loaded from the pillar, having the following structure:

```

netacl:
- my-filter:
  terms:
  - my-term:
    source_port:
    - 1234
    - 1235
    action: reject
  - my-other-term:
    source_port:
    - - 5678
    - 5680
    protocol: tcp
    action: accept

```

`salt.modules.napalm_netacl.load_policy_config`(*filters=None, prepend=True, pillar\_key='acl', pillarenv=None, saltenv=None, merge\_pillar=True, only\_lower\_merge=False, revision\_id=None, revision\_no=None, revision\_date=True, revision\_date\_format='%Y/%m/%d', test=False, commit=True, debug=False, \*\*kwargs*)

Generate and load the configuration of the whole policy.

---

**Note:** The order of the filters and their terms is very important. The configuration loaded on the device respects the order defined in the `filters` and/or inside the pillar.

When merging the `filters` with the pillar data, consider the `prepend` argument to make sure the order is correct!

---

**filters**

List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

**prepend: True**

When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

**pillar\_key: acl**

The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv**

Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**

Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar: True**

Merge the CLI variables with the pillar. Default: `True`.

The merge logic depends on the `prepend` argument and the CLI has higher priority than the pillar.

**only\_lower\_merge: False**

Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

**revision\_id**

Add a comment in the policy config having the description for the changes applied.

**revision\_no**

The revision count.

**revision\_date: True**

Boolean flag: display the date when the policy configuration was generated. Default: `True`.

**revision\_date\_format: %Y/%m/%d**

The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

**test: False**

Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True**

Commit? Default: `True`.

**debug: False**

Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

The output is a dictionary having the same form as `net.load_config`.

CLI Example:

```
salt 'edge01.flw01' netacl.load_policy_config debug=True
```

Output Example:

```
edge01.flw01:
-----
  already_configured:
    False
  comment:
  diff:
  ---
```

  terms:
    - first-term:
      protocol:
        - icmp
      action: reject

```

`salt.modules.napalm_netacl.load_term_config`(*filter\_name*, *term\_name*, *filter\_options=None*, *pillar\_key='acl'*, *pillarenv=None*, *saltenv=None*, *merge\_pillar=True*, *revision\_id=None*, *revision\_no=None*, *revision\_date=True*, *revision\_date\_format='%Y/%m/%d'*, *test=False*, *commit=True*, *debug=False*, *source\_service=None*, *destination\_service=None*, **\*\*term\_fields**)

Generate and load the configuration of a policy term.

**filter\_name**

The name of the policy filter.

**term\_name**

The name of the term.

**filter\_options**

Additional filter options. These options are platform-specific. See the complete list of [options](#).

**pillar\_key: acl**

The key in the pillar containing the default attributes values. Default: `acl`. If the pillar contains the following structure:

```

firewall:
- my-filter:
  terms:
    - my-term:
      source_port: 1234
      source_address:
        - 1.2.3.4/32
        - 5.6.7.8/32

```

The `pillar_key` field would be specified as `firewall`.

**pillarenv**

Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**

Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar: True**

Merge the CLI variables with the pillar. Default: `True`.

The properties specified through the CLI have higher priority than the pillar.

**revision\_id**

Add a comment in the term config having the description for the changes applied.

**revision\_no**

The revision count.

**revision\_date: True**

Boolean flag: display the date when the term configuration was generated. Default: `True`.

**revision\_date\_format:** `%Y/%m/%d`

The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

**test:** `False`

Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit:** `True`

Commit? Default: `True`.

**debug:** `False`

Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**source\_service**

A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `source_port` and protocol.

As this module is available on Unix platforms only, it reads the [IANA](#) port assignment from `/etc/services`.

If the user requires additional shortcuts to be referenced, they can add entries under `/etc/services`, which can be managed using the [file state](#).

**destination\_service**

A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `destination_port` and protocol. Allows the same options as `source_service`.

**term\_fields**

Term attributes. To see what fields are supported, please consult the list of supported [keywords](#). Some platforms have a few other [optional](#) keywords.

---

**Note:** The following fields are accepted (some being platform-specific):

- `action`
- `address`
- `address_exclude`
- `comment`
- `counter`
- `expiration`
- `destination_address`
- `destination_address_exclude`
- `destination_port`
- `destination_prefix`
- `forwarding_class`
- `forwarding_class_except`
- `logging`
- `log_name`
- `loss_priority`
- `option`
- `policer`
- `port`
- `precedence`
- `principals`
- `protocol`
- `protocol_except`
- `qos`
- `pan_application`
- `routing_instance`
- `source_address`
- `source_address_exclude`

- source\_port
  - source\_prefix
  - verbatim
  - packet\_length
  - fragment\_offset
  - hop\_limit
  - icmp\_type
  - ether\_type
  - traffic\_class\_count
  - traffic\_type
  - translated
  - dscp\_set
  - dscp\_match
  - dscp\_except
  - next\_ip
  - flexible\_match\_range
  - source\_prefix\_except
  - destination\_prefix\_except
  - vpn
  - source\_tag
  - destination\_tag
  - source\_interface
  - destination\_interface
  - flattened
  - flattened\_addr
  - flattened\_saddr
  - flattened\_daddr
  - priority
- 

**Note:** The following fields can be also a single value and a list of values:

- action
- address
- address\_exclude
- comment
- destination\_address
- destination\_address\_exclude
- destination\_port
- destination\_prefix
- forwarding\_class
- forwarding\_class\_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol\_except
- pan\_application
- source\_address
- source\_address\_exclude
- source\_port
- source\_prefix

- verbatim
- icmp\_type
- ether\_type
- traffic\_type
- dscp\_match
- dscp\_except
- flexible\_match\_range
- source\_prefix\_except
- destination\_prefix\_except
- source\_tag
- destination\_tag
- source\_service
- destination\_service

Example: `destination_address` can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:  
- 172.17.17.1/24  
- 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:  
- ntp  
- snmp  
- ldap  
- bgpd
```

---

**Note:** The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:  
- - 1000  
- 2000  
- - 3000  
- 4000
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

---

The output is a dictionary having the same form as `net.load_config`.

CLI Example:

```
salt 'edge01.bjm01' netacl.load_term_config filter-name term-name source_  
↪address=1.2.3.4 destination_address=5.6.7.8 action=accept test=Trueⓧ  
↪debug=True
```

Output Example:

```

edge01.bjm01:
-----
already_configured:
  False
comment:
  Configuration discarded.
diff:

## 26.6.284 salt.modules.napalm\_network

### NAPALM Network

Basic methods for interaction with the network device through the virtual proxy 'napalm'.

**codeauthor**

Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

**maturity**

new

**depends**

napalm

**platform**

unix

### Dependencies

- *napalm proxy minion*

New in version 2016.11.0.

Changed in version 2017.7.0.

`salt.modules.napalm_network.arp(interface="", ipaddr="", macaddr="", **kwargs)`

NAPALM returns a list of dictionaries with details of the ARP entries.

**Parameters**

- **interface** -- interface name to filter on
- **ipaddr** -- IP address to filter on
- **macaddr** -- MAC address to filter on

**Returns**

List of the entries in the ARP table

CLI Example:

```
salt '*' net.arp
salt '*' net.arp macaddr='5c:5e:ab:da:3c:f0'
```

Example output:

```
[
  {
    'interface' : 'MgmtEth0/RSP0/CPU0/0',
    'mac'       : '5c:5e:ab:da:3c:f0',
    'ip'        : '172.17.17.1',
    'age'       : 1454496274.84
  },
  {
```

(continues on next page)

(continued from previous page)

```

    'interface': 'MgmtEth0/RSP0/CPU0/0',
    'mac'       : '66:0e:94:96:e0:ff',
    'ip'        : '172.17.17.2',
    'age'       : 1435641582.49
  }
]

```

```

salt.modules.napalm_network.blockreplace(marker_start, marker_end, content="",
                                           append_if_not_found=False,
                                           prepend_if_not_found=False, show_changes=True,
                                           append_newline=False, source='running', path=None,
                                           test=False, commit=True, debug=False, replace=True)

```

New in version 2019.2.0.

Replace content of the configuration source, delimited by the line markers.

A block of content delimited by comments can help you manage several lines without worrying about old entries removal.

**marker\_start**

The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output.

**marker\_end**

The line content identifying a line as the end of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output.

**content**

The content to be used between the two lines identified by `marker_start` and `marker_stop`.

**append\_if\_not\_found: False**

If markers are not found and set to `True` then, the markers and content will be appended to the file.

**prepend\_if\_not\_found: False**

If markers are not found and set to `True` then, the markers and content will be prepended to the file.

**append\_newline: False**

Controls whether or not a newline is appended to the content block. If the value of this argument is `True` then a newline will be added to the content block. If it is `False`, then a newline will not be added to the content block. If it is `None` then a newline will only be added to the content block if it does not already end in a newline.

**show\_changes: True**

Controls how changes are presented. If `True`, this function will return the of the changes made. If `False`, then it will return a boolean (`True` if any changes were made, otherwise `False`).

**source: running**

The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

**path: None**

Save the temporary configuration to a specific path, then read from there. This argument is optional, can be used when you prefers a particular location of the temporary file.

**test: False**

Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True**

Commit the configuration changes? Default: `True`.

**debug: False**

Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace: True**

Load and replace the configuration. Default: True.

CLI Example:

```
salt '*' net.blockreplace 'ntp' 'interface' ''
```

`salt.modules.napalm_network.cancel_commit(jid)`

New in version 2019.2.0.

Cancel a commit scheduled to be executed via the `commit_in` and `commit_at` arguments from the `net.load_template` or `net.load_config` execution functions. The commit ID is displayed when the commit is scheduled via the functions named above.

CLI Example:

```
salt '*' net.cancel_commit 20180726083540640360
```

`salt.modules.napalm_network.cli(*commands, **kwargs)`

Returns a dictionary with the raw output of all commands passed as arguments.

**commands**

List of commands to be executed on the device.

**textfsm\_parse: False**

Try parsing the outputs using the TextFSM templates.

New in version 2018.3.0.

---

**Note:** This option can be also specified in the minion configuration file or pillar as `napalm_cli_textfsm_parse`.

---

**textfsm\_path**

The path where the TextFSM templates can be found. This option implies the usage of the TextFSM index file. `textfsm_path` can be either absolute path on the server, either specified using the following URL mschemes: `file://`, `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://`.

New in version 2018.3.0.

---

**Note:** This needs to be a directory with a flat structure, having an index file (whose name can be specified using the `index_file` option) and a number of TextFSM templates.

---

---

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_path`.

---

**textfsm\_template**

The path to a certain the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

New in version 2018.3.0.

**textfsm\_template\_dict**

A dictionary with the mapping between a command and the corresponding TextFSM path to use to extract the data. The TextFSM paths can be specified as in `textfsm_template`.

New in version 2018.3.0.

---

**Note:** This option can be also specified in the minion configuration file or pillar as `napalm_cli_textfsm_template_dict`.

---

**platform\_grain\_name: os**

The name of the grain used to identify the platform name in the TextFSM index file. Default: `os`.

New in version 2018.3.0.

---

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_platform_grain`.

---

**platform\_column\_name: Platform**

The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: `Platform`.

New in version 2018.3.0.

---

**Note:** This is field is case sensitive, make sure to assign the correct value to this option, exactly as defined in the index file.

---

---

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_platform_column_name`.

---

**index\_file: index**

The name of the TextFSM index file, under the `textfsm_path`. Default: `index`.

New in version 2018.3.0.

---

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_index_file`.

---

**saltenv: base**

Salt fileserver environment from which to retrieve the file. Ignored if `textfsm_path` is not a `salt:/` / URL.

New in version 2018.3.0.

**include\_empty: False**

Include empty files under the `textfsm_path`.

New in version 2018.3.0.

**include\_pat**

Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

New in version 2018.3.0.

**exclude\_pat**

Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

New in version 2018.3.0.

**Note:** If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

CLI Example:

```
salt '*' net.cli "show version" "show chassis fan"
```

CLI Example with TextFSM template:

```
salt '*' net.cli textfsm_parse=True textfsm_path=salt://textfsm/
```

Example output:

```
{
  'show version and haiku': 'Hostname: re0.edge01.arn01
                             Model: mx480
                             Junos: 13.3R6.5
                             Help me, Obi-Wan
                             I just saw Episode Two
                             You're my only hope
                             ',
  'show chassis fan' : 'Item          Status   RPM     ⓧ
→Measurement
                        Top Rear Fan   OK       3840    ⓧ
→Spinning at intermediate-speed
                        Bottom Rear Fan  OK       3840    ⓧ
→Spinning at intermediate-speed
                        Top Middle Fan   OK       3900    ⓧ
→Spinning at intermediate-speed
                        Bottom Middle Fan OK       3840    ⓧ
→Spinning at intermediate-speed
                        Top Front Fan    OK       3810    ⓧ
→Spinning at intermediate-speed
                        Bottom Front Fan  OK       3840    ⓧ
→Spinning at intermediate-speed
                        '
}
```

Example output with TextFSM parsing:

```
{
  "comment": "",
  "result": true,
  "out": {
    "sh ver": [
      {
        "kernel": "9.1S3.5",
        "documentation": "9.1S3.5",
        "boot": "9.1S3.5",
        "crypto": "9.1S3.5",
        "chassis": "",
        "routing": "9.1S3.5",
        "base": "9.1S3.5",
```

(continues on next page)

(continued from previous page)

```

    "model": "mx960"
  }
]
}
}

```

`salt.modules.napalm_network.commit`(*inherit\_napalm\_device=None*, *\*\*kwargs*)

Commits the configuration changes made on the network device.

CLI Example:

```
salt '*' net.commit
```

`salt.modules.napalm_network.compare_config`(*inherit\_napalm\_device=None*, *\*\*kwargs*)

Returns the difference between the running config and the candidate config.

CLI Example:

```
salt '*' net.compare_config
```

`salt.modules.napalm_network.config`(*source=None*, *\*\*kwargs*)

New in version 2017.7.0.

Return the whole configuration of the network device. By default, it will return all possible configuration sources supported by the network device. At most, there will be:

- running config
- startup config
- candidate config

To return only one of the configurations, you can use the `SOURCE` argument.

#### source

Which configuration type you want to display, default is all of them.

Options:

- running
- candidate
- startup

#### Returns

The object returned is a dictionary with the following keys:

- **running (string):** Representation of the native running configuration.
- **candidate (string):** Representation of the native candidate configuration.  
If the device doesn't differentiate between running and startup configuration this will an empty string.
- **startup (string):** Representation of the native startup configuration.  
If the device doesn't differentiate between running and startup configuration this will an empty string.

CLI Example:

```

salt '*' net.config
salt '*' net.config source=candidate

```

`salt.modules.napalm_network.config_changed`(*inherit\_napalm\_device=None*, *\*\*kwargs*)

Will prompt if the configuration has been changed.

**Returns**

A tuple with a boolean that specifies if the config was changed on the device. And a string that provides more details of the reason why the configuration was not changed.

CLI Example:

```
salt '*' net.config_changed
```

`salt.modules.napalm_network.config_control`(*inherit\_napalm\_device=None*, *\*\*kwargs*)

Will check if the configuration was changed. If differences found, will try to commit. In case commit unsuccessful, will try to rollback.

**Returns**

A tuple with a boolean that specifies if the config was changed/committed/rollbacked on the device. And a string that provides more details of the reason why the configuration was not committed properly.

CLI Example:

```
salt '*' net.config_control
```

`salt.modules.napalm_network.confirm_commit`(*jid*)

New in version 2019.2.0.

Confirm a commit scheduled to be reverted via the `revert_in` and `revert_at` arguments from the `net.load_template` or `net.load_config` execution functions. The commit ID is displayed when the commit confirmed is scheduled via the functions named above.

CLI Example:

```
salt '*' net.confirm_commit 20180726083540640360
```

`salt.modules.napalm_network.connected`(*\*\*kwargs*)

Specifies if the connection to the device succeeded.

CLI Example:

```
salt '*' net.connected
```

`salt.modules.napalm_network.discard_config`(*inherit\_napalm\_device=None*, *\*\*kwargs*)

Discards the changes applied.

CLI Example:

```
salt '*' net.discard_config
```

`salt.modules.napalm_network.environment`(*\*\*kwargs*)

Returns the environment of the device.

CLI Example:

```
salt '*' net.environment
```

Example output:

```

{
  'fans': {
    'Bottom Rear Fan': {
      'status': True
    },
    'Bottom Middle Fan': {
      'status': True
    },
    'Top Middle Fan': {
      'status': True
    },
    'Bottom Front Fan': {
      'status': True
    },
    'Top Front Fan': {
      'status': True
    },
    'Top Rear Fan': {
      'status': True
    }
  },
  'memory': {
    'available_ram': 16349,
    'used_ram': 4934
  },
  'temperature': {
    'FPC 0 Exhaust A': {
      'is_alert': False,
      'temperature': 35.0,
      'is_critical': False
    }
  },
  'cpu': {
    '1': {
      '%usage': 19.0
    },
    '0': {
      '%usage': 35.0
    }
  }
}

```

`salt.modules.napalm_network.facts(**kwargs)`

Returns characteristics of the network device. :return: a dictionary with the following keys:

- uptime - Uptime of the device in seconds.
- vendor - Manufacturer of the device.
- model - Device model.
- hostname - Hostname of the device
- fqdn - Fqdn of the device
- os\_version - String with the OS version running on the device.
- serial\_number - Serial number of the device
- interface\_list - List of the interfaces of the device

CLI Example:

```
salt '*' net.facts
```

Example output:

```
{
  'os_version': '13.3R6.5',
  'uptime': 10117140,
  'interface_list': [
    'lc-0/0/0',
    'pfe-0/0/0',
    'pfh-0/0/0',
    'xe-0/0/0',
    'xe-0/0/1',
    'xe-0/0/2',
    'xe-0/0/3',
    'gr-0/0/10',
    'ip-0/0/10'
  ],
  'vendor': 'Juniper',
  'serial_number': 'JN131356FBFA',
  'model': 'MX480',
  'hostname': 're0.edge05.syd01',
  'fqdn': 're0.edge05.syd01'
}
```

`salt.modules.napalm_network.interfaces(**kwargs)`

Returns details of the interfaces on the device.

#### Returns

Returns a dictionary of dictionaries. The keys for the first dictionary will be the interfaces in the devices.

CLI Example:

```
salt '*' net.interfaces
```

Example output:

```
{
  'Management1': {
    'is_up': False,
    'is_enabled': False,
    'description': '',
    'last_flapped': -1,
    'speed': 1000,
    'mac_address': 'dead:beef:dead',
  },
  'Ethernet1': {
    'is_up': True,
    'is_enabled': True,
    'description': 'foo',
    'last_flapped': 1429978575.1554043,
    'speed': 1000,
    'mac_address': 'beef:dead:beef',
  }
}
```

(continues on next page)

(continued from previous page)

}

`salt.modules.napalm_network.ipaddrs(**kwargs)`

Returns IP addresses configured on the device.

#### Returns

A dictionary with the IPv4 and IPv6 addresses of the interfaces. Returns all configured IP addresses on all interfaces as a dictionary of dictionaries. Keys of the main dictionary represent the name of the interface. Values of the main dictionary represent are dictionaries that may consist of two keys 'ipv4' and 'ipv6' (one, both or none) which are themselves dictionaries with the IP addresses as keys.

CLI Example:

```
salt '*' net.ipaddrs
```

Example output:

```
{
  'FastEthernet8': {
    'ipv4': {
      '10.66.43.169': {
        'prefix_length': 22
      }
    }
  },
  'Loopback555': {
    'ipv4': {
      '192.168.1.1': {
        'prefix_length': 24
      }
    },
    'ipv6': {
      '1::1': {
        'prefix_length': 64
      },
      '2001:DB8:1::1': {
        'prefix_length': 64
      },
      'FE80::3': {
        'prefix_length': 'N/A'
      }
    }
  }
}
```

`salt.modules.napalm_network.lldp(interface="", **kwargs)`

Returns a detailed view of the LLDP neighbors.

#### Parameters

**interface** -- interface name to filter on

#### Returns

A dictionary with the LLDP neighbors. The keys are the interfaces with LLDP activated on.

CLI Example:

```
salt '*' net.lldp
salt '*' net.lldp interface='TenGigE0/0/0/8'
```

Example output:

```
{
  'TenGigE0/0/0/8': [
    {
      'parent_interface': 'Bundle-Ether8',
      'interface_description': 'TenGigE0/0/0/8',
      'remote_chassis_id': '8c60.4f69.e96c',
      'remote_system_name': 'switch',
      'remote_port': 'Eth2/2/1',
      'remote_port_description': 'Ethernet2/2/1',
      'remote_system_description': 'Cisco Nexus Operating System
→(NX-OS) Software 7.1(0)N1(1a)
      TAC support: http://www.cisco.com/tac
      Copyright (c) 2002-2015, Cisco Systems, Inc. All rights
→reserved.',
      'remote_system_capab': 'B, R',
      'remote_system_enable_capab': 'B'
    }
  ]
}
```

`salt.modules.napalm_network.load_config`(*filename=None, text=None, test=False, commit=True, debug=False, replace=False, commit\_in=None, commit\_at=None, revert\_in=None, revert\_at=None, commit\_jid=None, inherit\_napalm\_device=None, saltenv='base', \*\*kwargs*)

Applies configuration changes on the device. It can be loaded from a file or from inline string. If you send both a filename and a string containing the configuration, the file has higher precedence.

By default this function will commit the changes. If there are no changes, it does not commit and the flag `already_configured` will be set as `True` to point this out.

To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To keep the changes but not commit, set `commit` to `False`.

To replace the config, set `replace` to `True`.

#### filename

Path to the file containing the desired configuration. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

Changed in version 2018.3.0.

#### text

String containing the desired configuration. This argument is ignored when `filename` is specified.

#### test: False

Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True**

Commit? Default: `True`.

**debug: False**

Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

New in version 2016.11.2.

**replace: False**

Load and replace the configuration. Default: `False`.

New in version 2016.11.2.

**commit\_in: None**

Commit the changes in a specific number of minutes / hours. Example of accepted formats: `5` (commit in 5 minutes), `2m` (commit in 2 minutes), `1h` (commit the changes in 1 hour), `5h30m` (commit the changes in 5 hours and 30 minutes).

---

**Note:** This feature works on any platforms, as it does not rely on the native features of the network operating system.

---

---

**Note:** After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

---

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the `diff` may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**commit\_at: None**

Commit the changes at a specific time. Example of accepted formats: `1am` (will commit the changes at the next 1AM), `13:20` (will commit at 13:20), `1:20am`, etc.

---

**Note:** This feature works on any platforms, as it does not rely on the native features of the network operating system.

---

---

**Note:** After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

---

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the `diff` may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**revert\_in: None**

Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats:

5 (revert in 5 minutes), 2m (revert in 2 minutes), 1h (revert the changes in 1 hour), 5h30m (revert the changes in 5 hours and 30 minutes).

---

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

---

**Warning:** This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**revert\_at: None**

Commit and revert the changes at a specific time. Example of accepted formats: 1am (will commit and revert the changes at the next 1AM), 13:20 (will commit and revert at 13:20), 1:20am, etc.

---

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

---

**Warning:** This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**saltenv: base**

Specifies the Salt environment name.

New in version 2018.3.0.

**Returns**

a dictionary having the following keys:

- result (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- comment (str): a message for the user

- `already_configured` (bool): flag to check if there were no changes applied
- `loaded_config` (str): the configuration loaded on the device. Requires `debug` to be set as `True`
- `diff` (str): returns the config changes applied

CLI Example:

```
salt '*' net.load_config text='ntp peer 192.168.0.1'
salt '*' net.load_config filename='/absolute/path/to/your/file'
salt '*' net.load_config filename='/absolute/path/to/your/file' test=True
salt '*' net.load_config filename='/absolute/path/to/your/file'
  ↳ commit=False
```

Example output:

```
{
  'comment': 'Configuration discarded.',
  'already_configured': False,
  'result': True,
  'diff': '[edit interfaces xe-0/0/5]+ description "Adding a
  ↳ description";'
}
```

`salt.modules.napalm_network.load_template` (*template\_name=None, template\_source=None, context=None, defaults=None, template\_engine='jinja', saltenv='base', template\_hash=None, template\_hash\_name=None, skip\_verify=False, test=False, commit=True, debug=False, replace=False, commit\_in=None, commit\_at=None, revert\_in=None, revert\_at=None, inherit\_napalm\_device=None, \*\*template\_vars*)

Renders a configuration template (default: Jinja) and loads the result on the device.

By default this function will commit the changes. If there are no changes, it does not commit, discards the config and the flag `already_configured` will be set as `True` to point this out.

To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To preserve the changes, set `commit` to `False`. However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set `replace` to `True`.

#### **template\_name**

Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the `file_roots` as specified in the master config file. For example, let's suppose the `file_roots` is configured as:

```
file_roots:
  base:
    - /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as `salt://templates/example.jinja`. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via `http`, `https` or `ftp`.

Examples:

- `salt://my_template.jinja`

- `/absolute/path/to/my_template.jinja`
- `http://example.com/template.cheetah`
- `https://example.com/template.mako`
- `ftp://example.com/template.py`

Changed in version 2019.2.0: This argument can now support a list of templates to be rendered. The resulting configuration text is loaded at once, as a single configuration chunk.

**template\_source: None**

Inline config template to be rendered and loaded on the device.

**template\_hash: None**

Hash of the template file. Format: `{hash_type: 'md5', 'hsum': <md5sum>}`

New in version 2016.11.2.

**context: None**

Overrides default context variables passed to the template.

New in version 2019.2.0.

**template\_hash\_name: None**

When `template_hash` refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.11.2.

**saltenv: base**

Specifies the template environment. This will influence the relative imports inside the templates.

New in version 2016.11.2.

**template\_engine: jinja**

The following templates engines are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

New in version 2016.11.2.

**skip\_verify: True**

If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.11.2.

**test: False**

Dry run? If set to `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True**

Commit? (default: `True`)

**debug: False**

Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw result after the template was rendered.

New in version 2016.11.2.

**replace: False**

Load and replace the configuration.

New in version 2016.11.2.

**commit\_in: None**

Commit the changes in a specific number of minutes / hours. Example of accepted formats: `5` (commit in 5 minutes), `2m` (commit in 2 minutes), `1h` (commit the changes in 1 hour), `5h30m` (commit the changes in 5 hours and 30 minutes).

---

**Note:** This feature works on any platforms, as it does not rely on the native features of the network operating system.

---

---

**Note:** After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

---

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**commit\_at: None**

Commit the changes at a specific time. Example of accepted formats: `1am` (will commit the changes at the next 1AM), `13:20` (will commit at 13:20), `1:20am`, etc.

---

**Note:** This feature works on any platforms, as it does not rely on the native features of the network operating system.

---

---

**Note:** After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

---

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**revert\_in: None**

Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats: `5` (revert in 5 minutes), `2m` (revert in 2 minutes), `1h` (revert the changes in 1 hour), `5h30m` (revert the changes in 5 hours and 30 minutes).

---

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

---

**Warning:** This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt

will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**revert\_at: None**

Commit and revert the changes at a specific time. Example of accepted formats: `1am` (will commit and revert the changes at the next 1AM), `13:20` (will commit and revert at 13:20), `1:20am`, etc.

---

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

---

**Warning:** This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**defaults: None**

Default variables/context passed to the template.

New in version 2016.11.2.

**template\_vars**

Dictionary with the arguments/context to be used when the template is rendered.

---

**Note:** Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see the examples below!

---

---

**Note:** It is more recommended to use the `context` argument to avoid conflicts between CLI arguments and template variables.

---

**Returns**

a dictionary having the following keys:

- `result` (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- `comment` (str): a message for the user
- `already_configured` (bool): flag to check if there were no changes applied

- `loaded_config` (str): the configuration loaded on the device, after rendering the template. Requires `debug` to be set as `True`
- `diff` (str): returns the config changes applied

The template can use variables from the `grains`, `pillar` or `opts`, for example:

```
{% set router_model = grains.get('model') -%}
{% set router_vendor = grains.get('vendor') -%}
{% set os_version = grains.get('version') -%}
{% set hostname = pillar.get('proxy', {}).get('host') -%}
{% if router_vendor|lower == 'juniper' %}
system {
    host-name {{hostname}};
}
{% elif router_vendor|lower == 'cisco' %}
hostname {{hostname}}
{% endif %}
```

CLI Examples:

```
salt '*' net.load_template set_ntp_peers peers=[192.168.0.1] # uses
→NAPALM default templates

# inline template:
salt -G 'os:junos' net.load_template template_source='system { host-name {
→{host_name}}; }'          host_name='MX480.lab'

# inline template using grains info:
salt -G 'os:junos' net.load_template          template_source='system {
→host-name {{grains.model}}.lab; }'
# if the device is a MX480, the command above will set the hostname as:
→MX480.lab

# inline template using pillar data:
salt -G 'os:junos' net.load_template template_source='system { host-name {
→{pillar.proxy.host}}; }'

salt '*' net.load_template https://bit.ly/20hSgqP hostname=example #
→will commit
salt '*' net.load_template https://bit.ly/20hSgqP hostname=example
→test=True # dry run

salt '*' net.load_template salt://templates/example.jinja debug=True #
→Using the salt:// URI

# render a mako template:
salt '*' net.load_template salt://templates/example.mako template_
→engine=mako debug=True

# render remote template
salt -G 'os:junos' net.load_template http://bit.ly/2fReJg7 test=True
→debug=True peers=['192.168.0.1']
salt -G 'os:ios' net.load_template http://bit.ly/2gK0j20 test=True
→debug=True peers=['192.168.0.1']
```

(continues on next page)

(continued from previous page)

```
# render multiple templates at once
salt '*' net.load_template "['https://bit.ly/20hSgqP', 'salt://templates/
→example.jinja']" context="{ 'hostname': 'example' }"
```

Example output:

```
{
  'comment': '',
  'already_configured': False,
  'result': True,
  'diff': '[edit system]+ host-name edge01.bjm01',
  'loaded_config': 'system { host-name edge01.bjm01; }'
}
```

`salt.modules.napalm_network.mac`(*address=""*, *interface=""*, *vlan=0*, *\*\*kwargs*)

Returns the MAC Address Table on the device.

**Parameters**

- **address** -- MAC address to filter on
- **interface** -- Interface name to filter on
- **vlan** -- VLAN identifier

**Returns**

A list of dictionaries representing the entries in the MAC Address Table

CLI Example:

```
salt '*' net.mac
salt '*' net.mac vlan=10
```

Example output:

```
[
  {
    'mac'       : '00:1c:58:29:4a:71',
    'interface' : 'xe-3/0/2',
    'static'    : False,
    'active'    : True,
    'moves'     : 1,
    'vlan'      : 10,
    'last_move' : 1454417742.58
  },
  {
    'mac'       : '8c:60:4f:58:e1:c1',
    'interface' : 'xe-1/0/1',
    'static'    : False,
    'active'    : True,
    'moves'     : 2,
    'vlan'      : 42,
    'last_move' : 1453191948.11
  }
]
```

`salt.modules.napalm_network.optics(**kwargs)`

New in version 2017.7.0.

Fetches the power usage on the various transceivers installed on the network device (in dBm), and returns a view that conforms with the OpenConfig model `openconfig-platform-transceiver.yang`.

#### Returns

Returns a dictionary where the keys are as listed below:

- **intf\_name** (unicode)
  - **physical\_channels**
    - \* **channels** (list of dicts)
      - **index** (int)
      - **state**
        - input\_power**
          - instant (float)
          - avg (float)
          - min (float)
          - max (float)
        - output\_power**
          - instant (float)
          - avg (float)
          - min (float)
          - max (float)
        - laser\_bias\_current**
          - instant (float)
          - avg (float)
          - min (float)
          - max (float)

CLI Example:

```
salt '*' net.optics
```

`salt.modules.napalm_network.patch(patchfile, options="", saltenv='base', source_hash=None, show_changes=True, source='running', path=None, test=False, commit=True, debug=False, replace=True)`

New in version 2019.2.0.

Apply a patch to the configuration source, and load the result into the running config of the device.

#### patchfile

A patch file to apply to the configuration source.

#### options

Options to pass to patch.

**source\_hash**

If the patch file (specified via the `patchfile` argument) is an HTTP(S) or FTP URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

**show\_changes: True**

Controls how changes are presented. If `True`, this function will return the of the changes made. If `False`, then it will return a boolean (`True` if any changes were made, otherwise `False`).

**source: running**

The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

**path: None**

Save the temporary configuration to a specific path, then read from there. This argument is optional, can the user prefers a particular location of the temporary file.

**test: False**

Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True**

Commit the configuration changes? Default: `True`.

**debug: False**

Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace: True**

Load and replace the configuration. Default: `True`.

CLI Example:

```
salt '*' net.patch https://example.com/running_config.patch
```

`salt.modules.napalm_network.ping`(*destination*, *source=None*, *ttl=None*, *timeout=None*, *size=None*, *count=None*, *vrf=None*, *\*\*kwargs*)

Executes a ping on the network device and returns a dictionary as a result.

**destination**

Hostname or IP address of remote host

**source**

Source address of echo request

**ttl**

IP time-to-live value (IPv6 hop-limit value) (1..255 hops)

**timeout**

Maximum wait time after sending final packet (seconds)

**size**

Size of request packets (0..65468 bytes)

**count**

Number of ping requests to send (1..2000000000 packets)

**vrf**

VRF (routing instance) for ping attempt

New in version 2016.11.4.

CLI Example:

```
salt '*' net.ping 8.8.8.8
salt '*' net.ping 8.8.8.8 ttl=3 size=65468
salt '*' net.ping 8.8.8.8 source=127.0.0.1 timeout=1 count=100
```

`salt.modules.napalm_network.replace_pattern`(*pattern*, *repl*, *count*=0, *flags*=8, *bufsize*=1, *append\_if\_not\_found*=False, *prepend\_if\_not\_found*=False, *not\_found\_content*=None, *search\_only*=False, *show\_changes*=True, *backslash\_literal*=False, *source*=None, *path*=None, *test*=False, *replace*=True, *debug*=False, *commit*=True)

New in version 2019.2.0.

Replace occurrences of a pattern in the configuration source. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made. This is a pure Python implementation that wraps Python's `sub()`.

**pattern**

A regular expression, to be matched using Python's `search()`.

**repl**

The replacement text.

**count: 0**

Maximum number of pattern occurrences to be replaced. If `count` is a positive integer `n`, only `n` occurrences will be replaced, otherwise all occurrences will be replaced.

**flags (list or int): 8**

A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., [`'IGNORECASE'`, `'MULTILINE'`]. Optionally, `flags` may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').

**bufsize (int or str): 1**

How much of the configuration to buffer into memory at once. The default value 1 processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

**append\_if\_not\_found: False**

If set to `True`, and `pattern` is not found, then the content will be appended to the file.

**prepend\_if\_not\_found: False**

If set to `True` and `pattern` is not found, then the content will be prepended to the file.

**not\_found\_content**

Content to use for append/prepend if not found. If `None` (default), uses `repl`. Useful when `repl` uses references to group in `pattern`.

**search\_only: False**

If set to `true`, this no changes will be performed on the file, and this function will simply return `True` if the pattern was matched, and `False` if not.

**show\_changes: True**

If `True`, return a diff of changes made. Otherwise, return `True` if changes were made, and `False` if not.

**backslash\_literal: False**

Interpret backslashes as literal backslashes for the `repl` and not escape characters. This will help when using `append/prepend` so that the backslashes are not interpreted for the `repl` on the second run of the state.

**source: running**

The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

**path**

Save the temporary configuration to a specific path, then read from there.

**test: False**

Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True**

Commit the configuration changes? Default: `True`.

**debug: False**

Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace: True**

Load and replace the configuration. Default: True.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' net.replace_pattern "bind-address\s*=" "bind-address:"
```

CLI Example:

```
salt '*' net.replace_pattern PREFIX-LIST_NAME new-prefix-list-name
salt '*' net.replace_pattern bgp-group-name new-bgp-group-name count=1
```

`salt.modules.napalm_network.rollback`(*inherit\_napalm\_device=None*, *\*\*kwargs*)

Rollbacks the configuration.

CLI Example:

```
salt '*' net.rollback
```

`salt.modules.napalm_network.save_config`(*source=None*, *path=None*)

New in version 2019.2.0.

Save the configuration to a file on the local file system.

**source: running**

The configuration source. Choose from: `running`, `candidate`, `startup`. Default: `running`.

**path**

Absolute path to file where to save the configuration. To push the files to the Master, use `cp.push` Execution function.

CLI Example:

```
salt '*' net.save_config source=running
```

`salt.modules.napalm_network.traceroute`(*destination*, *source=None*, *ttl=None*, *timeout=None*, *vrf=None*, *\*\*kwargs*)

Calls the method `traceroute` from the NAPALM driver object and returns a dictionary with the result of the `traceroute` command executed on the device.

**destination**

Hostname or address of remote host

**source**

Source address to use in outgoing traceroute packets

**ttl**

IP maximum time-to-live value (or IPv6 maximum hop-limit value)

**timeout**

Number of seconds to wait for response (seconds)

**vrf**

VRF (routing instance) for traceroute attempt

New in version 2016.11.4.

CLI Example:

```
salt '*' net.traceroute 8.8.8.8
salt '*' net.traceroute 8.8.8.8 source=127.0.0.1 ttl=5 timeout=1
```

## 26.6.285 salt.modules.napalm\_ntp

### NAPALM NTP

Manages NTP on network devices.

#### codeauthor

Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

#### maturity

new

#### depends

napalm

#### platform

unix

### Dependencies

- *NAPALM proxy minion*
- *NET basic features*

See also:

*NTP peers management state*

New in version 2016.11.0.

`salt.modules.napalm_ntp.delete_peers(*peers, **options)`

Removes NTP peers configured on the device.

#### Parameters

- **peers** -- list of IP Addresses/Domain Names to be removed as NTP peers
- **(bool)** (*commit*) -- discard loaded config. By default `test` is `False` (will not discard the changes)
- **(bool)** -- commit loaded config. By default `commit` is `True` (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For a dry run, use the `test` argument.

CLI Example:

```
salt '*' ntp.delete_peers 8.8.8.8 time.apple.com
salt '*' ntp.delete_peers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.delete_peers 192.168.0.1 commit=False # preserves the
→changes, but does not commit
```

`salt.modules.napalm_ntp.delete_servers(*servers, **options)`

Removes NTP servers configured on the device.

#### Parameters

- **servers** -- list of IP Addresses/Domain Names to be removed as NTP servers

- **(bool)** (*commit*) -- discard loaded config. By default `test` is `False` (will not discard the changes)
- **(bool)** -- commit loaded config. By default `commit` is `True` (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For dry run use the `test` argument.

CLI Example:

```
salt '*' ntp.delete_servers 8.8.8.8 time.apple.com
salt '*' ntp.delete_servers 172.17.17.1 test=True # only displays the
→diff
salt '*' ntp.delete_servers 192.168.0.1 commit=False # preserves the
→changes, but does not commit
```

`salt.modules.napalm_ntp.peers(**kwargs)`

Returns a list the NTP peers configured on the network device.

**Returns**

configured NTP peers as list.

CLI Example:

```
salt '*' ntp.peers
```

Example output:

```
[
  '192.168.0.1',
  '172.17.17.1',
  '172.17.17.2',
  '2400:cb00:6:1024::c71b:840a'
]
```

`salt.modules.napalm_ntp.servers(**kwargs)`

Returns a list of the configured NTP servers on the device.

CLI Example:

```
salt '*' ntp.servers
```

Example output:

```
[
  '192.168.0.1',
  '172.17.17.1',
  '172.17.17.2',
  '2400:cb00:6:1024::c71b:840a'
]
```

`salt.modules.napalm_ntp.set_peers(*peers, **options)`

Configures a list of NTP peers on the device.

**Parameters**

- **peers** -- list of IP Addresses/Domain Names
- **(bool)** (*test*) -- discard loaded config. By default `test` is `False` (will not discard the changes)

**Commit commit (bool)**

commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For dry run use the `test` argument.

CLI Example:

```
salt '*' ntp.set_peers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_peers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.set_peers 192.168.0.1 commit=False # preserves the changes,
↳but does not commit
```

**salt.modules.napalm\_ntp.set\_servers(\*servers, \*\*options)**

Configures a list of NTP servers on the device.

**Parameters**

- **servers** -- list of IP Addresses/Domain Names
- **(bool) (test)** -- discard loaded config. By default `test` is False (will not discard the changes)

**Commit commit (bool)**

commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For dry run use the `test` argument.

CLI Example:

```
salt '*' ntp.set_servers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_servers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.set_servers 192.168.0.1 commit=False # preserves the
↳changes, but does not commit
```

**salt.modules.napalm\_ntp.stats(peer=None, \*\*kwargs)**

Returns a dictionary containing synchronization details of the NTP peers.

**Parameters**

**peer** -- Returns only the details of a specific NTP peer.

**Returns**

a list of dictionaries, with the following keys:

- remote
- referenceid
- synchronized
- stratum
- type
- when
- hostpoll
- reachability
- delay
- offset
- jitter

CLI Example:

```
salt '*' ntp.stats
```

Example output:

```
[
  {
    'remote'      : '188.114.101.4',
    'referenceid' : '188.114.100.1',
    'synchronized' : True,
    'stratum'     : 4,
    'type'        : '-',
    'when'        : '107',
    'hostpoll'    : 256,
    'reachability' : 377,
    'delay'       : 164.228,
    'offset'      : -13.866,
    'jitter'      : 2.695
  }
]
```

## 26.6.286 salt.modules.napalm\_probes

### NAPALM Probes

Manages RPM/SLA probes on the network device.

#### codeauthor

Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

#### maturity

new

#### depends

napalm

#### platform

unix

### Dependencies

- *napalm proxy minion*
- *NET basic features*

#### See also:

*Probes configuration management state*

New in version 2016.11.0.

`salt.modules.napalm_probes.config(**kwargs)`

Returns the configuration of the RPM probes.

#### Returns

A dictionary containing the configuration of the RPM/SLA probes.

CLI Example:

```
salt '*' probes.config
```

Output Example:

```
{
  'probe1':{
    'test1': {
      'probe_type'   : 'icmp-ping',
      'target'       : '192.168.0.1',
      'source'       : '192.168.0.2',
      'probe_count'  : 13,
      'test_interval': 3
    },
    'test2': {
      'probe_type'   : 'http-ping',
      'target'       : '172.17.17.1',
      'source'       : '192.17.17.2',
      'probe_count'  : 5,
      'test_interval': 60
    }
  }
}
```

`salt.modules.napalm_probes.delete_probes` (*probes*, *test=False*, *commit=True*, *\*\*kwargs*)

Removes RPM/SLA probes from the network device. Calls the configuration template 'delete\_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be removed from the configuration of the device.

#### Parameters

- **probes** -- Dictionary with a similar format as the output dictionary of the function `config()`, where the details are not necessary.
- **test** -- Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False`
- **commit** -- Commit? (default: `True`) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

#### Raises

**MergeConfigException** -- If there is an error on the configuration sent.

#### Returns

A dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- **comment** (str): a message for the user
- **already\_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

Input example:

```
probes = {
  'existing_probe':{
    'existing_test1': {},
    'existing_test2': {}
  }
}
```

`salt.modules.napalm_probes.results` (*\*\*kwargs*)

Provides the results of the measurements of the RPM/SLA probes.

:return a dictionary with the results of the probes.

CLI Example:

```
salt '*' probes.results
```

Output example:

```
{
  'probe1': {
    'test1': {
      'last_test_min_delay' : 63.120,
      'global_test_min_delay' : 62.912,
      'current_test_avg_delay' : 63.190,
      'global_test_max_delay' : 177.349,
      'current_test_max_delay' : 63.302,
      'global_test_avg_delay' : 63.802,
      'last_test_avg_delay' : 63.438,
      'last_test_max_delay' : 65.356,
      'probe_type' : 'icmp-ping',
      'rtt' : 63.138,
      'last_test_loss' : 0,
      'round_trip_jitter' : -59.0,
      'target' : '192.168.0.1',
      'source' : '192.168.0.2',
      'probe_count' : 15,
      'current_test_min_delay' : 63.138
    },
    'test2': {
      'last_test_min_delay' : 176.384,
      'global_test_min_delay' : 169.226,
      'current_test_avg_delay' : 177.098,
      'global_test_max_delay' : 292.628,
      'current_test_max_delay' : 180.055,
      'global_test_avg_delay' : 177.959,
      'last_test_avg_delay' : 177.178,
      'last_test_max_delay' : 184.671,
      'probe_type' : 'icmp-ping',
      'rtt' : 176.449,
      'last_test_loss' : 0,
      'round_trip_jitter' : -34.0,
      'target' : '172.17.17.1',
      'source' : '172.17.17.2',
      'probe_count' : 15,
      'current_test_min_delay' : 176.402
    }
  }
}
```

`salt.modules.napalm_probes.schedule_probes` (*probes*, *test=False*, *commit=True*, *\*\*kwargs*)

Will schedule the probes. On Cisco devices, it is not enough to define the probes, it is also necessary to schedule them.

This function calls the configuration template `schedule_probes` from the NAPALM library, providing as input a rich formatted dictionary with the names of the probes and the tests to be scheduled.

#### Parameters

- **probes** -- Dictionary with a similar format as the output dictionary of the function `config()`, where the details are not necessary.
- **test** -- Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False`
- **commit** -- Commit? (default: `True`) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

#### Raises

**MergeConfigException** -- If there is an error on the configuration sent.

#### Returns

a dictionary having the following keys:

- `result` (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- `comment` (str): a message for the user
- `already_configured` (bool): flag to check if there were no changes applied
- `diff` (str): returns the config changes applied

Input example:

```
probes = {
    'new_probe': {
        'new_test1': {},
        'new_test2': {}
    }
}
```

`salt.modules.napalm_probes.set_probes` (*probes*, *test=False*, *commit=True*, *\*\*kwargs*)

Configures RPM/SLA probes on the device. Calls the configuration template 'set\_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be configured.

#### Parameters

- **probes** -- Dictionary formatted as the output of the function `config()`
- **test** -- Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False`
- **commit** -- Commit? (default: `True`) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

#### Raises

**MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- `result` (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- `comment` (str): a message for the user
- `already_configured` (bool): flag to check if there were no changes applied
- `diff` (str): returns the config changes applied

Input example - via state/script:

```

probes = {
  'new_probe':{
    'new_test1': {
      'probe_type'   : 'icmp-ping',
      'target'       : '192.168.0.1',
      'source'       : '192.168.0.2',
      'probe_count'  : 13,
      'test_interval': 3
    },
    'new_test2': {
      'probe_type'   : 'http-ping',
      'target'       : '172.17.17.1',
      'source'       : '192.17.17.2',
      'probe_count'  : 5,
      'test_interval': 60
    }
  }
}
set_probes(probes)

```

CLI Example - to push changes on the fly (not recommended):

```

salt 'junos_minion' probes.set_probes "{ 'new_probe':{ 'new_test1':{ 'probe_
→type': 'icmp-ping', 'target': '192.168.0.1', 'source': '192.168.
→0.2', 'probe_count': 13, 'test_interval': 3 } } }" test=True

```

Output example - for the CLI example above:

```

junos_minion:
-----
already_configured:
  False
comment:
  Configuration discarded.
diff:
  [edit services rpm]
      probe transit { ... }
+   probe new_probe {
+     test new_test1 {
+       probe-type icmp-ping;
+       target address 192.168.0.1;
+       probe-count 13;
+       test-interval 3;
+       source-address 192.168.0.2;
+     }
+   }
result:
  True

```

## 26.6.287 salt.modules.napalm\_route

### NAPALM Route

Retrieves route details from network devices.

**codeauthor**  
Mircea Ulinic <ping@mirceaulinic.net>

**maturity**  
new

**depends**  
napalm

**platform**  
unix

### Dependencies

- *NAPALM proxy minion*

New in version 2016.11.0.

`salt.modules.napalm_route.show(destination, protocol=None, **kwargs)`

Displays all details for a certain route learned via a specific protocol. If the protocol is not specified, will return all possible routes.

---

**Note:** This function return the routes from the RIB. In case the destination prefix is too short, there may be too many routes matched. Therefore in cases of devices having a very high number of routes it may be necessary to adjust the prefix length and request using a longer prefix.

---

**destination**  
destination prefix.

**protocol (optional)**  
protocol used to learn the routes to the destination.

Changed in version 2017.7.0.

CLI Example:

```
salt 'my_router' route.show 172.16.0.0/25
salt 'my_router' route.show 172.16.0.0/25 bgp
```

Output example:

```
{
  '172.16.0.0/25': [
    {
      'protocol': 'BGP',
      'last_active': True,
      'current_active': True,
      'age': 1178693,
      'routing_table': 'inet.0',
      'next_hop': '192.168.0.11',
```

(continues on next page)

```
'outgoing_interface': 'xe-1/1/1.100',
'preference': 170,
'selected_next_hop': False,
'protocol_attributes': {
    'remote_as': 65001,
    'metric': 5,
    'local_as': 13335,
    'as_path': '',
    'remote_address': '192.168.0.11',
    'metric2': 0,
    'local_preference': 0,
    'communities': [
        '0:2',
        'no-export'
    ],
    'preference2': -1
},
'inactive_reason': ''
},
{
    'protocol': 'BGP',
    'last_active': False,
    'current_active': False,
    'age': 2359429,
    'routing_table': 'inet.0',
    'next_hop': '192.168.0.17',
    'outgoing_interface': 'xe-1/1/1.100',
    'preference': 170,
    'selected_next_hop': True,
    'protocol_attributes': {
        'remote_as': 65001,
        'metric': 5,
        'local_as': 13335,

        'remote_address': '192.168.0.17',
        'metric2': 0,
        'local_preference': 0,
        'communities': [
            '0:3',
            'no-export'
        ],
        'preference2': -1
    },
    'inactive_reason': 'Not Best in its group - Router ID'
}
]
}
```

## 26.6.288 salt.modules.napalm\_snmp

### NAPALM SNMP

Manages SNMP on network devices.

**codeauthor**  
Mircea Ulinic <ping@mirceaulinic.net>

**maturity**  
new

**depends**  
napalm

**platform**  
unix

### Dependencies

- *NAPALM proxy minion*
- *NET basic features*

See also:

*SNMP configuration management state*

New in version 2016.11.0.

`salt.modules.napalm_snmp.config(**kwargs)`

Returns the SNMP configuration

CLI Example:

```
salt '*' snmp.config
```

`salt.modules.napalm_snmp.remove_config(chassis_id=None, community=None, contact=None, location=None, test=False, commit=True, **kwargs)`

Removes a configuration element from the SNMP configuration.

#### Parameters

- **chassis\_id** -- (optional) Chassis ID
- **community** -- (optional) A dictionary having the following optional keys:
  - **acl** (if any policy / ACL need to be set)
  - **mode**: rw or ro. Default: ro

#### Parameters

- **contact** -- Contact details
- **location** -- Location
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

**Raises**

**MergeConfigException** -- If there is an error on the configuration sent.

**Returns**

A dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already\_configured* flag (example below)
- **comment** (str): a message for the user
- **already\_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

CLI Example:

```
salt '*' snmp.remove_config community='abcd'
```

```
salt.modules.napalm_snmp.update_config(chassis_id=None, community=None, contact=None,
                                       location=None, test=False, commit=True, **kwargs)
```

Updates the SNMP configuration.

**Parameters**

- **chassis\_id** -- (optional) Chassis ID
- **community** -- (optional) A dictionary having the following optional keys:
  - **acl** (if any policy / ACL need to be set)
  - **mode**: rw or ro. Default: ro

**Parameters**

- **contact** -- Contact details
- **location** -- Location
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

**Raises**

**MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- **result** (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already\_configured* flag (example below)
- **comment** (str): a message for the user
- **already\_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

CLI Example:

```
salt 'edge01.lon01' snmp.update_config location="Greenwich, UK" test=True
```

Output example (for the CLI example above):

```
edge01.lon01:
-----
already_configured:
```

(continues on next page)

(continued from previous page)

```

False
comment:
  Configuration discarded.
diff:
  [edit snmp]
  - location "London, UK";
  + location "Greenwich, UK";
result:
  True

```

## 26.6.289 salt.modules.napalm\_users

### NAPALM Users

Manages the configuration of the users on network devices.

    ]
  }
}

```

`salt.modules.napalm_users.delete_users` (*users*, *test=False*, *commit=True*, *\*\*kwargs*)

Removes users from the configuration of network devices.

#### Parameters

- **users** -- Dictionary formatted as the output of the function `config()`
- **test** -- Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False`
- **commit** -- Commit? (default: `True`) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

#### Raises

**MergeConfigException** -- If there is an error on the configuration sent.

#### Return a dictionary having the following keys

- **result** (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- **comment** (str): a message for the user
- **already\_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

CLI Example:

```
salt '*' users.delete_users '{"mircea': {}}"
```

`salt.modules.napalm_users.set_users` (*users*, *test=False*, *commit=True*, *\*\*kwargs*)

Configures users on network devices.

#### Parameters

- **users** -- Dictionary formatted as the output of the function `config()`
- **test** -- Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False`
- **commit** -- Commit? (default: `True`) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify `commit=False` and will not discard the config.

#### Raises

**MergeConfigException** -- If there is an error on the configuration sent.

#### Return a dictionary having the following keys

- **result** (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the

- already\_configured* flag (example below)
- comment (str): a message for the user
- already\_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

CLI Example:

```
salt '*' users.set_users '{"mircea': {}}"
```

## 26.6.290 salt.modules.napalm\_yang\_mod

### NAPALM YANG

NAPALM YANG basic operations.

New in version 2017.7.0.

`salt.modules.napalm_yang_mod.compliance_report`(*data*, *\*models*, *\*\*kwargs*)

Return the compliance report using YANG objects.

**data**

Dictionary structured with respect to the models referenced.

**models**

A list of models to be used when generating the config.

**filepath**

The absolute path to the validation file.

CLI Example:

```
salt '*' napalm_yang.compliance_report {} models.openconfig_interfaces
→filepath=~/.validate.yml
```

Output Example:

```
{
  "skipped": [],
  "complies": true,
  "get_interfaces_ip": {
    "missing": [],
    "complies": true,
    "present": {
      "ge-0/0/0.0": {
        "complies": true,
        "nested": true
      }
    }
  },
  "extra": []
}
```

`salt.modules.napalm_yang_mod.diff`(*candidate*, *running*, *\*models*)

Returns the difference between two configuration entities structured according to the YANG model.

---

**Note:** This function is recommended to be used mostly as a state helper.

---

**candidate**

First model to compare.

**running**

Second model to compare.

**models**

A list of models to be used when comparing.

CLI Example:

```
salt '*' napalm_yang.diff {} {} models.openconfig_interfaces
```

Output Example:

```
{
  "interfaces": {
    "interface": {
      "both": {
        "Port-Channel1": {
          "config": {
            "mtu": {
              "first": "0",
              "second": "9000"
            }
          }
        }
      }
    },
    "first_only": [
      "Loopback0"
    ],
    "second_only": [
      "Loopback1"
    ]
  }
}
```

`salt.modules.napalm_yang_mod.get_config(data, *models, **kwargs)`

Return the native config.

**data**

Dictionary structured with respect to the models referenced.

**models**

A list of models to be used when generating the config.

**profiles: None**

Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

CLI Example:

```
salt '*' napalm_yang.get_config {} models.openconfig_interfaces
```

Output Example:

```
interface et1
  ip address 192.168.1.1/24
  description Uplink1
  mtu 9000
```

(continues on next page)

(continued from previous page)

```
interface et2
  ip address 192.168.2.1/24
  description Uplink2
  mtu 9000
```

`salt.modules.napalm_yang_mod.load_config(data, *models, **kwargs)`

Generate and load the config on the device using the OpenConfig or IETF models and device profiles.

**data**

Dictionary structured with respect to the models referenced.

**models**

A list of models to be used when generating the config.

**profiles: None**

Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

**test: False**

Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

**commit: True**

Commit? Default: True.

**debug: False**

Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace: False**

Should replace the config with the new generate one?

CLI Example:

```
salt '*' napalm_yang.load_config {} models.openconfig_interfaces
→test=True debug=True
```

Output Example:

```
device1:
-----
already_configured:
  False
comment:
diff:

```

`salt.modules.napalm_yang_mod.parse(*models, **kwargs)`

Parse configuration from the device.

**models**

A list of models to be used when parsing.

**config: False**

Parse config.

**state: False**

Parse state.

**profiles: None**

Use certain profiles to parse. If not specified, will use the device default profile(s).

CLI Example:

```
salt '*' napalm_yang.parse models.openconfig_interfaces
```

Output Example:

```

## 26.6.292 salt.modules.netbox

### NetBox

Module to query NetBox

```
codeauthor
    Zach Moody <zmoody@do.co>

maturity
    new

depends
    pynetbox
```

The following config should be in the minion config file. In order to work with `secrets` you should provide a token and path to your private key file:

```
netbox:
  url: <NETBOX_URL>
  token: <NETBOX_USERNAME_API_TOKEN (OPTIONAL)>
  keyfile: </PATH/TO/NETBOX/KEY (OPTIONAL)>
```

New in version 2018.3.0.

`salt.modules.netbox.create_circuit`(*name*, *provider\_id*, *circuit\_type*, *description=None*)

New in version 2019.2.0.

Create a new Netbox circuit

```
name
    Name of the circuit
provider_id
    The netbox id of the circuit provider
circuit_type
    The name of the circuit type
asn
    The ASN of the circuit provider
description
    The description of the circuit
```

CLI Example:

```
salt myminion netbox.create_circuit NEW_CIRCUIT_01 Telia Transit 1299
→ "New Telia circuit"
```

`salt.modules.netbox.create_circuit_provider`(*name*, *asn=None*)

New in version 2019.2.0.

Create a new Netbox circuit provider

```
name
    The name of the circuit provider
asn
    The ASN of the circuit provider
```

CLI Example:

```
salt myminion netbox.create_circuit_provider Telia 1299
```

`salt.modules.netbox.create_circuit_termination`(*circuit, interface, device, speed, xconnect\_id=None, term\_side='A'*)

New in version 2019.2.0.

Terminate a circuit on an interface

**circuit**

The name of the circuit

**interface**

The name of the interface to terminate on

**device**

The name of the device the interface belongs to

**speed**

The speed of the circuit, in Kbps

**xconnect\_id**

The cross-connect identifier

**term\_side**

The side of the circuit termination

CLI Example:

```
salt myminion netbox.create_circuit_termination NEW_CIRCUIT_01 xe-0/0/1x
→myminion 10000 xconnect_id=XCON01
```

`salt.modules.netbox.create_circuit_type`(*name*)

New in version 2019.2.0.

Create a new Netbox circuit type.

**name**

The name of the circuit type

CLI Example:

```
salt myminion netbox.create_circuit_type Transit
```

`salt.modules.netbox.create_device`(*name, role, model, manufacturer, site*)

New in version 2019.2.0.

Create a new device with a name, role, model, manufacturer and site. All these components need to be already in Netbox.

**name**

The name of the device, e.g., edge\_router

**role**

String of device role, e.g., router

**model**

String of device model, e.g., MX480

**manufacturer**

String of device manufacturer, e.g., Juniper

**site**

String of device site, e.g., BRU

CLI Example:

```
salt myminion netbox.create_device edge_router router MX480 Juniper BRU
```

`salt.modules.netbox.create_device_role`(*role, color*)

New in version 2019.2.0.

Create a device role

**role**

String of device role, e.g., router

CLI Example:

```
salt myminion netbox.create_device_role router
```

`salt.modules.netbox.create_device_type`(*model, manufacturer*)

New in version 2019.2.0.

Create a device type. If the manufacturer doesn't exist, create a new manufacturer.

**model**

String of device model, e.g., MX480

**manufacturer**

String of device manufacturer, e.g., Juniper

CLI Example:

```
salt myminion netbox.create_device_type MX480 Juniper
```

`salt.modules.netbox.create_interface`(*device\_name, interface\_name, mac\_address=None, description=None, enabled=None, lag=None, lag\_parent=None, form\_factor=None*)

New in version 2019.2.0.

Attach an interface to a device. If not all arguments are provided, they will default to Netbox defaults.

**device\_name**

The name of the device, e.g., edge\_router

**interface\_name**

The name of the interface, e.g., TenGigE0/0/0/0

**mac\_address**

String of mac address, e.g., 50:87:89:73:92:C8

**description**

String of interface description, e.g., NTT

**enabled**

String of boolean interface status, e.g., True

**lag:**

Boolean of interface lag status, e.g., True

**lag\_parent**

String of interface lag parent name, e.g., ae13

**form\_factor**

Integer of form factor id, obtained through `_choices` API endpoint, e.g., 200

CLI Example:

```
salt myminion netbox.create_interface edge_router ae13 description="Core  
↪uplink"
```

`salt.modules.netbox.create_interface_connection`(*interface\_a, interface\_b*)

New in version 2019.2.0.

Create an interface connection between 2 interfaces

**interface\_a**

Interface id for Side A

**interface\_b**

Interface id for Side B

CLI Example:

```
salt myminion netbox.create_interface_connection 123 456
```

`salt.modules.netbox.create_inventory_item`(*device\_name*, *item\_name*, *manufacturer\_name*=None, *serial*="", *part\_id*="", *description*="")

New in version 2019.2.0.

Add an inventory item to an existing device.

**device\_name**

The name of the device, e.g., `edge_router`.

**item\_name**

String of inventory item name, e.g., `Transceiver`.

**manufacturer\_name**

String of inventory item manufacturer, e.g., `Fiberstore`.

**serial**

String of inventory item serial, e.g., `FS1238931`.

**part\_id**

String of inventory item part id, e.g., `740-01234`.

**description**

String of inventory item description, e.g., `SFP+-10G-LR`.

CLI Example:

```
salt myminion netbox.create_inventory_item edge_router Transceiver part_
→id=740-01234
```

`salt.modules.netbox.create_ipaddress`(*ip\_address*, *family*, *device*=None, *interface*=None)

New in version 2019.2.0.

Add an IP address, and optionally attach it to an interface.

**ip\_address**

The IP address and CIDR, e.g., `192.168.1.1/24`

**family**

Integer of IP family, e.g., `4`

**device**

The name of the device to attach IP to, e.g., `edge_router`

**interface**

The name of the interface to attach IP to, e.g., `ae13`

CLI Example:

```
salt myminion netbox.create_ipaddress 192.168.1.1/24 4 device=edge_router
→interface=ae13
```

`salt.modules.netbox.create_manufacturer`(*name*)

New in version 2019.2.0.

Create a device manufacturer.

**name**

The name of the manufacturer, e.g., `Juniper`

CLI Example:

```
salt myminion netbox.create_manufacturer Juniper
```

`salt.modules.netbox.create_platform`(*platform*)

New in version 2019.2.0.

Create a new device platform

**platform**

String of device platform, e.g., junos

CLI Example:

```
salt myminion netbox.create_platform junos
```

**salt.modules.netbox.create\_site**(*site*)

New in version 2019.2.0.

Create a new device site

**site**

String of device site, e.g., BRU

CLI Example:

```
salt myminion netbox.create_site BRU
```

**salt.modules.netbox.delete\_interface**(*device\_name*, *interface\_name*)

New in version 2019.2.0.

Delete an interface from a device.

**device\_name**

The name of the device, e.g., edge\_router.

**interface\_name**

The name of the interface, e.g., ae13

CLI Example:

```
salt myminion netbox.delete_interface edge_router ae13
```

**salt.modules.netbox.delete\_inventory\_item**(*item\_id*)

New in version 2019.2.0.

Remove an item from a devices inventory. Identified by the netbox id

**item\_id**

Integer of item to be deleted

CLI Example:

```
salt myminion netbox.delete_inventory_item 1354
```

**salt.modules.netbox.delete\_ipaddress**(*ipaddr\_id*)

New in version 2019.2.0.

Delete an IP address. IP addresses in Netbox are a combination of address and the interface it is assigned to.

**id**

The Netbox id for the IP address.

CLI Example:

```
salt myminion netbox.delete_ipaddress 9002
```

**salt.modules.netbox.filter\_**(*app*, *endpoint*, **\*\*kwargs**)

Get a list of items from NetBox.

**app**

String of netbox app, e.g., dcim, circuits, ipam

**endpoint**

String of app endpoint, e.g., sites, regions, devices

**kwargs**

Optional arguments that can be used to filter. All filter keywords are available in Netbox, which can be found by surfing to the corresponding API endpoint, and clicking Filters. e.g., `role=router`

Returns a list of dictionaries

```
salt myminion netbox.filter dcim devices status=1 role=router
```

`salt.modules.netbox.get_`(*app*, *endpoint*, *id=None*, *\*\*kwargs*)

Get a single item from NetBox.

**app**

String of netbox app, e.g., `dcim`, `circuits`, `ipam`

**endpoint**

String of app endpoint, e.g., `sites`, `regions`, `devices`

Returns a single dictionary

To get an item based on ID.

```
salt myminion netbox.get dcim devices id=123
```

Or using named arguments that correspond with accepted filters on the NetBox endpoint.

```
salt myminion netbox.get dcim devices name=my-router
```

`salt.modules.netbox.get_circuit_provider`(*name*, *asn=None*)

New in version 2019.2.0.

Get a circuit provider with a given name and optional ASN.

**name**

The name of the circuit provider

**asn**

The ASN of the circuit provider

CLI Example:

```
salt myminion netbox.get_circuit_provider Telia 1299
```

`salt.modules.netbox.get_interfaces`(*device\_name=None*, *\*\*kwargs*)

New in version 2019.2.0.

Returns interfaces for a specific device using arbitrary netbox filters

**device\_name**

The name of the device, e.g., `edge_router`

**kwargs**

Optional arguments to be used for filtering

CLI Example:

```
salt myminion netbox.get_interfaces edge_router name="et-0/0/5"
```

`salt.modules.netbox.get_ipaddresses`(*device\_name=None*, *\*\*kwargs*)

New in version 2019.2.0.

Filters for an IP address using specified filters

**device\_name**

The name of the device to check for the IP address

**kwargs**

Optional arguments that can be used to filter, e.g., `family=4`

CLI Example:

```
salt myminion netbox.get_ipaddresses device_name family=4
```

`salt.modules.netbox.make_interface_child(device_name, interface_name, parent_name)`

New in version 2019.2.0.

Set an interface as part of a LAG.

**device\_name**

The name of the device, e.g., edge\_router.

**interface\_name**

The name of the interface to be attached to LAG, e.g., xe-1/0/2.

**parent\_name**

The name of the LAG interface, e.g., ae13.

CLI Example:

```
salt myminion netbox.make_interface_child xe-1/0/2 ae13
```

`salt.modules.netbox.make_interface_lag(device_name, interface_name)`

New in version 2019.2.0.

Update an interface to be a LAG.

**device\_name**

The name of the device, e.g., edge\_router.

**interface\_name**

The name of the interface, e.g., ae13.

CLI Example:

```
salt myminion netbox.make_interface_lag edge_router ae13
```

`salt.modules.netbox.openconfig_interfaces(device_name=None)`

New in version 2019.2.0.

Return a dictionary structured as standardised in the [openconfig-interfaces](#) YANG model, containing physical and configuration data available in Netbox, e.g., IP addresses, MTU, enabled / disabled, etc.

**device\_name: None**

The name of the device to query the interface data for. If not provided, will use the Minion ID.

CLI Example:

```
salt '*' netbox.openconfig_interfaces
salt '*' netbox.openconfig_interfaces device_name=cr1.thn.lon
```

`salt.modules.netbox.openconfig_lacp(device_name=None)`

New in version 2019.2.0.

Return a dictionary structured as standardised in the [openconfig-lacp](#) YANG model, with configuration data for Link Aggregation Control Protocol (LACP) for aggregate interfaces.

---

**Note:** The `interval` and `lacp_mode` keys have the values set as SLOW and ACTIVE respectively, as this data is not currently available in Netbox, therefore defaulting to the values defined in the standard. See [interval](#) and [lacp-mode](#) for further details.

---

**device\_name: None**

The name of the device to query the LACP information for. If not provided, will use the Minion ID.

CLI Example:

```
salt '*' netbox.openconfig_lacp
salt '*' netbox.openconfig_lacp device_name=cr1.thn.lon
```

`salt.modules.netbox.slugify`(*value*)

' Slugify given value. Credit to Django project [https://docs.djangoproject.com/en/2.0/\\_modules/django/utils/text/#slugify](https://docs.djangoproject.com/en/2.0/_modules/django/utils/text/#slugify)

`salt.modules.netbox.update_device`(*name*, *\*\*kwargs*)

New in version 2019.2.0.

Add attributes to an existing device, identified by name.

**name**

The name of the device, e.g., `edge_router`

**kwargs**

Arguments to change in device, e.g., `serial=JN2932930`

CLI Example:

```
salt myminion netbox.update_device edge_router serial=JN2932920
```

`salt.modules.netbox.update_interface`(*device\_name*, *interface\_name*, *\*\*kwargs*)

New in version 2019.2.0.

Update an existing interface with new attributes.

**device\_name**

The name of the device, e.g., `edge_router`

**interface\_name**

The name of the interface, e.g., `ae13`

**kwargs**

Arguments to change in interface, e.g., `mac_address=50:87:69:53:32:D0`

CLI Example:

```
salt myminion netbox.update_interface edge_router ae13 mac_
→address=50:87:69:53:32:D0
```

### 26.6.293 salt.modules.netbsd\_sysctl

Module for viewing and modifying sysctl parameters

`salt.modules.netbsd_sysctl.assign`(*name*, *value*)

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

`salt.modules.netbsd_sysctl.get`(*name*)

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

`salt.modules.netbsd_sysctl.persist`(*name*, *value*, *config*='/etc/sysctl.conf')

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
```

`salt.modules.netbsd_sysctl.show`(*config\_file*=False)

Return a list of sysctl parameters for this minion

**config:** Pull the data from the system configuration file instead of the live data.

CLI Example:

```
salt '*' sysctl.show
```

## 26.6.294 salt.modules.netbsdservice

The service module for NetBSD

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see [here](#).

---

`salt.modules.netbsdservice.available`(*name*)

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.netbsdservice.disable`(*name*, *\*\*kwargs*)

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.netbsdservice.disabled`(*name*)

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.netbsdservice.enable`(*name*, *\*\*kwargs*)

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.netbsdservice.enabled`(*name*, *\*\*kwargs*)

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.netbsdservice.force_reload(name)`

Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.netbsdservice.get_all()`

Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.netbsdservice.get_disabled()`

Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.netbsdservice.get_enabled()`

Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.netbsdservice.missing(name)`

The inverse of `service.available`. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.netbsdservice.reload_(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.netbsdservice.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.netbsdservice.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.netbsdservice.status`(*name*, *sig=None*)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

**Parameters**

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Signature to use to find the service via ps

**Returns**

True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type**

bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.netbsdservice.stop`(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

## 26.6.295 salt.modules.netmiko\_mod

### Netmiko Execution Module

New in version 2019.2.0.

Execution module to interface the connection with a remote network device. It is flexible enough to execute the commands both when running under a Netmiko Proxy Minion, as well as running under a Regular Minion by specifying the connection arguments, i.e., `device_type`, `ip`, `username`, `password` etc.

**codeauthor**

Mircea Ulinic <ping@mirceaulinic.net> & Kirk Byers <ktbyers@twb-tech.com>

**maturity**

new

**depends**

netmiko

**platform**

unix

## Dependencies

The `netmiko` proxy modules requires Netmiko to be installed: `pip install netmiko`.

## Usage

This module can equally be used via the `netmiko` Proxy module (check documentation), or directly from an arbitrary (Proxy) Minion that is running on a server (computer) having access to the network device, and has the `netmiko` library installed.

When running outside of the `netmiko Proxy` (i.e., from another Proxy Minion type, or regular Minion), the `netmiko` connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the `netmiko` key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the `netmiko` Proxy Module:

- `device_type` - Class selection based on device type. Supported options:
  - `a10`: A10 Networks
  - `accedian`: Accedian Networks
  - `alcatel_aos`: Alcatel AOS
  - `alcatel_sros`: Alcatel SROS
  - `apresia_aeos`: Apresia AEOS
  - `arista_eos`: Arista EOS
  - `aruba_os`: Aruba
  - `avaya_ers`: Avaya ERS
  - `avaya_vsp`: Avaya VSP
  - `brocade_fastiron`: Brocade Fastiron
  - `brocade_netiron`: Brocade Netiron
  - `brocade_nos`: Brocade NOS
  - `brocade_vdx`: Brocade NOS
  - `brocade_vyos`: VyOS
  - `checkpoint_gaia`: Check Point GAiA
  - `calix_b6`: Calix B6
  - `ciena_saos`: Ciena SAOS
  - `cisco_asa`: Cisco SA
  - `cisco_ios`: Cisco IOS
  - `cisco_nxos`: Cisco NX-oS
  - `cisco_s300`: Cisco S300
  - `cisco_tp`: Cisco TpTcCe
  - `cisco_wlc`: Cisco WLC
  - `cisco_xe`: Cisco IOS
  - `cisco_xr`: Cisco XR

- coriant: Coriant
- dell\_force10: Dell Force10
- dell\_os10: Dell OS10
- dell\_powerconnect: Dell PowerConnect
- eltex: Eltex
- enterasys: Enterasys
- extreme: Extreme
- extreme\_wing: Extreme Wing
- f5\_ltm: F5 LTM
- fortinet: Fortinet
- generic\_termserver: TerminalServer
- hp\_comware: HP Comware
- hp\_procurve: HP Procurve
- huawei: Huawei
- huawei\_vrpv8: Huawei VRPV8
- juniper: Juniper Junos
- juniper\_junos: Juniper Junos

- quanta\_mesh: Quanta Mesh
- ruckus\_fastiron: Ruckus Fastiron
- ubiquiti\_edge: Ubiquiti Edge
- ubiquiti\_edgeswitch: Ubiquiti Edge
- vyatta\_vyos: VyOS
- vyos: VyOS
- brocade\_fastiron\_telnet: Brocade Fastiron over Telnet
- brocade\_netiron\_telnet: Brocade Netiron over Telnet
- cisco\_ios\_telnet: Cisco IOS over Telnet
- apresia\_aeos\_telnet: Apresia AEOS over Telnet
- arista\_eos\_telnet: Arista EOS over Telnet

- `hp_procurve_telnet`: HP Procurve over Telnet
  - `hp_comware_telnet`: HP Comware over Telnet
  - `juniper_junos_telnet`: Juniper Junos over Telnet
  - `calix_b6_telnet`: Calix B6 over Telnet
  - `dell_powerconnect_telnet`: Dell PowerConnect over Telnet
  - `generic_termserver_telnet`: TerminalServer over Telnet
  - `extreme_telnet`: Extreme Networks over Telnet
  - `ruckus_fastiron_telnet`: Ruckus Fastiron over Telnet
  - `cisco_ios_serial`: Cisco IOS over serial port
- `ip` - IP address of target device (not required if `host` is provided)
  - `host` - Hostname of target device (not required if `ip` is provided)
  - `username` - Username to authenticate against target device, if required
  - `password` - Password to authenticate against target device, if required
  - `secret` - The enable password if target device requires one
  - `port` - The destination port used to connect to the target device
  - `global_delay_factor` - Multiplication factor affecting Netmiko delays (default: 1)
  - `use_keys` - Connect to target device using SSH keys (default: `False`)
  - `key_file` - Filename path of the SSH key file to use
  - `allow_agent` - Enable use of SSH key-agent
  - `ssh_strict` - Automatically reject unknown SSH host keys (default: `False`, which means unknown SSH host keys will be accepted)
  - `system_host_keys` - Load host keys from the user's "known\_hosts" file (default: `False`)
  - `alt_host_keys` - If `True`, host keys will be loaded from the file specified in `alt_key_file` (default: `False`)
  - `alt_key_file` - SSH host key file to use (if `alt_host_keys=True`)
  - `ssh_config_file` - File name of OpenSSH configuration file
  - `timeout` - Connection timeout, in seconds (default: 90)
  - `session_timeout` - Set a timeout for parallel requests, in seconds (default: 60)
  - `keepalive` - Send SSH keepalive packets at a specific interval, in seconds. Currently defaults to 0, for backwards compatibility (it will not attempt to keep the connection alive using the KEEPALIVE packets).
  - `default_enter` - Character(s) to send to correspond to enter key (default: `\n`)
  - `response_return` - Character(s) to use in normalized return data to represent enter key (default: `\n`)

Example (when not running in a netmiko Proxy Minion):

```
netmiko:
  username: test
  password: test
```

In case the username and password are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a netmiko Proxy, e.g.:

```
salt '*' netmiko.send_command 'show version' host=router1.example.com device_
→type=juniper
salt '*' netmiko.send_config https://bit.ly/2sgljCB host=sw2.example.com
→device_type=cisco_ios
```

---

**Note:** Remember that the above applies only when not running in a netmiko Proxy Minion. If you want to use the <salt.proxy.netmiko\_px>, please follow the documentation notes for a proper setup.

---

`salt.modules.netmiko_mod.call`(*method*, \**args*, \*\**kwargs*)

Invoke an arbitrary Netmiko method.

**method**

The name of the Netmiko method to invoke.

**args**

A list of arguments to send to the method invoked.

**kwargs**

Key-value dictionary to send to the method invoked.

`salt.modules.netmiko_mod.commit`(\*\**kwargs*)

Commit the configuration changes.

**Warning:** This function is supported only on the platforms that support the commit operation.

CLI Example:

```
salt '*' netmiko.commit
```

`salt.modules.netmiko_mod.enter_config_mode`(\*\**kwargs*)

Enter into config mode.

**config\_command**

Configuration command to send to the device.

**pattern**

Pattern to terminate reading of channel.

CLI Example:

```
salt '*' netmiko.enter_config_mode
salt '*' netmiko.enter_config_mode device_type='juniper_junos' ip='192.
→168.0.1' username='example'
```

`salt.modules.netmiko_mod.exit_config_mode`(\*\**kwargs*)

Exit from configuration mode.

**exit\_config**

Command to exit configuration mode.

**pattern**

Pattern to terminate reading of channel.

CLI Example:

```
salt '*' netmiko.exit_config_mode
salt '*' netmiko.exit_config_mode device_type='juniper' ip='192.168.0.1'
→username='example'
```

`salt.modules.netmiko_mod.get_connection(**kwargs)`

Return the Netmiko connection object.

**Warning:** This function returns an unserializable object, hence it is not meant to be used on the CLI. This should mainly be used when invoked from other modules for the low level connection with the network device.

**kwargs**

Key-value dictionary with the authentication details.

USAGE Example:

```
conn = __salt__['netmiko.get_connection'](host='router1.example.com',
                                         username='example',
                                         password='example')
show_if = conn.send_command('show interfaces')
conn.disconnect()
```

`salt.modules.netmiko_mod.multi_call(*methods, **kwargs)`

Invoke multiple Netmiko methods at once, and return their output, as list.

**methods**

A list of dictionaries with the following keys:

- **name:** the name of the Netmiko method to be executed.
- **args:** list of arguments to be sent to the Netmiko method.
- **kwargs:** dictionary of arguments to be sent to the Netmiko method.

**kwargs**

Key-value dictionary with the connection details (when not running under a Proxy Minion).

`salt.modules.netmiko_mod.send_command(command_string, **kwargs)`

Execute `command_string` on the SSH channel using a pattern-based mechanism. Generally used for show commands. By default this method will keep waiting to receive data until the network device prompt is detected. The current network device prompt will be determined automatically.

**command\_string**

The command to be executed on the remote device.

**expect\_string**

Regular expression pattern to use for determining end of output. If left blank will default to being based on router prompt.

**delay\_factor: 1**

Multiplying factor used to adjust delays (default: 1).

**max\_loops: 500**

Controls wait time in conjunction with `delay_factor`. Will default to be based upon `self.timeout`.

**auto\_find\_prompt: True**

Whether it should try to auto-detect the prompt (default: True).

**strip\_prompt: True**

Remove the trailing router prompt from the output (default: True).

**strip\_command: True**

Remove the echo of the command from the output (default: True).

**normalize: True**

Ensure the proper enter is sent at end of command (default: True).

**use\_textfsm: False**

Process command output through TextFSM template (default: False).

CLI Example:

```
salt '*' netmiko.send_command 'show version'
salt '*' netmiko.send_command 'show_version' host='router1.example.com'
↳username='example' device_type='cisco_ios'
```

`salt.modules.netmiko_mod.send_command_timing`(*command\_string*, *\*\*kwargs*)

Execute *command\_string* on the SSH channel using a delay-based mechanism. Generally used for show commands.

**command\_string**

The command to be executed on the remote device.

**delay\_factor: 1**

Multiplying factor used to adjust delays (default: 1).

**max\_loops: 500**

Controls wait time in conjunction with *delay\_factor*. Will default to be based upon *self.timeout*.

**strip\_prompt: True**

Remove the trailing router prompt from the output (default: True).

**strip\_command: True**

Remove the echo of the command from the output (default: True).

**normalize: True**

Ensure the proper enter is sent at end of command (default: True).

**use\_textfsm: False**

Process command output through TextFSM template (default: False).

CLI Example:

```
salt '*' netmiko.send_command_timing 'show version'
salt '*' netmiko.send_command_timing 'show version' host='router1.example.
↳com' username='example' device_type='arista_eos'
```

`salt.modules.netmiko_mod.send_config`(*config\_file=None*, *config\_commands=None*,  
*template\_engine='jinja'*, *commit=False*, *context=None*,  
*defaults=None*, *saltenv='base'*, *\*\*kwargs*)

Send configuration commands down the SSH channel. Return the configuration lines sent to the device.

The function is flexible to send the configuration from a local or remote file, or simply the commands as list.

**config\_file**

The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**config\_commands**

Multiple configuration commands to be sent to the device.

---

**Note:** This argument is ignored when *config\_file* is specified.

---

**template\_engine: jinja**

The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file

without attempting to render, set this argument to None.

**commit: False**

Commit the configuration changes before exiting the config mode. This option is by default disabled, as many platforms don't have this capability natively.

**context**

Variables to add to the template context.

**defaults**

Default values of the context\_dict.

**exit\_config\_mode: True**

Determines whether or not to exit config mode after complete.

**delay\_factor: 1**

Factor to adjust delays.

**max\_loops: 150**

Controls wait time in conjunction with delay\_factor (default: 150).

**strip\_prompt: False**

Determines whether or not to strip the prompt (default: False).

**strip\_command: False**

Determines whether or not to strip the command (default: False).

**config\_mode\_command**

The command to enter into config mode.

CLI Example:

```
salt '*' netmiko.send_config config_commands="['interface GigabitEthernet3
→', 'no ip address']"
salt '*' netmiko.send_config config_commands="['snmp-server location {{[
→grains.location ]}}']"
salt '*' netmiko.send_config config_file=salt://config.txt
salt '*' netmiko.send_config config_file=https://bit.ly/2sgljCB device_
→type='cisco_ios' ip='1.2.3.4' username='example'
```

## 26.6.296 salt.modules.netscaler

Module to provide Citrix Netscaler compatibility to Salt (compatible with netscaler 9.2+)

New in version 2015.2.0.

**depends**

- nsnitro Python module

**Note:** You can install nsnitro using:

```
pip install nsnitro
```

**configuration**

This module accepts connection configuration details either as parameters, or as configuration settings in /etc/salt/minion on the relevant minions

```
netscaler.host: 1.2.3.4
netscaler.user: user
netscaler.pass: password
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

CLI Examples:

Calls relying on configuration passed using /etc/salt/minion, grains, or pillars:

```
salt-call netcaler.server_exists server_name
```

Calls passing configuration as opts

```
salt-call netcaler.server_exists server_name netcaler_host=1.2.3.4
→netcaler_user=username netcaler_pass=password
salt-call netcaler.server_exists server_name netcaler_host=1.2.3.5
→netcaler_user=username2 netcaler_pass=password2
salt-call netcaler.server_enable server_name2 netcaler_host=1.2.3.5
salt-call netcaler.server_up server_name3 netcaler_host=1.2.3.6
→netcaler_useSSL=False
```

`salt.modules.netcaler.server_add(s_name, s_ip, s_state=None, **connection_args)`

Add a server Note: The default server state is ENABLED

CLI Example:

```
salt '*' netcaler.server_add 'serverName' 'serverIpAddress'
salt '*' netcaler.server_add 'serverName' 'serverIpAddress' 'serverState'
```

`salt.modules.netcaler.server_delete(s_name, **connection_args)`

Delete a server

CLI Example:

```
salt '*' netcaler.server_delete 'serverName'
```

`salt.modules.netcaler.server_disable(s_name, **connection_args)`

Disable a server globally

CLI Example:

```
salt '*' netcaler.server_disable 'serverName'
```

`salt.modules.netcaler.server_enable(s_name, **connection_args)`

Enables a server globally

CLI Example:

```
salt '*' netcaler.server_enable 'serverName'
```

`salt.modules.netcaler.server_enabled(s_name, **connection_args)`

Check if a server is enabled globally

CLI Example:

```
salt '*' netcaler.server_enabled 'serverName'
```

`salt.modules.netscaler.server_exists(s_name, ip=None, s_state=None, **connection_args)`

Checks if a server exists

CLI Example:

```
salt '*' netscaler.server_exists 'serverName'
```

`salt.modules.netscaler.server_update(s_name, s_ip, **connection_args)`

Update a server's attributes

CLI Example:

```
salt '*' netscaler.server_update 'serverName' 'serverIP'
```

`salt.modules.netscaler.service_disable(s_name, s_delay=None, **connection_args)`

Disable a service

CLI Example:

```
salt '*' netscaler.service_disable 'serviceName'
salt '*' netscaler.service_disable 'serviceName' 'delayInSeconds'
```

`salt.modules.netscaler.service_enable(s_name, **connection_args)`

Enable a service

CLI Example:

```
salt '*' netscaler.service_enable 'serviceName'
```

`salt.modules.netscaler.service_exists(s_name, **connection_args)`

Checks if a service exists

CLI Example:

```
salt '*' netscaler.service_exists 'serviceName'
```

`salt.modules.netscaler.service_up(s_name, **connection_args)`

Checks if a service is UP

CLI Example:

```
salt '*' netscaler.service_up 'serviceName'
```

`salt.modules.netscaler.servicegroup_add(sg_name, sg_type='HTTP', **connection_args)`

Add a new service group. If no service type is specified, HTTP will be used. Most common service types: HTTP, SSL, and SSL\_BRIDGE

CLI Example:

```
salt '*' netscaler.servicegroup_add 'serviceName'
salt '*' netscaler.servicegroup_add 'serviceName' 'serviceGroupType'
```

`salt.modules.netscaler.servicegroup_delete(sg_name, **connection_args)`

Delete a new service group

CLI Example:

```
salt '*' netcaler.servicegroup_delete 'serviceGroupName'
```

`salt.modules.netcaler.servicegroup_exists`(*sg\_name*, *sg\_type=None*, *\*\*connection\_args*)

Checks if a service group exists

CLI Example:

```
salt '*' netcaler.servicegroup_exists 'serviceGroupName'
```

`salt.modules.netcaler.servicegroup_server_add`(*sg\_name*, *s\_name*, *s\_port*, *\*\*connection\_args*)

Add a server:port member to a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_add 'serviceGroupName' 'serverName'  
→ 'serverPort'
```

`salt.modules.netcaler.servicegroup_server_delete`(*sg\_name*, *s\_name*, *s\_port*,  
*\*\*connection\_args*)

Remove a server:port member from a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_delete 'serviceGroupName'  
→ 'serverName' 'serverPort'
```

`salt.modules.netcaler.servicegroup_server_disable`(*sg\_name*, *s\_name*, *s\_port*,  
*\*\*connection\_args*)

Disable a server:port member of a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_disable 'serviceGroupName'  
→ 'serverName' 'serverPort'
```

`salt.modules.netcaler.servicegroup_server_enable`(*sg\_name*, *s\_name*, *s\_port*,  
*\*\*connection\_args*)

Enable a server:port member of a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_enable 'serviceGroupName'  
→ 'serverName' 'serverPort'
```

`salt.modules.netcaler.servicegroup_server_exists`(*sg\_name*, *s\_name*, *s\_port=None*,  
*\*\*connection\_args*)

Check if a server:port combination is a member of a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_exists 'serviceGroupName'  
→ 'serverName' 'serverPort'
```

`salt.modules.netcaler.servicegroup_server_up`(*sg\_name*, *s\_name*, *s\_port*, *\*\*connection\_args*)

Check if a server:port combination is in state UP in a servicegroup

CLI Example:

```
salt '*' netcaler.servicegroup_server_up 'serviceName' 'serverName'
↳ 'serverPort'
```

`salt.modules.netcaler.vserver_add`(*v\_name*, *v\_ip*, *v\_port*, *v\_type*, *\*\*connection\_args*)

Add a new lb vserver

CLI Example:

```
salt '*' netcaler.vserver_add 'vserverName' 'vserverIP' 'vserverPort'
↳ 'vserverType'
salt '*' netcaler.vserver_add 'alex.patate.chaude.443' '1.2.3.4' '443'
↳ 'SSL'
```

`salt.modules.netcaler.vserver_delete`(*v\_name*, *\*\*connection\_args*)

Delete a lb vserver

CLI Example:

```
salt '*' netcaler.vserver_delete 'vserverName'
```

`salt.modules.netcaler.vserver_exists`(*v\_name*, *v\_ip=None*, *v\_port=None*, *v\_type=None*, *\*\*connection\_args*)

Checks if a vserver exists

CLI Example:

```
salt '*' netcaler.vserver_exists 'vserverName'
```

`salt.modules.netcaler.vserver_servicegroup_add`(*v\_name*, *sg\_name*, *\*\*connection\_args*)

Bind a servicegroup to a vserver

CLI Example:

```
salt '*' netcaler.vserver_servicegroup_add 'vserverName'
↳ 'serviceName'
```

`salt.modules.netcaler.vserver_servicegroup_delete`(*v\_name*, *sg\_name*, *\*\*connection\_args*)

Unbind a servicegroup from a vserver

CLI Example:

```
salt '*' netcaler.vserver_servicegroup_delete 'vserverName'
↳ 'serviceName'
```

`salt.modules.netcaler.vserver_servicegroup_exists`(*v\_name*, *sg\_name*, *\*\*connection\_args*)

Checks if a servicegroup is tied to a vserver

CLI Example:

```
salt '*' netcaler.vserver_servicegroup_exists 'vserverName'
↳ 'serviceName'
```

`salt.modules.netcaler.vserver_sslcert_add`(*v\_name*, *sc\_name*, *\*\*connection\_args*)

Binds a SSL certificate to a vserver

CLI Example:

```
salt '*' netcaler.vserver_sslcert_add 'vserverName' 'sslCertificateName'
```

`salt.modules.netcaler.vserver_sslcert_delete(v_name, sc_name, **connection_args)`

Unbinds a SSL certificate from a vserver

CLI Example:

```
salt '*' netcaler.vserver_sslcert_delete 'vserverName'  
→ 'sslCertificateName'
```

`salt.modules.netcaler.vserver_sslcert_exists(v_name, sc_name, **connection_args)`

Checks if a SSL certificate is tied to a vserver

CLI Example:

```
salt '*' netcaler.vserver_sslcert_exists 'vserverName'  
→ 'sslCertificateName'
```

## 26.6.297 salt.modules.network

Module for gathering and managing network information

`salt.modules.network.active_tcp()`

Return a dict containing information on all of the running TCP connections (currently linux and solaris only)

Changed in version 2015.8.4: Added support for SunOS

CLI Example:

```
salt '*' network.active_tcp
```

`salt.modules.network.arp()`

Return the arp table from the minion

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.arp
```

`salt.modules.network.calc_net(ip_addr, netmask=None)`

Returns the CIDR of a subnet based on an IP address (CIDR notation supported) and optional netmask.

CLI Example:

```
salt '*' network.calc_net 172.17.0.5 255.255.255.240  
salt '*' network.calc_net 2a02:f6e:a000:80:84d8:8332:7866:4e07/64
```

New in version 2015.8.0.

`salt.modules.network.connect(host, port=None, **kwargs)`

Test connectivity to a host using a particular port from the minion.

New in version 2014.7.0.

CLI Example:

```

salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp
→timeout=3

```

`salt.modules.network.convert_cidr` (*cidr*)

returns the network address, subnet mask and broadcast address of a cidr address

New in version 2016.3.0.

CLI Example:

```

salt '*' network.convert_cidr 172.31.0.0/16

```

`salt.modules.network.default_route` (*family=None*)

Return default route(s) from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```

salt '*' network.default_route

```

`salt.modules.network.dig` (*host*)

Performs a DNS lookup with dig

CLI Example:

```

salt '*' network.dig archlinux.org

```

`salt.modules.network.fqdns` ()

Return all known FQDNs for the system by enumerating all interfaces and then trying to reverse resolve them (excluding 'lo' interface).

CLI Example:

```

salt '*' network.fqdns

```

`salt.modules.network.get_bufsize` (*iface*)

Return network buffer sizes as a dict (currently linux only)

CLI Example:

```

salt '*' network.get_bufsize eth0

```

`salt.modules.network.get_fqdn` ()

Get fully qualified domain name

CLI Example:

```
salt '*' network.get_fqdn
```

`salt.modules.network.get_hostname()`

Get hostname

CLI Example:

```
salt '*' network.get_hostname
```

`salt.modules.network.get_route(ip)`

Return routing information for given destination ip

New in version 2015.5.3.

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS) Added support for OpenBSD

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.get_route 10.10.10.10
```

`salt.modules.network.hw_addr(iface)`

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr eth0
```

`salt.modules.network.hwaddr(iface)`

This function is an alias of `hw_addr`.

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr eth0
```

`salt.modules.network.ifacestartswith(cidr)`

Retrieve the interface name from a specific CIDR

New in version 2016.11.0.

CLI Example:

```
salt '*' network.ifacestartswith 10.0
```

`salt.modules.network.in_subnet(cidr)`

Returns True if host is within specified subnet, otherwise False.

CLI Example:

```
salt '*' network.in_subnet 10.0.0.0/16
```

`salt.modules.network.interface(iface)`

Return the inet address for a given interface

New in version 2014.7.0.

CLI Example:

```
salt '*' network.interface eth0
```

`salt.modules.network.interface_ip`(*iface*)

Return the inet address for a given interface

New in version 2014.7.0.

CLI Example:

```
salt '*' network.interface_ip eth0
```

`salt.modules.network.interfaces`()

Return a dictionary of information about all the interfaces on the minion

CLI Example:

```
salt '*' network.interfaces
```

`salt.modules.network.ip_addrs`(*interface=None, include\_loopback=False, cidr=None, type=None*)

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include\_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If 'type' is 'public', then only public addresses will be returned. Ditto for 'type='private'.

Changed in version 3001: *interface* can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_addrs
```

`salt.modules.network.ip_addrs6`(*interface=None, include\_loopback=False, cidr=None*)

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless 'include\_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="2000::/3"' will return only the addresses which are within that subnet.

Changed in version 3001: *interface* can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_addrs6
```

`salt.modules.network.ip_in_subnet`(*ip\_addr, cidr*)

Returns True if given IP is within specified subnet, otherwise False.

CLI Example:

```
salt '*' network.ip_in_subnet 172.17.0.4 172.16.0.0/12
```

`salt.modules.network.ip_neighs`()

Return the ip neighbour (arp) table from the minion for IPv4 addresses

New in version 3007.0.

CLI Example:

```
salt '*' network.ip_neighs
```

`salt.modules.network.ip_neighs6()`

Return the ip neighbour (arp) table from the minion for IPv6 addresses

New in version 3007.0.

CLI Example:

```
salt '*' network.ip_neighs6
```

`salt.modules.network.ip_networks` (*interface=None, include\_loopback=False, verbose=False*)

New in version 3001.

Returns a list of IPv4 networks to which the minion belongs.

**interface**

Restrict results to the specified interface(s). This value can be either a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_networks
salt '*' network.ip_networks interface=docker0
salt '*' network.ip_networks interface=docker0,ensp*
salt '*' network.ip_networks interface=eth*
```

`salt.modules.network.ip_networks6` (*interface=None, include\_loopback=False, verbose=False*)

New in version 3001.

Returns a list of IPv6 networks to which the minion belongs.

**interface**

Restrict results to the specified interface(s). This value can be either a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_networks6
salt '*' network.ip_networks6 interface=docker0
salt '*' network.ip_networks6 interface=docker0,ensp*
salt '*' network.ip_networks6 interface=eth*
```

`salt.modules.network.ipaddrs` (*interface=None, include\_loopback=False, cidr=None, type=None*)

This function is an alias of `ip_addrs`.

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include\_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If 'type' is 'public', then only public addresses will be returned. Ditto for 'type'='private'.

Changed in version 3001: `interface` can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_addrs
```

`salt.modules.network.ipaddrs6` (*interface=None, include\_loopback=False, cidr=None*)

This function is an alias of `ip_addrs6`.

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless 'include\_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="2000::/3"' will return only the addresses which are within that subnet.

Changed in version 3001: `interface` can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_addrs6
```

`salt.modules.network.iphexval(ip)`

Retrieve the hexadecimal representation of an IP address

New in version 2016.11.0.

CLI Example:

```
salt '*' network.iphexval 10.0.0.1
```

`salt.modules.network.ipneighs()`

This function is an alias of `ip_neighs`.

Return the ip neighbour (arp) table from the minion for IPv4 addresses

New in version 3007.0.

CLI Example:

```
salt '*' network.ip_neighs
```

`salt.modules.network.ipneighs6()`

This function is an alias of `ip_neighs6`.

Return the ip neighbour (arp) table from the minion for IPv6 addresses

New in version 3007.0.

CLI Example:

```
salt '*' network.ip_neighs6
```

`salt.modules.network.is_loopback(ip_addr)`

Check if the given IP address is a loopback address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_loopback 127.0.0.1
```

`salt.modules.network.is_private(ip_addr)`

Check if the given IP address is a private address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_private 10.0.0.3
```

`salt.modules.network.mod_bufsize` (*iface*, \*args, \*\*kwargs)

Modify network interface buffers (currently linux only)

CLI Example:

```
salt '*' network.mod_bufsize tx=<val> rx=<val> rx-mini=<val> rx-jumbo=
-><val>
```

`salt.modules.network.mod_hostname` (*hostname*)

Modify hostname

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

CLI Example:

```
salt '*' network.mod_hostname master.saltstack.com
```

`salt.modules.network.netstat` ()

Return information on open ports and states

---

**Note:** On BSD minions, the output contains PID info (where available) for each netstat entry, fetched from sockstat/fstat output.

---

Changed in version 2014.1.4: Added support for OpenBSD, FreeBSD, and NetBSD

Changed in version 2015.8.0: Added support for SunOS

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.netstat
```

`salt.modules.network.ping` (*host*, *timeout=False*, *return\_boolean=False*)

Performs an ICMP ping to a host

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2015.5.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

`salt.modules.network.reverse_ip(ip_addr)`

Returns the reversed IP address

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.reverse_ip 172.17.0.4
```

`salt.modules.network.routes(family=None)`

Return currently configured routes from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.routes
```

`salt.modules.network.subnets(interfaces=None)`

Returns a list of IPv4 subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
salt '*' network.subnets interfaces=eth1
```

`salt.modules.network.subnets6()`

Returns a list of IPv6 subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
```

`salt.modules.network.traceroute(host)`

Performs a traceroute to a 3rd party host

Changed in version 2015.8.0: Added support for SunOS

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.traceroute archlinux.org
```

`salt.modules.network.wol(mac, bcast='255.255.255.255', destport=9)`

Send Wake On Lan packet to a host

CLI Example:

```
salt '*' network.wol 08-00-27-13-69-77
salt '*' network.wol 080027136977 255.255.255.255 7
salt '*' network.wol 08:00:27:13:69:77 255.255.255.255 7
```

## 26.6.298 salt.modules.neutron

Module for handling OpenStack Neutron calls

### depends

- neutronclient Python module

### configuration

This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: 'admin'
keystone.password: 'password'
keystone.tenant: 'admin'
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'

openstack2:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'
```

With this configuration in place, any of the neutron functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' neutron.network_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the *use\_keystoneauth* option in the pillar or minion config.

---

**Note:** this is required to use keystone v3 as for authentication.

---

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/'
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```

(continues on next page)

(continued from previous page)

```
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```

Note: by default the neutron module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the *verify* option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own.(defaults to True)

`salt.modules.neutron.add_gateway_router` (*router, ext\_network, profile=None*)

Adds an external network gateway to the specified router

CLI Example:

```
salt '*' neutron.add_gateway_router router-name ext-network-name
```

#### Parameters

- **router** -- ID or name of the router
- **ext\_network** -- ID or name of the external network the gateway
- **profile** -- Profile to build on (Optional)

#### Returns

Added Gateway router information

`salt.modules.neutron.add_interface_router` (*router, subnet, profile=None*)

Adds an internal network interface to the specified router

CLI Example:

```
salt '*' neutron.add_interface_router router-name subnet-name
```

#### Parameters

- **router** -- ID or name of the router
- **subnet** -- ID or name of the subnet
- **profile** -- Profile to build on (Optional)

#### Returns

Added interface information

`salt.modules.neutron.create_firewall_rule` (*protocol, action, profile=None, \*\*kwargs*)

Creates a new firewall rule

CLI Example:

```
salt '*' neutron.create_firewall_rule protocol action
      tenant_id=TENANT_ID name=NAME description=DESCRIPTION ip_
→version=IP_VERSION
      source_ip_address=SOURCE_IP_ADDRESS destination_ip_
→address=DESTINATION_IP_ADDRESS source_port=SOURCE_PORT
      destination_port=DESTINATION_PORT shared=SHARED enabled=ENABLED
```

#### Parameters

- **protocol** -- Protocol for the firewall rule, choose "tcp","udp","icmp" or "None".
- **action** -- Action for the firewall rule, choose "allow" or "deny".
- **tenant\_id** -- The owner tenant ID. (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip\_version** -- IP protocol version, default: 4. (Optional)

- **source\_ip\_address** -- Source IP address or subnet. (Optional)
- **destination\_ip\_address** -- Destination IP address or subnet. (Optional)
- **source\_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination\_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)

`salt.modules.neutron.create_floatingip` (*floating\_network*, *port=None*, *profile=None*)

Creates a new floatingIP

CLI Example:

```
salt '*' neutron.create_floatingip network-name port-name
```

#### Parameters

- **floating\_network** -- Network name or ID to allocate floatingIP from
- **port** -- Of the port to be associated with the floatingIP (Optional)
- **profile** -- Profile to build on (Optional)

#### Returns

Created floatingIP information

`salt.modules.neutron.create_ikepolicy` (*name*, *profile=None*, *\*\*kwargs*)

Creates a new IKEPolicy

CLI Example:

```
salt '*' neutron.create_ikepolicy ikepolicy-name
    phase1_negotiation_mode=main auth_algorithm=sha1
    encryption_algorithm=aes-128 pfs=group5
```

#### Parameters

- **name** -- Name of the IKE policy
- **phase1\_negotiation\_mode** -- IKE Phase1 negotiation mode in lowercase, default: main (Optional)
- **auth\_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encryption\_algorithm** -- Encryption algorithm in lowercase. default:aes-128 (Optional)
- **pfs** -- Perfect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IKE lifetime attribute. default: seconds (Optional)
- **value** -- IKE lifetime attribute. default: 3600 (Optional)
- **ike\_version** -- IKE version in lowercase, default: v1 (Optional)
- **profile** -- Profile to build on (Optional)
- **kwargs** --

#### Returns

Created IKE policy information

`salt.modules.neutron.create_ipsec_site_connection` (*name*, *ipsecpolicy*, *ikepolicy*, *vpnservice*, *peer\_cidrs*, *peer\_address*, *peer\_id*, *psk*, *admin\_state\_up=True*, *profile=None*, *\*\*kwargs*)

Creates a new IPsecSiteConnection

CLI Example:

```
salt '*' neutron.show_ipsec_site_connection connection-name
      ipsec-policy-name ikepolicy-name vpngservice-name
      192.168.XXX.XXX/24 192.168.XXX.XXX 192.168.XXX.XXX secret
```

#### Parameters

- **name** -- Set friendly name for the connection
- **ipsecpolicy** -- IPsec policy ID or name associated with this connection
- **ikepolicy** -- IKE policy ID or name associated with this connection
- **vpnservice** -- VPN service instance ID or name associated with this connection
- **peer\_cidrs** -- Remote subnet(s) in CIDR format
- **peer\_address** -- Peer gateway public IPv4/IPv6 address or FQDN
- **peer\_id** -- Peer router identity for authentication Can be IPv4/IPv6 address, e-mail address, key id, or FQDN
- **psk** -- Pre-shared key string
- **initiator** -- Initiator state in lowercase, default:bi-directional
- **admin\_state\_up** -- Set admin state up to true or false, default: True (Optional)
- **mtu** -- size for the connection, default:1500 (Optional)
- **dpd\_action** -- Dead Peer Detection attribute: hold/clear/disabled/ restart/restart-by-peer (Optional)
- **dpd\_interval** -- Dead Peer Detection attribute (Optional)
- **dpd\_timeout** -- Dead Peer Detection attribute (Optional)
- **profile** -- Profile to build on (Optional)

#### Returns

Created IPsec site connection information

`salt.modules.neutron.create_ipsecpolicy` (*name*, *profile=None*, *\*\*kwargs*)

Creates a new IPsecPolicy

CLI Example:

```
salt '*' neutron.create_ipsecpolicy ipsecpolicy-name
      transform_protocol=esp auth_algorithm=sha1
      encapsulation_mode=tunnel encryption_algorithm=aes-128
```

#### Parameters

- **name** -- Name of the IPsec policy
- **transform\_protocol** -- Transform protocol in lowercase, default: esp (Optional)
- **auth\_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encapsulation\_mode** -- Encapsulation mode in lowercase, default: tunnel (Optional)
- **encryption\_algorithm** -- Encryption algorithm in lowercase, default:aes-128 (Optional)
- **pfs** -- Perfect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IPsec lifetime attribute. default: seconds (Optional)
- **value** -- IPsec lifetime attribute. default: 3600 (Optional)
- **profile** -- Profile to build on (Optional)

#### Returns

Created IPsec policy information

`salt.modules.neutron.create_network` (*name*, *router\_ext=None*, *admin\_state\_up=True*, *network\_type=None*, *physical\_network=None*, *segmentation\_id=None*, *shared=None*, *profile=None*)

Creates a new network

CLI Example:

```
salt '*' neutron.create_network network-name
salt '*' neutron.create_network network-name profile=openstack1
```

#### Parameters

- **name** -- Name of network to create
- **admin\_state\_up** -- should the state of the network be up? default: True (Optional)
- **router\_ext** -- True then if create the external network (Optional)
- **network\_type** -- the Type of network that the provider is such as GRE, VXLAN, VLAN, FLAT, or LOCAL (Optional)
- **physical\_network** -- the name of the physical network as neutron knows it (Optional)
- **segmentation\_id** -- the vlan id or GRE id (Optional)
- **shared** -- is the network shared or not (Optional)
- **profile** -- Profile to build on (Optional)

#### Returns

Created network information

```
salt.modules.neutron.create_port(name, network, device_id=None, admin_state_up=True,
                                profile=None)
```

Creates a new port

CLI Example:

```
salt '*' neutron.create_port network-name port-name
```

#### Parameters

- **name** -- Name of port to create
- **network** -- Network name or ID
- **device\_id** -- ID of device (Optional)
- **admin\_state\_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

#### Returns

Created port information

```
salt.modules.neutron.create_router(name, ext_network=None, admin_state_up=True, profile=None)
```

Creates a new router

CLI Example:

```
salt '*' neutron.create_router new-router-name
```

#### Parameters

- **name** -- Name of router to create (must be first)
- **ext\_network** -- ID or name of the external for the gateway (Optional)
- **admin\_state\_up** -- Set admin state up to true or false, default:true (Optional)
- **profile** -- Profile to build on (Optional)

#### Returns

Created router information

```
salt.modules.neutron.create_security_group(name=None, description=None, profile=None)
```

Creates a new security group

CLI Example:

```
salt '*' neutron.create_security_group security-group-name
→ description='Security group for servers'
```

**Parameters**

- **name** -- Name of security group (Optional)
- **description** -- Description of security group (Optional)
- **profile** -- Profile to build on (Optional)

**Returns**

Created security group information

```
salt.modules.neutron.create_security_group_rule(security_group, remote_group_id=None,
direction='ingress', protocol=None,
port_range_min=None,
port_range_max=None, ethertype='IPv4',
profile=None)
```

Creates a new security group rule

CLI Example:

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

**Parameters**

- **security\_group** -- Security group name or ID to add rule
- **remote\_group\_id** -- Remote security group name or ID to apply rule (Optional)
- **direction** -- Direction of traffic: ingress/egress, default: ingress (Optional)
- **protocol** -- Protocol of packet: null/icmp/tcp/udp, default: null (Optional)
- **port\_range\_min** -- Starting port range (Optional)
- **port\_range\_max** -- Ending port range (Optional)
- **ethertype** -- IPv4/IPv6, default: IPv4 (Optional)
- **profile** -- Profile to build on (Optional)

**Returns**

Created security group rule information

```
salt.modules.neutron.create_subnet(network, cidr, name=None, ip_version=4, profile=None)
```

Creates a new subnet

CLI Example:

```
salt '*' neutron.create_subnet network-name 192.168.1.0/24
```

**Parameters**

- **network** -- Network ID or name this subnet belongs to
- **cidr** -- CIDR of subnet to create (Ex. '192.168.1.0/24')
- **name** -- Name of the subnet to create (Optional)
- **ip\_version** -- Version to use, default is 4(IPv4) (Optional)
- **profile** -- Profile to build on (Optional)

**Returns**

Created subnet information

```
salt.modules.neutron.create_vpnservice(subnet, router, name, admin_state_up=True, profile=None)
```

Creates a new VPN service

CLI Example:

```
salt '*' neutron.create_vpnservice router-name name
```

**Parameters**

- **subnet** -- Subnet unique identifier for the VPN service deployment
- **router** -- Router unique identifier for the VPN service
- **name** -- Set a name for the VPN service
- **admin\_state\_up** -- Set admin state up to true or false, default:True (Optional)
- **profile** -- Profile to build on (Optional)

**Returns**

Created VPN service information

`salt.modules.neutron.delete_firewall_rule` (*firewall\_rule*, *profile=None*)

Deletes the specified firewall\_rule

CLI Example:

```
salt '*' neutron.delete_firewall_rule firewall-rule
```

**Parameters**

- **firewall\_rule** -- ID or name of firewall rule to delete
- **profile** -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

`salt.modules.neutron.delete_floatingip` (*floatingip\_id*, *profile=None*)

Deletes the specified floating IP

CLI Example:

```
salt '*' neutron.delete_floatingip floatingip-id
```

**Parameters**

- **floatingip\_id** -- ID of floatingIP to delete
- **profile** -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

`salt.modules.neutron.delete_ikepolicy` (*ikepolicy*, *profile=None*)

Deletes the specified IKEPolicy

CLI Example:

```
salt '*' neutron.delete_ikepolicy ikepolicy-name
```

**Parameters**

- **ikepolicy** -- ID or name of IKE policy to delete
- **profile** -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

`salt.modules.neutron.delete_ipsec_site_connection` (*ipsec\_site\_connection*, *profile=None*)

Deletes the specified IPsecSiteConnection

CLI Example:

```
salt '*' neutron.delete_ipsec_site_connection connection-name
```

**Parameters**

- **ipsec\_site\_connection** -- ID or name of ipsec site connection to delete
- **profile** -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

`salt.modules.neutron.delete_ipsecpolicy` (*ipsecpolicy*, *profile=None*)

Deletes the specified IPsecPolicy

CLI Example:

```
salt '*' neutron.delete_ipsecpolicy ipsecpolicy-name
```

**Parameters**

- **ipsecpolicy** -- ID or name of IPsec policy to delete
- **profile** -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

`salt.modules.neutron.delete_network` (*network*, *profile=None*)

Deletes the specified network

CLI Example:

```
salt '*' neutron.delete_network network-name
salt '*' neutron.delete_network network-name profile=openstack1
```

**Parameters**

- **network** -- ID or name of network to delete
- **profile** -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

`salt.modules.neutron.delete_port` (*port*, *profile=None*)

Deletes the specified port

CLI Example:

```
salt '*' neutron.delete_network port-name
salt '*' neutron.delete_network port-name profile=openstack1
```

**Parameters**

- **port** -- port name or ID
- **profile** -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

`salt.modules.neutron.delete_quota` (*tenant\_id*, *profile=None*)

Delete the specified tenant's quota value

CLI Example:

```
salt '*' neutron.update_quota tenant-id
salt '*' neutron.update_quota tenant-id profile=openstack1
```

**Parameters**

- **tenant\_id** -- ID of tenant to quota delete
- **profile** -- Profile to build on (Optional)

**Returns**

True(Delete succeed) or False(Delete failed)

`salt.modules.neutron.delete_router` (*router*, *profile=None*)

Delete the specified router

CLI Example:

```
salt '*' neutron.delete_router router-name
```

**Parameters**

- **router** -- ID or name of router to delete
- **profile** -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

`salt.modules.neutron.delete_security_group` (*security\_group*, *profile=None*)

Deletes the specified security group

CLI Example:

```
salt '*' neutron.delete_security_group security-group-name
```

**Parameters**

- **security\_group** -- ID or name of security group to delete
- **profile** -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

`salt.modules.neutron.delete_security_group_rule` (*security\_group\_rule\_id*, *profile=None*)

Deletes the specified security group rule

CLI Example:

```
salt '*' neutron.delete_security_group_rule security-group-rule-id
```

**Parameters**

- **security\_group\_rule\_id** -- ID of security group rule to delete
- **profile** -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

`salt.modules.neutron.delete_subnet` (*subnet*, *profile=None*)

Deletes the specified subnet

CLI Example:

```
salt '*' neutron.delete_subnet subnet-name
salt '*' neutron.delete_subnet subnet-name profile=openstack1
```

**Parameters**

- **subnet** -- ID or name of subnet to delete
- **profile** -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

`salt.modules.neutron.delete_vpnservice` (*vpnservice*, *profile=None*)

Deletes the specified VPN service

CLI Example:

```
salt '*' neutron.delete_vpnservice vpnservice-name
```

**Parameters**

- **vpnservice** -- ID or name of vpn service to delete
- **profile** -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

`salt.modules.neutron.get_quotas_tenant` (*profile=None*)

Fetches tenant info in server's context for following quota operation

CLI Example:

```
salt '*' neutron.get_quotas_tenant
salt '*' neutron.get_quotas_tenant profile=openstack1
```

**Parameters**

- **profile** -- Profile to build on (Optional)

**Returns**

Quotas information

`salt.modules.neutron.list_agents` (*profile=None*)

List agents.

CLI Example:

```
salt '*' neutron.list_agents
```

**Parameters**

- **profile** -- Profile to build on (Optional)

**Returns**

agents message.

`salt.modules.neutron.list_extensions` (*profile=None*)

Fetches a list of all extensions on server side

CLI Example:

```
salt '*' neutron.list_extensions
salt '*' neutron.list_extensions profile=openstack1
```

**Parameters**

- **profile** -- Profile to build on (Optional)

**Returns**

List of extensions

`salt.modules.neutron.list_firewall_rules` (*profile=None*)

Fetches a list of all firewall rules for a tenant

CLI Example:

```
salt '*' neutron.list_firewall_rules
```

**Parameters**

- **profile** -- Profile to build on (Optional)

**Returns**

List of firewall rules

`salt.modules.neutron.list_firewalls` (*profile=None*)

Fetches a list of all firewalls for a tenant

CLI Example:

```
salt '*' neutron.list_firewalls
```

**Parameters**

**profile** -- Profile to build on (Optional)

**Returns**

List of firewalls

`salt.modules.neutron.list_floatingips` (*profile=None*)

Fetch a list of all floatingIPs for a tenant

CLI Example:

```
salt '*' neutron.list_floatingips
salt '*' neutron.list_floatingips profile=openstack1
```

**Parameters**

**profile** -- Profile to build on (Optional)

**Returns**

List of floatingIP

`salt.modules.neutron.list_ikepolicies` (*profile=None*)

Fetches a list of all configured IKEPolicies for a tenant

CLI Example:

```
salt '*' neutron.list_ikepolicies
salt '*' neutron.list_ikepolicies profile=openstack1
```

**Parameters**

**profile** -- Profile to build on (Optional)

**Returns**

List of IKE policy

`salt.modules.neutron.list_ipsec_site_connections` (*profile=None*)

Fetches all configured IPsec Site Connections for a tenant

CLI Example:

```
salt '*' neutron.list_ipsec_site_connections
salt '*' neutron.list_ipsec_site_connections profile=openstack1
```

**Parameters**

**profile** -- Profile to build on (Optional)

**Returns**

List of IPsec site connection

`salt.modules.neutron.list_ipsecpolicies` (*profile=None*)

Fetches a list of all configured IPsecPolicies for a tenant

CLI Example:

```
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name profile=openstack1
```

**Parameters****profile** -- Profile to build on (Optional)**Returns**

List of IPsec policy

`salt.modules.neutron.list_l3_agent_hosting_routers` (*router*, *profile=None*)

List L3 agents hosting a router.

CLI Example:

```
salt '*' neutron.list_l3_agent_hosting_routers router
```

:param router:router name or ID to query. :param profile: Profile to build on (Optional) :return: L3 agents message.

`salt.modules.neutron.list_networks` (*profile=None*)

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_networks
salt '*' neutron.list_networks profile=openstack1
```

**Parameters****profile** -- Profile to build on (Optional)**Returns**

List of network

`salt.modules.neutron.list_ports` (*profile=None*)

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_ports
salt '*' neutron.list_ports profile=openstack1
```

**Parameters****profile** -- Profile to build on (Optional)**Returns**

List of port

`salt.modules.neutron.list_quotas` (*profile=None*)

Fetches all tenants quotas

CLI Example:

```
salt '*' neutron.list_quotas
salt '*' neutron.list_quotas profile=openstack1
```

**Parameters****profile** -- Profile to build on (Optional)**Returns**

List of quotas

`salt.modules.neutron.list_routers` (*profile=None*)

Fetches a list of all routers for a tenant

CLI Example:

```
salt '*' neutron.list_routers
salt '*' neutron.list_routers profile=openstack1
```

**Parameters**

**profile** -- Profile to build on (Optional)

**Returns**

List of router

`salt.modules.neutron.list_security_group_rules` (*profile=None*)

Fetches a list of all security group rules for a tenant

CLI Example:

```
salt '*' neutron.list_security_group_rules
salt '*' neutron.list_security_group_rules profile=openstack1
```

**Parameters**

**profile** -- Profile to build on (Optional)

**Returns**

List of security group rule

`salt.modules.neutron.list_security_groups` (*profile=None*)

Fetches a list of all security groups for a tenant

CLI Example:

```
salt '*' neutron.list_security_groups
salt '*' neutron.list_security_groups profile=openstack1
```

**Parameters**

**profile** -- Profile to build on (Optional)

**Returns**

List of security group

`salt.modules.neutron.list_subnets` (*profile=None*)

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_subnets
salt '*' neutron.list_subnets profile=openstack1
```

**Parameters**

**profile** -- Profile to build on (Optional)

**Returns**

List of subnet

`salt.modules.neutron.list_vpnservices` (*retrieve\_all=True, profile=None, \*\*kwargs*)

Fetches a list of all configured VPN services for a tenant

CLI Example:

```
salt '*' neutron.list_vpnservices
```

**Parameters**

- **retrieve\_all** -- True or False, default: True (Optional)
- **profile** -- Profile to build on (Optional)

**Returns**

List of VPN service

`salt.modules.neutron.remove_gateway_router` (*router*, *profile=None*)

Removes an external network gateway from the specified router

CLI Example:

```
salt '*' neutron.remove_gateway_router router-name
```

**Parameters**

- **router** -- ID or name of router
- **profile** -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

`salt.modules.neutron.remove_interface_router` (*router*, *subnet*, *profile=None*)

Removes an internal network interface from the specified router

CLI Example:

```
salt '*' neutron.remove_interface_router router-name subnet-name
```

**Parameters**

- **router** -- ID or name of the router
- **subnet** -- ID or name of the subnet
- **profile** -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

`salt.modules.neutron.show_firewall` (*firewall*, *profile=None*)

Fetches information of a specific firewall rule

CLI Example:

```
salt '*' neutron.show_firewall firewall
```

**Parameters**

- **firewall** -- ID or name of firewall to look up
- **profile** -- Profile to build on (Optional)

**Returns**

firewall information

`salt.modules.neutron.show_firewall_rule` (*firewall\_rule*, *profile=None*)

Fetches information of a specific firewall rule

CLI Example:

```
salt '*' neutron.show_firewall_rule firewall-rule-name
```

**Parameters**

- **ipsecpolicy** -- ID or name of firewall rule to look up
- **profile** -- Profile to build on (Optional)

**Returns**

firewall rule information

`salt.modules.neutron.show_floatingip` (*floatingip\_id*, *profile=None*)

Fetches information of a certain floatingIP

CLI Example:

```
salt '*' neutron.show_floatingip floatingip-id
```

**Parameters**

- **floatingip\_id** -- ID of floatingIP to look up
- **profile** -- Profile to build on (Optional)

**Returns**

Floating IP information

`salt.modules.neutron.show_ikepolicy` (*ikepolicy*, *profile=None*)

Fetches information of a specific IKEPolicy

CLI Example:

```
salt '*' neutron.show_ikepolicy ikepolicy-name
```

**Parameters**

- **ikepolicy** -- ID or name of ikepolicy to look up
- **profile** -- Profile to build on (Optional)

**Returns**

IKE policy information

`salt.modules.neutron.show_ipsec_site_connection` (*ipsec\_site\_connection*, *profile=None*)

Fetches information of a specific IPsecSiteConnection

CLI Example:

```
salt '*' neutron.show_ipsec_site_connection connection-name
```

**Parameters**

- **ipsec\_site\_connection** -- ID or name of ipsec site connection to look up
- **profile** -- Profile to build on (Optional)

**Returns**

IPSec site connection information

`salt.modules.neutron.show_ipsecpolicy` (*ipsecpolicy*, *profile=None*)

Fetches information of a specific IPsecPolicy

CLI Example:

```
salt '*' neutron.show_ipsecpolicy ipsecpolicy-name
```

**Parameters**

- **ipsecpolicy** -- ID or name of IPSec policy to look up
- **profile** -- Profile to build on (Optional)

**Returns**

IPSec policy information

`salt.modules.neutron.show_network` (*network*, *profile=None*)

Fetches information of a certain network

CLI Example:

```
salt '*' neutron.show_network network-name
salt '*' neutron.show_network network-name profile=openstack1
```

**Parameters**

- **network** -- ID or name of network to look up
- **profile** -- Profile to build on (Optional)

**Returns**

Network information

`salt.modules.neutron.show_port`(*port*, *profile=None*)

Fetches information of a certain port

CLI Example:

```
salt '*' neutron.show_port port-id
salt '*' neutron.show_port port-id profile=openstack1
```

**Parameters**

- **port** -- ID or name of port to look up
- **profile** -- Profile to build on (Optional)

**Returns**

Port information

`salt.modules.neutron.show_quota`(*tenant\_id*, *profile=None*)

Fetches information of a certain tenant's quotas

CLI Example:

```
salt '*' neutron.show_quota tenant-id
salt '*' neutron.show_quota tenant-id profile=openstack1
```

**Parameters**

- **tenant\_id** -- ID of tenant
- **profile** -- Profile to build on (Optional)

**Returns**

Quota information

`salt.modules.neutron.show_router`(*router*, *profile=None*)

Fetches information of a certain router

CLI Example:

```
salt '*' neutron.show_router router-name
```

**Parameters**

- **router** -- ID or name of router to look up
- **profile** -- Profile to build on (Optional)

**Returns**

Router information

`salt.modules.neutron.show_security_group`(*security\_group*, *profile=None*)

Fetches information of a certain security group

CLI Example:

```
salt '*' neutron.show_security_group security-group-name
```

**Parameters**

- **security\_group** -- ID or name of security group to look up
- **profile** -- Profile to build on (Optional)

**Returns**

Security group information

```
salt.modules.neutron.show_security_group_rule(security_group_rule_id, profile=None)
```

Fetches information of a certain security group rule

CLI Example:

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

**Parameters**

- **security\_group\_rule\_id** -- ID of security group rule to look up
- **profile** -- Profile to build on (Optional)

**Returns**

Security group rule information

```
salt.modules.neutron.show_subnet(subnet, profile=None)
```

Fetches information of a certain subnet

CLI Example:

```
salt '*' neutron.show_subnet subnet-name
```

**Parameters**

- **subnet** -- ID or name of subnet to look up
- **profile** -- Profile to build on (Optional)

**Returns**

Subnet information

```
salt.modules.neutron.show_vpnservice(vpnservice, profile=None, **kwargs)
```

Fetches information of a specific VPN service

CLI Example:

```
salt '*' neutron.show_vpnservice vpnservice-name
```

**Parameters**

- **vpnservice** -- ID or name of vpn service to look up
- **profile** -- Profile to build on (Optional)

**Returns**

VPN service information

```
salt.modules.neutron.update_firewall_rule(firewall_rule, protocol=None, action=None,
name=None, description=None, ip_version=None,
source_ip_address=None,
destination_ip_address=None, source_port=None,
destination_port=None, shared=None, enabled=None,
profile=None)
```

Update a firewall rule

CLI Example:

```
salt '*' neutron.update_firewall_rule firewall_rule protocol=PROTOCOL
→action=ACTION
```

(continues on next page)

(continued from previous page)

```

name=NAME description=DESCRIPTION ip_version=IP_VERSION
source_ip_address=SOURCE_IP_ADDRESS destination_ip_
→address=DESTINATION_IP_ADDRESS
source_port=SOURCE_PORT destination_port=DESTINATION_PORT
→shared=SHARED enabled=ENABLED

```

**Parameters**

- **firewall\_rule** -- ID or name of firewall rule to update.
- **protocol** -- Protocol for the firewall rule, choose "tcp", "udp", "icmp" or "None". (Optional)
- **action** -- Action for the firewall rule, choose "allow" or "deny". (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip\_version** -- IP protocol version, default: 4. (Optional)
- **source\_ip\_address** -- Source IP address or subnet. (Optional)
- **destination\_ip\_address** -- Destination IP address or subnet. (Optional)
- **source\_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination\_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)
- **profile** -- Profile to build on (Optional)

`salt.modules.neutron.update_floatingip` (*floatingip\_id*, *port=None*, *profile=None*)

Updates a floatingIP

CLI Example:

```
salt '*' neutron.update_floatingip network-name port-name
```

**Parameters**

- **floatingip\_id** -- ID of floatingIP
- **port** -- ID or name of port, to associate floatingip to *None* or do not specify to disassociate the floatingip (Optional)
- **profile** -- Profile to build on (Optional)

**Returns**

Value of updated floating IP information

`salt.modules.neutron.update_network` (*network*, *name*, *profile=None*)

Updates a network

CLI Example:

```
salt '*' neutron.update_network network-name new-network-name
```

**Parameters**

- **network** -- ID or name of network to update
- **name** -- Name of this network
- **profile** -- Profile to build on (Optional)

**Returns**

Value of updated network information

`salt.modules.neutron.update_port` (*port*, *name*, *admin\_state\_up=True*, *profile=None*)

Updates a port

CLI Example:

```
salt '*' neutron.update_port port-name network-name new-port-name
```

**Parameters**

- **port** -- Port name or ID
- **name** -- Name of this port
- **admin\_state\_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

**Returns**

Value of updated port information

```
salt.modules.neutron.update_quota(tenant_id, subnet=None, router=None, network=None,
                                  floatingip=None, port=None, security_group=None,
                                  security_group_rule=None, profile=None)
```

Update a tenant's quota

CLI Example:

```
salt '*' neutron.update_quota tenant-id subnet=40 router=50
                                   network=10 floatingip=30 port=30
```

**Parameters**

- **tenant\_id** -- ID of tenant
- **subnet** -- Value of subnet quota (Optional)
- **router** -- Value of router quota (Optional)
- **network** -- Value of network quota (Optional)
- **floatingip** -- Value of floatingip quota (Optional)
- **port** -- Value of port quota (Optional)
- **security\_group** -- Value of security group (Optional)
- **security\_group\_rule** -- Value of security group rule (Optional)
- **profile** -- Profile to build on (Optional)

**Returns**

Value of updated quota

```
salt.modules.neutron.update_router(router, name=None, admin_state_up=None, profile=None,
                                   **kwargs)
```

Updates a router

CLI Example:

```
salt '*' neutron.update_router router_id name=new-router-name
                                   admin_state_up=True
```

**Parameters**

- **router** -- ID or name of router to update
- **name** -- Name of this router
- **ext\_network** -- ID or name of the external for the gateway (Optional)
- **admin\_state\_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)
- **kwargs** --

**Returns**

Value of updated router information

```
salt.modules.neutron.update_security_group(security_group, name=None, description=None,
                                           profile=None)
```

Updates a security group

CLI Example:

```
salt '*' neutron.update_security_group security-group-name
↳ new-security-group-name
```

#### Parameters

- **security\_group** -- ID or name of security group to update
- **name** -- Name of this security group (Optional)
- **description** -- Description of security group (Optional)
- **profile** -- Profile to build on (Optional)

#### Returns

Value of updated security group information

`salt.modules.neutron.update_subnet`(*subnet, name, profile=None*)

Updates a subnet

CLI Example:

```
salt '*' neutron.update_subnet subnet-name new-subnet-name
```

#### Parameters

- **subnet** -- ID or name of subnet to update
- **name** -- Name of this subnet
- **profile** -- Profile to build on (Optional)

#### Returns

Value of updated subnet information

`salt.modules.neutron.update_vpnservice`(*vpnservice, desc, profile=None*)

Updates a VPN service

CLI Example:

```
salt '*' neutron.update_vpnservice vpnservice-name desc='VPN Service1'
```

#### Parameters

- **vpnservice** -- ID or name of vpn service to update
- **desc** -- Set a description for the VPN service
- **profile** -- Profile to build on (Optional)

#### Returns

Value of updated VPN service information

## 26.6.299 salt.modules.neutronng

Neutron module for interacting with OpenStack Neutron

New in version 2018.3.0.

:depends:shade

Example configuration

```
neutron:
  cloud: default
```

```

neutron:
  auth:
    username: admin
    password: password123
    user_domain_name: mydomain
    project_name: myproject
    project_domain_name: myproject
    auth_url: https://example.org:5000/v3
    identity_api_version: 3

```

`salt.modules.neutronng.compare_changes(obj, **kwargs)`

Compare two dicts returning only keys that exist in the first dict and are different in the second one

`salt.modules.neutronng.get_openstack_cloud(auth=None)`

Return an openstack\_cloud

`salt.modules.neutronng.get_operator_cloud(auth=None)`

Return an operator\_cloud

`salt.modules.neutronng.list_networks(auth=None, **kwargs)`

List networks

**filters**

A Python dictionary of filter conditions to push down

CLI Example:

```

salt '*' neutronng.list_networks
salt '*' neutronng.list_networks          filters='{"tenant_id":
↳ "1dcac318a83b4610b7a7f7ba01465548"}'

```

`salt.modules.neutronng.list_subnets(auth=None, **kwargs)`

List subnets

**filters**

A Python dictionary of filter conditions to push down

CLI Example:

```

salt '*' neutronng.list_subnets
salt '*' neutronng.list_subnets          filters='{"tenant_id":
↳ "1dcac318a83b4610b7a7f7ba01465548"}'

```

`salt.modules.neutronng.network_create(auth=None, **kwargs)`

Create a network

**name**

Name of the network being created

**shared**

[False] If True, set the network as shared

**admin\_state\_up**

[True] If True, Set the network administrative state to "up"

**external**

[False] Control whether or not this network is externally accessible

**provider**

An optional Python dictionary of network provider options

**project\_id**

The project ID on which this network will be created

CLI Example:

```

salt '*' neutronng.network_create name=network2          shared=True
→admin_state_up=True external=True

salt '*' neutronng.network_create name=network3          provider='{
→"network_type": "vlan",                                "segmentation_id": "4010",
→"physical_network": "provider"}'                       project_
→id=1dcac318a83b4610b7a7f7ba01465548

```

`salt.modules.neutronng.network_delete` (*auth=None, \*\*kwargs*)

Delete a network

**name\_or\_id**

Name or ID of the network being deleted

CLI Example:

```

salt '*' neutronng.network_delete name_or_id=network1
salt '*' neutronng.network_delete name_or_
→id=1dcac318a83b4610b7a7f7ba01465548

```

`salt.modules.neutronng.network_get` (*auth=None, \*\*kwargs*)

Get a single network

**filters**

A Python dictionary of filter conditions to push down

CLI Example:

```

salt '*' neutronng.network_get name=XLB4

```

`salt.modules.neutronng.security_group_create` (*auth=None, \*\*kwargs*)

Create a security group. Use `security_group_get` to create default.

**project\_id**

The project ID on which this security group will be created

CLI Example:

```

salt '*' neutronng.security_group_create name=secgroup1
→description="Very secure security group"
salt '*' neutronng.security_group_create name=secgroup1
→description="Very secure security group"           project_
→id=1dcac318a83b4610b7a7f7ba01465548

```

`salt.modules.neutronng.security_group_delete` (*auth=None, \*\*kwargs*)

Delete a security group

**name\_or\_id**

The name or unique ID of the security group

CLI Example:

```

salt '*' neutronng.security_group_delete name_or_id=secgroup1

```

`salt.modules.neutronng.security_group_get` (*auth=None, \*\*kwargs*)

Get a single security group. This will create a default security group if one does not exist yet for a particular project id.

**filters**

A Python dictionary of filter conditions to push down

CLI Example:

```

salt '*' neutronng.security_group_get                                ✖
→name=1dcac318a83b4610b7a7f7ba01465548

salt '*' neutronng.security_group_get                                ✖
→filters='{"tenant_id":"2e778bb64ca64a199eb526b5958d8710"}'

```

`salt.modules.neutronng.security_group_rule_create` (*auth=None, \*\*kwargs*)

Create a rule in a security group

**secgroup\_name\_or\_id**

The security group name or ID to associate with this security group rule. If a non-unique group name is given, an exception is raised.

**port\_range\_min**

The minimum port number in the range that is matched by the security group rule. If the protocol is TCP or UDP, this value must be less than or equal to the `port_range_max` attribute value. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

**port\_range\_max**

The maximum port number in the range that is matched by the security group rule. The `port_range_min` attribute constrains the `port_range_max` attribute. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

**protocol**

The protocol that is matched by the security group rule. Valid values are None, `tcp`, `udp`, and `icmp`.

**remote\_ip\_prefix**

The remote IP prefix to be associated with this security group rule. This attribute matches the specified IP prefix as the source IP address of the IP packet.

**remote\_group\_id**

The remote group ID to be associated with this security group rule

**direction**

Either `ingress` or `egress`; the direction in which the security group rule is applied. For a compute instance, an ingress security group rule is applied to incoming (ingress) traffic for that instance. An egress rule is applied to traffic leaving the instance

**ethertype**

Must be IPv4 or IPv6, and addresses represented in CIDR must match the ingress or egress rules

**project\_id**

Specify the project ID this security group will be created on (admin-only)

CLI Example:

```

salt '*' neutronng.security_group_rule_create                        secgroup_name_or_
→id=secgroup1

salt '*' neutronng.security_group_rule_create                        secgroup_name_or_
→id=secgroup2 port_range_min=8080 port_range_max=8080 direction=
→'egress'

salt '*' neutronng.security_group_rule_create                        secgroup_name_or_
→id=c0e1d1ce-7296-405e-919d-1c08217be529 protocol=icmp project_
→id=1dcac318a83b4610b7a7f7ba01465548

```

`salt.modules.neutronng.security_group_rule_delete` (*auth=None, \*\*kwargs*)

Delete a security group

**name\_or\_id**

The unique ID of the security group rule

CLI Example:

```
salt '*' neutronng.security_group_rule_delete name_or_
→id=1dcac318a83b4610b7a7f7ba01465548
```

`salt.modules.neutronng.security_group_update` (*secgroup=None, auth=None, \*\*kwargs*)

Update a security group

**secgroup**

Name, ID or Raw Object of the security group to update

**name**

New name for the security group

**description**

New description for the security group

CLI Example:

```
salt '*' neutronng.security_group_update secgroup=secgroup1      ✘
→description="Very secure security group"
salt '*' neutronng.security_group_update secgroup=secgroup1      ✘
→description="Very secure security group" project_
→id=1dcac318a83b4610b7a7f7ba01465548
```

`salt.modules.neutronng.setup_clouds` (*auth=None*)

Call functions to create Shade cloud objects in `__context__` to take advantage of Shade's in-memory caching across several states

`salt.modules.neutronng.subnet_create` (*auth=None, \*\*kwargs*)

Create a subnet

**network\_name\_or\_id**

The unique name or ID of the attached network. If a non-unique name is supplied, an exception is raised.

**cidr**

The CIDR

**ip\_version**

The IP version, which is 4 or 6.

**enable\_dhcp**

[False] Set to True if DHCP is enabled and False if disabled

**subnet\_name**

The name of the subnet

**tenant\_id**

The ID of the tenant who owns the network. Only administrative users can specify a tenant ID other than their own.

**allocation\_pools**

A list of dictionaries of the start and end addresses for the allocation pools.

**gateway\_ip**

The gateway IP address. When you specify both `allocation_pools` and `gateway_ip`, you must ensure that the gateway IP does not overlap with the specified allocation pools.

**disable\_gateway\_ip**

[False] Set to True if gateway IP address is disabled and False if enabled. It is not allowed with `gateway_ip`.

**dns\_nameservers**

A list of DNS name servers for the subnet

**host\_routes**

A list of host route dictionaries for the subnet

**ipv6\_ra\_mode**

IPv6 Router Advertisement mode. Valid values are `dhcpv6-stateful`, `dhcpv6-stateless`, or `slaac`.

**ipv6\_address\_mode**

IPv6 address mode. Valid values are `dhcpv6-stateful`, `dhcpv6-stateless`, or `slaac`.

**use\_default\_subnetpool**

If True, use the default subnetpool for `ip_version` to obtain a CIDR. It is required to pass None to the `cidr` argument when enabling this option.

CLI Example:

```
salt '*' neutronng.subnet_create network_name_or_id=network1
    subnet_name=subnet1

salt '*' neutronng.subnet_create subnet_name=subnet2          network_
↳name_or_id=network2 enable_dhcp=True          allocation_pools='[{
↳"start": "192.168.199.2",                          "end": "192.168.
↳199.254"}]'          gateway_ip='192.168.199.1' cidr=192.168.199.0/24

salt '*' neutronng.subnet_create network_name_or_id=network1
↳subnet_name=subnet1 dns_nameservers='["8.8.8.8", "8.8.8.7"]'
```

`salt.modules.neutronng.subnet_delete` (*auth=None, \*\*kwargs*)

Delete a subnet

**name**

Name or ID of the subnet to update

CLI Example:

```
salt '*' neutronng.subnet_delete name=subnet1
salt '*' neutronng.subnet_delete
↳name=1dcac318a83b4610b7a7f7ba01465548
```

`salt.modules.neutronng.subnet_get` (*auth=None, \*\*kwargs*)

Get a single subnet

**filters**

A Python dictionary of filter conditions to push down

CLI Example:

```
salt '*' neutronng.subnet_get name=subnet1
```

`salt.modules.neutronng.subnet_update` (*auth=None, \*\*kwargs*)

Update a subnet

**name\_or\_id**

Name or ID of the subnet to update

**subnet\_name**

The new name of the subnet

**enable\_dhcp**

Set to True if DHCP is enabled and False if disabled

**gateway\_ip**

The gateway IP address. When you specify both `allocation_pools` and `gateway_ip`, you must ensure that the gateway IP does not overlap with the specified allocation pools.

**disable\_gateway\_ip**

[False] Set to True if gateway IP address is disabled and False if enabled. It is not allowed with `gateway_ip`.

**allocation\_pools**

A list of dictionaries of the start and end addresses for the allocation pools.

**dns\_nameservers**

A list of DNS name servers for the subnet

**host\_routes**

A list of host route dictionaries for the subnet

```
salt '*' neutronng.subnet_update name=subnet1 subnet_name=subnet2
salt '*' neutronng.subnet_update name=subnet1 dns_nameservers='["8.8.8.8",
↳ "8.8.8.7"]'
```

**26.6.300 salt.modules.nexus**

Module for fetching artifacts from Nexus 3.x

New in version 2018.3.0.

**salt.modules.nexus.get\_latest\_release** (*nexus\_url, repository, group\_id, artifact\_id, packaging, target\_dir='/tmp', target\_file=None, classifier=None, username=None, password=None*)

Gets the latest release of the artifact

**nexus\_url**

URL of nexus instance

**repository**

Release repository in nexus to retrieve artifact from, for example: libs-releases

**group\_id**

Group Id of the artifact

**artifact\_id**

Artifact Id of the artifact

**packaging**

Packaging type (jar,war,ear,etc)

**target\_dir**

Target directory to download artifact to (default: /tmp)

**target\_file**

Target file to download artifact to (by default it is target\_dir/artifact\_id-version.packaging)

**classifier**

Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

**username**

nexus username. Optional parameter.

**password**

nexus password. Optional parameter.

**salt.modules.nexus.get\_latest\_snapshot** (*nexus\_url, repository, group\_id, artifact\_id, packaging, target\_dir='/tmp', target\_file=None, classifier=None, username=None, password=None*)

Gets latest snapshot of the given artifact

**nexus\_url**

URL of nexus instance

**repository**

Snapshot repository in nexus to retrieve artifact from, for example: libs-snapshots

**group\_id**

Group Id of the artifact

**artifact\_id**

Artifact Id of the artifact

**packaging**

Packaging type (jar,war,ear,etc)

**target\_dir**

Target directory to download artifact to (default: /tmp)

**target\_file**

Target file to download artifact to (by default it is target\_dir/artifact\_id-snapshot\_version.packaging)

**classifier**

Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

**username**

nexus username. Optional parameter.

**password**

nexus password. Optional parameter.

```
salt.modules.nexus.get_release(nexus_url, repository, group_id, artifact_id, packaging, version,  
target_dir='/tmp', target_file=None, classifier=None, username=None,  
password=None)
```

Gets the specified release of the artifact

**nexus\_url**

URL of nexus instance

**repository**

Release repository in nexus to retrieve artifact from, for example: libs-releases

**group\_id**

Group Id of the artifact

**artifact\_id**

Artifact Id of the artifact

**packaging**

Packaging type (jar,war,ear,etc)

**version**

Version of the artifact

**target\_dir**

Target directory to download artifact to (default: /tmp)

**target\_file**

Target file to download artifact to (by default it is target\_dir/artifact\_id-version.packaging)

**classifier**

Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

**username**

nexus username. Optional parameter.

**password**

nexus password. Optional parameter.

```
salt.modules.nexus.get_snapshot(nexus_url, repository, group_id, artifact_id, packaging, version,  
snapshot_version=None, target_dir='/tmp', target_file=None,  
classifier=None, username=None, password=None)
```

Gets snapshot of the desired version of the artifact

**nexus\_url**

URL of nexus instance

**repository**

Snapshot repository in nexus to retrieve artifact from, for example: libs-snapshots

**group\_id**

Group Id of the artifact

**artifact\_id**

Artifact Id of the artifact

**packaging**

Packaging type (jar,war,ear,etc)

**version**

Version of the artifact

**target\_dir**

Target directory to download artifact to (default: /tmp)

**target\_file**

Target file to download artifact to (by default it is target\_dir/artifact\_id-snapshot\_version.packaging)

**classifier**

Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

**username**

nexus username. Optional parameter.

**password**

nexus password. Optional parameter.

```
salt.modules.nexus.get_snapshot_version_string(nexus_url, repository, group_id, artifact_id,
                                               packaging, version, classifier=None,
                                               username=None, password=None)
```

Gets the specific version string of a snapshot of the desired version of the artifact

**nexus\_url**

URL of nexus instance

**repository**

Snapshot repository in nexus to retrieve artifact from, for example: libs-snapshots

**group\_id**

Group Id of the artifact

**artifact\_id**

Artifact Id of the artifact

**packaging**

Packaging type (jar,war,ear,etc)

**version**

Version of the artifact

**classifier**

Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

**username**

nexus username. Optional parameter.

**password**

nexus password. Optional parameter.

**exception** salt.modules.nexus.nexusError (*value*)

### 26.6.301 salt.modules.nfs3

Module for managing NFS version 3.

```
salt.modules.nfs3.add_export(exports='/etc/exports', path=None, hosts=None, options=None)
```

Add an export

CLI Example:

```
salt '*' nfs3.add_export path='/srv/test' hosts='127.0.0.1' options=['rw']
```

```
salt.modules.nfs3.del_export(exports='/etc/exports', path=None)
```

Remove an export

CLI Example:

```
salt '*' nfs.del_export /media/storage
```

```
salt.modules.nfs3.list_exports(exports='/etc/exports')
```

List configured exports

CLI Example:

```
salt '*' nfs.list_exports
```

`salt.modules.nfs3.reload_exports()`

Trigger a reload of the exports file to apply changes

CLI Example:

```
salt '*' nfs3.reload_exports
```

### 26.6.302 salt.modules.nftables

Support for nftables

`salt.modules.nftables.append` (*table='filter', chain=None, rule=None, family='ipv4'*)

Append a rule to the specified table & chain.

This function accepts a rule in a standard nftables command format,

starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.append filter input \
    rule='tcp dport 22 log accept'
```

IPv6:

```
salt '*' nftables.append filter input \
    rule='tcp dport 22 log accept' \
    family=ipv6
```

`salt.modules.nftables.build_rule` (*table=None, chain=None, command=None, position="", full=None, family='ipv4', \*\*kwargs*)

Build a well-formatted nftables rule based on kwargs. A *table* and *chain* are not required, unless *full* is True.

If *full* is True, then *table*, *chain* and *command* are required. *command* may be specified as either insert, append, or delete. This will return the nftables command, exactly as it would be used from the command line.

If a position is required (as with *insert* or *delete*), it may be specified as *position*. This will only be useful if *full* is True.

If *connstate* is passed in, it will automatically be changed to *state*.

CLI Examples:

```
salt '*' nftables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT
salt '*' nftables.build_rule filter input command=insert position=3 \
    full=True match=state state=related,established jump=accept
```

IPv6:

```
salt '*' nftables.build_rule match=state \
    connstate=related,established jump=accept \
    family=ipv6
salt '*' nftables.build_rule filter input command=insert position=3 \
    full=True match=state state=related,established jump=accept \
    family=ipv6
```

`salt.modules.nftables.check`(*table='filter', chain=None, rule=None, family='ipv4'*)

Check for the existence of a rule in the table and chain

**This function accepts a rule in a standard nftables command format,** starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.check filter input \
    rule='tcp dport 22 log accept'
```

IPv6:

```
salt '*' nftables.check filter input \
    rule='tcp dport 22 log accept' \
    family=ipv6
```

`salt.modules.nftables.check_chain`(*table='filter', chain=None, family='ipv4'*)

New in version 2014.7.0.

Check for the existence of a chain in the table

CLI Example:

```
salt '*' nftables.check_chain filter input
```

IPv6:

```
salt '*' nftables.check_chain filter input family=ipv6
```

`salt.modules.nftables.check_table`(*table=None, family='ipv4'*)

Check for the existence of a table

CLI Example:

```
salt '*' nftables.check_table nat
```

`salt.modules.nftables.delete`(*table, chain=None, position=None, rule=None, family='ipv4'*)

**Delete a rule from the specified table & chain, specifying either the rule** in its entirety, or the rule's position in the chain.

**This function accepts a rule in a standard nftables command format,** starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' nftables.delete filter input position=3
```

```
salt '*' nftables.delete filter input \
    rule='tcp dport 22 log accept'
```

IPv6:

```
salt '*' nftables.delete filter input position=3 family=ipv6
```

```
salt '*' nftables.delete filter input \
    rule='tcp dport 22 log accept' \
    family=ipv6
```

`salt.modules.nftables.delete_chain`(*table='filter', chain=None, family='ipv4'*)

New in version 2014.7.0.

Delete the chain from the specified table.

CLI Example:

```
salt '*' nftables.delete_chain filter input

salt '*' nftables.delete_chain filter foo

IPv6:
salt '*' nftables.delete_chain filter input family=ipv6

salt '*' nftables.delete_chain filter foo family=ipv6
```

`salt.modules.nftables.delete_table`(*table, family='ipv4'*)

New in version 2014.7.0.

Create new custom table.

CLI Example:

```
salt '*' nftables.delete_table filter

IPv6:
salt '*' nftables.delete_table filter family=ipv6
```

`salt.modules.nftables.flush`(*table='filter', chain="", family='ipv4'*)

Flush the chain in the specified table, flush all chains in the specified table if chain is not specified.

CLI Example:

```
salt '*' nftables.flush filter

salt '*' nftables.flush filter input

IPv6:
salt '*' nftables.flush filter input family=ipv6
```

`salt.modules.nftables.get_policy`(*table='filter', chain=None, family='ipv4'*)

New in version 3002.

Return the current policy for the specified table/chain

**table**

Name of the table containing the chain to check

**chain**

Name of the chain to get the policy for

**family**

Networking family, either ipv4 or ipv6

CLI Example:

```
salt '*' nftables.get_policy filter input

IPv6:
salt '*' nftables.get_policy filter input family=ipv6
```

`salt.modules.nftables.get_rule_handle` (*table='filter', chain=None, rule=None, family='ipv4'*)

Get the handle for a particular rule

**This function accepts a rule in a standard nftables command format,** starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.get_rule_handle filter input \
    rule='tcp dport 22 log accept'
```

IPv6:

```
salt '*' nftables.get_rule_handle filter input \
    rule='tcp dport 22 log accept' \
    family=ipv6
```

`salt.modules.nftables.get_rules` (*family='ipv4'*)

Return a data structure of the current, in-memory rules

CLI Example:

```
salt '*' nftables.get_rules
salt '*' nftables.get_rules family=ipv6
```

`salt.modules.nftables.get_rules_json` (*family='ipv4'*)

New in version 3002.

Return a list of dictionaries comprising the current, in-memory rules  
**family**

Networking family, either ipv4 or ipv6

CLI Example:

```
salt '*' nftables.get_rules_json
salt '*' nftables.get_rules_json family=ipv6
```

`salt.modules.nftables.get_saved_rules` (*conf\_file=None*)

Return a data structure of the rules in the conf file

CLI Example:

```
salt '*' nftables.get_saved_rules
```

`salt.modules.nftables.insert` (*table='filter', chain=None, position=None, rule=None, family='ipv4'*)

Insert a rule into the specified table & chain, at the specified position.

If position is not specified, rule will be inserted in first position.

**This function accepts a rule in a standard nftables command format,** starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' nftables.insert filter input \
    rule='tcp dport 22 log accept'
```

(continues on next page)

(continued from previous page)

```

salt '*' nftables.insert filter input position=3 \
    rule='tcp dport 22 log accept'

IPv6:
salt '*' nftables.insert filter input \
    rule='tcp dport 22 log accept' \
    family=ipv6

salt '*' nftables.insert filter input position=3 \
    rule='tcp dport 22 log accept' \
    family=ipv6

```

`salt.modules.nftables.list_tables` (*family='ipv4'*)

Return a data structure of the current, in-memory tables

CLI Example:

```

salt '*' nftables.list_tables

salt '*' nftables.list_tables family=ipv6

```

`salt.modules.nftables.new_chain` (*table='filter', chain=None, table\_type=None, hook=None, priority=None, family='ipv4'*)

New in version 2014.7.0.

Create new chain to the specified table.

CLI Example:

```

salt '*' nftables.new_chain filter input

salt '*' nftables.new_chain filter input \
    table_type=filter hook=input priority=0

salt '*' nftables.new_chain filter foo

IPv6:
salt '*' nftables.new_chain filter input family=ipv6

salt '*' nftables.new_chain filter input \
    table_type=filter hook=input priority=0 family=ipv6

salt '*' nftables.new_chain filter foo family=ipv6

```

`salt.modules.nftables.new_table` (*table, family='ipv4'*)

New in version 2014.7.0.

Create new custom table.

CLI Example:

```

salt '*' nftables.new_table filter

IPv6:
salt '*' nftables.new_table filter family=ipv6

```

`salt.modules.nftables.save` (*filename=None, family='ipv4'*)

Changed in version 3002.

Save the current in-memory rules to disk. On systems where `/etc/nftables` is a directory, a file named `salt-all-in-one.nft` will be dropped inside by default. The main nftables configuration will need to include this file.

CLI Example:

```
salt '*' nftables.save /etc/nftables
```

`salt.modules.nftables.set_policy` (*table='filter', chain=None, policy=None, family='ipv4'*)

New in version 3002.

Set the current policy for the specified table/chain. This only works on chains with an existing base chain.

**table**

Name of the table containing the chain to modify

**chain**

Name of the chain to set the policy for

**policy**

accept or drop

**family**

Networking family, either ipv4 or ipv6

CLI Example:

```
salt '*' nftables.set_policy filter input accept
```

IPv6:

```
salt '*' nftables.set_policy filter input accept family=ipv6
```

`salt.modules.nftables.version`()

Return version from nftables --version

CLI Example:

```
salt '*' nftables.version
```

### 26.6.303 salt.modules.nginx

Support for nginx

`salt.modules.nginx.build_info`()

Return server and build arguments

CLI Example:

```
salt '*' nginx.build_info
```

`salt.modules.nginx.configtest`()

test configuration and exit

CLI Example:

```
salt '*' nginx.configtest
```

`salt.modules.nginx.signal`(*signal=None*)

Signals nginx to start, reload, reopen or stop.

CLI Example:

```
salt '*' nginx.signal reload
```

`salt.modules.nginx.status`(*url='http://127.0.0.1/status'*)

Return the data from an Nginx status page as a dictionary. <http://wiki.nginx.org/HttpStubStatusModule>

**url**

The URL of the status page. Defaults to 'http://127.0.0.1/status'

CLI Example:

```
salt '*' nginx.status
```

`salt.modules.nginx.version`()

Return server version from nginx -v

CLI Example:

```
salt '*' nginx.version
```

### 26.6.304 salt.modules.nilrt\_ip

The networking module for NI Linux Real-Time distro

`salt.modules.nilrt_ip.apply_network_settings`(*\*\*settings*)

Apply global network configuration.

CLI Example:

```
salt '*' ip.apply_network_settings
```

`salt.modules.nilrt_ip.build_interface`(*iface, iface\_type, enabled, \*\*settings*)

Build an interface script for a network interface.

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

`salt.modules.nilrt_ip.build_network_settings`(*\*\*settings*)

Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

`salt.modules.nilrt_ip.disable`(*interface*)

Disable the specified interface

Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.

**Parameters**

**interface** (*str*) -- interface label

**Returns**

True if the service was disabled, otherwise an exception will be thrown.

**Return type**

bool

CLI Example:

```
salt '*' ip.disable interface-label
```

`salt.modules.nilrt_ip.down(interface, iface_type=None)`

Disable the specified interface

Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.

**Parameters**

**interface** (*str*) -- interface label

**Returns**

True if the service was disabled, otherwise an exception will be thrown.

**Return type**

bool

CLI Example:

```
salt '*' ip.down interface-label
```

`salt.modules.nilrt_ip.enable(interface)`

Enable the specified interface

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

**Parameters**

**interface** (*str*) -- interface label

**Returns**

True if the service was enabled, otherwise an exception will be thrown.

**Return type**

bool

CLI Example:

```
salt '*' ip.enable interface-label
```

`salt.modules.nilrt_ip.get_interface(iface)`

Returns details about given interface.

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.nilrt_ip.get_interfaces_details()`

Get details about all the interfaces on the minion

**Returns**

information about all interfaces omitting loopback

**Return type**

dictionary

CLI Example:

```
salt '*' ip.get_interfaces_details
```

`salt.modules.nilrt_ip.get_network_settings()`

Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

`salt.modules.nilrt_ip.set_dhcp_linklocal_all(interface)`

Configure specified adapter to use DHCP with linklocal fallback

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

**Parameters**

**interface** (*str*) -- interface label

**Returns**

True if the settings were applied, otherwise an exception will be thrown.

**Return type**

bool

CLI Example:

```
salt '*' ip.set_dhcp_linklocal_all interface-label
```

`salt.modules.nilrt_ip.set_dhcp_only_all(interface)`

Configure specified adapter to use DHCP only

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

**Parameters**

**interface** (*str*) -- interface label

**Returns**

True if the settings were applied, otherwise an exception will be thrown.

**Return type**

bool

CLI Example:

```
salt '*' ip.dhcp_only_all interface-label
```

`salt.modules.nilrt_ip.set_ethercat(interface, master_id)`

Configure specified adapter to use EtherCAT adapter mode. If successful, the target will need reboot if it doesn't already use EtherCAT adapter mode, otherwise will return true.

**Parameters**

- **interface** -- interface label
- **master\_id** -- EtherCAT Master ID

**Returns**

True if the settings were applied, otherwise an exception will be thrown.

CLI Example:

```
salt '*' ip.set_ethercat interface-label master-id
```

`salt.modules.nilrt_ip.set_linklocal_only_all(interface)`

Configure specified adapter to use linklocal only

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

**Parameters**

**interface** (*str*) -- interface label

**Returns**

True if the settings were applied, otherwise an exception will be thrown.

**Return type**

bool

CLI Example:

```
salt '*' ip.linklocal_only_all interface-label
```

`salt.modules.nilrt_ip.set_static_all(interface, address, netmask, gateway, nameservers=None)`

Configure specified adapter to use ipv4 manual settings

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

#### Parameters

- **interface** (*str*) -- interface label
- **address** (*str*) -- ipv4 address
- **netmask** (*str*) -- ipv4 netmask
- **gateway** (*str*) -- ipv4 gateway
- **nameservers** (*str*) -- list of nameservers servers separated by spaces (Optional)

#### Returns

True if the settings were applied, otherwise an exception will be thrown.

#### Return type

bool

CLI Example:

```
salt '*' ip.set_static_all interface-label address netmask gateway
→nameservers
```

`salt.modules.nilrt_ip.up(interface, iface_type=None)`

Enable the specified interface

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

#### Parameters

**interface** (*str*) -- interface label

#### Returns

True if the service was enabled, otherwise an exception will be thrown.

#### Return type

bool

CLI Example:

```
salt '*' ip.up interface-label
```

## 26.6.305 salt.modules.nix

### Work with Nix packages

New in version 2017.7.0.

Does not require the machine to be Nixos, just have Nix installed and available to use for the user running this command. Their profile must be located in their home, under `$HOME/.nix-profile/`, and the nix store, unless specially set up, should be in `/nix`. To easily use this with multiple users or a root user, set up the `nix-daemon`.

This module exposes most of the common nix operations. Currently not meant to be run as a `pkg` module, but explicitly as `nix.*`.

For more information on nix, see the [nix documentation](#).

`salt.modules.nix.collect_garbage()`

Completely removed all currently 'uninstalled' packages in the nix store.

Tells the user how many store paths were removed and how much space was freed.

**Returns**

How much space was freed and how many derivations were removed

**Return type**

str

**Warning:** This is a destructive action on the nix store.

```
salt '*' nix.collect_garbage
```

`salt.modules.nix.install(*pkgs, **kwargs)`

Installs a single or multiple packages via nix

**Parameters**

- **pkgs** (*list(str)*) -- packages to update
- **attributes** (*bool*) -- Pass the list of packages or single package as attributes, not package names. default: False

**Returns**

Installed packages. Example element: gcc-3.3.2

**Return type**

list(str)

```
salt '*' nix.install package [package2 ...]
salt '*' nix.install attributes=True attr.name [attr.name2 ...]
```

`salt.modules.nix.list_pkgs(installed=True, attributes=True)`

Lists installed packages. Due to how nix works, it defaults to just doing a `nix-env -q`.

**Parameters**

- **installed** (*bool*) -- list only installed packages. This can be a very long list (12,000+ elements), so caution is advised. Default: True
- **attributes** (*bool*) -- show the attributes of the packages when listing all packages. Default: True

**Returns**

Packages installed or available, along with their attributes.

**Return type**

list(list(str))

```
salt '*' nix.list_pkgs
salt '*' nix.list_pkgs installed=False
```

`salt.modules.nix.uninstall(*pkgs)`

Erases a package from the current nix profile. Nix uninstalls work differently than other package managers, and the symlinks in the profile are removed, while the actual package remains. There is also a `nix.purge` function, to clear the package cache of unused packages.

**Parameters**

**pkgs** (*list(str)*) -- List, single package to uninstall

**Returns**

Packages that have been uninstalled

**Return type**

list(str)

```
salt '*' nix.uninstall pkg1 [pkg2 ...]
```

`salt.modules.nix.upgrade(*pkgs)`

Runs an update operation on the specified packages, or all packages if none is specified.

**Parameters****pkgs** (*list(str)*) -- List of packages to update**Returns**

The upgraded packages. Example element: ['libxslt-1.1.0', 'libxslt-1.1.10']

**Return type**

list(tuple(str, str))

```
salt '*' nix.update
salt '*' nix.update pkgs=one,two
```

### 26.6.306 salt.modules.nova

Module for handling OpenStack Nova calls

**depends**

- novaclient Python module

**configuration**

This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
# Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the nova functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' nova.flavor_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the *use\_keystoneauth* option in the pillar or minion config.

---

**Note:** This is required to use keystone v3 as for authentication.

---

```

keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/'
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'

```

**Note:** By default the nova module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the *verify* option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own. (defaults to True)

**salt.modules.nova.boot** (*name, flavor\_id=0, image\_id=0, profile=None, timeout=300*)

Boot (create) a new instance

**name**

Name of the new instance (must be first)

**flavor\_id**

Unique integer ID for the flavor

**image\_id**

Unique integer ID for the image

**timeout**

How long to wait, after creating the instance, for the provider to return information about it (default 300 seconds).

New in version 2014.1.0.

CLI Example:

```
salt '*' nova.boot myinstance flavor_id=4596 image_id=2
```

The *flavor\_id* and *image\_id* are obtained from *nova.flavor\_list* and *nova.image\_list*

```
salt '*' nova.flavor_list
salt '*' nova.image_list
```

**salt.modules.nova.delete** (*instance\_id, profile=None*)

Delete an instance

**instance\_id**

ID of the instance to be deleted

CLI Example:

```
salt '*' nova.delete 1138
```

**salt.modules.nova.flavor\_create** (*name, flavor\_id=0, ram=0, disk=0, vcpus=1, profile=None*)

Add a flavor to nova (nova flavor-create). The following parameters are required:

**name**

Name of the new flavor (must be first)

**flavor\_id**

Unique integer ID for the new flavor

**ram**

Memory size in MB

**disk**

Disk size in GB

**vcpus**  
 Number of vcpus  
 CLI Example:

```
salt '*' nova.flavor_create myflavor flavor_id=6 ram=4096 disk=10 vcpus=1
```

**salt.modules.nova.flavor\_delete**(*flavor\_id*, *profile=None*)  
 Delete a flavor from nova by id (nova flavor-delete)

CLI Example:

```
salt '*' nova.flavor_delete 7
```

**salt.modules.nova.flavor\_list**(*profile=None*)  
 Return a list of available flavors (nova flavor-list)

CLI Example:

```
salt '*' nova.flavor_list
```

**salt.modules.nova.image\_list**(*name=None*, *profile=None*)  
 Return a list of available images (nova images-list + nova image-show) If a name is provided, only that image will be displayed.

CLI Examples:

```
salt '*' nova.image_list
salt '*' nova.image_list myimage
```

**salt.modules.nova.image\_meta\_delete**(*image\_id=None*, *name=None*, *keys=None*, *profile=None*)  
 Delete a key=value pair from the metadata for an image (nova image-meta set)

CLI Examples:

```
salt '*' nova.image_meta_delete 6f52b2ff-0b31-4d84-8fd1-af45b84824f6
→keys=cheese
salt '*' nova.image_meta_delete name=myimage keys=salad,beans
```

**salt.modules.nova.image\_meta\_set**(*image\_id=None*, *name=None*, *profile=None*, *\*\*kwargs*)  
 Sets a key=value pair in the metadata for an image (nova image-meta set)

CLI Examples:

```
salt '*' nova.image_meta_set 6f52b2ff-0b31-4d84-8fd1-af45b84824f6
→cheese=gruyere
salt '*' nova.image_meta_set name=myimage salad=pasta beans=baked
```

**salt.modules.nova.keypair\_add**(*name*, *pubfile=None*, *pubkey=None*, *profile=None*)  
 Add a keypair to nova (nova keypair-add)

CLI Examples:

```
salt '*' nova.keypair_add mykey pubfile=/home/myuser/.ssh/id_rsa.pub
salt '*' nova.keypair_add mykey pubkey='ssh-rsa <key> myuser@mybox'
```

`salt.modules.nova.keypair_delete` (*name, profile=None*)

Add a keypair to nova (nova keypair-delete)

CLI Example:

```
salt '*' nova.keypair_delete mykey
```

`salt.modules.nova.keypair_list` (*profile=None*)

Return a list of available keypairs (nova keypair-list)

CLI Example:

```
salt '*' nova.keypair_list
```

`salt.modules.nova.list_` (*profile=None*)

To maintain the feel of the nova command line, this function simply calls the `server_list` function.

CLI Example:

```
salt '*' nova.list
```

`salt.modules.nova.lock` (*instance\_id, profile=None*)

Lock an instance

**instance\_id**

ID of the instance to be locked

CLI Example:

```
salt '*' nova.lock 1138
```

`salt.modules.nova.resume` (*instance\_id, profile=None*)

Resume an instance

**instance\_id**

ID of the instance to be resumed

CLI Example:

```
salt '*' nova.resume 1138
```

`salt.modules.nova.secgroup_create` (*name, description, profile=None*)

Add a secgroup to nova (nova secgroup-create)

CLI Example:

```
salt '*' nova.secgroup_create mygroup 'This is my security group'
```

`salt.modules.nova.secgroup_delete` (*name, profile=None*)

Delete a secgroup to nova (nova secgroup-delete)

CLI Example:

```
salt '*' nova.secgroup_delete mygroup
```

`salt.modules.nova.secgroup_list` (*profile=None*)

Return a list of available security groups (nova items-list)

CLI Example:

```
salt '*' nova.secgroup_list
```

`salt.modules.nova.server_by_name`(*name*, *profile=None*)

Return information about a server

**name**

Server Name

CLI Example:

```
salt '*' nova.server_by_name myserver profile=openstack
```

`salt.modules.nova.server_list`(*profile=None*)

Return list of active servers

CLI Example:

```
salt '*' nova.server_list
```

`salt.modules.nova.server_list_detailed`(*profile=None*)

Return detailed list of active servers

CLI Example:

```
salt '*' nova.server_list_detailed
```

`salt.modules.nova.server_show`(*server\_id*, *profile=None*)

Return detailed information for an active server

CLI Example:

```
salt '*' nova.server_show <server_id>
```

`salt.modules.nova.show`(*server\_id*, *profile=None*)

To maintain the feel of the nova command line, this function simply calls the `server_show` function.

CLI Example:

```
salt '*' nova.show
```

`salt.modules.nova.suspend`(*instance\_id*, *profile=None*)

Suspend an instance

**instance\_id**

ID of the instance to be suspended

CLI Example:

```
salt '*' nova.suspend 1138
```

`salt.modules.nova.volume_attach`(*name*, *server\_name*, *device='/dev/xvdb'*, *profile=None*, *timeout=300*)

Attach a block storage volume

**name**

Name of the new volume to attach

**server\_name**

Name of the server to attach to

**device**

Name of the device on the server

**profile**

Profile to build on

CLI Example:

```
salt '*' nova.volume_attach myblock slice.example.com profile=openstack
salt '*' nova.volume_attach myblock server.example.com device='/dev/xvdb'
↳profile=openstack
```

**salt.modules.nova.volume\_create**(*name, size=100, snapshot=None, voltype=None, profile=None*)

Create a block storage volume

**name**

Name of the new volume (must be first)

**size**

Volume size

**snapshot**

Block storage snapshot id

**voltype**

Type of storage

**profile**

Profile to build on

CLI Example:

```
salt '*' nova.volume_create myblock size=300 profile=openstack
```

**salt.modules.nova.volume\_delete**(*name, profile=None*)

Destroy the volume

**name**

Name of the volume

**profile**

Profile to build on

CLI Example:

```
salt '*' nova.volume_delete myblock profile=openstack
```

**salt.modules.nova.volume\_detach**(*name, profile=None, timeout=300*)

Attach a block storage volume

**name**

Name of the new volume to attach

**server\_name**

Name of the server to detach from

**profile**

Profile to build on

CLI Example:

```
salt '*' nova.volume_detach myblock profile=openstack
```

**salt.modules.nova.volume\_list**(*search\_opts=None, profile=None*)

List storage volumes

**search\_opts**

Dictionary of search options

**profile**

Profile to use

CLI Example:

```
salt '*' nova.volume_list search_opts='{"display_name": "myblock"}'
→profile=openstack
```

`salt.modules.nova.volume_show`(*name*, *profile=None*)

Create a block storage volume

**name**

Name of the volume

**profile**

Profile to use

CLI Example:

```
salt '*' nova.volume_show myblock profile=openstack
```

### 26.6.307 salt.modules.npm

Manage and query NPM packages.

`salt.modules.npm.cache_clean`(*path=None*, *runas=None*, *env=None*, *force=False*)

Clean cached NPM packages.

If no path for a specific package is provided the entire cache will be cleared.

**path**

The cache subpath to delete, or None to clear the entire cache

**runas**

The user to run NPM with

**env**

Environment variables to set when invoking npm. Uses the same env format as the `cmd.run` execution function.

**force**

Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

CLI Example:

```
salt '*' npm.cache_clean force=True
```

`salt.modules.npm.cache_list`(*path=None*, *runas=None*, *env=None*)

List NPM cached packages.

If no path for a specific package is provided this will list all the cached packages.

**path**

The cache subpath to list, or None to list the entire cache

**runas**

The user to run NPM with

**env**

Environment variables to set when invoking npm. Uses the same env format as the `cmd.run` execution function.

CLI Example:

```
salt '*' npm.cache_clean
```

`salt.modules.npm.cache_path`(*runas=None*, *env=None*)

List path of the NPM cache directory.

**runas**

The user to run NPM with

**env**

Environment variables to set when invoking npm. Uses the same env format as the `cmd.run` execution function.

CLI Example:

```
salt '*' npm.cache_path
```

`salt.modules.npm.install` (*pkg=None, pkgs=None, dir=None, runas=None, registry=None, env=None, dry\_run=False, silent=True*)

Install an NPM package.

If no directory is specified, the package will be installed globally. If no package is specified, the dependencies (from package.json) of the package in the given directory will be installed.

**pkg**

A package name in any format accepted by NPM, including a version identifier

**pkgs**

A list of package names in the same format as the `name` parameter

New in version 2014.7.0.

**dir**

The target directory in which to install the package, or None for global installation

**runas**

The user to run NPM with

**registry**

The NPM registry to install the package from.

New in version 2014.7.0.

**env**

Environment variables to set when invoking npm. Uses the same env format as the `cmd.run` execution function.

New in version 2014.7.0.

**silent**

Whether or not to run NPM install with `--silent` flag.

New in version 2016.3.0.

**dry\_run**

Whether or not to run NPM install with `--dry-run` flag.

New in version 2015.8.4.

**silent**

Whether or not to run NPM install with `--silent` flag.

New in version 2015.8.5.

CLI Example:

```
salt '*' npm.install coffee-script
salt '*' npm.install coffee-script@1.0.1
```

`salt.modules.npm.list_` (*pkg=None, dir=None, runas=None, env=None, depth=None*)

List installed NPM packages.

If no directory is specified, this will return the list of globally- installed packages.

**pkg**

Limit package listing by name

- dir**  
The directory whose packages will be listed, or None for global installation
- runas**  
The user to run NPM with  
New in version 2014.7.0.
- env**  
Environment variables to set when invoking npm. Uses the same env format as the `cmd.run` execution function.  
New in version 2014.7.0.
- depth**  
Limit the depth of the packages listed  
New in version 2016.11.6,2017.7.0.
- CLI Example:

```
salt '*' npm.list
```

`salt.modules.npm.uninstall` (*pkg, dir=None, runas=None, env=None*)

Uninstall an NPM package.

If no directory is specified, the package will be uninstalled globally.

- pkg**  
A package name in any format accepted by NPM
- dir**  
The target directory from which to uninstall the package, or None for global installation
- runas**  
The user to run NPM with
- env**  
Environment variables to set when invoking npm. Uses the same env format as the `cmd.run` execution function.  
New in version 2015.5.3.
- CLI Example:

```
salt '*' npm.uninstall coffee-script
```

### 26.6.308 salt.modules.nspawn

Manage nspawn containers

New in version 2015.8.0.

`systemd-nspawn(1)` is a tool used to manage lightweight namespace containers. This execution module provides several functions to help manage these containers.

Minions running `systemd >= 219` will place new containers in `/var/lib/machines`, while those running `systemd < 219` will place them in `/var/lib/container`.

`salt.modules.nspawn.bootstrap_container` (*name, dist=None, version=None*)

Bootstrap a container from package servers, if `dist` is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

```
salt myminion nspawn.bootstrap_container <name>
```

`salt.modules.nspawn.bootstrap_salt`(*name*, *config=None*, *approve\_key=True*, *install=True*, *pub\_key=None*, *priv\_key=None*, *bootstrap\_url=None*, *force\_install=False*, *unconditional\_install=False*, *bootstrap\_delay=None*, *bootstrap\_args=None*, *bootstrap\_shell=None*)

Bootstrap a container from package servers, if *dist* is `None` the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

```
salt '*' nspawn.bootstrap_salt arch1
```

`salt.modules.nspawn.copy_to`(*name*, *source*, *dest*, *overwrite=False*, *makedirs=False*)

Copy a file from the host into a container

**name**

Container name

**source**

File to be copied to the container

**dest**

Destination on the container. Must be an absolute path.

**overwrite**

[False] Unless this option is set to `True`, then if a file exists at the location specified by the *dest* argument, an error will be raised.

**makedirs** : `False`

Create the parent directory on the container if it does not already exist.

CLI Example:

```
salt 'minion' nspawn.copy_to /tmp/foo /root/foo
```

`salt.modules.nspawn.cp`(*name*, *source*, *dest*, *overwrite=False*, *makedirs=False*)

This function is an alias of `copy_to`.

Copy a file from the host into a container

**name**

Container name

**source**

File to be copied to the container

**dest**

Destination on the container. Must be an absolute path.

**overwrite**

[False] Unless this option is set to `True`, then if a file exists at the location specified by the *dest* argument, an error will be raised.

**makedirs** : `False`

Create the parent directory on the container if it does not already exist.

CLI Example:

```
salt 'minion' nspawn.copy_to /tmp/foo /root/foo
```

`salt.modules.nspawn.destroy`(*name*, *stop=False*)

This function is an alias of `remove`.

Remove the named container

**Warning:** This function will remove all data associated with the container. It will not, however, remove the btrfs subvolumes created by pulling container images (`nspawn.pull_raw`, `nspawn.pull_tar`, `nspawn.pull_dkr`).

**stop**

[False] If True, the container will be destroyed even if it is running/frozen.

CLI Examples:

```
salt '*' nspawn.remove foo
salt '*' nspawn.remove foo stop=True
```

`salt.modules.nspawn.disable(name)`

Set the named container to *not* be launched at boot

CLI Example:

```
salt myminion nspawn.enable <name>
```

`salt.modules.nspawn.enable(name)`

Set the named container to be launched at boot

CLI Example:

```
salt myminion nspawn.enable <name>
```

`salt.modules.nspawn.exists(name)`

Returns true if the named container exists

CLI Example:

```
salt myminion nspawn.exists <name>
```

`salt.modules.nspawn.info(name, **kwargs)`

Return info about a container

---

**Note:** The container must be running for `machinectl` to gather information about it. If the container is stopped, then this function will start it.

---

**start**

[False] If True, then the container will be started to retrieve the info. A `Started` key will be in the return data if the container was started.

CLI Example:

```
salt myminion nspawn.info arch1
salt myminion nspawn.info arch1 force_start=False
```

`salt.modules.nspawn.list_()`

This function is an alias of `list_running`.

Lists running nspawn containers

---

**Note:** `nspawn.list` also works to list running containers

---

CLI Example:

```
salt myminion nspawn.list_running
salt myminion nspawn.list
```

`salt.modules.nspawn.list_all()`

Lists all nspawn containers

CLI Example:

```
salt myminion nspawn.list_all
```

`salt.modules.nspawn.list_running()`

Lists running nspawn containers

---

**Note:** `nspawn.list` also works to list running containers

---

CLI Example:

```
salt myminion nspawn.list_running
salt myminion nspawn.list
```

`salt.modules.nspawn.list_stopped()`

Lists stopped nspawn containers

CLI Example:

```
salt myminion nspawn.list_stopped
```

`salt.modules.nspawn.pid(name)`

Returns the PID of a container

**name**

Container name

CLI Example:

```
salt myminion nspawn.pid arch1
```

`salt.modules.nspawn.poweroff(name)`

Issue a clean shutdown to the container. Equivalent to running `machinectl poweroff` on the named container.

For convenience, running `nspawn.stop` (as shown in the CLI examples below) is equivalent to running nspawn.poweroff.`

---

**Note:** `machinectl poweroff` is only supported in `systemd >= 219`. On earlier `systemd` versions, running this function will simply issue a clean shutdown via `systemctl`.

---

CLI Examples:

```
salt myminion nspawn.poweroff arch1
salt myminion nspawn.stop arch1
```

`salt.modules.nspawn.pull_dkr` (*url, name, index*)

Execute a `machinectl pull-dkr` to download a docker image and add it to `/var/lib/machines` as a new container.

---

**Note:** Requires `systemd >= 219`

---

**url**

URL from which to download the container

**name**

Name for the new container

**index**

URL of the Docker index server from which to pull (must be an `http://` or `https://` URL).

CLI Examples:

```
salt myminion nspawn.pull_dkr centos/centos6 cent6 index=https://get.
→docker.com
salt myminion nspawn.pull_docker centos/centos6 cent6 index=https://get.
→docker.com
```

`salt.modules.nspawn.pull_docker` (*url, name, index*)

This function is an alias of `pull_dkr`.

Execute a `machinectl pull-dkr` to download a docker image and add it to `/var/lib/machines` as a new container.

---

**Note:** Requires `systemd >= 219`

---

**url**

URL from which to download the container

**name**

Name for the new container

**index**

URL of the Docker index server from which to pull (must be an `http://` or `https://` URL).

CLI Examples:

```
salt myminion nspawn.pull_dkr centos/centos6 cent6 index=https://
→get.docker.com
salt myminion nspawn.pull_docker centos/centos6 cent6
→index=https://get.docker.com
```

`salt.modules.nspawn.pull_raw` (*url, name, verify=False*)

Execute a `machinectl pull-raw` to download a .qcow2 or raw disk image, and add it to `/var/lib/machines` as a new container.

---

**Note:** Requires `systemd >= 219`

---

**url**

URL from which to download the container

**name**

Name for the new container

**verify**

[False] Perform signature or checksum verification on the container. See the `machinectl(1)` man page (section titled "Image Transfer Commands") for more information on requirements for image verification. To perform signature verification, use `verify=signature`. For checksum verification, use `verify=checksum`. By default, no verification will be performed.

CLI Examples:

```
salt myminion nspawn.pull_raw http://ftp.halifax.rwth-aachen.de/fedora/
↳ linux/releases/21/Cloud/Images/x86_64/Fedora-Cloud-Base-20141203-21.x86_
↳ 64.raw.xz fedora21
```

`salt.modules.nspawn.pull_tar` (*url*, *name*, *verify=False*)

Execute a `machinectl pull-raw` to download a `.tar` container image, and add it to `/var/lib/machines` as a new container.

---

**Note:** Requires `systemd >= 219`

---

**url**

URL from which to download the container

**name**

Name for the new container

**verify**

[False] Perform signature or checksum verification on the container. See the `machinectl(1)` man page (section titled "Image Transfer Commands") for more information on requirements for image verification. To perform signature verification, use `verify=signature`. For checksum verification, use `verify=checksum`. By default, no verification will be performed.

CLI Examples:

```
salt myminion nspawn.pull_tar http://foo.domain.tld/containers/archlinux-
↳ 2015.02.01.tar.gz arch2
```

`salt.modules.nspawn.reboot` (*name*, *kill=False*)

Reboot the container by sending a SIGINT to its init process. Equivalent to running `machinectl reboot` on the named container.

For convenience, running `nspawn.restart` (as shown in the CLI examples below) is equivalent to running `nspawn.reboot`.

---

**Note:** `machinectl reboot` is only supported in `systemd >= 219`. On earlier `systemd` versions, running this function will instead restart the container via `systemctl`.

---

CLI Examples:

```
salt myminion nspawn.reboot arch1
salt myminion nspawn.restart arch1
```

`salt.modules.nspawn.remove` (*name*, *stop=False*)

Remove the named container

**Warning:** This function will remove all data associated with the container. It will not, however, remove the btrfs subvolumes created by pulling container images (*nspawn.pull\_raw*, *nspawn.pull\_tar*, *nspawn.pull\_dkr*).

**stop**

[False] If True, the container will be destroyed even if it is running/frozen.

CLI Examples:

```
salt '*' nspawn.remove foo
salt '*' nspawn.remove foo stop=True
```

`salt.modules.nspawn.restart`(*name*)

This is a compatibility function which simply calls `nspawn.reboot`.

`salt.modules.nspawn.retcode`(*name*, *cmd*, *no\_start=False*, *preserve\_state=True*, *stdin=None*, *python\_shell=True*, *output\_loglevel='debug'*, *use\_vt=False*, *ignore\_retcode=False*, *keep\_env=None*)

Run *cmd.retcode* within a container

**name**

Name of the container in which to run the command

**cmd**

Command to run

**no\_start**

[False] If the container is not running, don't start it

**preserve\_state**

[True] After running the command, return the container to its previous state

**stdin**

[None] Standard input to be used for the command

**output\_loglevel**

[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt**

[False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.

**keep\_env**

[None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.retcode mycontainer 'ip addr show'
```

`salt.modules.nspawn.run`(*name*, *cmd*, *no\_start=False*, *preserve\_state=True*, *stdin=None*, *python\_shell=True*, *output\_loglevel='debug'*, *use\_vt=False*, *ignore\_retcode=False*, *keep\_env=None*)

Run *cmd.run* within a container

**name**

Name of the container in which to run the command

**cmd**

Command to run

**no\_start**

[False] If the container is not running, don't start it

**preserve\_state**

[True] After running the command, return the container to its previous state

**stdin**

[None] Standard input to be used for the command

**output\_loglevel**

[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt**

[False] Use SaltStack's `utils.vt` to stream output to console.

**keep\_env**

[None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run mycontainer 'ip addr show'
```

```
salt.modules.nspawn.run_all(name, cmd, no_start=False, preserve_state=True, stdin=None,
                             python_shell=True, output_loglevel='debug', use_vt=False,
                             ignore_retcode=False, keep_env=None)
```

Run `cmd.run_all` within a container

---

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

---

**name**

Name of the container in which to run the command

**cmd**

Command to run

**no\_start**

[False] If the container is not running, don't start it

**preserve\_state**

[True] After running the command, return the container to its previous state

**stdin**

[None] Standard input to be used for the command

**output\_loglevel**

[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt**

[False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.

**keep\_env**

[None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_all mycontainer 'ip addr show'
```

```
salt.modules.nspawn.run_stderr(name, cmd, no_start=False, preserve_state=True, stdin=None,
                                python_shell=True, output_loglevel='debug', use_vt=False,
                                ignore_retcode=False, keep_env=None)
```

Run `cmd.run_stderr` within a container

**name**

Name of the container in which to run the command

**cmd**

Command to run

**no\_start**

[False] If the container is not running, don't start it

**preserve\_state**

[True] After running the command, return the container to its previous state

**stdin**

[None] Standard input to be used for the command

**output\_loglevel**

[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt**

[False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.

**keep\_env**

[None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stderr mycontainer 'ip addr show'
```

`salt.modules.nspawn.run_stdout` (*name*, *cmd*, *no\_start=False*, *preserve\_state=True*, *stdin=None*, *python\_shell=True*, *output\_loglevel='debug'*, *use\_vt=False*, *ignore\_retcode=False*, *keep\_env=None*)

Run `cmd.run_stdout` within a container

**name**

Name of the container in which to run the command

**cmd**

Command to run

**no\_start**

[False] If the container is not running, don't start it

**preserve\_state**

[True] After running the command, return the container to its previous state

**stdin**

[None] Standard input to be used for the command

**output\_loglevel**

[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt**

[False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.

**keep\_env**

[None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stdout mycontainer 'ip addr show'
```

`salt.modules.nspawn.start` (*name*)

Start the named container

CLI Example:

```
salt myminion nspawn.start <name>
```

`salt.modules.nspawn.state` (*name*)

Return state of container (running or stopped)

CLI Example:

```
salt myminion nspawn.state <name>
```

`salt.modules.nspawn.stop`(*name*, *kill=False*)

This is a compatibility function which provides the logic for `nspawn.poweroff` and `nspawn.terminate`.

`salt.modules.nspawn.terminate`(*name*)

Kill all processes in the container without issuing a clean shutdown. Equivalent to running `machinectl terminate` on the named container.

For convenience, running `nspawn.stop` and passing `kill=True` (as shown in the CLI examples below) is equivalent to running `nspawn.terminate`.

---

**Note:** `machinectl terminate` is only supported in `systemd >= 219`. On earlier `systemd` versions, running this function will simply issue a clean shutdown via `systemctl`.

---

CLI Examples:

```
salt myminion nspawn.terminate arch1
salt myminion nspawn.stop arch1 kill=True
```

### 26.6.309 salt.modules.nxos

Execution module for Cisco NX OS Switches.

New in version 2016.11.0.

**This module supports execution using a Proxy Minion or Native Minion:**

1) Proxy Minion: Connect over SSH or NX-API HTTP(S). See [salt.proxy.nxos](#) for proxy minion setup details. 2) Native Minion: Connect over NX-API Unix Domain Socket (UDS). Install the minion inside the GuestShell running on the NX-OS device.

**maturity**

new

**platform**

nxos

---

**Note:** To use this module over remote NX-API the feature must be enabled on the NX-OS device by executing `feature nxapi` in configuration mode.

This is not required for NX-API over UDS.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

Native minion configuration options:

```
nxos:
  cookie: 'username'
  save_config: False
```

#### cookie

Use the option to override the default cookie 'admin:local' when connecting over UDS and use 'username:local' instead. This is needed when running the salt-minion in the GuestShell using a non-admin user.

This option is ignored for SSH and NX-API Proxy minions.

#### save\_config:

If True, 'copy running-config starting-config' is issues for every configuration command. If False, Running config is not saved to startup config Default: True

The recommended approach is to use the `save_running_config` function instead of this option to improve performance. The default behavior controlled by this option is preserved for backwards compatibility.

The APIs defined in this execution module can also be executed using salt-call from the GuestShell environment as follows.

```
salt-call --local nxos.sendline 'show lldp neighbors' raw_text
```

**Note:** The functions in this module should be executed like so:

```
salt '*' nxos.<function> salt '*' nxos.get_user username=admin
```

For backwards compatibility, the following syntax will be supported until the 3001 release.

```
salt '*' nxos.cmd <function> salt '*' nxos.cmd get_user username=admin
```

`salt.modules.nxos.add_config`(*lines*, *\*\*kwargs*)

Add one or more config lines to the NX-OS device running config.

#### lines

Configuration lines to add

#### save\_config

If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.add_config 'snmp-server community TESTSTRINGHERE group
↳network-operator'
```

**Note:** For more than one config added per command, lines should be a list.

`salt.modules.nxos.check_password`(*username*, *password*, *encrypted=False*, *\*\*kwargs*)

Verify user password.

#### username

Username on which to perform password check

#### password

Password to check

#### encrypted

Whether or not the password is encrypted Default: False

`salt.modules.nxos.check_role(username, role, **kwargs)`

Verify role assignment for user.

```
salt '*' nxos.check_role username=admin role=network-admin
```

`salt.modules.nxos.cmd(command, *args, **kwargs)`

NOTE: This function is preserved for backwards compatibility. This allows commands to be executed using either of the following syntactic forms.

`salt '*' nxos.cmd <function>`

or

`salt '*' nxos.<function>`

**command**

function from `salt.modules.nxos` to run

**args**

positional args to pass to `command` function

**kwargs**

key word arguments to pass to `command` function

```
salt '*' nxos.cmd sendline 'show ver'
salt '*' nxos.cmd show_run
salt '*' nxos.cmd check_password username=admin password='$5$lkjsdfoi
→$blahblahblah' encrypted=True
```

`salt.modules.nxos.config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)`

Configures the Nexus switch with the specified commands.

This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

**Warning:** All the commands will be applied directly to the running-config.

**config\_file**

The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**commands**

The commands to send to the switch in config mode. If the `commands` argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

---

**Note:** This argument is ignored when `config_file` is specified.

---

**template\_engine: jinja**

The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

**context**

Variables to add to the template context.

**defaults**

Default values of the `context_dict`.

**save\_config**

If `False`, don't save configuration commands to startup configuration. If `True`, save configuration to startup configuration. Default: `True`

CLI Example:

```
salt '*' nxos.config commands="['spanning-tree mode mstp']"
salt '*' nxos.config config_file=salt://config.txt
salt '*' nxos.config config_file=https://bit.ly/2LGLcDy context="{ 'servers
↳ ': ['1.2.3.4'] }"
```

`salt.modules.nxos.delete_config(lines, **kwargs)`

Delete one or more config lines to the switch running config.

**lines**

Configuration lines to remove.

**save\_config**

If `False`, don't save configuration commands to startup configuration. If `True`, save configuration to startup configuration. Default: `True`

```
salt '*' nxos.delete_config 'snmp-server community TESTSTRINGHERE group
↳ network-operator'
```

---

**Note:** For more than one config deleted per command, lines should be a list.

---

`salt.modules.nxos.find(pattern, **kwargs)`

Find all instances where the pattern is in the running configuration.

```
salt '*' nxos.find '^snmp-server.*$'
```

---

**Note:** This uses the `re.MULTILINE` regex format for python, and runs the regex against the whole `show_run` output.

---

`salt.modules.nxos.get_roles(username, **kwargs)`

Get roles assigned to a username.

`salt.modules.nxos.get_user(username, **kwargs)`

Get username line from switch.

`salt.modules.nxos.grains(**kwargs)`

Get grains for minion.

`salt.modules.nxos.grains_refresh(**kwargs)`

Refresh the grains for the NX-OS device.

`salt.modules.nxos.ping(**kwargs)`

Ping the device on the other end of the connection.

`salt.modules.nxos.remove_user(username, **kwargs)`

Remove user from switch.

**username**

Username to remove

**save\_config**

If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.remove_user username=daniel
```

`salt.modules.nxos.replace(old_value, new_value, full_match=False, **kwargs)`

Replace string or full line matches in switch's running config.

If `full_match` is set to True, then the whole line will need to be matched as part of the old value.

```
salt '*' nxos.replace 'TESTSTRINGHERE' 'NEWTTESTSTRINGHERE'
```

`salt.modules.nxos.save_running_config(**kwargs)`

Save the running configuration to startup configuration.

```
salt '*' nxos.save_running_config
```

`salt.modules.nxos.sendline(command, method='cli_show_ascii', **kwargs)`

Send arbitrary commands to the NX-OS device.

**command**

The command or list of commands to be sent. ['cmd1', 'cmd2'] is converted to 'cmd1 ; cmd2'.

**method:**

`cli_show_ascii`: Return raw test or unstructured output. `cli_show`: Return structured output.

`cli_conf`: Send configuration commands to the device. Defaults to `cli_show_ascii`. NOTE: method is ignored for SSH proxy minion. All data is returned unstructured.

**error\_pattern**

Use the option to pass in a regular expression to search for in the returned output of the command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

`salt.modules.nxos.set_password(username, password, encrypted=False, role=None, crypt_salt=None, algorithm='sha256', **kwargs)`

Set users password on switch.

**username**

Username to configure

**password**

Password to configure for username

**encrypted**

Whether or not to encrypt the password Default: False

**role**

Configure role for the username Default: None

**crypt\_salt**

Configure crypt\_salt setting Default: None

**algorithm**

Encryption algorithm Default: sha256

**save\_config**

If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.set_password admin TestPass
salt '*' nxos.set_password admin \
    password='$5$2fWw02vK$S7.Hr3YltMNHuhywQQ3nf0d.gAPHgs3S0BYdGT3E.A' \
    encrypted=True
```

**salt.modules.nxos.set\_role**(*username*, *role*, **\*\*kwargs**)

Assign role to username.

**username**

Username for role configuration

**role**

Configure role for username

**save\_config**

If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.set_role username=daniel role=vdc-admin.
```

**salt.modules.nxos.show**(*commands*, *raw\_text=True*, **\*\*kwargs**)

Execute one or more show (non-configuration) commands.

**commands**

The commands to be executed.

**raw\_text: True**

Whether to return raw text or structured data. NOTE: *raw\_text* option is ignored for SSH proxy minion. Data is returned unstructured.

CLI Example:

```
salt-call --local nxos.show 'show version'
salt '*' nxos.show 'show bgp sessions ; show processes' raw_text=False
salt 'regular-minion' nxos.show 'show interfaces' host=sw01.example.com
    →username=test password=test
```

**salt.modules.nxos.show\_run**(**\*\*kwargs**)

Shortcut to run *show running-config* on the NX-OS device.

```
salt '*' nxos.show_run
```

**salt.modules.nxos.show\_ver**(**\*\*kwargs**)

Shortcut to run *show version* on the NX-OS device.

```
salt '*' nxos.show_ver
```

**salt.modules.nxos.system\_info**(**\*\*kwargs**)

Return system information for grains of the minion.

```
salt '*' nxos.system_info
```

**salt.modules.nxos.unset\_role**(*username*, *role*, **\*\*kwargs**)

Remove role from username.

**username**

Username for role removal

**role**

Role to remove

**save\_config**

If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.unset_role username=daniel role=vdc-admin
```

### 26.6.310 salt.modules.nxos\_api

Execution module to manage Cisco Nexus Switches (NX-OS) over the NX-API

New in version 2019.2.0.

Execution module used to interface the interaction with a remote or local Nexus switch whether we're running in a Proxy Minion or regular Minion (or regular Minion running directly on the Nexus switch).

**codeauthor**

Mircea Ulinic <ping@mirceaulinic.net>

**maturity**

new

**platform**

any

---

**Note:** To be able to use this module you need to enable to NX-API on your switch, by executing `feature nxapi` in configuration mode.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

---

**Note:** NX-API requires modern NXOS distributions, typically at least 7.0 depending on the hardware. Due to reliability reasons it is recommended to run the most recent version.

Check [https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus7000/sw/programmability/guide/b\\_Cisco\\_Nexus\\_7000\\_Series\\_NX-OS\\_Programmability\\_Guide/b\\_Cisco\\_Nexus\\_7000\\_Series\\_NX-OS\\_Programmability\\_Guide\\_chapter\\_0101.html](https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus7000/sw/programmability/guide/b_Cisco_Nexus_7000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_7000_Series_NX-OS_Programmability_Guide_chapter_0101.html) for more details.

---

## Usage

This module can equally be used via the `nxos_api` Proxy module or directly from an arbitrary (Proxy) Minion that is running on a machine having access to the network device API. Given that there are no external dependencies, this module can very well used when using the regular Salt Minion directly installed on the switch.

When running outside of the `nxos_api Proxy` (i.e., from another Proxy Minion type, or regular Minion), the NX-API connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the `nxos_api` key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the `nxos_api` Proxy Module:

**transport: https**

Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

**host: localhost**

The IP address or DNS host name of the connection device.

**username: admin**

The username to pass to the device to authenticate the NX-API connection.

**password**

The password to pass to the device to authenticate the NX-API connection.

**port**

The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**timeout: 60**

Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify: True**

Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

When there is no certificate configuration on the device and this option is set as `True` (default), the commands will fail with the following error: `SSLerror: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581)`. In this case, you either need to configure a proper certificate on the device (*recommended*), or bypass the checks setting this argument as `False` with all the security risks considered.

Check [https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus3000/sw/programmability/6\\_x/b\\_Cisco\\_Nexus\\_3000\\_Series\\_NX-OS\\_Programmability\\_Guide/b\\_Cisco\\_Nexus\\_3000\\_Series\\_NX-OS\\_Programmability\\_Guide\\_chapter\\_01.html](https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus3000/sw/programmability/6_x/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide_chapter_01.html) to see how to properly configure the certificate.

Example (when not running in a `nxos_api` Proxy Minion):

```
nxos_api:
  username: test
  password: test
```

In case the username and password are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a `nxos_api` Proxy, e.g.:

```
salt-call --local nxos_api.show 'show lldp neighbors' raw_text
# The command above is available when running in a regular Minion where Salt
→ is installed

salt '*' nxos_api.show 'show version' raw_text=False
```

**Note:** Remember that the above applies only when not running in a `nxos_api` Proxy Minion. If you want to use the `nxos_api Proxy`, please follow the documentation notes for a proper setup.

---

`salt.modules.nxos_api.config` (*commands=None, config\_file=None, template\_engine='jinja', context=None, defaults=None, saltenv='base', \*\*kwargs*)

Configures the Nexus switch with the specified commands.

This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

**Warning:** All the commands will be applied directly into the running-config.

**config\_file**

The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**commands**

The commands to send to the switch in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

---

**Note:** This argument is ignored when `config_file` is specified.

---

**template\_engine: jinja**

The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

**context**

Variables to add to the template context.

**defaults**

Default values of the `context_dict`.

**transport: https**

Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

**host: localhost**

The IP address or DNS host name of the connection device.

**username: admin**

The username to pass to the device to authenticate the NX-API connection.

**password**

The password to pass to the device to authenticate the NX-API connection.

**port**

The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**timeout: 60**

Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify: True**

Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in

which case it must be a path to a CA bundle to use. Defaults to True.

CLI Example:

```
salt '*' nxos_api.config commands="['spanning-tree mode mstp']"
salt '*' nxos_api.config config_file=salt://config.txt
salt '*' nxos_api.config config_file=https://bit.ly/2LGLcDy context="{
→'servers': ['1.2.3.4']}"
```

`salt.modules.nxos_api.rpc(commands, method='cli', **kwargs)`

Execute an arbitrary RPC request via the Nexus API.

**commands**

The commands to be executed.

**method: cli**

The type of the response, i.e., raw text (`cli_ascii`) or structured document (`cli`). Defaults to `cli` (structured data).

**transport: https**

Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

**host: localhost**

The IP address or DNS host name of the connection device.

**username: admin**

The username to pass to the device to authenticate the NX-API connection.

**password**

The password to pass to the device to authenticate the NX-API connection.

**port**

The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**timeout: 60**

Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify: True**

Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

CLI Example:

```
salt-call --local nxos_api.rpc 'show version'
```

`salt.modules.nxos_api.show(commands, raw_text=True, **kwargs)`

Execute one or more show (non-configuration) commands.

**commands**

The commands to be executed. Multiple commands should be specified as a list.

**raw\_text: True**

Whether to return raw text or structured data.

**transport: https**

Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

**host: localhost**

The IP address or DNS host name of the connection device.

**username: admin**

The username to pass to the device to authenticate the NX-API connection.

**password**

The password to pass to the device to authenticate the NX-API connection.

**port**

The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**timeout: 60**

Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify: True**

Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

CLI Example:

```
salt-call --local nxos_api.show 'show version'
salt '*' nxos_api.show "['show bgp sessions','show processes']" raw_
  ↳text=False
salt 'regular-minion' nxos_api.show 'show interfaces' host=sw01.example.
  ↳com username=test password=test
```

## 26.6.311 salt.modules.nxos\_upgrade

Execution module to upgrade Cisco NX-OS Switches.

New in version 3001.

**This module supports execution using a Proxy Minion or Native Minion:**

- 1) Proxy Minion: Connect over SSH or NX-API HTTP(S). See *salt.proxy.nxos* for proxy minion setup details.
- 2) Native Minion: Connect over NX-API Unix Domain Socket (UDS). Install the minion inside the Guest-Shell running on the NX-OS device.

**maturity**

new

**platform**

nxos

**codeauthor**

Michael G Wiebe

---

**Note:** To use this module over remote NX-API the feature must be enabled on the NX-OS device by executing `feature nxapi` in configuration mode.

This is not required for NX-API over UDS.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

---

`salt.modules.nxos_upgrade.check_upgrade_impact` (*system\_image*, *kickstart\_image=None*, *issu=True*, *\*\*kwargs*)

Display upgrade impact information without actually upgrading the device.

**system\_image (Mandatory Option)**

Path on bootflash: to system image upgrade file.

**kickstart\_image**

Path on bootflash: to kickstart image upgrade file. (Not required if using combined system/kickstart image file) Default: None

**issu**

In Service Software Upgrade (non-disruptive). When True, the upgrade will abort if issu is not possible. When False: Force (disruptive) Upgrade/Downgrade. Default: True

**timeout**

Timeout in seconds for long running 'install all' impact command. Default: 900

**error\_pattern**

Use the option to pass in a regular expression to search for in the output of the 'install all impact' command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

```
salt 'n9k' nxos.check_upgrade_impact system_image=nxos.9.2.1.bin
salt 'n7k' nxos.check_upgrade_impact system_image=n7000-s2-dk9.8.1.1.bin \
kickstart_image=n7000-s2-kickstart.8.1.1.bin issu=False
```

`salt.modules.nxos_upgrade.upgrade` (*system\_image*, *kickstart\_image=None*, *issu=True*, *\*\*kwargs*)

Upgrade NX-OS switch.

**system\_image (Mandatory Option)**

Path on bootflash: to system image upgrade file.

**kickstart\_image**

Path on bootflash: to kickstart image upgrade file. (Not required if using combined system/kickstart image file) Default: None

**issu**

Set this option to True when an In Service Software Upgrade or non-disruptive upgrade is required. The upgrade will abort if issu is not possible. Default: True

**timeout**

Timeout in seconds for long running 'install all' upgrade command. Default: 900

**error\_pattern**

Use the option to pass in a regular expression to search for in the output of the 'install all upgrade' command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

```
salt 'n9k' nxos.upgrade system_image=nxos.9.2.1.bin
salt 'n7k' nxos.upgrade system_image=n7000-s2-dk9.8.1.1.bin \
kickstart_image=n7000-s2-kickstart.8.1.1.bin issu=False
```

### 26.6.312 salt.modules.omapi

This module interacts with an ISC DHCP Server via OMAPI. `server_ip` and `server_port` params may be set in the minion config or pillar:

```
omapi.server_ip: 127.0.0.1
omapi.server_port: 7991
```

**depends**

pypureomapi Python module

`salt.modules.omapi.add_host` (*mac*, *name=None*, *ip=None*, *ddns=False*, *group=None*, *supersede\_host=False*)

Add a host object for the given mac.

CLI Example:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1
```

Add ddns-hostname and a fixed-ip statements:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1 ip=10.1.1.1  
→ddns=true
```

`salt.modules.omapi.delete_host` (*mac=None, name=None*)

Delete the host with the given mac or name.

CLI Examples:

```
salt dhcp-server omapi.delete_host name=host1  
salt dhcp-server omapi.delete_host mac=ab:ab:ab:ab:ab:ab
```

### 26.6.313 salt.modules.openbsd\_sysctl

Module for viewing and modifying OpenBSD sysctl parameters

`salt.modules.openbsd_sysctl.assign` (*name, value*)

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.ip.forwarding 1
```

`salt.modules.openbsd_sysctl.get` (*name*)

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

`salt.modules.openbsd_sysctl.persist` (*name, value, config='/etc/sysctl.conf'*)

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.ip.forwarding 1
```

`salt.modules.openbsd_sysctl.show` (*config\_file=False*)

Return a list of sysctl parameters for this minion

**config:** Pull the data from the system configuration file  
instead of the live data.

CLI Example:

```
salt '*' sysctl.show
```

## 26.6.314 salt.modules.openbsdpkg

Package support for OpenBSD

**Note:** The package repository is configured on each host using `/etc/installurl` from OpenBSD 6.1 onwards. Earlier releases relied on `/etc/pkg.conf`.

Changed in version 2016.3.5: Package versions on OpenBSD are not normally specified explicitly; instead packages may be available in multiple *flavors*, and *branches* which are specified by the format of the package name. This module allows you to use the same formatting as `pkg_add(1)`, and will select the empty flavor and default branch by default. Examples:

```
- rsync
- vim--no_x11
- ruby%2.3
```

`salt.modules.openbsdpkg.install` (*name=None, pkgs=None, sources=None, \*\*kwargs*)

Install the passed package

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example, Install one package:

```
salt '*' pkg.install <package name>
```

CLI Example, Install more than one package:

```
salt '*' pkg.install pkgs='["<package name>", "<package name>"]'
```

CLI Example, Install more than one package from a alternate source (e.g. salt file-server, HTTP, FTP, local filesystem):

```
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>
→"}]'
```

`salt.modules.openbsdpkg.latest_version` (*\*names, \*\*kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
```

`salt.modules.openbsdpkg.list_pkgs` (*versions\_as\_list=False, \*\*kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.openbsdpkg.purge` (*name=None, pkgs=None, \*\*kwargs*)

Remove a package and extra configuration files.

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.openbsdpkg.remove` (*name=None, pkgs=None, purge=False, \*\*kwargs*)

Remove a single package with `pkg_delete`

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.openbsdpkg.upgrade` (*name=None, pkgs=None, \*\*kwargs*)

Run a full package upgrade (`pkg_add -u`), or upgrade a specific package if `name` or `pkgs` is provided. `name` is ignored when `pkgs` is specified.

Returns a dictionary containing the changes:

New in version 2019.2.0.

```
{ '<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade python%2.7
```

`salt.modules.openbsdpkg.upgrade_available` (*name, \*\*kwargs*)

Check whether or not an upgrade is available for a given package

New in version 2019.2.0.

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.openbsd_pkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 26.6.315 salt.modules.openbsdrctl\_service.py

The rctl service module for OpenBSD

`salt.modules.openbsdrctl_service.available(name)`

Return True if the named service is available.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.openbsdrctl_service.disable(name, **kwargs)`

Disable the named service to not start at boot.

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.openbsdrctl_service.disabled(name)`

Return True if the named service is disabled at boot, False otherwise.

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.openbsdrctl_service.enable(name, **kwargs)`

Enable the named service to start at boot.

**flags**

[None] Set optional flags to run the service with.  
service.flags can be used to change the default flags.

CLI Example:

```
salt '*' service.enable <service name>
salt '*' service.enable <service name> flags=<flags>
```

`salt.modules.openbsdrctl_service.enabled(name, **kwargs)`

Return True if the named service is enabled at boot and the provided flags match the configured ones (if any).  
Return False otherwise.

**name**

Service name

CLI Example:

```
salt '*' service.enabled <service name>
salt '*' service.enabled <service name> flags=<flags>
```

`salt.modules.openbsdrctl_service.get_all()`

Return all installed services.

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.openbsdrctl_service.get_disabled()`

Return what services are available but not enabled to start at boot.

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.openbsdrctl_service.get_enabled()`

Return what services are set to run on boot.

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.openbsdrctl_service.missing(name)`

The inverse of `service.available`. Return True if the named service is not available.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.openbsdrctl_service.reload_(name)`

Reload the named service.

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.openbsdrctl_service.restart(name)`

Restart the named service.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.openbsdrctl_service.start(name)`

Start the named service.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.openbsdrctl_service.status(name, sig=None)`

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.openbsdrctl_service.stop(name)`

Stop the named service.

CLI Example:

```
salt '*' service.stop <service name>
```

### 26.6.316 salt.modules.openbsdservice

The service module for OpenBSD

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

`salt.modules.openbsdservice.available(name)`

New in version 2014.7.0.

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.openbsdservice.disabled(name)`

New in version 2014.7.0.

Return True if the named service is disabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.openbsdservice.enabled(name, **kwargs)`

New in version 2014.7.0.

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.openbsdservice.get_all()`

New in version 2014.7.0.

Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.openbsdservice.get_disabled()`

New in version 2014.7.0.

Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.openbsdservice.get_enabled()`

New in version 2014.7.0.

Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.openbsdservice.missing(name)`

New in version 2014.7.0.

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.openbsdservice.reload_(name)`

New in version 2014.7.0.

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.openbsdservice.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.openbsdservice.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.openbsdservice.status(name, sig=None)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

**Parameters**

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Signature to use to find the service via ps

**Returns**

True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type**

bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.openbsdservice.stop`(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

### 26.6.317 salt.modules.openscap

Module for OpenSCAP Management

`salt.modules.openscap.xccdf`(*params*)

Run `oscap xccdf` commands on minions. It uses `cp.push_dir` to upload the generated files to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`)

It needs `file_recv` set to `True` in the master configuration file.

CLI Example:

```
salt '*' openscap.xccdf "eval --profile Default /usr/share/openscap/scap-
→yast2sec-xccdf.xml"
```

`salt.modules.openscap.xccdf_eval`(*xccdf*file, *oval*files=None, *profile*=None, *rule*=None, *oval\_results*=None, *results*=None, *report*=None, *fetch\_remote\_resources*=None, *tailoring\_file*=None, *tailoring\_id*=None, *remediate*=None)

Run `oscap xccdf eval` commands on minions.

New in version 3007.0.

It uses `cp.push_dir` to upload the generated files to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`)

It needs `file_recv` set to `True` in the master configuration file.

**xccdf**file

the path to the xccdf file to evaluate

**oval**files

additional oval definition files

**profile**

the name of Profile to be evaluated

**rule**

the name of a single rule to be evaluated

**oval\_results**

save OVAL results as well (True or False)

**results**

write XCCDF Results into given file

**report**  
write HTML report into given file

**fetch\_remote\_resources**  
download remote content referenced by XCCDF (True or False)

**tailoring\_file**  
use given XCCDF Tailoring file

**tailoring\_id**  
use given DS component as XCCDF Tailoring file

**remediate**  
automatically execute XCCDF fix elements for failed rules. Use of this option is always at your own risk.  
(True or False)

CLI Example:

```
salt '*' openscap.xccdf_eval /usr/share/openscap/scap-yast2sec-xccdf.xml
→profile=Default
```

### 26.6.318 salt.modules.openstack\_config

Modify, retrieve, or delete values from OpenStack configuration files.

**maintainer**  
Jeffrey C. Ollie <jeff@ocjtech.us>

**maturity**  
new

**depends**

**platform**  
linux

**salt.modules.openstack\_config.delete**(*filename, section, parameter*)

Delete a value from an OpenStack configuration file.

**filename**  
The full path to the configuration file

**section**  
The section from which to delete the parameter

**parameter**  
The parameter to delete

CLI Example:

```
salt-call openstack_config.delete /etc/keystone/keystone.conf sql
→connection
```

**salt.modules.openstack\_config.get**(*filename, section, parameter*)

Get a value from an OpenStack configuration file.

**filename**  
The full path to the configuration file

**section**  
The section from which to search for the parameter

**parameter**  
The parameter to return

CLI Example:

```
salt-call openstack_config.get /etc/keystone/keystone.conf sql connection
```

`salt.modules.openstack_config.set_`(*filename, section, parameter, value*)

Set a value in an OpenStack configuration file.

**filename**

The full path to the configuration file

**section**

The section in which the parameter will be set

**parameter**

The parameter to change

**value**

The value to set

CLI Example:

```
salt-call openstack_config.set /etc/keystone/keystone.conf sql connection
→ foo
```

### 26.6.319 salt.modules.openstack\_mng

Module for OpenStack Management

**codeauthor**

Konrad Mosoń <[mosonkonrad@gmail.com](mailto:mosonkonrad@gmail.com)>

**maturity**

new

**depends**

openstack-utils

**platform**

linux

`salt.modules.openstack_mng.restart_service`(*service\_name, minimum\_running\_time=None*)

Restart OpenStack service immediately, or only if it's running longer than specified value

CLI Example:

```
salt '*' openstack_mng.restart_service neutron
salt '*' openstack_mng.restart_service neutron minimum_running_time=600
```

`salt.modules.openstack_mng.start_service`(*service\_name*)

Start OpenStack service immediately

CLI Example:

```
salt '*' openstack_mng.start_service neutron
```

`salt.modules.openstack_mng.stop_service`(*service\_name*)

Stop OpenStack service immediately

CLI Example:

```
salt '*' openstack_mng.stop_service neutron
```

## 26.6.320 salt.modules.openvswitch

Support for Open vSwitch - module with basic Open vSwitch commands.

Suitable for setting up Openstack Neutron.

### codeauthor

Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.modules.openvswitch.bridge_create`(*br*, *may\_exist=True*, *parent=None*, *vlan=None*)

Creates a new bridge.

### Parameters

- **br** -- string bridge name
- **may\_exist** -- bool if False - attempting to create a bridge that exists returns False.
- **parent** -- string name of the parent bridge (if the bridge shall be created as a fake bridge). If specified, vlan must also be specified.
- **versionadded:** ( . . ) -- 3006.0:
- **vlan** -- int VLAN ID of the bridge (if the bridge shall be created as a fake bridge). If specified, parent must also be specified.
- **versionadded:** -- 3006.0:

### Returns

True on success, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.bridge_create br0
```

`salt.modules.openvswitch.bridge_delete`(*br*, *if\_exists=True*)

Deletes bridge and all of its ports.

### Parameters

- **br** -- A string - bridge name
- **if\_exists** -- Bool, if False - attempting to delete a bridge that does not exist returns False.

### Returns

True on success, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.bridge_delete br0
```

`salt.modules.openvswitch.bridge_exists`(*br*)

Tests whether bridge exists as a real or fake bridge.

### Returns

True if Bridge exists, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.bridge_exists br0
```

`salt.modules.openvswitch.bridge_list`()

Lists all existing real and fake bridges.

### Returns

List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.bridge_list
```

`salt.modules.openvswitch.bridge_to_parent(br)`

New in version 3006.0.

Returns the parent bridge of a bridge.

**Parameters**

**br** -- string bridge name

**Returns**

Name of the parent bridge. This is the same as the bridge name if the bridge is not a fake bridge. If the bridge does not exist, False is returned.

CLI Example:

```
salt '*' openvswitch.bridge_to_parent br0
```

`salt.modules.openvswitch.bridge_to_vlan(br)`

New in version 3006.0.

Returns the VLAN ID of a bridge.

**Parameters**

**br** -- string bridge name

**Returns**

VLAN ID of the bridge. The VLAN ID is 0 if the bridge is not a fake bridge. If the bridge does not exist, False is returned.

CLI Example:

```
salt '*' openvswitch.bridge_to_parent br0
```

`salt.modules.openvswitch.db_get(table, record, column, if_exists=False)`

New in version 3006.0.

Gets a column's value for a specific record.

**Parameters**

- **table** -- string name of the database table
- **record** -- string identifier of the record
- **column** -- string name of the column
- **if\_exists** -- boolean if True, it is not an error if the record does not exist.

**Returns**

The column's value.

CLI Example:

```
salt '*' openvswitch.db_get Port br0 vlan_mode
```

`salt.modules.openvswitch.db_set(table, record, column, value, if_exists=False)`

New in version 3006.0.

Sets a column's value for a specific record.

**Parameters**

- **table** -- string name of the database table
- **record** -- string identifier of the record
- **column** -- string name of the column
- **value** -- string the value to be set

- **if\_exists** -- boolean if True, it is not an error if the record does not exist.

**Returns**

None on success and an error message on failure.

CLI Example:

```
salt '*' openvswitch.db_set Interface br0 mac 02:03:04:05:06:07
```

`salt.modules.openvswitch.interface_get_options(port)`

Port's interface's optional parameters.

**Parameters**

**port** -- A string - port name.

**Returns**

String containing optional parameters of port's interface, False on failure.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.interface_get_options tap0
```

`salt.modules.openvswitch.interface_get_type(port)`

Type of port's interface.

**Parameters**

**port** -- A string - port name.

**Returns**

String - type of interface or empty string, False on failure.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.interface_get_type tap0
```

`salt.modules.openvswitch.port_add(br, port, may_exist=False, internal=False)`

Creates on bridge a new port named port.

**Returns**

True on success, else False.

**Parameters**

- **br** -- A string - bridge name
- **port** -- A string - port name
- **may\_exist** -- Bool, if False - attempting to create a port that exists returns False.
- **internal** -- A boolean to create an internal interface if one does not exist.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_add br0 8080
```

`salt.modules.openvswitch.port_create_gre(br, port, id, remote)`

Generic Routing Encapsulation - creates GRE tunnel between endpoints.

**Parameters**

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer - unsigned 32-bit number, tunnel's key.
- **remote** -- A string - remote endpoint's IP address.

**Returns**

True on success, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_create_gre br0 gre1 5001 192.168.1.10
```

`salt.modules.openvswitch.port_create_vlan(br, port, id, internal=False)`

Isolate VM traffic using VLANs.

#### Parameters

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer in the valid range 0 to 4095 (inclusive), name of VLAN.
- **internal** -- A boolean to create an internal interface if one does not exist.

#### Returns

True on success, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_create_vlan br0 tap0 100
```

`salt.modules.openvswitch.port_create_vxlan(br, port, id, remote, dst_port=None)`

Virtual eXtensible Local Area Network - creates VXLAN tunnel between endpoints.

#### Parameters

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer - unsigned 64-bit number, tunnel's key.
- **remote** -- A string - remote endpoint's IP address.
- **dst\_port** -- An integer - port to use when creating tunnelport in the switch.

#### Returns

True on success, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_create_vxlan br0 vx1 5001 192.168.1.10 8472
```

`salt.modules.openvswitch.port_get_tag(port)`

Lists tags of the port.

#### Parameters

**port** -- A string - port name.

#### Returns

List of tags (or empty list), False on failure.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_get_tag tap0
```

`salt.modules.openvswitch.port_list(br)`

Lists all of the ports within bridge.

#### Parameters

**br** -- A string - bridge name.

#### Returns

List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_list br0
```

`salt.modules.openvswitch.port_remove`(*br*, *port*, *if\_exists=True*)

Deletes port.

**Parameters**

- **br** -- A string - bridge name (If bridge is None, port is removed from whatever bridge contains it)
- **port** -- A string - port name.
- **if\_exists** -- Bool, if False - attempting to delete a por that does not exist returns False. (Default True)

**Returns**

True on success, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_remove br0 8080
```

### 26.6.321 salt.modules.opkg

Support for Opkg

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see [here](#).

---

New in version 2016.3.0.

---

**Note:** For version comparison support on `opkg < 0.3.4`, the `opkg-utils` package must be installed.

---

`salt.modules.opkg.available_version`(\**names*, \*\**kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.opkg.check_extra_requirements`(*pkgname*, *pkgver*)

Check if the installed package already has the given requirements. There's nothing do to here for `nipkg.py`, therefore it will always return True.

`salt.modules.opkg.del_repo(repo, **kwargs)`

Delete a repo from `/etc/opkg/*.conf`

If the file does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:

```
salt '*' pkg.del_repo repo
```

`salt.modules.opkg.file_dict(*packages, **kwargs)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.opkg.file_list(*packages, **kwargs)`

List the files that belong to a package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.opkg.get_repo(repo, **kwargs)`

Display a repo from the `/etc/opkg/*.conf`

CLI Examples:

```
salt '*' pkg.get_repo repo
```

`salt.modules.opkg.hold(name=None, pkgs=None, sources=None, **kwargs)`

Set package in 'hold' state, meaning it will not be upgraded.

**name**

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

**pkgs**

A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs=['foo', 'bar']
```

`salt.modules.opkg.info_installed(*names, **kwargs)`

Return the information of the named package(s), installed on the system.

New in version 2017.7.0.

**Parameters**

- **names** -- Names of the packages to get information about. If none are specified, will return information for all installed packages.
- **attr** -- Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.

Valid attributes are:

arch, conffiles, conflicts, depends, description, filename, group, install\_date\_time\_t, md5sum, packager, provides, recommends, replaces, size, source, suggests, url, version

CLI Example:

```
salt '*' pkg.info_installed
salt '*' pkg.info_installed attr=version,packager
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> attr=version,packager
salt '*' pkg.info_installed <package1> <package2> <package3> ...
↪attr=version,packager
```

`salt.modules.opkg.install` (*name=None, refresh=False, pkgs=None, sources=None, reinstall=False, \*\*kwargs*)

Install the passed package, add refresh=True to update the opkg database.

**name**

The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh**

Whether or not to refresh the package database before installing.

**version**

Install a specific version of the package, e.g. 1.2.3-0ubuntu0. Ignored if "pkgs" or "sources" is passed.

New in version 2017.7.0.

**reinstall**

[False] Specifying reinstall=True will use `opkg install --force-reinstall` rather than simply `opkg install` for requested packages that are already installed.

If a version is specified with the requested package, then `opkg install --force-reinstall` will only be used if the installed version matches the requested version.

New in version 2017.7.0.

Multiple Package Installation Options:

**pkgs**

A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['foo', 'bar']
salt '*' pkg.install pkgs=['foo', {'bar': "1.2.3-0ubuntu0"}]
```

**sources**

A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"}, {"bar":
↳ "salt://bar.deb"}]'
```

#### **install\_recommends**

Whether to install the packages marked as recommended. Default is True.

#### **only\_upgrade**

Only upgrade the packages (disallow downgrades), if they are already installed. Default is False.

New in version 2017.7.0.

Returns a dict containing the new package names and versions:

```
{ '<package>': {'old': '<old-version>',
                'new': '<new-version>'}}
```

#### **salt.modules.opkg.latest\_version**(*\*names, \*\*kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

#### **salt.modules.opkg.list\_pkgs**(*versions\_as\_list=False, \*\*kwargs*)

List the packages currently installed in a dict:

```
{ '<package_name>': '<version>' }
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

#### **salt.modules.opkg.list\_repos**(*\*\*kwargs*)

Lists all repos on /etc/opkg/\*.conf

CLI Example:

```
salt '*' pkg.list_repos
```

#### **salt.modules.opkg.list\_upgrades**(*refresh=True, \*\*kwargs*)

List all available package upgrades.

CLI Example:

```
salt '*' pkg.list_upgrades
```

#### **salt.modules.opkg.mod\_repo**(*repo, \*\*kwargs*)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as uri is defined.

The following options are available to modify a repo definition:

#### **repo**

alias by which opkg refers to the repo.

**uri**

the URI to the repo.

**compressed**

defines (True or False) if the index file is compressed

**enabled**

enable or disable (True or False) repository but do not remove if disabled.

**refresh**

enable or disable (True or False) auto-refresh of the repositories

CLI Examples:

```
salt '*' pkg.mod_repo repo uri=http://new/uri
salt '*' pkg.mod_repo repo enabled=False
```

`salt.modules.opkg.owner` (*\*paths*, *\*\*kwargs*)

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version` <`salt.modules.opkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```

`salt.modules.opkg.purge` (*name=None*, *pkgs=None*, *\*\*kwargs*)

Package purges are not supported by opkg, this function is identical to `pkg.remove`.

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.opkg.refresh_db` (*failhard=False*, *\*\*kwargs*)

Updates the opkg database to latest packages based upon repositories

Returns a dict, with the keys being package databases and the values being the result of the update attempt. Values can be one of the following:

- True: Database updated successfully
- False: Problem updating database

**failhard**

If False, return results of failed lines as False for the package database that encountered the error. If True, raise an error with a list of the package databases that encountered errors.

New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.opkg.remove` (*name=None, pkgs=None, \*\*kwargs*)

Remove packages using opkg remove.

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

**remove\_dependencies**

Remove package and all dependencies

New in version 2019.2.0.

**auto\_remove\_deps**

Remove packages that were installed automatically to satisfy dependencies

New in version 2019.2.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
salt '*' pkg.remove pkgs='["foo", "bar"]' remove_dependencies=True auto_
→ remove_deps=True
```

`salt.modules.opkg.unhold` (*name=None, pkgs=None, sources=None, \*\*kwargs*)

Set package current in 'hold' state to install state, meaning it will be upgraded.

**name**

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

**pkgs**

A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.opkg.upgrade` (*refresh=True, \*\*kwargs*)

Upgrades all packages via opkg upgrade

Returns a dictionary containing the changes:

```
{ '<package>': { 'old': '<old-version>',
                 'new': '<new-version>' } }
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.opkg.upgrade_available`(*name*, *\*\*kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.opkg.version`(*\*names*, *\*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.opkg.version_clean`(*version*)

Clean the version string removing extra data. There's nothing do to here for nipkg.py, therefore it will always return the given version.

`salt.modules.opkg.version_cmp`(*pkg1*, *pkg2*, *ignore\_epoch=False*, *\*\*kwargs*)

Do a cmp-style comparison on two packages. Return -1 if *pkg1* < *pkg2*, 0 if *pkg1* == *pkg2*, and 1 if *pkg1* > *pkg2*. Return None if there was a problem making the comparison.

**ignore\_epoch**

[False] Set to True to ignore the epoch when comparing versions

New in version 2016.3.4.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```

## 26.6.322 salt.modules.opsgenie

Module for sending data to OpsGenie

New in version 2018.3.0.

**configuration**

This module can be used in Reactor System for posting data to OpsGenie as a remote-execution function.

For example:

```
opsgenie_event_poster:
  local.opsgenie.post_data:
    - tgt: 'salt-minion'
    - kwarg:
      name: event.reactor
      api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
      reason: {{ data['data']['reason'] }}
      action_type: Create
```

`salt.modules.opsgenie.post_data`(*api\_key=None*, *name='OpsGenie Execution Module'*, *reason=None*, *action\_type=None*)

Post data to OpsGenie. It's designed for Salt's Event Reactor.

After configuring the sls reaction file as shown above, you can trigger the module with your designated tag (og-tag in this case).

CLI Example:

```
salt-call event.send 'og-tag' '{"reason" : "Overheating CPU!"}'
```

Required parameters:

**api\_key**

It's the API Key you've copied while adding integration in OpsGenie.

**reason**

It will be used as alert's default message in OpsGenie.

**action\_type**

OpsGenie supports the default values Create/Close for action\_type. You can customize this field with OpsGenie's custom actions for other purposes like adding notes or acknowledging alerts.

Optional parameters:

**name**

It will be used as alert's alias. If you want to use the close functionality you must provide name field for both states like in this case.

### 26.6.323 salt.modules.oracle

Oracle DataBase connection module

**maintainer**

Vladimir Bormotov <bormotov@gmail.com>

**maturity**

new

**depends**

cx\_Oracle

**platform**

all

**configuration**

module provide connections for multiple Oracle DB instances.

OS Environment

**ORACLE\_HOME:** path to oracle product

**PATH:** path to Oracle Client libs need to be in PATH

**pillar**

```
oracle:
  dbs:
    <db>:
      uri: connection credentials in format:
      user/password@host[:port]/sid[ servicename as
      ↳{sysdba|sysoper}]
      optional keyword servicename will determine whether it is
      ↳a sid or service_name
    <db>:
      uri: .....
```

`salt.modules.oracle.client_version()`

Oracle Client Version

CLI Example:

```
salt '*' oracle.client_version
```

`salt.modules.oracle.run_query(db, query)`

Run SQL query and return result

CLI Example:

```
salt '*' oracle.run_query my_db "select * from my_table"
```

`salt.modules.oracle.show_dbs(*dbs)`

Show databases configuration from pillar. Filter by *\*args*

CLI Example:

```
salt '*' oracle.show_dbs
salt '*' oracle.show_dbs my_db
```

`salt.modules.oracle.show_env()`

Show Environment used by Oracle Client

CLI Example:

```
salt '*' oracle.show_env
```

---

**Note:** at first `_connect()` NLS\_LANG will forced to `'AL32UTF8'`

---

`salt.modules.oracle.show_pillar(item=None)`

Show Pillar segment oracle.\* and subitem with notation "item:subitem"

CLI Example:

```
salt '*' oracle.show_pillar
salt '*' oracle.show_pillar dbs:my_db
```

`salt.modules.oracle.version(*dbs)`

Server Version (select banner from v\$version)

CLI Example:

```
salt '*' oracle.version
salt '*' oracle.version my_db
```

## 26.6.324 salt.modules.osquery

Support for OSQuery - <https://osquery.io>.

New in version 2015.8.0.

`salt.modules.osquery.acpi_tables` (*attrs=None, where=None*)

Return acpi\_tables information from osquery

CLI Example:

```
salt '*' osquery.acpi_tables
```

`salt.modules.osquery.alf` (*attrs=None, where=None*)

Return alf information from osquery

CLI Example:

```
salt '*' osquery.alf
```

`salt.modules.osquery.alf_exceptions` (*attrs=None, where=None*)

Return alf\_exceptions information from osquery

CLI Example:

```
salt '*' osquery.alf_exceptions
```

`salt.modules.osquery.alf_explicit_auths` (*attrs=None, where=None*)

Return alf\_explicit\_auths information from osquery

CLI Example:

```
salt '*' osquery.alf_explicit_auths
```

`salt.modules.osquery.alf_services` (*attrs=None, where=None*)

Return alf\_services information from osquery

CLI Example:

```
salt '*' osquery.alf_services
```

`salt.modules.osquery.apps` (*attrs=None, where=None*)

Return apps information from osquery

CLI Example:

```
salt '*' osquery.apps
```

`salt.modules.osquery.apt_sources` (*attrs=None, where=None*)

Return apt\_sources information from osquery

CLI Example:

```
salt '*' osquery.apt_sources
```

`salt.modules.osquery.arp_cache` (*attrs=None, where=None*)

Return arp\_cache information from osquery

CLI Example:

```
salt '*' osquery.arp_cache
```

`salt.modules.osquery.block_devices` (*attrs=None, where=None*)

Return `block_devices` information from `osquery`

CLI Example:

```
salt '*' osquery.block_devices
```

`salt.modules.osquery.certificates` (*attrs=None, where=None*)

Return `certificates` information from `osquery`

CLI Example:

```
salt '*' osquery.certificates
```

`salt.modules.osquery.chrome_extensions` (*attrs=None, where=None*)

Return `chrome_extensions` information from `osquery`

CLI Example:

```
salt '*' osquery.chrome_extensions
```

`salt.modules.osquery.cpuid` (*attrs=None, where=None*)

Return `cpuid` information from `osquery`

CLI Example:

```
salt '*' osquery.cpuid
```

`salt.modules.osquery.crontab` (*attrs=None, where=None*)

Return `crontab` information from `osquery`

CLI Example:

```
salt '*' osquery.crontab
```

`salt.modules.osquery.deb_packages` (*attrs=None, where=None*)

Return `deb_packages` information from `osquery`

CLI Example:

```
salt '*' osquery.deb_packages
```

`salt.modules.osquery.etc_hosts` (*attrs=None, where=None*)

Return `etc_hosts` information from `osquery`

CLI Example:

```
salt '*' osquery.etc_hosts
```

`salt.modules.osquery.etc_services` (*attrs=None, where=None*)

Return `etc_services` information from `osquery`

CLI Example:

```
salt '*' osquery.etc_services
```

`salt.modules.osquery.file_` (*attrs=None, where=None*)

Return file information from osquery

CLI Example:

```
salt '*' osquery.file
```

`salt.modules.osquery.file_changes` (*attrs=None, where=None*)

Return file\_changes information from osquery

CLI Example:

```
salt '*' osquery.file_changes
```

`salt.modules.osquery.firefox_addons` (*attrs=None, where=None*)

Return firefox\_addons information from osquery

CLI Example:

```
salt '*' osquery.firefox_addons
```

`salt.modules.osquery.groups` (*attrs=None, where=None*)

Return groups information from osquery

CLI Example:

```
salt '*' osquery.groups
```

`salt.modules.osquery.hardware_events` (*attrs=None, where=None*)

Return hardware\_events information from osquery

CLI Example:

```
salt '*' osquery.hardware_events
```

`salt.modules.osquery.hash_` (*attrs=None, where=None*)

Return hash information from osquery

CLI Example:

```
salt '*' osquery.hash
```

`salt.modules.osquery.homebrew_packages` (*attrs=None, where=None*)

Return homebrew\_packages information from osquery

CLI Example:

```
salt '*' osquery.homebrew_packages
```

`salt.modules.osquery.interface_addresses` (*attrs=None, where=None*)

Return interface\_addresses information from osquery

CLI Example:

```
salt '*' osquery.interface_addresses
```

`salt.modules.osquery.interface_details` (*attrs=None, where=None*)

Return interface\_details information from osquery

CLI Example:

```
salt '*' osquery.interface_details
```

`salt.modules.osquery.iokit_devicetree` (*attrs=None, where=None*)

Return iokit\_devicetree information from osquery

CLI Example:

```
salt '*' osquery.iokit_devicetree
```

`salt.modules.osquery.iokit_registry` (*attrs=None, where=None*)

Return iokit\_registry information from osquery

CLI Example:

```
salt '*' osquery.iokit_registry
```

`salt.modules.osquery.kernel_extensions` (*attrs=None, where=None*)

Return kernel\_extensions information from osquery

CLI Example:

```
salt '*' osquery.kernel_extensions
```

`salt.modules.osquery.kernel_info` (*attrs=None, where=None*)

Return kernel\_info information from osquery

CLI Example:

```
salt '*' osquery.kernel_info
```

`salt.modules.osquery.kernel_integrity` (*attrs=None, where=None*)

Return kernel\_integrity information from osquery

CLI Example:

```
salt '*' osquery.kernel_integrity
```

`salt.modules.osquery.kernel_modules` (*attrs=None, where=None*)

Return kernel\_modules information from osquery

CLI Example:

```
salt '*' osquery.kernel_modules
```

`salt.modules.osquery.keychain_items` (*attrs=None, where=None*)

Return keychain\_items information from osquery

CLI Example:

```
salt '*' osquery.keychain_items
```

`salt.modules.osquery.last` (*attrs=None, where=None*)

Return last information from osquery

CLI Example:

```
salt '*' osquery.last
```

`salt.modules.osquery.launchd` (*attrs=None, where=None*)

Return launchd information from osquery

CLI Example:

```
salt '*' osquery.launchd
```

`salt.modules.osquery.listening_ports` (*attrs=None, where=None*)

Return listening\_ports information from osquery

CLI Example:

```
salt '*' osquery.listening_ports
```

`salt.modules.osquery.logged_in_users` (*attrs=None, where=None*)

Return logged\_in\_users information from osquery

CLI Example:

```
salt '*' osquery.logged_in_users
```

`salt.modules.osquery.memory_map` (*attrs=None, where=None*)

Return memory\_map information from osquery

CLI Example:

```
salt '*' osquery.memory_map
```

`salt.modules.osquery.mounts` (*attrs=None, where=None*)

Return mounts information from osquery

CLI Example:

```
salt '*' osquery.mounts
```

`salt.modules.osquery.nfs_shares` (*attrs=None, where=None*)

Return nfs\_shares information from osquery

CLI Example:

```
salt '*' osquery.nfs_shares
```

`salt.modules.osquery.nvram` (*attrs=None, where=None*)

Return nvram information from osquery

CLI Example:

```
salt '*' osquery.nvram
```

`salt.modules.osquery.os_version` (*attrs=None, where=None*)

Return `os_version` information from `osquery`

CLI Example:

```
salt '*' osquery.os_version
```

`salt.modules.osquery.osquery_extensions` (*attrs=None, where=None*)

Return `osquery_extensions` information from `osquery`

CLI Example:

```
salt '*' osquery.osquery_extensions
```

`salt.modules.osquery.osquery_flags` (*attrs=None, where=None*)

Return `osquery_flags` information from `osquery`

CLI Example:

```
salt '*' osquery.osquery_flags
```

`salt.modules.osquery.osquery_info` (*attrs=None, where=None*)

Return `osquery_info` information from `osquery`

CLI Example:

```
salt '*' osquery.osquery_info
```

`salt.modules.osquery.osquery_registry` (*attrs=None, where=None*)

Return `osquery_registry` information from `osquery`

CLI Example:

```
salt '*' osquery.osquery_registry
```

`salt.modules.osquery.passwd_changes` (*attrs=None, where=None*)

Return `passwd_changes` information from `osquery`

CLI Example:

```
salt '*' osquery.passwd_changes
```

`salt.modules.osquery.pci_devices` (*attrs=None, where=None*)

Return `pci_devices` information from `osquery`

CLI Example:

```
salt '*' osquery.pci_devices
```

`salt.modules.osquery.preferences` (*attrs=None, where=None*)

Return `preferences` information from `osquery`

CLI Example:

```
salt '*' osquery.preferences
```

`salt.modules.osquery.process_envs` (*attrs=None, where=None*)

Return process\_envs information from osquery

CLI Example:

```
salt '*' osquery.process_envs
```

`salt.modules.osquery.process_memory_map` (*attrs=None, where=None*)

Return process\_memory\_map information from osquery

CLI Example:

```
salt '*' osquery.process_memory_map
```

`salt.modules.osquery.process_open_files` (*attrs=None, where=None*)

Return process\_open\_files information from osquery

CLI Example:

```
salt '*' osquery.process_open_files
```

`salt.modules.osquery.process_open_sockets` (*attrs=None, where=None*)

Return process\_open\_sockets information from osquery

CLI Example:

```
salt '*' osquery.process_open_sockets
```

`salt.modules.osquery.processes` (*attrs=None, where=None*)

Return processes information from osquery

CLI Example:

```
salt '*' osquery.processes
```

`salt.modules.osquery.quarantine` (*attrs=None, where=None*)

Return quarantine information from osquery

CLI Example:

```
salt '*' osquery.quarantine
```

`salt.modules.osquery.query` (*sql=None*)

Return time information from osquery

CLI Example:

```
salt '*' osquery.query "select * from users;"
```

`salt.modules.osquery.routes` (*attrs=None, where=None*)

Return routes information from osquery

CLI Example:

```
salt '*' osquery.routes
```

`salt.modules.osquery.rpm_packages` (*attrs=None, where=None*)

Return cpuid information from osquery

CLI Example:

```
salt '*' osquery.rpm_packages
```

`salt.modules.osquery.safari_extensions` (*attrs=None, where=None*)

Return safari\_extensions information from osquery

CLI Example:

```
salt '*' osquery.safari_extensions
```

`salt.modules.osquery.shared_memory` (*attrs=None, where=None*)

Return shared\_memory information from osquery

CLI Example:

```
salt '*' osquery.shared_memory
```

`salt.modules.osquery.shell_history` (*attrs=None, where=None*)

Return shell\_history information from osquery

CLI Example:

```
salt '*' osquery.shell_history
```

`salt.modules.osquery.smbios_tables` (*attrs=None, where=None*)

Return smbios\_tables information from osquery

CLI Example:

```
salt '*' osquery.smbios_tables
```

`salt.modules.osquery.startup_items` (*attrs=None, where=None*)

Return startup\_items information from osquery

CLI Example:

```
salt '*' osquery.startup_items
```

`salt.modules.osquery.suid_bin` (*attrs=None, where=None*)

Return suid\_bin information from osquery

CLI Example:

```
salt '*' osquery.suid_bin
```

`salt.modules.osquery.system_controls` (*attrs=None, where=None*)

Return system\_controls information from osquery

CLI Example:

```
salt '*' osquery.system_controls
```

`salt.modules.osquery.time_` (*attrs=None*)

Return time information from osquery

CLI Example:

```
salt '*' osquery.time
```

`salt.modules.osquery.usb_devices` (*attrs=None, where=None*)

Return usb\_devices information from osquery

CLI Example:

```
salt '*' osquery.usb_devices
```

`salt.modules.osquery.users` (*attrs=None, where=None*)

Return users information from osquery

CLI Example:

```
salt '*' osquery.users
```

`salt.modules.osquery.version()`

Return version of osquery

CLI Example:

```
salt '*' osquery.version
```

`salt.modules.osquery.xattr_where_from` (*attrs=None, where=None*)

Return xattr\_where\_from information from osquery

CLI Example:

```
salt '*' osquery.xattr_where_from
```

`salt.modules.osquery.xprotect_entries` (*attrs=None, where=None*)

Return xprotect\_entries information from osquery

CLI Example:

```
salt '*' osquery.xprotect_entries
```

`salt.modules.osquery.xprotect_reports` (*attrs=None, where=None*)

Return xprotect\_reports information from osquery

CLI Example:

```
salt '*' osquery.xprotect_reports
```

## 26.6.325 salt.modules.out

### Output Module

New in version 2018.3.0.

Execution module that processes JSON serializable data and returns string having the format as processed by the outputters.

Although this does not bring much value on the CLI, it turns very handy in applications that require human readable data rather than Python objects.

For example, inside a Jinja template:

```
{{ salt.out.string_format(complex_object, out='highstate') }}
```

`salt.modules.out.html_format`(*data*, *out*='nested', *opts*=None, *\*\*kwargs*)

Return the formatted string as HTML.

**data**

The JSON serializable object.

**out: nested**

The name of the output to use to transform the data. Default: nested.

**opts**

Dictionary of configuration options. Default: `__opts__`.

**kwargs**

Arguments to sent to the outputter module.

CLI Example:

```
salt '*' out.html_format '{"key': 'value'}" out=yaml
```

`salt.modules.out.out_format`(*data*, *out*='nested', *opts*=None, *\*\*kwargs*)

Return the formatted outputter string for the Python object.

**data**

The JSON serializable object.

**out: nested**

The name of the output to use to transform the data. Default: nested.

**opts**

Dictionary of configuration options. Default: `__opts__`.

**kwargs**

Arguments to sent to the outputter module.

CLI Example:

```
salt '*' out.out_format '{"key': 'value'}"
```

`salt.modules.out.string_format`(*data*, *out*='nested', *opts*=None, *\*\*kwargs*)

Return the outputter formatted string, removing the ANSI escape sequences.

**data**

The JSON serializable object.

**out: nested**

The name of the output to use to transform the data. Default: nested.

**opts**

Dictionary of configuration options. Default: `__opts__`.

**kwargs**

Arguments to sent to the outputter module.

CLI Example:

```
salt '*' out.string_format "{key: 'value'}" out=table
```

### 26.6.326 salt.modules.pacmanpkg

A module to wrap pacman calls, since Arch is the best ([https://wiki.archlinux.org/index.php/Arch\\_is\\_the\\_best](https://wiki.archlinux.org/index.php/Arch_is_the_best))

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see [here](#).

`salt.modules.pacmanpkg.available_version(*names, **kwargs)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.pacmanpkg.file_dict(*packages, **kwargs)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.pacmanpkg.file_list(*packages, **kwargs)`

List the files that belong to a package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.pacmanpkg.group_diff(name)`

New in version 2016.11.0.

Lists which of a group's packages are installed and which are not installed

Compatible with `yumpkg.group_diff` for easy support of `state.pkg.group_installed`

CLI Example:

```
salt '*' pkg.group_diff 'xorg'
```

`salt.modules.pacmanpkg.group_info(name)`

New in version 2016.11.0.

Lists all packages in the specified group

CLI Example:

```
salt '*' pkg.group_info 'xorg'
```

`salt.modules.pacmanpkg.group_list()`

New in version 2016.11.0.

Lists all groups known by pacman on this system

CLI Example:

```
salt '*' pkg.group_list
```

`salt.modules.pacmanpkg.install(name=None, refresh=False, sysupgrade=None, pkgs=None, sources=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install (pacman `-S`) the specified package(s). Add `refresh=True` to install with `-y`, add `sysupgrade=True` to install with `-u`.

**name**

The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh**

Whether or not to refresh the package database before installing.

**sysupgrade**

Whether or not to upgrade the system packages before installing. If `refresh` is set to `True` but `sysupgrade` is not specified, `-u` will be applied

Multiple Package Installation Options:

**pkgs**

A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the `version` parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```
salt '*' pkg.install pkgs=['foo', 'bar']
salt '*' pkg.install pkgs=['foo', {'bar': '1.2.3-4'}]
salt '*' pkg.install pkgs=['foo', {'bar': '<1.2.3-4'}]
```

**sources**

A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.
↳pkg.tar.xz"}, {"bar": "salt://bar.pkg.tar.xz"}]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.pacmanpkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.pacmanpkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.pacmanpkg.list_repo_pkgs(*args, **kwargs)`

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a *pkg.installed* state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
  'bash': ['4.4.005-2'],
  'nginx': ['1.10.2-2']
}
# With byrepo=True
{
  'core': {
    'bash': ['4.4.005-2']
  },
  'extra': {
    'nginx': ['1.10.2-2']
  }
}
```

**fromrepo**

[None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

**byrepo**

[False] When True, the return data for each package will be organized by repository.

**refresh**

[False] When True, the package database will be refreshed (i.e. `pacman -Sy`) before checking for available versions.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

`salt.modules.pacmanpkg.list_upgrades` (*refresh=False, root=None, \*\*kwargs*)

List all available package upgrades on this system

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.pacmanpkg.owner` (*\*paths, \*\*kwargs*)

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/zsh
```

`salt.modules.pacmanpkg.purge` (*name=None, pkgs=None, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `pacman` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a `pacman -Rsc`

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.pacmanpkg.refresh_db`(*root=None, \*\*kwargs*)

Just run a `pacman -Sy`, return a dict:

```
{'<database name>': Bool}
```

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.pacmanpkg.remove`(*name=None, pkgs=None, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `pacman` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages with `pacman -R`.

#### name

The name of the package to be deleted.

Multiple Package Options:

#### pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.pacmanpkg.upgrade`(*refresh=False, root=None, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `pacman` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a `pacman -Syu`

#### refresh

Whether or not to refresh the package database before installing.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.pacmanpkg.upgrade_available`(*name*, *\*\*kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.pacmanpkg.version`(*\*names*, *\*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 26.6.327 salt.modules.pagerduty

Module for Firing Events via PagerDuty

New in version 2014.1.0.

#### configuration

This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-pagerduty-account:
  pagerduty.api_key: F3Rbyjbve43rffWf2214
  pagerduty.subdomain: mysubdomain
```

`salt.modules.pagerduty.create_event`(*service\_key=None*, *description=None*, *details=None*, *incident\_key=None*, *profile=None*)

Create an event in PagerDuty. Designed for use in states.

CLI Example:

```
salt myminion pagerduty.create_event <service_key> <description> <details>
↪      profile=my-pagerduty-account
```

The following parameters are required:

#### service\_key

This key can be found by using `pagerduty.list_services`.

#### description

This is a short description of the event.

#### details

This can be a more detailed description of the event.

#### profile

This refers to the configuration profile to use to connect to the PagerDuty service.

`salt.modules.pagerduty.list_escalation_policies`(*profile=None*, *api\_key=None*)

This function is an alias of `list_policies`.

List escalation policies belonging to this account

CLI Example:

```
salt myminion pagerduty.list_policies my-pagerduty-account
salt myminion pagerduty.list_escalation_policies my-pagerduty-
↪account
```

`salt.modules.pagerduty.list_incidents` (*profile=None, api\_key=None*)

List incidents belonging to this account

CLI Example:

```
salt myminion pagerduty.list_incidents my-pagerduty-account
```

`salt.modules.pagerduty.list_maintenance_windows` (*profile=None, api\_key=None*)

This function is an alias of `list_windows`.

List maintenance windows belonging to this account

CLI Example:

```
salt myminion pagerduty.list_windows my-pagerduty-account
salt myminion pagerduty.list_maintenance_windows my-pagerduty-
↪account
```

`salt.modules.pagerduty.list_policies` (*profile=None, api\_key=None*)

List escalation policies belonging to this account

CLI Example:

```
salt myminion pagerduty.list_policies my-pagerduty-account
salt myminion pagerduty.list_escalation_policies my-pagerduty-account
```

`salt.modules.pagerduty.list_schedules` (*profile=None, api\_key=None*)

List schedules belonging to this account

CLI Example:

```
salt myminion pagerduty.list_schedules my-pagerduty-account
```

`salt.modules.pagerduty.list_services` (*profile=None, api\_key=None*)

List services belonging to this account

CLI Example:

```
salt myminion pagerduty.list_services my-pagerduty-account
```

`salt.modules.pagerduty.list_users` (*profile=None, api\_key=None*)

List users belonging to this account

CLI Example:

```
salt myminion pagerduty.list_users my-pagerduty-account
```

`salt.modules.pagerduty.list_windows` (*profile=None, api\_key=None*)

List maintenance windows belonging to this account

CLI Example:

```
salt myminion pagerduty.list_windows my-pagerduty-account
salt myminion pagerduty.list_maintenance_windows my-pagerduty-account
```

### 26.6.328 salt.modules.pagerduty\_util

Module for manageing PagerDuty resource

#### configuration

This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The default configuration profile name is 'pagerduty.'

For example:

```
pagerduty:
  pagerduty.api_key: F3Rbyjbve43rfFWf2214
  pagerduty.subdomain: mysubdomain
```

For PagerDuty API details, see <https://developer.pagerduty.com/documentation/rest>

`salt.modules.pagerduty_util.create_or_update_resource` (*resource\_name*, *identifier\_fields*, *data*, *diff=None*, *profile='pagerduty'*, *subdomain=None*, *api\_key=None*)

create or update any pagerduty resource Helper method for present().

Determining if two resources are the same is different for different PD resource, so this method accepts a diff function. The diff function will be invoked as `diff(state_information, object_returned_from_pagerduty)`, and should return a dict of data to pass to the PagerDuty update API method, or None if no update is to be performed. If no diff method is provided, the default behavior is to scan the keys in the `state_information`, comparing the matching values in the `object_returned_from_pagerduty`, and update any values that differ.

#### Examples

```
create_or_update_resource("user", ["id","name","email"]) create_or_update_resource("escalation_policies",
["id","name"], diff=my_diff_function)
```

`salt.modules.pagerduty_util.delete_resource` (*resource\_name*, *key*, *identifier\_fields*, *profile='pagerduty'*, *subdomain=None*, *api\_key=None*)

delete any pagerduty resource

Helper method for absent()

#### Example

```
delete_resource("users", key, ["id","name","email"]) # delete by id or name or email
```

`salt.modules.pagerduty_util.get_escalation_policies` (*profile='pagerduty'*, *subdomain=None*, *api\_key=None*)

List escalation\_policies belonging to this account

CLI Example:

```
salt myminion pagerduty.get_escalation_policies
```

```
salt.modules.pagerduty_util.get_resource(resource_name, key, identifier_fields,
                                         profile='pagerduty', subdomain=None, api_key=None)
```

Get any single pagerduty resource by key.

We allow flexible lookup by any of a list of identifier\_fields. So, for example, you can look up users by email address or name by calling:

```
get_resource('users', key, ['name', 'email'], ...)
```

This method is mainly used to translate state sls into pagerduty id's for dependent objects. For example, a pagerduty escalation policy contains one or more schedules, which must be passed by their pagerduty id. We look up the schedules by name (using this method), and then translate the names into id's.

This method is implemented by getting all objects of the resource type (cached into `__context__`), then brute force searching through the list and trying to match any of the identifier\_fields. The `__context__` cache is purged after any create, update or delete to the resource.

```
salt.modules.pagerduty_util.get_schedules(profile='pagerduty', subdomain=None, api_key=None)
```

List schedules belonging to this account

CLI Example:

```
salt myminion pagerduty.get_schedules
```

```
salt.modules.pagerduty_util.get_services(profile='pagerduty', subdomain=None, api_key=None)
```

List services belonging to this account

CLI Example:

```
salt myminion pagerduty.get_services
```

```
salt.modules.pagerduty_util.get_users(profile='pagerduty', subdomain=None, api_key=None)
```

List users belonging to this account

CLI Example:

```
salt myminion pagerduty.get_users
```

```
salt.modules.pagerduty_util.resource_absent(resource, identifier_fields, profile='pagerduty',
                                             subdomain=None, api_key=None, **kwargs)
```

Generic resource.absent state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls `delete_resource()` and formats the result as a salt state return value.

### Example

```
resource_absent("users", ["id","name","email"])
```

```
salt.modules.pagerduty_util.resource_present(resource, identifier_fields, diff=None,
                                             profile='pagerduty', subdomain=None,
                                             api_key=None, **kwargs)
```

Generic resource.present state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls `create_or_update_resource()` and formats the result as a salt state return value.

### Example

```
resource_present("users", ["id","name","email"])
```

## 26.6.329 salt.modules.pam

Support for pam

`salt.modules.pam.read_file`(*file\_name*)

This is just a test function, to make sure parsing works

CLI Example:

```
salt '*' pam.read_file /etc/pam.d/login
```

## 26.6.330 salt.modules.panos

Module to provide Palo Alto compatibility to Salt

### codeauthor

Spencer Ervin <spencer\_ervin@hotmail.com>

### maturity

new

### depends

none

### platform

unix

New in version 2018.3.0.

## Configuration

This module accepts connection configuration details either as parameters, or as configuration settings in pillar as a Salt proxy. Options passed into `opts` will be ignored if options are passed into pillar.

See also:

*Palo Alto Proxy Module*

## About

This execution module was designed to handle connections to a Palo Alto based firewall. This module adds support to send connections directly to the device through the XML API or through a brokered connection to Panorama.

`salt.modules.panos.add_config_lock`()

Prevent other users from changing configuration until the lock is released.

CLI Example:

```
salt '*' panos.add_config_lock
```

`salt.modules.panos.check_antivirus()`

Get anti-virus information from PaloAlto Networks server

CLI Example:

```
salt '*' panos.check_antivirus
```

`salt.modules.panos.check_software()`

Get software information from PaloAlto Networks server.

CLI Example:

```
salt '*' panos.check_software
```

`salt.modules.panos.clear_commit_tasks()`

Clear all commit tasks.

CLI Example:

```
salt '*' panos.clear_commit_tasks
```

`salt.modules.panos.commit()`

Commits the candidate configuration to the running configuration.

CLI Example:

```
salt '*' panos.commit
```

`salt.modules.panos.deactivate_license(key_name=None)`

Deactivates an installed license. Required version 7.0.0 or greater.

`key_name(str)`: The file name of the license key installed.

CLI Example:

```
salt '*' panos.deactivate_license key_name=License_File_Name.key
```

`salt.modules.panos.delete_license(key_name=None)`

Remove license keys on disk.

`key_name(str)`: The file name of the license key to be deleted.

CLI Example:

```
salt '*' panos.delete_license key_name=License_File_Name.key
```

`salt.modules.panos.download_antivirus()`

Download the most recent anti-virus package.

CLI Example:

```
salt '*' panos.download_antivirus
```

`salt.modules.panos.download_software_file(filename=None, synch=False)`

Download software packages by filename.

**Parameters**

- **filename** (*str*) -- The filename of the PANOS file to download.
- **synch** (*bool*) -- If true then the file will synch to the peer unit.

CLI Example:

```
salt '*' panos.download_software_file PanOS_5000-8.0.0
salt '*' panos.download_software_file PanOS_5000-8.0.0 True
```

`salt.modules.panos.download_software_version`(*version=None, synch=False*)

Download software packages by version number.

**Parameters**

- **version** (*str*) -- The version of the PANOS file to download.
- **synch** (*bool*) -- If true then the file will synch to the peer unit.

CLI Example:

```
salt '*' panos.download_software_version 8.0.0
salt '*' panos.download_software_version 8.0.0 True
```

`salt.modules.panos.fetch_license`(*auth\_code=None*)

Get new license(s) using from the Palo Alto Network Server.

**auth\_code**

The license authorization code.

CLI Example:

```
salt '*' panos.fetch_license
salt '*' panos.fetch_license auth_code=foobar
```

`salt.modules.panos.get_address`(*address=None, vsys='1'*)

Get the candidate configuration for the specified `get_address` object. This will not return address objects that are marked as pre-defined objects.

`address(str)`: The name of the address object.

`vsys(str)`: The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_address myhost
salt '*' panos.get_address myhost 3
```

`salt.modules.panos.get_address_group`(*addressgroup=None, vsys='1'*)

Get the candidate configuration for the specified address group. This will not return address groups that are marked as pre-defined objects.

`addressgroup(str)`: The name of the address group.

`vsys(str)`: The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_address_group foobar
salt '*' panos.get_address_group foobar 3
```

`salt.modules.panos.get_admins_active`()

Show active administrators.

CLI Example:

```
salt '*' panos.get_admins_active
```

`salt.modules.panos.get_admins_all()`

Show all administrators.

CLI Example:

```
salt '*' panos.get_admins_all
```

`salt.modules.panos.get_antivirus_info()`

Show information about available anti-virus packages.

CLI Example:

```
salt '*' panos.get_antivirus_info
```

`salt.modules.panos.get_arp()`

Show ARP information.

CLI Example:

```
salt '*' panos.get_arp
```

`salt.modules.panos.get_cli_idle_timeout()`

Show timeout information for this administrative session.

CLI Example:

```
salt '*' panos.get_cli_idle_timeout
```

`salt.modules.panos.get_cli_permissions()`

Show cli administrative permissions.

CLI Example:

```
salt '*' panos.get_cli_permissions
```

`salt.modules.panos.get_disk_usage()`

Report filesystem disk space usage.

CLI Example:

```
salt '*' panos.get_disk_usage
```

`salt.modules.panos.get_dns_server_config()`

Get the DNS server configuration from the candidate configuration.

CLI Example:

```
salt '*' panos.get_dns_server_config
```

`salt.modules.panos.get_domain_config()`

Get the domain name configuration from the candidate configuration.

CLI Example:

```
salt '*' panos.get_domain_config
```

`salt.modules.panos.get_dos_blocks()`

Show the DoS block-ip table.

CLI Example:

```
salt '*' panos.get_dos_blocks
```

`salt.modules.panos.get_fqdn_cache()`

Print FQDNs used in rules and their IPs.

CLI Example:

```
salt '*' panos.get_fqdn_cache
```

`salt.modules.panos.get_ha_config()`

Get the high availability configuration.

CLI Example:

```
salt '*' panos.get_ha_config
```

`salt.modules.panos.get_ha_link()`

Show high-availability link-monitoring state.

CLI Example:

```
salt '*' panos.get_ha_link
```

`salt.modules.panos.get_ha_path()`

Show high-availability path-monitoring state.

CLI Example:

```
salt '*' panos.get_ha_path
```

`salt.modules.panos.get_ha_state()`

Show high-availability state information.

CLI Example:

```
salt '*' panos.get_ha_state
```

`salt.modules.panos.get_ha_transitions()`

Show high-availability transition statistic information.

CLI Example:

```
salt '*' panos.get_ha_transitions
```

`salt.modules.panos.get_hostname()`

Get the hostname of the device.

CLI Example:

```
salt '*' panos.get_hostname
```

`salt.modules.panos.get_interface_counters` (*name='all'*)

Get the counter statistics for interfaces.

**Parameters**

**name** (*str*) -- The name of the interface to view. By default, all interface statistics are viewed.

CLI Example:

```
salt '*' panos.get_interface_counters
salt '*' panos.get_interface_counters ethernet1/1
```

`salt.modules.panos.get_interfaces` (*name='all'*)

Show interface information.

**Parameters**

**name** (*str*) -- The name of the interface to view. By default, all interface statistics are viewed.

CLI Example:

```
salt '*' panos.get_interfaces
salt '*' panos.get_interfaces ethernet1/1
```

`salt.modules.panos.get_job` (*jid=None*)

List all a single job by ID.

**jid**

The ID of the job to retrieve.

CLI Example:

```
salt '*' panos.get_job jid=15
```

`salt.modules.panos.get_jobs` (*state='all'*)

List all jobs on the device.

**state**

The state of the jobs to display. Valid options are all, pending, or processed. Pending jobs are jobs that are currently in a running or waiting state. Processed jobs are jobs that have completed execution.

CLI Example:

```
salt '*' panos.get_jobs
salt '*' panos.get_jobs state=pending
```

`salt.modules.panos.get_lacp` ()

Show LACP state.

CLI Example:

```
salt '*' panos.get_lacp
```

`salt.modules.panos.get_license_info` ()

Show information about owned license(s).

CLI Example:

```
salt '*' panos.get_license_info
```

`salt.modules.panos.get_license_tokens` ()

Show license token files for manual license deactivation.

CLI Example:

```
salt '*' panos.get_license_tokens
```

`salt.modules.panos.get_lldp_config()`

Show lldp config for interfaces.

CLI Example:

```
salt '*' panos.get_lldp_config
```

`salt.modules.panos.get_lldp_counters()`

Show lldp counters for interfaces.

CLI Example:

```
salt '*' panos.get_lldp_counters
```

`salt.modules.panos.get_lldp_local()`

Show lldp local info for interfaces.

CLI Example:

```
salt '*' panos.get_lldp_local
```

`salt.modules.panos.get_lldp_neighbors()`

Show lldp neighbors info for interfaces.

CLI Example:

```
salt '*' panos.get_lldp_neighbors
```

`salt.modules.panos.get_local_admins()`

Show all local administrator accounts.

CLI Example:

```
salt '*' panos.get_local_admins
```

`salt.modules.panos.get_logdb_quota()`

Report the logdb quotas.

CLI Example:

```
salt '*' panos.get_logdb_quota
```

`salt.modules.panos.get_master_key()`

Get the master key properties.

CLI Example:

```
salt '*' panos.get_master_key
```

`salt.modules.panos.get_ntp_config()`

Get the NTP configuration from the candidate configuration.

CLI Example:

```
salt '*' panos.get_ntp_config
```

`salt.modules.panos.get_ntp_servers()`

Get list of configured NTP servers.

CLI Example:

```
salt '*' panos.get_ntp_servers
```

`salt.modules.panos.get_operational_mode()`

Show device operational mode setting.

CLI Example:

```
salt '*' panos.get_operational_mode
```

`salt.modules.panos.get_panorama_status()`

Show panorama connection status.

CLI Example:

```
salt '*' panos.get_panorama_status
```

`salt.modules.panos.get_permitted_ips()`

Get the IP addresses that are permitted to establish management connections to the device.

CLI Example:

```
salt '*' panos.get_permitted_ips
```

`salt.modules.panos.get_platform()`

Get the platform model information and limitations.

CLI Example:

```
salt '*' panos.get_platform
```

`salt.modules.panos.get_predefined_application(application=None)`

Get the configuration for the specified pre-defined application object. This will only return pre-defined application objects.

`application(str)`: The name of the pre-defined application object.

CLI Example:

```
salt '*' panos.get_predefined_application saltstack
```

`salt.modules.panos.get_security_rule(rulename=None, vsys='1')`

Get the candidate configuration for the specified security rule.

`rulename(str)`: The name of the security rule.

`vsys(str)`: The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_security_rule rule01
salt '*' panos.get_security_rule rule01 3
```

`salt.modules.panos.get_service`(*service=None, vsys='1'*)

Get the candidate configuration for the specified service object. This will not return services that are marked as pre-defined objects.

`service(str)`: The name of the service object.

`vsys(str)`: The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_service tcp-443
salt '*' panos.get_service tcp-443 3
```

`salt.modules.panos.get_service_group`(*servicegroup=None, vsys='1'*)

Get the candidate configuration for the specified service group. This will not return service groups that are marked as pre-defined objects.

`servicegroup(str)`: The name of the service group.

`vsys(str)`: The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_service_group foobar
salt '*' panos.get_service_group foobar 3
```

`salt.modules.panos.get_session_info`()

Show device session statistics.

CLI Example:

```
salt '*' panos.get_session_info
```

`salt.modules.panos.get_snmp_config`()

Get the SNMP configuration from the device.

CLI Example:

```
salt '*' panos.get_snmp_config
```

`salt.modules.panos.get_software_info`()

Show information about available software packages.

CLI Example:

```
salt '*' panos.get_software_info
```

`salt.modules.panos.get_system_date_time`()

Get the system date/time.

CLI Example:

```
salt '*' panos.get_system_date_time
```

`salt.modules.panos.get_system_files`()

List important files in the system.

CLI Example:

```
salt '*' panos.get_system_files
```

`salt.modules.panos.get_system_info()`

Get the system information.

CLI Example:

```
salt '*' panos.get_system_info
```

`salt.modules.panos.get_system_services()`

Show system services.

CLI Example:

```
salt '*' panos.get_system_services
```

`salt.modules.panos.get_system_state(mask=None)`

Show the system state variables.

**mask**

Filters by a subtree or a wildcard.

CLI Example:

```
salt '*' panos.get_system_state
salt '*' panos.get_system_state mask=config.enabled
salt '*' panos.get_system_state mask=config.*
```

`salt.modules.panos.get_uncommitted_changes()`

Retrieve a list of all uncommitted changes on the device. Requires PANOS version 8.0.0 or greater.

CLI Example:

```
salt '*' panos.get_uncommitted_changes
```

`salt.modules.panos.get_users_config()`

Get the local administrative user account configuration.

CLI Example:

```
salt '*' panos.get_users_config
```

`salt.modules.panos.get_vlans()`

Show all VLAN information.

CLI Example:

```
salt '*' panos.get_vlans
```

`salt.modules.panos.get_xpath(xpath="")`

Retrieve a specified xpath from the candidate configuration.

`xpath(str)`: The specified xpath in the candidate configuration.

CLI Example:

```
salt '*' panos.get_xpath /config/shared/service
```

`salt.modules.panos.get_zone(zone='', vsys='1')`

Get the candidate configuration for the specified zone.

`zone(str)`: The name of the zone.

`vsys(str)`: The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_zone trust
salt '*' panos.get_zone trust 2
```

`salt.modules.panos.get_zones(vsys='1')`

Get all the zones in the candidate configuration.

`vsys(str)`: The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_zones
salt '*' panos.get_zones 2
```

`salt.modules.panos.install_antivirus(version=None, latest=False, synch=False, skip_commit=False)`

Install anti-virus packages.

**Parameters**

- **version** (*str*) -- The version of the PANOS file to install.
- **latest** (*bool*) -- If true, the latest anti-virus file will be installed. The specified version option will be ignored.
- **synch** (*bool*) -- If true, the anti-virus will synch to the peer unit.
- **skip\_commit** (*bool*) -- If true, the install will skip committing to the device.

CLI Example:

```
salt '*' panos.install_antivirus 8.0.0
```

`salt.modules.panos.install_license()`

Install the license key(s).

CLI Example:

```
salt '*' panos.install_license
```

`salt.modules.panos.install_software(version=None)`

Upgrade to a software package by version.

**Parameters**

- **version** (*str*) -- The version of the PANOS file to install.

CLI Example:

```
salt '*' panos.install_license 8.0.0
```

`salt.modules.panos.reboot()`

Reboot a running system.

CLI Example:

```
salt '*' panos.reboot
```

`salt.modules.panos.refresh_fqdn_cache` (*force=False*)

Force refreshes all FQDNs used in rules.

**force**

Forces all fqdn refresh

CLI Example:

```
salt '*' panos.refresh_fqdn_cache
salt '*' panos.refresh_fqdn_cache force=True
```

`salt.modules.panos.remove_config_lock`()

Release config lock previously held.

CLI Example:

```
salt '*' panos.remove_config_lock
```

`salt.modules.panos.resolve_address` (*address=None, vsys=None*)

Resolve address to ip address. Required version 7.0.0 or greater.

**address**

Address name you want to resolve.

**vsys**

The vsys name.

CLI Example:

```
salt '*' panos.resolve_address foo.bar.com
salt '*' panos.resolve_address foo.bar.com vsys=2
```

`salt.modules.panos.save_device_config` (*filename=None*)

Save device configuration to a named file.

**filename**

The filename to save the configuration to.

CLI Example:

```
salt '*' panos.save_device_config foo.xml
```

`salt.modules.panos.save_device_state`()

Save files needed to restore device to local disk.

CLI Example:

```
salt '*' panos.save_device_state
```

`salt.modules.panos.set_authentication_profile` (*profile=None, deploy=False*)

Set the authentication profile of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

**Parameters**

- **profile** (*str*) -- The name of the authentication profile to set.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_authentication_profile foo
salt '*' panos.set_authentication_profile foo deploy=True
```

`salt.modules.panos.set_hostname` (*hostname=None, deploy=False*)

Set the hostname of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

**Parameters**

- **hostname** (*str*) -- The hostname to set
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_hostname newhostname
salt '*' panos.set_hostname newhostname deploy=True
```

`salt.modules.panos.set_management_http` (*enabled=True, deploy=False*)

Enables or disables the HTTP management service on the device.

CLI Example:

**Parameters**

- **enabled** (*bool*) -- If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_http
salt '*' panos.set_management_http enabled=False deploy=True
```

`salt.modules.panos.set_management_https` (*enabled=True, deploy=False*)

Enables or disables the HTTPS management service on the device.

CLI Example:

**Parameters**

- **enabled** (*bool*) -- If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_https
salt '*' panos.set_management_https enabled=False deploy=True
```

`salt.modules.panos.set_management_icmp` (*enabled=True, deploy=False*)

Enables or disables the ICMP management service on the device.

CLI Example:

**Parameters**

- **enabled** (*bool*) -- If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_icmp
salt '*' panos.set_management_icmp enabled=False deploy=True
```

`salt.modules.panos.set_management_ocsp` (*enabled=True, deploy=False*)

Enables or disables the HTTP OCSP management service on the device.

CLI Example:

**Parameters**

- **enabled** (*bool*) -- If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_ocsp
salt '*' panos.set_management_ocsp enabled=False deploy=True
```

`salt.modules.panos.set_management_snmp` (*enabled=True, deploy=False*)

Enables or disables the SNMP management service on the device.

CLI Example:

**Parameters**

- **enabled** (*bool*) -- If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_snmp
salt '*' panos.set_management_snmp enabled=False deploy=True
```

`salt.modules.panos.set_management_ssh` (*enabled=True, deploy=False*)

Enables or disables the SSH management service on the device.

CLI Example:

**Parameters**

- **enabled** (*bool*) -- If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_ssh
salt '*' panos.set_management_ssh enabled=False deploy=True
```

`salt.modules.panos.set_management_telnet` (*enabled=True, deploy=False*)

Enables or disables the Telnet management service on the device.

CLI Example:

**Parameters**

- **enabled** (*bool*) -- If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_telnet
salt '*' panos.set_management_telnet enabled=False deploy=True
```

`salt.modules.panos.set_ntp_authentication` (*target=None, authentication\_type=None, key\_id=None, authentication\_key=None, algorithm=None, deploy=False*)

Set the NTP authentication of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

**Parameters**

- **target** (*str*) -- Determines the target of the authentication. Valid options are primary, secondary, or both.

- **authentication\_type** (*str*) -- The authentication type to be used. Valid options are symmetric, autokey, and none.
- **key\_id** (*int*) -- The NTP authentication key ID.
- **authentication\_key** (*str*) -- The authentication key.
- **algorithm** (*str*) -- The algorithm type to be used for a symmetric key. Valid options are md5 and sha1.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' ntp.set_authentication target=both authentication_type=autokey
salt '*' ntp.set_authentication target=primary authentication_type=none
salt '*' ntp.set_authentication target=both authentication_type=symmetric
  ↳key_id=15 authentication_key=mykey algorithm=md5
salt '*' ntp.set_authentication target=both authentication_type=symmetric
  ↳key_id=15 authentication_key=mykey algorithm=md5 deploy=True
```

`salt.modules.panos.set_ntp_servers` (*primary\_server=None, secondary\_server=None, deploy=False*)

Set the NTP servers of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

#### Parameters

- **primary\_server** (*str*) -- The primary NTP server IP address or FQDN.
- **secondary\_server** (*str*) -- The secondary NTP server IP address or FQDN.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' ntp.set_servers 0.pool.ntp.org 1.pool.ntp.org
salt '*' ntp.set_servers primary_server=0.pool.ntp.org secondary_server=1.
  ↳pool.ntp.org
salt '*' ntp.set_servers 0.pool.ntp.org 1.pool.ntp.org deploy=True
```

`salt.modules.panos.set_permitted_ip` (*address=None, deploy=False*)

Add an IPv4 address or network to the permitted IP list.

CLI Example:

#### Parameters

- **address** (*str*) -- The IPv4 address or network to allow access to add to the Palo Alto device.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_permitted_ip 10.0.0.1
salt '*' panos.set_permitted_ip 10.0.0.0/24
salt '*' panos.set_permitted_ip 10.0.0.1 deploy=True
```

`salt.modules.panos.set_timezone` (*tz=None, deploy=False*)

Set the timezone of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

#### Parameters

- **tz** (*str*) -- The name of the timezone to set.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_timezone UTC
salt '*' panos.set_timezone UTC deploy=True
```

`salt.modules.panos.shutdown()`

Shutdown a running system.

CLI Example:

```
salt '*' panos.shutdown
```

`salt.modules.panos.test_fib_route` (*ip=None, vr='vr1'*)

Perform a route lookup within active route table (fib).

*ip* (str): The destination IP address to test.

*vr* (str): The name of the virtual router to test.

CLI Example:

```
salt '*' panos.test_fib_route 4.2.2.2
salt '*' panos.test_fib_route 4.2.2.2 my-vr
```

`salt.modules.panos.test_security_policy` (*sourcezone=None, destinationzone=None, source=None, destination=None, protocol=None, port=None, application=None, category=None, vsys='1', allrules=False*)

Checks which security policy as connection will match on the device.

*sourcezone* (str): The source zone matched against the connection.

*destinationzone* (str): The destination zone matched against the connection.

*source* (str): The source address. This must be a single IP address.

*destination* (str): The destination address. This must be a single IP address.

*protocol* (int): The protocol number for the connection. This is the numerical representation of the protocol.

*port* (int): The port number for the connection.

*application* (str): The application that should be matched.

*category* (str): The category that should be matched.

*vsys* (int): The numerical representation of the VSYS ID.

*allrules* (bool): Show all potential match rules until first allow rule.

CLI Example:

```
salt '*' panos.test_security_policy sourcezone=trust
→destinationzone=untrust protocol=6 port=22
salt '*' panos.test_security_policy sourcezone=trust
→destinationzone=untrust protocol=6 port=22 vsys=2
```

`salt.modules.panos.unlock_admin` (*username=None*)

Unlocks a locked administrator account.

**username**

Username of the administrator.

CLI Example:

```
salt '*' panos.unlock_admin username=bob
```

### 26.6.331 salt.modules.parallels

Manage Parallels Desktop VMs with `prlctl` and `prlsrvctl`. Only some of the `prlctl` commands implemented so far. Of those that have been implemented, not all of the options may have been provided yet. For a complete reference, see the [Parallels Desktop Reference Guide](#).

This module requires the `prlctl` binary to be installed to run most functions. To run `parallels.prlsrvctl`, the `prlsrvctl` binary is required.

What has not been implemented yet can be accessed through `parallels.prlctl` and `parallels.prlsrvctl` (note the preceding double dash `--` as necessary):

```
salt '*' parallels.prlctl installtools macvm runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png'
→runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev
```

New in version 2016.3.0.

`salt.modules.parallels.clone` (*name*, *new\_name*, *linked=False*, *template=False*, *runas=None*)

Clone a VM

New in version 2016.11.0.

#### Parameters

- **name** (*str*) -- Name/ID of VM to clone
- **new\_name** (*str*) -- Name of the new VM
- **linked** (*bool*) -- Create a linked virtual machine.
- **template** (*bool*) -- Create a virtual machine template instead of a real virtual machine.
- **runas** (*str*) -- The user that the `prlctl` command will be run as

Example:

```
salt '*' parallels.clone macvm macvm_new runas=macdev
salt '*' parallels.clone macvm macvm_tmpl template=True runas=macdev
```

`salt.modules.parallels.delete` (*name*, *runas=None*)

Delete a VM

New in version 2016.11.0.

#### Parameters

- **name** (*str*) -- Name/ID of VM to clone
- **runas** (*str*) -- The user that the `prlctl` command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

`salt.modules.parallels.delete_snapshot` (*name*, *snap\_name*, *runas=None*, *all=False*)

Delete a snapshot

---

**Note:** Deleting a snapshot from which other snapshots are derived will not delete the derived snapshots

---

**Parameters**

- **name** (*str*) -- Name/ID of VM whose snapshot will be deleted
- **snap\_name** (*str*) -- Name/ID of snapshot to delete
- **runas** (*str*) -- The user that the prlctl command will be run as
- **all** (*bool*) -- Delete all snapshots having the name given

New in version 2016.11.0.

Example:

```
salt '*' parallels.delete_snapshot macvm 'unneeded snapshot' runas=macdev
salt '*' parallels.delete_snapshot macvm 'Snapshot for linked clone'
↳all=True runas=macdev
```

`salt.modules.parallels.exec_(name, command, runas=None)`

Run a command on a VM

**Parameters**

- **name** (*str*) -- Name/ID of VM whose exec will be returned
- **command** (*str*) -- Command to run on the VM
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

`salt.modules.parallels.exists(name, runas=None)`

Query whether a VM exists

New in version 2016.11.0.

**Parameters**

- **name** (*str*) -- Name/ID of VM
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.exists macvm runas=macdev
```

`salt.modules.parallels.list_snapshots(name, snap_name=None, tree=False, names=False, runas=None)`

List the snapshots

**Parameters**

- **name** (*str*) -- Name/ID of VM whose snapshots will be listed
- **snap\_id** (*str*) -- Name/ID of snapshot to display information about. If `tree=True` is also specified, display the snapshot subtree having this snapshot as the root snapshot
- **tree** (*bool*) -- List snapshots in tree format rather than tabular format
- **names** (*bool*) -- List snapshots as ID, name pairs
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.list_snapshots macvm runas=macdev
salt '*' parallels.list_snapshots macvm tree=True runas=macdev
salt '*' parallels.list_snapshots macvm snap_name=original runas=macdev
salt '*' parallels.list_snapshots macvm names=True runas=macdev
```

`salt.modules.parallels.list_vms(name=None, info=False, all=False, args=None, runas=None, template=False)`

List information about the VMs

**Parameters**

- **name** (*str*) -- Name/ID of VM to list
- Changed in version 2016.11.0: No longer implies `info=True`
- **info** (*str*) -- List extra information
  - **all** (*bool*) -- List all non-template VMs
  - **args** (*tuple*) -- Additional arguments given to `prctl list`
  - **runas** (*str*) -- The user that the `prctl` command will be run as
  - **template** (*bool*) -- List the available virtual machine templates. The real virtual machines will not be included in the output

New in version 2016.11.0.

Example:

```
salt '*' parallels.list_vms runas=macdev
salt '*' parallels.list_vms name=macvm info=True runas=macdev
salt '*' parallels.list_vms info=True runas=macdev
salt '*' parallels.list_vms '-o uuid,status' all=True runas=macdev
```

`salt.modules.parallels.prlctl`(*sub\_cmd*, *args=None*, *runas=None*)

Execute a `prctl` command

**Parameters**

- **sub\_cmd** (*str*) -- `prctl` subcommand to execute
- **args** (*str*) -- The arguments supplied to `prctl <sub_cmd>`
- **runas** (*str*) -- The user that the `prctl` command will be run as

Example:

```
salt '*' parallels.prlctl user list runas=macdev
salt '*' parallels.prlctl exec 'macvm uname' runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png'
↳runas=macdev
```

`salt.modules.parallels.prlsrvctl`(*sub\_cmd*, *args=None*, *runas=None*)

Execute a `prlsrvctl` command

New in version 2016.11.0.

**Parameters**

- **sub\_cmd** (*str*) -- `prlsrvctl` subcommand to execute
- **args** (*str*) -- The arguments supplied to `prlsrvctl <sub_cmd>`
- **runas** (*str*) -- The user that the `prlsrvctl` command will be run as

Example:

```
salt '*' parallels.prlsrvctl info runas=macdev
salt '*' parallels.prlsrvctl usb list runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev
```

`salt.modules.parallels.reset`(*name*, *runas=None*)

Reset a VM by performing a hard shutdown and then a restart

**Parameters**

- **name** (*str*) -- Name/ID of VM to reset
- **runas** (*str*) -- The user that the `prctl` command will be run as

Example:

```
salt '*' parallels.reset macvm runas=macdev
```

`salt.modules.parallels.restart`(*name*, *runas=None*)

Restart a VM by gracefully shutting it down and then restarting it

**Parameters**

- **name** (*str*) -- Name/ID of VM to restart
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.restart macvm runas=macdev
```

`salt.modules.parallels.revert_snapshot`(*name*, *snap\_name*, *runas=None*)

Revert a VM to a snapshot

**Parameters**

- **name** (*str*) -- Name/ID of VM to revert to a snapshot
- **snap\_name** (*str*) -- Name/ID of snapshot to revert to
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.revert_snapshot macvm base-with-updates runas=macdev
```

`salt.modules.parallels.snapshot`(*name*, *snap\_name=None*, *desc=None*, *runas=None*)

Create a snapshot

**Parameters**

- **name** (*str*) -- Name/ID of VM to take a snapshot of
- **snap\_name** (*str*) -- Name of snapshot
- **desc** (*str*) -- Description of snapshot
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.create_snapshot macvm snap_name=macvm-original
→runas=macdev
salt '*' parallels.create_snapshot macvm snap_name=macvm-updates desc=
→'clean install with updates' runas=macdev
```

`salt.modules.parallels.snapshot_id_to_name`(*name*, *snap\_id*, *strict=False*, *runas=None*)

Attempt to convert a snapshot ID to a snapshot name. If the snapshot has no name or if the ID is not found or invalid, an empty string will be returned

**Parameters**

- **name** (*str*) -- Name/ID of VM whose snapshots are inspected
- **snap\_id** (*str*) -- ID of the snapshot
- **strict** (*bool*) -- Raise an exception if a name cannot be found for the given `snap_id`
- **runas** (*str*) -- The user that the prlctl command will be run as

Example data

```
ID: {a5b8999f-5d95-4aff-82de-e515b0101b66}
Name: original
Date: 2016-03-04 10:50:34
Current: yes
State: poweroff
Description: original state
```

CLI Example:

```
salt '*' parallels.snapshot_id_to_name macvm a5b8999f-5d95-4aff-82de-
→e515b0101b66 runas=macdev
```

`salt.modules.parallels.snapshot_name_to_id`(*name*, *snap\_name*, *strict=False*, *runas=None*)

Attempt to convert a snapshot name to a snapshot ID. If the name is not found an empty string is returned. If multiple snapshots share the same name, a list will be returned

**Parameters**

- **name** (*str*) -- Name/ID of VM whose snapshots are inspected
- **snap\_name** (*str*) -- Name of the snapshot
- **strict** (*bool*) -- Raise an exception if multiple snapshot IDs are found
- **runas** (*str*) -- The user that the prlctl command will be run as

CLI Example:

```
salt '*' parallels.snapshot_id_to_name macvm original runas=macdev
```

`salt.modules.parallels.start`(*name*, *runas=None*)

Start a VM

**Parameters**

- **name** (*str*) -- Name/ID of VM to start
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.start macvm runas=macdev
```

`salt.modules.parallels.status`(*name*, *runas=None*)

Status of a VM

**Parameters**

- **name** (*str*) -- Name/ID of VM whose status will be returned
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.status macvm runas=macdev
```

`salt.modules.parallels.stop`(*name*, *kill=False*, *runas=None*)

Stop a VM

**Parameters**

- **name** (*str*) -- Name/ID of VM to stop
- **kill** (*bool*) -- Perform a hard shutdown
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.stop macvm runas=macdev
salt '*' parallels.stop macvm kill=True runas=macdev
```

## 26.6.332 salt.modules.parted\_partition

Module for managing partitions on POSIX-like systems.

### depends

- parted, partprobe, lsblk (usually parted and util-linux packages)

Some functions may not be available, depending on your version of parted.

Check the manpage for parted(8) for more information, or the online docs at:

[http://www.gnu.org/software/parted/manual/html\\_chapter/parted\\_2.html](http://www.gnu.org/software/parted/manual/html_chapter/parted_2.html)

In light of parted not directly supporting partition IDs, some of this module has been written to utilize sfdisk instead. For further information, please reference the man page for sfdisk(8).

`salt.modules.parted_partition.align_check(device, part_type, partition)`

Check if partition satisfies the alignment constraint of part\_type. Type must be "minimal" or "optimal".

CLI Example:

```
salt '*' partition.align_check /dev/sda minimal 1
```

`salt.modules.parted_partition.check(device, minor)`

Checks if the file system on partition <minor> has any errors.

CLI Example:

```
salt '*' partition.check 1
```

`salt.modules.parted_partition.cp(device, from_minor, to_minor)`

Copies the file system on the partition <from-minor> to partition <to-minor>, deleting the original contents of the destination partition.

CLI Example:

```
salt '*' partition.cp /dev/sda 2 3
```

`salt.modules.parted_partition.disk_set(device, flag, state)`

Changes a flag on selected device.

A flag can be either "on" or "off" (make sure to use proper quoting, see *YAML Idiosyncrasies*). Some or all of these flags will be available, depending on what disk label you are using.

Valid flags are:

- cylinder\_alignment
- pibr\_boot
- implicit\_partition\_table

CLI Example:

```
salt '*' partition.disk_set /dev/sda pibr_boot "on"
```

`salt.modules.parted_partition.disk_toggle(device, flag)`

Toggle the state of <flag> on <device>. Valid flags are the same as the disk\_set command.

CLI Example:

```
salt '*' partition.disk_toggle /dev/sda pibr_boot
```

`salt.modules.parted_partition.exists(device=)`

Check to see if the partition exists

CLI Example:

```
salt '*' partition.exists /dev/sdb1
```

`salt.modules.parted_partition.get_block_device()`

Retrieve a list of disk devices

New in version 2014.7.0.

CLI Example:

```
salt '*' partition.get_block_device
```

`salt.modules.parted_partition.get_id(device, minor)`

Prints the system ID for the partition. Some typical values are:

```
b: FAT32 (vfat)
7: HPFS/NTFS
82: Linux Swap
83: Linux
8e: Linux LVM
fd: Linux RAID Auto
```

CLI Example:

```
salt '*' partition.get_id /dev/sda 1
```

`salt.modules.parted_partition.list_(device, unit=None)`

Prints partition information of given <device>

CLI Examples:

```
salt '*' partition.list /dev/sda
salt '*' partition.list /dev/sda unit=s
salt '*' partition.list /dev/sda unit=kB
```

`salt.modules.parted_partition.mkfs(device, fs_type)`

Makes a file system <fs\_type> on partition <device>, destroying all data that resides on that partition. <fs\_type> must be one of "ext2", "fat32", "fat16", "linux-swap" or "reiserfs" (if libreiserfs is installed)

CLI Example:

```
salt '*' partition.mkfs /dev/sda2 fat32
```

`salt.modules.parted_partition.mklabel(device, label_type)`

Create a new disklabel (partition table) of label\_type.

Type should be one of "aix", "amiga", "bsd", "dvh", "gpt", "loop", "mac", "msdos", "pc98", or "sun".

CLI Example:

```
salt '*' partition.mklabel /dev/sda msdos
```

`salt.modules.parted_partition.mkpart`(*device, part\_type, fs\_type=None, start=None, end=None*)

Make a `part_type` partition for filesystem `fs_type`, beginning at `start` and ending at `end` (by default in megabytes). `part_type` should be one of "primary", "logical", or "extended".

CLI Examples:

```
salt '*' partition.mkpart /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpart /dev/sda primary start=0 end=639
```

`salt.modules.parted_partition.mkpartfs`(*device, part\_type, fs\_type=None, start=None, end=None*)

The `mkpartfs` actually is an alias to `mkpart` and is kept for compatibility. To know the valid options and usage syntax read `mkpart` documentation.

CLI Examples:

```
salt '*' partition.mkpartfs /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpartfs /dev/sda primary start=0 end=639
```

`salt.modules.parted_partition.name`(*device, partition, name*)

Set the name of partition to `name`. This option works only on Mac, PC98, and GPT disklabels. The name can be placed in quotes, if necessary.

CLI Example:

```
salt '*' partition.name /dev/sda 1 'My Documents'
```

`salt.modules.parted_partition.probe`(*\*devices*)

Ask the kernel to update its local partition data. When no args are specified all block devices are tried.

Caution: Generally only works on devices with no mounted partitions and may take a long time to return if specified devices are in use.

CLI Examples:

```
salt '*' partition.probe
salt '*' partition.probe /dev/sda
salt '*' partition.probe /dev/sda /dev/sdb
```

`salt.modules.parted_partition.rescue`(*device, start, end*)

Rescue a lost partition that was located somewhere between `start` and `end`. If a partition is found, `parted` will ask if you want to create an entry for it in the partition table.

CLI Example:

```
salt '*' partition.rescue /dev/sda 0 8056
```

`salt.modules.parted_partition.resize`(*device, minor, start, end*)

Resizes the partition with number `<minor>`.

The partition will start `<start>` from the beginning of the disk, and end `<end>` from the beginning of the disk. `resize` never changes the minor number. Extended partitions can be resized, so long as the new extended partition completely contains all logical partitions.

CLI Example:

```
salt '*' partition.resize /dev/sda 3 200 850
```

`salt.modules.parted_partition.rm(device, minor)`

Removes the partition with number <minor>.

CLI Example:

```
salt '*' partition.rm /dev/sda 5
```

`salt.modules.parted_partition.set_(device, minor, flag, state)`

Changes a flag on the partition with number <minor>.

A flag can be either "on" or "off" (make sure to use proper quoting, see [YAML Idiosyncrasies](#)). Some or all of these flags will be available, depending on what disk label you are using.

Valid flags are:

- boot
- root
- swap
- hidden
- raid
- lvm
- lba
- hp-service
- palo
- prep
- msftres
- bios\_grub
- atvrecv
- diag
- legacy\_boot
- msftdata
- irst
- esp
- type

CLI Example:

```
salt '*' partition.set /dev/sda 1 boot '"on"'
```

`salt.modules.parted_partition.set_id(device, minor, system_id)`

Sets the system ID for the partition. Some typical values are:

```
b: FAT32 (vfat)
7: HPFS/NTFS
82: Linux Swap
83: Linux
8e: Linux LVM
fd: Linux RAID Auto
```

CLI Example:

```
salt '*' partition.set_id /dev/sda 1 83
```

`salt.modules.parted_partition.system_types()`

List the system types that are supported by the installed version of sfdisk

CLI Example:

```
salt '*' partition.system_types
```

`salt.modules.parted_partition.toggle` (*device, partition, flag*)

Toggle the state of <flag> on <partition>. Valid flags are the same as the set command.

CLI Example:

```
salt '*' partition.toggle /dev/sda 1 boot
```

### 26.6.333 salt.modules.pcs

#### Configure a Pacemaker/Corosync cluster with PCS

Configure Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

**depends**

pcs

New in version 2016.3.0.

`salt.modules.pcs.auth` (*nodes, pcsuser='hacluster', pcspasswd='hacluster', extra\_args=None*)

Authorize nodes to the cluster

**nodes**

a list of nodes which should be authorized to the cluster

**pcsuser**

user for communication with PCS (default: hacluster)

**pcspasswd**

password for pcsuser (default: hacluster)

**extra\_args**

list of extra option for the 'pcs cluster auth' command. The newer cluster host command has no extra args and so will ignore it.

CLI Example:

```
salt '*' pcs.auth nodes='[ node1.example.org, node2.example.org ]'
→pcsuser=hacluster pcspasswd=hoonetorg extra_args=[ '--force' ]
```

`salt.modules.pcs.cib_create` (*cibfile, scope='configuration', extra\_args=None*)

Create a CIB-file from the current CIB of the cluster

**cibfile**

name/path of the file containing the CIB

**scope**

specific section of the CIB (default: configuration)

**extra\_args**

additional options for creating the CIB-file

CLI Example:

```
salt '*' pcs.cib_create cibfile='/tmp/VIP_apache_1.cib' scope=False
```

`salt.modules.pcs.cib_push` (*cibfile, scope='configuration', extra\_args=None*)

Push a CIB-file as the new CIB to the cluster

**cibfile**

name/path of the file containing the CIB

**scope**  
specific section of the CIB (default: configuration)

**extra\_args**  
additional options for creating the CIB-file

CLI Example:

```
salt '*' pcs.cib_push cibfile='/tmp/VIP_apache_1.cib' scope=False
```

**salt.modules.pcs.cluster\_destroy**(*extra\_args=None*)  
Destroy corosync cluster using the pcs command

**extra\_args**  
list of extra option for the 'pcs cluster destroy' command (only really --all)

CLI Example:

```
salt '*' pcs.cluster_destroy extra_args=--all
```

**salt.modules.pcs.cluster\_node\_add**(*node, extra\_args=None*)  
Add a node to the pacemaker cluster via pcs command

**node**  
node that should be added

**extra\_args**  
list of extra option for the 'pcs cluster node add' command

CLI Example:

```
salt '*' pcs.cluster_node_add node=node2.example.org
```

**salt.modules.pcs.cluster\_setup**(*nodes, pcsclustername='pcscluster', extra\_args=None*)  
Setup pacemaker cluster via pcs command

**nodes**  
a list of nodes which should be set up

**pcsclustername**  
Name of the Pacemaker cluster (default: pcscluster)

**extra\_args**  
list of extra option for the 'pcs cluster setup' command

CLI Example:

```
salt '*' pcs.cluster_setup nodes='[ node1.example.org, node2.example.org ]  
->' pcsclustername=pcscluster
```

**salt.modules.pcs.config\_show**(*cibfile=None*)  
Show config of cluster

**cibfile**  
name/path of the file containing the CIB

CLI Example:

```
salt '*' pcs.config_show cibfile='/tmp/cib_for_galera'
```

**salt.modules.pcs.is\_auth**(*nodes, pcsuser='hacluster', pcspasswd='hacluster'*)  
Check if nodes are already authorized

**nodes**  
a list of nodes to be checked for authorization to the cluster

**pcsuser**  
user for communication with PCS (default: hacluster)

**pcspasswd**

password for pcsuser (default: hacluster)

CLI Example:

```
salt '*' pcs.is_auth nodes='[node1.example.org, node2.example.org]'
↳ pcsuser=hacluster pcspasswd=hoonetorg
```

**salt.modules.pcs.item\_create**(*item*, *item\_id*, *item\_type*, *create*='create', *extra\_args*=None, *cibfile*=None)

Create an item via pcs command (mainly for use with the pcs state module)

**item**

config, property, resource, constraint etc.

**item\_id**

id of the item

**item\_type**

item type

**create**

create command (create or set f.e., default: create)

**extra\_args**

additional options for the pcs command

**cibfile**

use cibfile instead of the live CIB

**salt.modules.pcs.item\_show**(*item*, *item\_id*=None, *item\_type*=None, *show*='show', *extra\_args*=None, *cibfile*=None)

Show an item via pcs command (mainly for use with the pcs state module)

**item**

config, property, resource, constraint etc.

**item\_id**

id of the item

**item\_type**

item type

**show**

show command (probably None, default: show or status for newer implementation)

**extra\_args**

additional options for the pcs command

**cibfile**

use cibfile instead of the live CIB

**salt.modules.pcs.prop\_set**(*prop*, *value*, *extra\_args*=None, *cibfile*=None)

Set the value of a cluster property

**prop**

name of the property

**value**

value of the property prop

**extra\_args**

additional options for the pcs property command

**cibfile**

use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.prop_set prop='no-quorum-policy' value='ignore' cibfile='/
↳ tmp/2_node_cluster.cib'
```

**salt.modules.pcs.prop\_show**(*prop*, *extra\_args*=None, *cibfile*=None)

Show the value of a cluster property

**prop**  
name of the property

**extra\_args**  
additional options for the pcs property command

**cibfile**  
use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.prop_show cibfile='/tmp/2_node_cluster.cib' prop='no-quorum-
↳policy' cibfile='/tmp/2_node_cluster.cib'
```

`salt.modules.pcs.resource_create(resource_id, resource_type, resource_options=None, cibfile=None)`

Create a resource via pcs command

**resource\_id**  
name for the resource

**resource\_type**  
resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)

**resource\_options**  
additional options for creating the resource

**cibfile**  
use cibfile instead of the live CIB for manipulation

CLI Example:

```
salt '*' pcs.resource_create resource_id='galera' resource_type=
↳'ocf:heartbeat:galera' resource_options="['wsrep_cluster_address=gcomm:/
↳/node1.example.org,node2.example.org,node3.example.org', '--master']"
↳cibfile='/tmp/cib_for_galera.cib'
```

`salt.modules.pcs.resource_show(resource_id, extra_args=None, cibfile=None)`

Show a resource via pcs command

**resource\_id**  
name of the resource

**extra\_args**  
additional options for the pcs command

**cibfile**  
use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.resource_show resource_id='galera' cibfile='/tmp/cib_for_
↳galera.cib'
```

`salt.modules.pcs.stonith_create(stonith_id, stonith_device_type, stonith_device_options=None, cibfile=None)`

Create a stonith resource via pcs command

**stonith\_id**  
name for the stonith resource

**stonith\_device\_type**  
name of the stonith agent fence\_eps, fence\_xvm f.e.

**stonith\_device\_options**  
additional options for creating the stonith resource

**cibfile**  
use cibfile instead of the live CIB for manipulation

CLI Example:

```

salt '*' pcs.stonith_create stonith_id='eps_fence' stonith_device_type=
→'fence_eps'
                                stonith_device_options="['pcmk_host_map=node1.
→example.org:01;node2.example.org:02', 'ipaddr=myepsdevice.example.org',
→'action=reboot', 'power_wait=5', 'verbose=1', 'debug=/var/log/pcsd/eps_
→fence.log', 'login=hidden', 'passwd=hoonetorg']" cibfile='/tmp/cib_for_
→stonith.cib'

```

`salt.modules.pcs.stonith_show`(*stonith\_id*, *extra\_args=None*, *cibfile=None*)

Show the value of a cluster stonith

**stonith\_id**

name for the stonith resource

**extra\_args**

additional options for the pcs stonith command

**cibfile**

use cibfile instead of the live CIB

CLI Example:

```

salt '*' pcs.stonith_show stonith_id='eps_fence' cibfile='/tmp/2_node_
→cluster.cib'

```

### 26.6.334 salt.modules.pdbedit

Manage accounts in Samba's passdb using pdbedit

**maintainer**

Jorge Schrauwen <sjorge@blackdot.be>

**maturity**

new

**platform**

posix

New in version 2017.7.0.

`salt.modules.pdbedit.create`(*login*, *password*, *password\_hashed=False*, *machine\_account=False*)

Create user account

**login**

[string] login name

**password**

[string] password

**password\_hashed**

[boolean] set if password is a nt hash instead of plain text

**machine\_account**

[boolean] set to create a machine trust account instead

CLI Example:

```

salt '*' pdbedit.create zoe 9764951149F84E770889011E1DC4A927 nthash
salt '*' pdbedit.create river 1sw4ll0w3d4bug

```

`salt.modules.pdbedit.delete`(*login*)

Delete user account

**login**

[string] login name

CLI Example:

```
salt '*' pdbedit.delete wash
```

**salt.modules.pdbedit.generate\_nt\_hash**(*password*)

Generate a NT HASH

CLI Example:

```
salt '*' pdbedit.generate_nt_hash my_passwd
```

**salt.modules.pdbedit.get\_user**(*login*, *hashes=False*)

Get user account details

**login**

[string] login name

**hashes**

[boolean] include NTHASH and LMHASH in verbose output

CLI Example:

```
salt '*' pdbedit.get kaylee
```

**salt.modules.pdbedit.list\_users**(*verbose=True*, *hashes=False*)

List user accounts

**verbose**

[boolean] return all information

**hashes**

[boolean] include NT HASH and LM HASH in verbose output

CLI Example:

```
salt '*' pdbedit.list
```

**salt.modules.pdbedit.modify**(*login*, *password=None*, *password\_hashed=False*, *domain=None*, *profile=None*, *script=None*, *drive=None*, *homedir=None*, *fullname=None*, *account\_desc=None*, *account\_control=None*, *machine\_sid=None*, *user\_sid=None*, *reset\_login\_hours=False*, *reset\_bad\_password\_count=False*)

Modify user account

**login**

[string] login name

**password**

[string] password

**password\_hashed**

[boolean] set if password is a nt hash instead of plain text

**domain**

[string] users domain

**profile**

[string] profile path

**script**

[string] logon script

**drive**

[string] home drive

**homedir**

[string] home directory

**fullname**  
[string] full name

**account\_desc**  
[string] account description

**machine\_sid**  
[string] specify the machines new primary group SID or rid

**user\_sid**  
[string] specify the users new primary group SID or rid

**account\_control**  
[string] specify user account control properties

---

**Note:** Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire

---

**reset\_login\_hours**  
[boolean] reset the users allowed logon hours

**reset\_bad\_password\_count**  
[boolean] reset the stored bad login counter

---

**Note:** if user is absent and password is provided, the user will be created

---

CLI Example:

```
salt '*' pdbedit.modify inara fullname='Inara Serra'
salt '*' pdbedit.modify simon password=r1v3r
salt '*' pdbedit.modify jane drive='V:' homedir='\\serenity\jane\profile'
salt '*' pdbedit.modify mal account_control=NX
```

### 26.6.335 salt.modules.pecl

Manage PHP pecl extensions.

**salt.modules.pecl.install**(*pecls*, *defaults=False*, *force=False*, *preferred\_state='stable'*)

New in version 0.17.0.

Installs one or several pecl extensions.

**pecls**

The pecl extensions to install.

**defaults**

Use default answers for extensions such as pecl\_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.

**force**

Whether to force the installed version or not

CLI Example:

```
salt '*' pecl.install fuse
```

**salt.modules.pecl.list\_**(*channel=None*)

List installed pecl extensions.

CLI Example:

```
salt '*' pecl.list
```

`salt.modules.pecl.uninstall` (*pecls*)

Uninstall one or several pecl extensions.

**pecls**

The pecl extensions to uninstall.

CLI Example:

```
salt '*' pecl.uninstall fuse
```

`salt.modules.pecl.update` (*pecls*)

Update one or several pecl extensions.

**pecls**

The pecl extensions to update.

CLI Example:

```
salt '*' pecl.update fuse
```

## 26.6.336 salt.modules.peeringdb

### PeeringDB Module

New in version 2019.2.0.

Execution module for the basic interaction with the PeeringDB API.

While for GET operations (the functions prefixed by `get_`) the credentials are optional, there are some specific details that are visible only to authenticated users. Moreover, the credentials are required when adding or updating information. That means, the module can equally work out of the box without any further configuration with the limitations imposed by the PeeringDB API.

For complete API documentation, please refer to <https://www.peeringdb.com/apidocs/>.

Configuration (in the opts or Pillar):

```
peeringdb:
  username: salt
  password: 5@1t
```

`salt.modules.peeringdb.get_fac` (*\*\*kwargs*)

Return the details of the facility identified using the search filters specified in the query.

---

**Note:** If no `id` or `filter` arguments are specified, it will return all the possible facilities registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/netfac/netfac\\_list](https://www.peeringdb.com/apidocs/#!/netfac/netfac_list)

---

CLI Example:

```
salt '*' peeringdb.get_fac id=1774
salt '*' peeringdb.get_fac state=UT
```

`salt.modules.peeringdb.get_ix(**kwargs)`

Return the details of an IX (Internet Exchange) using the search filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible IXs registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/ix/ix\\_list](https://www.peeringdb.com/apidocs/#!/ix/ix_list)

---

CLI Example:

```
salt '*' peeringdb.get_ix id=1
salt '*' peeringdb.get_ix city='Milwaukee'
```

`salt.modules.peeringdb.get_ixfac(**kwargs)`

Return the details of an IX (Internet Exchange) facility using the search filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible IX facilities registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/ixfac/ixfac\\_list](https://www.peeringdb.com/apidocs/#!/ixfac/ixfac_list)

---

CLI Example:

```
salt '*' peeringdb.get_ixfac id=1
salt '*' peeringdb.get_ixfac city='Milwaukee'
```

`salt.modules.peeringdb.get_ixlan(**kwargs)`

Return the details of an IX (Internet Exchange) together with the networks available in this location (and their details), using the search filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible IX LAN facilities registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/ixlan/ixlan\\_list](https://www.peeringdb.com/apidocs/#!/ixlan/ixlan_list)

---

CLI Example:

```
salt '*' peeringdb.get_ixlan id=780
salt '*' peeringdb.get_ixlan city='Milwaukee'
```

`salt.modules.peeringdb.get_ixpfx(**kwargs)`

Return the details of an IX (Internet Exchange) together with the PeeringDB IDs of the networks available in this location, using the search filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible IX LAN facilities registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/ixpfx/ixpfx\\_list](https://www.peeringdb.com/apidocs/#!/ixpfx/ixpfx_list)

---

CLI Example:

```
salt '*' peeringdb.get_ixpfx id=780
salt '*' peeringdb.get_ixpfx city='Milwaukee'
```

`salt.modules.peeringdb.get_net(**kwargs)`

Return the details of a network identified using the search filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible networks registered in PeeringDB. The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/net/net\\_list](https://www.peeringdb.com/apidocs/#!/net/net_list)

---

CLI Example:

```
salt '*' peeringdb.get_net id=4224
salt '*' peeringdb.get_net asn=13335
salt '*' peeringdb.get_net city='Salt Lake City'
salt '*' peeringdb.get_net name__startswith=GTT
```

`salt.modules.peeringdb.get_netfac(**kwargs)`

Return the list of facilities used by a particular network, given the `id` or other filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible network facilities registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/netfac/netfac\\_list](https://www.peeringdb.com/apidocs/#!/netfac/netfac_list)

---

CLI Example:

```
salt '*' peeringdb.get_netfac id=780
salt '*' peeringdb.get_netfac city='Milwaukee'
```

`salt.modules.peeringdb.get_netixlan(**kwargs)`

Return the IP addresses used by a particular network at all the IXs where it is available. The network is selected either via the `id` argument or the other filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible IP addresses, of all networks, at all IXs, registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/netixlan/netixlan\\_list](https://www.peeringdb.com/apidocs/#!/netixlan/netixlan_list)

---

CLI Example:

```
salt '*' peeringdb.get_netixlan asn=13335
salt '*' peeringdb.get_netixlan ipaddr4=185.1.114.25
```

`salt.modules.peeringdb.get_org(**kwargs)`

Return the details of an organisation together with the networks available in this location, using the search filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible organisations registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/org/org\\_list](https://www.peeringdb.com/apidocs/#!/org/org_list)

---

CLI Example:

```
salt '*' peeringdb.get_org id=2
salt '*' peeringdb.get_org city=Duesseldorf
```

`salt.modules.peeringdb.get_poc(**kwargs)`

Return the details of a person of contact together using the search filters specified in the query.

---

**Note:** If no `id` or filter arguments are specified, it will return all the possible contacts registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/poc/poc\\_list](https://www.peeringdb.com/apidocs/#!/poc/poc_list)

---

CLI Example:

```
salt '*' peeringdb.get_poc id=6721
salt '*' peeringdb.get_poc email__contains='@cloudflare.com'
```

### 26.6.337 salt.modules.pf

Control the OpenBSD packet filter (PF).

**codeauthor**

Jasper Lievisse Adriaanse <j@jasper.la>

New in version 2019.2.0.

`salt.modules.pf.disable()`

Disable the Packet Filter.

CLI Example:

```
salt '*' pf.disable
```

`salt.modules.pf.enable()`

Enable the Packet Filter.

CLI Example:

```
salt '*' pf.enable
```

`salt.modules.pf.flush(modifier)`

Flush the specified packet filter parameters.

**modifier:**

Should be one of the following:

- all
- info
- osfp
- rules
- sources
- states
- tables

Please refer to the OpenBSD [pfctl\(8\)](#) documentation for a detailed explanation of each command.

CLI Example:

```
salt '*' pf.flush states
```

`salt.modules.pf.load` (*file*=`/etc/pf.conf`, *noop*=`False`)

Load a ruleset from the specific file, overwriting the currently loaded ruleset.

**file:**

Full path to the file containing the ruleset.

**noop:**

Don't actually load the rules, just parse them.

CLI Example:

```
salt '*' pf.load /etc/pf.conf.d/lockdown.conf
```

`salt.modules.pf.loglevel` (*level*)

Set the debug level which limits the severity of log messages printed by `pf(4)`.

**level:**

Log level. Should be one of the following: `emerg`, `alert`, `crit`, `err`, `warning`, `notice`, `info` or `debug` (OpenBSD); or `none`, `urgent`, `misc`, `loud` (FreeBSD).

CLI Example:

```
salt '*' pf.loglevel emerg
```

`salt.modules.pf.show` (*modifier*)

Show filter parameters.

**modifier:**

Modifier to apply for filtering. Only a useful subset of what `pfctl` supports can be used with Salt.

- `rules`
- `states`
- `tables`

CLI Example:

```
salt '*' pf.show rules
```

`salt.modules.pf.table` (*command*, *table*, *\*\*kwargs*)

Apply a command on the specified table.

**table:**

Name of the table.

**command:**

Command to apply to the table. Supported commands are:

- `add`
- `delete`
- `expire`
- `flush`
- `kill`
- `replace`
- `show`
- `test`
- `zero`

Please refer to the OpenBSD `pfctl(8)` documentation for a detailed explanation of each command.

CLI Example:

```
salt '*' pf.table expire table=spam_hosts number=300
salt '*' pf.table add table=local_hosts addresses='["127.0.0.1", ":::1"]'
```

### 26.6.338 salt.modules.philips\_hue

Philips HUE lamps module for proxy.

New in version 2015.8.3.

### 26.6.339 salt.modules.pillar

Extract the pillar data for this minion

`salt.modules.pillar.data(*args, pillar=None, pillar_enc=None, pillarenv=None, saltenv=None)`

Calls the master for a fresh pillar, generates the pillar data on the fly (same as `items()`)

#### pillar

If specified, allows for a dictionary of pillar data to be made available to pillar and ext\_pillar rendering. these pillar variables will also override any variables of the same name in pillar or ext\_pillar.

#### pillar\_enc

If specified, the data passed in the `pillar` argument will be passed through this renderer to decrypt it.

---

**Note:** This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the [Pillar Encryption](#) documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext\_pillar rendering.

---

#### pillarenv

Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion's `pillarenv` option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

#### saltenv

Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

CLI Examples:

```
salt '*' pillar.data
```

`salt.modules.pillar.ext(external, pillar=None)`

Changed in version 2016.3.6,2016.11.3,2017.7.0: The supported ext\_pillar types are now tunable using the `on_demand_ext_pillar` config option. Earlier releases used a hard-coded default.

Generate the pillar and apply an explicit external pillar

#### external

A single ext\_pillar to add to the ext\_pillar configuration. This must be passed as a single section from the ext\_pillar configuration (see CLI examples below). For more complicated ext\_pillar configurations, it can be helpful to use the Python shell to load YAML configuration into a dictionary, and figure out

```
>>> import salt.utils.yaml
>>> ext_pillar = salt.utils.yaml.safe_load("""
... ext_pillar:
...   - git:
...     - issue38440 https://github.com/terminalmage/git_pillar:
...       - env: base
... """)
>>> ext_pillar
{'ext_pillar': [{'git': [{'mybranch https://github.com/myuser/myrepo
```

(continues on next page)

(continued from previous page)

```

↳': [{'env': 'base'}]]]]}]
>>> ext_pillar['ext_pillar'][0]
{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base
↳'}]]]}

```

In the above example, the value to pass would be `{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]]}]`. Note that this would need to be quoted when passing on the CLI (as in the CLI examples below).

**pillar**

[None] If specified, allows for a dictionary of pillar data to be made available to pillar and `ext_pillar` rendering. These pillar variables will also override any variables of the same name in pillar or `ext_pillar`.

New in version 2015.5.0.

CLI Examples:

```

salt '*' pillar.ext '{libvirt: _}'
salt '*' pillar.ext "'{git': ['master https://github.com/myuser/myrepo']}"
salt '*' pillar.ext "'{git': [{'mybranch https://github.com/myuser/myrepo
↳': [{'env': 'base'}]]}]}"

```

`salt.modules.pillar.fetch`(*key*, *default*=<Constant.NOT\_SET>, *merge*=False, *merge\_nested\_lists*=None, *delimiter*=':', *pillarenv*=None, *saltenv*=None)

New in version 0.14.0.

Attempt to retrieve the named value from *in-memory pillar data*. If the pillar key is not present in the in-memory pillar, then the value specified in the `default` option (described below) will be returned.

If the `merge` parameter is set to `True`, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed as:

```
pkg:apache
```

**key**

The pillar key to get value from

**default**

The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is not specified, then it will be an empty string, unless `pillar_raise_on_missing` is set to `True`, in which case an error will be raised.

**merge**

[False] If `True`, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

**merge\_nested\_lists**

If set to `False`, lists nested within the retrieved pillar dictionary will *overwrite* lists in `default`. If set

to `True`, nested lists will be *merged* into lists in `default`. If unspecified (the default), this option is inherited from the `pillar_merge_lists` minion config option.

---

**Note:** This option is ignored when `merge` is set to `False`.

---

New in version 2016.11.6.

#### **delimiter**

Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

#### **pillarenv**

If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

#### **saltenv**

Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

`salt.modules.pillar.file_exists`(*path*, *saltenv=None*)

New in version 2016.3.0.

This is a master-only function. Calling from the minion is not supported.

Use the given path and search relative to the pillar environments to see if a file exists at that path.

If the `saltenv` argument is given, restrict search to that environment only.

Will only work with `pillar_roots`, not external pillars.

Returns `True` if the file is found, and `False` otherwise.

#### **path**

The path to the file in question. Will be treated as a relative path

#### **saltenv**

Optional argument to restrict the search to a specific `saltenv`

CLI Example:

```
salt '*' pillar.file_exists foo/bar.sls
```

`salt.modules.pillar.filter_by`(*lookup\_dict*, *pillar*, *merge=None*, *default='default'*, *base=None*)

New in version 2017.7.0.

Look up the given pillar in a given dictionary and return the result

#### **Parameters**

- **lookup\_dict** -- A dictionary, keyed by a pillar, containing a value or values relevant to systems matching that pillar. For example, a key could be a pillar for a role and the value could be the name of a package on that particular OS.

The dictionary key can be a globbing pattern. The function will return the corresponding `lookup_dict` value where the pillar value matches the pattern. For example:

```
# this will render 'got some salt' if `role` begins
↳with 'salt'
salt '*' pillar.filter_by '{salt*: got some salt,
↳default: salt is not here}' role
```

- **pillar** -- The name of a pillar to match with the system's pillar. For example, the value of the "role" pillar could be used to pull values from the `lookup_dict` dictionary.

The pillar value can be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

- **merge** -- A dictionary to merge with the results of the pillar selection from `lookup_dict`. This allows another dictionary to override the values in the `lookup_dict`.
- **default** -- default `lookup_dict`'s key used if the pillar does not exist or if the pillar value has no match on `lookup_dict`. If unspecified the value is "default".
- **base** -- A `lookup_dict` key to use for a base dictionary. The pillar-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the pillar selection dictionary and the merge dictionary. Default is unset.

CLI Example:

```
salt '*' pillar.filter_by '{web: Serve it up, db: I query, default: x_x}'
↳role
```

`salt.modules.pillar.get`(*key*, *default*=<Constant.NOT\_SET>, *merge*=False, *merge\_nested\_lists*=None, *delimiter*=':', *pillarenv*=None, *saltenv*=None)

New in version 0.14.0.

Attempt to retrieve the named value from *in-memory pillar data*. If the pillar key is not present in the in-memory pillar, then the value specified in the `default` option (described below) will be returned.

If the `merge` parameter is set to `True`, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed as:

```
pkg:apache
```

**key**

The pillar key to get value from

**default**

The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is not specified, then it will be an empty string, unless `pillar_raise_on_missing` is set to `True`, in which case an error will be raised.

**merge**

[False] If True, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

**merge\_nested\_lists**

If set to False, lists nested within the retrieved pillar dictionary will *overwrite* lists in default. If set to True, nested lists will be *merged* into lists in default. If unspecified (the default), this option is inherited from the `pillar_merge_lists` minion config option.

---

**Note:** This option is ignored when `merge` is set to False.

---

New in version 2016.11.6.

**delimiter**

Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

**pillarenv**

If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

**saltenv**

Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

`salt.modules.pillar.item(*args, default=None, delimiter=None, pillarenv=None, saltenv=None)`

New in version 0.16.2.

Return one or more pillar entries from the *in-memory pillar data*.

**delimiter**

Delimiter used to traverse nested dictionaries.

---

**Note:** This is different from `pillar.get` in that no default value can be specified. `pillar.get` should probably still be used in most cases to retrieve nested pillar values, as it is a bit more flexible. One reason to use this function instead of `pillar.get` however is when it is desirable to retrieve the values of more than one key, since `pillar.get` can only retrieve one key at a time.

---

New in version 2015.8.0.

#### **pillarenv**

If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.6,2018.3.1.

#### **saltenv**

Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.6,2018.3.1.

CLI Examples:

```
salt '*' pillar.item foo
salt '*' pillar.item foo:bar
salt '*' pillar.item foo bar baz
```

`salt.modules.pillar.items(*args, pillar=None, pillar_enc=None, pillarenv=None, saltenv=None)`

Calls the master for a fresh pillar and generates the pillar data on the fly

Contrast with `raw()` which returns the pillar data that is currently loaded into the minion.

#### **pillar**

If specified, allows for a dictionary of pillar data to be made available to pillar and `ext_pillar` rendering. these pillar variables will also override any variables of the same name in pillar or `ext_pillar`.

New in version 2015.5.0.

#### **pillar\_enc**

If specified, the data passed in the `pillar` argument will be passed through this renderer to decrypt it.

---

**Note:** This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the [Pillar Encryption](#) documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/`ext_pillar` rendering.

---

New in version 2017.7.0.

#### **pillarenv**

Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion's `pillarenv` option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

New in version 2016.11.2.

#### **saltenv**

Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

CLI Example:

```
salt '*' pillar.items
```

`salt.modules.pillar.keys(key, delimiter=':')`

New in version 2015.8.0.

Attempt to retrieve a list of keys from the named value from the pillar.

The value can also represent a value in a nested dict using a ":" delimiter for the dict, similar to how `pillar.get` works.

**delimiter**

Specify an alternate delimiter to use when traversing a nested dict

CLI Example:

```
salt '*' pillar.keys web:sites
```

`salt.modules.pillar.ls(*args, pillar=None, pillar_enc=None, pillarenv=None, saltenv=None)`

New in version 2015.8.0.

Calls the master for a fresh pillar, generates the pillar data on the fly (same as `items()`), but only shows the available main keys.

**pillar**

If specified, allows for a dictionary of pillar data to be made available to pillar and `ext_pillar` rendering, these pillar variables will also override any variables of the same name in pillar or `ext_pillar`.

**pillar\_enc**

If specified, the data passed in the `pillar` argument will be passed through this renderer to decrypt it.

---

**Note:** This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the [Pillar Encryption](#) documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/`ext_pillar` rendering.

---

**pillarenv**

Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion's `pillarenv` option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

**saltenv**

Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

CLI Examples:

```
salt '*' pillar.ls
```

`salt.modules.pillar.obfuscate(*args, pillar=None, pillar_enc=None, pillarenv=None, saltenv=None)`

New in version 2015.8.0.

Same as `items()`, but replace pillar values with a simple type indication.

This is useful to avoid displaying sensitive information on console or flooding the console with long output, such as certificates. For many debug or control purposes, the stakes lie more in dispatching than in actual values.

In case the value is itself a collection type, obfuscation occurs within the value. For mapping types, keys are not obfuscated. Here are some examples:

- 'secret password' becomes '<str>'
- ['secret', 1] becomes ['<str>', '<int>']
- {'login': 'somelogin', 'pwd': 'secret'} becomes {'login': '<str>', 'pwd': '<str>'}

CLI Examples:

```
salt '*' pillar.obfuscate
```

`salt.modules.pillar.raw(key=None)`

Return the raw pillar data that is currently loaded into the minion.

Contrast with `items()` which calls the master to fetch the most up-to-date Pillar.

CLI Example:

```
salt '*' pillar.raw
```

With the optional key argument, you can select a subtree of the pillar raw data.:

```
salt '*' pillar.raw key='roles'
```

### 26.6.340 salt.modules.pip

Install Python packages with pip to either the system or a virtualenv

#### Windows Support

New in version 2014.7.4.

Salt now uses a portable python. As a result the entire pip module is now functional on the salt installation itself. You can pip install dependencies for your custom modules. You can even upgrade salt itself using pip. For this to work properly, you must specify the Current Working Directory (`cwd`) and the Pip Binary (`bin_env`) salt should use. The variable `pip_bin` can be either a virtualenv path or the path to the pip binary itself.

For example, the following command will list all software installed using pip to your current salt environment:

```
salt <minion> pip.list cwd='C:\salt\bin\Scripts' bin_env='C:\salt\bin\Scripts\
↳pip.exe'
```

Specifying the `cwd` and `bin_env` options ensures you're modifying the salt environment. If these are omitted, it will default to the local installation of python. If python is not installed locally it will fail saying it couldn't find pip.

#### State File Support

This functionality works in states as well. If you need to pip install colorama with a state, for example, the following will work:

```
install_colorama:
  pip.installed:
    - name: colorama
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - upgrade: True
```

## Upgrading Salt using Pip

You can now update salt using pip to any version from the 2014.7 branch forward. Previous version require recompiling some of the dependencies which is painful in windows.

To do this you just use pip with git to update to the version you want and then restart the service. Here is a sample state file that upgrades salt to the head of the 2015.5 branch:

```
install_salt:
  pip.installed:
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - editable: git+https://github.com/saltstack/salt@2015.5#egg=salt
    - upgrade: True

restart_service:
  service.running:
    - name: salt-minion
    - enable: True
    - watch:
      - pip: install_salt
```

**Note:** If you're having problems, you might try doubling the back slashes. For example, cwd: 'C:\salt\bin\scripts'. Sometimes python thinks the single back slash is an escape character.

There is a known incompatibility between Python2 pip>=10.\* and Salt <=2018.3.0. The issue is described here: <https://github.com/saltstack/salt/issues/46163>

`salt.modules.pip.freeze` (*bin\_env=None*, *user=None*, *cwd=None*, *use\_vt=False*, *env\_vars=None*, *\*\*kwargs*)

Return a list of installed packages either globally or in the specified virtualenv

**bin\_env**

Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`). If a directory path is specified, it is assumed to be a virtualenv.

**user**

The user under which to run pip

**cwd**

Directory from which to run pip

**Note:** If the version of pip available is older than 8.0.3, the list will not include the packages `pip`, `wheel`, `setuptools`, or `distribute` even if they are installed.

CLI Example:

```
salt '*' pip.freeze bin_env=/home/code/path/to/virtualenv
```

```
salt.modules.pip.install(pkgs=None, requirements=None, bin_env=None, use_wheel=False,
                        no_use_wheel=False, log=None, proxy=None, timeout=None, editable=None,
                        find_links=None, index_url=None, extra_index_url=None, no_index=False,
                        mirrors=None, build=None, target=None, download=None,
                        download_cache=None, source=None, upgrade=False, force_reinstall=False,
                        ignore_installed=False, exists_action=None, no_deps=False, no_install=False,
                        no_download=False, global_options=None, install_options=None, user=None,
                        cwd=None, pre_releases=False, cert=None, allow_all_external=False,
                        allow_external=None, allow_unverified=None, process_dependency_links=False,
                        saltenv='base', env_vars=None, use_vt=False, trusted_host=None,
                        no_cache_dir=False, extra_args=None, cache_dir=None, no_binary=None,
                        disable_version_check=False, **kwargs)
```

Install packages with pip

Install packages individually or from a pip requirements file. Install packages globally or to a virtualenv.

**pkgs**

Comma separated list of packages to install

**requirements**

Path to requirements

**bin\_env**

Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.

---

**Note:** For Windows, if the pip module is being used to upgrade the pip package, `bin_env` should be the path to the virtualenv or to the python binary that should be used. The pip command is unable to upgrade itself in Windows.

---

**use\_wheel**

Prefer wheel archives (requires pip>=1.4)

**no\_use\_wheel**

Force to not use wheel archives (requires pip>=1.4,<10.0.0)

**no\_binary**

Force to not use binary packages (requires pip >= 7.0.0) Accepts either `:all:` to disable all binary packages, `:none:` to empty the set, or one or more package names with commas between them

**log**

Log file where a complete (maximum verbosity) record will be kept. If this file doesn't exist and the parent directory is writeable, it will be created.

**proxy**

Specify a proxy in the form `user:passwd@proxy.server:port`. Note that the `user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.

---

**Note:** If the Minion has a globally configured proxy - it will be used even if no proxy was set here. To explicitly disable proxy for pip you should pass `False` as a value.

---

**timeout**

Set the socket timeout (default 15 seconds)

**editable**

install something editable (e.g. `git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed`)

**find\_links**

URL to search for packages

**index\_url**

Base URL of Python Package Index

**extra\_index\_url**

Extra URLs of package indexes to use in addition to `index_url`

**no\_index**

Ignore package index

**mirrors**

Specific mirror URL(s) to query (automatically adds `--use-mirrors`)

**Warning:** This option has been deprecated and removed in pip version 7.0.0. Please use `index_url` and/or `extra_index_url` instead.

**build**

Unpack packages into `build` dir

**target**

Install packages into `target` dir

**download**

Download packages into `download` instead of installing them

**download\_cache | cache\_dir**

Cache downloaded packages in `download_cache` or `cache_dir` dir

**source**

Check out `editable` packages into `source` dir

**upgrade**

Upgrade all packages to the newest available version

**force\_reinstall**

When upgrading, reinstall all packages even if they are already up-to-date.

**ignore\_installed**

Ignore the installed packages (reinstalling instead)

**exists\_action**

Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup

**no\_deps**

Ignore package dependencies

**no\_install**

Download and unpack all packages, but don't actually install them

**no\_download**

Don't download any packages, just install the ones already downloaded (completes an install run with `--no-install`)

**install\_options**

Extra arguments to be supplied to the `setup.py install` command (e.g. like `--install-option='--install-scripts=/usr/local/bin'`). Use multiple `--install-option` options to pass multiple options to `setup.py install`. If you are using an option with a directory path, be sure to use absolute path.

**global\_options**

Extra global options to be supplied to the `setup.py` call before the `install` command.

**user**

The user under which to run `pip`

**cwd**

Directory from which to run `pip`

**pre\_releases**

Include pre-releases in the available versions

**cert**

Provide a path to an alternate CA bundle

**allow\_all\_external**

Allow the installation of all externally hosted files

#### allow\_external

Allow the installation of externally hosted files (comma separated list)

#### allow\_unverified

Allow the installation of insecure and unverifiable files (comma separated list)

#### process\_dependency\_links

Enable the processing of dependency links

#### env\_vars

Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs INCLUDE\_PATH set to pick up a header file while compiling. This must be in the form of a dictionary or a mapping.

Example:

```
salt '*' pip.install django_app env_vars="{ 'CUSTOM_PATH': '/opt/
↳ django_app' }"
```

#### trusted\_host

Mark this host as trusted, even though it does not have valid or any HTTPS.

#### use\_vt

Use VT terminal emulation (see output while installing)

#### no\_cache\_dir

Disable the cache.

#### extra\_args

pip keyword and positional arguments not yet implemented in salt

```
salt '*' pip.install pandas extra_args="[{'--latest-pip-kwarg': 'param
↳'}, '--latest-pip-arg']"
```

**Warning:** If unsupported options are passed here that are not supported in a minion's version of pip, a *No such option error* will be thrown.

Will be translated into the following pip command:

```
pip install pandas --latest-pip-kwarg param --latest-pip-arg
```

#### disable\_version\_check

Pip may periodically check PyPI to determine whether a new version of pip is available to download. Passing True for this option disables that check.

CLI Example:

```
salt '*' pip.install <package name>, <package2 name>
salt '*' pip.install requirements=/path/to/requirements.txt
salt '*' pip.install <package name> bin_env=/path/to/virtualenv
salt '*' pip.install <package name> bin_env=/path/to/pip_bin
```

Complicated CLI Example:

```
salt '*' pip.install markdown, django editable=git+https://
↳ github.com/worldcompany/djangoembed.git#egg=djangoembed upgrade=True no_
↳ deps=True
```

`salt.modules.pip.is_installed` (*pkgname*, *bin\_env=None*, *user=None*, *cwd=None*)

New in version 2018.3.0.

Changed in version 3006.0.

Filter list of installed modules and return True if `pkgrname` exists in the list of packages installed.

CLI Example:

```
salt '*' pip.is_installed salt
```

`salt.modules.pip.list_` (*prefix=None, bin\_env=None, user=None, cwd=None, env\_vars=None, \*\*kwargs*)

Changed in version 3006.0.

Output list of installed apps from `pip list` in JSON format and check to see if `prefix` exists in the list of packages installed.

---

**Note:** If the version of `pip` available is older than 9.0.0, parsing the `freeze` function output will be used to determine the name and version of installed modules.

---

CLI Example:

```
salt '*' pip.list salt
```

`salt.modules.pip.list_all_versions` (*pkg, bin\_env=None, include\_alpha=False, include\_beta=False, include\_rc=False, user=None, cwd=None, index\_url=None, extra\_index\_url=None*)

New in version 2017.7.3.

List all available versions of a pip package

**pkg**

The package to check

**bin\_env**

Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.

**include\_alpha**

Include alpha versions in the list

**include\_beta**

Include beta versions in the list

**include\_rc**

Include release candidates versions in the list

**user**

The user under which to run pip

**cwd**

Directory from which to run pip

**index\_url**

Base URL of Python Package Index .. versionadded:: 2019.2.0

**extra\_index\_url**

Additional URL of Python Package Index .. versionadded:: 2019.2.0

CLI Example:

```
salt '*' pip.list_all_versions <package name>
```

`salt.modules.pip.list_freeze_parse` (*prefix=None, bin\_env=None, user=None, cwd=None, env\_vars=None, \*\*kwargs*)

New in version 3006.0.

Filter list of installed apps from freeze and check to see if `prefix` exists in the list of packages installed.

---

**Note:** If the version of pip available is older than 8.0.3, the packages `wheel`, `setuptools`, and `distribute` will not be reported by this function even if they are installed. Unlike `pip.freeze`, this function always reports the version of pip which is installed.

---

CLI Example:

```
salt '*' pip.list_freeze_parse salt
```

`salt.modules.pip.list_upgrades` (*bin\_env=None, user=None, cwd=None*)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pip.list_upgrades
```

`salt.modules.pip.uninstall` (*pkgs=None, requirements=None, bin\_env=None, log=None, proxy=None, timeout=None, user=None, cwd=None, saltenv='base', use\_vt=False*)

Uninstall packages individually or from a pip requirements file

**pkgs**

comma separated list of packages to install

**requirements**

Path to requirements file

**bin\_env**

Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.

**log**

Log file where a complete (maximum verbosity) record will be kept

**proxy**

Specify a proxy in the format `user:passwd@proxy.server:port`. Note that the `user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.

---

**Note:** If the Minion has a globally configured proxy - it will be used even if no proxy was set here. To explicitly disable proxy for pip you should pass `False` as a value.

---

**timeout**

Set the socket timeout (default 15 seconds)

**user**

The user under which to run pip

**cwd**

Directory from which to run pip

**use\_vt**

Use VT terminal emulation (see output while installing)

CLI Example:

```
salt '*' pip.uninstall <package name>,<package2 name>
salt '*' pip.uninstall requirements=/path/to/requirements.txt
salt '*' pip.uninstall <package name> bin_env=/path/to/virtualenv
salt '*' pip.uninstall <package name> bin_env=/path/to/pip_bin
```

`salt.modules.pip.upgrade` (*bin\_env=None, user=None, cwd=None, use\_vt=False*)

New in version 2015.5.0.

Upgrades outdated pip packages.

---

**Note:** On Windows you can't update salt from pip using salt, so salt will be skipped

---

Returns a dict containing the changes.

```
{<package>: {'old': '<old-version>',
             'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pip.upgrade
```

`salt.modules.pip.upgrade_available` (*pkg, bin\_env=None, user=None, cwd=None*)

New in version 2015.5.0.

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pip.upgrade_available <package name>
```

`salt.modules.pip.version` (*bin\_env=None, cwd=None, user=None*)

New in version 0.17.0.

Returns the version of pip. Use `bin_env` to specify the path to a virtualenv and get the version of pip in that virtualenv.

If unable to detect the pip version, returns None.

Changed in version 3001.1: The `user` parameter was added, to allow specifying the user who runs the version command.

CLI Example:

```
salt '*' pip.version
```

## 26.6.341 salt.modules.pkg\_resource

Resources needed by pkg providers

`salt.modules.pkg_resource.add_pkg` (*pkgs, name, pkgver*)

Add a package to a dict of installed packages.

CLI Example:

```
salt '*' pkg_resource.add_pkg '{} bind 9
```

`salt.modules.pkg_resource.check_extra_requirements` (*pkgname, pkgver*)

Check if the installed package already has the given requirements. This function will return the result of `pkg.check_extra_requirements` if this function exists for the minion, otherwise it will return True.

CLI Example:

```
salt '*' pkg_resource.check_extra_requirements <pkgname> <extra_
→requirements>
```

`salt.modules.pkg_resource.format_pkg_list`(*packages, versions\_as\_list, attr*)

Formats packages according to parameters for `list_pkgs`.

`salt.modules.pkg_resource.format_version`(*epoch, version, release*)

Formats a version string for `list_pkgs`.

`salt.modules.pkg_resource.pack_sources`(*sources, normalize=True*)

Accepts list of dicts (or a string representing a list of dicts) and packs the key/value pairs into a single dict.

'[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.rpm"}]' would become {"foo": "salt://foo.rpm", "bar": "salt://bar.rpm"}

**normalize**

[True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

CLI Example:

```
salt '*' pkg_resource.pack_sources '[{"foo": "salt://foo.rpm"}, {"bar":
→"salt://bar.rpm"}]'
```

`salt.modules.pkg_resource.parse_targets`(*name=None, pkgs=None, sources=None, saltenv='base', normalize=True, \*\*kwargs*)

Parses the input to `pkg.install` and returns back the package(s) to be installed. Returns a list of packages, as well as a string noting whether the packages are to come from a repository or a binary package.

CLI Example:

```
salt '*' pkg_resource.parse_targets
```

`salt.modules.pkg_resource.sort_pkglist`(*pkgs*)

Accepts a dict obtained from `pkg.list_pkgs()` and sorts in place the list of versions for any packages that have multiple versions installed, so that two package lists can be compared to one another.

CLI Example:

```
salt '*' pkg_resource.sort_pkglist '["3.45", "2.13"]'
```

`salt.modules.pkg_resource.stringify`(*pkgs*)

Takes a dict of package name/version information and joins each list of installed versions into a string.

CLI Example:

```
salt '*' pkg_resource.stringify 'vim: 7.127'
```

`salt.modules.pkg_resource.version`(*\*names, \*\*kwargs*)

Common interface for obtaining the version of installed packages.

CLI Example:

```
salt '*' pkg_resource.version vim
salt '*' pkg_resource.version foo bar baz
salt '*' pkg_resource.version 'python*'
```

`salt.modules.pkg_resource.version_clean`(*verstr*)

Clean the version string removing extra data. This function will simply try to call `pkg.version_clean`.

CLI Example:

```
salt '*' pkg_resource.version_clean <version_string>
```

`salt.modules.pkg_resource.version_compare`(*ver1, oper, ver2, ignore\_epoch=False*)

New in version 3001.

Perform a version comparison, using (where available) platform-specific version comparison tools to make the comparison.

**ver1**

The first version to be compared

**oper**

One of ==, !=, >=, <=, >, <

**ver2**

The second version to be compared

---

**Note:** To avoid shell interpretation, each of the above values should be quoted when this function is used on the CLI.

---

**ignore\_epoch**

[False] If True, both package versions will have their epoch prefix stripped before comparison.

This function is useful in Jinja templates, to perform specific actions when a package's version meets certain criteria. For example:

```
{%- set postfix_version = salt.pkg.version('postfix') %}
{%- if postfix_version and salt.pkg_resource.version_compare(postfix_
→version, '>=', '3.3', ignore_epoch=True) %}
  {#- do stuff #}
{%- endif %}
```

CLI Examples:

```
salt myminion pkg_resource.version_compare '3.5' '<=' '2.4'
salt myminion pkg_resource.version_compare '3.5' '<=' '2.4' ignore_
→epoch=True
```

## 26.6.342 salt.modules.pkgin

Package support for pkgin based systems, inspired from freebsd/pkg module

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

`salt.modules.pkgin.available_version(*names, **kwargs)`

This function is an alias of `latest_version`.

Changed in version 2016.3.0.

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

`salt.modules.pkgin.file_dict(*packages, **kwargs)`

Changed in version 2016.3.0.

List the files that belong to a package.

CLI Examples:

```
salt '*' pkg.file_dict nginx
salt '*' pkg.file_dict nginx varnish
```

`salt.modules.pkgin.file_list(package, **kwargs)`

List the files that belong to a package.

CLI Examples:

```
salt '*' pkg.file_list nginx
```

`salt.modules.pkgin.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)`

Install the passed package

**name**

The name of the package to be installed.

**refresh**

Whether or not to refresh the package database before installing.

**fromrepo**

Specify a package repository to install from.

Multiple Package Installation Options:

**pkgs**

A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

**sources**

A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"}, {"bar":
↳ "salt://bar.deb"}]'
```

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

`salt.modules.pkgin.latest_version(*names, **kwargs)`

Changed in version 2016.3.0.

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

`salt.modules.pkgin.list_pkgs(versions_as_list=False, **kwargs)`

Changed in version 2016.3.0.

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.pkgin.list_upgrades(refresh=True, **kwargs)`

List all available package upgrades.

New in version 2018.3.0.

**refresh**

Whether or not to refresh the package database before installing.

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.pkgin.normalize_name(pkgs, **kwargs)`

Normalize package names

---

**Note:** Nothing special to do to normalize, just return the original. (We do need it to be compatible with the pkg\_resource provider.)

---

`salt.modules.pkgin.purge` (*name=None, pkgs=None, \*\*kwargs*)

Package purges are not supported, this function is identical to `remove()`.

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.pkgin.refresh_db` (*force=False, \*\*kwargs*)

Use pkg update to get latest pkg\_summary

**force**

Pass -f so that the cache is always refreshed.

New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.pkgin.remove` (*name=None, pkgs=None, \*\*kwargs*)

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.pkgin.search` (*pkg\_name, \*\*kwargs*)

Searches for an exact match using `pkgin ^package$`

CLI Example:

```
salt '*' pkg.search 'mysql-server'
```

`salt.modules.pkgin.upgrade` (*refresh=True, pkgs=None, \*\*kwargs*)

Run pkg upgrade, if pkgin used. Otherwise do nothing

**refresh**

Whether or not to refresh the package database before installing.

Multiple Package Upgrade Options:

**pkgs**

A list of packages to upgrade from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.upgrade pkgs=['foo','bar']
```

Returns a dictionary containing the changes:

```
{ '<package>': {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.pkgin.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 26.6.343 salt.modules.pkgng

Support for pkgng, the new package manager for FreeBSD

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see [here](#).

---

**Warning:** This module has been completely rewritten. Up to and including version 0.17.x, it was available as the `pkgng` module, (`pkgng.install`, `pkgng.delete`, etc.), but moving forward this module will no longer be available as `pkgng`, as it will behave like a normal Salt `pkg` provider. The documentation below should not be considered to apply to this module in versions `<= 0.17.x`. If your minion is running a 0.17.x release or older, then the documentation for this module can be viewed using the `sys.doc` function:

```
salt bsdminion sys.doc pkgng
```

This module provides an interface to `pkg(8)`. It acts as the default package provider for FreeBSD 10 and newer. For FreeBSD hosts which have been upgraded to use `pkgng`, you will need to override the `pkg` provider by setting the `providers` parameter in your Minion config file, in order to use this module to manage packages, like so:

```
providers:
  pkg: pkgng
```

`salt.modules.pkgng.audit(jail=None, chroot=None, root=None)`

Audits installed packages against known vulnerabilities

CLI Example:

```
salt '*' pkg.audit
```

**jail**

Audit packages within the specified jail

CLI Example:

```
salt '*' pkg.audit jail=<jail name or id>
```

**chroot**

Audit packages within the specified chroot (ignored if jail is specified)

**root**

Audit packages within the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.audit chroot=/path/to/chroot
```

**salt.modules.pkgng.autoremove** (*jail=None, chroot=None, root=None, dryrun=False*)

Delete packages which were automatically installed as dependencies and are not required anymore.

**dryrun**

Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.autoremove
salt '*' pkg.autoremove jail=<jail name or id>
salt '*' pkg.autoremove dryrun=True
salt '*' pkg.autoremove jail=<jail name or id> dryrun=True
```

**salt.modules.pkgng.available\_version** (*\*names, \*\*kwargs*)

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

**salt.modules.pkgng.backup** (*file\_name, jail=None, chroot=None, root=None*)

Export installed packages into yaml+mtree file

CLI Example:

```
salt '*' pkg.backup /tmp/pkg
```

**jail**

Backup packages from the specified jail. Note that this will run the command within the jail, and so the path to the backup file will be relative to the root of the jail

CLI Example:

```
salt '*' pkg.backup /tmp/pkg jail=<jail name or id>
```

**chroot**

Backup packages from the specified chroot (ignored if `jail` is specified). Note that this will run the command within the chroot, and so the path to the backup file will be relative to the root of the chroot.

**root**

Backup packages from the specified root (ignored if `jail` is specified). Note that this will run the command within the root, and so the path to the backup file will be relative to the root of the root.

CLI Example:

```
salt '*' pkg.backup /tmp/pkg chroot=/path/to/chroot
```

`salt.modules.pkgng.check` (*jail=None, chroot=None, root=None, depends=False, recompute=False, checksum=False, checklibs=False*)

Sanity checks installed packages

**jail**

Perform the sanity check in the specified jail

CLI Example:

```
salt '*' pkg.check jail=<jail name or id>
```

**chroot**

Perform the sanity check in the specified chroot (ignored if `jail` is specified)

**root**

Perform the sanity check in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.check chroot=/path/to/chroot
```

Of the below, at least one must be set to `True`.

**depends**

Check for and install missing dependencies.

CLI Example:

```
salt '*' pkg.check depends=True
```

**recompute**

Recompute sizes and checksums of installed packages.

CLI Example:

```
salt '*' pkg.check recompute=True
```

**checksum**

Find invalid checksums for installed packages.

CLI Example:

```
salt '*' pkg.check checksum=True
```

**checklibs**

Regenerates the library dependency metadata for a package.

CLI Example:

```
salt '*' pkg.check checklibs=True
```

`salt.modules.pkgng.clean` (*jail=None, chroot=None, root=None, clean\_all=False, dryrun=False*)

Cleans the local cache of fetched remote packages

CLI Example:

```
salt '*' pkg.clean
```

**jail**

Cleans the package cache in the specified jail

CLI Example:

```
salt '*' pkg.clean jail=<jail name or id>
```

**chroot**

Cleans the package cache in the specified chroot (ignored if `jail` is specified)

**root**

Cleans the package cache in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.clean chroot=/path/to/chroot
```

**clean\_all**

Clean all packages from the local cache (not just those that have been superseded by newer versions).

CLI Example:

```
salt '*' pkg.clean clean_all=True
```

**dryrun**

Dry-run mode. This list of changes to the local cache is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.clean dryrun=True
```

`salt.modules.pkgng.delete` (*name=None, pkgs=None, jail=None, chroot=None, root=None, all\_installed=False, force=False, glob=False, dryrun=False, recurse=False, regex=False, pcre=False, \*\*kwargs*)

This function is an alias of `remove`.

Remove a package from the database and system

---

**Note:** This function can be accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

---

**name**

The package to remove

CLI Example:

```
salt '*' pkg.remove <package name>
```

**jail**

Delete the package from the specified jail

**chroot**

Delete the package from the specified chroot (ignored if `jail` is specified)

**root**

Delete the package from the specified root (ignored if `jail` is specified)

**all\_installed**

Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

```
salt '*' pkg.remove all all_installed=True force=True
```

**force**

Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```
salt '*' pkg.remove <package name> force=True
```

**glob**

Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.remove <package name> glob=True
```

**dryrun**

Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```
salt '*' pkg.remove <package name> dryrun=True
```

**recurse**

Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

**regex**

Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

**pcre**

Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

`salt.modules.pkgng.fetch` (*name*, *jail=None*, *chroot=None*, *root=None*, *fetch\_all=False*, *quiet=False*, *fromrepo=None*, *glob=True*, *regex=False*, *pcre=False*, *local=False*, *depends=False*)

Fetches remote packages

CLI Example:

```
salt '*' pkg.fetch <package name>
```

**jail**

Fetch package in the specified jail

CLI Example:

```
salt '*' pkg.fetch <package name> jail=<jail name or id>
```

**chroot**

Fetch package in the specified chroot (ignored if jail is specified)

**root**

Fetch package in the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.fetch <package name> chroot=/path/to/chroot
```

**fetch\_all**

Fetch all packages.

CLI Example:

```
salt '*' pkg.fetch <package name> fetch_all=True
```

**quiet**

Quiet mode. Show less output.

CLI Example:

```
salt '*' pkg.fetch <package name> quiet=True
```

**fromrepo**

Fetches packages from the given repo if multiple repo support is enabled. See `pkg.conf(5)`.

CLI Example:

```
salt '*' pkg.fetch <package name> fromrepo=repo
```

**glob**

Treat `pkg_name` as a shell glob pattern.

CLI Example:

```
salt '*' pkg.fetch <package name> glob=True
```

**regex**

Treat `pkg_name` as a regular expression.

CLI Example:

```
salt '*' pkg.fetch <regular expression> regex=True
```

**pcre**

Treat `pkg_name` is an extended regular expression.

CLI Example:

```
salt '*' pkg.fetch <extended regular expression> pcre=True
```

**local**

Skip updating the repository catalogs with `pkg-update(8)`. Use the local cache only.

CLI Example:

```
salt '*' pkg.fetch <package name> local=True
```

**depends**

Fetch the package and its dependencies as well.

CLI Example:

```
salt '*' pkg.fetch <package name> depends=True
```

`salt.modules.pkgng.hold`(*name=None, pkgs=None, \*\*kwargs*)

Version-lock packages

---

**Note:** This function is provided primarily for compatibility with some parts of `states.pkg`. Consider using `pkg.lock` instead. instead.

---

**name**

The name of the package to be held.

Multiple Package Options:

**pkgs**

A list of packages to hold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

`salt.modules.pkgng.info`(*\*names, \*\*kwargs*)

This function is an alias of `version`.

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

---

**Note:** This function can accessed using `pkg.info` in addition to `pkg.version`, to more closely match the CLI usage of `pkg(8)`.

---

**jail**

Get package version information for the specified jail

**chroot**

Get package version information for the specified chroot (ignored if `jail` is specified)

**root**

Get package version information for the specified root (ignored if `jail` is specified)

**with\_origin**

[False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.pkgng.install` (*name=None, fromrepo=None, pkgs=None, sources=None, jail=None, chroot=None, root=None, orphan=False, force=False, glob=False, local=False, dryrun=False, quiet=False, reinstall\_requires=False, regex=False, pcre=False, batch=False, \*\*kwargs*)

Install package(s) from a repository

**name**

The name of the package to install

CLI Example:

```
salt '*' pkg.install <package name>
```

**jail**

Install the package into the specified jail

**chroot**

Install the package into the specified chroot (ignored if `jail` is specified)

**root**

Install the package into the specified root (ignored if `jail` is specified)

**orphan**

Mark the installed package as orphan. Will be automatically removed if no other packages depend on them. For more information please refer to `pkg-autoremove(8)`.

CLI Example:

```
salt '*' pkg.install <package name> orphan=True
```

**force**

Force the reinstallation of the package if already installed.

CLI Example:

```
salt '*' pkg.install <package name> force=True
```

**glob**

Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.install <package name> glob=True
```

**local**

Do not update the repository catalogs with `pkg-update(8)`. A value of `True` here is equivalent to using the `-U` flag with `pkg install`.

CLI Example:

```
salt '*' pkg.install <package name> local=True
```

**dryrun**

Dru-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.install <package name> dryrun=True
```

**quiet**

Force quiet output, except when `dryrun` is used, where `pkg install` will always show packages to be installed, upgraded or deleted.

CLI Example:

```
salt '*' pkg.install <package name> quiet=True
```

**reinstall\_requires**

When used with force, reinstalls any packages that require the given package.

CLI Example:

```
salt '*' pkg.install <package name> reinstall_requires=True
↳ force=True
```

Changed in version 2014.7.0: require kwarg renamed to `reinstall_requires`

**fromrepo**

In multi-repo mode, override the `pkg.conf` ordering and only attempt to download packages from the named repository.

CLI Example:

```
salt '*' pkg.install <package name> fromrepo=repo
```

**regex**

Treat the package names as a regular expression

CLI Example:

```
salt '*' pkg.install <regular expression> regex=True
```

**pcre**

Treat the package names as extended regular expressions.

CLI Example:

**batch**

Use `BATCH=true` for `pkg install`, skipping all questions. Be careful when using in production.

CLI Example:

```
salt '*' pkg.install <package name> batch=True
```

`salt.modules.pkgng.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

`salt.modules.pkgng.list_locked(**kwargs)`

Query the package database those packages which are locked against reinstallation, modification or deletion.

Returns returns a list of package names with version strings

CLI Example:

```
salt '*' pkg.list_locked
```

**jail**

List locked packages within the specified jail

CLI Example:

```
salt '*' pkg.list_locked jail=<jail name or id>
```

**chroot**

List locked packages within the specified chroot (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.list_locked chroot=/path/to/chroot
```

**root**

List locked packages within the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.list_locked root=/path/to/chroot
```

`salt.modules.pkgng.list_pkgs` (*versions\_as\_list=False*, *jail=None*, *chroot=None*, *root=None*, *with\_origin=False*, *\*\*kwargs*)

List the packages currently installed as a dict:

```
{ '<package_name>': '<version>' }
```

**jail**

List the packages in the specified jail

**chroot**

List the packages in the specified chroot (ignored if jail is specified)

**root**

List the packages in the specified root (ignored if jail is specified)

**with\_origin**

[False] Return a nested dictionary containing both the origin name and version for each installed package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs jail=<jail name or id>
salt '*' pkg.list_pkgs chroot=/path/to/chroot
```

`salt.modules.pkgng.list_upgrades` (*refresh=True*, *\*\*kwargs*)

List those packages for which an upgrade is available

The `fromrepo` argument is also supported, as used in `pkg` states.

CLI Example:

```
salt '*' pkg.list_upgrades
```

**jail**

List upgrades within the specified jail

CLI Example:

```
salt '*' pkg.list_upgrades jail=<jail name or id>
```

**chroot**

List upgrades within the specified chroot (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.list_upgrades chroot=/path/to/chroot
```

**root**

List upgrades within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.list_upgrades root=/path/to/chroot
```

`salt.modules.pkgng.lock(name, **kwargs)`

Lock the named package against reinstallation, modification or deletion.

Returns True if the named package was successfully locked.

CLI Example:

```
salt '*' pkg.lock <package name>
```

**jail**

Lock packages within the specified jail

CLI Example:

```
salt '*' pkg.lock <package name> jail=<jail name or id>
```

**chroot**

Lock packages within the specified chroot (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.lock <package name> chroot=/path/to/chroot
```

**root**

Lock packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.lock <package name> root=/path/to/chroot
```

`salt.modules.pkgng.locked(name, **kwargs)`

Query the package database to determine if the named package is locked against reinstallation, modification or deletion.

Returns True if the named package is locked, False otherwise.

CLI Example:

```
salt '*' pkg.locked <package name>
```

**jail**

Test if a package is locked within the specified jail

CLI Example:

```
salt '*' pkg.locked <package name> jail=<jail name or id>
```

**chroot**

Test if a package is locked within the specified chroot (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.locked <package name> chroot=/path/to/chroot
```

**root**

Test if a package is locked within the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.locked <package name> root=/path/to/chroot
```

`salt.modules.pkgng.parse_config` (*file\_name='/usr/local/etc/pkg.conf'*)

Return dict of uncommented global variables.

CLI Example:

```
salt '*' pkg.parse_config
```

NOTE: not working properly right now

`salt.modules.pkgng.purge` (*name=None, pkgs=None, jail=None, chroot=None, root=None, all\_installed=False, force=False, glob=False, dryrun=False, recurse=False, regex=False, pcre=False, \*\*kwargs*)

This function is an alias of `remove`.

Remove a package from the database and system

---

**Note:** This function can be accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

---

**name**

The package to remove

CLI Example:

```
salt '*' pkg.remove <package name>
```

**jail**

Delete the package from the specified jail

**chroot**

Delete the package from the specified chroot (ignored if jail is specified)

**root**

Delete the package from the specified root (ignored if jail is specified)

**all\_installed**

Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

```
salt '*' pkg.remove all all_installed=True force=True
```

**force**

Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```
salt '*' pkg.remove <package name> force=True
```

**glob**

Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.remove <package name> glob=True
```

**dryrun**

Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```
salt '*' pkg.remove <package name> dryrun=True
```

**recurse**

Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

**regex**

Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

**pcre**

Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

`salt.modules.pkgng.refresh_db` (*jail=None, chroot=None, root=None, force=False, \*\*kwargs*)

Refresh PACKAGESITE contents

---

**Note:** This function can be accessed using `pkg.update` in addition to `pkg.refresh_db`, to more closely match the CLI usage of `pkg(8)`.

---

CLI Example:

```
salt '*' pkg.refresh_db
```

**jail**

Refresh the pkg database within the specified jail

**chroot**

Refresh the pkg database within the specified chroot (ignored if `jail` is specified)

**root**

Refresh the pkg database within the specified root (ignored if `jail` is specified)

**force**

Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

CLI Example:

```
salt '*' pkg.refresh_db force=True
```

`salt.modules.pkgng.remove` (*name=None, pkgs=None, jail=None, chroot=None, root=None, all\_installed=False, force=False, glob=False, dryrun=False, recurse=False, regex=False, pcre=False, \*\*kwargs*)

Remove a package from the database and system

---

**Note:** This function can be accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

---

**name**

The package to remove

CLI Example:

```
salt '*' pkg.remove <package name>
```

**jail**

Delete the package from the specified jail

**chroot**

Delete the package from the specified chroot (ignored if `jail` is specified)

**root**

Delete the package from the specified root (ignored if `jail` is specified)

**all\_installed**

Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

```
salt '*' pkg.remove all all_installed=True force=True
```

**force**

Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```
salt '*' pkg.remove <package name> force=True
```

**glob**

Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.remove <package name> glob=True
```

**dryrun**

Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```
salt '*' pkg.remove <package name> dryrun=True
```

**recurse**

Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

**regex**

Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

**pcre**

Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

**salt.modules.pkgng.restore** (*file\_name*, *jail=None*, *chroot=None*, *root=None*)

Reads archive created by pkg backup -d and recreates the database.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg
```

**jail**

Restore database to the specified jail. Note that this will run the command within the jail, and so the path to the file from which the pkg database will be restored is relative to the root of the jail.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg jail=<jail name or id>
```

**chroot**

Restore database to the specified chroot (ignored if `jail` is specified). Note that this will run the command within the chroot, and so the path to the file from which the pkg database will be restored is relative to the root of the chroot.

**root**

Restore database to the specified root (ignored if `jail` is specified). Note that this will run the command within the root, and so the path to the file from which the pkg database will be restored is relative to the root of the root.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg chroot=/path/to/chroot
```

**salt.modules.pkgng.search** (*name*, *jail=None*, *chroot=None*, *root=None*, *exact=False*, *glob=False*, *regex=False*, *pcre=False*, *comment=False*, *desc=False*, *full=False*, *depends=False*, *size=False*, *quiet=False*, *origin=False*, *prefix=False*)

Searches in remote package repositories

CLI Example:

```
salt '*' pkg.search pattern
```

**jail**

Perform the search using the `pkg.conf(5)` from the specified jail

CLI Example:

```
salt '*' pkg.search pattern jail=<jail name or id>
```

**chroot**

Perform the search using the `pkg.conf(5)` from the specified chroot (ignored if `jail` is specified)

**root**

Perform the search using the `pkg.conf(5)` from the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.search pattern chroot=/path/to/chroot
```

**exact**

Treat pattern as exact pattern.

CLI Example:

```
salt '*' pkg.search pattern exact=True
```

**glob**

Treat pattern as a shell glob pattern.

CLI Example:

```
salt '*' pkg.search pattern glob=True
```

**regex**

Treat pattern as a regular expression.

CLI Example:

```
salt '*' pkg.search pattern regex=True
```

**pcre**

Treat pattern as an extended regular expression.

CLI Example:

```
salt '*' pkg.search pattern pcre=True
```

**comment**

Search for pattern in the package comment one-line description.

CLI Example:

```
salt '*' pkg.search pattern comment=True
```

**desc**

Search for pattern in the package description.

CLI Example:

```
salt '*' pkg.search pattern desc=True
```

**full**

Displays full information about the matching packages.

CLI Example:

```
salt '*' pkg.search pattern full=True
```

**depends**

Displays the dependencies of pattern.

CLI Example:

```
salt '*' pkg.search pattern depends=True
```

**size**

Displays the size of the package

CLI Example:

```
salt '*' pkg.search pattern size=True
```

#### quiet

Be quiet. Prints only the requested information without displaying many hints.

CLI Example:

```
salt '*' pkg.search pattern quiet=True
```

#### origin

Displays pattern origin.

CLI Example:

```
salt '*' pkg.search pattern origin=True
```

#### prefix

Displays the installation prefix for each package matching pattern.

CLI Example:

```
salt '*' pkg.search pattern prefix=True
```

`salt.modules.pkgng.stats` (*local=False, remote=False, jail=None, chroot=None, root=None, bytes=False*)

Return pkgng stats.

CLI Example:

```
salt '*' pkg.stats
```

#### local

Display stats only for the local package database.

CLI Example:

```
salt '*' pkg.stats local=True
```

#### remote

Display stats only for the remote package database(s).

CLI Example:

```
salt '*' pkg.stats remote=True
```

#### bytes

Display disk space usage in bytes only.

CLI Example:

```
salt '*' pkg.stats bytes=True
```

#### jail

Retrieve stats from the specified jail.

CLI Example:

```
salt '*' pkg.stats jail=<jail name or id>
salt '*' pkg.stats jail=<jail name or id> local=True
salt '*' pkg.stats jail=<jail name or id> remote=True
```

**chroot**

Retrieve stats from the specified chroot (ignored if `jail` is specified).

**root**

Retrieve stats from the specified root (ignored if `jail` is specified).

CLI Example:

```
salt '*' pkg.stats chroot=/path/to/chroot
salt '*' pkg.stats chroot=/path/to/chroot local=True
salt '*' pkg.stats chroot=/path/to/chroot remote=True
```

`salt.modules.pkgng.unhold`(*name=None, pkgs=None, \*\*kwargs*)

Remove version locks

---

**Note:** This function is provided primarily for compatibility with some parts of `states.pkg`. Consider using `pkg.unlock` instead.

---

**name**

The name of the package to be unheld

Multiple Package Options:

**pkgs**

A list of packages to unhold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.pkgng.unlock`(*name, \*\*kwargs*)

Unlock the named package against reinstallation, modification or deletion.

Returns True if the named package was successfully unlocked.

CLI Example:

```
salt '*' pkg.unlock <package name>
```

**jail**

Unlock packages within the specified jail

CLI Example:

```
salt '*' pkg.unlock <package name> jail=<jail name or id>
```

**chroot**

Unlock packages within the specified chroot (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.unlock <package name> chroot=/path/to/chroot
```

**root**

Unlock packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.unlock <package name> root=/path/to/chroot
```

`salt.modules.pkgng.update` (*jail=None, chroot=None, root=None, force=False, \*\*kwargs*)

This function is an alias of `refresh_db`.

Refresh PACKAGESITE contents

---

**Note:** This function can be accessed using `pkg.update` in addition to `pkg.refresh_db`, to more closely match the CLI usage of `pkg(8)`.

---

CLI Example:

```
salt '*' pkg.refresh_db
```

**jail**

Refresh the pkg database within the specified jail

**chroot**

Refresh the pkg database within the specified chroot (ignored if `jail` is specified)

**root**

Refresh the pkg database within the specified root (ignored if `jail` is specified)

**force**

Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

CLI Example:

```
salt '*' pkg.refresh_db force=True
```

`salt.modules.pkgng.update_package_site` (*new\_url*)

Updates remote package repo URL, PACKAGESITE var to be exact.

Must use `http://`, `ftp://`, or `https://` protocol

CLI Example:

```
salt '*' pkg.update_package_site http://127.0.0.1/
```

`salt.modules.pkgng.updating` (*name, jail=None, chroot=None, root=None, filedate=None, filename=None*)

' Displays UPDATING entries of software packages

CLI Example:

```
salt '*' pkg.updating foo
```

**jail**

Perform the action in the specified jail

CLI Example:

```
salt '*' pkg.updating foo jail=<jail name or id>
```

**chroot**

Perform the action in the specified chroot (ignored if `jail` is specified)

**root**

Perform the action in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.update foo chroot=/path/to/chroot
```

**filedate**

Only entries newer than date are shown. Use a YYYYMMDD date format.

CLI Example:

```
salt '*' pkg.update foo filedate=20130101
```

**filename**

Defines an alternative location of the UPDATING file.

CLI Example:

```
salt '*' pkg.update foo filename=/tmp/UPDATING
```

`salt.modules.pkgng.upgrade(*names, **kwargs)`

Upgrade named or all packages (run a `pkg upgrade`). If `<package name>` is omitted, the operation is executed on all packages.

Returns a dictionary containing the changes:

```
{ '<package>': {'old': '<old-version>',  
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade <package name>
```

**jail**

Audit packages within the specified jail

CLI Example:

```
salt '*' pkg.upgrade <package name> jail=<jail name or id>
```

**chroot**

Audit packages within the specified chroot (ignored if `jail` is specified)

**root**

Audit packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.upgrade <package name> chroot=/path/to/chroot
```

Any of the below options can also be used with `jail` or `chroot`.

**force**

Force reinstalling/upgrading the whole set of packages.

CLI Example:

```
salt '*' pkg.upgrade <package name> force=True
```

**local**

Do not update the repository catalogs with `pkg-update(8)`. A value of `True` here is equivalent to using the `-U` flag with `pkg upgrade`.

CLI Example:

```
salt '*' pkg.upgrade <package name> local=True
```

**dryrun**

Dry-run mode: show what packages have updates available, but do not perform any upgrades. Repository catalogs will be updated as usual unless the local option is also given.

CLI Example:

```
salt '*' pkg.upgrade <package name> dryrun=True
```

**fromrepo**

In multi-repo mode, override the pkg.conf ordering and only attempt to upgrade packages from the named repository.

CLI Example:

```
salt '*' pkg.upgrade <package name> fromrepo=repo
```

**fetchonly**

Do not perform installation of packages, merely fetch packages that should be upgraded and detect possible conflicts.

CLI Example:

```
salt '*' pkg.upgrade <package name> fetchonly=True
```

`salt.modules.pkgng.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

---

**Note:** This function can be accessed using `pkg.info` in addition to `pkg.version`, to more closely match the CLI usage of `pkg(8)`.

---

**jail**

Get package version information for the specified jail

**chroot**

Get package version information for the specified chroot (ignored if `jail` is specified)

**root**

Get package version information for the specified root (ignored if `jail` is specified)

**with\_origin**

[False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.pkgng.version_cmp(pkg1, pkg2, ignore_epoch=False, **kwargs)`

Do a cmp-style comparison on two packages. Return -1 if `pkg1 < pkg2`, 0 if `pkg1 == pkg2`, and 1 if `pkg1 > pkg2`. Return None if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '2.1.11' '2.1.12'
```

`salt.modules.pkgng.which`(*path*, *jail=None*, *chroot=None*, *root=None*, *origin=False*, *quiet=False*)

Displays which package installed a specific file

CLI Example:

```
salt '*' pkg.which <file name>
```

**jail**

Perform the check in the specified jail

CLI Example:

```
salt '*' pkg.which <file name> jail=<jail name or id>
```

**chroot**

Perform the check in the specified chroot (ignored if `jail` is specified)

**root**

Perform the check in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.which <file name> chroot=/path/to/chroot
```

**origin**

Shows the origin of the package instead of name-version.

CLI Example:

```
salt '*' pkg.which <file name> origin=True
```

**quiet**

Quiet output.

CLI Example:

```
salt '*' pkg.which <file name> quiet=True
```

### 26.6.344 salt.modules.pkgutil

Pkgutil support for Solaris

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

`salt.modules.pkgutil.available_version`(\*names, \*\*kwargs)

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3>
↪...
```

`salt.modules.pkgutil.install`(*name=None, refresh=False, version=None, pkgs=None, \*\*kwargs*)

Install packages using the pkgutil tool.

CLI Example:

```
salt '*' pkg.install <package_name>
salt '*' pkg.install SMClgcc346
```

Multiple Package Installation Options:

**pkgs**

A list of packages to install from OpenCSW. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['"foo", "bar"']
salt '*' pkg.install pkgs=['"foo", {"bar": "1.2.3"}']
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.pkgutil.latest_version`(*\*names, \*\*kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3> ...
```

`salt.modules.pkgutil.list_pkgs`(*versions\_as\_list=False, \*\*kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.pkgutil.list_upgrades`(*refresh=True, \*\*kwargs*)

List all available package upgrades on this system

CLI Example:

```
salt '*' pkgutil.list_upgrades
```

`salt.modules.pkgutil.purge`(*name=None, pkgs=None, \*\*kwargs*)

Package purges are not supported, this function is identical to `remove()`.

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

**salt.modules.pkgutil.refresh\_db()**

Updates the pkgutil repo database (pkgutil -U)

CLI Example:

```
salt '*' pkgutil.refresh_db
```

**salt.modules.pkgutil.remove**(*name=None, pkgs=None, \*\*kwargs*)

Remove a package and all its dependencies which are not in use by other packages.

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

**salt.modules.pkgutil.upgrade**(*refresh=True*)

Upgrade all of the packages to the latest available version.

Returns a dict containing the changes:

```
{ '<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkgutil.upgrade
```

**salt.modules.pkgutil.upgrade\_available**(*name*)

Check if there is an upgrade available for a certain package

CLI Example:

```
salt '*' pkgutil.upgrade_available CSWpython
```

`salt.modules.pkgutil.version(*names, **kwargs)`

Returns a version if the package is installed, else returns an empty string

CLI Example:

```
salt '*' pkgutil.version CSWpython
```

### 26.6.345 salt.modules.portage\_config

Configure portage(5)

`salt.modules.portage_config.append_to_package_conf(conf, atom="", flags=None, string="", overwrite=False)`

Append a string or a list of flags for a given package or DEPEND atom to a given configuration file.

CLI Example:

```
salt '*' portage_config.append_to_package_conf use string="app-admin/salt\x
→ldap -libvirt"
salt '*' portage_config.append_to_package_conf use atom="> = app-admin/
→salt-0.14.1" flags="['ldap', '-libvirt']"
```

`salt.modules.portage_config.append_use_flags(atom, uses=None, overwrite=False)`

Append a list of use flags for a given package or DEPEND atom

CLI Example:

```
salt '*' portage_config.append_use_flags "app-admin/salt[ldap, -libvirt]"
salt '*' portage_config.append_use_flags ">=app-admin/salt-0.14.1" ["ldap
→', '-libvirt']"
```

`salt.modules.portage_config.enforce_nice_config()`

Enforce a nice tree structure for /etc/portage/package.\* configuration files.

See also:

**salt.modules.ebuild.ex\_mod\_init()**

for information on automatically running this when pkg is used.

CLI Example:

```
salt '*' portage_config.enforce_nice_config
```

`salt.modules.portage_config.filter_flags(use, use_expand_hidden, usemasked, useforced)`

New in version 2015.8.0.

Filter function to remove hidden or otherwise not normally visible USE flags from a list.

@type use: list @param use: the USE flag list to be filtered. @type use\_expand\_hidden: list @param use\_expand\_hidden: list of flags hidden. @type usemasked: list @param usemasked: list of masked USE flags. @type useforced: list @param useforced: the forced USE flags. @rtype: list @return the filtered USE flags.

`salt.modules.portage_config.get_all_cpv_use(cpv)`

New in version 2015.8.0.

Uses portage to determine final USE flags and settings for an emerge.

@type cp: string @param cp: eg cat/pkg @rtype: lists @return use, use\_expand\_hidden, usemask, useforce

`salt.modules.portage_config.get_cleared_flags(cpv)`

New in version 2015.8.0.

Uses portage for compare use flags which is used for installing package and use flags which now exist in `/etc/portage/package.use/`

@type cp: string @param cp: eg cat/pkg @rtype: tuple @rparam: tuple with two lists - list of used flags and list of flags which will be used

`salt.modules.portage_config.get_flags_from_package_conf(conf, atom)`

Get flags for a given package or DEPEND atom. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.get_flags_from_package_conf license salt
```

`salt.modules.portage_config.get_installed_use(cpv, use='USE')`

New in version 2015.8.0.

Gets the installed USE flags from the VARDB.

@type: cp: string @param cp: cat/pkg @type use: string @param use: 1 of ["USE", "PKGUSE"] @rtype list @returns [] or the list of IUSE flags

`salt.modules.portage_config.get_iuse(cpv)`

New in version 2015.8.0.

Gets the current IUSE flags from the tree.

@type: cpv: string @param cpv: cat/pkg @rtype list @returns [] or the list of IUSE flags

`salt.modules.portage_config.get_missing_flags(conf, atom, flags)`

Find out which of the given flags are currently not set.

CLI Example:

```
salt '*' portage_config.get_missing_flags use salt "['ldap', '-libvirt',  
→ 'openssl']"
```

`salt.modules.portage_config.has_flag(conf, atom, flag)`

Verify if the given package or DEPEND atom has the given flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.has_flag license salt Apache-2.0
```

`salt.modules.portage_config.has_use(atom, use)`

Verify if the given package or DEPEND atom has the given use flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.has_use salt libvirt
```

`salt.modules.portage_config.is_changed_uses`(*cp*)

New in version 2015.8.0.

Uses portage for determine if the use flags of installed package is compatible with use flags in portage configs.

@type cp: string @param cp: eg cat/pkg

`salt.modules.portage_config.is_present`(*conf, atom*)

Tell if a given package or DEPEND atom is present in the configuration files tree. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.is_present unmask salt
```

### 26.6.346 salt.modules.postfix

Support for Postfix

This module is currently little more than a config file viewer and editor. It is able to read the `master.cf` file (which is one style) and files in the style of `main.cf` (which is a different style, that is used in multiple postfix configuration files).

The design of this module is such that when files are edited, a minimum of changes are made to them. Each file should look as if it has been edited by hand; order, comments and whitespace are all preserved.

`salt.modules.postfix.delete`(*queue\_id*)

Delete message(s) from the mail queue

CLI Example:

```
salt '*' postfix.delete 5C33CA0DEA
```

```
salt '*' postfix.delete ALL
```

`salt.modules.postfix.hold`(*queue\_id*)

Put message(s) on hold from the mail queue

CLI Example:

```
salt '*' postfix.hold 5C33CA0DEA
```

```
salt '*' postfix.hold ALL
```

`salt.modules.postfix.requeue`(*queue\_id*)

Requeue message(s) in the mail queue

CLI Example:

```
salt '*' postfix.requeue 5C33CA0DEA
```

```
salt '*' postfix.requeue ALL
```

`salt.modules.postfix.set_main(key, value, path='/etc/postfix/main.cf')`

Set a single config value in the main.cf file. If the value does not already exist, it will be appended to the end.

CLI Example:

```
salt <minion> postfix.set_main mailq_path /usr/bin/mailq
```

`salt.modules.postfix.set_master(service, conn_type, private='y', unpriv='y', chroot='y', wakeup='n', maxproc='100', command="", write_conf=True, path='/etc/postfix/master.cf')`

Set a single config value in the master.cf file. If the value does not already exist, it will be appended to the end.

Because of shell parsing issues, '-' cannot be set as a value, as is normal in the master.cf file; either 'y', 'n' or a number should be used when calling this function from the command line. If the value used matches the default, it will internally be converted to a '-'. Calling this function from the Python API is not affected by this limitation

The settings and their default values, in order, are: service (required), conn\_type (required), private (y), unpriv (y), chroot (y), wakeup (n), maxproc (100), command (required).

By default, this function will write out the changes to the master.cf file, and then returns the full contents of the file. By setting the `write_conf` option to `False`, it will skip writing the file.

CLI Example:

```
salt <minion> postfix.set_master smtp inet n y n n 100 smtpd
```

`salt.modules.postfix.show_main(path='/etc/postfix/main.cf')`

Return a dict of active config values. This does not include comments, spacing or order. Bear in mind that order is functionally important in the main.cf file, since keys can be referred to as variables. This means that the data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:

```
salt <minion> postfix.show_main
salt <minion> postfix.show_main path=/path/to/main.cf
```

`salt.modules.postfix.show_master(path='/etc/postfix/master.cf')`

Return a dict of active config values. This does not include comments, spacing or order.

The data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:

```
salt <minion> postfix.show_master
salt <minion> postfix.show_master path=/path/to/master.cf
```

`salt.modules.postfix.show_queue()`

Show contents of the mail queue

CLI Example:

```
salt '*' postfix.show_queue
```

`salt.modules.postfix.unhold(queue_id)`

Set held message(s) in the mail queue to unheld

CLI Example:

```
salt '*' postfix.unhold 5C33CA0DEA
salt '*' postfix.unhold ALL
```

### 26.6.347 salt.modules.postgres

Module to provide Postgres compatibility to salt.

#### configuration

In order to connect to Postgres, certain configuration is required in `/etc/salt/minion` on the relevant minions. Some sample configs might look like:

```
postgres.host: 'localhost'
postgres.port: '5432'
postgres.user: 'postgres' -> db user
postgres.pass: ''
postgres.maintenance_db: 'postgres'
```

The default for the `maintenance_db` is `'postgres'` and in most cases it can be left at the default setting. This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar

To prevent Postgres commands from running arbitrarily long, a timeout (in seconds) can be set

```
postgres.timeout: 60
```

New in version 3006.0.

#### note

This module uses MD5 hashing which may not be compliant with certain security audits.

#### note

When installing postgres from the official postgres repos, on certain linux distributions, either the `psql` or the `initdb` binary is *not* automatically placed on the path. Add a configuration to the location of the postgres bin's path to the relevant minion for this module:

```
postgres.bins_dir: '/usr/pgsql-9.5/bin/'
```

`salt.modules.postgres.available_extensions` (*user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

List available postgresql extensions

CLI Example:

```
salt '*' postgres.available_extensions
```

`salt.modules.postgres.create_extension` (*name, if\_not\_exists=None, schema=None, ext\_version=None, from\_version=None, user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

Install a postgresql extension

CLI Example:

```
salt '*' postgres.create_extension 'adminpack'
```

`salt.modules.postgres.create_metadata`(*name*, *ext\_version=None*, *schema=None*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Get lifecycle information about an extension

CLI Example:

```
salt '*' postgres.create_metadata adminpack
```

`salt.modules.postgres.datadir_exists`(*name*)

New in version 2016.3.0.

Checks if postgres data directory has been initialized

CLI Example:

```
salt '*' postgres.datadir_exists '/var/lib/pgsql/data'
```

**name**

Name of the directory to check

`salt.modules.postgres.datadir_init`(*name*, *auth='password'*, *user=None*, *password=None*, *encoding='UTF8'*, *locale=None*, *waldir=None*, *checksums=False*, *runas=None*)

New in version 2016.3.0.

Initializes a postgres data directory

CLI Example:

```
salt '*' postgres.datadir_init '/var/lib/pgsql/data'
```

**name**

The name of the directory to initialize

**auth**

The default authentication method for local connections

**password**

The password to set for the postgres user

**user**

The database superuser name

**encoding**

The default encoding for new databases

**locale**

The default locale for new databases

**waldir**

The transaction log (WAL) directory (default is to keep WAL inside the data directory)

New in version 2019.2.0.

**checksums**

If True, the cluster will be created with data page checksums.

---

**Note:** Data page checksums are supported since PostgreSQL 9.3.

---

New in version 2019.2.0.

#### runas

The system user the operation should be performed on behalf of

```
salt.modules.postgres.db_alter(name, user=None, host=None, port=None, maintenance_db=None,
                               password=None, tablespace=None, owner=None, owner_recurse=False,
                               runas=None)
```

Change tablespace or/and owner of database.

CLI Example:

```
salt '*' postgres.db_alter dbname owner=otheruser
```

```
salt.modules.postgres.db_create(name, user=None, host=None, port=None, maintenance_db=None,
                                password=None, tablespace=None, encoding=None, lc_collate=None,
                                lc_ctype=None, owner=None, template=None, runas=None)
```

Adds a databases to the Postgres server.

CLI Example:

```
salt '*' postgres.db_create 'dbname'
salt '*' postgres.db_create 'dbname' template=template_postgis
```

```
salt.modules.postgres.db_exists(name, user=None, host=None, port=None, maintenance_db=None,
                                password=None, runas=None)
```

Checks if a database exists on the Postgres server.

CLI Example:

```
salt '*' postgres.db_exists 'dbname'
```

```
salt.modules.postgres.db_list(user=None, host=None, port=None, maintenance_db=None,
                              password=None, runas=None)
```

Return dictionary with information about databases of a Postgres server.

CLI Example:

```
salt '*' postgres.db_list
```

```
salt.modules.postgres.db_remove(name, user=None, host=None, port=None, maintenance_db=None,
                                password=None, runas=None)
```

Removes a databases from the Postgres server.

CLI Example:

```
salt '*' postgres.db_remove 'dbname'
```

```
salt.modules.postgres.drop_extension(name, if_exists=None, restrict=None, cascade=None,
                                     user=None, host=None, port=None, maintenance_db=None,
                                     password=None, runas=None)
```

Drop an installed postgresql extension

CLI Example:

```
salt '*' postgres.drop_extension 'adminpack'
```

`salt.modules.postgres.get_available_extension`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Get info about an available postgresql extension

CLI Example:

```
salt '*' postgres.get_available_extension plpgsql
```

`salt.modules.postgres.get_installed_extension`(*name*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Get info about an installed postgresql extension

CLI Example:

```
salt '*' postgres.get_installed_extension plpgsql
```

`salt.modules.postgres.group_create`(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *createdb=None*, *createroles=None*, *encrypted=None*, *login=None*, *inherit=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Creates a Postgres group. A group in postgres is similar to a user, but cannot login.

CLI Example:

```
salt '*' postgres.group_create 'groupname' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword'
```

`salt.modules.postgres.group_remove`(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *runas=None*)

Removes a group from the Postgres server.

CLI Example:

```
salt '*' postgres.group_remove 'groupname'
```

`salt.modules.postgres.group_update`(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance\_db=None*, *password=None*, *createdb=None*, *createroles=None*, *encrypted=None*, *inherit=None*, *login=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Updates a postgres group

CLI Examples:

```
salt '*' postgres.group_update 'username' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword'
```

`salt.modules.postgres.has_privileges` (*name*, *object\_name*, *object\_type*, *privileges*=None, *grant\_option*=None, *prepend*='public', *maintenance\_db*=None, *user*=None, *host*=None, *port*=None, *password*=None, *runas*=None)

New in version 2016.3.0.

Check if a role has the specified privileges on an object

CLI Example:

```
salt '*' postgres.has_privileges user_name table_name table \
SELECT,INSERT maintenance_db=db_name
```

**name**

Name of the role whose privileges should be checked on *object\_type*

**object\_name**

Name of the object on which the check is to be performed

**object\_type**

The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**privileges**

Comma separated list of privileges to check, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**grant\_option**

If *grant\_option* is set to True, the grant option check is performed

**prepend**

Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

**maintenance\_db**

The database to connect to

**user**

database username if different from config or default

**password**

user password if any password for a specified user

**host**

Database host if different from config or default

**port**

Database port if different from config or default

**runas**

System user all operations should be performed on behalf of

`salt.modules.postgres.installed_extensions` (*user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

List installed postgresql extensions

CLI Example:

```
salt '*' postgres.installed_extensions
```

`salt.modules.postgres.is_available_extension` (*name, user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

Test if a specific extension is available

CLI Example:

```
salt '*' postgres.is_available_extension
```

`salt.modules.postgres.is_installed_extension` (*name, user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

Test if a specific extension is installed

CLI Example:

```
salt '*' postgres.is_installed_extension
```

`salt.modules.postgres.language_create` (*name, maintenance\_db, user=None, host=None, port=None, password=None, runas=None*)

New in version 2016.3.0.

Installs a language into a database

CLI Example:

```
salt '*' postgres.language_create plpgsql dbname
```

**name**

Language to install

**maintenance\_db**

The database to install the language in

**user**

database username if different from config or default

**password**

user password if any password for a specified user

**host**

Database host if different from config or default

**port**

Database port if different from config or default

**runas**

System user all operations should be performed on behalf of

`salt.modules.postgres.language_exists` (*name, maintenance\_db, user=None, host=None, port=None, password=None, runas=None*)

New in version 2016.3.0.

Checks if language exists in a database.

CLI Example:

```
salt '*' postgres.language_exists plpgsql dbname
```

**name**

Language to check for

**maintenance\_db**

The database to check in

**user**

database username if different from config or default

**password**

user password if any password for a specified user

**host**

Database host if different from config or default

**port**

Database port if different from config or default

**runas**

System user all operations should be performed on behalf of

`salt.modules.postgres.language_list` (*maintenance\_db, user=None, host=None, port=None, password=None, runas=None*)

New in version 2016.3.0.

Return a list of languages in a database.

CLI Example:

```
salt '*' postgres.language_list dbname
```

**maintenance\_db**

The database to check

**user**

database username if different from config or default

**password**

user password if any password for a specified user

**host**

Database host if different from config or default

**port**

Database port if different from config or default

**runas**

System user all operations should be performed on behalf of

`salt.modules.postgres.language_remove` (*name, maintenance\_db, user=None, host=None, port=None, password=None, runas=None*)

New in version 2016.3.0.

Removes a language from a database

CLI Example:

```
salt '*' postgres.language_remove plpgsql dbname
```

**name**

Language to remove

**maintenance\_db**

The database to install the language in

**user**

database username if different from config or default

**password**

user password if any password for a specified user

**host**

Database host if different from config or default

**port**

Database port if different from config or default

**runas**

System user all operations should be performed on behalf of

```
salt.modules.postgres.owner_to(dbname, ownername, user=None, host=None, port=None,
                                password=None, runas=None)
```

Set the owner of all schemas, functions, tables, views and sequences to the given username.

CLI Example:

```
salt '*' postgres.owner_to 'dbname' 'username'
```

```
salt.modules.postgres.privileges_grant(name, object_name, object_type, privileges=None,
                                       grant_option=None, prepend='public',
                                       maintenance_db=None, user=None, host=None, port=None,
                                       password=None, runas=None)
```

New in version 2016.3.0.

Grant privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_grant user_name table_name table \
SELECT,UPDATE maintenance_db=db_name
```

**name**

Name of the role to which privileges should be granted

**object\_name**

Name of the object on which the grant is to be performed

**object\_type**

The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**privileges**

Comma separated list of privileges to grant, from the list below:

- INSERT

- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**grant\_option**

If `grant_option` is set to `True`, the recipient of the privilege can in turn grant it to others

**prepend**

Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

**maintenance\_db**

The database to connect to

**user**

database username if different from config or default

**password**

user password if any password for a specified user

**host**

Database host if different from config or default

**port**

Database port if different from config or default

**runas**

System user all operations should be performed on behalf of

```
salt.modules.postgres.privileges_list(name, object_type, prepend='public', maintenance_db=None,
                                         user=None, host=None, port=None, password=None,
                                         runas=None)
```

New in version 2016.3.0.

Return a list of privileges for the specified object.

CLI Example:

```
salt '*' postgres.privileges_list table_name table maintenance_db=db_name
```

**name**

Name of the object for which the permissions should be returned

**object\_type**

The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**prepend**

Table and Sequence object types live under a schema so this should be provided if the object is not under

the default *public* schema

**maintenance\_db**  
The database to connect to

**user**  
database username if different from config or default

**password**  
user password if any password for a specified user

**host**  
Database host if different from config or default

**port**  
Database port if different from config or default

**runas**  
System user all operations should be performed on behalf of

`salt.modules.postgres.privileges_revoke` (*name*, *object\_name*, *object\_type*, *privileges=None*,  
*prepend='public'*, *maintenance\_db=None*, *user=None*,  
*host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Revoke privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_revoke user_name table_name table \  
SELECT,UPDATE maintenance_db=db_name
```

**name**  
Name of the role whose privileges should be revoked

**object\_name**  
Name of the object on which the revoke is to be performed

**object\_type**  
The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**privileges**  
Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**maintenance\_db**  
The database to connect to

**user**  
database username if different from config or default

**password**  
user password if any password for a specified user

**host**  
Database host if different from config or default

**port**  
Database port if different from config or default

**runas**  
System user all operations should be performed on behalf of

`salt.modules.postgres.psycopg_query` (*query, user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None, write=False*)

Run an SQL-Query and return the results as a list. This command only supports SELECT statements. This limitation can be worked around with a query like this:

```
WITH updated AS (UPDATE pg_authid SET rolconnlimit = 2000 WHERE rolname = 'rolename' RETURNING rolconnlimit) SELECT * FROM updated;
```

**query**  
The query string.

**user**  
Database username, if different from config or default.

**host**  
Database host, if different from config or default.

**port**  
Database port, if different from the config or default.

**maintenance\_db**  
The database to run the query against.

**password**  
User password, if different from the config or default.

**runas**  
User to run the command as.

**write**  
Mark query as READ WRITE transaction.

CLI Example:

```
salt '*' postgres.psycopg_query 'select * from pg_stat_activity'
```

`salt.modules.postgres.role_get` (*name, user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None, return\_password=False*)

Return a dict with information about users of a Postgres server.

Set `return_password` to True to get password hash in the result.

CLI Example:

```
salt '*' postgres.role_get postgres
```

`salt.modules.postgres.schema_create` (*dbname, name, owner=None, user=None, db\_user=None, db\_password=None, db\_host=None, db\_port=None*)

Creates a Postgres schema.

CLI Example:

```
salt '*' postgres.schema_create dbname name owner='owner' \
    user='user' \
    db_user='user' db_password='password'
    db_host='hostname' db_port='port'
```

`salt.modules.postgres.schema_exists` (*dbname, name, user=None, db\_user=None, db\_password=None, db\_host=None, db\_port=None*)

Checks if a schema exists on the Postgres server.

CLI Example:

```
salt '*' postgres.schema_exists dbname schemaname
```

**dbname**

Database name we query on

**name**

Schema name we look for

**user**

The system user the operation should be performed on behalf of

**db\_user**

database username if different from config or default

**db\_password**

user password if any password for a specified user

**db\_host**

Database host if different from config or default

**db\_port**

Database port if different from config or default

`salt.modules.postgres.schema_get` (*dbname, name, user=None, db\_user=None, db\_password=None, db\_host=None, db\_port=None*)

Return a dict with information about schemas in a database.

CLI Example:

```
salt '*' postgres.schema_get dbname name
```

**dbname**

Database name we query on

**name**

Schema name we look for

**user**

The system user the operation should be performed on behalf of

**db\_user**

database username if different from config or default

**db\_password**

user password if any password for a specified user

**db\_host**

Database host if different from config or default

**db\_port**

Database port if different from config or default

`salt.modules.postgres.schema_list` (*dbname, user=None, db\_user=None, db\_password=None, db\_host=None, db\_port=None*)

Return a dict with information about schemas in a Postgres database.

CLI Example:

```
salt '*' postgres.schema_list dbname
```

**dbname**

Database name we query on

**user**

The system user the operation should be performed on behalf of

**db\_user**

database username if different from config or default

**db\_password**

user password if any password for a specified user

**db\_host**

Database host if different from config or default

**db\_port**

Database port if different from config or default

```
salt.modules.postgres.schema_remove(dbname, name, user=None, db_user=None, db_password=None,
                                     db_host=None, db_port=None)
```

Removes a schema from the Postgres server.

CLI Example:

```
salt '*' postgres.schema_remove dbname schemaname
```

**dbname**

Database name we work on

**schemaname**

The schema's name we'll remove

**user**

System user all operations should be performed on behalf of

**db\_user**

database username if different from config or default

**db\_password**

user password if any password for a specified user

**db\_host**

Database host if different from config or default

**db\_port**

Database port if different from config or default

```
salt.modules.postgres.tablespace_alter(name, user=None, host=None, port=None,
                                       maintenance_db=None, password=None, new_name=None,
                                       new_owner=None, set_option=None, reset_option=None,
                                       runas=None)
```

Change tablespace name, owner, or options.

CLI Example:

```
salt '*' postgres.tablespace_alter tsname new_owner=otheruser
salt '*' postgres.tablespace_alter index_space new_name=fast_raid
salt '*' postgres.tablespace_alter test set_option="{ 'seq_page_cost': '1.1
→ }'"
salt '*' postgres.tablespace_alter tsname reset_option=seq_page_cost
```

New in version 2015.8.0.

```
salt.modules.postgres.tablespace_create(name, location, options=None, owner=None, user=None,
                                       host=None, port=None, maintenance_db=None,
                                       password=None, runas=None)
```

Adds a tablespace to the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_create tablespacename '/path/datadir'
```

New in version 2015.8.0.

`salt.modules.postgres.tablespace_exists` (*name, user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

Checks if a tablespace exists on the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_exists 'dbname'
```

New in version 2015.8.0.

`salt.modules.postgres.tablespace_list` (*user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

Return dictionary with information about tablespaces of a Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_list
```

New in version 2015.8.0.

`salt.modules.postgres.tablespace_remove` (*name, user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

Removes a tablespace from the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_remove tsname
```

New in version 2015.8.0.

`salt.modules.postgres.user_create` (*username, user=None, host=None, port=None, maintenance\_db=None, password=None, createdb=None, createroles=None, inherit=None, login=None, connlimit=None, encrypted=None, superuser=None, replication=None, rolepassword=None, valid\_until=None, groups=None, runas=None*)

Creates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_create 'username' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword' valid_until='valid_until'
```

`salt.modules.postgres.user_exists` (*name, user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

Checks if a user exists on the Postgres server.

CLI Example:

```
salt '*' postgres.user_exists 'username'
```

`salt.modules.postgres.user_list` (*user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None, return\_password=False*)

Return a dict with information about users of a Postgres server.

Set `return_password` to `True` to get password hash in the result.

CLI Example:

```
salt '*' postgres.user_list
```

`salt.modules.postgres.user_remove` (*username, user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

Removes a user from the Postgres server.

CLI Example:

```
salt '*' postgres.user_remove 'username'
```

`salt.modules.postgres.user_update` (*username, user=None, host=None, port=None, maintenance\_db=None, password=None, createdb=None, createroles=None, encrypted=None, superuser=None, inherit=None, login=None, connlimit=None, replication=None, rolepassword=None, valid\_until=None, groups=None, runas=None*)

Updates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_update 'username' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword' valid_until='valid_until'
```

`salt.modules.postgres.version` (*user=None, host=None, port=None, maintenance\_db=None, password=None, runas=None*)

Return the version of a Postgres server.

CLI Example:

```
salt '*' postgres.version
```

### 26.6.348 salt.modules.poudriere

Support for poudriere

`salt.modules.poudriere.bulk_build` (*jail, pkg\_file, keep=False*)

Run bulk build on poudriere server.

Return number of pkg builds, failures, and errors, on error dump to CLI

CLI Example:

```
salt -N buildbox_group poudriere.bulk_build 90amd64 /root/pkg_list
```

`salt.modules.poudriere.create_jail(name, arch, version='9.0-RELEASE')`

Creates a new poudriere jail if one does not exist

*NOTE* creating a new jail will take some time the master is not hanging

CLI Example:

```
salt '*' poudriere.create_jail 90amd64 amd64
```

`salt.modules.poudriere.create_ports_tree()`

Not working need to run portfetch non interactive

`salt.modules.poudriere.delete_jail(name)`

Deletes poudriere jail with *name*

CLI Example:

```
salt '*' poudriere.delete_jail 90amd64
```

`salt.modules.poudriere.info_jail(name)`

Show information on *name* poudriere jail

CLI Example:

```
salt '*' poudriere.info_jail head-amd64
```

`salt.modules.poudriere.is_jail(name)`

Return True if jail exists False if not

CLI Example:

```
salt '*' poudriere.is_jail <jail name>
```

`salt.modules.poudriere.list_jails()`

Return a list of current jails managed by poudriere

CLI Example:

```
salt '*' poudriere.list_jails
```

`salt.modules.poudriere.list_ports()`

Return a list of current port trees managed by poudriere

CLI Example:

```
salt '*' poudriere.list_ports
```

`salt.modules.poudriere.make_pkgng_aware(jname)`

Make jail *jname* pkgng aware

CLI Example:

```
salt '*' poudriere.make_pkgng_aware <jail name>
```

`salt.modules.poudriere.parse_config(config_file=None)`

Returns a dict of poudriere main configuration definitions

CLI Example:

```
salt '*' poudriere.parse_config
```

`salt.modules.poudriere.update_jail`(*name*)

Run freebsd-update on *name* poudriere jail

CLI Example:

```
salt '*' poudriere.update_jail freebsd:10:x86:64
```

`salt.modules.poudriere.update_ports_tree`(*ports\_tree*)

Updates the ports tree, either the default or the *ports\_tree* specified

CLI Example:

```
salt '*' poudriere.update_ports_tree staging
```

`salt.modules.poudriere.version`()

Return poudriere version

CLI Example:

```
salt '*' poudriere.version
```

### 26.6.349 salt.modules.powerpath

powerpath support.

Assumes RedHat

`salt.modules.powerpath.add_license`(*key*)

Add a license

`salt.modules.powerpath.has_powerpath`()

`salt.modules.powerpath.list_licenses`()

returns a list of applied powerpath license keys

`salt.modules.powerpath.remove_license`(*key*)

Remove a license

### 26.6.350 salt.modules.proxy

This module allows you to manage proxy settings

```
salt '*' network.get_http_proxy
```

`salt.modules.proxy.get_ftp_proxy`(*network\_service*='Ethernet')

Returns the current ftp proxy settings

**network\_service**

The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.get_ftp_proxy Ethernet
```

`salt.modules.proxy.get_http_proxy(network_service='Ethernet')`

Returns the current http proxy settings

**network\_service**

The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.get_http_proxy Ethernet
```

`salt.modules.proxy.get_https_proxy(network_service='Ethernet')`

Returns the current https proxy settings

**network\_service**

The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.get_https_proxy Ethernet
```

`salt.modules.proxy.get_proxy_bypass(network_service='Ethernet')`

Returns the current domains that can bypass the proxy

**network\_service**

The network service to get the bypass domains from, this is only necessary on macOS

CLI Example:

```
salt '*' proxy.get_proxy_bypass
```

`salt.modules.proxy.get_proxy_win()`

Gets all of the proxy settings in one call, only available on Windows

CLI Example:

```
salt '*' proxy.get_proxy_win
```

`salt.modules.proxy.set_ftp_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)`

Sets the ftp proxy settings

**server**

The proxy server to use

**port**

The port used by the proxy server

**user**

The username to use for the proxy server if required

**password**

The password to use if required by the server

**network\_service**

The network service to apply the changes to, this only necessary on macOS

**bypass\_hosts**

The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use `set_proxy_bypass` to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_ftp_proxy example.com 1080 user=proxy_user  
→password=proxy_pass network_service=Ethernet
```

`salt.modules.proxy.set_http_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)`

Sets the http proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using `set_proxy`.

**server**

The proxy server to use

**port**

The port used by the proxy server

**user**

The username to use for the proxy server if required

**password**

The password to use if required by the server

**network\_service**

The network service to apply the changes to, this only necessary on macOS

**bypass\_hosts**

The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use `set_proxy_bypass` to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 user=proxy_user
↳password=proxy_pass network_service=Ethernet
```

`salt.modules.proxy.set_https_proxy`(*server, port, user=None, password=None, network\_service='Ethernet', bypass\_hosts=None*)

Sets the https proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using `set_proxy`.

**server**

The proxy server to use

**port**

The port used by the proxy server

**user**

The username to use for the proxy server if required

**password**

The password to use if required by the server

**network\_service**

The network service to apply the changes to, this only necessary on macOS

**bypass\_hosts**

The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use `set_proxy_bypass` to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_https_proxy example.com 1080 user=proxy_user
↳password=proxy_pass network_service=Ethernet
```

`salt.modules.proxy.set_proxy_bypass`(*domains, network\_service='Ethernet'*)

Sets the domains that can bypass the proxy

**domains**

An array of domains allowed to bypass the proxy

**network\_service**

The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.set_proxy_bypass ["'127.0.0.1', 'localhost']"
```

`salt.modules.proxy.set_proxy_win`(*server, port, types=None, bypass\_hosts=None*)

Sets the http proxy settings, only works with Windows.

**server**

The proxy server to use

**password**

The password to use if required by the server

**types**

The types of proxy connections should be setup with this server. Valid types are:

- http
- https
- ftp

**bypass\_hosts**

The hosts that are allowed to by pass the proxy.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 types="['http', 'https']"
```

### 26.6.351 salt.modules.ps

A salt interface to psutil, a system and process library. See <http://code.google.com/p/psutil>.

**depends**

- python-utmp package (optional)

`salt.modules.ps.boot_time` (*time\_format=None*)

Return the boot time in number of seconds since the epoch began.

CLI Example:

**time\_format**

Optionally specify a `strptime` format string. Use `time_format='%c'` to get a nicely-formatted locale specific date and time (i.e. `Fri May 2 19:08:32 2014`).

New in version 2014.1.4.

```
salt '*' ps.boot_time
```

`salt.modules.ps.cpu_percent` (*interval=0.1, per\_cpu=False*)

Return the percent of time the CPU is busy.

**interval**

the number of seconds to sample CPU usage over

**per\_cpu**

if True return an array of CPU percent busy for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_percent
```

`salt.modules.ps.cpu_times` (*per\_cpu=False*)

Return the percent of time the CPU spends in each state, e.g. user, system, idle, nice, iowait, irq, softirq.

**per\_cpu**

if True return an array of percents for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_times
```

`salt.modules.ps.disk_io_counters(device=None)`

Return disk I/O statistics.

CLI Example:

```
salt '*' ps.disk_io_counters
salt '*' ps.disk_io_counters device=sda1
```

`salt.modules.ps.disk_partition_usage(all=False)`

Return a list of disk partitions plus the mount point, filesystem and usage statistics.

CLI Example:

```
salt '*' ps.disk_partition_usage
```

`salt.modules.ps.disk_partitions(all=False)`

Return a list of disk partitions and their device, mount point, and filesystem type.

**all**

if set to False, only return local, physical partitions (hard disk, USB, CD/DVD partitions). If True, return all filesystems.

CLI Example:

```
salt '*' ps.disk_partitions
```

`salt.modules.ps.disk_usage(path)`

Given a path, return a dict listing the total available space as well as the free space, and used space.

CLI Example:

```
salt '*' ps.disk_usage /home
```

`salt.modules.ps.get_pid_list()`

Return a list of process ids (PIDs) for all running processes.

CLI Example:

```
salt '*' ps.get_pid_list
```

`salt.modules.ps.get_users()`

Return logged-in users.

CLI Example:

```
salt '*' ps.get_users
```

`salt.modules.ps.kill_pid(pid, signal=15)`

Kill a process by PID.

```
salt 'minion' ps.kill_pid pid [signal=signal_number]
```

**pid**

PID of process to kill.

**signal**

Signal to send to the process. See manpage entry for kill for possible values. Default: 15 (SIGTERM).

**Example:**

Send SIGKILL to process with PID 2000:

```
salt 'minion' ps.kill_pid 2000 signal=9
```

**salt.modules.ps.lsof**(*name*)

Retrieve the lsof information of the given process name.

CLI Example:

```
salt '*' ps.lsof apache2
```

**salt.modules.ps.netstat**(*name*)

Retrieve the netstat information of the given process name.

CLI Example:

```
salt '*' ps.netstat apache2
```

**salt.modules.ps.network\_io\_counters**(*interface=None*)

Return network I/O statistics.

CLI Example:

```
salt '*' ps.network_io_counters
salt '*' ps.network_io_counters interface=eth0
```

**salt.modules.ps.num\_cpus**()

Return the number of CPUs.

CLI Example:

```
salt '*' ps.num_cpus
```

**salt.modules.ps.pgrep**(*pattern, user=None, full=False, pattern\_is\_regex=False*)

Return the pids for processes matching a pattern.

If full is true, the full command line is searched for a match, otherwise only the name of the command is searched.

```
salt '*' ps.pgrep pattern [user=username] [full=(true|false)]
```

**pattern**

Pattern to search for in the process list.

**user**

Limit matches to the given username. Default: All users.

**full**

A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

**pattern\_is\_regex**

This flag enables ps.pgrep to mirror the regex search functionality found in the pgrep command line utility.

New in version 3001.

**Examples:**

Find all httpd processes on all 'www' minions:

```
salt 'www.*' ps.pgrep httpd
```

Find all bash processes owned by user 'tom':

```
salt '*' ps.pgrep bash user=tom
```

`salt.modules.ps.pkill` (*pattern*, *user=None*, *signal=15*, *full=False*)

Kill processes matching a pattern.

```
salt '*' ps.pkill pattern [user=username] [signal=signal_number] \
    [full=(true|false)]
```

**pattern**

Pattern to search for in the process list.

**user**

Limit matches to the given username. Default: All users.

**signal**

Signal to send to the process(es). See manpage entry for kill for possible values. Default: 15 (SIGTERM).

**full**

A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

**Examples:**

Send SIGHUP to all httpd processes on all 'www' minions:

```
salt 'www.*' ps.pkill httpd signal=1
```

Send SIGKILL to all bash processes owned by user 'tom':

```
salt '*' ps.pkill bash signal=9 user=tom
```

`salt.modules.ps.proc_info` (*pid*, *attrs=None*)

Return a dictionary of information for a process id (PID).

CLI Example:

```
salt '*' ps.proc_info 2322
salt '*' ps.proc_info 2322 attrs='["pid", "name"]'
```

**pid**

PID of process to query.

**attrs**

Optional list of desired process attributes. The list of possible attributes can be found here: <https://psutil.readthedocs.io/en/latest/#processes>

`salt.modules.ps.psaux` (*name*)

Retrieve information corresponding to a "ps aux" filtered with the given pattern. It could be just a name or a regular expression (using python search from "re" module).

CLI Example:

```
salt '*' ps.psaux www-data.+apache2
```

`salt.modules.ps.ss`(*name*)

Retrieve the ss information of the given process name.

CLI Example:

```
salt '*' ps.ss apache2
```

New in version 2016.11.6.

`salt.modules.ps.status`(*status*)

New in version 3006.0.

Returns a list of processes according to their state.

CLI Example:

```
salt '*' ps.status STATUS
```

where STATUS is one of

- running
- sleeping
- disk\_sleep
- stopped
- tracing\_stop
- zombie
- dead
- wake\_kill
- waking
- parked (Linux)
- idle (Linux, macOS, FreeBSD)
- locked (FreeBSD)
- waiting (FreeBSD)
- suspended (NetBSD)

See <https://psutil.readthedocs.io/en/latest/index.html?highlight=status#process-status-constants>

`salt.modules.ps.swap_memory`()

New in version 2014.7.0.

Return a dict that describes swap memory statistics.

---

**Note:** This function is only available in psutil version 0.6.0 and above.

---

CLI Example:

```
salt '*' ps.swap_memory
```

`salt.modules.ps.top`(*num\_processes=5, interval=3*)

Return a list of top CPU consuming processes during the interval. *num\_processes* = return the top N CPU consuming processes *interval* = the number of seconds to sample CPU usage over

CLI Examples:

```
salt '*' ps.top
salt '*' ps.top 5 10
```

`salt.modules.ps.total_physical_memory()`

Return the total number of bytes of physical memory.

CLI Example:

```
salt '*' ps.total_physical_memory
```

`salt.modules.ps.virtual_memory()`

New in version 2014.7.0.

Return a dict that describes statistics about system memory usage.

---

**Note:** This function is only available in psutil version 0.6.0 and above.

---

CLI Example:

```
salt '*' ps.virtual_memory
```

### 26.6.352 salt.modules.publish

Publish a command from a minion to a target

`salt.modules.publish.full_data(tgt, fun, arg=None, tgt_type='glob', returner="", timeout=5)`

Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:

```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

---

#### Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

---

`salt.modules.publish.publish(tgt, fun, arg=None, tgt_type='glob', returner="", timeout=5, via_master=None)`

Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The `tgt_type` argument is used to pass a target other than a glob into the execution, the available options are:

- glob
- pcre

- grain
- grain\_pcre
- pillar
- pillar\_pcre
- ipcidr
- range
- compound

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Note that for pillar matches must be exact, both in the pillar matcher and the compound matcher. No globbing is supported.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'  
salt system.example.com publish.publish 'os:Fedora' network.interfaces ''  
→grain
```

CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

---

### Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

Multiple keyword arguments should be passed as a list.

```
salt '*' publish.publish test.kwarg arg="['cheese=spam', 'spam=cheese']"
```

---

When running via `salt-call`, the `via_master` flag may be set to specific which master the publication should be sent to. Only one master may be specified. If unset, the publication will be sent only to the first master in minion configuration.

`salt.modules.publish.runner` (*fun*, *arg=None*, *timeout=5*)

Execute a runner on the master and return the data from the runner function

CLI Example:

```
salt publish.runner manage.down
```

### 26.6.353 salt.modules.puppet

Execute puppet routines

**salt.modules.puppet.disable**(*message=None*)

New in version 2014.7.0.

Disable the puppet agent

**message**

New in version 2015.5.2.

Disable message to send to puppet

CLI Example:

```
salt '*' puppet.disable
salt '*' puppet.disable 'Disabled, contact XYZ before enabling'
```

**salt.modules.puppet.enable**()

New in version 2014.7.0.

Enable the puppet agent

CLI Example:

```
salt '*' puppet.enable
```

**salt.modules.puppet.fact**(*name, puppet=False*)

Run facter for a specific fact

CLI Example:

```
salt '*' puppet.fact kernel
```

**salt.modules.puppet.facts**(*puppet=False*)

Run facter and return the results

CLI Example:

```
salt '*' puppet.facts
```

**salt.modules.puppet.noop**(\*args, \*\*kwargs)

Execute a puppet noop run and return a dict with the stderr, stdout, return code, etc. Usage is the same as for puppet.run.

CLI Example:

```
salt '*' puppet.noop
salt '*' puppet.noop tags=basefiles::edit,apache::server
salt '*' puppet.noop debug
salt '*' puppet.noop apply /a/b/manifest.pp modulepath=/a/b/modules
→tags=basefiles::edit,apache::server
```

**salt.modules.puppet.plugin\_sync**()

Runs a plugin sync between the puppet master and agent

CLI Example:

```
salt '*' puppet.plugin_sync
```

`salt.modules.puppet.run(*args, **kwargs)`

Execute a puppet run and return a dict with the stderr, stdout, return code, etc. The first positional argument given is checked as a subcommand. Following positional arguments should be ordered with arguments required by the subcommand first, followed by non-keyword arguments. Tags are specified by a tag keyword and comma separated list of values. -- [http://docs.puppetlabs.com/puppet/latest/reference/lang\\_tags.html](http://docs.puppetlabs.com/puppet/latest/reference/lang_tags.html)

CLI Examples:

```
salt '*' puppet.run
salt '*' puppet.run tags=basefiles::edit,apache::server
salt '*' puppet.run agent onetime no-daemonize no-usecacheonfailure no-
→splay ignorecache
salt '*' puppet.run debug
salt '*' puppet.run apply /a/b/manifest.pp modulepath=/a/b/modules
→tags=basefiles::edit,apache::server
```

`salt.modules.puppet.status()`

New in version 2014.7.0.

Display puppet agent status

CLI Example:

```
salt '*' puppet.status
```

`salt.modules.puppet.summary()`

New in version 2014.7.0.

Show a summary of the last puppet agent run

CLI Example:

```
salt '*' puppet.summary
```

### 26.6.354 salt.modules.purefa

Management of Pure Storage FlashArray

#### Installation Prerequisites

- You will need the purestorage python package in your python installation path that is running salt.

```
pip install purestorage
```

- Configure Pure Storage FlashArray authentication. Use one of the following three methods.

1) From the minion config

```
pure_tags:
fa:
  san_ip: management vip or hostname for the FlashArray
  api_token: A valid api token for the FlashArray being managed
```

2) From environment (PUREFA\_IP and PUREFA\_API)

3) From the pillar (PUREFA\_IP and PUREFA\_API)

**maintainer**

Simon Dodsley ([simon@purestorage.com](mailto:simon@purestorage.com))

**maturity**

new

**requires**

purestorage

**platform**

all

New in version 2018.3.0.

`salt.modules.purefa.hg_create` (*name*, *host=None*, *volume=None*)

Create a hostgroup on a Pure Storage FlashArray.

Will return False if hostgroup already exists, or if named host or volume do not exist.

New in version 2018.3.0.

**name**

[string] name of hostgroup (truncated to 63 characters)

**host**

[string] name of host to add to hostgroup

**volume**

[string] name of volume to add to hostgroup

CLI Example:

```
salt '*' purefa.hg_create foo host=bar volume=vol
```

`salt.modules.purefa.hg_delete` (*name*)

Delete a hostgroup on a Pure Storage FlashArray (removes all volumes and hosts).

Will return False is hostgroup is already in a deleted state.

New in version 2018.3.0.

**name**

[string] name of hostgroup

CLI Example:

```
salt '*' purefa.hg_delete foo
```

`salt.modules.purefa.hg_remove` (*name*, *volume=None*, *host=None*)

Remove a host and/or volume from a hostgroup on a Pure Storage FlashArray.

Will return False is hostgroup does not exist, or named host or volume are not in the hostgroup.

New in version 2018.3.0.

**name**

[string] name of hostgroup

**volume**

[string] name of volume to remove from hostgroup

**host**

[string] name of host to remove from hostgroup

CLI Example:

```
salt '*' purefa.hg_remove foo volume=test host=bar
```

`salt.modules.purefa.hg_update` (*name*, *host=None*, *volume=None*)

Adds entries to a hostgroup on a Pure Storage FlashArray.

Will return False is hostgroup doesn't exist, or host or volume do not exist.

New in version 2018.3.0.

**name**

[string] name of hostgroup

**host**

[string] name of host to add to hostgroup

**volume**

[string] name of volume to add to hostgroup

CLI Example:

```
salt '*' purefa.hg_update foo host=bar volume=vol
```

`salt.modules.purefa.host_create` (*name*, *iqn=None*, *wwn=None*, *nqn=None*)

Add a host on a Pure Storage FlashArray.

Will return False if host already exists, or the iSCSI or Fibre Channel parameters are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.

**name**

[string] name of host (truncated to 63 characters)

**iqn**

[string] iSCSI IQN of host

**nqn**

[string] NVMeF NQN of host .. versionadded:: 3006.0

**wwn**

[string] Fibre Channel WWN of host

CLI Example:

```
salt '*' purefa.host_create foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>'
→nqn='<Valid NQN>'
```

`salt.modules.purefa.host_delete` (*name*)

Delete a host on a Pure Storage FlashArray (detaches all volumes).

Will return False if the host doesn't exist.

New in version 2018.3.0.

**name**

[string] name of host

CLI Example:

```
salt '*' purefa.host_delete foo
```

`salt.modules.purefa.host_update` (*name*, *iqn=None*, *wwn=None*, *nqn=None*)

Update a hosts port definitions on a Pure Storage FlashArray.

Will return False if new port definitions are already in use by another host, or are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.

**name**  
[string] name of host

**nqn**  
[string] Additional NVMeF NQN of host .. versionadded:: 3006.0

**iqn**  
[string] Additional iSCSI IQN of host

**wwn**  
[string] Additional Fibre Channel WWN of host

CLI Example:

```
salt '*' purefa.host_update foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>'
↳nqn='<Valid NQN>'
```

**salt.modules.purefa.pg\_create**(*name, hostgroup=None, host=None, volume=None, enabled=True*)

Create a protection group on a Pure Storage FlashArray.

Will return False is the following cases:

- Protection Grop already exists
- Protection Group in a deleted state
- More than one type is specified - protection groups are for only hostgroups, hosts or volumes
- Named type for protection group does not exist

New in version 2018.3.0.

**name**  
[string] name of protection group

**hostgroup**  
[string] name of hostgroup to add to protection group

**host**  
[string] name of host to add to protection group

**volume**  
[string] name of volume to add to protection group

CLI Example:

```
salt '*' purefa.pg_create foo [hostgroup=foo | host=bar | volume=vol]
↳enabled=[true | false]
```

**salt.modules.purefa.pg\_delete**(*name, eradicate=False*)

Delete a protecton group on a Pure Storage FlashArray.

Will return False if protection group is already in a deleted state.

New in version 2018.3.0.

**name**  
[string] name of protection group

CLI Example:

```
salt '*' purefa.pg_delete foo
```

**salt.modules.purefa.pg\_eradicate**(*name*)

Eradicate a deleted protecton group on a Pure Storage FlashArray.

Will return False if protection group is not in a deleted state.

New in version 2018.3.0.

**name**  
[string] name of protection group

CLI Example:

```
salt '*' purefa.pg_eradicate foo
```

`salt.modules.purefa.pg_remove` (*name*, *hostgroup=None*, *host=None*, *volume=None*)

Remove a hostgroup, host or volume from a protection group on a Pure Storage FlashArray.

**Will return False in the following cases:**

- Protection group does not exist
- Specified type is not currently associated with the protection group

New in version 2018.3.0.

**name**

[string] name of hostgroup

**hostgroup**

[string] name of hostgroup to remove from protection group

**host**

[string] name of host to remove from hostgroup

**volume**

[string] name of volume to remove from hostgroup

CLI Example:

```
salt '*' purefa.pg_remove foo [hostgroup=bar | host=test | volume=bar]
```

`salt.modules.purefa.pg_update` (*name*, *hostgroup=None*, *host=None*, *volume=None*)

Update a protection group on a Pure Storage FlashArray.

**Will return False in the following cases:**

- Protection group does not exist
- Incorrect type selected for current protection group type
- Specified type does not exist

New in version 2018.3.0.

**name**

[string] name of protection group

**hostgroup**

[string] name of hostgroup to add to protection group

**host**

[string] name of host to add to protection group

**volume**

[string] name of volume to add to protection group

CLI Example:

```
salt '*' purefa.pg_update foo [hostgroup=foo | host=bar | volume=vol]
```

`salt.modules.purefa.snap_create` (*name*, *suffix=None*)

Create a volume snapshot on a Pure Storage FlashArray.

Will return False is volume selected to snap does not exist.

New in version 2018.3.0.

**name**

[string] name of volume to snapshot

**suffix**

[string] if specified forces snapshot name suffix. If not specified defaults to timestamp.

CLI Example:

```
salt '*' purefa.snap_create foo
salt '*' purefa.snap_create foo suffix=bar
```

`salt.modules.purefa.snap_delete`(*name*, *suffix=None*, *eradicate=False*)

Delete a volume snapshot on a Pure Storage FlashArray.

Will return False if selected snapshot does not exist.

New in version 2018.3.0.

**name**

[string] name of volume

**suffix**

[string] name of snapshot

**eradicate**

[boolean] Eradicate snapshot after deletion if True. Default is False

CLI Example:

```
salt '*' purefa.snap_delete foo suffix=snap eradicate=True
```

`salt.modules.purefa.snap_eradicate`(*name*, *suffix=None*)

Eradicate a deleted volume snapshot on a Pure Storage FlashArray.

Will return False if snapshot is not in a deleted state.

New in version 2018.3.0.

**name**

[string] name of volume

**suffix**

[string] name of snapshot

CLI Example:

```
salt '*' purefa.snap_eradicate foo suffix=snap
```

`salt.modules.purefa.snap_volume_create`(*name*, *target*, *overwrite=False*)

Create R/W volume from snapshot on a Pure Storage FlashArray.

Will return False if target volume already exists and overwrite is not specified, or selected snapshot doesn't exist.

New in version 2018.3.0.

**name**

[string] name of volume snapshot

**target**

[string] name of clone volume

**overwrite**

[boolean] overwrite clone if already exists (default: False)

CLI Example:

```
salt '*' purefa.snap_volume_create foo.bar clone overwrite=True
```

`salt.modules.purefa.volume_attach`(*name*, *host*)

Attach a volume to a host on a Pure Storage FlashArray.

Host and volume must exist or else will return False.

New in version 2018.3.0.

**name**

[string] name of volume

**host**

[string] name of host

CLI Example:

```
salt '*' purefa.volume_attach foo bar
```

`salt.modules.purefa.volume_clone` (*name*, *target*, *overwrite=False*)

Clone an existing volume on a Pure Storage FlashArray.

Will return False if source volume doesn't exist, or target volume already exists and overwrite not specified.

New in version 2018.3.0.

**name**

[string] name of volume

**target**

[string] name of clone volume

**overwrite**

[boolean] overwrite clone if already exists (default: False)

CLI Example:

```
salt '*' purefa.volume_clone foo bar overwrite=True
```

`salt.modules.purefa.volume_create` (*name*, *size=None*)

Create a volume on a Pure Storage FlashArray.

Will return False if volume already exists.

New in version 2018.3.0.

**name**

[string] name of volume (truncated to 63 characters)

**size**

[string] if specified capacity of volume. If not specified default to 1G. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefa.volume_create foo
salt '*' purefa.volume_create foo size=10T
```

`salt.modules.purefa.volume_delete` (*name*, *eradicate=False*)

Delete a volume on a Pure Storage FlashArray.

Will return False if volume doesn't exist is already in a deleted state.

New in version 2018.3.0.

**name**

[string] name of volume

**eradicate**

[boolean] Eradicate volume after deletion if True. Default is False

CLI Example:

```
salt '*' purefa.volume_delete foo eradicate=True
```

`salt.modules.purefa.volume_detach` (*name*, *host*)

Detach a volume from a host on a Pure Storage FlashArray.

Will return False if either host or volume do not exist, or if selected volume isn't already connected to the host.

New in version 2018.3.0.

**name**

[string] name of volume

**host**

[string] name of host

CLI Example:

```
salt '*' purefa.volume_detach foo bar
```

**salt.modules.purefa.volume\_eradicate**(*name*)

Eradicate a deleted volume on a Pure Storage FlashArray.

Will return False is volume is not in a deleted state.

New in version 2018.3.0.

**name**

[string] name of volume

CLI Example:

```
salt '*' purefa.volume_eradicate foo
```

**salt.modules.purefa.volume\_extend**(*name*, *size*)

Extend an existing volume on a Pure Storage FlashArray.

Will return False if new size is less than or equal to existing size.

New in version 2018.3.0.

**name**

[string] name of volume

**size**

[string] New capacity of volume. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefa.volume_extend foo 10T
```

## 26.6.355 salt.modules.purefb

Management of Pure Storage FlashBlade

### Installation Prerequisites

- You will need the `purity_fb` python package in your python installation path that is running salt.

```
pip install purity_fb
```

- Configure Pure Storage FlashBlade authentication. Use one of the following three methods.

- From the minion config

```
pure_tags:
  fb:
    san_ip: management vip or hostname for the FlashBlade
    api_token: A valid api token for the FlashBlade being managed
```

- From environment (PUREFB\_IP and PUREFB\_API)
- From the pillar (PUREFB\_IP and PUREFB\_API)

**maintainer**Simon Dodsley ([simon@purestorage.com](mailto:simon@purestorage.com))**maturity**

new

**requires**

purity\_fb

**platform**

all

New in version 2019.2.0.

```
salt.modules.purefb.fs_create(name, size=None, proto='NFS', nfs_rules='*(rw,no_root_squash)',
                             snapshot=False)
```

Create a filesystem on a Pure Storage FlashBlade.

Will return False if filesystem already exists.

New in version 2019.2.0.

**name**

[string] name of filesystem (truncated to 63 characters)

**proto**

[string] (Optional) Sharing protocol (NFS, CIFS or HTTP). If not specified default is NFS

**snapshot: boolean**

(Optional) Are snapshots enabled on the filesystem. Default is False

**nfs\_rules**[string] (Optional) export rules for NFS. If not specified default is `*(rw,no_root_squash)`. Refer to Pure Storage documentation for formatting rules.**size**

[string] if specified capacity of filesystem. If not specified default to 32G. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefb.fs_create foo proto=CIFS
salt '*' purefb.fs_create foo size=10T
```

```
salt.modules.purefb.fs_delete(name, eradicate=False)
```

Delete a share on a Pure Storage FlashBlade.

Will return False if filesystem doesn't exist or is already in a deleted state.

New in version 2019.2.0.

**name**

[string] name of filesystem

**eradicate**

[boolean] (Optional) Eradicate filesystem after deletion if True. Default is False

CLI Example:

```
salt '*' purefb.fs_delete foo eradicate=True
```

```
salt.modules.purefb.fs_eradicate(name)
```

Eradicate a deleted filesystem on a Pure Storage FlashBlade.

Will return False is filesystem is not in a deleted state.

New in version 2019.2.0.

**name**  
 [string] name of filesystem  
 CLI Example:

```
salt '*' purefb.fs_eradicate foo
```

`salt.modules.purefb.fs_extend`(*name*, *size*)

Resize an existing filesystem on a Pure Storage FlashBlade.

Will return False if new size is less than or equal to existing size.

New in version 2019.2.0.

**name**  
 [string] name of filesystem  
**size**  
 [string] New capacity of filesystem. Refer to Pure Storage documentation for formatting rules.  
 CLI Example:

```
salt '*' purefb.fs_extend foo 10T
```

`salt.modules.purefb.fs_update`(*name*, *rules*, *snapshot=False*)

Update filesystem on a Pure Storage FlashBlade.

Allows for change of NFS export rules and enabling/disabled of snapshotting capability.

New in version 2019.2.0.

**name**  
 [string] name of filesystem  
**rules**  
 [string] NFS export rules for filesystem Refer to Pure Storage documentation for formatting rules.  
**snapshot: boolean**  
 (Optional) Enable/Disable snapshots on the filesystem. Default is False  
 CLI Example:

```
salt '*' purefb.fs_nfs_update foo rules='10.234.112.23(ro), 10.234.112.
→24(rw)' snapshot=True
```

`salt.modules.purefb.snap_create`(*name*, *suffix=None*)

Create a filesystem snapshot on a Pure Storage FlashBlade.

Will return False if filesystem selected to snap does not exist.

New in version 2019.2.0.

**name**  
 [string] name of filesystem to snapshot  
**suffix**  
 [string] if specified forces snapshot name suffix. If not specified defaults to timestamp.  
 CLI Example:

```
salt '*' purefb.snap_create foo
salt '*' purefb.snap_create foo suffix=bar
```

`salt.modules.purefb.snap_delete`(*name*, *suffix=None*, *eradicate=False*)

Delete a filesystem snapshot on a Pure Storage FlashBlade.

Will return False if selected snapshot does not exist.

New in version 2019.2.0.

**name**  
[string] name of filesystem

**suffix**  
[string] name of snapshot

**eradicate**  
[boolean] Eradicate snapshot after deletion if True. Default is False

CLI Example:

```
salt '*' purefb.snap_delete foo suffix=snap eradicate=True
```

`salt.modules.purefb.snap_eradicate` (*name*, *suffix=None*)  
Eradicate a deleted filesystem snapshot on a Pure Storage FlashBlade.

Will return False if snapshot is not in a deleted state.

New in version 2019.2.0.

**name**  
[string] name of filesystem

**suffix**  
[string] name of snapshot

CLI Example:

```
salt '*' purefb.snap_eradicate foo suffix=snap
```

### 26.6.356 salt.modules.pushbullet

Module for sending messages to Pushbullet (<https://www.pushbullet.com>)

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

```
pushbullet:  
api_key: 'ABC123abc123ABC123abc123ABC123ab'
```

For example:

```
pushbullet:  
device: "Chrome"  
title: "Example push message"  
body: "Message body."
```

`salt.modules.pushbullet.push_note` (*device=None*, *title=None*, *body=None*)

Pushing a text note.

**Parameters**

- **device** -- Pushbullet target device
- **title** -- Note title
- **body** -- Note body

**Returns**

Boolean if message was sent successfully.

CLI Example:

```
salt "*" pushbullet.push_note device="Chrome" title="Example title" body=  
→"Example body."
```

## 26.6.357 salt.modules.pushover\_notify

**Warning:** This module will be removed from Salt in version 3009 in favor of the [pushover Salt Extension](#).

Module for sending messages to Pushover (<https://www.pushover.net>)

New in version 2016.3.0.

### configuration

This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
pushover:
  token: abAHuZyCLtdH8P4zhmFZmgUHUsv1ei8
```

`salt.modules.pushover_notify.post_message` (*user=None, device=None, message=None, title=None, priority=None, expire=None, retry=None, sound=None, api\_version=1, token=None*)

Send a message to a Pushover user or group.

### Parameters

- **user** -- The user or group to send to, must be key of user or group not email address.
- **message** -- The message to send to the PushOver user or group.
- **title** -- Specify who the message is from.
- **priority** -- The priority of the message, defaults to 0.
- **expire** -- The message should expire after N number of seconds.
- **retry** -- The number of times the message should be retried.
- **sound** -- The sound to associate with the message.
- **api\_version** -- The PushOver API version, if not specified in the configuration.
- **token** -- The PushOver token, if not specified in the configuration.

### Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx'
→title='Message from Salt' message='Build is done'

salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx'
→title='Message from Salt' message='Build is done' priority='2' expire=
→'720' retry='5'
```

## 26.6.358 salt.modules.pw\_group

Manage groups on FreeBSD

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info' is not available`), see [here](#).

`salt.modules.pw_group.add` (*name, gid=None, \*\*kwargs*)

Changed in version 3006.0.

Add the specified group

**name**

Name of the new group

**gid**

Use GID for the new group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.pw_group.adduser`(*name*, *username*)

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

`salt.modules.pw_group.chgid`(*name*, *gid*)

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.pw_group.delete`(*name*)

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.pw_group.deluser`(*name*, *username*)

Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

`salt.modules.pw_group.getent`(*refresh=False*)

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.pw_group.info`(*name*)

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.pw_group.members`(*name, members\_list*)

Replaces members of the group with a provided list.

New in version 2015.5.4.

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo'.

foo:x:1234:user1,user2,user3,...

## 26.6.359 salt.modules.pw\_user

Manage users with the pw command

---

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *'user.info' is not available*), see [here](#).

---

`salt.modules.pw_user.add`(*name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname="", roomnumber="", workphone="", homephone="", createhome=True, loginclass=None, \*\*kwargs*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.pw_user.chfullname`(*name, fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

`salt.modules.pw_user.chgid`(*name, gid*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.pw_user.chgroups`(*name, groups, append=False*)

Change the groups to which a user belongs

**name**

Username to modify

**groups**

List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

**append**

[False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

`salt.modules.pw_user.chhome` (*name*, *home*, *persist=False*)

Set a new home directory for an existing user

**name**

Username to modify

**home**

New home directory to set

**persist**

[False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.pw_user.chhomephone` (*name*, *homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo "7735551234"
```

`salt.modules.pw_user.chloginclass` (*name*, *loginclass*, *root=None*)

Change the default login class of the user

New in version 2016.3.5.

CLI Example:

```
salt '*' user.chloginclass foo staff
```

`salt.modules.pw_user.chroomnumber` (*name*, *roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

`salt.modules.pw_user.chshell` (*name*, *shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.pw_user.chuid` (*name*, *uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.pw_user.chworkphone` (*name*, *workphone*)

Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo "7735550123"
```

`salt.modules.pw_user.delete`(*name*, *remove=False*, *force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.pw_user.get_loginclass`(*name*)

Get the login class of the user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.get_loginclass foo
```

`salt.modules.pw_user.getent`(*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.pw_user.info`(*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.pw_user.list_groups`(*name*)

Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.pw_user.list_users`()

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.pw_user.rename`(*name*, *new\_name*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

## 26.6.360 salt.modules.pyenv

Manage python installations with pyenv.

---

**Note:** Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

---

New in version 2014.4.0.

**salt.modules.pyenv.default**(*python=None, runas=None*)

Returns or sets the currently defined default python.

**python=None**

The version to set as the default. Should match one of the versions listed by *pyenv.versions*. Leave blank to return the current default.

CLI Example:

```
salt '*' pyenv.default
salt '*' pyenv.default 2.0.0-p0
```

**salt.modules.pyenv.do**(*cmdline=None, runas=None*)

Execute a python command with pyenv's shims from the user or the system.

CLI Example:

```
salt '*' pyenv.do 'gem list bundler'
salt '*' pyenv.do 'gem list bundler' deploy
```

**salt.modules.pyenv.do\_with\_python**(*python, cmdline, runas=None*)

Execute a python command with pyenv's shims using a specific python version.

CLI Example:

```
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler'
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler' deploy
```

**salt.modules.pyenv.install**(*runas=None, path=None*)

Install pyenv systemwide

CLI Example:

```
salt '*' pyenv.install
```

**salt.modules.pyenv.install\_python**(*python, runas=None*)

Install a python implementation.

**python**

The version of python to install, should match one of the versions listed by *pyenv.list*

CLI Example:

```
salt '*' pyenv.install_python 2.0.0-p0
```

**salt.modules.pyenv.is\_installed**(*runas=None*)

Check if pyenv is installed.

CLI Example:

```
salt '*' pyenv.is_installed
```

`salt.modules.pyenv.list_`(*runas=None*)

List the installable versions of python.

CLI Example:

```
salt '*' pyenv.list
```

`salt.modules.pyenv.rehash`(*runas=None*)

Run pyenv rehash to update the installed shims.

CLI Example:

```
salt '*' pyenv.rehash
```

`salt.modules.pyenv.uninstall_python`(*python, runas=None*)

Uninstall a python implementation.

**python**

The version of python to uninstall. Should match one of the versions listed by `pyenv.versions`

CLI Example:

```
salt '*' pyenv.uninstall_python 2.0.0-p0
```

`salt.modules.pyenv.update`(*runas=None, path=None*)

Updates the current versions of pyenv and python-Build

CLI Example:

```
salt '*' pyenv.update
```

`salt.modules.pyenv.versions`(*runas=None*)

List the installed versions of python.

CLI Example:

```
salt '*' pyenv.versions
```

### 26.6.361 salt.modules.qemu\_img

#### Qemu-img Command Wrapper

The qemu img command is wrapped for specific functions

**depends**

qemu-img

`salt.modules.qemu_img.convert`(*orig, dest, fmt*)

Convert an existing disk image to another format using qemu-img

CLI Example:

```
salt '*' qemu_img.convert /path/to/original.img /path/to/new.img qcow2
```

`salt.modules.qemu_img.make_image(location, size, fmt)`

Create a blank virtual machine image file of the specified size in megabytes. The image can be created in any format supported by qemu

CLI Example:

```
salt '*' qemu_img.make_image /tmp/image.qcow 2048 qcow2
salt '*' qemu_img.make_image /tmp/image.raw 10240 raw
```

### 26.6.362 salt.modules.qemu\_nbd

Qemu Command Wrapper

The qemu system comes with powerful tools, such as qemu-img and qemu-nbd which are used here to build up kvm images.

`salt.modules.qemu_nbd.clear(mnt)`

Pass in the mnt dict returned from `nbd_mount` to unmount and disconnect the image from nbd. If all of the partitions are unmounted return an empty dict, otherwise return a dict containing the still mounted partitions

CLI Example:

```
salt '*' qemu_nbd.clear '{"mnt/foo": "/dev/nbd0p1"}'
```

`salt.modules.qemu_nbd.connect(image)`

Activate nbd for an image file.

CLI Example:

```
salt '*' qemu_nbd.connect /tmp/image.raw
```

`salt.modules.qemu_nbd.init(image, root=None)`

Mount the named image via qemu-nbd and return the mounted roots

CLI Example:

```
salt '*' qemu_nbd.init /srv/image.qcow2
```

`salt.modules.qemu_nbd.mount(nbd, root=None)`

Pass in the nbd connection device location, mount all partitions and return a dict of mount points

CLI Example:

```
salt '*' qemu_nbd.mount /dev/nbd0
```

### 26.6.363 salt.modules.quota

Module for managing quotas on POSIX-like systems.

`salt.modules.quota.get_mode(device)`

Report whether the quota system for this device is on or off

CLI Example:

```
salt '*' quota.get_mode
```

`salt.modules.quota.off(device)`

Turns off the quota system

CLI Example:

```
salt '*' quota.off
```

`salt.modules.quota.on(device)`

Turns on the quota system

CLI Example:

```
salt '*' quota.on
```

`salt.modules.quota.report(mount)`

Report on quotas for a specific volume

CLI Example:

```
salt '*' quota.report /media/data
```

`salt.modules.quota.set_(device, **kwargs)`

Calls out to setquota, for a specific user or group

CLI Example:

```
salt '*' quota.set /media/data user=larry block-soft-limit=1048576
salt '*' quota.set /media/data group=painters file-hard-limit=1000
```

`salt.modules.quota.stats()`

Runs the quotastats command, and returns the parsed output

CLI Example:

```
salt '*' quota.stats
```

`salt.modules.quota.warn()`

Runs the warnquota command, to send warning emails to users who are over their quota limit.

CLI Example:

```
salt '*' quota.warn
```

### 26.6.364 salt.modules.rabbitmq

Module to provide RabbitMQ compatibility to Salt. Todo: A lot, need to add cluster support, logging, and minion configuration data.

`salt.modules.rabbitmq.add_user(name, password=None, runas=None)`

Add a rabbitMQ user via rabbitmqctl user\_add <user> <password>

CLI Example:

```
salt '*' rabbitmq.add_user rabbit_user password
```

`salt.modules.rabbitmq.add_vhost` (*vhost*, *runas=None*)

Adds a vhost via `rabbitmqctl add_vhost`.

CLI Example:

```
salt '*' rabbitmq add_vhost '<vhost_name>'
```

`salt.modules.rabbitmq.change_password` (*name*, *password*, *runas=None*)

Changes a user's password.

CLI Example:

```
salt '*' rabbitmq.change_password rabbit_user password
```

`salt.modules.rabbitmq.check_password` (*name*, *password*, *runas=None*)

New in version 2016.3.0.

Checks if a user's password is valid.

CLI Example:

```
salt '*' rabbitmq.check_password rabbit_user password
```

`salt.modules.rabbitmq.clear_password` (*name*, *runas=None*)

Removes a user's password.

CLI Example:

```
salt '*' rabbitmq.clear_password rabbit_user
```

`salt.modules.rabbitmq.cluster_status` (*runas=None*)

return `rabbitmq cluster_status`

CLI Example:

```
salt '*' rabbitmq.cluster_status
```

`salt.modules.rabbitmq.delete_policy` (*vhost*, *name*, *runas=None*)

Delete a policy based on `rabbitmqctl clear_policy`.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.delete_policy / HA
```

`salt.modules.rabbitmq.delete_upstream` (*name*, *runas=None*)

Deletes an upstream via `rabbitmqctl clear_parameter`.

**Parameters**

- **name** (*str*) -- The name of the upstream to delete.
- **runas** (*str*) -- The name of the user to run the command as.

CLI Example:

```
salt '*' rabbitmq.delete_upstream upstream_name
```

New in version 3000.

`salt.modules.rabbitmq.delete_user`(*name*, *runas=None*)

Deletes a user via rabbitmqctl delete\_user.

CLI Example:

```
salt '*' rabbitmq.delete_user rabbit_user
```

`salt.modules.rabbitmq.delete_vhost`(*vhost*, *runas=None*)

Deletes a vhost rabbitmqctl delete\_vhost.

CLI Example:

```
salt '*' rabbitmq.delete_vhost '<vhost_name>'
```

`salt.modules.rabbitmq.disable_plugin`(*name*, *runas=None*)

Disable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:

```
salt '*' rabbitmq.disable_plugin foo
```

`salt.modules.rabbitmq.enable_plugin`(*name*, *runas=None*)

Enable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:

```
salt '*' rabbitmq.enable_plugin foo
```

`salt.modules.rabbitmq.force_reset`(*runas=None*)

Forcefully Return a RabbitMQ node to its virgin state

CLI Example:

```
salt '*' rabbitmq.force_reset
```

`salt.modules.rabbitmq.join_cluster`(*host*, *user='rabbit'*, *ram\_node=None*, *runas=None*)

Join a rabbit cluster

CLI Example:

```
salt '*' rabbitmq.join_cluster rabbit.example.com rabbit
```

`salt.modules.rabbitmq.list_available_plugins`(*runas=None*)

Returns a list of the names of all available plugins (enabled and disabled).

CLI Example:

```
salt '*' rabbitmq.list_available_plugins
```

`salt.modules.rabbitmq.list_enabled_plugins`(*runas=None*)

Returns a list of the names of the enabled plugins.

CLI Example:

```
salt '*' rabbitmq.list_enabled_plugins
```

`salt.modules.rabbitmq.list_permissions` (*vhost*, *runas=None*)

Lists permissions for vhost via rabbitmqctl list\_permissions

CLI Example:

```
salt '*' rabbitmq.list_permissions /myvhost
```

`salt.modules.rabbitmq.list_policies` (*vhost='/'*, *runas=None*)

Return a dictionary of policies nested by vhost and name based on the data returned from rabbitmqctl list\_policies.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.list_policies
```

`salt.modules.rabbitmq.list_queues` (*runas=None*, *\*args*)

Returns queue details of the / virtual host

CLI Example:

```
salt '*' rabbitmq.list_queues messages consumers
```

`salt.modules.rabbitmq.list_queues_vhost` (*vhost*, *runas=None*, *\*args*)

Returns queue details of specified virtual host. This command will consider first parameter as the vhost name and rest will be treated as queueinfoitem. For getting details on vhost /, use `list_queues` instead).

CLI Example:

```
salt '*' rabbitmq.list_queues messages consumers
```

`salt.modules.rabbitmq.list_upstreams` (*runas=None*)

Returns a dict of upstreams based on rabbitmqctl list\_parameters.

**Parameters**

**runas** (*str*) -- The name of the user to run this command as.

CLI Example:

```
salt '*' rabbitmq.list_upstreams
```

New in version 3000.

`salt.modules.rabbitmq.list_user_permissions` (*name*, *runas=None*)

List permissions for a user via rabbitmqctl list\_user\_permissions

CLI Example:

```
salt '*' rabbitmq.list_user_permissions user
```

`salt.modules.rabbitmq.list_users` (*runas=None*)

Return a list of users based off of rabbitmqctl user\_list.

CLI Example:

```
salt '*' rabbitmq.list_users
```

`salt.modules.rabbitmq.list_vhosts` (*runas=None*)

Return a list of vhost based on rabbitmqctl list\_vhosts.

CLI Example:

```
salt '*' rabbitmq.list_vhosts
```

`salt.modules.rabbitmq.plugin_is_enabled` (*name, runas=None*)

Return whether the plugin is enabled.

CLI Example:

```
salt '*' rabbitmq.plugin_is_enabled rabbitmq_plugin_name
```

`salt.modules.rabbitmq.policy_exists` (*vhost, name, runas=None*)

Return whether the policy exists based on rabbitmqctl list\_policies.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.policy_exists / HA
```

`salt.modules.rabbitmq.reset` (*runas=None*)

Return a RabbitMQ node to its virgin state

CLI Example:

```
salt '*' rabbitmq.reset
```

`salt.modules.rabbitmq.set_permissions` (*vhost, user, conf='.\*', write='.\*', read='.\*', runas=None*)

Sets permissions for vhost via rabbitmqctl set\_permissions

CLI Example:

```
salt '*' rabbitmq.set_permissions myvhost myuser
```

`salt.modules.rabbitmq.set_policy` (*vhost, name, pattern, definition, priority=None, runas=None, apply\_to=None*)

Set a policy based on rabbitmqctl set\_policy.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.set_policy / HA '.*' '{"ha-mode":"all"}'
```

`salt.modules.rabbitmq.set_upstream` (*name, uri, prefetch\_count=None, reconnect\_delay=None, ack\_mode=None, trust\_user\_id=None, exchange=None, max\_hops=None, expires=None, message\_ttl=None, ha\_policy=None, queue=None, runas=None*)

Configures an upstream via rabbitmqctl set\_parameter. This can be an exchange-upstream, a queue-upstream or both.

**Parameters**

**name** (*str*) -- The name of the upstream to configure.

The following parameters apply to federated exchanges and federated queues:

**Parameters**

- **uri** (*str*) -- The AMQP URI(s) for the upstream.
- **prefetch\_count** (*int*) -- The maximum number of unacknowledged messages copied over a link at any one time. Default: 1000
- **reconnect\_delay** (*int*) -- The duration (in seconds) to wait before reconnecting to the broker after being disconnected. Default: 1
- **ack\_mode** (*str*) -- Determines how the link should acknowledge messages. If set to `on-confirm` (the default), messages are acknowledged to the upstream broker after they have been confirmed downstream. This handles network errors and broker failures without losing messages, and is the slowest option. If set to `on-publish`, messages are acknowledged to the upstream broker after they have been published downstream. This handles network errors without losing messages, but may lose messages in the event of broker failures. If set to `no-ack`, message acknowledgements are not used. This is the fastest option, but may lose messages in the event of network or broker failures.
- **trust\_user\_id** (*bool*) -- Determines how federation should interact with the validated user-id feature. If set to true, federation will pass through any validated user-id from the upstream, even though it cannot validate it itself. If set to false or not set, it will clear any validated user-id it encounters. You should only set this to true if you trust the upstream server (and by extension, all its upstreams) not to forge user-ids.

The following parameters apply to federated exchanges only:

#### Parameters

- **exchange** (*str*) -- The name of the upstream exchange. Default is to use the same name as the federated exchange.
- **max\_hops** (*int*) -- The maximum number of federation links that a message published to a federated exchange can traverse before it is discarded. Default is 1. Note that even if max-hops is set to a value greater than 1, messages will never visit the same node twice due to travelling in a loop. However, messages may still be duplicated if it is possible for them to travel from the source to the destination via multiple routes.
- **expires** (*int*) -- The expiry time (in milliseconds) after which an upstream queue for a federated exchange may be deleted, if a connection to the upstream broker is lost. The default is 'none', meaning the queue should never expire. This setting controls how long the upstream queue will last before it is eligible for deletion if the connection is lost. This value is used to set the "x-expires" argument for the upstream queue.
- **message\_ttl** (*int*) -- The expiry time for messages in the upstream queue for a federated exchange (see expires), in milliseconds. Default is `NONE`, meaning messages should never expire. This does not apply to federated queues. This value is used to set the "x-message-ttl" argument for the upstream queue.
- **ha\_policy** (*str*) -- Determines the "x-ha-policy" argument for the upstream queue for a federated exchange (see expires). This is only of interest when connecting to old brokers which determine queue HA mode using this argument. Default is `NONE`, meaning the queue is not HA.

The following parameter applies to federated queues only:

#### Parameters

- **queue** (*str*) -- The name of the upstream queue. Default is to use the same name as the federated queue.
- **runas** (*str*) -- The name of the user to run the command as.

CLI Example:

```
salt '*' rabbitmq.set_upstream upstream_name ack_mode=on-confirm max_
→hops=1 trust_user_id=True uri=amqp://hostname
```

New in version 3000.

`salt.modules.rabbitmq.set_user_tags` (*name*, *tags*, *runas=None*)

Add user tags via rabbitmqctl set\_user\_tags

CLI Example:

```
salt '*' rabbitmq.set_user_tags myadmin administrator
```

`salt.modules.rabbitmq.start_app` (*runas=None*)

Start the RabbitMQ application.

CLI Example:

```
salt '*' rabbitmq.start_app
```

`salt.modules.rabbitmq.status` (*runas=None*)

return rabbitmq status

CLI Example:

```
salt '*' rabbitmq.status
```

`salt.modules.rabbitmq.stop_app` (*runas=None*)

Stops the RabbitMQ application, leaving the Erlang node running.

CLI Example:

```
salt '*' rabbitmq.stop_app
```

`salt.modules.rabbitmq.upstream_exists` (*name*, *runas=None*)

Return whether the upstreamexists based on rabbitmqctl list\_parameters.

**Parameters**

- **name** (*str*) -- The name of the upstream to check for.
- **runas** (*str*) -- The name of the user to run the command as.

CLI Example:

```
salt '*' rabbitmq.upstream_exists rabbit_upstream
```

New in version 3000.

`salt.modules.rabbitmq.user_exists` (*name*, *runas=None*)

Return whether the user exists based on rabbitmqctl list\_users.

CLI Example:

```
salt '*' rabbitmq.user_exists rabbit_user
```

`salt.modules.rabbitmq.vhost_exists` (*name*, *runas=None*)

Return whether the vhost exists based on rabbitmqctl list\_vhosts.

CLI Example:

```
salt '*' rabbitmq.vhost_exists rabbit_host
```

## 26.6.365 salt.modules.rallydev

Support for RallyDev

New in version 2015.8.0.

Requires a username and a password in /etc/salt/minion:

```
rallydev:  
  username: myuser@example.com  
  password: 123pass
```

`salt.modules.rallydev.list_items(name)`

List items of a particular type

CLI Examples:

```
salt myminion rallydev.list_<item name>s  
salt myminion rallydev.list_users  
salt myminion rallydev.list_artifacts
```

`salt.modules.rallydev.list_users()`

List the users

CLI Example:

```
salt myminion rallydev.list_users
```

`salt.modules.rallydev.query_item(name, query_string, order='Rank')`

Query a type of record for one or more items. Requires a valid query string. See <https://rally1.rallydev.com/slm/doc/webservice/introduction.jsp> for information on query syntax.

CLI Example:

```
salt myminion rallydev.query_<item name> <query string> [<order>]  
salt myminion rallydev.query_task '(Name contains github)'  
salt myminion rallydev.query_task '(Name contains reactor)' Rank
```

`salt.modules.rallydev.query_user(query_string, order='UserName')`

Update a user

CLI Example:

```
salt myminion rallydev.query_user '(Name contains Jo)'
```

`salt.modules.rallydev.show_artifact(id_)`

Show an artifact

CLI Example:

```
salt myminion rallydev.show_artifact <artifact id>
```

`salt.modules.rallydev.show_item(name, id_)`

Show an item

CLI Example:

```
salt myminion rallydev.show_<item name> <item id>
```

`salt.modules.rallydev.show_user`(*id\_*)

Show a user

CLI Example:

```
salt myminion rallydev.show_user <user id>
```

`salt.modules.rallydev.update_item`(*name, id\_, field=None, value=None, postdata=None*)

Update an item. Either a field and a value, or a chunk of POST data, may be used, but not both.

CLI Example:

```
salt myminion rallydev.update_<item name> <item id> field=<field> value=
-><value>
salt myminion rallydev.update_<item name> <item id> postdata=<post data>
```

`salt.modules.rallydev.update_user`(*id\_, field, value*)

Update a user

CLI Example:

```
salt myminion rallydev.update_user <user id> <field> <new value>
```

## 26.6.366 salt.modules.random\_org

Module for retrieving random information from Random.org

New in version 2015.5.0.

### configuration

This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
random_org:
  api_key: 7be1402d-5719-5bd3-a306-3def9f135da5
  api_version: 1
```

`salt.modules.random_org.generateBlobs`(*api\_key=None, api\_version=None, \*\*kwargs*)

List all Slack users.

### Parameters

- **api\_key** -- The Random.org api key.
- **api\_version** -- The Random.org api version.
- **format** -- Specifies the format in which the blobs will be returned. Values allowed are base64 and hex.

### Returns

The user list.

CLI Example:

```
salt '*' get_integers number=5 min=1 max=6
salt '*' get_integers number=5 min=1 max=6
```

`salt.modules.random_org.generateDecimalFractions` (*api\_key=None, api\_version=None, \*\*kwargs*)

Generates true random decimal fractions

#### Parameters

- **api\_key** -- The Random.org api key.
- **api\_version** -- The Random.org api version.
- **number** -- How many random decimal fractions you need. Must be within the [1,1e4] range.
- **decimalPlaces** -- The number of decimal places to use. Must be within the [1,20] range.
- **replacement** -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.

#### Returns

A list of decimal fraction

CLI Example:

```
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
→ replacement=True
```

`salt.modules.random_org.generateGaussians` (*api\_key=None, api\_version=None, \*\*kwargs*)

This method generates true random numbers from a Gaussian distribution (also known as a normal distribution).

#### Parameters

- **api\_key** -- The Random.org api key.
- **api\_version** -- The Random.org api version.
- **number** -- How many random numbers you need. Must be within the [1,1e4] range.
- **mean** -- The distribution's mean. Must be within the [-1e6,1e6] range.
- **standardDeviation** -- The distribution's standard deviation. Must be within the [-1e6,1e6] range.
- **significantDigits** -- The number of significant digits to use. Must be within the [2,20] range.

#### Returns

The user list.

CLI Example:

```
salt '*' random_org.generateGaussians number=10 mean=0.0
→ standardDeviation=1.0 significantDigits=8
```

`salt.modules.random_org.generateIntegers` (*api\_key=None, api\_version=None, \*\*kwargs*)

Generate random integers

#### Parameters

- **api\_key** -- The Random.org api key.
- **api\_version** -- The Random.org api version.
- **number** -- The number of integers to generate
- **minimum** -- The lower boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **maximum** -- The upper boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.

- **replacement** -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.
- **base** -- Specifies the base that will be used to display the numbers. Values allowed are 2, 8, 10 and 16. This affects the JSON types and formatting of the resulting data as discussed below.

#### Returns

A list of integers.

CLI Example:

```
salt '*' random_org.generateIntegers number=5 minimum=1 maximum=6
salt '*' random_org.generateIntegers number=5 minimum=2 maximum=255 base=2
```

`salt.modules.random_org.generateStrings` (*api\_key=None, api\_version=None, \*\*kwargs*)

Generate random strings.

#### Parameters

- **api\_key** -- The Random.org api key.
- **api\_version** -- The Random.org api version.
- **number** -- The number of strings to generate.
- **length** -- The length of each string. Must be within the [1,20] range. All strings will be of the same length
- **characters** -- A string that contains the set of characters that are allowed to occur in the random strings. The maximum number of characters is 80.
- **replacement** -- Specifies whether the random strings should be picked with replacement. The default (true) will cause the strings to be picked with replacement, i.e., the resulting list of strings may contain duplicates (like a series of dice rolls). If you want the strings to be unique (like raffle tickets drawn from a container), set this value to false.

#### Returns

A list of strings.

CLI Example:

```
salt '*' random_org.generateStrings number=5 length=8 characters=
↳'abcdefghijklmnopqrstuvwxy'
salt '*' random_org.generateStrings number=10 length=16 characters
↳'abcdefghijklmnopqrstuvwxy'
```

`salt.modules.random_org.generateUUIDs` (*api\_key=None, api\_version=None, \*\*kwargs*)

Generate a list of random UUIDs

#### Parameters

- **api\_key** -- The Random.org api key.
- **api\_version** -- The Random.org api version.
- **number** -- How many random UUIDs you need. Must be within the [1,1e3] range.

#### Returns

A list of UUIDs

CLI Example:

```
salt '*' random_org.generateUUIDs number=5
```

`salt.modules.random_org.getUsage` (*api\_key=None, api\_version=None*)

Show current usages statistics

**Parameters**

- **api\_key** -- The Random.org api key.
- **api\_version** -- The Random.org api version.

**Returns**

The current usage statistics.

CLI Example:

```
salt '*' random_org.getUsage
salt '*' random_org.getUsage api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_
↪version=1
```

### 26.6.367 salt.modules.rbac\_solaris

Module for Solaris' Role-Based Access Control

**salt.modules.rbac\_solaris.auth\_add**(*user, auth*)

Add authorization to user

**user**

[string] username

**auth**

[string] authorization name

CLI Example:

```
salt '*' rbac.auth_add martine solaris.zone.manage
salt '*' rbac.auth_add martine solaris.zone.manage,solaris.mail.mailq
```

**salt.modules.rbac\_solaris.auth\_get**(*user, computed=True*)

List authorization for user

**user**

[string] username

**computed**

[boolean] merge results from *auths* command into data from *user\_attr*

CLI Example:

```
salt '*' rbac.auth_get leo
```

**salt.modules.rbac\_solaris.auth\_list**()

List all available authorization

CLI Example:

```
salt '*' rbac.auth_list
```

**salt.modules.rbac\_solaris.auth\_rm**(*user, auth*)

Remove authorization from user

**user**

[string] username

**auth**

[string] authorization name

CLI Example:

```
salt '*' rbac.auth_rm jorge solaris.zone.manage
salt '*' rbac.auth_rm jorge solaris.zone.manage,solaris.mail.mailq
```

`salt.modules.rbac_solaris.profile_add`(*user*, *profile*)

Add profile to user

**user**

[string] username

**profile**

[string] profile name

CLI Example:

```
salt '*' rbac.profile_add martine 'Primary Administrator'
salt '*' rbac.profile_add martine 'User Management,User Security'
```

`salt.modules.rbac_solaris.profile_get`(*user*, *default\_hidden=True*)

List profiles for user

**user**

[string] username

**default\_hidden**

[boolean] hide default profiles

CLI Example:

```
salt '*' rbac.profile_get leo
salt '*' rbac.profile_get leo default_hidden=False
```

`salt.modules.rbac_solaris.profile_list`(*default\_only=False*)

List all available profiles

**default\_only**

[boolean] return only default profile

CLI Example:

```
salt '*' rbac.profile_list
```

`salt.modules.rbac_solaris.profile_rm`(*user*, *profile*)

Remove profile from user

**user**

[string] username

**profile**

[string] profile name

CLI Example:

```
salt '*' rbac.profile_rm jorge 'Primary Administrator'
salt '*' rbac.profile_rm jorge 'User Management,User Security'
```

`salt.modules.rbac_solaris.role_add`(*user*, *role*)

Add role to user

**user**

[string] username

**role**

[string] role name

CLI Example:

```
salt '*' rbac.role_add martine netcfg
salt '*' rbac.role_add martine netcfg,zfssnap
```

`salt.modules.rbac_solaris.role_get(user)`

List roles for user

**user**

[string] username

CLI Example:

```
salt '*' rbac.role_get leo
```

`salt.modules.rbac_solaris.role_list()`

List all available roles

CLI Example:

```
salt '*' rbac.role_list
```

`salt.modules.rbac_solaris.role_rm(user, role)`

Remove role from user

**user**

[string] username

**role**

[string] role name

CLI Example:

```
salt '*' rbac.role_rm jorge netcfg
salt '*' rbac.role_rm jorge netcfg,zfssnap
```

### 26.6.368 salt.modules.rbenv

Manage ruby installations with rbenv. rbenv is supported on Linux and macOS. rbenv doesn't work on Windows (and isn't really necessary on Windows as there is no system Ruby on Windows). On Windows, the RubyInstaller and/or Pkx are both good alternatives to work with multiple versions of Ruby on the same box.

<http://misheska.com/blog/2013/06/15/using-rbenv-to-manage-multiple-versions-of-ruby/>

New in version 0.16.0.

`salt.modules.rbenv.default(ruby=None, runas=None)`

Returns or sets the currently defined default ruby

**ruby**

The version to set as the default. Should match one of the versions listed by `rbenv.versions`. Leave blank to return the current default.

CLI Example:

```
salt '*' rbenv.default
salt '*' rbenv.default 2.0.0-p0
```

`salt.modules.rbenv.do(cmdline, runas=None, env=None)`

Execute a ruby command with rbenv's shims from the user or the system

CLI Example:

```
salt '*' rbenv.do 'gem list bundler'
salt '*' rbenv.do 'gem list bundler' deploy
```

`salt.modules.rbenv.do_with_ruby` (*ruby, cmdline, runas=None*)

Execute a ruby command with rbenv's shims using a specific ruby version

CLI Example:

```
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler'
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler' runas=deploy
```

`salt.modules.rbenv.install` (*runas=None, path=None*)

Install rbenv systemwide

CLI Example:

```
salt '*' rbenv.install
```

`salt.modules.rbenv.install_ruby` (*ruby, runas=None*)

Install a ruby implementation.

**ruby**

The version of Ruby to install, should match one of the versions listed by `rbenv.list`

**runas**

The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

Additional environment variables can be configured in pillar / grains / master:

```
rbenv:
build_env: 'CONFIGURE_OPTS="--no-tcmalloc" CFLAGS="-fno-tree-dce"'
```

CLI Example:

```
salt '*' rbenv.install_ruby 2.0.0-p0
```

`salt.modules.rbenv.is_installed` (*runas=None*)

Check if rbenv is installed

CLI Example:

```
salt '*' rbenv.is_installed
```

`salt.modules.rbenv.list_` (*runas=None*)

List the installable versions of ruby

**runas**

The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.list
```

`salt.modules.rbenv.rehash` (*runas=None*)

Run rbenv rehash to update the installed shims

**runas**

The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.rehash
```

`salt.modules.rbenv.uninstall_ruby` (*ruby*, *runas=None*)

Uninstall a ruby implementation.

**ruby**

The version of ruby to uninstall. Should match one of the versions listed by `rbenv.versions`.

**runas**

The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.uninstall_ruby 2.0.0-p0
```

`salt.modules.rbenv.update` (*runas=None*, *path=None*)

Updates the current versions of rbenv and ruby-build

**runas**

The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.update
```

`salt.modules.rbenv.versions` (*runas=None*)

List the installed versions of ruby

CLI Example:

```
salt '*' rbenv.versions
```

### 26.6.369 salt.modules.rdp

Manage RDP Service on Windows servers

`salt.modules.rdp.disable` ()

Disable RDP the service on the server

CLI Example:

```
salt '*' rdp.disable
```

`salt.modules.rdp.disconnect_session` (*session\_id*)

Disconnect a session.

New in version 2016.11.0.

**Parameters**

**session\_id** -- The numeric Id of the session.

**Returns**

A boolean representing whether the disconnect succeeded.

CLI Example:

```
salt '*' rdp.disconnect_session session_id
```

```
salt '*' rdp.disconnect_session 99
```

`salt.modules.rdp.enable()`

Enable RDP the service on the server

CLI Example:

```
salt '*' rdp.enable
```

`salt.modules.rdp.get_session(session_id)`

Get information about a session.

New in version 2016.11.0.

**Parameters**

**session\_id** -- The numeric Id of the session.

**Returns**

A dictionary of session information.

CLI Example:

```
salt '*' rdp.get_session session_id
salt '*' rdp.get_session 99
```

`salt.modules.rdp.list_sessions(logged_in_users_only=False)`

List information about the sessions.

New in version 2016.11.0.

**Parameters**

**logged\_in\_users\_only** -- If True, only return sessions with users logged in.

**Returns**

A list containing dictionaries of session information.

CLI Example:

```
salt '*' rdp.list_sessions
```

`salt.modules.rdp.logoff_session(session_id)`

Initiate the logoff of a session.

New in version 2016.11.0.

**Parameters**

**session\_id** -- The numeric Id of the session.

**Returns**

A boolean representing whether the logoff succeeded.

CLI Example:

```
salt '*' rdp.logoff_session session_id
salt '*' rdp.logoff_session 99
```

`salt.modules.rdp.status()`

Show if rdp is enabled on the server

CLI Example:

```
salt '*' rdp.status
```

### 26.6.370 salt.modules.rebootmgr module

Module for rebootmgr :maintainer: Alberto Planas <aplanas@suse.com> :maturity: new :depends: None :platform: Linux

New in version 3004.

`salt.modules.rebootmgr.cancel()`

Cancels an already running reboot.

CLI Example:

```
salt microos rebootmgr cancel
```

`salt.modules.rebootmgr.get_group()`

The currently set lock group for etcd.

CLI Example:

```
salt microos rebootmgr get_group
```

`salt.modules.rebootmgr.get_strategy()`

The currently used reboot strategy of rebootmgrd will be printed.

CLI Example:

```
salt microos rebootmgr get_strategy
```

`salt.modules.rebootmgr.get_window()`

The currently set maintenance window will be printed.

CLI Example:

```
salt microos rebootmgr get_window
```

`salt.modules.rebootmgr.is_active()`

Check if the rebootmgrd is running and active or not.

CLI Example:

```
salt microos rebootmgr is_active
```

`salt.modules.rebootmgr.lock(machine_id=None, group=None)`

**Lock a machine. If no group is specified, the local default group** will be used. If no machine-id is specified, the local machine will be locked.

**machine\_id**

The machine-id is a network wide, unique ID. Per default the ID from /etc/machine-id is used.

**group**

Group name

CLI Example:

```
salt microos rebootmgr lock group=group1
```

`salt.modules.rebootmgr.reboot(order=None)`

Tells rebootmgr to schedule a reboot.

With the [now] option, a forced reboot is done, no lock from etcd is requested and a set maintenance window is ignored. With the [fast] option, a lock from etcd is requested if needed, but a defined maintenance window is ignored.

**order**

If specified, can be "now" or "fast"

CLI Example:

```
salt microos rebootmgr reboot
salt microos rebootmgr reboot order=now
```

`salt.modules.rebootmgr.set_group(group)`

Set the group, to which this machine belongs to get a reboot lock from etcd.

**group**

Group name

CLI Example:

```
salt microos rebootmgr set_group group=group_1
```

`salt.modules.rebootmgr.set_max(max_locks, group=None)`

Set the maximal number of hosts in a group, which are allowed to reboot at the same time.

**number**

Maximal number of hosts in a group

**group**

Group name

CLI Example:

```
salt microos rebootmgr set_max 4
```

`salt.modules.rebootmgr.set_strategy(strategy=None)`

A new strategy to reboot the machine is set and written into /etc/rebootmgr.conf.

**strategy**

If specified, must be one of those options:

**best-effort** - This is the default strategy. If etcd is

running, etcd-lock is used. If no etcd is running, but a maintenance window is specified, the strategy will be maint-window. If no maintenance window is specified, the machine is immediately rebooted (instantly).

**etcd-lock** - A lock at etcd for the specified lock-group will

be acquired before reboot. If a maintenance window is specified, the lock is only acquired during this window.

**maint-window** - Reboot does happen only during a specified

maintenance window. If no window is specified, the instantly strategy is followed.

**instantly** - Other services will be informed that a reboot will

happen. Reboot will be done without getting any locks or waiting for a maintenance window.

**off** - Reboot requests are temporary

ignored. /etc/rebootmgr.conf is not modified.

CLI Example:

```
salt microos rebootmgr set_strategy strategy=off
```

`salt.modules.rebootmgr.set_window(time, duration)`

Set's the maintenance window.

**time**

The format of time is the same as described in `systemd.time(7)`.

**duration**

The format of duration is "[XXh][YYm]".

CLI Example:

```
salt microos rebootmgr set_window time="Thu,Fri 2020-*-1,5 11:12:13"
↳duration=1h
```

**salt.modules.rebootmgr.status()**

Returns the current status of `rebootmgrd`.

**Valid returned values are:**

- 0 - No reboot requested
- 1 - Reboot requested
- 2 - Reboot requested, waiting for maintenance window
- 3 - Reboot requested, waiting for `etcd` lock.

CLI Example:

```
salt microos rebootmgr status
```

**salt.modules.rebootmgr.unlock(*machine\_id=None, group=None*)**

**Unlock a machine. If no `group` is specified, the local default group**

will be used. If no `machine-id` is specified, the local machine will be locked.

**machine\_id**

The `machine-id` is a network wide, unique ID. Per default the ID from `/etc/machine-id` is used.

**group**

Group name

CLI Example:

```
salt microos rebootmgr unlock group=group1
```

**salt.modules.rebootmgr.version()**

Return the version of `rebootmgrd`

CLI Example:

```
salt microos rebootmgr version
```

### 26.6.371 salt.modules.redis

Module to provide redis functionality to Salt

New in version 2014.7.0.

**configuration**

This module requires the `redis python` module and uses the following defaults which may be overridden in the minion configuration:

```
redis.host: 'salt'
redis.port: 6379
redis.db: 0
redis.password: None
```

**salt.modules.redismod.bgrewriteaof(*host=None, port=None, db=None, password=None*)**

Asynchronously rewrite the append-only file

CLI Example:

```
salt '*' redis.bgrewriteaof
```

`salt.modules.redismod.bgsave` (*host=None, port=None, db=None, password=None*)

Asynchronously save the dataset to disk

CLI Example:

```
salt '*' redis.bgsave
```

`salt.modules.redismod.config_get` (*pattern='\*', host=None, port=None, db=None, password=None*)

Get redis server configuration values

CLI Example:

```
salt '*' redis.config_get
salt '*' redis.config_get port
```

`salt.modules.redismod.config_set` (*name, value, host=None, port=None, db=None, password=None*)

Set redis server configuration values

CLI Example:

```
salt '*' redis.config_set masterauth luv_kittens
```

`salt.modules.redismod.dbsize` (*host=None, port=None, db=None, password=None*)

Return the number of keys in the selected database

CLI Example:

```
salt '*' redis.dbsize
```

`salt.modules.redismod.delete` (*\*keys, \*\*connection\_args*)

Deletes the keys from redis, returns number of keys deleted

CLI Example:

```
salt '*' redis.delete foo
```

`salt.modules.redismod.exists` (*key, host=None, port=None, db=None, password=None*)

Return true if the key exists in redis

CLI Example:

```
salt '*' redis.exists foo
```

`salt.modules.redismod.expire` (*key, seconds, host=None, port=None, db=None, password=None*)

Set a keys time to live in seconds

CLI Example:

```
salt '*' redis.expire foo 300
```

`salt.modules.redismod.expireat` (*key, timestamp, host=None, port=None, db=None, password=None*)

Set a keys expire at given UNIX time

CLI Example:

```
salt '*' redis.expireat foo 1400000000
```

`salt.modules.redismod.flushall` (*host=None, port=None, db=None, password=None*)

Remove all keys from all databases

CLI Example:

```
salt '*' redis.flushall
```

`salt.modules.redismod.flushdb` (*host=None, port=None, db=None, password=None*)

Remove all keys from the selected database

CLI Example:

```
salt '*' redis.flushdb
```

`salt.modules.redismod.get_key` (*key, host=None, port=None, db=None, password=None*)

Get redis key value

CLI Example:

```
salt '*' redis.get_key foo
```

`salt.modules.redismod.get_master_ip` (*host=None, port=None, password=None*)

Get host information about slave

New in version 2016.3.0.

CLI Example:

```
salt '*' redis.get_master_ip
```

`salt.modules.redismod.hdel` (*key, \*fields, \*\*options*)

Delete one or more hash fields.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hdel foo_hash bar_field1 bar_field2
```

`salt.modules.redismod.hexists` (*key, field, host=None, port=None, db=None, password=None*)

Determine if a hash field exists.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hexists foo_hash bar_field
```

`salt.modules.redismod.hget` (*key, field, host=None, port=None, db=None, password=None*)

Get specific field value from a redis hash, returns dict

CLI Example:

```
salt '*' redis.hget foo_hash bar_field
```

`salt.modules.redismod.hgetall`(*key, host=None, port=None, db=None, password=None*)

Get all fields and values from a redis hash, returns dict

CLI Example:

```
salt '*' redis.hgetall foo_hash
```

`salt.modules.redismod.hincrby`(*key, field, increment=1, host=None, port=None, db=None, password=None*)

Increment the integer value of a hash field by the given number.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hincrby foo_hash bar_field 5
```

`salt.modules.redismod.hincrbyfloat`(*key, field, increment=1.0, host=None, port=None, db=None, password=None*)

Increment the float value of a hash field by the given number.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hincrbyfloat foo_hash bar_field 5.17
```

`salt.modules.redismod.hlen`(*key, host=None, port=None, db=None, password=None*)

Returns number of fields of a hash.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hlen foo_hash
```

`salt.modules.redismod.hmget`(*key, \*fields, \*\*options*)

Returns the values of all the given hash fields.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hmget foo_hash bar_field1 bar_field2
```

`salt.modules.redismod.hmset`(*key, \*\*fieldsvals*)

Sets multiple hash fields to multiple values.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hmset foo_hash bar_field1=bar_value1 bar_field2=bar_value2
```

`salt.modules.redismod.hscan`(*key, cursor=0, match=None, count=None, host=None, port=None, db=None, password=None*)

Incrementally iterate hash fields and associated values.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hscan foo_hash match='field_prefix_*' count=1
```

`salt.modules.redismod.hset`(*key, field, value, host=None, port=None, db=None, password=None*)

Set the value of a hash field.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hset foo_hash bar_field bar_value
```

`salt.modules.redismod.hsetnx`(*key, field, value, host=None, port=None, db=None, password=None*)

Set the value of a hash field only if the field does not exist.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hsetnx foo_hash bar_field bar_value
```

`salt.modules.redismod.hvals`(*key, host=None, port=None, db=None, password=None*)

Return all the values in a hash.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hvals foo_hash bar_field1 bar_value1
```

`salt.modules.redismod.info`(*host=None, port=None, db=None, password=None*)

Get information and statistics about the server

CLI Example:

```
salt '*' redis.info
```

`salt.modules.redismod.key_type`(*key, host=None, port=None, db=None, password=None*)

Get redis key type

CLI Example:

```
salt '*' redis.type foo
```

`salt.modules.redismod.keys`(*pattern='\*', host=None, port=None, db=None, password=None*)

Get redis keys, supports glob style patterns

CLI Example:

```
salt '*' redis.keys
salt '*' redis.keys test*
```

`salt.modules.redismod.lastsave`(*host=None, port=None, db=None, password=None*)

Get the UNIX time in seconds of the last successful save to disk

CLI Example:

```
salt '*' redis.lastsave
```

`salt.modules.redismod.llen`(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Get the length of a list in Redis

CLI Example:

```
salt '*' redis.llen foo_list
```

`salt.modules.redismod.lrange`(*key*, *start*, *stop*, *host=None*, *port=None*, *db=None*, *password=None*)

Get a range of values from a list in Redis

CLI Example:

```
salt '*' redis.lrange foo_list 0 10
```

`salt.modules.redismod.ping`(*host=None*, *port=None*, *db=None*, *password=None*)

Ping the server, returns False on connection errors

CLI Example:

```
salt '*' redis.ping
```

`salt.modules.redismod.save`(*host=None*, *port=None*, *db=None*, *password=None*)

Synchronously save the dataset to disk

CLI Example:

```
salt '*' redis.save
```

`salt.modules.redismod.sentinel_get_master_ip`(*master*, *host=None*, *port=None*, *password=None*)

Get ip for sentinel master

New in version 2016.3.0.

CLI Example:

```
salt '*' redis.sentinel_get_master_ip 'mymaster'
```

`salt.modules.redismod.set_key`(*key*, *value*, *host=None*, *port=None*, *db=None*, *password=None*)

Set redis key value

CLI Example:

```
salt '*' redis.set_key foo bar
```

`salt.modules.redismod.shutdown`(*host=None*, *port=None*, *db=None*, *password=None*)

Synchronously save the dataset to disk and then shut down the server

CLI Example:

```
salt '*' redis.shutdown
```

`salt.modules.redismod.slaveof`(*master\_host=None*, *master\_port=None*, *host=None*, *port=None*, *db=None*, *password=None*)

Make the server a slave of another instance, or promote it as master

CLI Example:

```
# Become slave of redis-n01.example.com:6379
salt '*' redis.slaveof redis-n01.example.com 6379
salt '*' redis.slaveof redis-n01.example.com
# Become master
salt '*' redis.slaveof
```

`salt.modules.redismod.smembers` (*key, host=None, port=None, db=None, password=None*)

Get members in a Redis set

CLI Example:

```
salt '*' redis.smembers foo_set
```

`salt.modules.redismod.time` (*host=None, port=None, db=None, password=None*)

Return the current server UNIX time in seconds

CLI Example:

```
salt '*' redis.time
```

`salt.modules.redismod.zcard` (*key, host=None, port=None, db=None, password=None*)

Get the length of a sorted set in Redis

CLI Example:

```
salt '*' redis.zcard foo_sorted
```

`salt.modules.redismod.zrange` (*key, start, stop, host=None, port=None, db=None, password=None*)

Get a range of values from a sorted set in Redis by index

CLI Example:

```
salt '*' redis.zrange foo_sorted 0 10
```

## 26.6.372 salt.modules.reg

Manage the Windows registry

### Hives

Hives are the main sections of the registry and all begin with the word HKEY.

- HKEY\_LOCAL\_MACHINE
- HKEY\_CURRENT\_USER
- HKEY\_USER

## Keys

Keys are the folders in the registry. Keys can have many nested subkeys. Keys can have a value assigned to them under the (Default)

When passing a key on the CLI it must be quoted correctly depending on the backslashes being used (\ vs \\\). The following are valid methods of passing the key on the CLI:

Using **single backslashes**:

```
"SOFTWARE\Python" 'SOFTWARE\Python' (will not work on a Windows Master)
```

Using **double backslashes**:

```
SOFTWARE\\Python
```

## Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is (Default) with a displayed value of (value not set). The actual value is Null.

## Example

The following example is an export from the Windows startup portion of the registry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"="\"C:\\Program Files\\Realtek\\Audio\\HDA\\RtkNGUI64.exe\" -s"
"NvBackend"="\"C:\\Program Files (x86)\\NVIDIA Corporation\\Update Core\\
↳NvBackend.exe\""
"BTMTrayAgent"="rundll32.exe \"C:\\Program Files (x86)\\Intel\\Bluetooth\\
↳btmshellex.dll\",TrayApp"
```

In this example these are the values for each:

**Hive:**

```
HKEY_LOCAL_MACHINE
```

**Key and subkeys:**

```
SOFTWARE\\Microsoft\\Windows\\CurrentVersion\\Run
```

**Value:**

- There are 3 value names:
  - *RTHDVCPL*
  - *NvBackend*
  - *BTMTrayAgent*
- Each value name has a corresponding value

**depends**

- salt.utils.win\_reg

```
salt.modules.reg.broadcast_change()
```

Refresh the windows environment.

---

**Note:** This will only effect new processes and windows. Services will not see the change until the system restarts.

---

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' reg.broadcast_change
```

`salt.modules.reg.delete_key_recursive` (*hive, key, use\_32bit\_registry=False*)

New in version 2015.5.4.

Delete a registry key to include all subkeys and value/data pairs.

**Parameters**

**hive** (*str*) -- The name of the hive. Can be one of the following

- HKEY\_LOCAL\_MACHINE or HKLM
- HKEY\_CURRENT\_USER or HKCU
- HKEY\_USER or HKU
- HKEY\_CLASSES\_ROOT or HKCR
- HKEY\_CURRENT\_CONFIG or HKCC

**key** (*str*):

The key to remove (looks like a path)

**use\_32bit\_registry** (*bool*):

Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

**Returns**

A dictionary listing the keys that deleted successfully as well as those that failed to delete.

**Return type**

dict

CLI Example:

The following example will remove delete\_me and all its subkeys from the SOFTWARE key in HKEY\_LOCAL\_MACHINE:

```
salt '*' reg.delete_key_recursive HKLM SOFTWARE\\delete_me
```

`salt.modules.reg.delete_value` (*hive, key, vname=None, use\_32bit\_registry=False*)

Delete a registry value entry or the default value for a key.

**Parameters**

• **hive** (*str*) -- The name of the hive. Can be one of the following

- HKEY\_LOCAL\_MACHINE or HKLM
- HKEY\_CURRENT\_USER or HKCU
- HKEY\_USER or HKU
- HKEY\_CLASSES\_ROOT or HKCR
- HKEY\_CURRENT\_CONFIG or HKCC

• **key** (*str*) -- The key (looks like a path) to the value name.

• **vname** (*str*) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be deleted.

• **use\_32bit\_registry** (*bool*) -- Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' reg.delete_value HKEY_CURRENT_USER 'SOFTWARE\\Salt'
↳ 'version'
```

`salt.modules.reg.import_file` (*source*, *use\_32bit\_registry=False*)

Import registry settings from a Windows REG file by invoking REG.EXE.

New in version 2018.3.0.

**Parameters**

- **source** (*str*) -- The full path of the REG file. This can be either a local file path or a URL type supported by salt (e.g. `salt://salt_master_path`)
- **use\_32bit\_registry** (*bool*) -- If the value of this parameter is True then the REG file will be imported into the Windows 32 bit registry. Otherwise the Windows 64 bit registry will be used.

**Returns**

True if successful, otherwise an error is raised

**Return type**

bool

**Raises**

- **ValueError** -- If the value of `source` is an invalid path or otherwise causes `cp.cache_file` to return False
- **CommandExecutionError** -- If `reg.exe` exits with a non-0 exit code

CLI Example:

```
salt machine1 reg.import_file salt://win/printer_config/110_
↳Canon/postinstall_config.reg
```

`salt.modules.reg.key_exists` (*hive*, *key*, *use\_32bit\_registry=False*)

Check that the key is found in the registry. This refers to keys and not value/data pairs.

**Parameters**

- **hive** (*str*) -- The hive to connect to
- **key** (*str*) -- The key to check
- **use\_32bit\_registry** (*bool*) -- Look in the 32bit portion of the registry

**Returns**

True if exists, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' reg.key_exists HKLM SOFTWARE\Microsoft
```

`salt.modules.reg.list_keys` (*hive*, *key=None*, *use\_32bit\_registry=False*)

Enumerates the subkeys in a registry key or hive.

**Parameters**

- **hive** (*str*) -- The name of the hive. Can be one of the following:
  - HKEY\_LOCAL\_MACHINE or HKLM
  - HKEY\_CURRENT\_USER or HKCU
  - HKEY\_USER or HKU
  - HKEY\_CLASSES\_ROOT or HKCR

- HKEY\_CURRENT\_CONFIG or HKCC
- **key** (*str*) -- The key (looks like a path) to the value name. If a key is not passed, the keys under the hive will be returned.
- **use\_32bit\_registry** (*bool*) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

**Returns**

A list of keys/subkeys under the hive or key.

**Return type**

list

CLI Example:

```
salt '*' reg.list_keys HKLM 'SOFTWARE'
```

`salt.modules.reg.list_values` (*hive*, *key=None*, *use\_32bit\_registry=False*)

Enumerates the values in a registry key or hive.

---

**Note:** The (Default) value will only be returned if it is set, otherwise it will not be returned in the list of values.

---

**Parameters**

- **hive** (*str*) -- The name of the hive. Can be one of the following:
  - HKEY\_LOCAL\_MACHINE or HKLM
  - HKEY\_CURRENT\_USER or HKCU
  - HKEY\_USER or HKU
  - HKEY\_CLASSES\_ROOT or HKCR
  - HKEY\_CURRENT\_CONFIG or HKCC
- **key** (*str*) -- The key (looks like a path) to the value name. If a key is not passed, the values under the hive will be returned.
- **use\_32bit\_registry** (*bool*) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

**Returns**

A list of values under the hive or key.

**Return type**

list

CLI Example:

```
salt '*' reg.list_values HKLM 'SYSTEM\\CurrentControlSet\\
↳ Services\\Tcpip'
```

`salt.modules.reg.read_value` (*hive*, *key*, *vname=None*, *use\_32bit\_registry=False*)

Reads a registry value entry or the default value for a key. To read the default value, don't pass *vname*

**Parameters**

- **hive** (*str*) -- The name of the hive. Can be one of the following:
  - HKEY\_LOCAL\_MACHINE or HKLM
  - HKEY\_CURRENT\_USER or HKCU
  - HKEY\_USER or HKU
  - HKEY\_CLASSES\_ROOT or HKCR
  - HKEY\_CURRENT\_CONFIG or HKCC
- **key** (*str*) -- The key (looks like a path) to the value name.
- **vname** (*str*) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be returned.
- **use\_32bit\_registry** (*bool*) -- Accesses the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

**Returns**

A dictionary containing the passed settings as well as the `value_data` if successful. If unsuccessful, sets `success` to `False`.

`bool`: Returns `False` if the key is not found

If `vname` is not passed:

- Returns the first unnamed value (Default) as a string.
- Returns `None` if first unnamed value is empty.

**Return type**

`dict`

CLI Example:

The following will get the value of the `version` value name in the `HKEY_LOCAL_MACHINE\SOFTWARE\Salt` key

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt'
↳ 'version'
```

CLI Example:

The following will get the default value of the `HKEY_LOCAL_MACHINE\SOFTWARE\Salt` key

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt'
```

```
salt.modules.reg.set_value(hive, key, vname=None, vdata=None, vtype='REG_SZ',
                           use_32bit_registry=False, volatile=False)
```

Sets a value in the registry. If `vname` is passed, it will be the value for that value name, otherwise it will be the default value for the specified key

**Parameters**

- **hive** (*str*) -- The name of the hive. Can be one of the following
  - `HKEY_LOCAL_MACHINE` or `HKLM`
  - `HKEY_CURRENT_USER` or `HKCU`
  - `HKEY_USER` or `HKU`
  - `HKEY_CLASSES_ROOT` or `HKCR`
  - `HKEY_CURRENT_CONFIG` or `HKCC`
- **key** (*str*) -- The key (looks like a path) to the value name.
- **vname** (*str*) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be set.
- **vdata** (*str, int, list, bytes*) -- The value you'd like to set. If a value name (`vname`) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type of data this parameter expects is determined by the value type specified in `vtype`. The correspondence is as follows:

- `REG_BINARY`: Binary data (str in Py2, bytes in Py3)
- `REG_DWORD`: int
- `REG_EXPAND_SZ`: str
- `REG_MULTI_SZ`: list of str
- `REG_QWORD`: int
- `REG_SZ`: str

---

**Note:** When setting `REG_BINARY`, string data will be converted to binary.

---

---

**Note:** The type for the (Default) value is always REG\_SZ and cannot be changed.

---

**Note:** This parameter is optional. If `vdata` is not passed, the Key will be created with no associated item/value pairs.

---

- **`vtype`** (*str*) -- The value type. The possible values of the `vtype` parameter are indicated above in the description of the `vdata` parameter.
- **`use_32bit_registry`** (*bool*) -- Sets the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
- **`volatile`** (*bool*) -- When this parameter has a value of True, the registry key will be made volatile (i.e. it will not persist beyond a system reset or shutdown). This parameter only has an effect when a key is being created and at no other time.

#### Returns

True if successful, otherwise False

#### Return type

bool

#### CLI Example:

This will set the version value to 2015.5.2 in the SOFTWARE\Salt key in the HKEY\_LOCAL\_MACHINE hive

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt'
↳'version' '2015.5.2'
```

#### CLI Example:

This function is strict about the type of `vdata`. For instance this example will fail because `vtype` has a value of REG\_SZ and `vdata` has a type of int (as opposed to str as expected).

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_
↳data' 1.2
```

#### CLI Example:

In this next example `vdata` is properly quoted and should succeed.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_
↳data' vtype=REG_SZ vdata="'1.2'"
```

#### CLI Example:

This is an example of using `vtype` REG\_BINARY.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'bin_
↳data' vtype=REG_BINARY vdata='Salty Data'
```

#### CLI Example:

An example of using `vtype` REG\_MULTI\_SZ is as follows:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'list_
↳data' vtype=REG_MULTI_SZ vdata='["Salt", "is", "great"]'
```

`salt.modules.reg.value_exists` (*hive*, *key*, *vname*, *use\_32bit\_registry=False*)

Check that the value/data pair is found in the registry.

New in version 3000.

#### Parameters

- **`hive`** (*str*) -- The hive to connect to
- **`key`** (*str*) -- The key to check in

- **vname** (*str*) -- The name of the value/data pair you're checking
- **use\_32bit\_registry** (*bool*) -- Look in the 32bit portion of the registry

**Returns**

True if exists, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' reg.value_exists HKLM SOFTWARE\Microsoft\Windows\
↳ CurrentVersion CommonFilesDir
```

**26.6.373 salt.modules.rest\_pkg**

Package support for the REST example

**salt.modules.rest\_pkg.install** (*name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, \*\*kwargs*)

**salt.modules.rest\_pkg.installed** (*name, version=None, refresh=False, fromrepo=None, skip\_verify=False, pkgs=None, sources=None, \*\*kwargs*)

**salt.modules.rest\_pkg.list\_pkgs** (*versions\_as\_list=False, \*\*kwargs*)

**salt.modules.rest\_pkg.remove** (*name=None, pkgs=None, \*\*kwargs*)

**salt.modules.rest\_pkg.upgrade** (*refresh=True, skip\_verify=True, \*\*kwargs*)

**salt.modules.rest\_pkg.version** (*\*names, \*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

**26.6.374 salt.modules.rest\_sample\_utils**

Utility functions for the rest\_sample

**salt.modules.rest\_sample\_utils.fix\_outage** ()

"Fix" the outage

CLI Example:

```
salt 'rest-sample-proxy' rest_sample.fix_outage
```

**salt.modules.rest\_sample\_utils.get\_test\_string** ()

Helper function to test cross-calling to the \_\_proxy\_\_ dunder.

CLI Example:

```
salt 'rest-sample-proxy' rest_sample.get_test_string
```

### 26.6.375 salt.modules.rest\_service

Provide the service module for the proxy-minion REST sample

`salt.modules.rest_service.enabled(name, sig=None)`

Only the 'redbull' service is 'enabled' in the test

New in version 2015.8.1.

`salt.modules.rest_service.get_all()`

Return a list of all available services

New in version 2015.8.0.

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.rest_service.list_()`

Return a list of all available services.

New in version 2015.8.1.

CLI Example:

```
salt '*' service.list
```

`salt.modules.rest_service.restart(name, sig=None)`

Restart the specified service with rest\_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.rest_service.running(name, sig=None)`

Return whether this service is running.

New in version 2015.8.0.

`salt.modules.rest_service.start(name, sig=None)`

Start the specified service on the rest\_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.rest_service.status(name, sig=None)`

Return the status for a service via rest\_sample. If the name contains globbing, a dict mapping service name to True/False values is returned.

New in version 2015.8.0.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt\*)

**Parameters**

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Not implemented

**Returns**

True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type**

bool

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.rest_service.stop`(*name*, *sig=None*)

Stop the specified service on the rest\_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.stop <service name>
```

### 26.6.376 salt.modules.restartcheck

checkrestart functionality for Debian and Red Hat Based systems

Identifies services (processes) that are linked against deleted files (for example after downloading an updated binary of a shared library).

Based on checkrestart script from debian-goodies (written by Matt Zimmerman for the Debian GNU/Linux distribution, <https://packages.debian.org/debian-goodies>) and psdel by Sam Morris.

**codeauthor**

Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.modules.restartcheck.restartcheck`(*ignorelist=None*, *blacklist=None*, *excludepid=None*, *\*\*kwargs*)

Analyzes files opened by running processes and seeks for packages which need to be restarted.

**Parameters**

- **ignorelist** -- string or list of packages to be ignored.
- **blacklist** -- string or list of file paths to be ignored.
- **excludepid** -- string or list of process IDs to be ignored.
- **verbose** -- boolean, enables extensive output.
- **timeout** -- int, timeout in minute.

**Returns**

{ 'result': False, 'comment': '<reason>' }. String with checkrestart output if some package seems to need to be restarted or if no packages need restarting.

**Return type**

Dict on error

New in version 2015.8.3.

CLI Example:

```
salt '*' restartcheck.restartcheck
```

### 26.6.377 salt.modules.restconf

Execution module for RESTCONF Proxy minions

**codeauthor**

Jamie (Bear) Murphy <jamiemurphyit@gmail.com>

**maturity**

new

**platform**

any

**salt.modules.restconf.get\_data**(*path*)

Returns an object containing the content of the request path with a GET request. Data returned will contain a dict with at minimum a key of "status" containing the http status code Other keys that should be available error (if http error), body, dict (parsed json to dict)

CLI Example:

```
salt '*' restconf.get_data restconf/yang-library-version
```

**salt.modules.restconf.info**()

Returns the RESTCONF capabilities PATH

CLI Example:

```
salt '*' restconf.info
```

**salt.modules.restconf.path\_check**(*primary\_path*, *init\_path*)

Used to check which path responds with a 200 status Returns an array of True/False and a dict with keys path + path\_method + response data, used in states code.

CLI Example:

```
salt '*' restconf.path_check restconf/yang-library-version/specifc_item  
→restconf/yang-library-version
```

**salt.modules.restconf.set\_data**(*path*, *method*, *dict\_payload*)

Sends a post/patch/other type of rest method to a specified path with the specified method with specified payload

CLI Example:

```
salt '*' restconf.set_data restconf/yang-library-version method=PATCH  
→dict_payload=""
```

### 26.6.378 salt.modules.ret

Module to integrate with the returner system and retrieve data sent to a salt returner

**salt.modules.ret.get\_fun**(*returner*, *fun*)

Return info about last time fun was called on each minion

CLI Example:

```
salt '*' ret.get_fun mysql network.interfaces
```

`salt.modules.ret.get_jid`(*returner*, *jid*)

Return the information for a specified job id

CLI Example:

```
salt '*' ret.get_jid redis 20421104181954700505
```

`salt.modules.ret.get_jids`(*returner*)

Return a list of all job ids

CLI Example:

```
salt '*' ret.get_jids mysql
```

`salt.modules.ret.get_minions`(*returner*)

Return a list of all minions

CLI Example:

```
salt '*' ret.get_minions mysql
```

### 26.6.379 salt.modules.rh\_ip

The networking module for RHEL/Fedora based distros

`salt.modules.rh_ip.apply_network_settings`(*\*\*settings*)

Apply global network configuration.

CLI Example:

```
salt '*' ip.apply_network_settings
```

`salt.modules.rh_ip.build_interface`(*iface*, *iface\_type*, *enabled*, *\*\*settings*)

Build an interface script for a network interface.

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

`salt.modules.rh_ip.build_network_settings`(*\*\*settings*)

Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

`salt.modules.rh_ip.build_routes`(*iface*, *\*\*settings*)

Build a route script for a network interface.

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

`salt.modules.rh_ip.down(iface, iface_type)`

Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

`salt.modules.rh_ip.get_interface(iface)`

Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.rh_ip.get_network_settings()`

Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

`salt.modules.rh_ip.get_routes(iface)`

Return the contents of the interface routes script.

CLI Example:

```
salt '*' ip.get_routes eth0
```

`salt.modules.rh_ip.up(iface, iface_type)`

Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```

## 26.6.380 salt.modules.rh\_service

Service support for RHEL-based systems, including support for both upstart and sysvinit

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

`salt.modules.rh_service.available(name, limit="")`

Return True if the named service is available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.available sshd
salt '*' service.available sshd limit=upstart
salt '*' service.available sshd limit=sysvinit
```

`salt.modules.rh_service.delete(name, **kwargs)`

Delete the named service

New in version 2016.3.0.

CLI Example:

```
salt '*' service.delete <service name>
```

`salt.modules.rh_service.disable(name, **kwargs)`

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.rh_service.disabled(name)`

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.rh_service.enable(name, **kwargs)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.rh_service.enabled(name, **kwargs)`

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.rh_service.get_all(limit="")`

Return all installed services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_all
salt '*' service.get_all limit=upstart
salt '*' service.get_all limit=sysvinit
```

`salt.modules.rh_service.get_disabled(limit="")`

Return the disabled services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_disabled
salt '*' service.get_disabled limit=upstart
salt '*' service.get_disabled limit=sysvinit
```

`salt.modules.rh_service.get_enabled(limit="")`

Return the enabled services. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.get_enabled
salt '*' service.get_enabled limit=upstart
salt '*' service.get_enabled limit=sysvinit
```

`salt.modules.rh_service.missing(name, limit="")`

The inverse of `service.available`. Return True if the named service is not available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.missing sshd
salt '*' service.missing sshd limit=upstart
salt '*' service.missing sshd limit=sysvinit
```

`salt.modules.rh_service.reload_(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.rh_service.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.rh_service.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.rh_service.status(name, sig=None)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

**Parameters**

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Signature to use to find the service via ps

**Returns**

True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type**

`bool`

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.rh_service.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

## 26.6.381 salt.modules.riak

Riak Salt Module

`salt.modules.riak.cluster_commit()`

Commit Cluster Changes

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_commit
```

`salt.modules.riak.cluster_join(username, hostname)`

Join a Riak cluster

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_join <user> <host>
```

username - The riak username to join the cluster hostname - The riak hostname you are connecting to

`salt.modules.riak.cluster_leave(username, hostname)`

Leave a Riak cluster

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_leave <username> <host>
```

username - The riak username to join the cluster hostname - The riak hostname you are connecting to

`salt.modules.riak.cluster_plan()`

Review Cluster Plan

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_plan
```

`salt.modules.riak.member_status()`

Get cluster member status

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.member_status
```

`salt.modules.riak.services()`

List available services on a node

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.services
```

`salt.modules.riak.start()`

Start Riak

CLI Example:

```
salt '*' riak.start
```

`salt.modules.riak.status()`

Current node status

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.status
```

`salt.modules.riak.stop()`

Stop Riak

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.stop
```

`salt.modules.riak.test()`

Runs a test of a few standard Riak operations

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.test
```

### 26.6.382 salt.modules.rpm\_lowpkg

Support for rpm

`salt.modules.rpm_lowpkg.bin_pkg_info(path, saltenv='base')`

New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

**path**

Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.rpm`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

**saltenv**

[base] Salt fileserver environment from which to retrieve the package. Ignored if path is a local file path on the minion.

CLI Example:

```
salt '*' lowpkg.bin_pkg_info /root/salt-2015.5.1-2.el7.noarch.rpm
salt '*' lowpkg.bin_pkg_info salt://salt-2015.5.1-2.el7.noarch.rpm
```

`salt.modules.rpm_lowpkg.checksum(*paths, **kwargs)`

Return if the signature of a RPM file is valid.

**root**

use root as top level directory (default: "/")

CLI Example:

```
salt '*' lowpkg.checksum /path/to/package1.rpm
salt '*' lowpkg.checksum /path/to/package1.rpm /path/to/package2.rpm
```

`salt.modules.rpm_lowpkg.diff(package_path, path)`

Return a formatted diff between current file and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

**Parameters**

- **package** -- Full pack of the RPM file
- **path** -- Full path to the installed file

**Returns**

Difference or empty string. For binary files only a notification.

CLI Example:

```
salt '*' lowpkg.diff /path/to/apache2.rpm /etc/apache2/httpd.conf
```

`salt.modules.rpm_lowpkg.file_dict(*packages, **kwargs)`

List the files that belong to a package, sorted by group. Not specifying any packages will return a list of `_every_` file on the system's rpm database (not generally recommended).

**root**

use root as top level directory (default: "/")

CLI Examples:

```
salt '*' lowpkg.file_dict httpd
salt '*' lowpkg.file_dict httpd postfix
salt '*' lowpkg.file_dict
```

`salt.modules.rpm_lowpkg.file_list(*packages, **kwargs)`

List the files that belong to a package. Not specifying any packages will return a list of `_every_` file on the system's rpm database (not generally recommended).

**root**

use root as top level directory (default: "/")

CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

`salt.modules.rpm_lowpkg.info(*packages, **kwargs)`

Return a detailed package(s) summary information. If no packages specified, all packages will be returned.

**Parameters**

- **packages** --
- **attr** -- Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.  
Valid attributes are:  
version, vendor, release, build\_date, build\_date\_time\_t, install\_date, install\_date\_time\_t, build\_host, group, source\_rpm, arch, epoch, size, license, signature, packager, url, summary, description.
- **all\_versions** -- Return information for all installed versions of the packages
- **root** -- use root as top level directory (default: "/")

**Returns**

CLI Example:

```
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info apache2 bash attr=version
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size all_
→versions=True
```

`salt.modules.rpm_lowpkg.list_pkgs(*packages, **kwargs)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

**root**

use root as top level directory (default: "/")

CLI Example:

```
salt '*' lowpkg.list_pkgs
```

`salt.modules.rpm_lowpkg.modified(*packages, **flags)`

List the modified files that belong to a package. Not specifying any packages will return a list of `_all_` modified files on the system's RPM database.

New in version 2015.5.0.

**root**

use root as top level directory (default: "/")

CLI Examples:

```
salt '*' lowpkg.modified httpd
salt '*' lowpkg.modified httpd postfix
salt '*' lowpkg.modified
```

`salt.modules.rpm_lowpkg.owner(*paths, **kwargs)`

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

**root**

use root as top level directory (default: "/")

CLI Examples:

```
salt '*' lowpkg.owner /usr/bin/apachectl
salt '*' lowpkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

`salt.modules.rpm_lowpkg.verify(*packages, **kwargs)`

Runs an rpm -Va on a system, and returns the results in a dict

**root**

use root as top level directory (default: "/")

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' lowpkg.verify
salt '*' lowpkg.verify httpd
salt '*' lowpkg.verify httpd postfix
salt '*' lowpkg.verify httpd postfix ignore_types=['config','doc']
```

`salt.modules.rpm_lowpkg.version_cmp(ver1, ver2, ignore_epoch=False)`

New in version 2015.8.9.

Do a cmp-style comparison on two packages. Return -1 if `ver1 < ver2`, 0 if `ver1 == ver2`, and 1 if `ver1 > ver2`. Return None if there was a problem making the comparison.

**ignore\_epoch**

[False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

### 26.6.383 salt.modules.rpmbuild\_pkgbuild

RPM Package builder system

New in version 2015.8.0.

This system allows for all of the components to build rpms safely in chrooted environments. This also provides a function to generate yum repositories

This module implements the pkgbuild interface

`salt.modules.rpmbuild_pkgbuild.build(runas, tgt, dest_dir, spec, sources, deps, env, template, saltenv='base', log_dir='/var/log/salt/pkgbuild')`

Given the package destination directory, the spec file source and package sources, use mock to safely build the rpm defined in the spec file

CLI Example:

```
salt '*' pkgbuild.build mock epel-7-x86_64 /var/www/html
                        https://raw.githubusercontent.com/saltstack/libnacl/master/
→pkg/rpm/python-libnacl.spec
                        https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.
→5.tar.gz
```

This example command should build the libnacl package for rhel 7 using user mock and place it in `/var/www/html/` on the minion

`salt.modules.rpmbuild_pkgbuild.make_repo(repodir, keyid=None, env=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='root', timeout=15.0)`

Make a package repository and optionally sign packages present

Given the repodir, create a yum repository out of the rpms therein and optionally sign it and packages present, the name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

**repodir**

The directory to find packages that will be in the repository.

**keyid**

Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
-----BEGIN PGP PRIVATE KEY BLOCK-----
Version: GnuPG v1

lQ0+BFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
.
.
Ebe+8JCQTWqSXPRTzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRPv/rawukEcNptn
R50mgHqvydEn04pWbn8JzQ09YX/Us0SMHBVzLC8eIi5ZIoPzAlvX
=JvW8
-----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
-----BEGIN PGP PUBLIC KEY BLOCK-----
Version: GnuPG v1

mQENBFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
.
.
bYP7t5iwJmQzRMMyFInYRt77wkJBPCpJc9FPNebL9vLZcN4zv0KQta+4alcWivvoP
4QIxE+/+trC6QRw2m2dHk6aAeq/J0Sc7ilZufwnNA71hf9SzRIwcFXMsLx4iLlki
inNqW9c=
=s1CX
-----END PGP PUBLIC KEY BLOCK-----

gpg_pkg_pub_keyname: gpg_pkg_key.pub
```

**env**

Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

---

**Note:** This parameter is not used for making yum repositories.

---

**use\_passphrase**

[False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter.

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

New in version 3001.1.

RHEL 8 and above leverages `gpg-agent` and `gpg-preset-passphrase` for caching keys, etc.

#### **gnupghome**

[`/etc/salt/gpgkeys`] New in version 2016.3.0.

Location where GPG related files are stored, used with `keyid`.

#### **runas**

[`root`] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

---

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

---

#### **timeout**

[15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html/
```

`salt.modules.rpmbuild_pkgbuild.make_src_pkg` (*dest\_dir*, *spec*, *sources*, *env=None*, *template=None*, *saltenv='base'*, *runas='root'*)

Create a source rpm from the given spec file and sources

CLI Example:

```
salt '*' pkgbuild.make_src_pkg /var/www/html/
      https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/
→rpm/python-libnacl.spec
      https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.
→tar.gz
```

This example command should build the `libnacl` SOURCE package and place it in `/var/www/html/` on the minion

Changed in version 2017.7.0.

#### **dest\_dir**

The directory on the minion to place the built package(s)

#### **spec**

The location of the spec file (used for rpms)

#### **sources**

The list of package sources

#### **env**

A dictionary of environment variables to be set prior to execution.

#### **template**

Run the spec file through a templating engine Optional argument, allows for no templating engine used to be if none is desired.

#### **saltenv**

The saltenv to use for files downloaded from the salt fileserver

**runas**

The user to run the build process as

New in version 2018.3.3.

---

**Note:** using SHA256 as digest and minimum level dist el6

---

### 26.6.384 salt.modules.rsync

Wrapper for rsync

New in version 2014.1.0.

This data can also be passed into *pillar*. Options passed into *opts* will overwrite options passed into *pillar*.

`salt.modules.rsync.config` (*conf\_path*='/etc/rsyncd.conf')

Changed in version 2016.3.0: Return data now contains just the contents of the `rsyncd.conf` as a string, instead of a dictionary as returned from `cmd.run_all`.

Returns the contents of the rsync config file

**conf\_path**

[/etc/rsyncd.conf] Path to the config file

CLI Example:

```
salt '*' rsync.config
```

`salt.modules.rsync.rsync` (*src*, *dst*, *delete=False*, *force=False*, *update=False*, *passwordfile=None*, *exclude=None*, *excludefrom=None*, *dryrun=False*, *rsh=None*, *additional\_opts=None*, *saltenv='base'*)

Changed in version 2016.3.0: Return data now contains just the output of the rsync command, instead of a dictionary as returned from `cmd.run_all`.

Rsync files from *src* to *dst*

**src**

The source location where files will be rsynced from.

**dst**

The destination location where files will be rsynced to.

**delete**

[False] Whether to enable the rsync `--delete` flag, which will delete extraneous files from dest dirs

**force**

[False] Whether to enable the rsync `--force` flag, which will force deletion of dirs even if not empty.

**update**

[False] Whether to enable the rsync `--update` flag, which forces rsync to skip any files which exist on the destination and have a modified time that is newer than the source file.

**passwordfile**

A file that contains a password for accessing an rsync daemon. The file should contain just the password.

**exclude**

Whether to enable the rsync `--exclude` flag, which will exclude files matching a PATTERN.

**excludefrom**

Whether to enable the rsync `--excludefrom` flag, which will read exclude patterns from a file.

**dryrun**

[False] Whether to enable the rsync `--dry-run` flag, which will perform a trial run with no changes made.

**rsh**

Whether to enable the rsync `--rsh` flag, to specify the remote shell to use.

**additional\_opts**

Any additional rsync options, should be specified as a list.

**saltenv**

Specify a salt fileservers environment to be used.

CLI Example:

```
salt '*' rsync.rsync /path/to/src /path/to/dest delete=True update=True
↳ passwordfile=/etc/pass.crt exclude=exclude/dir
salt '*' rsync.rsync /path/to/src delete=True excludefrom=/xx.ini
salt '*' rsync.rsync /path/to/src delete=True exclude='[exclude1/dir,
↳ exclude2/dir]' additional_opts='["--partial", "--bwlimit=5000"]'
```

**salt.modules.rsync.version()**

Changed in version 2016.3.0: Return data now contains just the version number as a string, instead of a dictionary as returned from `cmd.run_all`.

Returns rsync version

CLI Example:

```
salt '*' rsync.version
```

**26.6.385 salt.modules.runit**

runit service module (<http://smarden.org/runit>)

This module is compatible with the `service` states, so it can be used to maintain services using the provider argument:

```
myservice:
service:
- running
- provider: runit
```

Provides virtual `service` module on systems using runit as init.

Service management rules (`sv` command):

service \$n is ENABLED if file SERVICE\_DIR/\$n/run exists service \$n is AVAILABLE if ENABLED or if file AVAIL\_SVR\_DIR/\$n/run exists service \$n is DISABLED if AVAILABLE but not ENABLED

SERVICE\_DIR/\$n is normally a symlink to a AVAIL\_SVR\_DIR/\$n folder

Service auto-start/stop mechanism:

`sv` (auto)starts/stops service as soon as SERVICE\_DIR/<service> is created/deleted, both on service creation or a boot time.

autostart feature is disabled if file SERVICE\_DIR/<n>/down exists. This does not affect the current's service status (if already running) nor manual service management.

Service's alias:

Service `sva` is an alias of service `svc` when `AVAIL_SVR_DIR/sva` symlinks to folder `AVAIL_SVR_DIR/svc`. `svc` can't be enabled if it is already enabled through an alias already enabled, since `sv` files are stored in folder `SERVICE_DIR/svc/`.

XBPS package management uses a service's alias to provides service alternative(s), such as `chrony` and `openntpd` both aliased to `ntpd`.

`salt.modules.runit.add_svc_avail_path(path)`

Add a path that may contain available services. Return `True` if added (or already present), `False` on error.

**path**

directory to add to `AVAIL_SVR_DIRS`

`salt.modules.runit.available(name)`

Returns `True` if the specified service is available, otherwise returns `False`.

**name**

the service's name

CLI Example:

```
salt '*' runit.available <service name>
```

`salt.modules.runit.disable(name, stop=False, **kwargs)`

Don't start service `name` at boot Returns `True` if operation is successful

**name**

the service's name

**stop**

if `True`, also stops the service

CLI Example:

```
salt '*' service.disable <name> [stop=True]
```

`salt.modules.runit.disabled(name)`

Return `True` if the named service is disabled, `False` otherwise

**name**

the service's name

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.runit.enable(name, start=False, **kwargs)`

Start service `name` at boot. Returns `True` if operation is successful

**name**

the service's name

**start**

[`False`] If `True`, start the service once enabled.

CLI Example:

```
salt '*' service.enable <name> [start=True]
```

`salt.modules.runit.enabled(name)`

Return `True` if the named service is enabled, `False` otherwise

**name**

the service's name

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.runit.full_restart(name)`

Calls `runit.restart()`

**name**

the service's name

CLI Example:

```
salt '*' runit.full_restart <service name>
```

`salt.modules.runit.get_all()`

Return a list of all available services

CLI Example:

```
salt '*' runit.get_all
```

`salt.modules.runit.get_disabled()`

Return a list of all disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.runit.get_enabled()`

Return a list of all enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.runit.get_svc_alias()`

Returns the list of service's name that are aliased and their alias path(s)

`salt.modules.runit.get_svc_avail_path()`

Return list of paths that may contain available services

`salt.modules.runit.get_svc_broken_path(name='*')`

Return list of broken path(s) in SERVICE\_DIR that match name

A path is broken if it is a broken symlink or can not be a runit service

**name**

a glob for service name. default is '\*'

CLI Example:

```
salt '*' runit.get_svc_broken_path <service name>
```

`salt.modules.runit.missing(name)`

The inverse of `runit.available`. Returns True if the specified service is not available, otherwise returns False.

**name**

the service's name

CLI Example:

```
salt '*' runit.missing <service name>
```

`salt.modules.runit.reload_(name)`

Reload service

**name**

the service's name

CLI Example:

```
salt '*' runit.reload <service name>
```

`salt.modules.runit.remove(name)`

Remove the service <name> from system. Returns True if operation is successful. The service will be also stopped.

**name**

the service's name

CLI Example:

```
salt '*' service.remove <name>
```

`salt.modules.runit.restart(name)`

Restart service

**name**

the service's name

CLI Example:

```
salt '*' runit.restart <service name>
```

`salt.modules.runit.show(name)`

Show properties of one or more units/jobs or the manager

**name**

the service's name

CLI Example:

```
salt '*' service.show <service name>
```

`salt.modules.runit.start(name)`

Start service

**name**

the service's name

CLI Example:

```
salt '*' runit.start <service name>
```

`salt.modules.runit.status(name, sig=None)`

Return True if service is running

**name**

the service's name

**sig**

signature to identify with ps

CLI Example:

```
salt '*' runit.status <service name>
```

`salt.modules.runit.status_autostart(name)`

Return True if service <name> is autostarted by sv (file \$service\_folder/down does not exist) NB: return False if the service is not enabled.

**name**

the service's name

CLI Example:

```
salt '*' runit.status_autostart <service name>
```

`salt.modules.runit.stop(name)`

Stop service

**name**  
the service's name  
CLI Example:

```
salt '*' runit.stop <service name>
```

### 26.6.386 salt.modules.rvm

Manage ruby installations and gemsets with RVM, the Ruby Version Manager.

**salt.modules.rvm.do**(*ruby, command, runas=None, cwd=None, env=None*)

Execute a command in an RVM controlled environment.

**ruby**

Which ruby to use

**command**

The rvm command to execute

**runas**

The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

**cwd**

The directory from which to run the rvm command. Defaults to the user's home directory.

CLI Example:

```
salt '*' rvm.do 2.0.0 <command>
```

**salt.modules.rvm.gemset\_copy**(*source, destination, runas=None*)

Copy all gems from one gemset to another.

**source**

The name of the gemset to copy, complete with ruby version

**destination**

The destination gemset

**runas**

The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_copy foobar bazquo
```

**salt.modules.rvm.gemset\_create**(*ruby, gemset, runas=None*)

Creates a gemset.

**ruby**

The ruby version for which to create the gemset

**gemset**

The name of the gemset to create

**runas**

The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_create 2.0.0 foobar
```

**salt.modules.rvm.gemset\_delete**(*ruby, gemset, runas=None*)

Delete a gemset

**ruby**

The ruby version to which the gemset belongs

**gemset**

The gemset to delete

**runas**

The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_delete 2.0.0 foobar
```

`salt.modules.rvm.gemset_empty` (*ruby*, *gemset*, *runas=None*)

Remove all gems from a gemset.

**ruby**

The ruby version to which the gemset belongs

**gemset**

The gemset to empty

**runas**

The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_empty 2.0.0 foobar
```

`salt.modules.rvm.gemset_list` (*ruby='default'*, *runas=None*)

List all gemsets for the given ruby.

**ruby**

[default] The ruby version for which to list the gemsets

**runas**

The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_list
```

`salt.modules.rvm.gemset_list_all` (*runas=None*)

List all gemsets for all installed rubies.

Note that you must have set a default ruby before this can work.

**runas**

The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_list_all
```

`salt.modules.rvm.get` (*version='stable'*, *runas=None*)

Update RVM

**version**

[stable] Which version of RVM to install, (e.g. stable or head)

CLI Example:

```
salt '*' rvm.get
```

`salt.modules.rvm.install`(*runas=None*)

Install RVM system-wide

**runas**

The user under which to run the rvm installer script. If not specified, then it be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.install
```

`salt.modules.rvm.install_ruby`(*ruby, runas=None, opts=None, env=None*)

Install a ruby implementation.

**ruby**

The version of ruby to install

**runas**

The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

**env**

Environment to set for the install command. Useful for exporting compilation flags such as RUBY\_CONFIGURE\_OPTS

**opts**

List of options to pass to the RVM installer (ie -C, --patch, etc)

CLI Example:

```
salt '*' rvm.install_ruby 1.9.3-p385
```

`salt.modules.rvm.is_installed`(*runas=None*)

Check if RVM is installed.

CLI Example:

```
salt '*' rvm.is_installed
```

`salt.modules.rvm.list_`(*runas=None*)

List all rvm-installed rubies

**runas**

The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.list
```

`salt.modules.rvm.reinstall_ruby`(*ruby, runas=None, env=None*)

Reinstall a ruby implementation

**ruby**

The version of ruby to reinstall

**runas**

The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.reinstall_ruby 1.9.3-p385
```

`salt.modules.rvm.rubygems`(*ruby, version, runas=None*)

Installs a specific rubygems version in the given ruby

**ruby**

The ruby for which to install rubygems

**version**

The version of rubygems to install, or 'remove' to use the version that ships with 1.9

**runas**

The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.rubygems 2.0.0 1.8.24
```

`salt.modules.rvm.set_default`(*ruby*, *runas=None*)

Set the default ruby

**ruby**

The version of ruby to make the default

**runas**

The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.set_default 2.0.0
```

`salt.modules.rvm.wrapper`(*ruby\_string*, *wrapper\_prefix*, *runas=None*, *\*binaries*)

Install RVM wrapper scripts

**ruby\_string**

Ruby/gemset to install wrappers for

**wrapper\_prefix**

What to prepend to the name of the generated wrapper binaries

**runas**

The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

**binaries**

[None] The names of the binaries to create wrappers for. When nothing is given, wrappers for ruby, gem, rake, irb, rdoc, ri and testrb are generated.

CLI Example:

```
salt '*' rvm.wrapper <ruby_string> <wrapper_prefix>
```

### 26.6.387 salt.modules.s3

Connection module for Amazon S3

**configuration**

This module accepts explicit s3 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

<http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

**Warning:** This is literally the pillar key `s3.keyid` or the config option `s3.keyid`, not:

```
s3:
  keyid: blah
```

A `service_url` may also be specified in the configuration:

```
s3.service_url: s3.amazonaws.com
```

A `role_arn` may also be specified in the configuration:

```
s3.role_arn: arn:aws:iam::111111111111:role/my-role-to-assume
```

If a `service_url` is not specified, the default is `s3.amazonaws.com`. This may appear in various documentation as an "endpoint". A comprehensive list for Amazon S3 may be found at:

[http://docs.aws.amazon.com/general/latest/gr/rande.html#s3\\_region](http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region)

The `service_url` will form the basis for the final endpoint that is used to query the service.

Path style can be enabled:

```
s3.path_style: True
```

This can be useful if you need to use Salt with a proxy for a S3 compatible storage.

You can use either HTTPS protocol or HTTP protocol:

```
s3.https_enable: True
```

SSL verification may also be turned off in the configuration:

```
s3.verify_ssl: False
```

This is required if using S3 bucket names that contain a period, as these will not match Amazon's S3 wildcard certificates. Certificate verification is enabled by default.

AWS region may be specified in the configuration:

```
s3.location: eu-central-1
```

Default is `us-east-1`.

This module should be usable to query other S3-like services, such as Eucalyptus.

#### depends

requests

`salt.modules.s3.delete` (*bucket*, *path=None*, *action=None*, *key=None*, *keyid=None*, *service\_url=None*, *verify\_ssl=None*, *kms\_keyid=None*, *location=None*, *role\_arn=None*, *path\_style=None*, *https\_enable=None*)

Delete a bucket, or delete an object from a bucket.

CLI Example to delete a bucket:

```
salt myminion s3.delete mybucket
```

CLI Example to delete an object from a bucket:

```
salt myminion s3.delete mybucket remoteobject
```

**salt.modules.s3.get** (*bucket=""*, *path=""*, *return\_bin=False*, *action=None*, *local\_file=None*, *key=None*, *keyid=None*, *service\_url=None*, *verify\_ssl=None*, *kms\_keyid=None*, *location=None*, *role\_arn=None*, *path\_style=None*, *https\_enable=None*)

List the contents of a bucket, or return an object from a bucket. Set `return_bin` to `True` in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list buckets:

```
salt myminion s3.get
```

CLI Example to list the contents of a bucket:

```
salt myminion s3.get mybucket
```

CLI Example to return the binary contents of an object:

```
salt myminion s3.get mybucket myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion s3.get mybucket myfile.png local_file=/tmp/myfile.png
```

It is also possible to perform an action on a bucket. Currently, S3 supports the following actions:

```
acl
cors
lifecycle
policy
location
logging
notification
tagging
versions
requestPayment
versioning
website
```

To perform an action on a bucket:

```
salt myminion s3.get mybucket myfile.png action=acl
```

**salt.modules.s3.head** (*bucket*, *path=""*, *key=None*, *keyid=None*, *service\_url=None*, *verify\_ssl=None*, *kms\_keyid=None*, *location=None*, *role\_arn=None*, *path\_style=None*, *https\_enable=None*)

Return the metadata for a bucket, or an object in a bucket.

CLI Examples:

```
salt myminion s3.head mybucket
salt myminion s3.head mybucket myfile.png
```

**salt.modules.s3.put** (*bucket*, *path=None*, *return\_bin=False*, *action=None*, *local\_file=None*, *key=None*, *keyid=None*, *service\_url=None*, *verify\_ssl=None*, *kms\_keyid=None*, *location=None*, *role\_arn=None*, *path\_style=None*, *https\_enable=None*)

Create a new bucket, or upload an object to a bucket.

CLI Example to create a bucket:

```
salt myminion s3.put mybucket
```

CLI Example to upload an object to a bucket:

```
salt myminion s3.put mybucket remotepath local_file=/path/to/file
```

## 26.6.388 salt.modules.s6

s6 service module

This module is compatible with the *service* states, so it can be used to maintain services using the provider argument:

```

myservice:
  service:
    - running
    - provider: s6

```

Note that the enabled argument is not available with this provider.

### codeauthor

Marek Skrobacki <skrobul@skrobul.com>

`salt.modules.s6.available(name)`

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```

salt '*' s6.available foo

```

`salt.modules.s6.full_restart(name)`

Calls `s6.restart()` function

CLI Example:

```

salt '*' s6.full_restart <service name>

```

`salt.modules.s6.get_all()`

Return a list of all available services

CLI Example:

```

salt '*' s6.get_all

```

`salt.modules.s6.missing(name)`

The inverse of `s6.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```

salt '*' s6.missing foo

```

`salt.modules.s6.reload_(name)`

Send a HUP to service via `s6`

CLI Example:

```

salt '*' s6.reload <service name>

```

`salt.modules.s6.restart(name)`

Restart service via `s6`. This will stop/start service

CLI Example:

```
salt '*' s6.restart <service name>
```

`salt.modules.s6.start(name)`

Starts service via s6

CLI Example:

```
salt '*' s6.start <service name>
```

`salt.modules.s6.status(name, sig=None)`

Return the status for a service via s6, return pid if running

CLI Example:

```
salt '*' s6.status <service name>
```

`salt.modules.s6.stop(name)`

Stops service via s6

CLI Example:

```
salt '*' s6.stop <service name>
```

`salt.modules.s6.term(name)`

Send a TERM to service via s6

CLI Example:

```
salt '*' s6.term <service name>
```

## 26.6.389 salt.modules.salt\_proxy

Salt proxy module

New in version 2015.8.3.

Module to deploy and manage salt-proxy processes on a minion.

`salt.modules.salt_proxy.configure_proxy(proxyname, start=True)`

Create the salt proxy file and start the proxy process if required

**Parameters**

- **proxyname** -- Name to be used for this proxy (should match entries in pillar)
- **start** -- Boolean indicating if the process should be started default = True

CLI Example:

```
salt deviceminion salt_proxy.configure_proxy p8000
```

`salt.modules.salt_proxy.is_running(proxyname)`

Check if the salt-proxy process associated with this proxy (name) is running.

Returns True if the process is running False otherwise

**Parameters**

- **proxyname** -- String name of the proxy (p8000 for example)

CLI Example:

```
salt deviceminion salt_proxy.is_running p8000
```

### 26.6.390 salt.modules.salt\_version

Access Salt's elemental release code-names.

New in version 3000.

Salt's feature release schedule is based on the Periodic Table, as described in the Version Numbers documentation.

When a feature was added (or removed) in a specific release, it can be difficult to build out future-proof functionality that is dependent on a naming scheme that moves.

For example, a state syntax needs to change to support an option that will be removed in the future, but there are many Minion versions in use across an infrastructure. It would be handy to use some Jinja syntax to check for these instances to perform one state syntax over another.

A simple example might be something like the following:

```
{# a boolean check #}
{% set option_deprecated = salt['salt_version.less_than']("Sodium") %}

{% if option_deprecated %}
    <use old syntax>
{% else %}
    <use new syntax>
{% endif %}
```

#### salt.modules.salt\_version.equal(*name*)

Returns a boolean (True) if the minion's current version code name matches the named version.

**name**

The release code name to check the version against.

CLI Example:

```
salt '*' salt_version.equal 'Oxygen'
```

#### salt.modules.salt\_version.get\_release\_number(*name*)

Returns the release number of a given release code name in a MAJOR.PATCH format (for Salt versions < 3000) or MAJOR for newer Salt versions.

If the release name has not been given an assigned release number, the function returns a string. If the release cannot be found, it returns None.

**name**

The release code name for which to find a release number.

CLI Example:

```
salt '*' salt_version.get_release_number 'Oxygen'
```

#### salt.modules.salt\_version.greater\_than(*name*)

Returns a boolean (True) if the minion's current version code name is greater than the named version.

**name**

The release code name to check the version against.

CLI Example:

```
salt '*' salt_version.greater_than 'Oxygen'
```

`salt.modules.salt_version.less_than(name)`

Returns a boolean (True) if the minion's current version code name is less than the named version.

**name**

The release code name to check the version against.

CLI Example:

```
salt '*' salt_version.less_than 'Oxygen'
```

### 26.6.391 salt.modules.saltcheck

A module for testing the logic of states and highstates on salt minions

**codeauthor**

William Cannon <william.cannon@gmail.com>

**maturity**

new

Saltcheck provides unittest like functionality requiring only the knowledge of salt module execution and yaml. Saltcheck uses salt modules to return data, then runs an assertion against that return. This allows for testing with all the features included in salt modules.

In order to run state and highstate saltcheck tests, a sub-folder in the state directory must be created and named `saltcheck-tests`. Tests for a state should be created in files ending in `*.tst` and placed in the `saltcheck-tests` folder. `tst` files are run through the salt rendering system, enabling tests to be written in yaml (or renderer of choice), and include jinja, as well as the usual grain and pillar information. Like states, multiple tests can be specified in a `tst` file. Multiple `tst` files can be created in the `saltcheck-tests` folder, and should be named the same as the associated state. The `id` of a test works in the same manner as in salt state files and should be unique and descriptive.

New in version 3000: The `saltcheck-tests` folder can be customized using the `saltcheck_test_location` minion configuration setting. This setting is a relative path from the formula's `salt://` path to the test files.

#### Usage

Example Default file system layout:

```
/srv/salt/apache/  
  init.sls  
  config.sls  
  saltcheck-tests/  
    init.tst  
    config.tst  
    deployment_validation.tst
```

Alternative example file system layout with custom `saltcheck_test_location`:

**Minion configuration:**

```
saltcheck_test_location: tests/integration/saltcheck
```

**Filesystem layout:**

```
/srv/salt/apache/
  init.sls
  config.sls
  tests/integration/saltcheck/
    init.tst
    config.tst
    deployment_validation.tst
```

Tests can be run for each state by name, for all `apache/saltcheck/*.tst` files, or for all states assigned to the minion in `top.sls`. Tests may also be created with no associated state. These tests will be run through the use of `saltcheck.run_state_tests`, but will not be automatically run by `saltcheck.run_highstate_tests`.

```
salt '*' saltcheck.run_state_tests apache,apache.config
salt '*' saltcheck.run_state_tests apache check_all=True
salt '*' saltcheck.run_highstate_tests
salt '*' saltcheck.run_state_tests apache.deployment_validation
```

**Saltcheck Keywords****module\_and\_function:**

(str) This is the salt module which will be run locally, the same as `salt-call --local <module>`. The `saltcheck.state_apply` module name is special as it bypasses the local option in order to resolve state names when run in a master/minion environment.

**args:**

(list) Optional arguments passed to the salt module

**kwargs:**

(dict) Optional keyword arguments to be passed to the salt module

**assertion:**

(str) One of the supported assertions and required except for `saltcheck.state_apply` Tests which fail the assertion and `expected_return`, cause saltcheck to exit which a non-zero exit code.

**expected\_return:**

(str) Required except by `assertEmpty`, `assertNotEmpty`, `assertTrue`, `assertFalse`. The return of `module_and_function` is compared to this value in the assertion.

**assertion\_section:**

(str) Optional keyword used to parse the `module_and_function` return. If a salt module returns a dictionary as a result, the `assertion_section` value is used to lookup a specific value in that return for the assertion comparison.

**assertion\_section\_delimiter:**

(str) Optional delimiter to use when splitting a nested structure. Defaults to '!'.

**print\_result:**

(bool) Optional keyword to show results in the `assertEqual`, `assertNotEqual`, `assertIn`, and `assertNotIn` output. Defaults to `True`.

**output\_details:**

(bool) Optional keyword to display `module_and_function`, `args`, `assertion_section`, and assertion results text in the output. If `print_result` is `False`, assertion results will be hidden. This is a per test setting, but can be set globally for all tests by adding `saltcheck_output_details: True` in the minion configuration file. Defaults to `False`

**pillar\_data:**

(dict) Optional keyword for passing in pillar data. Intended for use in potential test setup or teardown with the `saltcheck.state_apply` function.

**skip:**

(bool) Optional keyword to skip running the individual test

New in version 3000: Multiple assertions can be run against the output of a single `module_and_function` call. The `assertion`, `expected_return`, `assertion_section`, and `assertion_section_delimiter` keys can be placed in a list under an `assertions` key. See the multiple assertions example below.

## Sample Cases/Examples

### Basic Example

```
echo_test_hello:
  module_and_function: test.echo
  args:
    - "hello"
  kwargs:
  assertion: assertEquals
  expected_return: 'hello'
```

### Example with jinja

```
{% for package in ["apache2", "openssh"] %}
{# or another example #}
{# for package in salt['pillar.get']("packages") #}
test_{{ package }}_latest:
  module_and_function: pkg.upgrade_available
  args:
    - {{ package }}
  assertion: assertFalse
{% endfor %}
```

## Example with setup state including pillar

```

setup_test_environment:
  module_and_function: saltcheck.state_apply
  args:
    - common
  pillar_data:
    data: value

verify_vim:
  module_and_function: pkg.version
  args:
    - vim
  assertion: assertNotEmpty

```

## Example with jinja

```

{% for package in ["apache2", "openssh"] %}
{# or another example #}
{# for package in salt['pillar.get']("packages") #}
test_{{ package }}_latest:
  module_and_function: pkg.upgrade_available
  args:
    - {{ package }}
  assertion: assertFalse
{% endfor %}

```

## Example with setup state including pillar

```

setup_test_environment:
  module_and_function: saltcheck.state_apply
  args:
    - common
  pillar-data:
    data: value

verify_vim:
  module_and_function: pkg.version
  args:
    - vim
  assertion: assertNotEmpty

```

## Example with skip

```
package_latest:
  module_and_function: pkg.upgrade_available
  args:
    - apache2
  assertion: assertFalse
  skip: True
```

## Example with assertion\_section

```
validate_shell:
  module_and_function: user.info
  args:
    - root
  assertion: assertEquals
  expected_return: /bin/bash
  assertion_section: shell
```

## Example with a nested assertion\_section

```
validate_smb_signing:
  module_and_function: lgpo.get
  args:
    - 'Machine'
  kwargs:
    return_full_policy_names: True
  assertion: assertEquals
  expected_return: Enabled
  assertion_section: 'Computer Configuration|Microsoft network client:
↳Digitally sign communications (always)
  assertion_section_delimiter: '|'
```

## Example suppressing print results

```
validate_env_nameNode:
  module_and_function: hadoop.dfs
  args:
    - text
    - /oozie/common/env.properties
  expected_return: nameNode = hdfs://nameservice2
  assertion: assertNotIn
  print_result: False
```

### Example with multiple assertions and output\_details

```

multiple_validations:
  module_and_function: network.netstat
  assertions:
    - assertion: assertEquals
      assertion_section: "0:program"
      expected_return: "systemd-resolve"
    - assertion: assertEquals
      assertion_section: "0:proto"
      expected_return: "udp"
  output_details: True

```

### Supported assertions

- assertEquals
- assertNotEqual
- assertTrue
- assertFalse
- assertIn
- assertNotIn
- assertGreater
- assertGreaterEqual
- assertLess
- assertLessEqual
- assertEmpty
- assertNotEmpty

**Warning:** The saltcheck.state\_apply function is an alias for state.apply. If using the *ACL system* saltcheck.\* might provide more capability than intended if only saltcheck.run\_state\_tests and saltcheck.run\_highstate\_tests are needed.

**class** salt.modules.saltcheck.**SaltCheck**(saltenv='base')

This class validates and runs the saltchecks

**run\_test**(test\_dict)

Run a single saltcheck test

**class** salt.modules.saltcheck.**StateTestLoader**(saltenv='base')

Class loads in test files for a state e.g. state\_dir/saltcheck-tests/[1.tst, 2.tst, 3.tst]

**add\_test\_files\_for\_sls**(sls\_name, check\_all=False)

Detects states used, caches needed files, and adds to test list

**load\_test\_suite**()

Load tests either from one file, or a set of files

`salt.modules.saltcheck.parallel_scheck(data)`

triggers salt-call in parallel

`salt.modules.saltcheck.report_highstate_tests(saltenv=None)`

Report on tests for states assigned to the minion through highstate. Quits with the exit code for the number of missing tests.

CLI Example:

```
salt '*' saltcheck.report_highstate_tests
```

New in version 3000.

`salt.modules.saltcheck.run_highstate_tests(saltenv=None, only_fails=False, junit=False)`

Execute all tests for states assigned to the minion through highstate and return results

**Parameters**

- **saltenv** (*str*) -- optional saltenv. Defaults to base
- **only\_fails** (*bool*) -- boolean to only print failure results
- **junit** (*bool*) -- boolean to print results in junit format .. versionadded:: 3007.0

CLI Example:

```
salt '*' saltcheck.run_highstate_tests
```

`salt.modules.saltcheck.run_state_tests(state, saltenv=None, check_all=False, only_fails=False, junit=False)`

Execute tests for a salt state and return results Nested states will also be tested

**Parameters**

- **state** (*str*) -- state name for which to run associated .tst test files
- **saltenv** (*str*) -- optional saltenv. Defaults to base
- **check\_all** (*bool*) -- boolean to run all tests in state/saltcheck-tests directory
- **only\_fails** (*bool*) -- boolean to only print failure results
- **junit** (*bool*) -- boolean to print results in junit format .. versionadded:: 3007.0

CLI Example:

```
salt '*' saltcheck.run_state_tests postfix,common
```

Tests will be run in parallel by adding "saltcheck\_parallel: True" in minion config. When enabled, saltcheck will use up to the number of cores detected. This can be limited by setting the "saltcheck\_processes" value to an integer to set the maximum number of parallel processes.

`salt.modules.saltcheck.run_state_tests_ssh(state, saltenv=None, check_all=False, only_fails=False, junit=False)`

This function is an alias of `run_state_tests`.

Execute tests for a salt state and return results Nested states will also be tested

**param str state**

state name for which to run associated .tst test files

**param str saltenv**

optional saltenv. Defaults to base

**param bool check\_all**

boolean to run all tests in state/saltcheck-tests directory

**param bool only\_fails**

boolean to only print failure results

**param bool junit**

boolean to print results in junit format .. versionadded:: 3007.0

CLI Example:

```
salt '*' saltcheck.run_state_tests postfix,common
```

Tests will be run in parallel by adding "saltcheck\_parallel: True" in minion config. When enabled, saltcheck will use up to the number of cores detected. This can be limited by setting the "saltcheck\_processes" value to an integer to set the maximum number of parallel processes.

`salt.modules.saltcheck.run_test(**kwargs)`

Execute one saltcheck test and return result

**Parameters**

**test** (*keyword arg*)--

CLI Example:

```
salt '*' saltcheck.run_test
test='{"module_and_function": "test.echo",
      "assertion": "assertEqual",
      "expected_return": "This works!",
      "args": ["This works!"] }'
```

`salt.modules.saltcheck.state_apply(state_name, **kwargs)`

Runs state.apply with given options to set up test data. Intended to be used for optional test setup or teardown

Reference the state.apply module documentation for arguments and usage options

CLI Example:

```
salt '*' saltcheck.state_apply postfix
```

### 26.6.392 salt.modules.saltcloudmod

Control a salt cloud system

`salt.modules.saltcloudmod.create(name, profile)`

Create the named vm

CLI Example:

```
salt <minion-id> saltcloud.create webserver rackspace_centos_512
```

### 26.6.393 salt.modules.saltutil

The Saltutil module is used to manage the state of the salt minion itself. It is used to manage minion modules as well as automate updates to the salt minion.

**depends**

- esky Python module for update functionality

`salt.modules.saltutil.clear_cache()`

Forcibly removes all caches on a minion.

New in version 2014.7.0.

**WARNING:** The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_cache
```

`salt.modules.saltutil.clear_job_cache` (*hours=24*)

Forcibly removes job cache folders and files on a minion.

New in version 2018.3.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_job_cache hours=12
```

`salt.modules.saltutil.cmd` (*tgt, fun, arg=(), timeout=None, tgt\_type='glob', ret="", kwarg=None, ssh=False, \*\*kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd
```

`salt.modules.saltutil.cmd_iter` (*tgt, fun, arg=(), timeout=None, tgt\_type='glob', ret="", kwarg=None, ssh=False, \*\*kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd_iter
```

`salt.modules.saltutil.find_cached_job` (*jid*)

Return the data for a specific cached job id. Note this only works if `cache_jobs` has previously been set to `True` on the minion.

CLI Example:

```
salt '*' saltutil.find_cached_job <job id>
```

`salt.modules.saltutil.find_job` (*jid*)

Return the data for a specific job id that is currently running.

**jid**

The job id to search for and return data.

CLI Example:

```
salt '*' saltutil.find_job <job id>
```

Note that the `find_job` function only returns job information when the job is still running. If the job is currently running, the output looks something like this:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
-----
  arg:
    - 30
  fun:
    test.sleep
  jid:
    20160503150049487736
  pid:
    9601
  ret:
  tgt:
    my-minion
  tgt_type:
    glob
  user:
    root
```

If the job has already completed, the job cannot be found and therefore the function returns an empty dictionary, which looks like this on the CLI:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
-----
```

#### `salt.modules.saltutil.is_running(fun)`

If the named function is running return the data associated with it/them. The argument can be a glob

CLI Example:

```
salt '*' saltutil.is_running state.highstate
```

#### `salt.modules.saltutil.kill_all_jobs()`

Sends a kill signal (SIGKILL 9) to all currently running jobs

CLI Example:

```
salt '*' saltutil.kill_all_jobs
```

#### `salt.modules.saltutil.kill_job(jid)`

Sends a kill signal (SIGKILL 9) to the named salt job's process

CLI Example:

```
salt '*' saltutil.kill_job <job id>
```

#### `salt.modules.saltutil.list_extmods()`

New in version 2017.7.0.

List Salt modules which have been synced externally

CLI Examples:

```
salt '*' saltutil.list_extmods
```

`salt.modules.saltutil.mmodule`(*saltenv, fun, \*args, \*\*kwargs*)

Loads minion modules from an environment so that they can be used in pillars for that environment

CLI Example:

```
salt '*' saltutil.mmodule base test.ping
```

`salt.modules.saltutil.pillar_refresh`(*wait=False, timeout=30, clean\_cache=True*)

This function is an alias of `refresh_pillar`.

Signal the minion to refresh the in-memory pillar data. See *In-Memory Pillar Data vs. On-Demand Pillar Data*.

**param wait**

Wait for pillar refresh to complete, defaults to False.

**type wait**

bool, optional

**param timeout**

How long to wait in seconds, only used when `wait` is True, defaults to 30.

**type timeout**

int, optional

**param clean\_cache**

Clean the pillar cache, only used when *pillar\_cache* is True. Defaults to True

**type clean\_cache**

bool, optional .. versionadded:: 3005

**return**

Boolean status, True when the `pillar_refresh` event was fired successfully.

CLI Example:

```
salt '*' saltutil.refresh_pillar
salt '*' saltutil.refresh_pillar wait=True timeout=60
```

`salt.modules.saltutil.refresh_beacons`()

Signal the minion to refresh the beacons.

CLI Example:

```
salt '*' saltutil.refresh_beacons
```

`salt.modules.saltutil.refresh_grains`(*\*\*kwargs*)

New in version 2016.3.6,2016.11.4,2017.7.0.

Refresh the minion's grains without syncing custom grains modules from `salt://_grains`.

---

**Note:** The available execution modules will be reloaded as part of this process, as grains can affect which modules are available.

---

**refresh\_pillar**

[True] Set to False to keep pillar data from being refreshed.

**clean\_pillar\_cache**

[False] Set to True to refresh pillar cache.

CLI Examples:

```
salt '*' saltutil.refresh_grains
```

`salt.modules.saltutil.refresh_matchers()`

Signal the minion to refresh its matchers.

CLI Example:

```
salt '*' saltutil.refresh_matchers
```

`salt.modules.saltutil.refresh_modules(**kwargs)`

Signal the minion to refresh the module and grain data

The default is to refresh module asynchronously. To block until the module refresh is complete, set the 'async' flag to False.

CLI Example:

```
salt '*' saltutil.refresh_modules
```

`salt.modules.saltutil.refresh_pillar(wait=False, timeout=30, clean_cache=True)`

Signal the minion to refresh the in-memory pillar data. See *In-Memory Pillar Data vs. On-Demand Pillar Data*.

#### Parameters

- **wait** (*bool, optional*) -- Wait for pillar refresh to complete, defaults to False.
- **timeout** (*int, optional*) -- How long to wait in seconds, only used when wait is True, defaults to 30.
- **clean\_cache** (*bool, optional .. versionadded:: 3005*) -- Clean the pillar cache, only used when *pillar\_cache* is True. Defaults to True

#### Returns

Boolean status, True when the pillar\_refresh event was fired successfully.

CLI Example:

```
salt '*' saltutil.refresh_pillar
salt '*' saltutil.refresh_pillar wait=True timeout=60
```

`salt.modules.saltutil.regen_keys()`

Used to regenerate the minion keys.

CLI Example:

```
salt '*' saltutil.regen_keys
```

`salt.modules.saltutil.revoke_auth(preserve_minion_cache=False)`

The minion sends a request to the master to revoke its own key. Note that the minion session will be revoked and the minion may not be able to return the result of this command back to the master.

If the 'preserve\_minion\_cache' flag is set to True, the master cache for this minion will not be removed.

CLI Example:

```
salt '*' saltutil.revoke_auth
```

`salt.modules.saltutil.runner(name, arg=None, kwarg=None, full_return=False, saltenv='base', jid=None, **kwargs)`

Execute a runner function. This function must be run on the master, either by targeting a minion running on a master or by using salt-call on a master.

New in version 2014.7.0.

#### name

The name of the function to run

**kwargs**

Any keyword arguments to pass to the runner function

CLI Example:

In this example, assume that *master\_minion* is a minion running on a master.

```
salt master_minion saltutil.runner jobs.list_jobs
salt master_minion saltutil.runner test.arg arg="['baz']" kwarg="{ 'foo':
↳ 'bar' }"
```

**salt.modules.saltutil.running()**

Return the data on all running salt processes on the minion

CLI Example:

```
salt '*' saltutil.running
```

**salt.modules.saltutil.signal\_job(jid, sig)**

Sends a signal to the named salt job's process

CLI Example:

```
salt '*' saltutil.signal_job <job id> 15
```

**salt.modules.saltutil.sync\_all** (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None, clean\_pillar\_cache=False*)

Changed in version 3007.0: On masterless minions, master top modules are now synced as well. When *refresh* is set to *True*, this module's cache containing the environments from which extension modules are synced when *saltenv* is not specified will be refreshed.

Changed in version 2015.8.11,2016.3.2: On masterless minions, pillar modules are now synced, and refreshed when *refresh* is set to *True*.

Sync down all of the dynamic modules from the file server for a specific environment. This function synchronizes custom modules, states, beacons, grains, returners, output modules, renderers, and utils.

**refresh**

[*True*] Also refresh the execution modules and recompile pillar data available to the minion. If this is a masterless minion, also refresh the environments from which extension modules are synced after syncing master tops. This refresh will be performed even if no new dynamic modules are synced. Set to *False* to prevent this refresh.

---

**Important:** If this function is executed using a *module.run* state, the SLS file will not have access to newly synced execution modules unless a *refresh* argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_all
    - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

---

**extmod\_whitelist**

[*None*] dictionary of modules to sync based on type

**extmod\_blacklist**

[*None*] dictionary of modules to blacklist based on type

**clean\_pillar\_cache**

[False] Set to True to refresh pillar cache.

CLI Examples:

```
salt '*' saltutil.sync_all
salt '*' saltutil.sync_all saltenv=dev
salt '*' saltutil.sync_all saltenv=base,dev
salt '*' saltutil.sync_all extmod_whitelist={'modules': ['custom_module']}
```

`salt.modules.saltutil.sync_beacons` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2015.5.1.

Sync beacons from `salt://_beacons` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for beacons to sync. If no top files are found, then the *base* environment will be synced.

**refresh**

[True] If True, refresh the available beacons on the minion. This refresh will be performed even if no new beacons are synced. Set to False to prevent this refresh.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_beacons
salt '*' saltutil.sync_beacons saltenv=dev
salt '*' saltutil.sync_beacons saltenv=base,dev
```

`salt.modules.saltutil.sync_clouds` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2017.7.0.

Sync cloud modules from `salt://_cloud` to the minion

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**refresh**

[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_clouds
salt '*' saltutil.sync_clouds saltenv=dev
salt '*' saltutil.sync_clouds saltenv=base,dev
```

`salt.modules.saltutil.sync_engines` (*saltenv=None, refresh=False, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2016.3.0.

Sync engine modules from `salt://_engines` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for engines to sync. If no top files are found, then the `base` environment will be synced.

**refresh**

[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new engine modules are synced. Set to `False` to prevent this refresh.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_engines
salt '*' saltutil.sync_engines saltenv=base,dev
```

`salt.modules.saltutil.sync_executors` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 3000.

Sync executors from `salt://_executors` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for log handlers to sync. If no top files are found, then the `base` environment will be synced.

**refresh**

[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to `False` to prevent this refresh.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_executors
salt '*' saltutil.sync_executors saltenv=dev
salt '*' saltutil.sync_executors saltenv=base,dev
```

`salt.modules.saltutil.sync_grains` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None, clean\_pillar\_cache=False*)

New in version 0.10.0.

Sync grains modules from `salt://_grains` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for grains modules to sync. If no top files are found, then the `base` environment will be synced.

**refresh**

[True] If True, refresh the available execution modules and recompile pillar data for the minion. This refresh will be performed even if no new grains modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

**clean\_pillar\_cache**

[False] Set to True to refresh pillar cache.

CLI Examples:

```
salt '*' saltutil.sync_grains
salt '*' saltutil.sync_grains saltenv=dev
salt '*' saltutil.sync_grains saltenv=base,dev
```

`salt.modules.saltutil.sync_log_handlers` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2015.8.0.

Sync log handlers from `salt://_log_handlers` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for log handlers to sync. If no top files are found, then the `base` environment will be synced.

**refresh**

[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to False to prevent this refresh.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_log_handlers
salt '*' saltutil.sync_log_handlers saltenv=dev
salt '*' saltutil.sync_log_handlers saltenv=base,dev
```

`salt.modules.saltutil.sync_matchers` (*saltenv=None, refresh=False, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2019.2.0.

Sync engine modules from `salt://_matchers` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for engines to sync. If no top files are found, then the `base` environment will be synced.

**refresh**

[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new matcher modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_matchers
salt '*' saltutil.sync_matchers saltenv=base,dev
```

`salt.modules.saltutil.sync_modules` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 0.10.0.

Sync execution modules from `salt://_modules` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for execution modules to sync. If no top files are found, then the base environment will be synced.

**refresh**

[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new execution modules are synced. Set to False to prevent this refresh.

---

**Important:** If this function is executed using a *module.run* state, the SLS file will not have access to newly synced execution modules unless a *refresh* argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_modules
    - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

---

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_modules
salt '*' saltutil.sync_modules saltenv=dev
salt '*' saltutil.sync_modules saltenv=base,dev
```

`salt.modules.saltutil.sync_output` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

Sync outputters from `salt://_output` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for outputters to sync. If no top files are found, then the base environment will be synced.

**refresh**

[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

**salt.modules.saltutil.sync\_outputters** (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

This function is an alias of `sync_output`.

Sync outputters from `salt://_output` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for outputters to sync. If no top files are found, then the base environment will be synced.

**refresh**

[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

**salt.modules.saltutil.sync\_pillar** (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None, clean\_pillar\_cache=False*)

New in version 2015.8.11,2016.3.2.

Sync pillar modules from the `salt://_pillar` directory on the Salt fileserver. This function is environment-aware, pass the desired environment to grab the contents of the `_pillar` directory from that environment. The default environment, if none is specified, is `base`.

**refresh**

[True] Also refresh the execution modules available to the minion, and refresh pillar data.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

**clean\_pillar\_cache**

[False] Set to True to refresh pillar cache.

---

**Note:** This function will raise an error if executed on a traditional (i.e. not masterless) minion

---

CLI Examples:

```
salt '*' saltutil.sync_pillar
salt '*' saltutil.sync_pillar saltenv=dev
```

`salt.modules.saltutil.sync_proxymodules` (*saltenv=None, refresh=False, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2015.8.2.

Sync proxy modules from `salt://_proxy` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for proxy modules to sync. If no top files are found, then the `base` environment will be synced.

**refresh**

[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new proxy modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_proxymodules
salt '*' saltutil.sync_proxymodules saltenv=dev
salt '*' saltutil.sync_proxymodules saltenv=base,dev
```

`salt.modules.saltutil.sync_renderers` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 0.10.0.

Sync renderers from `salt://_renderers` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for renderers to sync. If no top files are found, then the `base` environment will be synced.

**refresh**

[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new renderers are synced. Set to False to prevent this refresh.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_renderers
salt '*' saltutil.sync_renderers saltenv=dev
salt '*' saltutil.sync_renderers saltenv=base,dev
```

`salt.modules.saltutil.sync_returners` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 0.10.0.

Sync returners from `salt://_returners` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for returners to sync. If no top files are found, then the **base** environment will be synced.

**refresh**

[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new returners are synced. Set to False to prevent this refresh.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_returners
salt '*' saltutil.sync_returners saltenv=dev
```

`salt.modules.saltutil.sync_sdb` (*saltenv=None, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2015.5.8,2015.8.3.

Sync sdb modules from `salt://_sdb` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for sdb modules to sync. If no top files are found, then the **base** environment will be synced.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_sdb
salt '*' saltutil.sync_sdb saltenv=dev
salt '*' saltutil.sync_sdb saltenv=base,dev
```

`salt.modules.saltutil.sync_serializers` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2019.2.0.

Sync serializers from `salt://_serializers` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for serializer modules to sync. If no top files are found, then the **base** environment will be synced.

**refresh**

[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new serializer modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_serializers
salt '*' saltutil.sync_serializers saltenv=dev
salt '*' saltutil.sync_serializers saltenv=base,dev
```

`salt.modules.saltutil.sync_states` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 0.10.0.

Sync state modules from `salt://_states` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for state modules to sync. If no top files are found, then the base environment will be synced.

**refresh**

[True] If True, refresh the available states on the minion. This refresh will be performed even if no new state modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_states
salt '*' saltutil.sync_states saltenv=dev
salt '*' saltutil.sync_states saltenv=base,dev
```

`salt.modules.saltutil.sync_thorium` (*saltenv=None, refresh=False, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2018.3.0.

Sync Thorium modules from `salt://_thorium` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for engines to sync. If no top files are found, then the base environment will be synced.

**refresh: True**

If True, refresh the available execution modules on the minion. This refresh will be performed even if no new Thorium modules are synced. Set to False to prevent this refresh.

**extmod\_whitelist**

comma-separated list of modules to sync

**extmod\_blacklist**

comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_thorium
salt '*' saltutil.sync_thorium saltenv=base,dev
```

`salt.modules.saltutil.sync_tops` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 3007.0.

Sync master tops from `salt://_tops` to the minion.

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for master tops to sync. If no top files are found, then the `base` environment will be synced.

**refresh**

[True] Refresh this module's cache containing the environments from which extension modules are synced when `saltenv` is not specified. This refresh will be performed even if no new master tops are synced. Set to `False` to prevent this refresh.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

---

**Note:** This function will raise an error if executed on a traditional (i.e. not masterless) minion

---

CLI Examples:

```
salt '*' saltutil.sync_tops
salt '*' saltutil.sync_tops saltenv=dev
```

`salt.modules.saltutil.sync_utils` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2014.7.0.

Sync utility modules from `salt://_utils` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for utility modules to sync. If no top files are found, then the `base` environment will be synced.

**refresh**

[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to `False` to prevent this refresh.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_utils
salt '*' saltutil.sync_utils saltenv=dev
salt '*' saltutil.sync_utils saltenv=base,dev
```

`salt.modules.saltutil.sync_wrapper` (*saltenv=None, refresh=True, extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 3007.0.

Sync salt-ssh wrapper modules from `salt://_wrapper` to the minion.

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for wrappers to sync. If no top files are found, then the `base` environment will be synced.

**refresh**

[True] If True, refresh the available wrapper modules on the minion. This refresh will be performed even if no wrappers are synced. Set to False to prevent this refresh.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

---

**Note:** This function will raise an error if executed on a traditional (i.e. not masterless) minion.

---

CLI Examples:

```
salt '*' saltutil.sync_wrapper
salt '*' saltutil.sync_wrapper saltenv=dev
salt '*' saltutil.sync_wrapper saltenv=base,dev
```

**salt.modules.saltutil.term\_all\_jobs()**

Sends a termination signal (SIGTERM 15) to all currently running jobs

CLI Example:

```
salt '*' saltutil.term_all_jobs
```

**salt.modules.saltutil.term\_job(jid)**

Sends a termination signal (SIGTERM 15) to the named salt job's process

CLI Example:

```
salt '*' saltutil.term_job <job id>
```

**salt.modules.saltutil.update(version=None)**

Update the salt minion from the URL defined in `opts['update_url']` VMware, Inc provides the latest builds here: `update_url: https://repo.saltproject.io/windows/`

Be aware that as of 2014-8-11 there's a bug in esky such that only the latest version available in the `update_url` can be downloaded and installed.

This feature requires the minion to be running a `bdist_esky` build.

The version number is optional and will default to the most recent version available at `opts['update_url']`.

Returns details about the transaction upon completion.

CLI Examples:

```
salt '*' saltutil.update
salt '*' saltutil.update 0.10.3
```

**salt.modules.saltutil.wheel(name, \*args, \*\*kwargs)**

Execute a wheel module and function. This function must be run against a minion that is local to the master.

New in version 2014.7.0.

**name**

The name of the function to run

**args**

Any positional arguments to pass to the wheel function. A common example of this would be the `match` arg needed for key functions.

New in version 2015.8.11.

**kwargs**

Any keyword arguments to pass to the wheel function

CLI Example:

```
salt my-local-minion saltutil.wheel key.accept jerry
salt my-local-minion saltutil.wheel minions.connected
```

---

**Note:** Since this function must be run against a minion that is running locally on the master in order to get accurate returns, if this function is run against minions that are not local to the master, "empty" returns are expected. The remote minion does not have access to wheel functions and their return data.

---

## 26.6.394 salt.modules.schedule

Module for managing the Salt schedule on a minion

Requires that `python-dateutil` is installed on the minion.

New in version 2014.7.0.

`salt.modules.schedule.add`(*name*, *\*\*kwargs*)

Add a job to the schedule

CLI Example:

```
salt '*' schedule.add job1 function='test.ping' seconds=3600
# If function have some arguments, use job_args
salt '*' schedule.add job2 function='cmd.run' job_args="['date >> /tmp/
→date.log']" seconds=60

# Add job to Salt minion when the Salt minion is not running
salt '*' schedule.add job1 function='test.ping' seconds=3600 offline=True
```

`salt.modules.schedule.build_schedule_item`(*name*, *\*\*kwargs*)

Build a schedule job

CLI Example:

```
salt '*' schedule.build_schedule_item job1 function='test.ping'
→seconds=3600
```

`salt.modules.schedule.copy`(*name*, *target*, *\*\*kwargs*)

Copy scheduled job to another minion or minions.

CLI Example:

```
salt '*' schedule.copy jobname target
```

`salt.modules.schedule.delete(name, **kwargs)`

Delete a job from the minion's schedule

CLI Example:

```
salt '*' schedule.delete job1

# Delete job on Salt minion when the Salt minion is not running
salt '*' schedule.delete job1
```

`salt.modules.schedule.disable(**kwargs)`

Disable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.disable
```

`salt.modules.schedule.disable_job(name, **kwargs)`

Disable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.disable_job job1
```

`salt.modules.schedule.enable(**kwargs)`

Enable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.enable
```

`salt.modules.schedule.enable_job(name, **kwargs)`

Enable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.enable_job job1
```

`salt.modules.schedule.is_enabled(name=None)`

List a Job only if its enabled

If job is not specified, indicate if the scheduler is enabled or disabled.

New in version 2015.5.3.

CLI Example:

```
salt '*' schedule.is_enabled name=job_name
salt '*' schedule.is_enabled
```

`salt.modules.schedule.job_status(name, time_fmt='%Y-%m-%dT%H:%M:%S')`

Show the information for a particular job.

CLI Example:

```
salt '*' schedule.job_status job_name
```

`salt.modules.schedule.list_`(*show\_all=False, show\_disabled=True, where=None, return\_yaml=True, offline=False*)

List the jobs currently scheduled on the minion

CLI Example:

```
salt '*' schedule.list

# Show all jobs including hidden internal jobs
salt '*' schedule.list show_all=True

# Hide disabled jobs from list of jobs
salt '*' schedule.list show_disabled=False
```

`salt.modules.schedule.modify`(*name, \*\*kwargs*)

Modify an existing job in the schedule

CLI Example:

```
salt '*' schedule.modify job1 function='test.ping' seconds=3600

# Modify job on Salt minion when the Salt minion is not running
salt '*' schedule.modify job1 function='test.ping' seconds=3600
→offline=True
```

`salt.modules.schedule.move`(*name, target, \*\*kwargs*)

Move scheduled job to another minion or minions.

CLI Example:

```
salt '*' schedule.move jobname target
```

`salt.modules.schedule.postpone_job`(*name, current\_time, new\_time, \*\*kwargs*)

Postpone a job in the minion's schedule

Current time and new time should be in date string format, default value is %Y-%m-%dT%H:%M:%S.

New in version 2018.3.0.

CLI Example:

```
salt '*' schedule.postpone_job job current_time new_time

salt '*' schedule.postpone_job job current_time new_time time_fmt='%Y-%m-
→%dT%H:%M:%S'
```

`salt.modules.schedule.purge`(*\*\*kwargs*)

Purge all the jobs currently scheduled on the minion

CLI Example:

```
salt '*' schedule.purge

# Purge jobs on Salt minion
salt '*' schedule.purge
```

`salt.modules.schedule.reload_()`

Reload saved scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.reload
```

`salt.modules.schedule.run_job(name, force=False)`

Run a scheduled job on the minion immediately

CLI Example:

```
salt '*' schedule.run_job job1

salt '*' schedule.run_job job1 force=True
Force the job to run even if it is disabled.
```

`salt.modules.schedule.save(**kwargs)`

Save all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.save
```

`salt.modules.schedule.show_next_fire_time(name, **kwargs)`

Show the next fire time for scheduled job

New in version 2018.3.0.

CLI Example:

```
salt '*' schedule.show_next_fire_time job_name
```

`salt.modules.schedule.skip_job(name, current_time, **kwargs)`

Skip a job in the minion's schedule at specified time.

Time to skip should be specified as date string format, default value is %Y-%m-%dT%H:%M:%S.

New in version 2018.3.0.

CLI Example:

```
salt '*' schedule.skip_job job time
```

## 26.6.395 salt.modules.scp

### SCP Module

New in version 2019.2.0.

Module to copy files via [SCP](#)

`salt.modules.scp_mod.get(remote_path, local_path="", recursive=False, preserve_times=False, **kwargs)`

Transfer files and directories from remote host to the localhost of the Minion.

**remote\_path**

Path to retrieve from remote host. Since this is evaluated by scp on the remote host, shell wildcards and environment variables may be used.

**recursive: False**

Transfer files and directories recursively.

**preserve\_times: False**

Preserve `mtime` and `atime` of transferred files and directories.

**hostname**

The hostname of the remote device.

**port: 22**

The port of the remote device.

**username**

The username required for SSH authentication on the device.

**password**

Used for password authentication. It is also used for private key decryption if `passphrase` is not given.

**passphrase**

Used for decrypting private keys.

**pkey**

An optional private key to use for authentication.

**key\_filename**

The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

**timeout**

An optional timeout (in seconds) for the TCP connect.

**socket\_timeout: 10**

The channel socket timeout in seconds.

**buff\_size: 16384**

The size of the SCP send buffer.

**allow\_agent: True**

Set to `False` to disable connecting to the SSH agent.

**look\_for\_keys: True**

Set to `False` to disable searching for discoverable private key files in `~/ .ssh/`

**banner\_timeout**

An optional timeout (in seconds) to wait for the SSH banner to be presented.

**auth\_timeout**

An optional timeout (in seconds) to wait for an authentication response.

**auto\_add\_policy: False**

Automatically add the host to the `known_hosts`.

CLI Example:

```
salt '*' scp.get /var/tmp/file /tmp/file hostname=10.10.10.1 auto_add_
→policy=True
```

```
salt.modules.scp_mod.put(files, remote_path=None, recursive=False, preserve_times=False, saltenv='base',
                        **kwargs)
```

Transfer files and directories to remote host.

**files**

A single path or a list of paths to be transferred.

**remote\_path**

The path on the remote device where to store the files.

**recursive: True**

Transfer files and directories recursively.

**preserve\_times: False**

Preserve `mtime` and `atime` of transferred files and directories.

**hostname**

The hostname of the remote device.

**port: 22**

The port of the remote device.

**username**

The username required for SSH authentication on the device.

**password**

Used for password authentication. It is also used for private key decryption if `passphrase` is not given.

**passphrase**

Used for decrypting private keys.

**pkey**

An optional private key to use for authentication.

**key\_filename**

The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

**timeout**

An optional timeout (in seconds) for the TCP connect.

**socket\_timeout: 10**

The channel socket timeout in seconds.

**buff\_size: 16384**

The size of the SCP send buffer.

**allow\_agent: True**

Set to `False` to disable connecting to the SSH agent.

**look\_for\_keys: True**

Set to `False` to disable searching for discoverable private key files in `~/ .ssh/`

**banner\_timeout**

An optional timeout (in seconds) to wait for the SSH banner to be presented.

**auth\_timeout**

An optional timeout (in seconds) to wait for an authentication response.

**auto\_add\_policy: False**

Automatically add the host to the `known_hosts`.

CLI Example:

```
salt '*' scp.put /path/to/file /var/tmp/file hostname=server1 auto_add_
→policy=True
```

## 26.6.396 salt.modules.scsi

SCSI administration module

`salt.modules.scsi.ls_(get_size=True)`

List SCSI devices, with details

CLI Examples:

```
salt '*' scsi.ls
salt '*' scsi.ls get_size=False
```

**get\_size**

[True] Get the size information for scsi devices. This option should be set to `False` for older OS distributions (RHEL6 and older) due to lack of support for the `'-s'` option in `lsscsi`.

New in version 2015.5.10.

`salt.modules.scsi.rescan_all(host)`

List scsi devices

CLI Example:

```
salt '*' scsi.rescan_all 0
```

## 26.6.397 salt.modules.sdb

### Module for Manipulating Data via the Salt DB API

`salt.modules.sdb.delete(uri)`

Delete a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully deleted, return `False`.

CLI Example:

```
salt '*' sdb.delete sdb://mymemcached/foo
```

`salt.modules.sdb.get(uri, strict=False)`

Get a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided is not valid, then it will be returned as-is, unless `strict=True` was passed.

CLI Example:

```
salt '*' sdb.get sdb://mymemcached/foo strict=True
```

`salt.modules.sdb.get_or_set_hash(uri, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#%&^*(_=+)' )`

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

State Example:

```
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: '{{ salt["sdb.get_or_set_hash"]("sdb://mymemcached/some_
↪user_pass") }}'
```

CLI Example:

```
salt '*' sdb.get_or_set_hash 'sdb://mymemcached/SECRET_KEY' 50
```

**Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with `%`. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

`salt.modules.sdb.set_(uri, value)`

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt '*' sdb.set sdb://mymemcached/foo bar
```

## 26.6.398 salt.modules.seed

Virtual machine image management tools

```
salt.modules.seed.apply_(path, id_=None, config=None, approve_key=True, install=True,
                        prep_install=False, pub_key=None, priv_key=None, mount_point=None)
```

Seed a location (disk image, directory, or block device) with the minion config, approve the minion's key, and/or install salt-minion.

CLI Example:

```
salt 'minion' seed.apply path id [config=config_data] \
    [gen_key=(true|false)] [approve_key=(true|false)] \
    [install=(true|false)]
```

### path

Full path to the directory, device, or disk image on the target minion's file system.

### id

Minion id with which to seed the path.

### config

Minion configuration options. By default, the 'master' option is set to the target host's 'master'.

### approve\_key

Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: true.

### install

Install salt-minion, if absent. Default: true.

### prep\_install

Prepare the bootstrap script, but don't run it. Default: false

```
salt.modules.seed.mkconfig(config=None, tmp=None, id_=None, approve_key=True, pub_key=None,
                          priv_key=None)
```

Generate keys and config and put them in a tmp directory.

### pub\_key

absolute path or file content of an optional preseeded salt key

### priv\_key

absolute path or file content of an optional preseeded salt key

CLI Example:

```
salt 'minion' seed.mkconfig [config=config_data] [tmp=tmp_dir] \
    [id_=minion_id] [approve_key=(true|false)]
```

```
salt.modules.seed.prep_bootstrap(mpt)
```

Update and get the random script to a random place

CLI Example:

```
salt '*' seed.prep_bootstrap /tmp
```

## 26.6.399 salt.modules.selinux

Execute calls on selinux

**Note:** This module requires the `semanage`, `setsebool`, and `semodule` commands to be available on the minion. On RHEL-based distributions, ensure that the `policycoreutils` and `policycoreutils-python` packages are installed. If not on a Fedora or RHEL-based distribution, consult the selinux documentation for your distribution to ensure that the proper packages are installed.

`salt.modules.selinux.fcontext_add_policy` (*name*, *filetype=None*, *sel\_type=None*, *sel\_user=None*, *sel\_level=None*)

New in version 2019.2.0.

Adds the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to `semanage`.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with `semanage` automatically overwrites a previously configured SELinux context.

**name**

filespec of the file or directory. Regex syntax is allowed.

**file\_type**

The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to 'a' (all files).

**sel\_type**

SELinux context type. There are many.

**sel\_user**

SELinux user. Use `semanage login -l` to determine which ones are available to you.

**sel\_level**

The MLS range of the SELinux context.

CLI Example:

```
salt '*' selinux.fcontext_add_policy my-policy
```

`salt.modules.selinux.fcontext_apply_policy` (*name*, *recursive=False*)

New in version 2017.7.0.

Applies SELinux policies to filespec using `restorecon [-R] filespec`. Returns dict with changes if successful, the output of the `restorecon` command otherwise.

**name**

filespec of the file or directory. Regex syntax is allowed.

**recursive**

Recursively apply SELinux policies.

CLI Example:

```
salt '*' selinux.fcontext_apply_policy my-policy
```

`salt.modules.selinux.fcontext_delete_policy` (*name*, *filetype=None*, *sel\_type=None*, *sel\_user=None*, *sel\_level=None*)

New in version 2019.2.0.

Deletes the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to `semanage`.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with `semanage` automatically overwrites a previously configured SELinux context.

**name**

filespec of the file or directory. Regex syntax is allowed.

**file\_type**

The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to 'a' (all files).

**sel\_type**

SELinux context type. There are many.

**sel\_user**

SELinux user. Use `semanage login -l` to determine which ones are available to you.

**sel\_level**

The MLS range of the SELinux context.

CLI Example:

```
salt '*' selinux.fcontext_delete_policy my-policy
```

`salt.modules.selinux.fcontext_get_policy`(*name*, *filetype=None*, *sel\_type=None*, *sel\_user=None*, *sel\_level=None*)

New in version 2017.7.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:

- filespec (the name supplied and matched)
- filetype (the descriptive name of the filetype supplied)
- sel\_user, sel\_role, sel\_type, sel\_level (the selinux context)

For a more in-depth explanation of the selinux context, go to [https://access.redhat.com/documentation/en-US/Red\\_Hat\\_Enterprise\\_Linux/6/html/Security-Enhanced\\_Linux/chap-Security-Enhanced\\_Linux-SELinux\\_Contexts.html](https://access.redhat.com/documentation/en-US/Red_Hat_Enterprise_Linux/6/html/Security-Enhanced_Linux/chap-Security-Enhanced_Linux-SELinux_Contexts.html)

**name**

filespec of the file or directory. Regex syntax is allowed.

**filetype**

The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to 'a' (all files).

CLI Example:

```
salt '*' selinux.fcontext_get_policy my-policy
```

`salt.modules.selinux.fcontext_policy_is_applied`(*name*, *recursive=False*)

New in version 2017.7.0.

Returns an empty string if the SELinux policy for a given filespec is applied, returns string with differences in policy and actual situation otherwise.

**name**

filespec of the file or directory. Regex syntax is allowed.

CLI Example:

```
salt '*' selinux.fcontext_policy_is_applied my-policy
```

`salt.modules.selinux.filetype_id_to_string`(*filetype='a'*)

New in version 2017.7.0.

Translates SELinux filetype single-letter representation to a more human-readable version (which is also used in `semanage fcontext -l`).

`salt.modules.selinux.getconfig()`

Return the selinux mode from the config file

CLI Example:

```
salt '*' selinux.getconfig
```

`salt.modules.selinux.getenforce()`

Return the mode selinux is running in

CLI Example:

```
salt '*' selinux.getenforce
```

`salt.modules.selinux.getsebool(boolean)`

Return the information on a specific selinux boolean

CLI Example:

```
salt '*' selinux.getsebool virt_use_usb
```

`salt.modules.selinux.getsemod(module)`

Return the information on a specific selinux module

CLI Example:

```
salt '*' selinux.getsemod mysql
```

New in version 2016.3.0.

`salt.modules.selinux.install_semod(module_path)`

Install custom SELinux module from file

CLI Example:

```
salt '*' selinux.install_semod [salt://]path/to/module.pp
```

New in version 2016.11.6.

`salt.modules.selinux.list_sebool()`

Return a structure listing all of the selinux booleans on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_sebool
```

`salt.modules.selinux.list_semod()`

Return a structure listing all of the selinux modules on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_semod
```

New in version 2016.3.0.

`salt.modules.selinux.port_add_policy(name, sel_type=None, protocol=None, port=None, sel_range=None)`

New in version 2019.2.0.

Adds the SELinux policy for a given protocol and port.

Returns the result of the call to semanage.

**name**

The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

**sel\_type**

The SELinux Type. Required.

**protocol**

The protocol for the port, tcp or udp. Required if name is not formatted.

**port**

The port or port range. Required if name is not formatted.

**sel\_range**

The SELinux MLS/MCS Security Range.

CLI Example:

```
salt '*' selinux.port_add_policy tcp/8080 http_port_t
salt '*' selinux.port_add_policy foobar http_port_t protocol=tcp port=8091
```

**salt.modules.selinux.port\_delete\_policy**(*name, protocol=None, port=None*)

New in version 2019.2.0.

Deletes the SELinux policy for a given protocol and port.

Returns the result of the call to semanage.

**name**

The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

**protocol**

The protocol for the port, tcp or udp. Required if name is not formatted.

**port**

The port or port range. Required if name is not formatted.

CLI Example:

```
salt '*' selinux.port_delete_policy tcp/8080
salt '*' selinux.port_delete_policy foobar protocol=tcp port=8091
```

**salt.modules.selinux.port\_get\_policy**(*name, sel\_type=None, protocol=None, port=None*)

New in version 2019.2.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:

- sel\_type (the selinux type)
- proto (the protocol)
- port (the port(s) and/or port range(s))

**name**

The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

**sel\_type**

The SELinux Type.

**protocol**

The protocol for the port, tcp or udp. Required if name is not formatted.

**port**

The port or port range. Required if name is not formatted.

CLI Example:

```
salt '*' selinux.port_get_policy tcp/80
salt '*' selinux.port_get_policy foobar protocol=tcp port=80
```

`salt.modules.selinux.port_modify_policy` (*name*, *sel\_type=None*, *protocol=None*, *port=None*, *sel\_range=None*)

New in version 2019.2.0.

Modifies the SELinux policy for a given protocol and port.

Returns the result of the call to semanage.

**name**

The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

**sel\_type**

The SELinux Type. Required.

**protocol**

The protocol for the port, tcp or udp. Required if name is not formatted.

**port**

The port or port range. Required if name is not formatted.

**sel\_range**

The SELinux MLS/MCS Security Range.

CLI Example:

```
salt '*' selinux.port_modify_policy tcp/8080 http_port_t
salt '*' selinux.port_modify_policy foobar http_port_t protocol=tcp
→port=8091
```

`salt.modules.selinux.remove_semod` (*module*)

Remove SELinux module

CLI Example:

```
salt '*' selinux.remove_semod module_name
```

New in version 2016.11.6.

`salt.modules.selinux.selinux_fs_path` ()

Return the location of the SELinux VFS directory

CLI Example:

```
salt '*' selinux.selinux_fs_path
```

`salt.modules.selinux.setenforce` (*mode*)

Set the SELinux enforcing mode

CLI Example:

```
salt '*' selinux.setenforce enforcing
```

`salt.modules.selinux.setsebool` (*boolean*, *value*, *persist=False*)

Set the value for a boolean

CLI Example:

```
salt '*' selinux.setsebool virt_use_usb off
```

`salt.modules.selinux.setsebools` (*pairs*, *persist=False*)

Set the value of multiple booleans

CLI Example:

```
salt '*' selinux.setsebools '{virt_use_usb: on, squid_use_tproxy: off}'
```

`salt.modules.selinux.setsemod` (*module*, *state*)

Enable or disable an SELinux module.

CLI Example:

```
salt '*' selinux.setsemod nagios Enabled
```

New in version 2016.3.0.

### 26.6.400 `salt.modules.sensehat`

Module for controlling the LED matrix or reading environment data on the SenseHat of a Raspberry Pi.

New in version 2017.7.0.

**maintainer**

Benedikt Werner <1benediktwerner@gmail.com>, Joachim Werner <joe@suse.com>

**maturity**

new

**depends**

sense\_hat Python module

The rotation of the Pi can be specified in a pillar. This is useful if the Pi is used upside down or sideways to correct the orientation of the image being shown.

Example:

```
sensehat:  
rotation: 90
```

`salt.modules.sensehat.clear` (*color=None*)

Sets the LED matrix to a single color or turns all LEDs off.

CLI Example:

```
salt 'raspberrypi' sensehat.clear  
salt 'raspberrypi' sensehat.clear '[255, 0, 0]'
```

`salt.modules.sensehat.get_humidity` ()

Get the percentage of relative humidity from the humidity sensor.

`salt.modules.sensehat.get_pixel` (*x*, *y*)

Returns the color of a single pixel on the LED matrix.

*x*

The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.

*y*

The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.

---

**Note:** Please read the note for `get_pixels`

---

### `salt.modules.sensehat.get_pixels()`

Returns a list of 64 smaller lists of [R, G, B] pixels representing the the currently displayed image on the LED matrix.

---

**Note:** When using `set_pixels` the pixel values can sometimes change when you read them again using `get_pixels`. This is because we specify each pixel element as 8 bit numbers (0 to 255) but when they're passed into the Linux frame buffer for the LED matrix the numbers are bit shifted down to fit into RGB 565. 5 bits for red, 6 bits for green and 5 bits for blue. The loss of binary precision when performing this conversion (3 bits lost for red, 2 for green and 3 for blue) accounts for the discrepancies you see.

The `get_pixels` method provides an accurate representation of how the pixels end up in frame buffer memory after you have called `set_pixels`.

---

### `salt.modules.sensehat.get_pressure()`

Gets the current pressure in Millibars from the pressure sensor.

### `salt.modules.sensehat.get_temperature()`

Gets the temperature in degrees Celsius from the humidity sensor. Equivalent to calling `get_temperature_from_humidity`.

If you get strange results try using `get_temperature_from_pressure`.

### `salt.modules.sensehat.get_temperature_from_humidity()`

Gets the temperature in degrees Celsius from the humidity sensor.

### `salt.modules.sensehat.get_temperature_from_pressure()`

Gets the temperature in degrees Celsius from the pressure sensor.

### `salt.modules.sensehat.low_light(low_light=True)`

Sets the LED matrix to low light mode. Useful in a dark environment.

CLI Example:

```
salt 'raspberrypi' sensehat.low_light
salt 'raspberrypi' sensehat.low_light False
```

### `salt.modules.sensehat.set_pixel(x, y, color)`

Sets a single pixel on the LED matrix to a specified color.

**x**

The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.

**y**

The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.

**color**

The new color of the pixel as a list of [R, G, B] values.

CLI Example:

```
salt 'raspberrypi' sensehat.set_pixel 0 0 '[255, 0, 0]'
```

### `salt.modules.sensehat.set_pixels(pixels)`

Sets the entire LED matrix based on a list of 64 pixel values

**pixels**

A list of 64 [R, G, B] color values.

`salt.modules.sensehat.show_image(image)`

Displays an 8 x 8 image on the LED matrix.

**image**

The path to the image to display. The image must be 8 x 8 pixels in size.

CLI Example:

```
salt 'raspberrry' sensehat.show_image /tmp/my_image.png
```

`salt.modules.sensehat.show_letter(letter, text_color=None, back_color=None)`

Displays a single letter on the LED matrix.

**letter**

The letter to display

**text\_color**

The color in which the letter is shown. Defaults to '[255, 255, 255]' (white).

**back\_color**

The background color of the display. Defaults to '[0, 0, 0]' (black).

CLI Example:

```
salt 'raspberrry' sensehat.show_letter 0
salt 'raspberrry' sensehat.show_letter X '[255, 0, 0]'
salt 'raspberrry' sensehat.show_letter B '[0, 0, 255]' '[255, 255, 0]'
```

`salt.modules.sensehat.show_message(message, msg_type=None, text_color=None, back_color=None, scroll_speed=0.1)`

Displays a message on the LED matrix.

**message**

The message to display

**msg\_type**

The type of the message. Changes the appearance of the message.

Available types are:

```
error:      red text
warning:    orange text
success:    green text
info:       blue text
```

**scroll\_speed**

The speed at which the message moves over the LED matrix. This value represents the time paused for between shifting the text to the left by one column of pixels. Defaults to '0.1'.

**text\_color**

The color in which the message is shown. Defaults to '[255, 255, 255]' (white).

**back\_color**

The background color of the display. Defaults to '[0, 0, 0]' (black).

CLI Example:

```
salt 'raspberrry' sensehat.show_message 'Status ok'
salt 'raspberrry' sensehat.show_message 'Something went wrong' error
salt 'raspberrry' sensehat.show_message 'Red' text_color='[255, 0, 0]'
salt 'raspberrry' sensehat.show_message 'Hello world' None '[0, 0, 255]'
→ '[255, 255, 0]' 0.2
```

## 26.6.401 salt.modules.sensors

Read lm-sensors

New in version 2014.1.3.

`salt.modules.sensors.sense(chip, fahrenheit=False)`

Gather lm-sensors data from a given chip

To determine the chip to query, use the 'sensors' command and see the leading line in the block.

Example:

```
/usr/bin/sensors
```

```
coretemp-isa-0000 Adapter: ISA adapter Physical id 0: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 0: +52.0°C
(high = +87.0°C, crit = +105.0°C) Core 1: +50.0°C (high = +87.0°C, crit = +105.0°C) Core 2: +56.0°C (high = +87.0°C,
crit = +105.0°C) Core 3: +53.0°C (high = +87.0°C, crit = +105.0°C)
```

Given the above, the chip is 'coretemp-isa-0000'.

## 26.6.402 salt.modules.serverdensity\_device

### Wrapper around Server Density API

New in version 2014.7.0.

`salt.modules.serverdensity_device.create(name, **params)`

Function to create device in Server Density. For more info, see the [API docs](#).

CLI Example:

```
salt '*' serverdensity_device.create lama
salt '*' serverdensity_device.create rich_lama group=lama_band
→ installed RAM=32768
```

`salt.modules.serverdensity_device.delete(device_id)`

Delete a device from Server Density. For more information, see the [API docs](#).

CLI Example:

```
salt '*' serverdensity_device.delete 51f7eafcdba4bb235e000ae4
```

`salt.modules.serverdensity_device.get_sd_auth(val, sd_auth_pillar_name='serverdensity')`

Returns requested Server Density authentication value from pillar.

CLI Example:

```
salt '*' serverdensity_device.get_sd_auth <val>
```

`salt.modules.serverdensity_device.install_agent(agent_key, agent_version=1)`

Function downloads Server Density installation agent, and installs sd-agent with agent\_key. Optionally the agent\_version would select the series to use (defaults on the v1 one).

CLI Example:

```
salt '*' serverdensity_device.install_agent
→c2bbdd6689ff46282bdaa07555641498
salt '*' serverdensity_device.install_agent
→c2bbdd6689ff46282bdaa07555641498 2
```

`salt.modules.serverdensity_device.ls(**params)`

List devices in Server Density

Results will be filtered by any params passed to this function. For more information, see the API docs on [listing](#) and [searching](#).

CLI Example:

```
salt '*' serverdensity_device.ls
salt '*' serverdensity_device.ls name=lama
salt '*' serverdensity_device.ls name=lama group=lama_band
→installedRAM=32768
```

`salt.modules.serverdensity_device.update(device_id, **params)`

Updates device information in Server Density. For more information see the [API docs](#).

CLI Example:

```
salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=lama
→group=lama_band
salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=better_
→lama group=rock_lamas swapSpace=512
```

### 26.6.403 salt.modules.servicenow

Module for execution of ServiceNow CI (configuration items)

New in version 2016.11.0.

#### depends

servicenow\_rest python module

#### configuration

Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'servicenow' key by default, if defined.

For example:

```
servicenow:
  instance_name: ''
  username: ''
  password: ''
```

`salt.modules.servicenow.delete_record(table, sys_id)`

Delete an existing record

#### Parameters

- **table** (str) -- The table name, e.g. sys\_user
- **sys\_id** (str) -- The unique ID of the record

CLI Example:

```
salt myminion servicenow.delete_record sys_computer 2134566
```

`salt.modules.servicenow.non_structured_query` (*table*, *query=None*, *\*\*kwargs*)

Run a non-structured (not a dict) query on a servicenow table. See [http://wiki.servicenow.com/index.php?title=Encoded\\_Query\\_Strings#gsc.tab=0](http://wiki.servicenow.com/index.php?title=Encoded_Query_Strings#gsc.tab=0) for help on constructing a non-structured query string.

**Parameters**

- **table** (str) -- The table name, e.g. sys\_user
- **query** (str) -- The query to run (or use keyword arguments to filter data)

CLI Example:

```
salt myminion servicenow.non_structured_query sys_computer 'role=web'
salt myminion servicenow.non_structured_query sys_computer role=web
→ type=computer
```

`salt.modules.servicenow.set_change_request_state` (*change\_id*, *state='approved'*)

Set the approval state of a change request/record

**Parameters**

- **change\_id** (str) -- The ID of the change request, e.g. CHG123545
- **state** (str) -- The target state, e.g. approved

CLI Example:

```
salt myminion servicenow.set_change_request_state CHG000123 declined
salt myminion servicenow.set_change_request_state CHG000123 approved
```

`salt.modules.servicenow.update_record_field` (*table*, *sys\_id*, *field*, *value*)

Update the value of a record's field in a servicenow table

**Parameters**

- **table** (str) -- The table name, e.g. sys\_user
- **sys\_id** (str) -- The unique ID of the record
- **field** (str) -- The new value
- **value** (str) -- The new value

CLI Example:

```
salt myminion servicenow.update_record_field sys_user 2348234 first_name
→ jimmy
```

## 26.6.404 salt.modules.slack\_notify

Module for sending messages to Slack

New in version 2015.5.0.

**configuration**

This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.call_hook` (*message*, *attachment=None*, *color='good'*, *short=False*, *identifier=None*, *channel=None*, *username=None*, *icon\_emoji=None*)

Send message to Slack incoming webhook.

**Parameters**

- **message** -- The topic of message.
- **attachment** -- The message to send to the Slack WebHook.
- **color** -- The color of border of left side
- **short** -- An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
- **identifier** -- The identifier of WebHook.
- **channel** -- The channel to use instead of the WebHook default.
- **username** -- Username to use instead of WebHook default.
- **icon\_emoji** -- Icon to use instead of WebHook default.

**Returns**

Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.call_hook message='Hello, from SaltStack'
```

`salt.modules.slack_notify.find_room`(*name*, *api\_key=None*)

Find a room by name and return it.

**Parameters**

- **name** -- The room name.
- **api\_key** -- The Slack admin api key.

**Returns**

The room object.

CLI Example:

```
salt '*' slack.find_room name="random"
salt '*' slack.find_room name="random" api_
↳key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.find_user`(*name*, *api\_key=None*)

Find a user by name and return it.

**Parameters**

- **name** -- The user name.
- **api\_key** -- The Slack admin api key.

**Returns**

The user object.

CLI Example:

```
salt '*' slack.find_user name="ThomasHatch"
salt '*' slack.find_user name="ThomasHatch" api_
↳key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.list_rooms`(*api\_key=None*)

List all Slack rooms.

**Parameters**

**api\_key** -- The Slack admin api key.

**Returns**

The room list.

CLI Example:

```
salt '*' slack.list_rooms
salt '*' slack.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.list_users`(*api\_key=None*)

List all Slack users.

**Parameters**

**api\_key** -- The Slack admin api key.

**Returns**

The user list.

CLI Example:

```
salt '*' slack.list_users
salt '*' slack.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.post_message`(*channel, message, from\_name, api\_key=None, icon=None, attachments=None, blocks=None*)

Send a message to a Slack channel.

Changed in version 3003: Added *attachments* and *blocks* kwargs

**Parameters**

- **channel** -- The channel name, either will work.
- **message** -- The message to send to the Slack channel.
- **from\_name** -- Specify who the message is from.
- **api\_key** -- The Slack api key, if not specified in the configuration.
- **icon** -- URL to an image to use as the icon for this message
- **attachments** -- Any attachments to be sent with the message.
- **blocks** -- Any blocks to be sent with the message.

**Returns**

Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.post_message channel="Development Room" message="Build is
→done" from_name="Build Server"
```

### 26.6.405 salt.modules.slackware\_service

The service module for Slackware

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see [here](#).

---

`salt.modules.slackware_service.available`(*name*)

Returns True if the specified service is available, otherwise returns False.

New in version 3002.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.slackware_service.disable(name, **kwargs)`

Disable the named service to start at boot

New in version 3002.

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.slackware_service.disabled(name)`

Return True if the named service is enabled, false otherwise

New in version 3002.

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.slackware_service.enable(name, **kwargs)`

Enable the named service to start at boot

New in version 3002.

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.slackware_service.enabled(name, **kwargs)`

Return True if the named service is enabled, false otherwise

New in version 3002.

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.slackware_service.force_reload(name)`

Force-reload the named service

New in version 3002.

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.slackware_service.get_all()`

Return all available boot services

New in version 3002.

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.slackware_service.get_disabled()`

Return a set of services that are installed but disabled

New in version 3002.

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.slackware_service.get_enabled()`

Return a list of service that are enabled on boot

New in version 3002.

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.slackware_service.missing(name)`

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

New in version 3002.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.slackware_service.reload_(name)`

Reload the named service

New in version 3002.

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.slackware_service.restart(name)`

Restart the named service

New in version 3002.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.slackware_service.start(name)`

Start the specified service

New in version 3002.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.slackware_service.status(name, sig=None)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

New in version 3002.

#### Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Signature to use to find the service via ps

#### Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type**

bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.slackware_service.stop`(*name*)

Stop the specified service

New in version 3002.

CLI Example:

```
salt '*' service.stop <service name>
```

**26.6.406 salt.modules.slsutil**

Utility functions for use with or in SLS files

`salt.modules.slsutil.banner` (*width=72, commentchar='#, borderchar='#, blockstart=None, blockend=None, title=None, text=None, newline=False*)

Create a standardized comment block to include in a templated file.

A common technique in configuration management is to include a comment block in managed files, warning users not to modify the file. This function simplifies and standardizes those comment blocks.

**Parameters**

- **width** -- The width, in characters, of the banner. Default is 72.
- **commentchar** -- The character to be used in the starting position of each line. This value should be set to a valid line comment character for the syntax of the file in which the banner is being inserted. Multiple character sequences, like '/' are supported. If the file's syntax does not support line comments (such as XML), use the `blockstart` and `blockend` options.
- **borderchar** -- The character to use in the top and bottom border of the comment box. Must be a single character.
- **blockstart** -- The character sequence to use at the beginning of a block comment. Should be used in conjunction with `blockend`
- **blockend** -- The character sequence to use at the end of a block comment. Should be used in conjunction with `blockstart`
- **title** -- The first field of the comment block. This field appears centered at the top of the box.
- **text** -- The second field of the comment block. This field appears left-justified at the bottom of the box.
- **newline** -- Boolean value to indicate whether the comment block should end with a newline. Default is `False`.

**Example 1 - the default banner:**

```
{{ salt['slsutil.banner']() }}
```

```
#####
#
#           THIS FILE IS MANAGED BY SALT - DO NOT EDIT           #
#
# The contents of this file are managed by Salt. Any changes to this #
```

(continues on next page)

(continued from previous page)

```
# file may be overwritten automatically and without warning.      #
#####
```

Example 2 - a Javadoc-style banner:

```
{{ salt['slsutil.banner'](commentchar=' *', borderchar='*', blockstart='/'
→**', blockend=' */') }}
```

```
/**
*****
*
*           THIS FILE IS MANAGED BY SALT - DO NOT EDIT           *
*
* The contents of this file are managed by Salt. Any changes to this *
* file may be overwritten automatically and without warning.      *
*****
*/
```

Example 3 - custom text:

```
{{ set copyright='This file may not be copied or distributed without
→permission of VMware, Inc.' }}
{{ salt['slsutil.banner'](title='Copyright 2019 VMware, Inc.',
→text=copyright, width=60) }}
```

```
#####
#
#           Copyright 2019 VMware, Inc.           #
#
# This file may not be copied or distributed without #
# permission of VMware, Inc.                       #
#####
```

`salt.modules.slsutil.boolstr` (*value*, *true*='true', *false*='false')

Convert a boolean value into a string. This function is intended to be used from within file templates to provide an easy way to take boolean values stored in Pillars or Grains, and write them out in the appropriate syntax for a particular file template.

#### Parameters

- **value** -- The boolean value to be converted
- **true** -- The value to return if `value` is True
- **false** -- The value to return if `value` is False

In this example, a pillar named `smtp:encrypted` stores a boolean value, but the template that uses that value needs `yes` or `no` to be written, based on the boolean value.

*Note: this is written on two lines for clarity. The same result could be achieved in one line.*

```
{% set encrypted = salt[pillar.get]('smtp:encrypted', false) %}
use_tls: {{ salt['slsutil.boolstr'](encrypted, 'yes', 'no') }}
```

Result (assuming the value is True):

```
use_tls: yes
```

`salt.modules.slsutil.deserialize(serializer, stream_or_string, **mod_kwargs)`

Deserialize a Python object using one of the available *serializer modules*.

CLI Example:

```
salt '*' slsutil.deserialize 'json' '{"foo": "Foo!"}'
salt '*' --no-parse=stream_or_string slsutil.deserialize 'json' \
    stream_or_string='{"foo": "Foo!"}'
```

Jinja Example:

```
{% set python_object = salt.slsutil.deserialize('json',
    '{"foo": "Foo!"}') %}
```

`salt.modules.slsutil.dir_exists(path, saltenv='base')`

Return True if a directory exists in the state tree, False otherwise.

Parameters

- **path** (*str*) -- The fully qualified path to a directory in the state tree.
- **saltenv** (*str*) -- The fileserver environment to search. Default: base

New in version 3004.

CLI Example:

```
salt '*' slsutil.dir_exists nginx/files
```

`salt.modules.slsutil.file_exists(path, saltenv='base')`

Return True if a file exists in the state tree, False otherwise.

New in version 3004.

Parameters

- **path** (*str*) -- The fully qualified path to a file in the state tree.
- **saltenv** (*str*) -- The fileserver environment to search. Default: base

CLI Example:

```
salt '*' slsutil.file_exists nginx/defaults.yaml
```

`salt.modules.slsutil.findup(startpath, filenames, saltenv='base')`

Find the first path matching a filename or list of filenames in a specified directory or the nearest ancestor directory. Returns the full path to the first file found.

New in version 3004.

Parameters

- **startpath** (*str*) -- The fileserver path from which to begin the search. An empty string refers to the state tree root.
- **filenames** -- A filename or list of filenames to search for. Searching for directory names is also supported.
- **saltenv** (*str*) -- The fileserver environment to search. Default: base

Example: return the path to `defaults.yaml`, walking up the tree from the state file currently being processed.

```
{{ salt["slsutil.findup"](tplfile, "defaults.yaml") }}
```

CLI Example:

```
salt '*' slsutil.findup formulas/shared/nginx map.jinja
```

`salt.modules.slsutil.merge(obj_a, obj_b, strategy='smart', renderer='yaml', merge_lists=False)`

Merge a data structure into another by choosing a merge strategy

Strategies:

- aggregate
- list
- overwrite
- recurse
- smart

CLI Example:

```
salt '*' slsutil.merge '{foo: Foo}' '{bar: Bar}'
```

`salt.modules.slsutil.merge_all(lst, strategy='smart', renderer='yaml', merge_lists=False)`

New in version 2019.2.0.

Merge a list of objects into each other in order

Parameters

- **lst** (*Iterable*) -- List of objects to be merged.
- **strategy** (*String*) -- Merge strategy. See `utils.dictupdate`.
- **renderer** (*String*) -- Renderer type. Used to determine strategy when strategy is 'smart'.
- **merge\_lists** (*Bool*) -- Defines whether to merge embedded object lists.

CLI Example:

```
$ salt-call --output=txt slsutil.merge_all '[[{foo: Foo}, {foo: Bar}]]'
local: {u'foo': u'Bar'}
```

`salt.modules.slsutil.path_exists(path, saltenv='base')`

Return `True` if a path exists in the state tree, `False` otherwise. The path could refer to a file or directory.

New in version 3004.

Parameters

- **path** (*str*) -- The fully qualified path to a file or directory in the state tree.
- **saltenv** (*str*) -- The fileserver environment to search. Default: `base`

CLI Example:

```
salt '*' slsutil.path_exists nginx/defaults.yaml
```

`salt.modules.slsutil.renderer(path=None, string=None, default_renderer='jinja|yaml', **kwargs)`

Parse a string or file through Salt's renderer system

Changed in version 2018.3.0: Add support for Salt fileserver URIs.

This is an open-ended function and can be used for a variety of tasks. It makes use of Salt's "renderer pipes" system to run a string or file through a pipe of any of the loaded renderer modules.

Parameters

- **path** -- The path to a file on Salt's fileserver (any URIs supported by `cp.get_url`) or on the local file system.
- **string** -- An inline string to be used as the file to send through the renderer system. Note, not all renderer modules can work with strings; the 'py' renderer requires a file, for example.
- **default\_renderer** -- The renderer pipe to send the file through; this is overridden by a "she-bang" at the top of the file.
- **kwargs** -- Keyword args to pass to Salt's `compile_template()` function.

Keep in mind the goal of each renderer when choosing a render-pipe; for example, the Jinja renderer processes a text file and produces a string, however the YAML renderer processes a text file and produces a data structure.

One possible use is to allow writing "map files", as are commonly seen in Salt formulas, but without tying the renderer of the map file to the renderer used in the other sls files. In other words, a map file could use the Python renderer and still be included and used by an sls file that uses the default 'jinja|yaml' renderer.

For example, the two following map files produce identical results but one is written using the normal 'jinja|yaml' and the other is using 'py':

```
#!jinja|yaml
{% set apache = salt.grains.filter_by({
    ...normal jinja map file here...
}), merge=salt.pillar.get('apache:lookup')) %}
{{ apache | yaml() }}
```

```
#!py
def run():
    apache = __salt__.grains.filter_by({
        ...normal map here but as a python dict...
    }, merge=__salt__.pillar.get('apache:lookup'))
    return apache
```

Regardless of which of the above map files is used, it can be accessed from any other sls file by calling this function. The following is a usage example in Jinja:

```
{% set apache = salt.slsutil.renderer('map.sls') %}
```

CLI Example:

```
salt '*' slsutil.renderer salt://path/to/file
salt '*' slsutil.renderer /path/to/file
salt '*' slsutil.renderer /path/to/file.jinja default_renderer='jinja'
salt '*' slsutil.renderer /path/to/file.sls default_renderer='jinja|yaml'
salt '*' slsutil.renderer string='Inline template! {{ saltenv }}'
salt '*' slsutil.renderer string='Hello, {{ name }}.' name='world'
```

`salt.modules.slsutil.serialize(serializer, obj, **mod_kwargs)`

Serialize a Python object using one of the available *serializer modules*.

CLI Example:

```
salt '*' --no-parse=obj slsutil.serialize 'json' obj="{ 'foo': 'Foo!' }
```

Jinja Example:

```
{% set json_string = salt.slsutil.serialize('json',
    {'foo': 'Foo!'}) %}
```

`salt.modules.slsutil.update(dest, upd, recursive_update=True, merge_lists=False)`

Merge upd recursively into dest

If `merge_lists=True`, will aggregate list object types instead of replacing. This behavior is only activated when `recursive_update=True`.

CLI Example:

```
salt '*' slsutil.update '{foo: Foo}' '{bar: Bar}'
```

### 26.6.407 salt.modules.smartos\_imgadm

Module for running imgadm command on SmartOS

`salt.modules.smartos_imgadm.avail` (*search=None, verbose=False*)

Return a list of available images

**search**

[string] search keyword

**verbose**

[boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.avail [percona]
salt '*' imgadm.avail verbose=True
```

`salt.modules.smartos_imgadm.delete` (*uuid*)

Remove an installed image

**uuid**

[string] Specifies uuid to import

CLI Example:

```
salt '*' imgadm.delete e42f8c84-bbea-11e2-b920-078fab2aab1f
```

`salt.modules.smartos_imgadm.docker_to_uuid` (*uuid*)

Get the image uuid from an imported docker image

New in version 2019.2.0.

`salt.modules.smartos_imgadm.get` (*uuid*)

Return info on an installed image

**uuid**

[string] uuid of image

CLI Example:

```
salt '*' imgadm.get e42f8c84-bbea-11e2-b920-078fab2aab1f
salt '*' imgadm.get plexinc/pms-docker:plexpass
```

`salt.modules.smartos_imgadm.import_image` (*uuid, verbose=False*)

Import an image from the repository

**uuid**

[string] uuid to import

**verbose**

[boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.import e42f8c84-bbea-11e2-b920-078fab2aab1f [verbose=True]
```

`salt.modules.smartos_imgadm.list_installed` (*verbose=False*)

Return a list of installed images

**verbose**

[boolean (False)] toggle verbose output

Changed in version 2019.2.0: Docker images are now also listed

CLI Example:

```
salt '*' imgadm.list
salt '*' imgadm.list docker=True
salt '*' imgadm.list verbose=True
```

`salt.modules.smartos_imgadm.show(uuid)`

Show manifest of a given image

**uuid**

[string] uuid of image

CLI Example:

```
salt '*' imgadm.show e42f8c84-bbea-11e2-b920-078fab2aab1f
salt '*' imgadm.show plexinc/pms-docker:plexpass
```

`salt.modules.smartos_imgadm.source_add(source, source_type='imgapi')`

Add a new source

**source**

[string] source url to add

**source\_type**

[string (imgapi)] source type, either imgapi or docker

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.source_add https://updates.joyent.com
salt '*' imgadm.source_add https://docker.io docker
```

`salt.modules.smartos_imgadm.source_delete(source)`

Delete a source

**source**

[string] source url to delete

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.source_delete https://updates.joyent.com
```

`salt.modules.smartos_imgadm.sources(verbose=False)`

Return a list of available sources

**verbose**

[boolean (False)] toggle verbose output

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.sources
```

`salt.modules.smartos_imgadm.update_installed(uuid="")`

Gather info on unknown image(s) (locally installed)

**uuid**

[string] optional uuid of image

CLI Example:

```
salt '*' imgadm.update [uuid]
```

`salt.modules.smartos_imgadm.vacuum(verbose=False)`

Remove unused images

**verbose**

[boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.vacuum [verbose=True]
```

`salt.modules.smartos_imgadm.version()`

Return imgadm version

CLI Example:

```
salt '*' imgadm.version
```

### 26.6.408 salt.modules.smartos\_nictagadm

Module for running nictagadm command on SmartOS :maintainer: Jorge Schrauwen <sjorge@blackdot.be> :maturity: new :depends: nictagadm binary, dladm binary :platform: smartos

New in version 2016.11.0.

`salt.modules.smartos_nictagadm.add(name, mac, mtu=1500)`

Add a new nictag

**name**

[string] name of new nictag

**mac**

[string] mac of parent interface or 'etherstub' to create a ether stub

**mtu**

[int] MTU (ignored for etherstubs)

CLI Example:

```
salt '*' nictagadm.add storage0 etherstub
salt '*' nictagadm.add trunk0 'DE:AD:00:00:BE:EF' 9000
```

`salt.modules.smartos_nictagadm.delete(name, force=False)`

Delete nictag

**name**

[string] nictag to delete

**force**

[boolean] force delete even if vms attached

CLI Example:

```
salt '*' nictagadm.exists admin
```

`salt.modules.smartos_nictagadm.exists(*nictag, **kwargs)`

Check if nictags exists

**nictag**

[string] one or more nictags to check

**verbose**

[boolean] return list of nictags

CLI Example:

```
salt '*' nictagadm.exists admin
```

`salt.modules.smartos_nictagadm.list_nictags` (*include\_etherstubs=True*)

List all nictags

**include\_etherstubs**

[boolean] toggle include of etherstubs

CLI Example:

```
salt '*' nictagadm.list
```

`salt.modules.smartos_nictagadm.update` (*name, mac=None, mtu=None*)

Update a nictag

**name**

[string] name of nictag

**mac**

[string] optional new mac for nictag

**mtu**

[int] optional new MTU for nictag

CLI Example:

```
salt '*' nictagadm.update trunk mtu=9000
```

`salt.modules.smartos_nictagadm.vms` (*nictag*)

List all vms connect to nictag

**nictag**

[string] name of nictag

CLI Example:

```
salt '*' nictagadm.vms admin
```

### 26.6.409 salt.modules.smartos\_virt

virt compatibility module for managing VMs on SmartOS

`salt.modules.smartos_virt.get_macs` (*domain*)

Return a list off MAC addresses from the named VM

CLI Example:

```
salt '*' virt.get_macs <domain>
```

`salt.modules.smartos_virt.init` (*\*\*kwargs*)

Initialize a new VM

CLI Example:

```
salt '*' virt.init image_uuid='...' alias='...' [...]
```

`salt.modules.smartos_virt.list_active_vms` ()

Return a list of uuids for active virtual machine on the minion

CLI Example:

```
salt '*' virt.list_active_vms
```

`salt.modules.smartos_virt.list_domains()`

Return a list of virtual machine names on the minion

CLI Example:

```
salt '*' virt.list_domains
```

`salt.modules.smartos_virt.list_inactive_vms()`

Return a list of uuids for inactive virtual machine on the minion

CLI Example:

```
salt '*' virt.list_inactive_vms
```

`salt.modules.smartos_virt.reboot(domain)`

Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <domain>
```

`salt.modules.smartos_virt.setmem(domain, memory)`

Change the amount of memory allocated to VM. <memory> is to be specified in MB.

Note for KVM : this would require a restart of the VM.

CLI Example:

```
salt '*' virt.setmem <domain> 512
```

`salt.modules.smartos_virt.shutdown(domain)`

Send a soft shutdown signal to the named vm

CLI Example:

```
salt '*' virt.shutdown <domain>
```

`salt.modules.smartos_virt.start(domain)`

Start a defined domain

CLI Example:

```
salt '*' virt.start <domain>
```

`salt.modules.smartos_virt.stop(domain)`

Hard power down the virtual machine, this is equivalent to powering off the hardware.

CLI Example:

```
salt '*' virt.destroy <domain>
```

`salt.modules.smartos_virt.vm_info(domain)`

Return a dict with information about the specified VM on this CN

CLI Example:

```
salt '*' virt.vm_info <domain>
```

`salt.modules.smartos_virt.vm_virt_type(domain)`

Return VM virtualization type : OS or KVM

CLI Example:

```
salt '*' virt.vm_virt_type <domain>
```

### 26.6.410 salt.modules.smartos\_vmadm

Module for running vmadm command on SmartOS

`salt.modules.smartos_vmadm.create(from_file=None, **kwargs)`

Create a new vm

**from\_file**

[string] json file to create the vm from -- if present, all other options will be ignored

**kwargs**

[string|int|...] options to set for the vm

CLI Example:

```
salt '*' vmadm.create from_file=/tmp/new_vm.json
salt '*' vmadm.create image_uuid='...' alias='...' nics='[{ "nic_tag":
→"admin", "ip": "198.51.100.123", ...}, {...}]' [...]
```

`salt.modules.smartos_vmadm.create_snapshot(vm, name, key='uuid')`

Create snapshot of a vm

**vm**

[string] vm to be targeted

**name**

[string]

**snapshot name**

The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-\_:%] to comply with ZFS restrictions.

**key**

[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.create_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543
→baseline
salt '*' vmadm.create_snapshot nacl baseline key=alias
```

`salt.modules.smartos_vmadm.delete(vm, key='uuid')`

Delete a vm

**vm**

[string] vm to be deleted

**key**

[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.delete 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.delete nacl key=alias
```

`salt.modules.smartos_vmadm.delete_snapshot` (*vm*, *name*, *key*='uuid')

Delete snapshot of a vm

**vm**

[string] vm to be targeted

**name**

[string]

**snapshot name**

The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-\_:%] to comply with ZFS restrictions.

**key**

[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.delete_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543
→baseline
salt '*' vmadm.delete_snapshot nacl baseline key=alias
```

`salt.modules.smartos_vmadm.get` (*vm*, *key*='uuid')

Output the JSON object describing a VM

**vm**

[string] vm to be targeted

**key**

[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.get 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.get nacl key=alias
```

`salt.modules.smartos_vmadm.info` (*vm*, *info\_type*='all', *key*='uuid')

Lookup info on running kvm

**vm**

[string] vm to be targeted

**info\_type**

[string [all|block|blockstats|chardev|cpus|kvm|pci|spice|version|vnc]] info type to return

**key**

[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543 vnc
salt '*' vmadm.info nacl key=alias
salt '*' vmadm.info nacl vnc key=alias
```

`salt.modules.smartos_vmadm.list_vms` (*search*=None, *sort*=None, *order*='uuid,type,ram,state,alias', *keyed*=True)

Return a list of VMs

**search**

[string] vmadm filter property

**sort**

[string] vmadm sort (-s) property

**order**

[string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias

**keyed**

[boolean]

specified if the output should be an array (False) or dict (True)

For a dict the key is the first item from the order parameter. Note: If key is not unique last vm wins.

CLI Example:

```
salt '*' vmadm.list
salt '*' vmadm.list order=alias,ram,cpu_cap sort=-ram,-cpu_cap
salt '*' vmadm.list search='type=KVM'
```

`salt.modules.smartos_vmadm.lookup` (*search=None, order=None, one=False*)

Return a list of VMs using lookup

**search**

[string] vmadm filter property

**order**

[string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias

**one**

[boolean] return only one result (vmadm's -1)

CLI Example:

```
salt '*' vmadm.lookup search='state=running'
salt '*' vmadm.lookup search='state=running' order=uuid,alias,hostname
salt '*' vmadm.lookup search='alias=nacl' one=True
```

`salt.modules.smartos_vmadm.reboot` (*vm, force=False, key='uuid'*)

Reboot a vm

**vm**

[string] vm to be rebooted

**force**

[boolean] force reboot of vm if true

**key**

[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.reboot vm=nacl key=alias
salt '*' vmadm.reboot vm=nina.example.org key=hostname
```

`salt.modules.smartos_vmadm.receive` (*uuid, source*)

Receive a vm from a directory

**uuid**

[string] uuid of vm to be received

**source**

[string] source directory

CLI Example:

```
salt '*' vmadm.receive 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
```

`salt.modules.smartos_vmadm.reprovision` (*vm, image, key='uuid'*)

Reprovision a vm

**vm**

[string] vm to be reprovisioned

**image**

[string] uuid of new image

**key**

[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```

salt '*' vmadm.reprovision 186da9ab-7392-4f55-91a5-b8f1fe770543 c02a2044-
↳c1bd-11e4-bd8c-dfc1db8b0182
salt '*' vmadm.reprovision nacl c02a2044-c1bd-11e4-bd8c-dfc1db8b0182
↳key=alias

```

**salt.modules.smartos\_vmadm.rollback\_snapshot**(*vm, name, key='uuid'*)

Rollback snapshot of a vm

**vm**

[string] vm to be targeted

**name**

[string]

**snapshot name**

The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-\_.:%] to comply with ZFS restrictions.

**key**

[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```

salt '*' vmadm.rollback_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543
↳baseline
salt '*' vmadm.rollback_snapshot nacl baseline key=alias

```

**salt.modules.smartos\_vmadm.send**(*vm, target, key='uuid'*)

Send a vm to a directory

**vm**

[string] vm to be sent

**target**

[string] target directory

**key**

[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```

salt '*' vmadm.send 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
salt '*' vmadm.send vm=nacl target=/opt/backups key=alias

```

**salt.modules.smartos\_vmadm.start**(*vm, options=None, key='uuid'*)

Start a vm

**vm**

[string] vm to be started

**options**

[string] optional additional options

**key**

[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```

salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543 'order=c,once=d
↳cdrom=/path/to/image.iso,ide'
salt '*' vmadm.start vm=nacl key=alias
salt '*' vmadm.start vm=nina.example.org key=hostname

```

`salt.modules.smartos_vmadm.stop` (*vm*, *force=False*, *key='uuid'*)

Stop a vm

**vm**

[string] vm to be stopped

**force**

[boolean] force stop of vm if true

**key**

[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.stop vm=nacl key=alias
salt '*' vmadm.stop vm=nina.example.org key=hostname
```

`salt.modules.smartos_vmadm.sysrq` (*vm*, *action='nmi'*, *key='uuid'*)

Send non-maskable interrupt to vm or capture a screenshot

**vm**

[string] vm to be targeted

**action**

[string] nmi or screenshot -- Default: nmi

**key**

[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 nmi
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 screenshot
salt '*' vmadm.sysrq nacl nmi key=alias
```

`salt.modules.smartos_vmadm.update` (*vm*, *from\_file=None*, *key='uuid'*, *\*\*kwargs*)

Update a new vm

**vm**

[string] vm to be updated

**from\_file**

[string] json file to update the vm with -- if present, all other options will be ignored

**key**

[string [uuid|alias|hostname]] value type of 'vm' parameter

**kwargs**

[string|int|...] options to update for the vm

CLI Example:

```
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 from_file=/
→tmp/new_vm.json
salt '*' vmadm.update vm=nacl key=alias from_file=/tmp/new_vm.json
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 max_
→physical_memory=1024
```

## 26.6.411 salt.modules.smbios

Interface to SMBIOS/DMI

(Parsing through dmidecode)

### External References

Desktop Management Interface (DMI)

System Management BIOS

DMidecode

`salt.modules.smbios.get`(*string*, *clean=True*)

Get an individual DMI string from SMBIOS info

*string*

The string to fetch. DMidecode supports:

- bios-vendor
- bios-version
- bios-release-date
- system-manufacturer
- system-product-name
- system-version
- system-serial-number
- system-uuid
- baseboard-manufacturer
- baseboard-product-name
- baseboard-version
- baseboard-serial-number
- baseboard-asset-tag
- chassis-manufacturer
- chassis-type
- chassis-version
- chassis-serial-number
- chassis-asset-tag
- processor-family
- processor-manufacturer
- processor-version
- processor-frequency

*clean*

Don't return well-known false information  
(invalid UUID's, serial 00000000's, etcetera)

Defaults to True

CLI Example:

```
salt '*' smbios.get system-uuid clean=False
```

`salt.modules.smbios.records`(*rec\_type=None*, *fields=None*, *clean=True*)

Return DMI records from SMBIOS

*type*

Return only records of type(s) The SMBIOS specification defines the following DMI types:

Type	Information
0	BIOS
1	System
2	Baseboard
3	Chassis
4	Processor
5	Memory Controller
6	Memory Module
7	Cache
8	Port Connector
9	System Slots
10	On Board Devices
11	OEM Strings
12	System Configuration Options
13	BIOS Language
14	Group Associations
15	System Event Log
16	Physical Memory Array
17	Memory Device
18	32-bit Memory Error
19	Memory Array Mapped Address
20	Memory Device Mapped Address
21	Built-in Pointing Device
22	Portable Battery
23	System Reset
24	Hardware Security
25	System Power Controls
26	Voltage Probe
27	Cooling Device
28	Temperature Probe
29	Electrical Current Probe
30	Out-of-band Remote Access
31	Boot Integrity Services
32	System Boot
33	64-bit Memory Error
34	Management Device
35	Management Device Component
36	Management Device Threshold Data
37	Memory Channel
38	IPMI Device
39	Power Supply
40	Additional Information
41	Onboard Devices Extended Information
42	Management Controller Host Interface

`clean`

Don't return well-known false information  
(invalid UUID's, serial 00000000's, etcetera)

Defaults to `True`

CLI Example:

```
salt '*' smbios.records clean=False
salt '*' smbios.records 14
salt '*' smbios.records 4 core_count,thread_count,current_speed
```

### 26.6.412 salt.modules.smf\_service

Service support for Solaris 10 and 11, should work with other systems that use SMF also. (e.g. SmartOS)

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see [here](#).

`salt.modules.smf_service.available(name)`

Returns True if the specified service is available, otherwise returns False.

We look up the name with the `svcs` command to get back the FMRI This allows users to use simpler service names

CLI Example:

```
salt '*' service.available net-snmp
```

`salt.modules.smf_service.disable(name, **kwargs)`

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.smf_service.disabled(name)`

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.smf_service.enable(name, **kwargs)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.smf_service.enabled(name, **kwargs)`

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.smf_service.get_all()`

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.smf_service.get_disabled()`

Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.smf_service.get_enabled()`

Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.smf_service.get_running()`

Return the running services

CLI Example:

```
salt '*' service.get_running
```

`salt.modules.smf_service.get_stopped()`

Return the stopped services

CLI Example:

```
salt '*' service.get_stopped
```

`salt.modules.smf_service.missing(name)`

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing net-snmp
```

`salt.modules.smf_service.reload_(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.smf_service.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.smf_service.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.smf_service.status`(*name*, *sig=None*)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

**Parameters**

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Not implemented

**Returns**

True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type**

bool

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.smf_service.stop`(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

### 26.6.413 salt.modules.smtp

Module for Sending Messages via SMTP

New in version 2014.7.0.

**depends**

- smtplib python module

**configuration**

This module can be used by either passing a jid and password directly to `send_message`, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
  smtp.username: myuser
  smtp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
```

(continues on next page)

(continued from previous page)

```

smtp.username: myuser
smtp.password: verybadpass

another-smtp-login:
smtp.server: smtp.domain.com
smtp.tls: True
smtp.sender: admin@domain.com
smtp.username: myuser
smtp.password: verybadpass

```

`salt.modules.smtp.send_msg`(*recipient, message, subject='Message from Salt', sender=None, server=None, use\_ssl='True', username=None, password=None, profile=None, attachments=None*)

Send a message to an SMTP recipient. To send a message to multiple recipients, the recipients should be in a comma-separated Python string. Designed for use in states.

CLI Examples:

```

salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test'
  ↳profile='my-smtp-account'
salt '*' smtp.send_msg 'admin@example.com,admin2@example.com' 'This is a
  ↳salt module test for multiple recipients' profile='my-smtp-account'
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test'
  ↳username='myuser' password='verybadpass' sender='admin@example.com'
  ↳server='smtp.domain.com'
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test'
  ↳username='myuser' password='verybadpass' sender='admin@example.com'
  ↳server='smtp.domain.com' attachments="['/var/log/messages']"

```

## 26.6.414 salt.modules.snapper

Module to manage filesystem snapshots with snapper

New in version 2016.11.0.

### codeauthor

Duncan Mac-Vicar P. <dmacvicar@suse.de>

### codeauthor

Pablo Suárez Hernández <psuarezhernandez@suse.de>

### depends

dbus Python module.

### depends

snapper <http://snapper.io>, available in most distros

### maturity

new

### platform

Linux

`salt.modules.snapper.changed_files`(*config='root', num\_pre=None, num\_post=None*)

Returns the files changed between two snapshots

**config**

Configuration name.

**num\_pre**

first snapshot ID to compare. Default is last snapshot

**num\_post**

last snapshot ID to compare. Default is 0 (current state)

CLI Example:

```
salt '*' snapper.changed_files
salt '*' snapper.changed_files num_pre=19 num_post=20
```

`salt.modules.snapper.create_baseline` (*tag='baseline', config='root'*)

Creates a snapshot marked as baseline

**tag**

Tag name for the baseline

**config**

Configuration name.

CLI Example:

```
salt '*' snapper.create_baseline
salt '*' snapper.create_baseline my_custom_baseline
```

`salt.modules.snapper.create_config` (*name=None, subvolume=None, fstype=None, template=None, extra\_opts=None*)

Creates a new Snapper configuration

**name**

Name of the new Snapper configuration.

**subvolume**

Path to the related subvolume.

**fstype**

Filesystem type of the subvolume.

**template**

Configuration template to use. (Default: default)

**extra\_opts**

Extra Snapper configuration opts dictionary. It will override the values provided by the given template (if any).

CLI Example:

```
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ⓧ
↳fstype=btrfs
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ⓧ
↳fstype=btrfs template="default"
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ⓧ
↳fstype=btrfs extra_opts='{ "NUMBER_CLEANUP": False}'
```

`salt.modules.snapper.create_snapshot` (*config='root', snapshot\_type='single', pre\_number=None, description=None, cleanup\_algorithm='number', userdata=None, \*\*kwargs*)

Creates an snapshot

**config**

Configuration name.

**snapshot\_type**

Specifies the type of the new snapshot. Possible values are single, pre and post.

**pre\_number**

For post snapshots the number of the pre snapshot must be provided.

**description**

Description for the snapshot. If not given, the salt job will be used.

**cleanup\_algorithm**

Set the cleanup algorithm for the snapshot.

**number**

Deletes old snapshots when a certain number of snapshots is reached.

**timeline**

Deletes old snapshots but keeps a number of hourly, daily, weekly, monthly and yearly snapshots.

**empty-pre-post**

Deletes pre/post snapshot pairs with empty diffs.

**userdata**

Set userdata for the snapshot (key-value pairs).

Returns the number of the created snapshot.

CLI Example:

```
salt '*' snapper.create_snapshot
```

`salt.modules.snapper.delete_snapshot` (*snapshots\_ids=None, config='root'*)

Deletes an snapshot

**config**

Configuration name. (Default: root)

**snapshots\_ids**

List of the snapshots IDs to be deleted.

CLI Example:

```
salt '*' snapper.delete_snapshot 54
salt '*' snapper.delete_snapshot config=root 54
salt '*' snapper.delete_snapshot config=root snapshots_ids=[54,55,56]
```

`salt.modules.snapper.diff` (*config='root', filename=None, num\_pre=None, num\_post=None*)

Returns the differences between two snapshots

**config**

Configuration name.

**filename**

if not provided the showing differences between snapshots for all "text" files

**num\_pre**

first snapshot ID to compare. Default is last snapshot

**num\_post**

last snapshot ID to compare. Default is 0 (current state)

CLI Example:

```
salt '*' snapper.diff
salt '*' snapper.diff filename=/var/log/snapper.log num_pre=19 num_post=20
```

`salt.modules.snapper.diff_jid` (*jid, config='root'*)

Returns the changes applied by a *jid*

**jid**

The job id to lookup

**config**

Configuration name.

CLI Example:

```
salt '*' snapper.diff_jid jid=20160607130930720112
```

`salt.modules.snapper.get_config(name='root')`

Retrieves all values from a given configuration

CLI Example:

```
salt '*' snapper.get_config
```

`salt.modules.snapper.get_snapshot(number=0, config='root')`

Get detailed information about a given snapshot

CLI Example:

```
salt '*' snapper.get_snapshot 1
```

`salt.modules.snapper.list_configs()`

List all available configs

CLI Example:

```
salt '*' snapper.list_configs
```

`salt.modules.snapper.list_snapshots(config='root')`

List available snapshots

CLI Example:

```
salt '*' snapper.list_snapshots config=myconfig
```

`salt.modules.snapper.modify_snapshot(snapshot_id=None, description=None, userdata=None, cleanup=None, config='root')`

Modify attributes of an existing snapshot.

**config**

Configuration name. (Default: root)

**snapshot\_id**

ID of the snapshot to be modified.

**cleanup**

Change the cleanup method of the snapshot. (str)

**description**

Change the description of the snapshot. (str)

**userdata**

Change the userdata dictionary of the snapshot. (dict)

CLI Example:

```
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 userdata='{"foo": "bar"}'
salt '*' snapper.modify_snapshot snapshot_id=54 cleanup="number"
```

`salt.modules.snapper.run(function, *args, **kwargs)`

Runs a function from an execution module creating pre and post snapshots and associating the salt job id with those snapshots for easy undo and cleanup.

**function**

Salt function to call.

**config**

Configuration name. (default: "root")

**description**

A description for the snapshots. (default: None)

**userdata**

Data to include in the snapshot metadata. (default: None)

**cleanup\_algorithm**

Snapper cleanup algorithm. (default: "number")

**\*args**

args for the function to call. (default: None)

**\*\*kwargs**

kwargs for the function to call (default: None)

This would run append text to /etc/motd using the file.append module, and will create two snapshots, pre and post with the associated metadata. The `jid` will be available as `salt_jid` in the `userdata` of the snapshot.

You can immediately see the changes

CLI Example:

```
salt '*' snapper.run file.append args='["/etc/motd", "some text"]'
```

`salt.modules.snapper.set_config`(*name='root', \*\*kwargs*)

Set configuration values

CLI Example:

```
salt '*' snapper.set_config SYNC_ACL=True
```

Keys are case insensitive as they will be always uppercased to snapper convention. The above example is equivalent to:

```
salt '*' snapper.set_config sync_acl=True
```

`salt.modules.snapper.status`(*config='root', num\_pre=None, num\_post=None*)

Returns a comparison between two snapshots

**config**

Configuration name.

**num\_pre**

first snapshot ID to compare. Default is last snapshot

**num\_post**

last snapshot ID to compare. Default is 0 (current state)

CLI Example:

```
salt '*' snapper.status
salt '*' snapper.status num_pre=19 num_post=20
```

`salt.modules.snapper.status_to_string`(*dbus\_status*)

Converts a numeric dbus snapper status into a string

CLI Example:

```
salt '*' snapper.status_to_string <dbus_status>
```

`salt.modules.snapper.undo`(*config='root', files=None, num\_pre=None, num\_post=None*)

Undo all file changes that happened between `num_pre` and `num_post`, leaving the files into the state of `num_pre`.

**Warning:** If one of the files has changes after num\_post, they will be overwritten. The snapshots are used to determine the file list, but the current version of the files will be overwritten by the versions in num\_pre. You to undo changes between num\_pre and the current version of the files use num\_post=0.

CLI Example:

```
salt '*' snapper.undo
```

`salt.modules.snapper.undo_jid(jid, config='root')`

Undo the changes applied by a salt job

**jid**

The job id to lookup

**config**

Configuration name.

CLI Example:

```
salt '*' snapper.undo_jid jid=20160607130930720112
```

## 26.6.415 salt.modules.solaris\_fmadm

Module for running fmadm and fmdump on Solaris

**maintainer**

Jorge Schrauwen <sjorge@blackdot.be>

**maturity**

new

**platform**

solaris,illumos

New in version 2016.3.0.

`salt.modules.solaris_fmadm.acquit(fmri)`

Acquit resource or acquit case

**fmri: string**

fmri or uuid

CLI Example:

```
salt '*' fmadm.acquit fmri | uuid
```

`salt.modules.solaris_fmadm.config()`

Display fault manager configuration

CLI Example:

```
salt '*' fmadm.config
```

`salt.modules.solaris_fmadm.faulty()`

Display list of faulty resources

CLI Example:

```
salt '*' fmadm.faulty
```

`salt.modules.solaris_fmadm.flush(fmri)`

Flush cached state for resource

**fmri:** string  
fmri

CLI Example:

```
salt '*' fmadm.flush fmri
```

`salt.modules.solaris_fmadm.healthy()`

Return whether fmadm is reporting faults

CLI Example:

```
salt '*' fmadm.healthy
```

`salt.modules.solaris_fmadm.list_records(after=None, before=None)`

Display fault management logs

**after**

[string] filter events after time, see man fmdump for format

**before**

[string] filter events before time, see man fmdump for format

CLI Example:

```
salt '*' fmadm.list
```

`salt.modules.solaris_fmadm.load(path)`

Load specified fault manager module

**path:** string

path of fault manager module

CLI Example:

```
salt '*' fmadm.load /module/path
```

`salt.modules.solaris_fmadm.repaired(fmri)`

Notify fault manager that resource has been repaired

**fmri:** string  
fmri

CLI Example:

```
salt '*' fmadm.repaired fmri
```

`salt.modules.solaris_fmadm.replaced(fmri)`

Notify fault manager that resource has been replaced

**fmri:** string  
fmri

CLI Example:

```
salt '*' fmadm.repaired fmri
```

`salt.modules.solaris_fmadm.reset(module, serd=None)`

Reset module or sub-component

**module:** **string**  
 module to unload  
**serd**  
 [string] serd sub module  
 CLI Example:

```
salt '*' fmadm.reset software-response
```

`salt.modules.solaris_fmadm.show(uuid)`

Display log details  
**uuid:** **string**  
 uuid of fault  
 CLI Example:

```
salt '*' fmadm.show 11b4070f-4358-62fa-9e1e-998f485977e1
```

`salt.modules.solaris_fmadm.unload(module)`

Unload specified fault manager module  
**module:** **string**  
 module to unload  
 CLI Example:

```
salt '*' fmadm.unload software-response
```

## 26.6.416 salt.modules.solaris\_group

Manage groups on Solaris

---

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *'group.info' is not available*), see [here](#).

---

`salt.modules.solaris_group.add(name, gid=None, **kwargs)`

Add the specified group  
 CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.solaris_group.chgid(name, gid)`

Change the gid for a named group  
 CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.solaris_group.delete(name)`

Remove the named group  
 CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.solaris_group.getent` (*refresh=False*)

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.solaris_group.info` (*name*)

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

### 26.6.417 salt.modules.solaris\_shadow

Manage the password database on Solaris systems

---

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to *'shadow.info' is not available*), see [here](#).

---

`salt.modules.solaris_shadow.default_hash` ()

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

`salt.modules.solaris_shadow.del_password` (*name*)

New in version 2015.8.8.

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

`salt.modules.solaris_shadow.gen_password` (*password*, *crypt\_salt=None*, *algorithm='sha512'*)

New in version 2015.8.8.

Generate hashed password

---

**Note:** When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

---

**password**

Plaintext password to be hashed.

**crypt\_salt**

Cryptographic salt. If not given, a random 8-character salt will be generated.

**algorithm**

The following hash algorithms are supported:

- md5
- blowfish (not in mainline glibc, only available in distros that add it)

- sha256
- sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
↳algorithm=sha256
```

`salt.modules.solaris_shadow.info(name)`

Return information for the specified user

CLI Example:

```
salt '*' shadow.info root
```

`salt.modules.solaris_shadow.set_maxdays(name, maxdays)`

Set the maximum number of days during which a password is valid. See man passwd.

CLI Example:

```
salt '*' shadow.set_maxdays username 90
```

`salt.modules.solaris_shadow.set_mindays(name, mindays)`

Set the minimum number of days between password changes. See man passwd.

CLI Example:

```
salt '*' shadow.set_mindays username 7
```

`salt.modules.solaris_shadow.set_password(name, password)`

Set the password for a named user. The password must be a properly defined hash, the password hash can be generated with this command: `openssl passwd -1 <plaintext password>`

CLI Example:

```
salt '*' shadow.set_password root $1$UYCIxa628.9qXjpQCjM4a..
```

`salt.modules.solaris_shadow.set_warndays(name, warndays)`

Set the number of days of warning before a password change is required. See man passwd.

CLI Example:

```
salt '*' shadow.set_warndays username 7
```

### 26.6.418 salt.modules.solaris\_system

Support for reboot, shutdown, etc

This module is assumes we are using solaris-like shutdown

New in version 2016.3.0.

`salt.modules.solaris_system.halt()`

Halt a running system

CLI Example:

```
salt '*' system.halt
```

`salt.modules.solaris_system.init`(*state*)

Change the system runlevel on sysV compatible systems

CLI Example:

**state**

[string] Init state

```
salt '*' system.init 3
```

`salt.modules.solaris_system.poweroff`()

Poweroff a running system

CLI Example:

```
salt '*' system.poweroff
```

`salt.modules.solaris_system.reboot`(*delay=0, message=None*)

Reboot the system

**delay**

[int] Optional wait time in seconds before the system will be rebooted.

**message**

[string] Optional message to broadcast before rebooting.

CLI Example:

```
salt '*' system.reboot
salt '*' system.reboot 60 "=== system upgraded ==="
```

`salt.modules.solaris_system.shutdown`(*delay=0, message=None*)

Shutdown a running system

**delay**

[int] Optional wait time in seconds before the system will be shutdown.

**message**

[string] Optional message to broadcast before rebooting.

CLI Example:

```
salt '*' system.shutdown
salt '*' system.shutdown 60 "=== disk replacement ==="
```

### 26.6.419 salt.modules.solaris\_user

Manage users with the useradd command

---

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info' is not available`), see [here](#).

---

`salt.modules.solaris_user.add`(*name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname="", roomnumber="", workphone="", homephone="", createhome=True, \*\*kwargs*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.solaris_user.chfullname`(*name, fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

`salt.modules.solaris_user.chgid`(*name, gid*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.solaris_user.chgroups`(*name, groups, append=False*)

Change the groups to which a user belongs

**name**

Username to modify

**groups**

List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

**append**

[False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

`salt.modules.solaris_user.chhome`(*name, home, persist=False*)

Set a new home directory for an existing user

**name**

Username to modify

**home**

New home directory to set

**persist**

[False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.solaris_user.chhomephone`(*name, homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo "7735551234"
```

`salt.modules.solaris_user.chroomnumber`(*name, roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

`salt.modules.solaris_user.chshell`(*name, shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.solaris_user.chuid`(*name, uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.solaris_user.chworkphone`(*name, workphone*)

Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo "7735550123"
```

`salt.modules.solaris_user.delete`(*name, remove=False, force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.solaris_user.getent`(*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.solaris_user.info`(*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.solaris_user.list_groups`(*name*)

Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.solaris_user.list_users`()

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.solaris_user.rename`(*name*, *new\_name*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

## 26.6.420 salt.modules.solarisipspkg

IPS pkg support for Solaris

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see [here](#).

---

This module provides support for Solaris 11 new package management - IPS (Image Packaging System). This is the default pkg module for Solaris 11 (and later).

If you want to use also other packaging module (e.g. pkgutil) together with IPS, you need to override the pkg provider in sls for each package:

```
mypackage:
  pkg.installed:
    - provider: pkgutil
```

Or you can override it globally by setting the *providers* parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

Or you can override it globally by setting the *providers* parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

`salt.modules.solarisipspkg.available_version`(\*names, \*\*kwargs)

This function is an alias of `latest_version`.

The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use `pkg.latest_version` as `pkg.available_version` is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:

```
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail
```

`salt.modules.solarisipspkg.get_fmri`(*name*, *\*\*kwargs*)

Returns FMRI from partial name. Returns empty string (") if not found. In case of multiple match, the function returns list of all matched packages.

CLI Example:

```
salt '*' pkg.get_fmri bash
```

`salt.modules.solarisipspkg.install`(*name=None*, *refresh=False*, *pkgs=None*, *version=None*, *test=False*, *\*\*kwargs*)

Install the named package using the IPS pkg command. Accepts full or partial FMRI.

Returns a dict containing the new package names and versions:

```
{ '<package>': {'old': '<old-version>',
                'new': '<new-version>'}}
```

Multiple Package Installation Options:

**pkgs**

A list of packages to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install vim
salt '*' pkg.install pkg://solaris/editor/vim
salt '*' pkg.install pkg://solaris/editor/vim refresh=True
salt '*' pkg.install pkgs=['"foo"', '"bar"']
```

`salt.modules.solarisipspkg.is_installed`(*name*, *\*\*kwargs*)

Returns True if the package is installed. Otherwise returns False. Name can be full or partial FMRI. In case of multiple match from partial FMRI name, it returns True.

CLI Example:

```
salt '*' pkg.is_installed bash
```

`salt.modules.solarisipspkg.latest_version`(*\*names*, *\*\*kwargs*)

The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use `pkg.latest_version` as `pkg.available_version` is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:

```
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail
```

`salt.modules.solarisipspkg.list_pkgs`(*versions\_as\_list=False*, *\*\*kwargs*)

List the currently installed packages as a dict:

```
{ '<package_name>': '<version>' }
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.solarisipspkg.list_upgrades` (*refresh=True, \*\*kwargs*)

Lists all packages available for update.

When run in global zone, it reports only upgradable packages for the global zone.

When run in non-global zone, it can report more upgradable packages than `pkg update -vn`, because `pkg update` hides packages that require newer version of `pkg://solaris/entire` (which means that they can be upgraded only from the global zone). If `pkg://solaris/entire` is found in the list of upgrades, then the global zone should be updated to get all possible updates. Use `refresh=True` to refresh the package database.

**refresh**

[True] Runs a full package database refresh before listing. Set to `False` to disable running the refresh.

Changed in version 2017.7.0.

In previous versions of Salt, `refresh` defaulted to `False`. This was changed to default to `True` in the 2017.7.0 release to make the behavior more consistent with the other package modules, which all default to `True`.

CLI Example:

```
salt '*' pkg.list_upgrades
salt '*' pkg.list_upgrades refresh=False
```

`salt.modules.solarisipspkg.normalize_name` (*name, \*\*kwargs*)

Internal function. Normalizes pkg name to full FMRI before running `pkg.install`. In case of multiple matches or no match, it returns the name without modifications.

CLI Example:

```
salt '*' pkg.normalize_name vim
```

`salt.modules.solarisipspkg.purge` (*name, \*\*kwargs*)

Remove specified package. Accepts full or partial FMRI.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.purge <package name>
```

`salt.modules.solarisipspkg.refresh_db` (*full=False, \*\*kwargs*)

Updates the remote repos database.

**full** : False

Set to `True` to force a refresh of the pkg DB from all publishers, regardless of the last refresh time.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db full=True
```

`salt.modules.solarisipspkg.remove` (*name=None, pkgs=None, \*\*kwargs*)

Remove specified package. Accepts full or partial FMRI. In case of multiple match, the command fails and won't modify the OS.

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The **name** parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove tcsh
salt '*' pkg.remove pkg://solaris/shell/tcsh
salt '*' pkg.remove pkgs=['"foo"', "bar"]'
```

`salt.modules.solarisipspkg.search(name, versions_as_list=False, **kwargs)`

Searches the repository for given pkg name. The name can be full or partial FMRI. All matches are printed. Globs are also supported.

CLI Example:

```
salt '*' pkg.search bash
```

`salt.modules.solarisipspkg.upgrade(refresh=False, **kwargs)`

Upgrade all packages to the latest possible version. When run in global zone, it updates also all non-global zones. In non-global zones upgrade is limited by dependency constrains linked to the version of `pkg://solaris/entire`.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

When there is a failure, an explanation is also included in the error message, based on the return code of the `pkg update` command.

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.solarisipspkg.upgrade_available(name, **kwargs)`

Check if there is an upgrade available for a certain package Accepts full or partial FMRI. Returns all matches found.

CLI Example:

```
salt '*' pkg.upgrade_available apache-22
```

`salt.modules.solarisipspkg.version(*names, **kwargs)`

Common interface for obtaining the version of installed packages. Accepts full or partial FMRI. If called using `pkg_resource`, full FMRI is required. Partial FMRI is returned if the package is not installed.

CLI Example:

```
salt '*' pkg.version vim
salt '*' pkg.version foo bar baz
salt '*' pkg_resource.version pkg://solaris/entire
```

## 26.6.421 salt.modules.solarispkg

Package support for Solaris

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

`salt.modules.solarispkg.available_version(*names, **kwargs)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris `pkgadd`, this function will always return an empty string for a given package.

`salt.modules.solarispkg.install(name=None, sources=None, saltenv='base', **kwargs)`

Install the passed package. Can install packages from the following sources:

- Locally (package already exists on the minion)
- HTTP/HTTPS server
- FTP server
- Salt master

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Examples:

```
# Installing a data stream pkg that already exists on the minion
salt '*' pkg.install sources='[{"<pkg name>": "/dir/on/minion/<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6-sol10-sparc-local.pkg"}]'

# Installing a data stream pkg that exists on the salt master
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "salt://pkgs/gcc-3.4.6-sol10-sparc-local.pkg"}]'
```

CLI Example:

```
# Installing a data stream pkg that exists on a HTTP server
salt '*' pkg.install sources='[{"<pkg name>": "http://packages.server.com/
```

(continues on next page)

(continued from previous page)

```
→<pkg filename>"]}]'
```

```
salt '*' pkg.install sources='[{"SMClgcc346": "http://packages.server.com/
```

```
→gcc-3.4.6-sol10-sparc-local.pkg"}]'
```

If working with solaris zones and you want to install a package only in the global zone you can pass 'current\_zone\_only=True' to salt to have the package only installed in the global zone. (Behind the scenes this is passing '-G' to the pkgadd command.) Solaris default when installing a package in the global zone is to install it in all zones. This overrides that and installs the package only in the global.

CLI Example:

```
# Installing a data stream package only in the global zone:
```

```
salt 'global_zone' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/
```

```
→gcc-3.4.6-sol10-sparc-local.pkg"}]' current_zone_only=True
```

By default salt automatically provides an adminfile, to automate package installation, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin\_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

CLI Example:

```
# Overriding the 'instance' adminfile option when calling the module☒
```

```
→directly
```

```
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>
```

```
→"}]' instance="overwrite"
```

SLS Example:

```
# Overriding the 'instance' adminfile option when used in a state
```

```
SMClgcc346:
```

```
  pkg.installed:
```

```
    - sources:
```

```
      - SMClgcc346: salt://srv/salt/pkgs/gcc-3.4.6-sol10-sparc-local.pkg
```

```
    - instance: overwrite
```

---

**Note:** The ID declaration is ignored, as the package name is read from the `sources` parameter.

---

CLI Example:

```
# Providing your own adminfile when calling the module directly
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>
→"}]' admin_source='salt://pkgs/<adminfile filename>'

# Providing your own adminfile when using states
<pkg name>:
  pkg.installed:
    - sources:
      - <pkg name>: salt://pkgs/<pkg filename>
      - admin_source: salt://pkgs/<adminfile filename>
```

---

**Note:** The ID declaration is ignored, as the package name is read from the `sources` parameter.

---

`salt.modules.solarispkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

`salt.modules.solarispkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.solarispkg.purge(name=None, pkgs=None, **kwargs)`

Package purges are not supported, this function is identical to `remove()`.

**name**

The name of the package to be deleted

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.solarispkg.remove` (*name=None, pkgs=None, saltenv='base', \*\*kwargs*)

Remove packages with pkgrm

**name**

The name of the package to be deleted

By default salt automatically provides an adminfile, to automate package removal, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin\_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove SUNWgit
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.solarispkg.upgrade_available` (*name, \*\*kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.solarispkg.version` (*\*names, \*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

## 26.6.422 salt.modules.solr

Apache Solr Salt Module

Author: Jed Glazner Version: 0.2.1 Modified: 12/09/2011

This module uses HTTP requests to talk to the apache solr request handlers to gather information and report errors. Because of this the minion doesn't necessarily need to reside on the actual slave. However if you want to use the signal function the minion must reside on the physical solr host.

This module supports multi-core and standard setups. Certain methods are master/slave specific. Make sure you set the solr.type. If you have questions or want a feature request please ask.

### Coming Features in 0.3

1. Add command for checking for replication failures on slaves
2. Improve match\_index\_versions since it's pointless on busy solr masters
3. Add additional local fs checks for backups to make sure they succeeded

### Override these in the minion config

#### **solr.cores**

A list of core names e.g. ['core1','core2']. An empty list indicates non-multicore setup.

#### **solr.baseurl**

The root level URL to access solr via HTTP

#### **solr.request\_timeout**

The number of seconds before timing out an HTTP/HTTPS/FTP request. If nothing is specified then the python global timeout setting is used.

#### **solr.type**

Possible values are 'master' or 'slave'

#### **solr.backup\_path**

The path to store your backups. If you are using cores and you can specify to append the core name to the path in the backup method.

#### **solr.num\_backups**

For versions of solr >= 3.5. Indicates the number of backups to keep. This option is ignored if your version is less.

#### **solr.init\_script**

The full path to your init script with start/stop options

#### **solr.dih.options**

A list of options to pass to the DIH.

## Required Options for DIH

### clean

[False] Clear the index before importing

### commit

[True] Commit the documents to the index upon completion

### optimize

[True] Optimize the index after commit is complete

### verbose

[True] Get verbose output

`salt.modules.solr.abort_import` (*handler*, *host=None*, *core\_name=None*, *verbose=False*)

MASTER ONLY Aborts an existing import command to the specified handler. This command can only be run if the minion is configured with `solr.type=master`

### handler

[str] The name of the data import handler.

### host

[str (None)] The solr host to query. `__opts__['host']` is default.

### core

[str (None)] The core the handler belongs to.

### verbose

[boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.abort_import dataimport None music {'clean':True}
```

`salt.modules.solr.backup` (*host=None*, *core\_name=None*, *append\_core\_to\_path=False*)

Tell solr make a backup. This method can be mis-leading since it uses the backup API. If an error happens during the backup you are not notified. The status: 'OK' in the response simply means that solr received the request successfully.

### host

[str (None)] The solr host to query. `__opts__['host']` is default.

### core\_name

[str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

### append\_core\_to\_path

[boolean (False)] If True add the name of the core to the backup path. Assumes that minion backup path is not None.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.backup music
```

`salt.modules.solr.core_status` (*host=None*, *core\_name=None*)

MULTI-CORE HOSTS ONLY Get the status for a given core or all cores if no core is specified

**host**

[str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name**

[str] The name of the core to reload

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.core_status None music
```

`salt.modules.solr.delta_import` (*handler, host=None, core\_name=None, options=None, extra=None*)

Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with `solr.type=master`

**handler**

[str] The name of the data import handler.

**host**

[str (None)] The solr host to query. `__opts__['host']` is default.

**core**

[str (None)] The core the handler belongs to.

**options**

[dict (`__opts__`)] A list of options such as `clean`, `optimize`, `commit`, `verbose`, and `pause_replication`. leave blank to use `__opts__` defaults. options will be merged with `__opts__`

**extra**

[dict ({})] Extra name value pairs to pass to the handler. e.g. ["name=value"]

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.delta_import dataimport None music {'clean':True}
```

`salt.modules.solr.full_import` (*handler, host=None, core\_name=None, options=None, extra=None*)

MASTER ONLY Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with `solr.type=master`

**handler**

[str] The name of the data import handler.

**host**

[str (None)] The solr host to query. `__opts__['host']` is default.

**core**

[str (None)] The core the handler belongs to.

**options**

[dict (`__opts__`)] A list of options such as `clean`, `optimize`, `commit`, `verbose`, and `pause_replication`. leave blank to use `__opts__` defaults. options will be merged with `__opts__`

**extra**

[dict ({})] Extra name value pairs to pass to the handler. e.g. ["name=value"]

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.full_import dataimport None music {'clean':True}
```

`salt.modules.solr.import_status` (*handler, host=None, core\_name=None, verbose=False*)

Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with `solr.type: 'master'`

**handler**

[str] The name of the data import handler.

**host**

[str (None)] The solr host to query. `__opts__['host']` is default.

**core**

[str (None)] The core the handler belongs to.

**verbose**

[boolean (False)] Specifies verbose output

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.import_status dataimport None music False
```

`salt.modules.solr.is_replication_enabled` (*host=None, core\_name=None*)

SLAVE CALL Check for errors, and determine if a slave is replicating or not.

**host**

[str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name**

[str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.is_replication_enabled music
```

`salt.modules.solr.lucene_version` (*core\_name=None*)

Gets the lucene version that solr is using. If you are running a multi-core setup you should specify a core name since all the cores run under the same servlet container, they will all have the same version.

**core\_name**

[str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.lucene_version
```

`salt.modules.solr.match_index_versions` (*host=None, core\_name=None*)

SLAVE CALL Verifies that the master and the slave versions are in sync by comparing the index version. If you are constantly pushing updates the index the master and slave versions will seldom match. A solution to

this is pause indexing every so often to allow the slave to replicate and then call this method before allowing indexing to resume.

**host**

[str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name**

[str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.match_index_versions music
```

`salt.modules.solr.optimize` (*host=None, core\_name=None*)

Search queries fast, but it is a very expensive operation. The ideal process is to run this with a master/slave configuration. Then you can optimize the master, and push the optimized index to the slaves. If you are running a single solr instance, or if you are going to run this on a slave be aware than search performance will be horrible while this command is being run. Additionally it can take a LONG time to run and your HTTP request may timeout. If that happens adjust your timeout settings.

**host**

[str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name**

[str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.optimize music
```

`salt.modules.solr.ping` (*host=None, core\_name=None*)

Does a health check on solr, makes sure solr can talk to the indexes.

**host**

[str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name**

[str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.ping music
```

`salt.modules.solr.reload_core` (*host=None, core\_name=None*)

MULTI-CORE HOSTS ONLY Load a new core from the same configuration as an existing registered core. While the "new" core is initializing, the "old" one will continue to accept requests. Once it has finished, all new request will go to the "new" core, and the "old" core will be unloaded.

**host**

[str (None)] The solr host to query. `__opts__['host']` is default.

**core\_name**

[str] The name of the core to reload

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.reload_core None music
```

Return data is in the following format:

```
{'success':bool, 'data':dict, 'errors':list, 'warnings':list}
```

`salt.modules.solr.reload_import_config`(*handler, host=None, core\_name=None, verbose=False*)

MASTER ONLY re-loads the handler config XML file. This command can only be run if the minion is a 'master' type

**handler**

[str] The name of the data import handler.

**host**

[str (None)] The solr host to query. \_\_opts\_\_[ 'host' ] is default.

**core**

[str (None)] The core the handler belongs to.

**verbose**

[boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.reload_import_config dataimport None music {'clean':True}
```

`salt.modules.solr.replication_details`(*host=None, core\_name=None*)

Get the full replication details.

**host**

[str (None)] The solr host to query. \_\_opts\_\_[ 'host' ] is default.

**core\_name**

[str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.replication_details music
```

`salt.modules.solr.set_is_polling`(*polling, host=None, core\_name=None*)

SLAVE CALL Prevent the slaves from polling the master for updates.

**polling**

[boolean] True will enable polling. False will disable it.

**host**

[str (None)] The solr host to query. \_\_opts\_\_[ 'host' ] is default.

**core\_name**

[str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_is_polling False
```

**salt.modules.solr.set\_replication\_enabled**(*status*, *host=None*, *core\_name=None*)

MASTER ONLY Sets the master to ignore poll requests from the slaves. Useful when you don't want the slaves replicating during indexing or when clearing the index.

**status**

[boolean] Sets the replication status to the specified state.

**host**

[str (None)] The solr host to query. \_\_opts\_\_[ 'host' ] is default.

**core\_name**

[str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to set the status on all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_replication_enabled false, None, music
```

**salt.modules.solr.signal**(*signal=None*)

Signals Apache Solr to start, stop, or restart. Obviously this is only going to work if the minion resides on the solr host. Additionally Solr doesn't ship with an init script so one must be created.

**signal**

[str (None)] The command to pass to the apache solr init valid values are 'start', 'stop', and 'restart'

CLI Example:

```
salt '*' solr.signal restart
```

**salt.modules.solr.version**(*core\_name=None*)

Gets the solr version for the core specified. You should specify a core here as all the cores will run under the same servlet container and so will all have the same version.

**core\_name**

[str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.version
```

## 26.6.423 salt.modules.solrcloud

Module for solrcloud configuration

New in version 2017.7.0.

For now, module is limited to http-exposed API. It doesn't implement config upload via Solr zkCli

`salt.modules.solrcloud.BOOL_PROPS_LIST = ['transient', 'loadOnStartup']`

Collections options type definition Reference: <https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-api1>

`salt.modules.solrcloud.DICT_OPTIONS_LIST = ['properties']`

Collection unmodifiable options Reference: <https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-modifycoll>

`salt.modules.solrcloud.alias_exists(alias_name, **kwargs)`

Check alias existence

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_exists my_alias
```

`salt.modules.solrcloud.alias_get_collections(alias_name, **kwargs)`

Get collection list for an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_get my_alias
```

`salt.modules.solrcloud.alias_set_collections(alias_name, collections=None, **kwargs)`

Define an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_set my_alias collections=[collection1, ↵  
→collection2]
```

`salt.modules.solrcloud.cluster_status(**kwargs)`

Get cluster status

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.cluster_status
```

`salt.modules.solrcloud.collection_backup(collection_name, location, backup_name=None, **kwargs)`

Create a backup for a collection.

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_backup collection_name /mnt/nfs_backup
```

`salt.modules.solrcloud.collection_backup_all`(*location*, *backup\_name*=None, *\*\*kwargs*)

Create a backup for all collection present on the server.

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_backup /mnt/nfs_backup
```

`salt.modules.solrcloud.collection_check_options`(*options*)

Check collections options

CLI Example:

```
salt '*' solrcloud.collection_check_options '{"replicationFactor":4}'
```

`salt.modules.solrcloud.collection_create`(*collection\_name*, *options*=None, *\*\*kwargs*)

Create a collection,

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_create collection_name
```

Collection creation options may be passed using the "options" parameter. Do not include option "name" since it already specified by the mandatory parameter "collection\_name"

```
salt '*' solrcloud.collection_create collection_name options={
  ↪ "replicationFactor":2, "numShards":3}
```

Cores options may be passed using the "properties" key in options. Do not include property "name"

```
salt '*' solrcloud.collection_create collection_name options={
  ↪ "replicationFactor":2, "numShards":3, "properties":{"dataDir
  ↪":"/srv/solr/hugePartitionCollection"}}
```

`salt.modules.solrcloud.collection_creation_options`()

Get collection option list that can only be defined at creation

CLI Example:

```
salt '*' solrcloud.collection_creation_options
```

`salt.modules.solrcloud.collection_exists`(*collection\_name*, *\*\*kwargs*)

Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_exists collection_name
```

`salt.modules.solrcloud.collection_get_options(collection_name, **kwargs)`

Get collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_get_options collection_name
```

`salt.modules.solrcloud.collection_list(**kwargs)`

List all collections

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_list
```

`salt.modules.solrcloud.collection_reload(collection, **kwargs)`

Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_reload collection_name
```

`salt.modules.solrcloud.collection_set_options(collection_name, options, **kwargs)`

Change collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

Note that not every parameter can be changed after collection creation

CLI Example:

```
salt '*' solrcloud.collection_set_options collection_name options={
  →"replicationFactor":4}
```

`salt.modules.solrcloud.log = <SaltLoggingClass salt.modules.solrcloud (GARBAGE)>`

Core properties type definition. Reference: <https://cwiki.apache.org/confluence/display/solr/Defining+core.properties>

### 26.6.424 salt.modules.splunk

Module for interop with the Splunk API

New in version 2016.3.0.

#### depends

- splunk-sdk python module

#### configuration

Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:

```

splunk:
  username: alice
  password: abc123
  host: example.splunkcloud.com
  port: 8080

```

`salt.modules.splunk.create_user` (*email*, *profile='splunk'*, *\*\*kwargs*)

create a splunk user by name/email

CLI Example:

```

salt myminion splunk.create_user user@example.com roles=['user'] realname=
→ "Test User" name=testuser

```

`salt.modules.splunk.delete_user` (*email*, *profile='splunk'*)

Delete a splunk user by email

CLI Example:

```

salt myminion splunk_user.delete 'user@example.com'

```

`salt.modules.splunk.get_user` (*email*, *profile='splunk'*, *\*\*kwargs*)

Get a splunk user by name/email

CLI Example:

```

salt myminion splunk.get_user 'user@example.com' user_details=false
salt myminion splunk.get_user 'user@example.com' user_details=true

```

`salt.modules.splunk.list_users` (*profile='splunk'*)

List all users in the splunk DB

CLI Example:

```

salt myminion splunk.list_users

```

`salt.modules.splunk.update_user` (*email*, *profile='splunk'*, *\*\*kwargs*)

Create a splunk user by email

CLI Example:

```

salt myminion splunk.update_user example@domain.com roles=['user']
→ realname="Test User"

```

### 26.6.425 salt.modules.splunk\_search

Module for interop with the Splunk API

New in version 2015.5.0.

**depends**

- splunk-sdk python module

**configuration**

Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:

```
splunk:
  username: alice
  password: abc123
  host: example.splunkcloud.com
  port: 8080
```

`salt.modules.splunk_search.create` (*name*, *profile='splunk'*, *\*\*kwargs*)

Create a splunk search

CLI Example:

```
splunk_search.create 'my search name' search='error msg'
```

`salt.modules.splunk_search.delete` (*name*, *profile='splunk'*)

Delete a splunk search

CLI Example:

```
splunk_search.delete 'my search name'
```

`salt.modules.splunk_search.get` (*name*, *profile='splunk'*)

Get a splunk search

CLI Example:

```
splunk_search.get 'my search name'
```

`salt.modules.splunk_search.list_` (*profile='splunk'*)

List splunk searches (names only)

CLI Example:

```
splunk_search.list
```

`salt.modules.splunk_search.list_all` (*prefix=None*, *app=None*, *owner=None*, *description\_contains=None*, *name\_not\_contains=None*, *profile='splunk'*)

Get all splunk search details. Produces results that can be used to create an sls file.

if *app* or *owner* are specified, results will be limited to matching saved searches.

if *description\_contains* is specified, results will be limited to those where "description\_contains in description" is true if *name\_not\_contains* is specified, results will be limited to those where "name\_not\_contains not in name" is true.

If *prefix* parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

CLI Example:

1. **Make a "backup" of all existing searches**  

```
$ salt-call splunk_search.list_all --out=txt | sed "s/local: //" > legacy_searches.sls
```
2. **Get all searches with new prefixed names**  

```
$ salt-call splunk_search.list_all "prefix=**MANAGED BY SALT**" --out=txt | sed "s/local: //" > managed_searches.sls
```
3. **Insert the managed searches into splunk**  

```
$ salt-call state.sls managed_searches.sls
```
4. Manually verify that the new searches look right

5. Delete the original searches \$ sed s/present/absent/ legacy\_searches.sls > remove\_legacy\_searches.sls \$ salt-call state.sls remove\_legacy\_searches.sls
6. Get all searches again, verify no changes \$ salt-call splunk\_search.list\_all --out=txt | sed "s/local: //" > final\_searches.sls \$ diff final\_searches.sls managed\_searches.sls

`salt.modules.splunk_search.update` (*name*, *profile='splunk'*, *\*\*kwargs*)

Update a splunk search

CLI Example:

```
splunk_search.update 'my search name' sharing=app
```

### 26.6.426 salt.modules.sqlite3

Support for SQLite3

`salt.modules.sqlite3.fetch` (*db=None*, *sql=None*)

Retrieve data from an sqlite3 db (returns all rows, be careful!)

CLI Example:

```
salt '*' sqlite3.fetch /root/test.db 'SELECT * FROM test;'
```

`salt.modules.sqlite3.indexes` (*db=None*)

Show all indices in the database, for people with poor spelling skills

CLI Example:

```
salt '*' sqlite3.indexes /root/test.db
```

`salt.modules.sqlite3.indices` (*db=None*)

Show all indices in the database

CLI Example:

```
salt '*' sqlite3.indices /root/test.db
```

`salt.modules.sqlite3.modify` (*db=None*, *sql=None*)

Issue an SQL query to sqlite3 (with no return data), usually used to modify the database in some way (insert, delete, create, etc)

CLI Example:

```
salt '*' sqlite3.modify /root/test.db 'CREATE TABLE test(id INT, testdata
→TEXT);'
```

`salt.modules.sqlite3.sqlite_version` ()

Return version of sqlite

CLI Example:

```
salt '*' sqlite3.sqlite_version
```

`salt.modules.sqlite3.tables` (*db=None*)

Show all tables in the database

CLI Example:

```
salt '*' sqlite3.tables /root/test.db
```

`salt.modules.sqlite3.version()`

Return version of pysqlite

CLI Example:

```
salt '*' sqlite3.version
```

### 26.6.427 salt.modules.ssh

Manage client ssh components

---

**Note:** This module requires the use of MD5 hashing. Certain security audits may not permit the use of MD5. For those cases, this module should be disabled or removed.

---

`salt.modules.ssh.auth_keys` (*user=None, config='.ssh/authorized\_keys', fingerprint\_hash\_type=None*)

Return the authorized keys for users

CLI Example:

```
salt '*' ssh.auth_keys
salt '*' ssh.auth_keys root
salt '*' ssh.auth_keys user=root
salt '*' ssh.auth_keys user="[user1, user2]"
```

`salt.modules.ssh.check_key` (*user, key, enc, comment, options, config='.ssh/authorized\_keys', cache\_keys=None, fingerprint\_hash\_type=None*)

Check to see if a key needs updating, returns "update", "add" or "exists"

CLI Example:

```
salt '*' ssh.check_key <user> <key> <enc> <comment> <options>
```

`salt.modules.ssh.check_key_file` (*user, source, config='.ssh/authorized\_keys', saltenv='base', fingerprint\_hash\_type=None*)

Check a keyfile from a source destination against the local keys and return the keys to change

CLI Example:

```
salt '*' ssh.check_key_file root salt://ssh/keyfile
```

`salt.modules.ssh.check_known_host` (*user=None, hostname=None, key=None, fingerprint=None, config=None, port=None, fingerprint\_hash\_type=None*)

Check the record in known\_hosts file, either by its value or by fingerprint (it's enough to set up either key or fingerprint, you don't need to set up both).

If provided key or fingerprint doesn't match with stored value, return "update", if no value is found for a given host, return "add", otherwise return "exists".

If neither key, nor fingerprint is defined, then additional validation is not performed.

CLI Example:

```
salt '*' ssh.check_known_host <user> <hostname> key='AAAA...FAaQ=='
```

`salt.modules.ssh.get_known_host_entries` (*user, hostname, config=None, port=None, fingerprint\_hash\_type=None*)

New in version 2018.3.0.

Return information about known host entries from the configfile, if any. If there are no entries for a matching hostname, return None.

CLI Example:

```
salt '*' ssh.get_known_host_entries <user> <hostname>
```

`salt.modules.ssh.hash_known_hosts` (*user=None, config=None*)

Hash all the hostnames in the known hosts file.

New in version 2014.7.0.

**user**

hash known hosts of this user

**config**

path to known hosts file: can be absolute or relative to user's home directory

CLI Example:

```
salt '*' ssh.hash_known_hosts
```

`salt.modules.ssh.host_keys` (*keydir=None, private=True, certs=True*)

Return the minion's host keys

CLI Example:

```
salt '*' ssh.host_keys
salt '*' ssh.host_keys keydir=/etc/ssh
salt '*' ssh.host_keys keydir=/etc/ssh private=False
salt '*' ssh.host_keys keydir=/etc/ssh certs=False
```

`salt.modules.ssh.key_is_encrypted` (*key*)

New in version 2015.8.7.

Function to determine whether or not a private key is encrypted with a passphrase.

Checks key for a Proc-Type header with ENCRYPTED in the value. If found, returns True, otherwise returns False.

CLI Example:

```
salt '*' ssh.key_is_encrypted /root/id_rsa
```

`salt.modules.ssh.recv_known_host_entries` (*hostname, enc=None, port=None, hash\_known\_hosts=True, timeout=5, fingerprint\_hash\_type=None*)

New in version 2018.3.0.

Retrieve information about host public keys from remote server

**hostname**

The name of the remote host (e.g. "github.com")

**enc**

Defines what type of key is being used, can be ed25519, ecdsa, ssh-rsa, ssh-dss or any other type as of openssh server version 8.7.

**port**

Optional parameter, denoting the port of the remote host on which an SSH daemon is running. By default the port 22 is used.

**hash\_known\_hosts**

[True] Hash all hostnames and addresses in the known hosts file.

**timeout**

[int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

**fingerprint\_hash\_type**

The fingerprint hash type that the public key fingerprints were originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from md5 to sha256

CLI Example:

```
salt '*' ssh.recv_known_host_entries <hostname> enc=<enc> port=<port>
```

`salt.modules.ssh.rm_auth_key`(*user, key, config='.ssh/authorized\_keys', fingerprint\_hash\_type=None*)

Remove an authorized key from the specified user's authorized key file

CLI Example:

```
salt '*' ssh.rm_auth_key <user> <key>
```

`salt.modules.ssh.rm_auth_key_from_file`(*user, source, config='.ssh/authorized\_keys', saltenv='base', fingerprint\_hash\_type=None*)

Remove an authorized key from the specified user's authorized key file, using a file as source

CLI Example:

```
salt '*' ssh.rm_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.
↳pub
```

`salt.modules.ssh.rm_known_host`(*user=None, hostname=None, config=None, port=None*)

Remove all keys belonging to hostname from a known\_hosts file.

CLI Example:

```
salt '*' ssh.rm_known_host <user> <hostname>
```

`salt.modules.ssh.set_auth_key`(*user, key, enc='ssh-rsa', comment='', options=None, config='.ssh/authorized\_keys', cache\_keys=None, fingerprint\_hash\_type=None*)

Add a key to the authorized\_keys file. The "key" parameter must only be the string of text that is the encoded key. If the key begins with "ssh-rsa" or ends with `user@host`, remove those from the key before passing it to this function.

CLI Example:

```
salt '*' ssh.set_auth_key <user> '<key>' enc='dsa'
```

```
salt.modules.ssh.set_auth_key_from_file(user, source, config='.ssh/authorized_keys', saltenv='base',
                                       fingerprint_hash_type=None)
```

Add a key to the authorized\_keys file, using a file as the source.

CLI Example:

```
salt '*' ssh.set_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.
→ pub
```

```
salt.modules.ssh.set_known_host(user=None, hostname=None, fingerprint=None, key=None, port=None,
                                enc=None, config=None, hash_known_hosts=True, timeout=5,
                                fingerprint_hash_type=None)
```

Download SSH public key from remote host "hostname", optionally validate its fingerprint against "fingerprint" variable and save the record in the known\_hosts file.

If such a record does already exists in there, do nothing.

**user**

The user who owns the ssh authorized keys file to modify

**hostname**

The name of the remote host (e.g. "github.com")

**fingerprint**

The fingerprint of the key which must be present in the known\_hosts file (optional if key specified)

**key**

The public key which must be presented in the known\_hosts file (optional if fingerprint specified)

**port**

optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.

**enc**

Defines what type of key is being used, can be ed25519, ecdsa, ssh-rsa, ssh-dss or any other type as of openssh server version 8.7.

**config**

The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known\_hosts". If no user is specified, defaults to "/etc/ssh/ssh\_known\_hosts". If present, must be an absolute path when a user is not specified.

**hash\_known\_hosts**

[True] Hash all hostnames and addresses in the known hosts file.

**timeout**

[int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

**fingerprint\_hash\_type**

The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from md5 to sha256

CLI Example:

```
salt '*' ssh.set_known_host <user> fingerprint='xx:xx:..:xx' enc='ssh-rsa
→ ' config='.ssh/known_hosts'
```

```
salt.modules.ssh.user_keys(user=None, pubfile=None, prvfile=None)
```

Return the user's ssh keys on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' ssh.user_keys
salt '*' ssh.user_keys user=user1
salt '*' ssh.user_keys user=user1 pubfile=/home/user1/.ssh/id_rsa.pub
↳prvfile=/home/user1/.ssh/id_rsa
salt '*' ssh.user_keys user=user1 prvfile=False
salt '*' ssh.user_keys user="['user1','user2'] pubfile=id_rsa.pub
↳prvfile=id_rsa
```

As you can see you can tell Salt not to read from the user's private (or public) key file by setting the file path to `False`. This can be useful to prevent Salt from publishing private data via Salt Mine or others.

### 26.6.428 salt.modules.ssh\_pkg

Service support for the REST example

```
salt.modules.ssh_pkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None,
                               **kwargs)
```

```
salt.modules.ssh_pkg.list_pkgs(versions_as_list=False, **kwargs)
```

```
salt.modules.ssh_pkg.remove(name=None, pkgs=None, **kwargs)
```

### 26.6.429 salt.modules.ssh\_service

Provide the service module for the proxy-minion SSH sample .. versionadded:: 2015.8.2

```
salt.modules.ssh_service.enabled(name, sig=None)
```

Only the 'redbull' service is 'enabled' in the test

```
salt.modules.ssh_service.get_all()
```

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

```
salt.modules.ssh_service.list_()
```

Return a list of all available services.

CLI Example:

```
salt '*' service.list
```

```
salt.modules.ssh_service.restart(name, sig=None)
```

Restart the specified service with rest\_sample

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.ssh_service.running(name, sig=None)`

Return whether this service is running.

`salt.modules.ssh_service.start(name, sig=None)`

Start the specified service on the `ssh_sample`

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.ssh_service.status(name, sig=None)`

Return the status for a service via `ssh_sample`. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

**Parameters**

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Not implemented

**Returns**

True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type**

`bool`

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.ssh_service.stop(name, sig=None)`

Stop the specified service on the `rest_sample`

CLI Example:

```
salt '*' service.stop <service name>
```

## 26.6.430 salt.modules.state

Control the state system on the minion.

### State Caching

When a highstate is called, the minion automatically caches a copy of the last high data. If you then run a highstate with `cache=True` it will use that cached highdata and won't hit the fileserver except for `salt://` links in the states themselves.

`salt.modules.state.apply_(mods=None, **kwargs)`

New in version 2015.5.0.

This function will call `state.highstate` or `state.sls` based on the arguments passed to this function. It exists as a more intuitive way of applying states.

## APPLYING ALL STATES CONFIGURED IN TOP.SLS (A.K.A. HIGHSTATE)

To apply all configured states, simply run `state.apply` with no SLS targets, like so:

```
salt '*' state.apply
```

The following additional arguments are also accepted when applying all states configured in `top.sls`:

### test

Run states in test-only (dry-run) mode

### mock

The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

### pillar

Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply stuff pillar='{ "foo": "bar" }'
```

---

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

### exclude

Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.apply exclude=bar,baz
salt '*' state.apply exclude=foo*
salt '*' state.apply exclude="['id': 'id_to_exclude'], {'sls': 'sls_
↳to_exclude}']"
```

### queue

[False] Instead of failing immediately when another state run is in progress, a value of `True` will queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

### localconfig

Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

```
salt '*' state.apply localconfig=/path/to/minion.yml
```

### state\_events

The `state_events` option sends progress events as each function in a state run completes execution.

New in version 3006.0.

## APPLYING INDIVIDUAL SLS FILES (A.K.A. STATE .SLS)

To apply individual SLS files, pass them as a comma-separated list:

```
# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
salt '*' state.apply stuff

# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
# and salt://pkgs.sls (or salt://pkgs/init.sls).
salt '*' state.apply stuff,pkgs

# Run the states configured in a more deeply nested directory such as
↳ salt://my/organized/stuff.sls (or salt://my/organized/stuff/init.sls)
salt '*' state.apply my.organized.stuff
```

The following additional arguments are also accepted when applying individual SLS files:

### test

Run states in test-only (dry-run) mode

### mock

The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

### pillar

Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply stuff pillar='{"foo": "bar"}'
```

---

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

### queue

[False] Instead of failing immediately when another state run is in progress, a value of `True` will queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

### concurrent

[False] Execute state runs concurrently instead of serially

**Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

### saltenv

Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`

Changed in version 2014.7.0: If no `saltenv` is specified, the minion config will be checked for an `environment` parameter and if found, it will be used. If none is found, `base` will be used. In prior

releases, the minion config was not checked and `base` would always be assumed when the saltenv was not explicitly set.

**pillarenv**

Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**localconfig**

Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

```
salt '*' state.apply stuff localconfig=/path/to/minion.yml
```

**sync\_mods**

If specified, the desired custom module types will be synced prior to running the SLS files:

```
salt '*' state.apply stuff sync_mods=states,modules
salt '*' state.apply stuff sync_mods=all
```

---

**Note:** This option is ignored when no SLS files are specified, as a `highstate` automatically syncs all custom module types.

---

New in version 2017.7.8,2018.3.3,2019.2.0.

**state\_events**

The `state_events` option sends progress events as each function in a state run completes execution.

New in version 3006.0.

`salt.modules.state.check_request` (*name=None*)

New in version 2015.5.0.

Return the state request information, if any

CLI Example:

```
salt '*' state.check_request
```

`salt.modules.state.clear_cache`()

Clear out cached state files, forcing even cache runs to refresh the cache on the next state execution.

Remember that the state cache is completely disabled by default, this execution only applies if `cache=True` is used in states

CLI Example:

```
salt '*' state.clear_cache
```

`salt.modules.state.clear_request` (*name=None*)

New in version 2015.5.0.

Clear out the state execution request without executing it

CLI Example:

```
salt '*' state.clear_request
```

`salt.modules.state.disable(states)`

Disable state runs.

CLI Example:

```
salt '*' state.disable highstate
salt '*' state.disable highstate,test.succeed_without_changes
```

**Note:** To disable a state file from running provide the same name that would be passed in a state.sls call.

```
salt '*' state.disable bind.config
```

`salt.modules.state.enable(states)`

Enable state function or sls run

CLI Example:

```
salt '*' state.enable highstate
salt '*' state.enable test.succeed_without_changes
```

**Note:** To enable a state file from running provide the same name that would be passed in a state.sls call.

```
salt '*' state.disable bind.config
```

`salt.modules.state.event(tagmatch='*', count=-1, quiet=False, sock_dir=None, pretty=False, node='minion')`

Watch Salt's event bus and block until the given tag is matched

New in version 2016.3.0.

Changed in version 2019.2.0: `tagmatch` can now be either a glob or regular expression.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

#### Parameters

- **tagmatch** -- the event is written to stdout for each tag that matches this glob or regular expression.
- **count** -- this number is decremented for each event that matches the `tagmatch` parameter; pass `-1` to listen forever.
- **quiet** -- do not print to stdout; just block
- **sock\_dir** -- path to the Salt master's event socket file.
- **pretty** -- Output the JSON all on a single line if `False` (useful for shell tools); pretty-print the JSON output if `True`.
- **node** -- Watch the minion-side or master-side event bus.

CLI Example:

```
salt-call --local state.event pretty=True
```

`salt.modules.state.get_pauses(jid=None)`

Get a report on all of the currently paused state runs and pause run settings. Optionally send in a `jid` if you only desire to see a single pause data set.

`salt.modules.state.high`(*data*, *test=None*, *queue=None*, *\*\*kwargs*)

Execute the compound calls stored in a single set of high data

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.high '{"vim": {"pkg": ["installed"]}}'
```

`salt.modules.state.highstate`(*test=None*, *queue=None*, *state\_events=None*, *\*\*kwargs*)

Retrieve the state data from the salt master for this minion and execute it

**test**

Run states in test-only (dry-run) mode

**pillar**

Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.highstate stuff pillar='{"foo": "bar"}'
```

---

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.

**pillar\_enc**

Specify which renderer to use to decrypt encrypted data located within the `pillar` value. Currently, only `gpg` is supported.

New in version 2016.3.0.

**exclude**

Exclude specific states from execution. Accepts a list of `sls` names, a comma-separated string of `sls` names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.highstate exclude=bar,baz
salt '*' state.highstate exclude=foo*
salt '*' state.highstate exclude="['id': 'id_to_exclude'], {'sls':
  ↳ 'sls_to_exclude'}]"
```

**saltenv**

Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`.

Changed in version 2014.7.0: If no `saltenv` is specified, the minion config will be checked for a `saltenv` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the `saltenv` was not explicitly set.

**pillarenv**

Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**queue**

[False] Instead of failing immediately when another state run is in progress, a value of `True` will queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

#### **concurrent**

[False] Execute state runs concurrently instead of serially

**Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

#### **localconfig**

Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

#### **mock**

The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

#### **state\_events**

The `state_events` option sends progress events as each function in a state run completes execution.

New in version 3006.0.

CLI Examples:

```
salt '*' state.highstate

salt '*' state.highstate whitelist=sls1_to_run,sls2_to_run
salt '*' state.highstate exclude=sls_to_exclude
salt '*' state.highstate exclude="{ 'id': 'id_to_exclude'}, {'sls': 'sls_
→to_exclude'}"

salt '*' state.highstate pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

`salt.modules.state.id_exists(ids, mods, test=None, queue=None, **kwargs)`

Tests for the existence of a specific ID or list of IDs within the specified SLS file(s). Similar to `state.sls_exists`, returns True or False. The default environment is `base``, use `saltenv` to specify a different environment.

New in version 2019.2.0.

#### **saltenv**

Specify a salt fileserver environment from which to look for the SLS files specified in the `mods` argument

CLI Example:

```
salt '*' state.id_exists create_myfile,update_template filestate
→saltenv=dev
```

`salt.modules.state.list_disabled()`

List the states which are currently disabled

CLI Example:

```
salt '*' state.list_disabled
```

`salt.modules.state.low`(*data*, *queue=None*, *\*\*kwargs*)

Execute a single low data call

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.low '{"state": "pkg", "fun": "installed", "name": "vi"}'
```

`salt.modules.state.orchestrate`(*mods*, *saltenv='base'*, *test=None*, *exclude=None*, *pillar=None*, *pillarenv=None*)

New in version 2016.11.0.

Execute the orchestrate runner from a masterless minion.

See also:

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- Docs for the salt state module `salt.states.saltmod`

CLI Examples:

```
salt-call --local state.orchestrate webserver
salt-call --local state.orchestrate webserver saltenv=dev test=True
salt-call --local state.orchestrate webserver saltenv=dev pillarenv=aws
```

`salt.modules.state.pause`(*jid*, *state\_id=None*, *duration=None*)

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds. If a *state\_id* is not passed then the jid referenced will be paused at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```
vim:
  pkg.installed: []
```

The *state\_id* to pass to *pause* is *vim*

CLI Examples:

```
salt '*' state.pause 20171130110407769519
salt '*' state.pause 20171130110407769519 vim
salt '*' state.pause 20171130110407769519 vim 20
```

`salt.modules.state.pkg`(*pkg\_path*, *pkg\_sum*, *hash\_type*, *test=None*, *\*\*kwargs*)

Execute a packaged state run, the packaged state run will exist in a tarball available locally. This packaged state can be generated using salt-ssh.

CLI Example:

```
salt '*' state.pkg /tmp/salt_state.tgz 760a9353810e36f6d81416366fc426dc
→md5
```

`salt.modules.state.request`(*mods=None*, *\*\*kwargs*)

New in version 2015.5.0.

Request that the local admin execute a state run via `salt-call state.run_request`. All arguments match those of `state.apply`.

CLI Example:

```
salt '*' state.request
salt '*' state.request stuff
salt '*' state.request stuff,pkgs
```

`salt.modules.state.resume(jid, state_id=None)`

Remove a pause from a `jid`, allowing it to continue. If the `state_id` is not specified then the a general pause will be resumed.

The given `state_id` is the id got a given state execution, so given a state that looks like this:

```
vim:
  pkg.installed: []
```

The `state_id` to pass to `rm_pause` is `vim`

CLI Examples:

```
salt '*' state.resume 20171130110407769519
salt '*' state.resume 20171130110407769519 vim
```

`salt.modules.state.run_request(name='default', **kwargs)`

New in version 2015.5.0.

Execute the pending state request

CLI Example:

```
salt '*' state.run_request
```

`salt.modules.state.running(concurrent=False)`

Return a list of strings that contain state return data if a state function is already running. This function is used to prevent multiple state calls from being run at the same time.

CLI Example:

```
salt '*' state.running
```

`salt.modules.state.show_highstate(queue=None, **kwargs)`

Retrieve the highstate data from the salt master and display it

Custom Pillar data can be passed with the `pillar` kwarg.

CLI Example:

```
salt '*' state.show_highstate
```

`salt.modules.state.show_low_sls(mods, test=None, queue=None, **kwargs)`

Display the low data from a specific `sls`. The default environment is `base`, use `saltenv` to specify a different environment.

**saltenv**

Specify a salt fileserver environment to be used when applying states

**pillar**

Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.show_low_sls stuff pillar='{"foo": "bar"}'
```

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

#### **pillarenv**

Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_low_sls foo
salt '*' state.show_low_sls foo saltenv=dev
```

`salt.modules.state.show_lowstate` (*queue=None, \*\*kwargs*)

List out the low data that will be applied to this minion

CLI Example:

```
salt '*' state.show_lowstate
```

`salt.modules.state.show_sls` (*mods, test=None, queue=None, \*\*kwargs*)

Display the state data from a specific sls or list of sls files on the master. The default environment is `base`, use `saltenv` to specify a different environment.

This function does not support topfiles. For `top.sls` please use `show_top` instead.

Custom Pillar data can be passed with the `pillar` kwarg.

#### **saltenv**

Specify a salt fileserver environment to be used when applying states

#### **pillarenv**

Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_sls core,edit.vim saltenv=dev
```

`salt.modules.state.show_state_usage` (*queue=None, \*\*kwargs*)

Retrieve the highstate data from the salt master to analyse used and unused states

Custom Pillar data can be passed with the `pillar` kwarg.

CLI Example:

```
salt '*' state.show_state_usage
```

`salt.modules.state.show_states` (*queue=None, \*\*kwargs*)

Returns the list of states that will be applied on highstate.

CLI Example:

```
salt '*' state.show_states
```

New in version 2019.2.0.

`salt.modules.state.show_top` (*queue=None, \*\*kwargs*)

Return the top data that the minion will use for a highstate

CLI Example:

```
salt '*' state.show_top
```

`salt.modules.state.single` (*fun, name, test=None, queue=None, \*\*kwargs*)

Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

CLI Example:

```
salt '*' state.single pkg.installed name=vim
```

`salt.modules.state.sls` (*mods, test=None, exclude=None, queue=None, sync\_mods=None, state\_events=None, \*\*kwargs*)

Execute the states in one or more SLS files

**test**

Run states in test-only (dry-run) mode

**pillar**

Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.sls stuff pillar='{"foo": "bar"}'
```

---

**Note:** Values passed this way will override existing Pillar values set via `pillar_roots` or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

---

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.

**pillar\_enc**

Specify which renderer to use to decrypt encrypted data located within the `pillar` value. Currently, only `gpg` is supported.

New in version 2016.3.0.

**exclude**

Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.sls foo,bar,baz exclude=bar,baz
salt '*' state.sls foo,bar,baz exclude=ba*
salt '*' state.sls foo,bar,baz exclude="['id': 'id_to_exclude'], {
  ↪ 'sls': 'sls_to_exclude'}]"
```

**queue**

[False] Instead of failing immediately when another state run is in progress, a value of `True` will queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained

before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

#### concurrent

[False] Execute state runs concurrently instead of serially

**Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

#### saltenv

Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`.

Changed in version 2014.7.0: If no `saltenv` is specified, the minion config will be checked for an `environment` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the `saltenv` was not explicitly set.

#### pillarenv

Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

#### localconfig

Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

#### mock

The `mock` option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

#### sync\_mods

If specified, the desired custom module types will be synced prior to running the SLS files:

```
salt '*' state.sls stuff sync_mods=states,modules
salt '*' state.sls stuff sync_mods=all
```

New in version 2017.7.8,2018.3.3,2019.2.0.

#### state\_events

The `state_events` option sends progress events as each function in a state run completes execution.

New in version 3006.0.

CLI Example:

```
# Run the states configured in salt://example.sls (or salt://example/init.
→sls)
salt '*' state.apply example

# Run the states configured in salt://core.sls (or salt://core/init.sls)
# and salt://edit/vim.sls (or salt://edit/vim/init.sls)
salt '*' state.sls core,edit.vim

# Run the states configured in a more deeply nested directory such as
→salt://my/nested/state.sls (or salt://my/nested/state/init.sls)
salt '*' state.sls my.nested.state
```

(continues on next page)

(continued from previous page)

```
salt '*' state.sls core exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_
→to_exclude'}]"
salt '*' state.sls myslsfile pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

`salt.modules.state.sls_exists`(*mods*, *test=None*, *queue=None*, *\*\*kwargs*)

Tests for the existence the of a specific SLS or list of SLS files on the master. Similar to `state.show_sls`, rather than returning state details, returns True or False. The default environment is base, use `saltenv` to specify a different environment.

New in version 2019.2.0.

**saltenv**

Specify a salt fileserver environment from which to look for the SLS files specified in the `mods` argument

CLI Example:

```
salt '*' state.sls_exists core,edit.vim saltenv=dev
```

`salt.modules.state.sls_id`(*id\_*, *mods*, *test=None*, *queue=None*, *state\_events=None*, *\*\*kwargs*)

Call a single ID from the named module(s) and handle all requisites

The state ID comes *before* the module ID(s) on the command line.

**id**

ID to call

**mods**

Comma-delimited list of modules to search for given id and its requisites

New in version 2014.7.0.

**saltenv**

[base] Specify a salt fileserver environment to be used when applying states

**pillarenv**

Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**pillar**

Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.sls_id my_state my_module pillar='{ "foo": "bar" }'
```

---

**Note:** Values passed this way will override existing Pillar values set via `pillar_roots` or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

---

New in version 2018.3.0.

CLI Example:

```
salt '*' state.sls_id my_state my_module
salt '*' state.sls_id my_state my_module,a_common_module
```

`salt.modules.state.soft_kill`(*jid*, *state\_id=None*)

Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given state id. This needs to pass in the `jid` of the running state. If a `state_id` is not passed then the `jid` referenced will be safely exited at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```
vim:
pkg.installed: []
```

The `state_id` to pass to `soft_kill` is `vim`

CLI Examples:

```
salt '*' state.soft_kill 20171130110407769519
salt '*' state.soft_kill 20171130110407769519 vim
```

`salt.modules.state.template`(*tem*, *queue=None*, *\*\*kwargs*)

Execute the information stored in a template file on the minion.

This function does not ask a master for a SLS file to render but instead directly processes the file at the provided path on the minion.

CLI Example:

```
salt '*' state.template '<Path to template on the minion>'
```

`salt.modules.state.template_str`(*tem*, *queue=None*, *\*\*kwargs*)

Execute the information stored in a string from an sls template

CLI Example:

```
salt '*' state.template_str '<Template String>'
```

`salt.modules.state.test`(*\*args*, *\*\*kwargs*)

New in version 3001.

Alias for `state.apply` with the kwarg `test` forced to `True`.

This is a nicety to avoid the need to type out `test=True` and the possibility of a typo causing changes you do not intend.

`salt.modules.state.top`(*topfn*, *test=None*, *queue=None*, *\*\*kwargs*)

Execute a specific top file instead of the default. This is useful to apply configurations from a different environment (for example, dev or prod), without modifying the default top file.

**queue**

[False] Instead of failing immediately when another state run is in progress, a value of `True` will queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

**saltenv**

Specify a salt fileserver environment to be used when applying states

**pillarenv**

Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2017.7.0.

CLI Example:

```
salt '*' state.top reverse_top.sls
salt '*' state.top prod_top.sls exclude=sls_to_exclude
salt '*' state.top dev_top.sls exclude="{ 'id': 'id_to_exclude'}, {'sls':
→ 'sls_to_exclude'}]"
```

### 26.6.431 salt.modules.status

Module for returning various status data about a minion. These data can be useful for compiling into stats later.

`salt.modules.status.all_status()`

Return a composite of all status data and info for this minion. Warning: There is a LOT here!

CLI Example:

```
salt '*' status.all_status
```

`salt.modules.status.cpuinfo()`

Changed in version 2016.3.2: Return the CPU info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for NetBSD and OpenBSD

CLI Example:

```
salt '*' status.cpuinfo
```

`salt.modules.status.cputats()`

Return the CPU stats for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.cputats
```

`salt.modules.status.custom()`

Return a custom composite of status data and info for this minion, based on the minion config file. An example config like might be:

```
status.cputats.custom: [ 'cpu', 'ctxt', 'btime', 'processes' ]
```

Where status refers to status.py, cputats is the function where we get our data, and custom is this function It is followed by a list of keys that we want returned.

This function is meant to replace `all_status()`, which returns anything and everything, which we probably don't want.

By default, nothing is returned. Warning: Depending on what you include, there can be a LOT here!

CLI Example:

```
salt '*' status.custom
```

**salt.modules.status.diskstats()**

Changed in version 2016.3.2: Return the disk stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.diskstats
```

**salt.modules.status.diskusage(\*args)**

Return the disk usage for this minion

Usage:

```
salt '*' status.diskusage [paths and/or filesystem types]
```

CLI Example:

```
salt '*' status.diskusage           # usage for all filesystems
salt '*' status.diskusage / /tmp    # usage for / and /tmp
salt '*' status.diskusage ext?     # usage for ext[234] filesystems
salt '*' status.diskusage / ext?   # usage for / and all ext filesystems
```

**salt.modules.status.loadavg()**

Return the load averages for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.loadavg

:raises CommandExecutionError: If the system cannot report loadaverages
→to Python
```

**salt.modules.status.master(master=None, connected=True)**

New in version 2014.7.0.

Return the connection status with master. Fire an event if the connection to master is not as expected. This function is meant to be run via a scheduled job from the minion. If master\_ip is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.master
```

**salt.modules.status.meminfo()**

Return the memory info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.meminfo
```

**salt.modules.status.netdev()**

Changed in version 2016.3.2: Return the network device stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.netdev
```

**salt.modules.status.netstats()**

Return the network stats for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.netstats
```

**salt.modules.status.nproc()**

Return the number of processing units available on this system

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for Darwin, FreeBSD and OpenBSD

CLI Example:

```
salt '*' status.nproc
```

**salt.modules.status.pid(*sig*)**

Return the PID or an empty string if the process is running or not. Pass a signature to use to find the process via ps. Note you can pass a Python-compatible regular expression to return all pids of processes matching the regexp.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.pid <sig>
```

**salt.modules.status.ping\_master(*master*)**

New in version 2016.3.0.

Sends ping request to the given master. Fires '`__master_failback`' event on success. Returns bool result.

CLI Example:

```
salt '*' status.ping_master localhost
```

**salt.modules.status.procs()**

Return the process data

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.procs
```

`salt.modules.status.proxy_reconnect` (*proxy\_name*, *opts=None*)

Forces proxy minion reconnection when not alive.

**proxy\_name**

The virtual name of the proxy module.

**opts: None**

Opts dictionary. Not intended for CLI usage.

CLI Example:

```
salt '*' status.proxy_reconnect rest_sample
```

`salt.modules.status.time_` (*format='%A, %d. %B %Y %I:%M%p'*)

New in version 2016.3.0.

Return the current time on the minion, formatted based on the format parameter.

Default date format: Monday, 27. July 2015 07:55AM

CLI Example:

```
salt '*' status.time
salt '*' status.time '%s'
```

`salt.modules.status.uptime`()

Return the uptime for this system.

Changed in version 2015.8.9: The uptime function was changed to return a dictionary of easy-to-read key/value pairs containing uptime information, instead of the output from a `cmd.run` call.

Changed in version 2016.11.0: Support for OpenBSD, FreeBSD, NetBSD, MacOS, and Solaris

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.uptime
```

`salt.modules.status.version`()

Return the system version for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.version
```

`salt.modules.status.vmstats`()

Changed in version 2016.3.2: Return the virtual memory stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.vmstats
```

`salt.modules.status.w()`

Return a list of logged in users for this minion, using the `w` command

CLI Example:

```
salt '*' status.w
```

## 26.6.432 salt.modules.statuspage

### StatusPage

Handle requests for the StatusPage API.

In the minion configuration file, the following block is required:

```
statuspage:
  api_key: <API_KEY>
  page_id: <PAGE_ID>
```

New in version 2017.7.0.

`salt.modules.statuspage.create` (*endpoint='incidents', api\_url=None, page\_id=None, api\_key=None, api\_version=None, \*\*kwargs*)

Insert a new entry under a specific endpoint.

**endpoint: incidents**

Insert under this specific endpoint.

**page\_id**

Page ID. Can also be specified in the config file.

**api\_key**

API key. Can also be specified in the config file.

**api\_version: 1**

API version. Can also be specified in the config file.

**api\_url**

Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.create endpoint='components' name='my component'
→group_id='993vgplshj12'
```

Example output:

```
minion:
  -----
  comment:
  out:
    -----
    created_at:
      2017-01-05T19:35:27.135Z
    description:
      None
    group_id:
      993vgplshj12
    id:
```

(continues on next page)

(continued from previous page)

```

    mjkmtt5lhdc
  name:
    my component
  page_id:
    ksdhgfyyiuhaa
  position:
    7
  status:
    operational
  updated_at:
    2017-01-05T19:35:27.135Z
result:
  True

```

`salt.modules.statuspage.delete` (*endpoint='incidents', id=None, api\_url=None, page\_id=None, api\_key=None, api\_version=None*)

Remove an entry from an endpoint.

**endpoint: incidents**

Request a specific endpoint.

**page\_id**

Page ID. Can also be specified in the config file.

**api\_key**

API key. Can also be specified in the config file.

**api\_version: 1**

API version. Can also be specified in the config file.

**api\_url**

Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.delete endpoint='components' id='ftgks51sfs2d'
```

Example output:

```

minion:
-----
comment:
out:
  None
result:
  True

```

`salt.modules.statuspage.retrieve` (*endpoint='incidents', api\_url=None, page\_id=None, api\_key=None, api\_version=None*)

Retrieve a specific endpoint from the Statuspage API.

**endpoint: incidents**

Request a specific endpoint.

**page\_id**

Page ID. Can also be specified in the config file.

**api\_key**

API key. Can also be specified in the config file.

**api\_version: 1**

API version. Can also be specified in the config file.

**api\_url**

Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.retrieve components
```

Example output:

```
minion:
-----
comment:
out:
  |-----

```

`salt.modules.statuspage.update` (*endpoint='incidents', id=None, api\_url=None, page\_id=None, api\_key=None, api\_version=None, \*\*kwargs*)

Update attribute(s) of a specific endpoint.

**id**

The unique ID of the endpoint entry.

**endpoint: incidents**

Endpoint name.

**page\_id**

Page ID. Can also be specified in the config file.

**api\_key**

API key. Can also be specified in the config file.

**api\_version: 1**

API version. Can also be specified in the config file.

**api\_url**

Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.update id=dz959yz2nd4l status=resolved
```

Example output:

```
minion:
  -----
  comment:
  out:
  -----
  created_at:
    2017-01-03T15:25:30.718Z
  description:
    None
  group_id:
    993vgplshj12
  id:
    dz959yz2nd4l
  name:

  page_id:
    xzwjjdw87vpf
  position:
    11
  status:
    resolved
  updated_at:
    2017-01-05T15:34:27.676Z
  result:
    True
```

### 26.6.433 salt.modules.supervisord

Provide the service module for system supervisord or supervisord in a virtualenv

**salt.modules.supervisord.add**(*name*, *user=None*, *conf\_file=None*, *bin\_env=None*)

Activates any updates in config for process/group.

**user**

user to run supervisorctl as

**conf\_file**

path to supervisord config file

**bin\_env**

path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.add <name>
```

**salt.modules.supervisord.custom**(*command*, *user=None*, *conf\_file=None*, *bin\_env=None*)

Run any custom supervisord command

**user**

user to run supervisorctl as

**conf\_file**

path to supervisord config file

**bin\_env**

path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisorctl.custom "mstop '*unicorn*'"
```

**salt.modules.supervisord.options** (*name, conf\_file=None*)

New in version 2014.1.0.

Read the config file and return the config options for a given process

**name**

Name of the configured process

**conf\_file**

path to supervisord config file

CLI Example:

```
salt '*' supervisord.options foo
```

**salt.modules.supervisord.remove** (*name, user=None, conf\_file=None, bin\_env=None*)

Removes process/group from active config

**user**

user to run supervisorctl as

**conf\_file**

path to supervisord config file

**bin\_env**

path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.remove <name>
```

**salt.modules.supervisord.reread** (*user=None, conf\_file=None, bin\_env=None*)

Reload the daemon's configuration files

**user**

user to run supervisorctl as

**conf\_file**

path to supervisord config file

**bin\_env**

path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.reread
```

**salt.modules.supervisord.restart** (*name='all', user=None, conf\_file=None, bin\_env=None*)

Restart the named service. Process group names should not include a trailing asterisk.

**user**

user to run supervisorctl as

**conf\_file**

path to supervisord config file

**bin\_env**

path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.restart <service>
salt '*' supervisord.restart <group>:
```

`salt.modules.supervisord.start` (*name='all', user=None, conf\_file=None, bin\_env=None*)

Start the named service. Process group names should not include a trailing asterisk.

**user**

user to run supervisorctl as

**conf\_file**

path to supervisord config file

**bin\_env**

path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.start <service>
salt '*' supervisord.start <group>:
```

`salt.modules.supervisord.status` (*name=None, user=None, conf\_file=None, bin\_env=None*)

List programs and its state

**user**

user to run supervisorctl as

**conf\_file**

path to supervisord config file

**bin\_env**

path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.status
```

`salt.modules.supervisord.status_bool` (*name, expected\_state=None, user=None, conf\_file=None, bin\_env=None*)

Check for status of a specific supervisord process and return boolean result.

**name**

name of the process to check

**expected\_state**

search for a specific process state. If set to None - any process state will match.

**user**

user to run supervisorctl as

**conf\_file**

path to supervisord config file

**bin\_env**

path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.status_bool nginx expected_state='RUNNING'
```

`salt.modules.supervisord.status_raw` (*name=None, user=None, conf\_file=None, bin\_env=None*)

Display the raw output of status

**user**

user to run supervisorctl as

**conf\_file**

path to supervisord config file

**bin\_env**

path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.status_raw
```

`salt.modules.supervisord.stop` (*name='all', user=None, conf\_file=None, bin\_env=None*)

Stop the named service. Process group names should not include a trailing asterisk.

**user**

user to run supervisorctl as

**conf\_file**

path to supervisord config file

**bin\_env**

path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.stop <service>
salt '*' supervisord.stop <group>:
```

`salt.modules.supervisord.update` (*user=None, conf\_file=None, bin\_env=None, name=None*)

Reload config and add/remove/update as necessary

**user**

user to run supervisorctl as

**conf\_file**

path to supervisord config file

**bin\_env**

path to supervisorctl bin or path to virtualenv with supervisor installed

**name**

name of the process group to update. if none then update any process group that has changes

CLI Example:

```
salt '*' supervisord.update
```

### 26.6.434 salt.modules.suse\_apache

**Warning:** This module will be removed from Salt in version 3009 in favor of the [apache Salt Extension](#).

Support for Apache

Please note: The functions in here are SUSE-specific. Placing them in this separate file will allow them to load only on SUSE systems, while still loading under the `apache` namespace.

`salt.modules.suse_apache.a2dismod` (*mod*)

Runs a2dismod for the given mod.

CLI Example:

```
salt '*' apache.a2dismod vhost_alias
```

`salt.modules.suse_apache.a2enmod` (*mod*)

Runs a2enmod for the given mod.

CLI Example:

```
salt '*' apache.a2enmod vhost_alias
```

`salt.modules.suse_apache.check_mod_enabled` (*mod*)

Checks to see if the specific apache mod is enabled.

This will only be functional on operating systems that support `a2enmod -l` to list the enabled mods.

CLI Example:

```
salt '*' apache.check_mod_enabled status
```

### 26.6.435 salt.modules.suse\_ip

The networking module for SUSE based distros

New in version 3005.

`salt.modules.suse_ip.apply_network_settings(**settings)`

Apply global network configuration.

**:param**

[param settings:] The network settings to apply

**Returns**

The result of `service.reload` for network service

CLI Example:

```
salt '*' ip.apply_network_settings
```

`salt.modules.suse_ip.build_interface(iface, iface_type, enabled, **settings)`

Build an interface script for a network interface.

**:param**

[param iface:] The name of the interface to build the configuration for

**:param**

[param iface\_type:]

**The type of the interface. The following types are possible:**

- eth
- bond
- alias
- clone
- ipsec
- dialup
- bridge
- slave
- vlan
- ipip
- ib

**:param**

[param enabled:] Build the interface enabled or disabled

**:param**

[param settings:] The settings for the interface

**Returns**

A dictionary of file/content

**Return type**

dict

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

`salt.modules.suse_ip.build_network_settings(**settings)`

Build the global network script.

**:param**

[param settings:] The network settings

**Returns**

A dictionary of file/content

**Return type**

dict

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

`salt.modules.suse_ip.build_routes(iface, **settings)`

Build a route script for a network interface.

**:param**

[param iface:] The name of the interface to build the routes for

**:param**

[param settings:] The settings for the routes

**Returns**

A dictionary of file/content

**Return type**

dict

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

`salt.modules.suse_ip.down(iface, iface_type=None)`

Shutdown a network interface

**:param**

[param iface:] The name of the interface to shutdown

**:param**

[param iface\_type:] The type of the interface If `slave` is specified, no any action is performing Default is `None`

**Returns**

The result of `ifdown` command or `None` if `slave` `iface_type` was specified

**Return type**

str

CLI Example:

```
salt '*' ip.down eth0
```

`salt.modules.suse_ip.get_interface(iface)`

Return the contents of an interface script

**:param**

[param iface:] The name of the interface to get settings for

**Returns**

A dictionary of file/content

**Return type**

dict

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.suse_ip.get_network_settings()`

Return the contents of the global network script.

**:param**

[param iface:] The name of the interface to start up

**:param**

[param iface\_type:] The type of the interface If `slave` is specified, no any action is performing Default is `None`

**Returns**

A dictionary of file/content

**Return type**

`dict`

CLI Example:

```
salt '*' ip.get_network_settings
```

`salt.modules.suse_ip.get_routes(iface)`

Return the contents of the interface routes script.

**:param**

[param iface:] The name of the interface to get the routes for

**Returns**

A dictionary of file/content

**Return type**

`dict`

CLI Example:

```
salt '*' ip.get_routes eth0
```

`salt.modules.suse_ip.up(iface, iface_type=None)`

Start up a network interface

**:param**

[param iface:] The name of the interface to start up

**:param**

[param iface\_type:] The type of the interface If `slave` is specified, no any action is performing Default is `None`

**Returns**

The result of `ifup` command or `None` if `slave` `iface_type` was specified

**Return type**

`str`

CLI Example:

```
salt '*' ip.up eth0
```

## 26.6.436 salt.modules.svn

Subversion SCM

**salt.modules.svn.add**(*cwd*, *targets*, *user=None*, *username=None*, *password=None*, *\*opts*)

Add files to be tracked by the Subversion working-copy checkout

**cwd**

The path to the Subversion repository

**targets**

[None] files and directories to pass to the command as arguments

**user**

[None] Run svn as a user other than what the minion runs as

**username**

[None] Connect to the Subversion server as another user

**password**

[None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.add /path/to/repo /path/to/new/file
```

**salt.modules.svn.checkout**(*cwd*, *remote*, *target=None*, *user=None*, *username=None*, *password=None*, *\*opts*)

Download a working copy of the remote Subversion repository directory or file

**cwd**

The path to the Subversion repository

**remote**

[None] URL to checkout

**target**

[None] The name to give the file or directory working copy Default: svn uses the remote basename

**user**

[None] Run svn as a user other than what the minion runs as

**username**

[None] Connect to the Subversion server as another user

**password**

[None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.checkout /path/to/repo svn://remote/repo
```

**salt.modules.svn.commit**(*cwd*, *targets=None*, *msg=None*, *user=None*, *username=None*, *password=None*, *\*opts*)

Commit the current directory, files, or directories to the remote Subversion repository

**cwd**

The path to the Subversion repository

**targets**

[None] files and directories to pass to the command as arguments Default: svn uses '.'

**msg**

[None] Message to attach to the commit log

**user**

[None] Run svn as a user other than what the minion runs as

**username**

[None] Connect to the Subversion server as another user

**password**

[None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.commit /path/to/repo
```

`salt.modules.svn.diff`(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, *\*opts*)

Return the diff of the current directory, files, or directories from the remote Subversion repository

**cwd**

The path to the Subversion repository

**targets**

[None] files and directories to pass to the command as arguments Default: svn uses ''

**user**

[None] Run svn as a user other than what the minion runs as

**username**

[None] Connect to the Subversion server as another user

**password**

[None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.diff /path/to/repo
```

`salt.modules.svn.export`(*cwd*, *remote*, *target=None*, *user=None*, *username=None*, *password=None*, *revision='HEAD'*, *\*opts*)

Create an unversioned copy of a tree.

**cwd**

The path to the Subversion repository

**remote**

[None] URL and path to file or directory checkout

**target**

[None] The name to give the file or directory working copy Default: svn uses the remote basename

**user**

[None] Run svn as a user other than what the minion runs as

**username**

[None] Connect to the Subversion server as another user

**password**

[None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.export /path/to/repo svn://remote/repo
```

`salt.modules.svn.info`(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, *fmt='str'*)

Display the Subversion information from the checkout.

**cwd**

The path to the Subversion repository

**targets**

[None] files, directories, and URLs to pass to the command as arguments svn uses '' by default

**user**

[None] Run svn as a user other than what the minion runs as

**username**

[None] Connect to the Subversion server as another user

**password**

[None] Connect to the Subversion server with this password

New in version 0.17.0.

**fmt**

[str] How to fmt the output from info. (str, xml, list, dict)

CLI Example:

```
salt '*' svn.info /path/to/svn/repo
```

`salt.modules.svn.remove`(*cwd*, *targets*, *msg=None*, *user=None*, *username=None*, *password=None*, *\*opts*)

Remove files and directories from the Subversion repository

**cwd**

The path to the Subversion repository

**targets**

[None] files, directories, and URLs to pass to the command as arguments

**msg**

[None] Message to attach to the commit log

**user**

[None] Run svn as a user other than what the minion runs as

**username**

[None] Connect to the Subversion server as another user

**password**

[None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.remove /path/to/repo /path/to/repo/remove
```

`salt.modules.svn.status`(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, *\*opts*)

Display the status of the current directory, files, or directories in the Subversion repository

**cwd**

The path to the Subversion repository

**targets**

[None] files, directories, and URLs to pass to the command as arguments Default: svn uses ''

**user**

[None] Run svn as a user other than what the minion runs as

**username**

[None] Connect to the Subversion server as another user

**password**

[None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.status /path/to/repo
```

`salt.modules.svn.switch`(*cwd*, *remote*, *target=None*, *user=None*, *username=None*, *password=None*, *\*opts*)

New in version 2014.1.0.

Switch a working copy of a remote Subversion repository directory

**cwd**

The path to the Subversion repository

**remote**

[None] URL to switch

**target**

[None] The name to give the file or directory working copy Default: svn uses the remote basename

**user**

[None] Run svn as a user other than what the minion runs as

**username**

[None] Connect to the Subversion server as another user

**password**

[None] Connect to the Subversion server with this password

CLI Example:

```
salt '*' svn.switch /path/to/repo svn://remote/repo
```

**salt.modules.svn.update**(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, *\*opts*)

Update the current directory, files, or directories from the remote Subversion repository

**cwd**

The path to the Subversion repository

**targets**

[None] files and directories to pass to the command as arguments Default: svn uses ''

**user**

[None] Run svn as a user other than what the minion runs as

**password**

[None] Connect to the Subversion server with this password

New in version 0.17.0.

**username**

[None] Connect to the Subversion server as another user

CLI Example:

```
salt '*' svn.update /path/to/repo
```

## 26.6.437 salt.modules.swarm

### Docker Swarm Module using Docker's Python SDK

**codeauthor**

Tyler Jones &lt;jonestyler806@gmail.com&gt;

New in version 2018.3.0.

The Docker Swarm Module is used to manage and create Docker Swarms.

### Dependencies

- Docker installed on the host
- Docker python sdk >= 2.5.1

## Docker Python SDK

```
pip install -U docker
```

More information: <https://docker-py.readthedocs.io/en/stable/>

`salt.modules.swarm.joinswarm`(*remote\_addr*=<class 'int'>, *listen\_addr*=<class 'int'>, *token*=<class 'str'>)

Join a Swarm Worker to the cluster

**remote\_addr**

The manager node you want to connect to for the swarm

**listen\_addr**

Listen address used for inter-manager communication if the node gets promoted to manager, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP)

**token**

Either the manager join token or the worker join token. You can get the worker or manager token via `salt '*' swarm.swarm_tokens`

CLI Example:

```
salt '*' swarm.joinswarm remote_addr=192.168.50.10 listen_addr='0.0.0.0'
→ token='SWMTKN-1-
→64tux2g0701r84ofq93zppcih0pe081akq45owe9ts61f30x4t-
→06trjugdu7x2z47j938s54il'
```

`salt.modules.swarm.leave_swarm`(*force*=<class 'bool'>)

Force the minion to leave the swarm

**force**

Will force the minion/worker/manager to leave the swarm

CLI Example:

```
salt '*' swarm.leave_swarm force=False
```

`salt.modules.swarm.node_ls`(*server*=<class 'str'>)

Displays Information about Swarm Nodes with passing in the server

**server**

The minion/server name

CLI Example:

```
salt '*' swarm.node_ls server=minion1
```

`salt.modules.swarm.remove_node`(*node\_id*=<class 'str'>, *force*=<class 'bool'>)

Remove a node from a swarm and the target needs to be a swarm manager

**node\_id**

The node id from the return of `swarm.node_ls`

**force**

Forcefully remove the node/minion from the service

CLI Example:

```
salt '*' swarm.remove_node node_id=z4gjbe9rwmqahc2a91snvolm5 force=false
```

`salt.modules.swarm.remove_service`(*service*=<class 'str'>)

Remove Swarm Service

**service**

The name of the service

CLI Example:

```
salt '*' swarm.remove_service service=Test_Service
```

```
salt.modules.swarm.service_create(image=<class 'str'>, name=<class 'str'>, command=<class 'str'>,
                                  hostname=<class 'str'>, replicas=<class 'int'>, target_port=<class
                                  'int'>, published_port=<class 'int'>)
```

Create Docker Swarm Service Create

**image**

The docker image

**name**

Is the service name

**command**

The docker command to run in the container at launch

**hostname**

The hostname of the containers

**replicas**

How many replicas you want running in the swarm

**target\_port**

The target port on the container

**published\_port**

port that's published on the host/os

CLI Example:

```
salt '*' swarm.service_create image=httpd name=Test_Service
→command=None hostname=salthttpd replicas=6 target_port=80 published_
→port=80
```

```
salt.modules.swarm.swarm_init(advertise_addr=<class 'str'>, listen_addr=<class 'int'>,
                              force_new_cluster=<class 'bool'>)
```

Initialize Docker on Minion as a Swarm Manager

**advertise\_addr**

The ip of the manager

**listen\_addr**

Listen address used for inter-manager communication, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP). This can either be an address/port combination in the form 192.168.1.1:4567, or an interface followed by a port number, like eth0:4567

**force\_new\_cluster**

Force a new cluster if True is passed

CLI Example:

```
salt '*' swarm.swarm_init advertise_addr='192.168.50.10' listen_addr='0.0.
→0.0' force_new_cluster=False
```

```
salt.modules.swarm.swarm_service_info(service_name=<class 'str'>)
```

Swarm Service Information

**service\_name**

The name of the service that you want information on about the service

CLI Example:

```
salt '*' swarm.swarm_service_info service_name=Test_Service
```

```
salt.modules.swarm.swarm_tokens()
```

Get the Docker Swarm Manager or Worker join tokens

CLI Example:

```
salt '*' swarm.swarm_tokens
```

```
salt.modules.swarm.update_node(availability=<class 'str'>, node_name=<class 'str'>, role=<class 'str'>,
                                node_id=<class 'str'>, version=<class 'int'>)
```

Updates docker swarm nodes/needs to target a manager node/minion

**availability**

Drain or Active

**node\_name**

minion/node

**role**

role of manager or worker

**node\_id**

The Id and that can be obtained via swarm.node\_ls

**version**

Is obtained by swarm.node\_ls

CLI Example:

```
salt '*' swarm.update_node availability=drain node_name=minion2
→ role=worker node_id=3k9x7t8m4pel9c0nqr3iajnzp version=19
```

## 26.6.438 salt.modules.swift

Module for handling OpenStack Swift calls Author: Anthony Stanton <[anthony.stanton@gmail.com](mailto:anthony.stanton@gmail.com)>

Inspired by the S3 and Nova modules

**depends**

- swiftclient Python module

**configuration**

This module is not usable until the user, tenant, auth URL, and password or auth\_key are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
keystone.password: verybadpass
# or
keystone.auth_key: 203802934809284k2j34lkj2l3kj43k
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
  keystone.password: verybadpass
  # or
  keystone.auth_key: 203802934809284k2j34lkj2l3kj43k

openstack2:
```

(continues on next page)

(continued from previous page)

```
keystone.user: admin
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
keystone.password: verybadpass
# or
keystone.auth_key: 303802934809284k2j34lkj2l3kj43k
```

With this configuration in place, any of the swift functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' swift.get mycontainer myfile /tmp/file
--profile=openstack1
```

NOTE: For Rackspace cloud files setting `keystone.auth_version = 1` is recommended.

`salt.modules.swift.delete` (*cont*, *path=None*, *profile=None*)

Delete a container, or delete an object from a container.

CLI Example to delete a container:

```
salt myminion swift.delete mycontainer
```

CLI Example to delete an object from a container:

```
salt myminion swift.delete mycontainer remoteobject
```

`salt.modules.swift.get` (*cont=None*, *path=None*, *local\_file=None*, *return\_bin=False*, *profile=None*)

List the contents of a container, or return an object from a container. Set `return_bin` to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list containers:

```
salt myminion swift.get
```

CLI Example to list the contents of a container:

```
salt myminion swift.get mycontainer
```

CLI Example to return the binary contents of an object:

```
salt myminion swift.get mycontainer myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion swift.get mycontainer myfile.png local_file=/tmp/myfile.png
```

`salt.modules.swift.head`()

`salt.modules.swift.put` (*cont*, *path=None*, *local\_file=None*, *profile=None*)

Create a new container, or upload an object to a container.

CLI Example to create a container:

```
salt myminion swift.put mycontainer
```

CLI Example to upload an object to a container:

```
salt myminion swift.put mycontainer remotepath local_file=/path/to/file
```

### 26.6.439 salt.modules.sysbench

The 'sysbench' module is used to analyze the performance of the minions, right from the master! It measures various system parameters such as CPU, Memory, File I/O, Threads and Mutex.

#### salt.modules.sysbench.cpu()

Tests for the CPU performance of minions.

CLI Examples:

```
salt '*' sysbench.cpu
```

#### salt.modules.sysbench.fileio()

This tests for the file read and write operations Various modes of operations are

- sequential write
- sequential rewrite
- sequential read
- random read
- random write
- random read and write

The test works with 32 files with each file being 1Gb in size The test consumes a lot of time. Be patient!

CLI Examples:

```
salt '*' sysbench.fileio
```

#### salt.modules.sysbench.memory()

This tests the memory for read and write operations.

CLI Examples:

```
salt '*' sysbench.memory
```

#### salt.modules.sysbench.mutex()

Tests the implementation of mutex

CLI Examples:

```
salt '*' sysbench.mutex
```

#### salt.modules.sysbench.ping()

#### salt.modules.sysbench.threads()

This tests the performance of the processor's scheduler

CLI Example:

```
salt '*' sysbench.threads
```

## 26.6.440 salt.modules.sysfs

Module for interfacing with SysFS

See also:

<https://www.kernel.org/doc/Documentation/filesystems/sysfs.txt>

New in version 2016.3.0.

**salt.modules.sysfs.attr**(*key*, *value=None*)

Access/write a SysFS attribute. If the attribute is a symlink, its destination is returned

**Returns**

value or bool

CLI Example:

```
salt '*' sysfs.attr block/sda/queue/logical_block_size
```

**salt.modules.sysfs.interfaces**(*root*)

Generate a dictionary with all available interfaces relative to root. Symlinks are not followed.

CLI Example:

```
salt '*' sysfs.interfaces block/bcache0/bcache
```

Output example:

```
{
  "r": [
    "state",
    "partial_stripes_expensive",
    "writeback_rate_debug",
    "stripe_size",
    "dirty_data",
    "stats_total/cache_hits",
    "stats_total/cache_bypass_misses",
    "stats_total/bypassed",
    "stats_total/cache_readaheads",
    "stats_total/cache_hit_ratio",
    "stats_total/cache_miss_collisions",
    "stats_total/cache_misses",
    "stats_total/cache_bypass_hits",
  ],
  "rw": [
    "writeback_rate",
    "writeback_rate_update_seconds",
    "cache_mode",
    "writeback_delay",
    "label",
    "writeback_running",
    "writeback_metadata",
    "running",
    "writeback_rate_p_term_inverse",
    "sequential_cutoff",
    "writeback_percent",
    "writeback_rate_d_term",
  ]
}
```

(continues on next page)

(continued from previous page)

```

    "readahead"
  ],
  "w": [
    "stop",
    "clear_stats",
    "attach",
    "detach"
  ]
}

```

**Note:**

- 'r' interfaces are read-only
- 'w' interfaces are write-only (e.g. actions)
- 'rw' are interfaces that can both be read or written

`salt.modules.sysfs.read(key, root="")`

Read from SysFS

**Parameters**

**key** -- file or path in SysFS; if key is a list then root will be prefixed on each key

**Returns**

the full (tree of) SysFS attributes under key

CLI Example:

```
salt '*' sysfs.read class/net/em1/statistics
```

`salt.modules.sysfs.target(key, full=True)`

Return the basename of a SysFS key path

**Parameters**

- **key** -- the location to resolve within SysFS
- **full** -- full path instead of basename

**Returns**

fullpath or basename of path

CLI Example:

```
salt '*' sysfs.read class/ttyS0
```

`salt.modules.sysfs.write(key, value)`

Write a SysFS attribute/action

CLI Example:

```
salt '*' sysfs.write devices/system/cpu/cpu0/cpufreq/scaling_
↳governor 'performance'
```

## 26.6.441 salt.modules.syslog\_ng

Module for getting information about syslog-ng

```

maintainer
    Tibor Benke <btibi@sch.bme.hu>

maturity
    new

depends
    cmd

platform
    all

```

This module is capable of managing syslog-ng instances which were installed via a package manager or from source. Users can use a directory as a parameter in the case of most functions, which contains the syslog-ng and syslog-ng-ctl binaries.

Syslog-ng can be installed via a package manager or from source. In the latter case, the syslog-ng and syslog-ng-ctl binaries are not available from the PATH, so users should set location of the sbin directory with *syslog\_ng.set\_binary\_path*.

Similarly, users can specify the location of the configuration file with *syslog\_ng.set\_config\_file*, then the module will use it. If it is not set, syslog-ng uses the default configuration file.

**class** salt.modules.syslog\_ng.**Argument** (*value=""*)

A TypedParameterValue has one or more Arguments. For example this can be the value of key\_file.

Does not need examples.

**build()**

**class** salt.modules.syslog\_ng.**Buildable** (*iterable, join\_body\_on="", append\_extra\_newline=True*)

Base class of most classes, which have a build method.

It contains a common build function.

Does not need examples.

**build()**

Builds the textual representation of the whole configuration object with its children.

**build\_body()**

Builds the body of a syslog-ng configuration object.

**build\_header()**

Builds the header of a syslog-ng configuration object.

**build\_tail()**

Builds the tail of a syslog-ng configuration object.

**class** salt.modules.syslog\_ng.**GivenStatement** (*value, add\_newline=True*)

This statement returns a string without modification. It can be used to use existing configuration snippets.

Does not need examples.

**build()**

Builds the textual representation of the whole configuration object with its children.

**class** salt.modules.syslog\_ng.**NamedStatement**(*type*, *id*="", *options*=None)

It represents a configuration statement, which has a name, e.g. a source.

Does not need examples.

**class** salt.modules.syslog\_ng.**Option**(*type*="", *params*=None)

A Statement class contains Option instances.

An instance of Option can represent a file(), tcp(), udp(), etc. option.

Does not need examples.

**add\_parameter**(*param*)

**build**()

Builds the textual representation of the whole configuration object with its children.

**class** salt.modules.syslog\_ng.**Parameter**(*iterable*=None, *join\_body\_on*="")

An Option has one or more Parameter instances.

Does not need examples.

**class** salt.modules.syslog\_ng.**ParameterValue**(*iterable*=None, *join\_body\_on*="")

A TypedParameter can have one or more values.

Does not need examples.

**class** salt.modules.syslog\_ng.**SimpleParameter**(*value*="")

A Parameter is a SimpleParameter, if it's just a simple type, like a string.

For example:

```
destination d_file {
    file(
        '/var/log/messages'
    );
};
```

/var/log/messages is a SimpleParameter.

Does not need examples.

**build**()

Builds the textual representation of the whole configuration object with its children.

**class** salt.modules.syslog\_ng.**SimpleParameterValue**(*value*="")

A ParameterValue which holds a simple type, like a string or a number.

For example in ip(127.0.0.1) 127.0.0.1 is a SimpleParameterValue.

Does not need examples.

**build**()

Builds the textual representation of the whole configuration object with its children.

**class** salt.modules.syslog\_ng.**Statement**(*type*, *id*="", *options*=None, *has\_name*=True)

It represents a syslog-ng configuration statement, e.g. source, destination, filter.

Does not need examples.

**add\_child**(*option*)

**build\_header()**

Builds the header of a syslog-ng configuration object.

**build\_tail()**

Builds the tail of a syslog-ng configuration object.

**exception** salt.modules.syslog\_ng.**SyslogNgError****class** salt.modules.syslog\_ng.**TypedParameter** (*type=""*, *values=None*)

A Parameter, which has a type:

```
destination d_tcp {
    tcp(
        ip(127.0.0.1)
    );
};
```

`ip(127.0.0.1)` is a TypedParameter.

Does not need examples.

**add\_value** (*value*)**build()**

Builds the textual representation of the whole configuration object with its children.

**class** salt.modules.syslog\_ng.**TypedParameterValue** (*type=""*, *arguments=None*)

We have to go deeper...

A TypedParameter can have a 'parameter', which also have a type. For example `key_file` and `cert_file`:

```
source demo_tls_source {
    tcp(
        ip(0.0.0.0)
        port(1999)
        tls(
            key_file('/opt/syslog-ng/etc/syslog-ng/key.d/syslog-ng.key')
            cert_file('/opt/syslog-ng/etc/syslog-ng/cert.d/syslog-ng.cert
→ ')
        )
    );
};
```

Does not need examples.

**add\_argument** (*arg*)**build()**

Builds the textual representation of the whole configuration object with its children.

**class** salt.modules.syslog\_ng.**UnnamedStatement** (*type*, *options=None*)

It represents a configuration statement, which doesn't have a name, e.g. a log path.

Does not need examples.

**salt.modules.syslog\_ng.config** (*name*, *config*, *write=True*)

Builds syslog-ng configuration. This function is intended to be used from the state module, users should not use it directly!

`name` : the id of the Salt document or it is the format of `<statement name>.id`  
`config` : the parsed YAML code  
`write` : if True, it writes the config into the configuration file, otherwise just returns it

CLI Example:

```
salt '*' syslog_ng.config name='s_local' config="{ 'tcp': [ { 'ip': '127.0.0.1'
↪ }, { 'port': 1233 } ] }"
```

`salt.modules.syslog_ng.config_test`(`syslog_ng_sbin_dir=None`, `cfgfile=None`)

Runs syntax check against `cfgfile`. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the test.

CLI Example:

```
salt '*' syslog_ng.config_test
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin /etc/
↪ syslog-ng/syslog-ng.conf
```

`salt.modules.syslog_ng.get_config_file`()

Returns the configuration directory, which contains `syslog-ng.conf`.

CLI Example:

```
salt '*' syslog_ng.get_config_file
```

`salt.modules.syslog_ng.modules`(`syslog_ng_sbin_dir=None`)

Returns the available modules. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the execution of the command `syslog-ng`.

CLI Example:

```
salt '*' syslog_ng.modules
salt '*' syslog_ng.modules /home/user/install/syslog-ng/sbin
```

`salt.modules.syslog_ng.reload_`(`name`)

Reloads `syslog-ng`. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.reload
```

`salt.modules.syslog_ng.set_binary_path`(`name`)

Sets the path, where the `syslog-ng` binary can be found. This function is intended to be used from states.

If `syslog-ng` is installed via a package manager, users don't need to use this function.

CLI Example:

```
salt '*' syslog_ng.set_binary_path name=/usr/sbin
```

`salt.modules.syslog_ng.set_config_file`(`name`)

Sets the configuration's name. This function is intended to be used from states.

CLI Example:

```
salt '*' syslog_ng.set_config_file name=/etc/syslog-ng
```

`salt.modules.syslog_ng.set_parameters`(*version=None, binary\_path=None, config\_file=None, \*args, \*\*kwargs*)

Sets variables.

CLI Example:

```
salt '*' syslog_ng.set_parameters version='3.6'
salt '*' syslog_ng.set_parameters binary_path=/home/user/install/syslog-
ng/sbin config_file=/home/user/install/syslog-ng/etc/syslog-ng.conf
```

`salt.modules.syslog_ng.start`(*name=None, user=None, group=None, chroot=None, caps=None, no\_caps=False, pidfile=None, enable\_core=False, fd\_limit=None, verbose=False, debug=False, trace=False, yydebug=False, persist\_file=None, control=None, worker\_threads=None*)

Ensures, that syslog-ng is started via the given parameters. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If `syslog_ng.set_config_file`, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.start
```

`salt.modules.syslog_ng.stats`(*syslog\_ng\_sbin\_dir=None*)

Returns statistics from the running syslog-ng instance. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the execution of the command `syslog-ng-ctl`.

CLI Example:

```
salt '*' syslog_ng.stats
salt '*' syslog_ng.stats /home/user/install/syslog-ng/sbin
```

`salt.modules.syslog_ng.stop`(*name=None*)

Kills syslog-ng. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If `syslog_ng.set_config_file` is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.stop
```

`salt.modules.syslog_ng.version`(*syslog\_ng\_sbin\_dir=None*)

Returns the version of the installed syslog-ng. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the execution of the command `syslog-ng`.

CLI Example:

```
salt '*' syslog_ng.version
salt '*' syslog_ng.version /home/user/install/syslog-ng/sbin
```

`salt.modules.syslog_ng.write_config`(*config*, *newlines=2*)

Writes the given parameter *config* into the config file. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_config config='# comment'
```

`salt.modules.syslog_ng.write_version`(*name*)

Removes the previous configuration file, then creates a new one and writes the name line. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_version name="3.6"
```

## 26.6.442 salt.modules.sysmod

The `sys` module provides information about the available functions on the minion

`salt.modules.sysmod.argspec`(*module=""*)

Return the argument specification of functions in Salt execution modules.

CLI Example:

```
salt '*' sys.argspec pkg.install
salt '*' sys.argspec sys
salt '*' sys.argspec
```

Module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.argspec 'pkg.*'
```

`salt.modules.sysmod.doc`(*\*args*)

Return the docstrings for all modules. Optionally, specify a module or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple modules/functions can be specified.

CLI Example:

```
salt '*' sys.doc
salt '*' sys.doc sys
salt '*' sys.doc sys.doc
salt '*' sys.doc network.traceroute user.info
```

Modules can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.doc 'sys.*'
salt '*' sys.doc 'sys.list_*'
```

`salt.modules.sysmod.list_functions(*args, **kwargs)`

List the functions for all modules. Optionally, specify a module or modules from which to list.

CLI Example:

```
salt '*' sys.list_functions
salt '*' sys.list_functions sys
salt '*' sys.list_functions sys user
```

New in version 0.12.0.

```
salt '*' sys.list_functions 'module.specific_function'
```

Function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_functions 'sys.list_*'
```

`salt.modules.sysmod.list_modules(*args)`

List the modules loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_modules
```

Module names can be specified as globs.

```
salt '*' sys.list_modules 's*'
```

`salt.modules.sysmod.list_renderers(*args)`

List the renderers loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_renderers
```

Render names can be specified as globs.

```
salt '*' sys.list_renderers 'yaml*'
```

`salt.modules.sysmod.list_returner_functions(*args, **kwargs)`

List the functions for all returner modules. Optionally, specify a returner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returner_functions
salt '*' sys.list_returner_functions mysql
salt '*' sys.list_returner_functions mysql etcd
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returner_functions 'sqlite3.get_*'
```

`salt.modules.sysmod.list_returners(*args)`

List the returners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returners
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returners 's*'
```

`salt.modules.sysmod.list_runner_functions(*args, **kwargs)`

List the functions for all runner modules. Optionally, specify a runner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runner_functions
salt '*' sys.list_runner_functions state
salt '*' sys.list_runner_functions state virt
```

Runner function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_runner_functions 'state.*' 'virt.*'
```

`salt.modules.sysmod.list_runners(*args)`

List the runners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runners
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_runners 'm*'
```

`salt.modules.sysmod.list_state_functions(*args, **kwargs)`

List the functions for all state modules. Optionally, specify a state module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_state_functions
salt '*' sys.list_state_functions file
salt '*' sys.list_state_functions pkg user
```

State function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_state_functions 'file.*'
salt '*' sys.list_state_functions 'file.s*'
```

New in version 2016.9.0.

```
salt '*' sys.list_state_functions 'module.specific_function'
```

`salt.modules.sysmod.list_state_modules(*args)`

List the modules loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_state_modules
```

State module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_state_modules 'mysql_*'
```

`salt.modules.sysmod.reload_modules()`

Tell the minion to reload the execution modules

CLI Example:

```
salt '*' sys.reload_modules
```

`salt.modules.sysmod.renderer_doc(*args)`

Return the docstrings for all renderers. Optionally, specify a renderer or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple renderers can be specified.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.renderer_doc
salt '*' sys.renderer_doc cheetah
salt '*' sys.renderer_doc jinja json
```

Renderer names can be specified as globs.

```
salt '*' sys.renderer_doc 'c*' 'j*'
```

`salt.modules.sysmod.returner_argspec(module=)`

Return the argument specification of functions in Salt returner modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.returnspec xmpp
salt '*' sys.returnspec xmpp smtp
salt '*' sys.returnspec
```

Returner names can be specified as globs.

```
salt '*' sys.returnspec 'sqlite3.*'
```

`salt.modules.sysmod.returnspec(*args)`

Return the docstrings for all returners. Optionally, specify a returner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple returners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.returnspec
salt '*' sys.returnspec sqlite3
salt '*' sys.returnspec sqlite3.get_fun
salt '*' sys.returnspec sqlite3.get_fun etcd.get_fun
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.returnspec 'sqlite3.get_*'
```

`salt.modules.sysmod.runner_argspec(module=)`

Return the argument specification of functions in Salt runner modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.runner_argspec state
salt '*' sys.runner_argspec http
salt '*' sys.runner_argspec
```

Runner names can be specified as globs.

```
salt '*' sys.runner_argspec 'winrepo.*'
```

`salt.modules.sysmod.runner_doc(*args)`

Return the docstrings for all runners. Optionally, specify a runner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple runners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.runner_doc
salt '*' sys.runner_doc cache
```

(continues on next page)

(continued from previous page)

```
salt '*' sys.runner_doc cache.grains
salt '*' sys.runner_doc cache.grains mine.get
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.runner_doc 'cache.clear_*'
```

`salt.modules.sysmod.state_argspec` (*module=""*)

Return the argument specification of functions in Salt state modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.state_argspec pkg.installed
salt '*' sys.state_argspec file
salt '*' sys.state_argspec
```

State names can be specified as globs.

```
salt '*' sys.state_argspec 'pkg.*'
```

`salt.modules.sysmod.state_doc` (*\*args*)

Return the docstrings for all states. Optionally, specify a state or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple states/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.state_doc
salt '*' sys.state_doc service
salt '*' sys.state_doc service.running
salt '*' sys.state_doc service.running ipables.append
```

State names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.state_doc 'service.*' 'iptables.*'
```

`salt.modules.sysmod.state_schema` (*module=""*)

Return a JSON Schema for the given state function(s)

New in version 2016.3.0.

CLI Example:

```
salt '*' sys.state_schema
salt '*' sys.state_schema pkg.installed
```

### 26.6.443 salt.modules.sysrc

sysrc module for FreeBSD

`salt.modules.sysrc.get(**kwargs)`

Return system rc configuration variables

CLI Example:

```
salt '*' sysrc.get includeDefaults=True
```

`salt.modules.sysrc.remove(name, **kwargs)`

Remove system rc configuration variables

CLI Example:

```
salt '*' sysrc.remove name=sshd_enable
```

`salt.modules.sysrc.set_(name, value, **kwargs)`

Set system rc configuration variables

CLI Example:

```
salt '*' sysrc.set name=sshd_flags value="-p 2222"
```

### 26.6.444 salt.modules.system

Support for reboot, shutdown, etc on POSIX-like systems.

---

**Note:** If a wrapper such as `molly-guard` to intercept *interactive* shutdown commands is configured, calling `system.halt`, `system.poweroff`, `system.reboot`, and `system.shutdown` with `salt-call` will hang indefinitely while the wrapper script waits for user input. Calling them with `salt` will work as expected.

---

`salt.modules.system.get_computer_desc()`

Get PRETTY\_HOSTNAME value stored in `/etc/machine-info`. If this file doesn't exist or the variable doesn't exist return `False`.

**Returns**

Value of PRETTY\_HOSTNAME in `/etc/machine-info`. If file/variable does not exist `False`.

**Return type**

`str`

CLI Example:

```
salt '*' system.get_computer_desc
```

`salt.modules.system.get_computer_name()`

Get hostname.

CLI Example:

```
salt '*' network.get_hostname
```

`salt.modules.system.get_reboot_required_witnessed()`

---

**Note:** This only applies to Minions running on NI Linux RT

---

Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.

**Returns**

True if the a reboot request was witnessed, False otherwise

**Return type**

bool

CLI Example:

```
salt '*' system.get_reboot_required_witnessed
```

`salt.modules.system.get_system_date(utc_offset=None)`

Get the system date

**Parameters**

**utc\_offset** (*str*) -- The UTC offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use +0000. Note: If being passed through the command line will need to be quoted twice to allow negative offsets (e.g. "'+0000'").

**Returns**

Returns the system date.

**Return type**

str

CLI Example:

```
salt '*' system.get_system_date
```

`salt.modules.system.get_system_date_time(utc_offset=None)`

Get the system date/time.

**Parameters**

**utc\_offset** (*str*) -- The UTC offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use +0000. Note: If being passed through the command line will need to be quoted twice to allow negative offsets (e.g. "'+0000'").

**Returns**

Returns the system time in YYYY-MM-DD hh:mm:ss format.

**Return type**

str

CLI Example:

```
salt '*' system.get_system_date_time "'-0500'"
```

`salt.modules.system.get_system_time(utc_offset=None)`

Get the system time.

**Parameters**

**utc\_offset** (*str*) -- The UTC offset in 4 digit (e.g. +0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use +0000. Note: If being passed through the command line will need to be quoted twice to allow negative offsets (e.g. "'+0000'").

**Returns**

Returns the system time in HH:MM:SS AM/PM format.

**Return type***str*

CLI Example:

```
salt '*' system.get_system_time
```

**salt.modules.system.halt()**

Halt a running system

CLI Example:

```
salt '*' system.halt
```

**salt.modules.system.has\_settable\_hwclock()**

Returns True if the system has a hardware clock capable of being set from software.

CLI Example:

```
salt '*' system.has_settable_hwclock
```

**salt.modules.system.init(*runlevel*)**

Change the system runlevel on sysV compatible systems

CLI Example:

```
salt '*' system.init 3
```

**salt.modules.system.poweroff()**

Poweroff a running system

CLI Example:

```
salt '*' system.poweroff
```

**salt.modules.system.reboot(*at\_time=None*)**

Reboot the system

**at\_time**

The wait time in minutes before the system will be rebooted.

CLI Example:

```
salt '*' system.reboot
```

**salt.modules.system.set\_computer\_desc(*desc*)**

Set PRETTY\_HOSTNAME value stored in /etc/machine-info This will create the file if it does not exist. If it is unable to create or modify this file, False is returned.

**Parameters****desc** (*str*) -- The computer description**Returns**

False on failure. True if successful.

CLI Example:

```
salt '*' system.set_computer_desc "Michael's laptop"
```

**salt.modules.system.set\_computer\_name(*hostname*)**

Modify hostname.

CLI Example:

```
salt '*' system.set_computer_name master.saltstack.com
```

`salt.modules.system.set_reboot_required_witnessed()`

---

**Note:** This only applies to Minions running on NI Linux RT

---

This function is used to remember that an event indicating that a reboot is required was witnessed. This function writes to a temporary filesystem so the event gets cleared upon reboot.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' system.set_reboot_required_witnessed
```

`salt.modules.system.set_system_date(newdate, utc_offset=None)`

Set the system date. Use <mm-dd-yy> format for the date.

**Parameters**

**newdate** (*str*) -- The date to set. Can be any of the following formats:

- YYYY-MM-DD
- MM-DD-YYYY
- MM-DD-YY
- MM/DD/YYYY
- MM/DD/YY
- YYYY/MM/DD

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

`salt.modules.system.set_system_date_time(years=None, months=None, days=None, hours=None, minutes=None, seconds=None, utc_offset=None)`

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if the year is not passed, the current system year will be used. (Used by `system.set_system_date` and `system.set_system_time`)

Updates hardware clock, if present, in addition to software (kernel) clock.

**Parameters**

- **years** (*int*) -- Years digit, e.g.: 2015
- **months** (*int*) -- Months digit: 1-12
- **days** (*int*) -- Days digit: 1-31
- **hours** (*int*) -- Hours digit: 0-23
- **minutes** (*int*) -- Minutes digit: 0-59
- **seconds** (*int*) -- Seconds digit: 0-59
- **utc\_offset** (*str*) -- The UTC offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use +0000. Note: If being passed through the command line will need to be quoted twice to allow negative offsets (e.g. "' +0000 '").

**Returns**

True if successful. Otherwise False.

**Return type**

bool

CLI Example:

```
salt '*' system.set_system_date_time 2015 5 12 11 37 53 "'-0500'"
```

`salt.modules.system.set_system_time` (*newtime*, *utc\_offset=None*)

Set the system time.

#### Parameters

- **newtime** (*str*) -- The time to set. Can be any of the following formats.
  - HH:MM:SS AM/PM
  - HH:MM AM/PM
  - HH:MM:SS (24 hour)
  - HH:MM (24 hour)

Note that the Salt command line parser parses the date/time before we obtain the argument (preventing us from doing UTC) Therefore the argument must be passed in as a string. Meaning the text might have to be quoted twice on the command line.

- **utc\_offset** (*str*) -- The UTC offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use +0000. Note: If being passed through the command line will need to be quoted twice to allow negative offsets (e.g. "'+0000'")

#### Returns

Returns True if successful. Otherwise False.

#### Return type

bool

CLI Example:

```
salt '*' system.set_system_time "'11:20'"
```

`salt.modules.system.shutdown` (*at\_time=None*)

Shutdown a running system

#### at\_time

The wait time in minutes before the system will be shutdown.

CLI Example:

```
salt '*' system.shutdown 5
```

## 26.6.445 salt.modules.system\_profiler

System Profiler Module

Interface with macOS's command-line System Profiler utility to get information about package receipts and installed applications.

New in version 2015.5.0.

`salt.modules.system_profiler.applications` ()

Return the results of a call to `system_profiler -xml -detail full SPApplicationsDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

Note that this can take a long time depending on how many applications are installed on the target Mac.

CLI Example:

```
salt '*' systemprofiler.applications
```

**salt.modules.system\_profiler.receipts()**

Return the results of a call to `system_profiler -xml -detail full SPInstallHistoryDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

CLI Example:

```
salt '*' systemprofiler.receipts
```

**26.6.446 salt.modules.systemd\_service**

Provides the service module for systemd

New in version 0.10.0.

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

---

**Important:** This is an implementation of virtual 'service' module. As such, you must call it under the name 'service' and NOT 'systemd'. You can see that also in the examples below.

---

**salt.modules.systemd\_service.available(name)**

New in version 0.10.4.

Check that the given service is available taking into account template units.

CLI Example:

```
salt '*' service.available sshd
```

**salt.modules.systemd\_service.disable(name, no\_block=False, root=None, \*\*kwargs)**

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Disable the named service to not start when the system boots

**no\_block**

[False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

**root**

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.disable <service name>
```

**salt.modules.systemd\_service.disabled(name, root=None)**

Return if the named service is disabled from starting on boot

**root**

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.systemd_service.enable`(*name*, *no\_block=False*, *unmask=False*, *unmask\_runtime=False*, *root=None*, *\*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Enable the named service to start when the system boots

**no\_block**

[False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

**unmask**

[False] Set to `True` to remove an indefinite mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

**unmask\_runtime**

[False] Set to `True` to remove a runtime mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

**root**

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.systemd_service.enabled`(*name*, *root=None*, *\*\*kwargs*)

Return if the named service is enabled to start on boot

**root**

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.systemd_service.execs`(*root=None*)

New in version 2014.7.0.

Return a list of all files specified as `ExecStart` for all services.

**root**

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.execs
```

`salt.modules.systemd_service.firstboot`(*locale=None*, *locale\_message=None*, *keymap=None*, *timezone=None*, *hostname=None*, *machine\_id=None*, *root=None*)

New in version 3001.

Call `systemd-firstboot` to configure basic settings of the system

**locale**  
Set primary locale (LANG=)

**locale\_message**  
Set message locale (LC\_MESSAGES=)

**keymap**  
Set keymap

**timezone**  
Set timezone

**hostname**  
Set host name

**machine\_id**  
Set machine ID

**root**  
Operate on an alternative filesystem root

CLI Example:

```
salt '*' service.firstboot keymap=jp locale=en_US.UTF-8
```

`salt.modules.systemd_service.force_reload`(*name*, *no\_block=True*, *unmask=False*, *unmask\_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

New in version 0.12.0.

Force-reload the specified service with `systemd`

**no\_block**

[False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

**unmask**

[False] Set to `True` to remove an indefinite mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

**unmask\_runtime**

[False] Set to `True` to remove a runtime mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.systemd_service.get_all`(*root=None*)

Return a list of all available services

**root**

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.systemd_service.get_disabled`(*root=None*)

Return a list of all disabled services

**root**

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.systemd_service.get_enabled`(*root=None*)

Return a list of all enabled services

**root**

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.systemd_service.get_running`()

Return a list of all running services, so far as systemd is concerned

CLI Example:

```
salt '*' service.get_running
```

`salt.modules.systemd_service.get_static`(*root=None*)

New in version 2015.8.5.

Return a list of all static services

**root**

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_static
```

`salt.modules.systemd_service.mask`(*name, runtime=False, root=None*)

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Mask the specified service with systemd

**runtime**

[False] Set to `True` to mask this service only until the next reboot

New in version 2015.8.5.

**root**

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.mask foo
salt '*' service.mask foo runtime=True
```

`salt.modules.systemd_service.masked`(*name, runtime=False, root=None*)

New in version 2015.8.0.

Changed in version 2015.8.5: The return data for this function has changed. If the service is masked, the return value will now be the output of the `systemctl is-enabled` command (so that a persistent mask can be distinguished from a runtime mask). If the service is not masked, then `False` will be returned.

Changed in version 2017.7.0: This function now returns a boolean telling the user whether a mask specified by the new `runtime` argument is set. If `runtime` is `False`, this function will return `True` if an indefinite mask is set for the named service (otherwise `False` will be returned). If `runtime` is `False`, this function will return `True` if a runtime mask is set, otherwise `False`.

Check whether or not a service is masked

**runtime**

[False] Set to `True` to check for a runtime mask

New in version 2017.7.0: In previous versions, this function would simply return the output of `systemctl is-enabled` when the service was found to be masked. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now only checks for runtime masks if this argument is set to `True`. Otherwise, it will check for an indefinite mask.

**root**

Enable/disable/mask unit files in the specified root directory

CLI Examples:

```
salt '*' service.masked foo
salt '*' service.masked foo runtime=True
```

`salt.modules.systemd_service.missing(name)`

New in version 2014.1.0.

The inverse of `service.available`. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.systemd_service.offline()`

New in version 3004.

Check if `systemd` is working in offline mode, where is not possible to talk with PID 1.

CLI Example:

```
salt '*' service.offline
```

`salt.modules.systemd_service.reload_(name, no_block=False, unmask=False, unmask_runtime=False)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Reload the specified service with `systemd`

**no\_block**

[False] Set to `True` to reload the service using `--no-block`.

New in version 2017.7.0.

**unmask**

[False] Set to True to remove an indefinite mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

**unmask\_runtime**

[False] Set to True to remove a runtime mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.systemd_service.restart`(*name*, *no\_block*=False, *unmask*=False, *unmask\_runtime*=False)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Restart the specified service with `systemd`

**no\_block**

[False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

**unmask**

[False] Set to True to remove an indefinite mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

**unmask\_runtime**

[False] Set to True to remove a runtime mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.systemd_service.show`(*name*, *root*=None)

New in version 2014.7.0.

Show properties of one or more units/jobs or the manager

**root**

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.show <service name>
```

`salt.modules.systemd_service.start`(*name*, *no\_block*=False, *unmask*=False, *unmask\_runtime*=False)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Start the specified service with systemd

**no\_block**

[False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

**unmask**

[False] Set to True to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

**unmask\_runtime**

[False] Set to True to remove a runtime mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.systemd_service.status`(*name*, *sig=None*)

Return the status for a service via systemd. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

**Parameters**

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Not implemented

**Returns**

True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type**

`bool`

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.systemd_service.stop`(*name*, *no\_block=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Stop the specified service with systemd

**no\_block**

[False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

CLI Example:

```
salt '*' service.stop <service name>
```

`salt.modules.systemd_service.systemctl_reload`()

New in version 0.15.0.

Reloads systemctl, an action needed whenever unit files are updated.

CLI Example:

```
salt '*' service.systemctl_reload
```

`salt.modules.systemd_service.unmask_` (*name*, *runtime=False*, *root=None*)

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Unmask the specified service with `systemd`

**runtime**

[False] Set to `True` to unmask this service only until the next reboot

New in version 2017.7.0: In previous versions, this function would remove whichever mask was identified by running `systemctl is-enabled` on the service. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now removes a runtime mask only when this argument is set to `True`, and otherwise removes an indefinite mask.

**root**

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.unmask foo
salt '*' service.unmask foo runtime=True
```

## 26.6.447 salt.modules.telegram

Module for sending messages via Telegram.

**configuration**

In order to send a message via the Telegram, certain configuration is required in `/etc/salt/minion` on the relevant minions or in the pillar. Some sample configs might look like:

```
telegram.chat_id: '123456789'
telegram.token: '00000000:xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx'
```

`salt.modules.telegram.post_message` (*message*, *chat\_id=None*, *token=None*)

Send a message to a Telegram chat.

**Parameters**

- **message** -- The message to send to the Telegram chat.
- **chat\_id** -- (optional) The Telegram chat id.
- **token** -- (optional) The Telegram API token.

**Returns**

Boolean if message was sent successfully.

CLI Example:

```
salt '*' telegram.post_message message="Hello Telegram!"
```

## 26.6.448 salt.modules.telemetry

Connection module for Telemetry

New in version 2016.3.0.

<https://github.com/mongolab/mongolab-telemetry-api-docs/blob/master/alerts.md>

### configuration

This module accepts explicit telemetry credentials or can also read api key credentials from a pillar. More Information available [here](#).

In the minion's config file:

```
telemetry.telemetry_api_keys:
- abc123 # Key 1
- efg321 # Backup Key 1
telemetry_api_base_url: https://telemetry-api.mongolab.com/v0
```

### depends

requests

`salt.modules.telemetry.create_alarm`(*deployment\_id*, *metric\_name*, *data*, *api\_key=None*, *profile='telemetry'*)

create an telemetry alarms.

*data* is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.create_alarm rs-ds033197 {} profile=telemetry
```

`salt.modules.telemetry.delete_alarms`(*deployment\_id*, *alert\_id=None*, *metric\_name=None*, *api\_key=None*, *profile='telemetry'*)

delete an alert specified by *alert\_id* or if not specified blows away all the alerts in the current deployment.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.delete_alarms rs-ds033197 profile=telemetry
```

`salt.modules.telemetry.get_alarms`(*deployment\_id*, *profile='telemetry'*)

get all the alarms set up against the current deployment

Returns dictionary of alarm information

CLI Example:

```
salt myminion telemetry.get_alarms rs-ds033197 profile=telemetry
```

`salt.modules.telemetry.get_alert_config`(*deployment\_id*, *metric\_name=None*, *api\_key=None*, *profile='telemetry'*)

Get all alert definitions associated with a given deployment or if *metric\_name* is specified, obtain the specific alert config

Returns dictionary or list of dictionaries.

CLI Example:

```
salt myminion telemetry.get_alert_config rs-ds033197 currentConnections
↳profile=telemetry
salt myminion telemetry.get_alert_config rs-ds033197 profile=telemetry
```

`salt.modules.telemetry.get_notification_channel_id`(*notify\_channel*, *profile='telemetry'*)

Given an email address, creates a notification-channels if one is not found and also returns the corresponding notification channel id.

**notify\_channel**

Email escalation policy

**profile**

A dict of telemetry config information.

CLI Example:

```
salt myminion telemetry.get_notification_channel_id userx@company.com
↳profile=telemetry
```

`salt.modules.telemetry.update_alarm`(*deployment\_id*, *metric\_name*, *data*, *api\_key=None*,  
*profile='telemetry'*)

update an telemetry alarms. data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.update_alarm rs-ds033197 {} profile=telemetry
```

### 26.6.449 salt.modules.temp

Simple module for creating temporary directories and files

This is a thin wrapper around Python's tempfile module

New in version 2015.8.0.

`salt.modules.temp.dir`(*suffix=""*, *prefix='tmp'*, *parent=None*)

Create a temporary directory

CLI Example:

```
salt '*' temp.dir
salt '*' temp.dir prefix='mytemp-' parent='/var/run/'
```

`salt.modules.temp.file`(*suffix=""*, *prefix='tmp'*, *parent=None*)

Create a temporary file

CLI Example:

```
salt '*' temp.file
salt '*' temp.file prefix='mytemp-' parent='/var/run/'
```

## 26.6.450 salt.modules.test

Module for running arbitrary tests

`salt.modules.test.arg(*args, **kwargs)`

Print out the data passed into the function `*args` and `kwargs`, this is used to both test the publication data and CLI argument passing, but also to display the information available within the publication data.

**Returns**

```
{"args": args, "kwargs": kwargs}
```

**Return type**

dict

CLI Example:

```
salt '*' test.arg 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

`salt.modules.test.arg_clean(*args, **kwargs)`

Like `test.arg` but cleans `kwargs` of the `__pub*` items

CLI Example:

```
salt '*' test.arg_clean 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

`salt.modules.test.arg_repr(*args, **kwargs)`

Print out the data passed into the function `*args` and `kwargs`, this is used to both test the publication data and CLI argument passing, but also to display the information available within the publication data.

**Returns**

```
{"args": repr(args), "kwargs": repr(kwargs)}
```

CLI Example:

```
salt '*' test.arg_repr 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

`salt.modules.test.arg_type(*args, **kwargs)`

Print out the types of the `args` and `kwargs`. This is used to test the types of the `args` and `kwargs` passed down to the Minion

**Return type**

dict

CLI Example:

```
salt '*' test.arg_type 1 'int'
```

`salt.modules.test.assertion(assertion)`

Assert the given argument

CLI Example:

```
salt '*' test.assertion False
```

`salt.modules.test.attr_call()`

Call `grains.items` via the attribute

CLI Example:

```
salt '*' test.attr_call
```

`salt.modules.test.collatz`(*start*)

Execute the collatz conjecture from the passed starting number, returns the sequence and the time it took to compute. Used for performance tests.

CLI Example:

```
salt '*' test.collatz 3
```

`salt.modules.test.conf_test`()

Return the value for test.foo in the minion configuration file, or return the default value

CLI Example:

```
salt '*' test.conf_test
```

`salt.modules.test.cross_test`(*func, args=None*)

Execute a minion function via the `__salt__` object in the test module, used to verify that the Minion functions can be called via the `__salt__` module.

CLI Example:

```
salt '*' test.cross_test file.gid_to_group 0
```

`salt.modules.test.deprecation_warning`()

Return True, but also produce two DeprecationWarnings. One by date, the other by the codename - release Oganesson, which should correspond to Salt 3108.

CLI Example:

```
salt \* test.deprecation_warning
```

`salt.modules.test.echo`(*text*)

Return a string - used for testing the connection

CLI Example:

```
salt '*' test.echo 'foo bar baz quo qux'
```

`salt.modules.test.exception`(*message='Test Exception'*)

Raise an exception

Optionally provide an error message or output the full stack.

CLI Example:

```
salt '*' test.exception 'Oh noes!'
```

`salt.modules.test.false_`()

Always return False

CLI Example:

```
salt '*' test.false
```

`salt.modules.test.fib`(*num*)

Return the num-th Fibonacci number, and the time it took to compute in seconds. Used for performance tests.

This function is designed to have terrible performance.

CLI Example:

```
salt '*' test.fib 3
```

`salt.modules.test.get_opts()`

Return the configuration options passed to this minion

CLI Example:

```
salt '*' test.get_opts
```

`salt.modules.test.kwarg(**kwargs)`

Print out the data passed into the function `**kwargs`, this is used to both test the publication data and CLI kwarg passing, but also to display the information available within the publication data.

CLI Example:

```
salt '*' test.kwarg num=1 txt="two" env='{a: 1, b: "hello"}'
```

`salt.modules.test.missing_func()`

`salt.modules.test.module_report()`

Return a dict containing all of the execution modules with a report on the overall availability via different references

CLI Example:

```
salt '*' test.module_report
```

`salt.modules.test.not_loaded()`

List the modules that were not loaded by the salt loader system

CLI Example:

```
salt '*' test.not_loaded
```

`salt.modules.test.opts_pkg()`

Return an opts package with the grains and opts for this Minion. This is primarily used to create the options used for Master side state compiling routines

CLI Example:

```
salt '*' test.opts_pkg
```

`salt.modules.test.outputter(data)`

Test the outputter, pass in data to return

CLI Example:

```
salt '*' test.outputter foobar
```

`salt.modules.test.ping()`

Used to make sure the minion is up and responding. Not an ICMP ping.

Returns True.

CLI Example:

```
salt '*' test.ping
```

`salt.modules.test.provider`(*module*)

Pass in a function name to discover what provider is being used

CLI Example:

```
salt '*' test.provider service
```

`salt.modules.test.providers`()

Return a dict of the provider names and the files that provided them

CLI Example:

```
salt '*' test.providers
```

`salt.modules.test.raise_exception`(*name, \*args, \*\*kwargs*)

Raise an exception. Built-in exceptions and those in `salt.exceptions` can be raised by this test function. If no matching exception is found, then no exception will be raised and this function will return `False`.

This function is designed to test Salt's exception and return code handling.

CLI Example:

```
salt '*' test.raise_exception TypeError "An integer is required"
salt '*' test.raise_exception salt.exceptions.CommandExecutionError
→ "Something went wrong"
```

`salt.modules.test.rand_sleep`(*max=60*)

Sleep for a random number of seconds, used to test long-running commands and minions returning at differing intervals

CLI Example:

```
salt '*' test.rand_sleep 60
```

`salt.modules.test.rand_str`(*size=999999999, hash\_type=None*)

This function has been renamed to `test.random_hash`. This function will stay to ensure backwards compatibility, but please switch to using the preferred name `test.random_hash`.

`salt.modules.test.random_hash`(*size=999999999, hash\_type=None*)

New in version 2015.5.2.

Changed in version 2018.3.0: Function has been renamed from `test.rand_str` to `test.random_hash`

Generates a random number between 1 and `size`, then returns a hash of that number. If no `hash_type` is passed, the `hash_type` specified by the Minion's `hash_type` config option is used.

CLI Example:

```
salt '*' test.random_hash
salt '*' test.random_hash hash_type=sha512
```

`salt.modules.test.retcode`(*code=42*)

Test that the returncode system is functioning correctly

CLI Example:

```
salt '*' test.retcode 42
```

`salt.modules.test.sleep(length)`

Instruct the minion to initiate a process that will sleep for a given period of time.

CLI Example:

```
salt '*' test.sleep 20
```

`salt.modules.test.stack()`

Return the current stack trace

CLI Example:

```
salt '*' test.stack
```

`salt.modules.test.true_()`

Always return True

CLI Example:

```
salt '*' test.true
```

`salt.modules.test.try_(module, return_try_exception=False, **kwargs)`

Try to run a module command. On an exception return None. If `return_try_exception` is set to True, return the exception. This can be helpful in templates where running a module might fail as expected.

Jinja Example:

```
{% for i in range(0,230) %}
  {{ salt['test.try'](module='ipmi.get_users', bmc_host='172.2.2.
  →'+i)|yaml(False) }}
{% endfor %}
```

`salt.modules.test.tty(*args, **kwargs)`

Deprecated! Moved to `cmd.tty`

CLI Example:

```
salt '*' test.tty tty0 'This is a test'
salt '*' test.tty pts3 'This is a test'
```

`salt.modules.test.version()`

Return the version of salt on the minion

CLI Example:

```
salt '*' test.version
```

`salt.modules.test.versions()`

This function is an alias of `versions_report`.

Returns versions of components used by salt

CLI Example:

```
salt '*' test.versions_report
```

`salt.modules.test.versions_information()`

Report the versions of dependent and system software

CLI Example:

```
salt '*' test.versions_information
```

`salt.modules.test.versions_report()`

Returns versions of components used by salt

CLI Example:

```
salt '*' test.versions_report
```

### 26.6.451 `salt.modules.test_virtual`

Module for testing that a `__virtual__` function returning False will not be available via the Salt Loader.

`salt.modules.test_virtual.ping()`

### 26.6.452 `salt.modules.testinframod`

This module exposes the functionality of the TestInfra library for use with SaltStack in order to verify the state of your minions. In order to allow for the addition of new resource types in TestInfra this module dynamically generates wrappers for the various resources by iterating over the values in the `__all__` variable exposed by the `testinfra.modules` namespace.

**exception** `salt.modules.testinframod.InvalidArgumentError`

`salt.modules.testinframod.camel_to_snake_case(camel_input)`

Converts camelCase (or CamelCase) to snake\_case. From <https://codereview.stackexchange.com/questions/185966/functions-to-convert-camelcase-strings-to-snake-case>

Parameters

**camel\_input** (*str*) -- The camelcase or CamelCase string to convert to snake\_case

:return str

`salt.modules.testinframod.snake_to_camel_case(snake_input, uppercamel=False)`

Converts snake\_case to camelCase (or CamelCase if uppercamel is True). Inspired by <https://codereview.stackexchange.com/questions/85311/transform-snake-case-to-camelcase>

Parameters

- **snake\_input** (*str*) -- The input snake\_case string to convert to camelCase
- **uppercamel** (*bool*) -- Whether or not to convert to CamelCase instead

:return str

## 26.6.453 salt.modules.textfsm\_mod

### TextFSM

New in version 2018.3.0.

Execution module that processes plain text and extracts data using TextFSM templates. The output is presented in JSON serializable data, and can be easily re-used in other modules, or directly inside the renderer (Jinja, Mako, Genshi, etc.).

#### depends

- textfsm Python library

---

**Note:** Install textfsm library: `pip install textfsm`.

---

`salt.modules.textfsm_mod.extract(template_path, raw_text=None, raw_text_file=None, saltenv='base')`

Extracts the data entities from the unstructured raw text sent as input and returns the data mapping, processing using the TextFSM template.

#### template\_path

The path to the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

#### raw\_text: **None**

The unstructured text to be parsed.

#### raw\_text\_file: **None**

Text file to read, having the raw text to be parsed using the TextFSM template. Supports the same URL schemes as the `template_path` argument.

#### saltenv: **base**

Salt fileserver environment from which to retrieve the file. Ignored if `template_path` is not a `salt://` URL.

CLI Example:

```

salt '*' textfsm.extract salt://textfsm/juniper_version_template raw_text_
→file=s3://junos_ver.txt
salt '*' textfsm.extract http://some-server/textfsm/juniper_version_
→template raw_text='Hostname: router.abc ... snip ...'

```

Jinja template example:

```

{%- set raw_text = 'Hostname: router.abc ... snip ...' -%}
{%- set textfsm_extract = salt.textfsm.extract('https://some-server/
→textfsm/juniper_version_template', raw_text) -%}

```

Raw text example:

```

Hostname: router.abc
Model: mx960
JUNOS Base OS boot [9.1S3.5]
JUNOS Base OS Software Suite [9.1S3.5]

```

(continues on next page)

(continued from previous page)

```
JUNOS Kernel Software Suite [9.1S3.5]
JUNOS Crypto Software Suite [9.1S3.5]
JUNOS Packet Forwarding Engine Support (M/T Common) [9.1S3.5]
JUNOS Packet Forwarding Engine Support (MX Common) [9.1S3.5]
JUNOS Online Documentation [9.1S3.5]
JUNOS Routing Software Suite [9.1S3.5]
```

TextFSM Example:

```
Value Chassis (\S+)
Value Required Model (\S+)
Value Boot (.*
Value Base (.*
Value Kernel (.*
Value Crypto (.*
Value Documentation (.*
Value Routing (.*

Start
# Support multiple chassis systems.
^\S+:$$ -> Continue.Record
^${Chassis}:$$
^Model: ${Model}
^JUNOS Base OS boot \[${Boot}\]
^JUNOS Software Release \[${Base}\]
^JUNOS Base OS Software Suite \[${Base}\]
^JUNOS Kernel Software Suite \[${Kernel}\]
^JUNOS Crypto Software Suite \[${Crypto}\]
^JUNOS Online Documentation \[${Documentation}\]
^JUNOS Routing Software Suite \[${Routing}\]
```

Output example:

```
{
  "comment": "",
  "result": true,
  "out": [
    {
      "kernel": "9.1S3.5",
      "documentation": "9.1S3.5",
      "boot": "9.1S3.5",
      "crypto": "9.1S3.5",
      "chassis": "",
      "routing": "9.1S3.5",
      "base": "9.1S3.5",
      "model": "mx960"
    }
  ]
}
```

`salt.modules.textfsm_mod.index` (*command*, *platform=None*, *platform\_grain\_name=None*, *platform\_column\_name=None*, *output=None*, *output\_file=None*, *textfsm\_path=None*, *index\_file=None*, *saltenv='base'*, *include\_empty=False*, *include\_pat=None*, *exclude\_pat=None*)

Dynamically identify the template required to extract the information from the unstructured raw text.

The output has the same structure as the `extract` execution function, the difference being that `index` is capable to identify what template to use, based on the platform details and the `command`.

**command**

The command executed on the device, to get the output.

**platform**

The platform name, as defined in the TextFSM index file.

---

**Note:** For ease of use, it is recommended to define the TextFSM indexfile with values that can be matches using the grains.

---

**platform\_grain\_name**

The name of the grain used to identify the platform name in the TextFSM index file.

---

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_platform_grain`.

---

---

**Note:** This option is ignored when `platform` is specified.

---

**platform\_column\_name: Platform**

The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: `Platform`.

---

**Note:** This is field is case sensitive, make sure to assign the correct value to this option, exactly as defined in the index file.

---

---

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_platform_column_name`.

---

**output**

The raw output from the device, to be parsed and extract the structured data.

**output\_file**

The path to a file that contains the raw output from the device, used to extract the structured data. This option supports the usual Salt-specific schemes: `file://`, `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://`.

**textfsm\_path**

The path where the TextFSM templates can be found. This can be either absolute path on the server, either specified using the following URL schemes: `file://`, `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://`.

---

**Note:** This needs to be a directory with a flat structure, having an index file (whose name can be specified using the `index_file` option) and a number of TextFSM templates.

---

---

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_path`.

---

**index\_file: index**

The name of the TextFSM index file, under the `textfsm_path`. Default: `index`.

---

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_index_file`.

---

**saltenv: base**

Salt fileserver environment from which to retrieve the file. Ignored if `textfsm_path` is not a `salt://` / URL.

**include\_empty: False**

Include empty files under the `textfsm_path`.

**include\_pat**

Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

**exclude\_pat**

Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

---

**Note:** If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

---

CLI Example:

```
salt '*' textfsm.index 'sh ver' platform=Juniper output_file=salt://
→textfsm/juniper_version_example textfsm_path=salt://textfsm/
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_
→version_example textfsm_path=ftp://textfsm/ platform_column_name=Vendor
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_
→version_example textfsm_path=https://some-server/textfsm/ platform_
→column_name=Vendor platform_grain_name=vendor
```

TextFSM index file example:

```
salt://textfsm/index
```

```
Template, Hostname, Vendor, Command
juniper_version_template, .*, Juniper, sh[[ow]] ve[[rsion]]
```

The usage can be simplified, by defining (some of) the following options: `textfsm_platform_grain`, `textfsm_path`, `textfsm_platform_column_name`, or `textfsm_index_file`, in the (proxy) minion configuration file or pillar.

Configuration example:

```
textfsm_platform_grain: vendor
textfsm_path: salt://textfsm/
textfsm_platform_column_name: Vendor
```

And the CLI usage becomes as simple as:

```
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_
→version_example
```

Usgae inside a Jinja template:

```
{%- set command = 'sh ver' -%}
{%- set output = salt.net.cli(command) -%}
{%- set textfsm_extract = salt.textfsm.index(command, output=output) -%}
```

### 26.6.454 salt.modules.timezone

Module for managing timezone on POSIX-like systems.

`salt.modules.timezone.get_hwclock()`

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

`salt.modules.timezone.get_offset()`

Get current numeric timezone offset from UTC (i.e. -0700)

CLI Example:

```
salt '*' timezone.get_offset
```

`salt.modules.timezone.get_zone()`

Get current timezone (i.e. America/Denver)

Changed in version 2016.11.4.

---

**Note:** On AIX operating systems, Posix values can also be returned 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'

---

CLI Example:

```
salt '*' timezone.get_zone
```

`salt.modules.timezone.get_zonecode()`

Get current timezone (i.e. PST, MDT, etc)

CLI Example:

```
salt '*' timezone.get_zonecode
```

`salt.modules.timezone.set_hwclock(clock)`

Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

`salt.modules.timezone.set_zone(timezone)`

Unlinks, then symlinks /etc/localtime to the set timezone.

The timezone is crucial to several system processes, each of which SHOULD be restarted (for instance, whatever you system uses as its cron and syslog daemons). This will not be automagically done and must be done manually!

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

Changed in version 2016.11.4.

---

**Note:** On AIX operating systems, Posix values are also allowed, see below

---

```
salt '*' timezone.set_zone 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'
```

`salt.modules.timezone.zone_compare` (*timezone*)

Compares the given timezone name with the system timezone name. Checks the hash sum between the given timezone, and the one set in `/etc/localtime`. Returns True if names and hash sums match, and False if not. Mostly useful for running state checks.

Changed in version 2016.3.0.

---

**Note:** On Solaris-like operating systems only a string comparison is done.

---

Changed in version 2016.11.4.

---

**Note:** On AIX operating systems only a string comparison is done.

---

CLI Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

## 26.6.455 salt.modules.tls

A salt module for SSL/TLS. Can create a Certificate Authority (CA) or use Self-Signed certificates.

### depends

PyOpenSSL Python module (0.10 or later, 0.14 or later for X509 extension support)

### configuration

Add the following values in `/etc/salt/minion` for the CA module to function properly:

```
ca.cert_base_path: '/etc/pki'
```

CLI Example #1: Creating a CA, a server request and its signed certificate:

```
# salt-call tls.create_ca my_little \  
days=5 \  
CN='My Little CA' \  
C=US \  
ST=Utah \  
L=Salt Lake City \  
O=Saltstack \  
emailAddress=pleasedontemail@example.com  
  
Created Private Key: "/etc/pki/my_little/my_little_ca_cert.key"  
Created CA "my_little_ca": "/etc/pki/my_little_ca/my_little_ca_cert.crt"
```

(continues on next page)

(continued from previous page)

```
# salt-call tls.create_csr my_little CN=www.example.com
Created Private Key: "/etc/pki/my_little/certs/www.example.com.key
Created CSR for "www.example.com": "/etc/pki/my_little/certs/www.example.com.
→csr"

# salt-call tls.create_ca_signed_cert my_little CN=www.example.com
Created Certificate for "www.example.com": /etc/pki/my_little/certs/www.
→example.com.crt"
```

CLI Example #2: Creating a client request and its signed certificate

```
# salt-call tls.create_csr my_little CN=DBReplica_No.1 cert_type=client
Created Private Key: "/etc/pki/my_little/certs//DBReplica_No.1.key"
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.csr
→"

# salt-call tls.create_ca_signed_cert my_little CN=DBReplica_No.1
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_
→No.1.crt"
```

CLI Example #3: Creating both a server and client req + cert for the same CN

```
# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
cert_type=client
Created Private Key: "/etc/pki/my_little/certs/MasterDBReplica_No.2.key"
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/MasterDBReplica_
→No.2.csr"

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_
→No.1.crt"

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
cert_type=server
Certificate "MasterDBReplica_No.2" already exists

(doh!)

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/DBReplica_No.1_client.key"
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1_
→client.csr"

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Certificate "MasterDBReplica_No.2" already exists

(DOH!)

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2 \
cert_type=server type_ext=True
```

(continues on next page)

(continued from previous page)

```
Created Certificate for "MasterDBReplica_No.2": "/etc/pki/my_little/certs/
↳MasterDBReplica_No.2_server.crt"
```

CLI Example #4: Create a server req + cert with non-CN filename for the cert

```
# salt-call tls.create_csr my_little CN=www.anothersometh.ing \
    cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/www.anothersometh.ing_server.
↳key"
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/www.anothersometh.
↳ing_server.csr"

# salt-call tls.create_ca_signed_cert my_little CN=www.anothersometh.ing \
    cert_type=server cert_filename="something_completely_different"
Created Certificate for "www.anothersometh.ing": /etc/pki/my_little/certs/
↳something_completely_different.crt
```

**salt.modules.tls.ca\_exists**(*ca\_name*, *cacert\_path*=None, *ca\_filename*=None)

Verify whether a Certificate Authority (CA) already exists

**ca\_name**

name of the CA

**cacert\_path**

absolute path to ca certificates root directory

**ca\_filename**

alternative filename for the CA

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.ca_exists test_ca /etc/certs
```

**salt.modules.tls.cert\_base\_path**(*cacert\_path*=None)

Return the base path for certs from CLI or from options

**cacert\_path**

absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.cert_base_path
```

**salt.modules.tls.cert\_info**(*cert*, *digest*='sha256')

Return information for a particular certificate

**cert**

path to the certifiante PEM file or string

Changed in version 2018.3.4.

**digest**

what digest to use for fingerprinting

CLI Example:

```
salt '*' tls.cert_info /dir/for/certs/cert.pem
```

**salt.modules.tls.create\_ca**(*ca\_name*, *bits*=2048, *days*=365, *CN*='localhost', *C*='US', *ST*='Utah', *L*='Salt Lake City', *O*='SaltStack', *OU*=None, *emailAddress*=None, *fixmode*=False, *cacert\_path*=None, *ca\_filename*=None, *digest*='sha256', *onlyif*=None, *unless*=None, *replace*=False)

Create a Certificate Authority (CA)

**ca\_name**

name of the CA

**bits**

number of RSA key bits, default is 2048

**days**

number of days the CA will be valid, default is 365

**CN**

common name in the request, default is "localhost"

**C**

country, default is "US"

**ST**

state, default is "Utah"

**L**

locality, default is "Centerville", the city where SaltStack originated

**O**

organization, default is "SaltStack"

**OU**

organizational unit, default is None

**emailAddress**

email address for the CA owner, default is None

**cacert\_path**

absolute path to ca certificates root directory

**ca\_filename**

alternative filename for the CA

New in version 2015.5.3.

**digest**

The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by `EVP_get_digestbyname`, specifically). For example, "md5" or "sha1". Default: 'sha256'

**replace**

Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a CA certificate based upon defined config values. If the file already exists, the function just returns assuming the CA certificate already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
```

the resulting CA, and corresponding key, would be written in the following location with appropriate permissions:

```
/etc/pki/koji/koji_ca_cert.crt
/etc/pki/koji/koji_ca_cert.key
```

CLI Example:

```
salt '*' tls.create_ca test_ca
```

```
salt.modules.tls.create_ca_signed_cert(ca_name, CN, days=365, cacert_path=None,
ca_filename=None, cert_path=None, cert_filename=None,
digest='sha256', cert_type=None, type_ext=False,
replace=False)
```

Create a Certificate (CERT) signed by a named Certificate Authority (CA)

If the certificate file already exists, the function just returns assuming the CERT already exists.

The CN *must* match an existing CSR generated by `create_csr`. If it does not, this method does nothing.

**ca\_name**

name of the CA

**CN**

common name matching the certificate signing request

**days**

number of days certificate is valid, default is 365 (1 year)

**ca\_cert\_path**

absolute path to ca certificates root directory

**ca\_filename**

alternative filename for the CA

New in version 2015.5.3.

**cert\_path**

full path to the certificates directory

**cert\_filename**

alternative filename for the certificate, useful when using special characters in the CN. If this option is set it will override the certificate filename output effects of `cert_type`. `type_ext` will be completely overridden.

New in version 2015.5.3.

**digest**

The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by `EVP_get_digestbyname`, specifically). For example, "md5" or "sha1". Default: 'sha256'

**replace**

Replace this certificate even if it exists

New in version 2015.5.1.

**cert\_type**

string. Either 'server' or 'client' (see `create_csr()` for details).

If `create_csr(type_ext=True)` this function **must** be called with the same `cert_type` so it can find the CSR file.

---

**Note:** `create_csr()` defaults to `cert_type='server'`; therefore, if it was also called with `type_ext`, `cert_type` becomes a required argument for `create_ca_signed_cert()`

---

**type\_ext**

bool. If set True, use `cert_type` as an extension to the CN when formatting the filename.

e.g.: `some_subject_CN_server.crt` or `some_subject_CN_client.crt`

This facilitates the context where both types are required for the same subject

If `cert_filename` is *not None*, setting `type_ext` has no effect

If the following values were set:

```
ca.cert_base_path='/etc/pki'  
ca_name='koji'  
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
```

CLI Example:

```
salt '*' tls.create_ca_signed_cert test localhost
```

```
salt.modules.tls.create_csr(ca_name, bits=2048, CN='localhost', C='US', ST='Utah', L='Salt Lake City',
                             O='SaltStack', OU=None, emailAddress=None, subjectAltName=None,
                             cacert_path=None, ca_filename=None, csr_path=None, csr_filename=None,
                             digest='sha256', type_ext=False, cert_type='server', replace=False)
```

Create a Certificate Signing Request (CSR) for a particular Certificate Authority (CA)

**ca\_name**

name of the CA

**bits**

number of RSA key bits, default is 2048

**CN**

common name in the request, default is "localhost"

**C**

country, default is "US"

**ST**

state, default is "Utah"

**L**

locality, default is "Centerville", the city where SaltStack originated

**O**

organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised

**OU**

organizational unit, default is None

**emailAddress**

email address for the request, default is None

**subjectAltName**

valid subjectAltNames in full form, e.g. to add DNS entry you would call this function with this value:

**examples:** ['DNS:somednsname.com',

'DNS:1.2.3.4', 'IP:1.2.3.4', 'IP:2001:4801:7821:77:be76:4eff:fe11:e51', 'email:me@i.like.pie.com']

---

**Note:** some libraries do not properly query IP: prefixes, instead looking for the given req. source with a DNS: prefix. To be thorough, you may want to include both DNS: and IP: entries if you are using subjectAltNames for destinations for your TLS connections. e.g.: requests to <https://1.2.3.4> will fail from python's requests library w/out the second entry in the above list

---

New in version 2015.8.0.

**cert\_type**

Specify the general certificate type. Can be either *server* or *client*. Indicates the set of common extensions added to the CSR.

```
server: {
  'basicConstraints': 'CA:FALSE',
  'extendedKeyUsage': 'serverAuth',
  'keyUsage': 'digitalSignature, keyEncipherment'
}

client: {
  'basicConstraints': 'CA:FALSE',
```

(continues on next page)

(continued from previous page)

```
'extendedKeyUsage': 'clientAuth',
'keyUsage': 'nonRepudiation, digitalSignature, keyEncipherment'
}
```

**type\_ext**

boolean. Whether or not to extend the filename with CN\_[cert\_type] This can be useful if a server and client certificate are needed for the same CN. Defaults to False to avoid introducing an unexpected file naming pattern

The files normally named some\_subject\_CN.csr and some\_subject\_CN.key will then be saved

**replace**

Replace this signing request even if it exists

New in version 2015.5.1.

Writes out a Certificate Signing Request (CSR) If the file already exists, the function just returns assuming the CSR already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting CSR, and corresponding key, would be written in the following location with appropriate permissions:

```
/etc/pki/koji/certs/test.egavas.org.csr
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_csr test
```

**salt.modules.tls.create\_empty\_crl**(*ca\_name*, *cacert\_path*=None, *ca\_filename*=None, *crl\_file*=None, *digest*='sha256')

Create an empty Certificate Revocation List.

New in version 2015.8.0.

**ca\_name**

name of the CA

**cacert\_path**

absolute path to ca certificates root directory

**ca\_filename**

alternative filename for the CA

New in version 2015.5.3.

**crl\_file**

full path to the CRL file

**digest**

The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP\_get\_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

CLI Example:

```
salt '*' tls.create_empty_crl ca_name='koji' ca_filename=
→ 'ca' crl_file='/etc/openssl/team1/crl.pem'
```

`salt.modules.tls.create_pkcs12` (*ca\_name*, *CN*, *passphrase=""*, *cacert\_path=None*, *replace=False*)

Create a PKCS#12 browser certificate for a particular Certificate (CN)

**ca\_name**

name of the CA

**CN**

common name matching the certificate signing request

**passphrase**

used to unlock the PKCS#12 certificate when loaded into the browser

**cacert\_path**

absolute path to ca certificates root directory

**replace**

Replace this certificate even if it exists

New in version 2015.5.1.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.p12
```

CLI Example:

```
salt '*' tls.create_pkcs12 test localhost
```

`salt.modules.tls.create_self_signed_cert` (*tls\_dir='tls'*, *bits=2048*, *days=365*, *CN='localhost'*, *C='US'*, *ST='Utah'*, *L='Salt Lake City'*, *O='SaltStack'*, *OU=None*, *emailAddress=None*, *cacert\_path=None*, *cert\_filename=None*, *digest='sha256'*, *replace=False*)

Create a Self-Signed Certificate (CERT)

**tls\_dir**

location appended to the `ca.cert_base_path`, default is 'tls'

**bits**

number of RSA key bits, default is 2048

**CN**

common name in the request, default is "localhost"

**C**

country, default is "US"

**ST**

state, default is "Utah"

**L**

locality, default is "Centerville", the city where SaltStack originated

**O**

organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised

**OU**

organizational unit, default is None

**emailAddress**

email address for the request, default is None

**cacert\_path**

absolute path to ca certificates root directory

**digest**

The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by

EVP\_get\_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

**replace**

Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a Self-Signed Certificate (CERT). If the file already exists, the function just returns.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
tls_dir='koji'
CN='test.egavas.org'
```

the resulting CERT, and corresponding key, would be written in the following location with appropriate permissions:

```
/etc/pki/koji/certs/test.egavas.org.crt
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_self_signed_cert
```

Passing options from the command line:

```
salt 'minion' tls.create_self_signed_cert CN='test.mysite.org'
```

**salt.modules.tls.get\_ca**(*ca\_name*, *as\_text=False*, *cacert\_path=None*)

Get the certificate path or content

**ca\_name**

name of the CA

**as\_text**

if true, return the certificate content instead of the path

**cacert\_path**

absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.get_ca test_ca as_text=False cacert_path=/etc/certs
```

**salt.modules.tls.get\_ca\_signed\_cert**(*ca\_name*, *CN='localhost'*, *as\_text=False*, *cacert\_path=None*, *cert\_filename=None*)

Get the certificate path or content

**ca\_name**

name of the CA

**CN**

common name of the certificate

**as\_text**

if true, return the certificate content instead of the path

**cacert\_path**

absolute path to certificates root directory

**cert\_filename**

alternative filename for the certificate, useful when using special characters in the CN

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.get_ca_signed_cert test_ca CN=localhost as_text=False cacert_
→path=/etc/certs
```

`salt.modules.tls.get_ca_signed_key` (*ca\_name*, *CN='localhost'*, *as\_text=False*, *cacert\_path=None*, *key\_filename=None*)

Get the certificate path or content

**ca\_name**

name of the CA

**CN**

common name of the certificate

**as\_text**

if true, return the certificate content instead of the path

**cacert\_path**

absolute path to certificates root directory

**key\_filename**

alternative filename for the key, useful when using special characters

New in version 2015.5.3.

in the CN

CLI Example:

```
salt '*' tls.get_ca_signed_key test_ca CN=localhost
→ as_text=False cacert_path=/etc/certs
```

`salt.modules.tls.get_expiration_date` (*cert*, *date\_format='%Y-%m-%d'*)

New in version 2019.2.0.

Get a certificate's expiration date

**cert**

Full path to the certificate

**date\_format**

By default this will return the expiration date in YYYY-MM-DD format, use this to specify a different strftime format string. Note that the expiration time will be in UTC.

CLI Examples:

```
salt '*' tls.get_expiration_date /path/to/foo.crt
salt '*' tls.get_expiration_date /path/to/foo.crt date_format='%d/%m/%Y'
```

`salt.modules.tls.get_extensions` (*cert\_type*)

Fetch X509 and CSR extension definitions from `tls:extensions:` (`common|server|client`) or set them to standard defaults.

New in version 2015.8.0.

**cert\_type:**

The type of certificate such as `server` or `client`.

CLI Example:

```
salt '*' tls.get_extensions client
```

`salt.modules.tls.maybe_fix_ssl_version` (*ca\_name*, *cacert\_path=None*, *ca\_filename=None*)

Check that the X509 version is correct (was incorrectly set in previous salt versions). This will fix the version if needed.

**ca\_name**

ca authority name

**cacert\_path**

absolute path to ca certificates root directory

**ca\_filename**

alternative filename for the CA

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.maybe_fix_ssl_version test_ca /etc/certs
```

`salt.modules.tls.revoke_cert`(*ca\_name*, *CN*, *cacert\_path*=None, *ca\_filename*=None, *cert\_path*=None, *cert\_filename*=None, *crl\_file*=None, *digest*='sha256')

Revoke a certificate.

New in version 2015.8.0.

**ca\_name**

Name of the CA.

**CN**

Common name matching the certificate signing request.

**cacert\_path**

Absolute path to ca certificates root directory.

**ca\_filename**

Alternative filename for the CA.

**cert\_path**

Path to the cert file.

**cert\_filename**

Alternative filename for the certificate, useful when using special characters in the CN.

**crl\_file**

Full path to the CRL file.

**digest**The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by `EVP_get_digestbyname`, specifically). For example, "md5" or "sha1". Default: 'sha256'

CLI Example:

```
salt '*' tls.revoke_cert ca_name='koji' ca_filename='ca'
→                               crl_file='/etc/openssl/team1/crl.pem'
```

`salt.modules.tls.set_ca_path`(*cacert\_path*)

If wanted, store the aforementioned `cacert_path` in context to be used as the basepath for further operations

CLI Example:

```
salt '*' tls.set_ca_path /etc/certs
```

`salt.modules.tls.validate`(*cert*, *ca\_name*, *crl\_file*)

New in version 3000.

Validate a certificate against a given CA/CRL.

**cert**

path to the certificate PEM file or string

**ca\_name**

name of the CA

**crl\_file**

full path to the CRL file

## 26.6.456 salt.modules.tomcat

Support for Tomcat

This module uses the manager webapp to manage Apache tomcat webapps. If the manager webapp is not configured some of the functions won't work.

### configuration

- Java bin path should be in default path
- If ipv6 is enabled make sure you permit manager access to ipv6 interface "0:0:0:0:0:0:1"
- If you are using tomcat.tar.gz it has to be installed or symlinked under /opt, preferably using name tomcat
- "tomcat.signal start/stop" works but it does not use the startup scripts

The following grains/pillar should be set:

```
tomcat-manager:
  user: <username>
  passwd: <password>
```

or the old format:

```
tomcat-manager.user: <username>
tomcat-manager.passwd: <password>
```

Also configure a user in the conf/tomcat-users.xml file:

```
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
  <role rolename="manager-script"/>
  <user username="tomcat" password="tomcat" roles="manager-script"/>
</tomcat-users>
```

### Note:

- More information about tomcat manager: <http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html>
- if you use only this module for deployments you've might want to strict access to the manager only from localhost for more info: [http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring\\_Manager\\_Application\\_Access](http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access)

- Tested on:

#### JVM Vendor:

Sun Microsystems Inc.

#### JVM Version:

1.6.0\_43-b01

#### OS Architecture:

amd64

#### OS Name:

Linux

#### OS Version:

2.6.32-358.el6.x86\_64

**Tomcat Version:**

Apache Tomcat/7.0.37

```
salt.modules.tomcat.deploy_war(war, context, force='no', url='http://localhost:8080/manager',
                               saltenv='base', timeout=180, temp_war_location=None, version=True)
```

Deploy a WAR file

**war**

absolute path to WAR file (should be accessible by the user running tomcat) or a path supported by the salt.modules.cp.get\_file function

**context**

the context path to deploy

**force**

[False] set True to deploy the webapp even one is deployed in the context

**url**

[http://localhost:8080/manager] the URL of the server manager webapp

**saltenv**

[base] the environment for WAR file in used by salt.modules.cp.get\_url function

**timeout**

[180] timeout for HTTP request

**temp\_war\_location**

[None] use another location to temporarily copy to war file by default the system's temp directory is used

**version**

[""] Specify the war version. If this argument is provided, it overrides the version encoded in the war file name, if one is present.

Examples:

```
salt '*' tomcat.deploy_war salt://salt-2015.8.6.war version=2015.08.
→r6
```

New in version 2015.8.6.

CLI Examples:

cp module

```
salt '*' tomcat.deploy_war salt://application.war /api
salt '*' tomcat.deploy_war salt://application.war /api no
salt '*' tomcat.deploy_war salt://application.war /api yes http://
→localhost:8080/manager
```

minion local file system

```
salt '*' tomcat.deploy_war /tmp/application.war /api
salt '*' tomcat.deploy_war /tmp/application.war /api no
salt '*' tomcat.deploy_war /tmp/application.war /api yes http://
→localhost:8080/manager
```

```
salt.modules.tomcat.extract_war_version(war)
```

Extract the version from the war file name. There does not seem to be a standard for encoding the version into the war file name

Examples:

```
/path/salt-2015.8.6.war -> 2015.8.6
/path/V6R2013xD5.war -> None
```

**salt.modules.tomcat.fullversion()**

Return all server information from catalina.sh version

CLI Example:

```
salt '*' tomcat.fullversion
```

**salt.modules.tomcat.leaks** (*url='http://localhost:8080/manager', timeout=180*)

Find memory leaks in tomcat

**url**

[<http://localhost:8080/manager>] the URL of the server manager webapp

**timeout**

[180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.leaks
```

**salt.modules.tomcat.ls** (*url='http://localhost:8080/manager', timeout=180*)

list all the deployed webapps

**url**

[<http://localhost:8080/manager>] the URL of the server manager webapp

**timeout**

[180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.ls
salt '*' tomcat.ls http://localhost:8080/manager
```

**salt.modules.tomcat.passwd** (*passwd, user="", alg='sha1', realm=None*)

This function replaces the \$CATALINA\_HOME/bin/digest.sh script convert a clear-text password to the \$CATALINA\_BASE/conf/tomcat-users.xml format

CLI Examples:

```
salt '*' tomcat.passwd secret
salt '*' tomcat.passwd secret tomcat sha1
salt '*' tomcat.passwd secret tomcat sha1 'Protected Realm'
```

**salt.modules.tomcat.reload\_** (*app, url='http://localhost:8080/manager', timeout=180*)

Reload the webapp

**app**

the webapp context path

**url**

[<http://localhost:8080/manager>] the URL of the server manager webapp

**timeout**

[180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.reload /jenkins
salt '*' tomcat.reload /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.serverinfo` (*url*='http://localhost:8080/manager', *timeout*=180)

return details about the server

**url**

[http://localhost:8080/manager] the URL of the server manager webapp

**timeout**

[180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.serverinfo
salt '*' tomcat.serverinfo http://localhost:8080/manager
```

`salt.modules.tomcat.sessions` (*app*, *url*='http://localhost:8080/manager', *timeout*=180)

return the status of the webapp sessions

**app**

the webapp context path

**url**

[http://localhost:8080/manager] the URL of the server manager webapp

**timeout**

[180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.sessions /jenkins
salt '*' tomcat.sessions /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.signal` (*signal*=None)

Signals catalina to start, stop, securestart, forcestop.

CLI Example:

```
salt '*' tomcat.signal start
```

`salt.modules.tomcat.start` (*app*, *url*='http://localhost:8080/manager', *timeout*=180)

Start the webapp

**app**

the webapp context path

**url**

[http://localhost:8080/manager] the URL of the server manager webapp

**timeout**

timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.start /jenkins
salt '*' tomcat.start /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.status` (*url*='http://localhost:8080/manager', *timeout*=180)

Used to test if the tomcat manager is up

**url**

[http://localhost:8080/manager] the URL of the server manager webapp

**timeout**

[180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.status
salt '*' tomcat.status http://localhost:8080/manager
```

`salt.modules.tomcat.status_webapp` (*app*, *url*='http://localhost:8080/manager', *timeout*=180)

return the status of the webapp (stopped | running | missing)

**app**

the webapp context path

**url**

[http://localhost:8080/manager] the URL of the server manager webapp

**timeout**

[180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.status_webapp /jenkins
salt '*' tomcat.status_webapp /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.stop` (*app*, *url*='http://localhost:8080/manager', *timeout*=180)

Stop the webapp

**app**

the webapp context path

**url**

[http://localhost:8080/manager] the URL of the server manager webapp

**timeout**

[180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.stop /jenkins
salt '*' tomcat.stop /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.undeploy` (*app*, *url*='http://localhost:8080/manager', *timeout*=180)

Undeploy a webapp

**app**

the webapp context path

**url**

[http://localhost:8080/manager] the URL of the server manager webapp

**timeout**

[180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.undeploy /jenkins
salt '*' tomcat.undeploy /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.version` ()

Return server version from catalina.sh version

CLI Example:

```
salt '*' tomcat.version
```

## 26.6.457 salt.modules.trafficserver

Apache Traffic Server execution module.

New in version 2015.8.0.

`traffic_ctl` is used to execute individual Traffic Server commands and to script multiple commands in a shell.

### `salt.modules.trafficserver.alarms()`

List all alarm events that have not been acknowledged (cleared).

```
salt '*' trafficserver.alarms
```

### `salt.modules.trafficserver.bounce_cluster()`

Bounce all Traffic Server nodes in the cluster. Bouncing Traffic Server shuts down and immediately restarts Traffic Server, node-by-node.

```
salt '*' trafficserver.bounce_cluster
```

### `salt.modules.trafficserver.bounce_local(drain=False)`

Bounce Traffic Server on the local node. Bouncing Traffic Server shuts down and immediately restarts the Traffic Server node.

#### **drain**

This option modifies the restart behavior such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
salt '*' trafficserver.bounce_local
salt '*' trafficserver.bounce_local drain=True
```

### `salt.modules.trafficserver.clear_alarms(alarm)`

Clear (acknowledge) an alarm event. The arguments are “all” for all current alarms, a specific alarm number (e.g. “1”), or an alarm string identifier (e.g. “MGMT\_ALARM\_PROXY\_CONFIG\_ERROR”).

```
salt '*' trafficserver.clear_alarms [all | #event | name]
```

### `salt.modules.trafficserver.clear_cluster()`

Clears accumulated statistics on all nodes in the cluster.

```
salt '*' trafficserver.clear_cluster
```

### `salt.modules.trafficserver.clear_node()`

Clears accumulated statistics on the local node.

```
salt '*' trafficserver.clear_node
```

### `salt.modules.trafficserver.match_config(regex)`

Display the current values of all configuration variables whose names match the given regular expression.

New in version 2016.11.0.

```
salt '*' trafficserver.match_config regex
```

`salt.modules.trafficserver.match_metric(regex)`

Display the current values of all metrics whose names match the given regular expression.

New in version 2016.11.0.

```
salt '*' trafficserver.match_metric regex
```

`salt.modules.trafficserver.offline(path)`

Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in `storage.config`. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the `traffic_server` process.

```
salt '*' trafficserver.offline /path/to/cache
```

`salt.modules.trafficserver.read_config(*args)`

Read Traffic Server configuration variable definitions.

New in version 2016.11.0.

```
salt '*' trafficserver.read_config proxy.config.http.keep_alive_post_out
```

`salt.modules.trafficserver.read_metric(*args)`

Read Traffic Server one or more metrics.

New in version 2016.11.0.

```
salt '*' trafficserver.read_metric proxy.process.http.tcp_hit_count_stat
```

`salt.modules.trafficserver.refresh()`

Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the `proxy.node.config.reconfigure_time` metric.

```
salt '*' trafficserver.refresh
```

`salt.modules.trafficserver.restart_cluster()`

Restart the `traffic_manager` process and the `traffic_server` process on all the nodes in a cluster.

```
salt '*' trafficserver.restart_cluster
```

`salt.modules.trafficserver.restart_local(drain=False)`

Restart the `traffic_manager` and `traffic_server` processes on the local node.

**drain**

This option modifies the restart behavior such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
salt '*' trafficserver.restart_local
salt '*' trafficserver.restart_local drain=True
```

`salt.modules.trafficserver.set_config(variable, value)`

Set the value of a Traffic Server configuration variable.

**variable**

Name of a Traffic Server configuration variable.

**value**

The new value to set.

New in version 2016.11.0.

```
salt '*' trafficserver.set_config proxy.config.http.keep_alive_post_out 0
```

**salt.modules.trafficserver.shutdown()**

Shut down Traffic Server on the local node.

```
salt '*' trafficserver.shutdown
```

**salt.modules.trafficserver.startup()**

Start Traffic Server on the local node.

```
salt '*' trafficserver.start
```

**salt.modules.trafficserver.status()**

Show the current proxy server status, indicating if we're running or not.

```
salt '*' trafficserver.status
```

**salt.modules.trafficserver.zero\_cluster()**

Reset performance statistics to zero across the cluster.

```
salt '*' trafficserver.zero_cluster
```

**salt.modules.trafficserver.zero\_node()**

Reset performance statistics to zero on the local node.

```
salt '*' trafficserver.zero_cluster
```

## 26.6.458 salt.modules.transactional\_update module

### Transactional update

New in version 3004.

A transactional system, like [MicroOS](#), can present some challenges when the user decided to manage it via Salt.

MicroOS provides a read-only rootfs and a tool, `transactional-update`, that takes care of the management of the system (updating, upgrading, installation or reboot, among others) in an atomic way.

Atomicity is the main feature of MicroOS, and to guarantee this property, this model leverages `snapper`, `zypper`, `btrfs` and `overlayfs` to create snapshots that will be updated independently of the currently running system, and that are activated after the reboot. This implies, for example, that some changes made on the system are not visible until the next reboot, as those changes are living in a different snapshot of the file system.

This model presents a lot of problems with the traditional Salt model, where the inspections (like 'is this package installed?') are executed in order to determine if a subsequent action is required (like 'install this package').

Lets consider this use case, to see how it works on a traditional system, and in a transactional system:

- 1) Check if apache is installed

- 2) If it is not installed, install it
- 3) Check that a `vhost` is configured for `apache`
- 4) Make sure that `apache2.service` is enabled
- 5) If the configuration changes, restart `apache2.service`

In the traditional system everything will work as expected. The system can see if the package is present or not, install it if it isn't, and a re-check will show that it is already present. The same will happen to the configuration file in `/etc/apache2`, that will be available as soon the package gets installed. Salt can inspect the current form of this file, and add the missing bits if required. Salt can annotate that a change is present, and restart the service.

In a transactional system we will have multiple issues. The first one is that Salt can only see the content of the snapshot where the system booted from. Later snapshots may contain different content, including the presence of `apache`. If Salt decides to install `apache` calling `zypper`, it will fail, as this will try to write into the read-only roots. Even if Salt would call `transactional-update pkg install`, the package would only be present in the new transaction (snapshot), and will not be found in the currently running system when later Salt tries to validate the presence of the package in the current one.

Any change in `/etc` alone will have also problems, as the changes will be alive in a different overlay, only visible after the reboot. And, finally, the service can only be enabled and restarted if the service file is already present in the current `/etc`.

## General strategy

`transactional-update` is the reference tool used for the administration of transactional systems. Newer versions of this tool support the execution of random commands in the new transaction, the continuation of a transaction, the automatic detection of changes in new transactions and the merge of `/etc` overlays.

## Continue a transaction

One prerequisite already present is the support for branching from a different snapshot than the current one in `snapper`.

With this feature we can represent in `transactional-update` the action of creating a transaction snapshot based on one that is planned to be the active one after the reboot. This feature removes a lot of user complaints (like, for example, losing changes that are stored in a transaction not yet activated), but also provide a more simple model to work with.

So, for example, if the user have this scenario:

```
+-----+ *=====+ ---V---+
--| T.1 |--| T.2 |--| T.3 |
+-----+ *=====+ ---A---+
```

where T.2 is the current active one, and T.3 is a snapshot generated from T.2 with a new package (`apache2`), and is marked to be the active after the reboot.

Previously, if the user (that is still on T.2) created a new transaction, maybe for adding a new package (`tomcat`, for example), the new T.4 will be based on the content of T.2 again, and not T.3, so the new T.4 will have lost the changes of T.3 (i.e. `apache2` will not be present in T.4).

With the `--continue` parameter, `transactional-update` will create T.4 based on T.3, and nothing will be lost.

### Command execution inside a new transaction

With `transactional-update` run we will create a new transaction based on the current one (T.2), where we can send interactive commands that can modify the new transaction, and as commented, with `transactional-update --continue` run, we will create a new transaction based on the last created (T.3)

The run command can execute any application inside the new transaction namespace. This module uses this feature to execute the different Salt execution modules, via `call()`. Or even the full `salt-thin` or `salt-call` via `sls()`, `apply()`, `single()` or `highstate`.

### `transactional-update` will drop empty snapshots

The option `--drop-if-no-change` is used to detect whether there is any change in the file system on the read-only subvolume of the new transaction will be added. If a change is present, the new transaction will remain, if not it will be discarded.

For example:

```
transactional-update --continue --drop-if-no-change run zypper in apache2
```

If we are in the scenario described before, `apache2` is already present in T.3. In this case a new transaction, T.4, will be created based on T.3, `zypper` will detect that the package is already present and no change will be produced on T.4. At the end of the execution, `transactional-update` will validate that T.3 and T.4 are equivalent and T.4 will be discarded.

If the command is:

```
transactional-update --continue --drop-if-no-change run zypper in tomcat
```

the new T.4 will be indeed different from T.3, and will remain after the transaction is closed.

With this feature, every time that we call any function of this execution module, we will minimize the amount of transaction, while maintaining the idempotence so some operations.

### Report for pending transaction

A change in the system will create a new transaction, that needs to be activated via a reboot. With `pending_transaction()` we can check if a reboot is needed. We can execute the reboot using the `reboot()` function, that will follow the plan established by the functions of the `rebootmgr` execution module.

### `/etc` overlay merge when no new transaction is created

In a transactional model, `/etc` is an overlay file system. Changes done during the update are only present in the new transaction, and so will only be available after the reboot. Or worse, if the transaction gets dropped, because there is no change in the `rootfs`, the changes in `/etc` will be dropped too!. This is designed like that in order to make the configuration files for the new package available only when new package is also available to the user. So, after the reboot.

This makes sense for the case when, for example, `apache2` is not present in the current transaction, but we installed it. The new snapshot contains the `apache2` service, and the configuration files in `/etc` will be accessible only after the reboot.

But this model presents an issue. If we use `transactional-update --continue --drop-if-no-change run <command>`, where `<command>` does not make any change in the read-only subvolume, but only in `/etc` (which is also read-write in the running system), the new overlay with the changes in `/etc` will be dropped together with the transaction.

To fix this, `transactional-update` will detect that when no change has been made on the read-only subvolume, but done in the overlay, the transaction will be dropped and the changes in the overlay will be merged back into `/etc` overlay of the current transaction.

### Using the execution module

With this module we can create states that leverage Salt into this kind of systems:

```
# Install apache (low-level API)
salt-call transactional_update.pkg_install apache2

# We can call any execution module
salt-call transactional_update.call pkg.install apache2

# Or via a state
salt-call transactional_update.single pkg.installed name=apache2

# We can also execute a zypper directly
salt-call transactional_update run "zypper in apache2" snapshot="continue"

# We can reuse SLS states
salt-call transactional_update.apply install_and_configure_apache

# Or apply the full highstate
salt-call transactional_update.highstate

# Is there any change done in the system?
salt-call transactional_update pending_transaction

# If so, reboot via rebootmgr
salt-call transactional_update reboot

# We can enable the service
salt-call service.enable apache2

# If apache2 is available, this will work too
salt-call service.restart apache2
```

## Fixing some expectations

This module alone is an improvement over the current state, but is easy to see some limitations and problems:

### Is not a fully transparent approach

The user needs to know if the system is transactional or not, as not everything can be expressed inside a transaction (for example, restarting a service inside transaction is not allowed).

### Two step for service restart

In the `apache2` example from the beginning we can observe the biggest drawback. If the package `apache2` is missing, the new module will create a new transaction, will execute `pkg.install` inside the transaction (creating the `salt-thin`, moving it inside and delegating the execution to `transactional-update` CLI as part of the full state). Inside the transaction we can do too the required changes in `/etc` for adding the new `vhost`, and we can enable the service via `systemctl` inside the same transaction.

At this point we will not merge the `/etc` overlay into the current one, and we expect from the user call the `reboot` function inside this module, in order to activate the new transaction and start the `apache2` service.

In the case that the package is already there, but the configuration for the `vhost` is required, the new transaction will be dropped and the `/etc` overlay will be visible in the live system. Then from outside the transaction, via a different call to Salt, we can command a restart of the `apache2` service.

We can see that in both cases we break the user expectation, where a change on the configuration will trigger automatically the restart of the associated service. In a transactional scenario we need two different steps: or a reboot, or a restart from outside of the transaction.

```
maintainer
  Alberto Planas <aplanas@suse.com>

maturity

depends
  None

platform
  Linux
```

`salt.modules.transactional_update.apply_(mods=None, **kwargs)`

Apply an state inside a transaction.

This function will call `transactional_update.highstate` or `transactional_update.sls` based on the arguments passed to this function. It exists as a more intuitive way of applying states.

For a formal description of the possible parameters accepted in this function, check `state.apply_` documentation.

#### activate\_transaction

If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (default False)

CLI Example:

```
salt microos transactional_update.apply
salt microos transactional_update.apply stuff
salt microos transactional_update.apply stuff pillar='{"foo": "bar"}'
salt microos transactional_update.apply stuff activate_transaction=True
```

`salt.modules.transactional_update.bootloader` (*self\_update=False, snapshot=None*)

Reinstall the bootloader

Same as grub.cfg, but will also rewrite the bootloader itself.

**self\_update**

Check for newer transactional-update versions.

**snapshot**

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update bootloader snapshot="continue"
```

`salt.modules.transactional_update.call` (*function, \*args, \*\*kwargs*)

Executes a Salt function inside a transaction.

The chroot does not need to have Salt installed, but Python is required.

**function**

Salt execution module function

**activate\_transaction**

If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (default False)

CLI Example:

```
salt microos transactional_update.call test.ping
salt microos transactional_update.call ssh.set_auth_key user key=mykey
salt microos transactional_update.call pkg.install emacs activate_
→ transaction=True
```

`salt.modules.transactional_update.cleanup` (*self\_update=False*)

Run both cleanup-snapshots and cleanup-overlays.

Identical to calling both cleanup-snapshots and cleanup-overlays.

**self\_update**

Check for newer transactional-update versions.

CLI Example:

```
salt microos transactional_update cleanup
```

`salt.modules.transactional_update.cleanup_overlays` (*self\_update=False*)

Remove unused overlay layers.

Removes all unreferenced (and thus unused) /etc overlay directories in /var/lib/overlay.

**self\_update**

Check for newer transactional-update versions.

CLI Example:

```
salt microos transactional_update cleanup_overlays
```

`salt.modules.transactional_update.cleanup_snapshots` (*self\_update=False*)

Mark unused snapshots for snapper removal.

If the current root filesystem is identical to the active root filesystem (means after a reboot, before transactional-update creates a new snapshot with updates), all old snapshots without a cleanup algorithm get a cleanup algorithm set. This is to make sure, that old snapshots will be deleted by snapper. See the section about cleanup algorithms in snapper(8).

**self\_update**

Check for newer transactional-update versions.

CLI Example:

```
salt microos transactional_update cleanup_snapshots
```

`salt.modules.transactional_update.dup`(*self\_update=False*, *snapshot=None*)

Call 'zypper dup'

If new updates are available, a new snapshot is created and `zypper dup --no-allow-vendor-change` is used to update the snapshot. Afterwards, the snapshot is activated and will be used as the new root filesystem during next boot.

**self\_update**

Check for newer transactional-update versions.

**snapshot**

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update dup snapshot="continue"
```

`salt.modules.transactional_update.grub_cfg`(*self\_update=False*, *snapshot=None*)

Regenerate `grub.cfg`

`grub2-mkconfig(8)` is called to create a new `/boot/grub2/grub.cfg` configuration file for the bootloader.

**self\_update**

Check for newer transactional-update versions.

**snapshot**

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update grub_cfg snapshot="continue"
```

`salt.modules.transactional_update.highstate`(*activate\_transaction=False*, *queue=False*,  
*\*\*kwargs*)

Retrieve the state data from the salt master for this minion and execute it inside a transaction.

For a formal description of the possible parameters accepted in this function, check `state.highstate` documentation.

**activate\_transaction**

If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (Default: False).

**queue**

Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly (Default: False).

CLI Example:

```
salt microos transactional_update.highstate
salt microos transactional_update.highstate pillar='{"foo": "bar"}'
salt microos transactional_update.highstate activate_transaction=True
```

`salt.modules.transactional_update.in_transaction`()

Check if Salt is executing while in a transaction

CLI Example:

```
salt microos transactional_update in_transaction
```

`salt.modules.transactional_update.initrtd` (*self\_update=False, snapshot=None*)

Regenerate initrd

A new initrd is created in a snapshot.

**self\_update**

Check for newer transactional-update versions.

**snapshot**

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update initrd snapshot="continue"
```

`salt.modules.transactional_update.kdump` (*self\_update=False, snapshot=None*)

Regenerate kdump initrd

A new initrd for kdump is created in a snapshot.

**self\_update**

Check for newer transactional-update versions.

**snapshot**

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update kdump snapshot="continue"
```

`salt.modules.transactional_update.migration` (*self\_update=False, snapshot=None*)

Updates systems registered via SCC / SMT

On systems which are registered against the SUSE Customer Center (SCC) or SMT, a migration to a new version of the installed products can be made with this option.

**self\_update**

Check for newer transactional-update versions.

**snapshot**

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update migration snapshot="continue"
```

`salt.modules.transactional_update.patch` (*self\_update=False, snapshot=None*)

Call 'zypper patch'

If new updates are available, a new snapshot is created and zypper patch is used to update the snapshot. Afterwards, the snapshot is activated and will be used as the new root filesystem during next boot.

**self\_update**

Check for newer transactional-update versions.

**snapshot**

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update patch snapshot="continue"
```

`salt.modules.transactional_update.pending_transaction()`

Check if there is a pending transaction

CLI Example:

```
salt microos transactional_update pending_transaction
```

`salt.modules.transactional_update.pkg_install` (*pkg=None, pkgs=None, args=None, self\_update=False, snapshot=None*)

Install individual packages

Installs additional software. See the install description in the "Package Management Commands" section of zypper's man page for all available arguments.

**pkg**

Package name to install

**pkgs**

List of packages names to install

**args**

String or list of extra parameters for zypper

**self\_update**

Check for newer transactional-update versions.

**snapshot**

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update pkg_install pkg=emacs snapshot="continue"
→"
```

`salt.modules.transactional_update.pkg_remove` (*pkg=None, pkgs=None, args=None, self\_update=False, snapshot=None*)

Remove individual packages

Removes installed software. See the remove description in the "Package Management Commands" section of zypper's man page for all available arguments.

**pkg**

Package name to install

**pkgs**

List of packages names to install

**args**

String or list of extra parameters for zypper

**self\_update**

Check for newer transactional-update versions.

**snapshot**

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update pkg_remove pkg=vim snapshot="continue"
```

`salt.modules.transactional_update.pkg_update` (*pkg=None, pkgs=None, args=None, self\_update=False, snapshot=None*)

Updates individual packages

Update selected software. See the update description in the "Update Management Commands" section of zypper's man page for all available arguments.

**pkg**

Package name to install

**pkgs**

List of packages names to install

**args**

String or list of extra parameters for zypper

**self\_update**

Check for newer transactional-update versions.

**snapshot**

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update pkg_update pkg=emacs snapshot="continue"
```

`salt.modules.transactional_update.reboot` (*self\_update=False*)

Reboot after update

Trigger a reboot after updating the system.

Several different reboot methods are supported, configurable via the REBOOT\_METHOD configuration option in transactional-update.conf(5). By default rebootmgrd(8) will be used to reboot the system according to the configured policies if the service is running, otherwise systemctl reboot will be called.

**self\_update**

Check for newer transactional-update versions.

CLI Example:

```
salt microos transactional_update reboot
```

`salt.modules.transactional_update.rollback` (*snapshot=None*)

Set the current, given or last working snapshot as default snapshot

Sets the default root file system. On a read-only system the root file system is set directly using btrfs. On read-write systems snapper(8) rollback is called.

If no snapshot number is given, the current root file system is set as the new default root file system. Otherwise number can either be a snapshot number (as displayed by snapper list) or the word last. last will try to reset to the latest working snapshot.

**snapshot**

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "last" to indicate the last working snapshot done.

CLI Example:

```
salt microos transactional_update rollback
```

`salt.modules.transactional_update.run` (*command, self\_update=False, snapshot=None*)

Run a command in a new snapshot

Execute the command inside a new snapshot. By default this snapshot will remain, but if --drop-if-no-change is set, the new snapshot will be dropped if there is no change in the file system.

**command**

Command with parameters that will be executed (as string or array)

**self\_update**

Check for newer transactional-update versions.

**snapshot**

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update run "mkdir /tmp/dir" snapshot="continue"
```

`salt.modules.transactional_update.single`(*fun, name, activate\_transaction=False, queue=False, \*\*kwargs*)

Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

**activate\_transaction**

If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (Default: False).

**queue**

Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly (Default: False).

CLI Example:

```
salt microos transactional_update.single pkg.installed name=emacs
salt microos transactional_update.single pkg.installed name=emacs
↳ activate_transaction=True
```

`salt.modules.transactional_update.sls`(*mods, activate\_transaction=False, queue=False, \*\*kwargs*)

Execute the states in one or more SLS files inside a transaction.

**saltenv**

Specify a salt fileserver environment to be used when applying states

**mods**

List of states to execute

**test**

Run states in test-only (dry-run) mode

**exclude**

Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

**activate\_transaction**

If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (Default: False).

**queue**

Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly (Default: False).

For a formal description of the possible parameters accepted in this function, check *state.sls* documentation.

CLI Example:

```
salt microos transactional_update.sls stuff pillar='{"foo": "bar"}'
salt microos transactional_update.sls stuff activate_transaction=True
```

`salt.modules.transactional_update.transactional()`

Check if the system is a transactional system

CLI Example:

```
salt microos transactional_update transactional
```

`salt.modules.transactional_update.up(self_update=False, snapshot=None)`

Call 'zypper up'

If new updates are available, a new snapshot is created and zypper up is used to update the snapshot. Afterwards, the snapshot is activated and will be used as the new root filesystem during next boot.

**self\_update**

Check for newer transactional-update versions.

**snapshot**

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update up snapshot="continue"
```

### 26.6.459 salt.modules.travisci

Commands for working with travisci.

**depends**

pyOpenSSL >= 16.0.0

`salt.modules.travisci.verify_webhook(signature, body)`

Verify the webhook signature from travisci

**signature**

The signature header from the webhook header

**body**

The full payload body from the webhook post

---

**Note:** The body needs to be the urlencoded version of the body.

---

CLI Example:

```
salt '*' travisci.verify_webhook 'M6NucCX5722bxisQs7e...' 'payload=%7B
↳%22id%22%3A183791261%2C%22repository...''
```

### 26.6.460 salt.modules.tuned

Interface to Red Hat tuned-adm module

**maintainer**

Syed Ali <alicsyed@gmail.com>

**maturity**

new

**depends**

tuned-adm

**platform**  
Linux

`salt.modules.tuned.active()`

Return current active profile in stdout key if retcode is 0, otherwise raw result

CLI Example:

```
salt '*' tuned.active
```

`salt.modules.tuned.list_()`

List the profiles available

CLI Example:

```
salt '*' tuned.list
```

`salt.modules.tuned.off()`

Turn off all profiles

CLI Example:

```
salt '*' tuned.off
```

`salt.modules.tuned.profile(profile_name)`

Activate specified profile

CLI Example:

```
salt '*' tuned.profile virtual-guest
```

## 26.6.461 salt.modules.twilio\_notify

Module for notifications via Twilio

New in version 2014.7.0.

### depends

- twilio python module

### configuration

Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config (with *pillar\_opts* set to True).

For example:

```
my-twilio-account:  
  twilio.account_sid: AC32a3c83990934481add5ce1659f04d2  
  twilio.auth_token: mytoken
```

`salt.modules.twilio_notify.send_sms(profile, body, to, from_)`

Send an sms

CLI Example:

```
twilio.send_sms my-twilio-account 'Test sms' '+18019999999' '+18011111111'
```

## 26.6.462 salt.modules.udev

Manage and query udev info

New in version 2015.8.0.

**salt.modules.udev.env**(*dev*)

Return all environment variables udev has for dev

CLI Example:

```
salt '*' udev.env /dev/sda
salt '*' udev.env /sys/class/net/eth0
```

**salt.modules.udev.exportdb**()

Return all the udev database

CLI Example:

```
salt '*' udev.exportdb
```

**salt.modules.udev.info**(*dev*)

Extract all info delivered by udevadm

CLI Example:

```
salt '*' udev.info /dev/sda
salt '*' udev.info /sys/class/net/eth0
```

**salt.modules.udev.links**(*dev*)

Return all udev-created device symlinks

CLI Example:

```
salt '*' udev.links /dev/sda
salt '*' udev.links /sys/class/net/eth0
```

**salt.modules.udev.name**(*dev*)

Return the actual dev name(s?) according to udev for dev

CLI Example:

```
salt '*' udev.dev /dev/sda
salt '*' udev.dev /sys/class/net/eth0
```

**salt.modules.udev.path**(*dev*)

Return the physical device path(s?) according to udev for dev

CLI Example:

```
salt '*' udev.path /dev/sda
salt '*' udev.path /sys/class/net/eth0
```

## 26.6.463 salt.modules.upstart\_service

Module for the management of upstart systems. The Upstart system only supports service starting, stopping and restarting.

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

Currently (as of Ubuntu 12.04) there is no tool available to disable Upstart services (like update-rc.d). This[1] is the recommended way to disable an Upstart service. So we assume that all Upstart services that have not been disabled in this manner are enabled.

But this is broken because we do not check to see that the dependent services are enabled. Otherwise we would have to do something like parse the output of `initctl show-config` to determine if all service dependencies are enabled to start on boot. For example, see the "start on" condition for the `lightdm` service below[2]. And this would be too hard. So we wait until the upstart developers have solved this problem. :) This is to say that an Upstart service that is enabled may not really be enabled.

Also, when an Upstart service is enabled, should the dependent services be enabled too? Probably not. But there should be a notice about this, at least.

[1] <http://upstart.ubuntu.com/cookbook/#disabling-a-job-from-automatically-starting>

[2] example upstart configuration file:

```
lightdm
emits login-session-start
emits desktop-session-start
emits desktop-shutdown
start on (((filesystem and runlevel [!06]) and started dbus) and (drm-device-
→added card0 PRIMARY_DEVICE_FOR_DISPLAY=1 or stopped udev-fallback-
→graphics)) or runlevel PREVLEVEL=S)
stop on runlevel [016]
```

**Warning:** This module should not be used on Red Hat systems. For these, the `rh_service` module should be used, as it supports the hybrid upstart/sysvinit system used in RHEL/CentOS 6.

`salt.modules.upstart_service.available(name)`

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.upstart_service.disable(name, **kwargs)`

Disable the named service from starting on boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.upstart_service.disabled(name)`

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.upstart_service.enable(name, **kwargs)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.upstart_service.enabled(name, **kwargs)`

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.upstart_service.force_reload(name)`

Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.upstart_service.full_restart(name)`

Do a full restart (stop/start) of the named service

CLI Example:

```
salt '*' service.full_restart <service name>
```

`salt.modules.upstart_service.get_all()`

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.upstart_service.get_disabled()`

Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.upstart_service.get_enabled()`

Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.upstart_service.missing(name)`

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.upstart_service.reload_(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.upstart_service.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.upstart_service.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.upstart_service.status(name, sig=None)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt\*)

**Parameters**

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Signature to use to find the service via ps

**Returns**

True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type**

bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.upstart_service.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

## 26.6.464 salt.modules.uptime

### Wrapper around uptime API

`salt.modules.uptime.check_exists(name)`

Check if a given URL is in being monitored by uptime

CLI Example:

```
salt '*' uptime.check_exists http://example.org
```

`salt.modules.uptime.checks_list()`

List URL checked by uptime

CLI Example:

```
salt '*' uptime.checks_list
```

`salt.modules.uptime.create(name, **params)`

Create a check on a given URL.

Additional parameters can be used and are passed to API (for example interval, maxTime, etc). See the documentation <https://github.com/fzaninotto/uptime> for a full list of the parameters.

CLI Example:

```
salt '*' uptime.create http://example.org
```

`salt.modules.uptime.delete(name)`

Delete a check on a given URL

CLI Example:

```
salt '*' uptime.delete http://example.org
```

## 26.6.465 salt.modules.useradd

Manage users with the useradd command

---

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info' is not available`), see [here](#).

---

`salt.modules.useradd.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, system=False, fullname="", roomnumber="", workphone="", homephone="", other="", createhome=True, loginclass=None, nologinit=False, root=None, usergroup=None, local=False)`

Add a user to the minion

**name**

Username LOGIN to add

**uid**

User ID of the new account

**gid**

Name or ID of the primary group of the new account

**groups**

List of supplementary groups of the new account

**home**

Home directory of the new account

**shell**

Login shell of the new account

**unique**

If not True, the user account can have a non-unique UID

**system**

Create a system account

**fullname**

GECOS field for the full name

**roomnumber**

GECOS field for the room number

**workphone**

GECOS field for the work phone

**homephone**

GECOS field for the home phone

**other**

GECOS field for other information

**createhome**

Create the user's home directory

**loginclass**

Login class for the new account (OpenBSD)

**nologinit**

Do not add the user to the lastlog and faillog databases

**root**

Directory to chroot into

**usergroup**

Create and add the user to a new primary group of the same name

**local (Only on systems with luseradd available)**

Specifically add the user locally rather than possibly through remote providers (e.g. LDAP)

New in version 3007.0.

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.useradd.chfullname` (*name, fullname, root=None*)

Change the user's Full Name

**name**

User to modify

**fullname**

GECOS field for the full name

**root**

Directory to chroot into

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

`salt.modules.useradd.chgid` (*name, gid, root=None*)

Change the default group of the user

**name**

User to modify

**gid**  
Force use GID as new primary group

**root**  
Directory to chroot into

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.useradd.chgroups` (*name, groups, append=False, root=None*)

Change the groups to which this user belongs

**name**  
User to modify

**groups**  
Groups to set for the user

**append**  
[False] If True, append the specified group(s). Otherwise, this function will replace the user's groups with the specified group(s).

**root**  
Directory to chroot into

CLI Examples:

```
salt '*' user.chgroups foo wheel,root
salt '*' user.chgroups foo wheel,root append=True
```

`salt.modules.useradd.chhome` (*name, home, persist=False, root=None*)

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

**name**  
User to modify

**home**  
New home directory for the user account

**persist**  
Move contents of the home directory to the new location

**root**  
Directory to chroot into

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.useradd.chhomephone` (*name, homephone, root=None*)

Change the user's Home Phone

**name**  
User to modify

**homephone**  
GECOS field for the home phone

**root**  
Directory to chroot into

CLI Example:

```
salt '*' user.chhomephone foo 7735551234
```

`salt.modules.useradd.chloginclass` (*name, loginclass, root=None*)

Change the default login class of the user

**name**  
User to modify

**loginclass**  
Login class for the new account

**root**  
Directory to chroot into

---

**Note:** This function only applies to OpenBSD systems.

---

CLI Example:

```
salt '*' user.chloginclass foo staff
```

`salt.modules.useradd.chother` (*name, other, root=None*)

Change the user's other GECOS attribute

**name**  
User to modify

**other**  
GECOS field for other information

**root**  
Directory to chroot into

CLI Example:

```
salt '*' user.chother foobar
```

`salt.modules.useradd.chroomnumber` (*name, roomnumber, root=None*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

`salt.modules.useradd.chshell` (*name, shell, root=None*)

Change the default shell of the user

**name**  
User to modify

**shell**  
New login shell for the user account

**root**  
Directory to chroot into

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.useradd.chuid` (*name, uid, root=None*)

Change the uid for a named user

**name**  
User to modify

**uid**  
New UID for the user account

**root**  
Directory to chroot into

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.useradd.chworkphone` (*name*, *workphone*, *root=None*)

Change the user's Work Phone

**name**

User to modify

**workphone**

GECOS field for the work phone

**root**

Directory to chroot into

CLI Example:

```
salt '*' user.chworkphone foo 7735550123
```

`salt.modules.useradd.delete` (*name*, *remove=False*, *force=False*, *root=None*, *local=False*)

Remove a user from the minion

**name**

Username to delete

**remove**

Remove home directory and mail spool

**force**

Force some actions that would fail otherwise

**root**

Directory to chroot into

**local (Only on systems with luserdel available):**

Ensure the user account is removed locally ignoring global account management (default is False).

New in version 3007.0.

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.useradd.get_loginclass` (*name*)

Get the login class of the user

**name**

User to get the information

---

**Note:** This function only applies to OpenBSD systems.

---

CLI Example:

```
salt '*' user.get_loginclass foo
```

`salt.modules.useradd.getent` (*refresh=False*, *root=None*)

Return the list of all info for all users

**refresh**

Force a refresh of user information

**root**

Directory to chroot into

CLI Example:

```
salt '*' user.getent
```

`salt.modules.useradd.info`(*name*, *root=None*)

Return user information

**name**

User to get the information

**root**

Directory to chroot into

CLI Example:

```
salt '*' user.info root
```

`salt.modules.useradd.list_groups`(*name*)

Return a list of groups the named user belongs to

**name**

User to get the information

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.useradd.list_users`(*root=None*)

Return a list of all users

**root**

Directory to chroot into

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.useradd.primary_group`(*name*)

Return the primary group of the named user

New in version 2016.3.0.

**name**

User to get the information

CLI Example:

```
salt '*' user.primary_group saltadmin
```

`salt.modules.useradd.rename`(*name*, *new\_name*, *root=None*)

Change the username for a named user

**name**

User to modify

**new\_name**

New value of the login name

**root**

Directory to chroot into

CLI Example:

```
salt '*' user.rename name new_name
```

## 26.6.466 salt.modules.uwsgi

uWSGI stats server <https://uwsgi-docs.readthedocs.io/en/latest/StatsServer.html>

**maintainer**

Peter Baumgartner <pete@lincolnloop.com>

**maturity**

new

**platform**

all

**salt.modules.uwsgi.stats**(*socket*)

Return the data from `uwsgi --connect-and-read` as a dictionary.

**socket**

The socket the uWSGI stats server is listening on

CLI Example:

```
salt '*' uwsgi.stats /var/run/mystatserver.sock
salt '*' uwsgi.stats 127.0.0.1:5050
```

## 26.6.467 salt.modules.vagrant

Work with virtual machines managed by Vagrant.

New in version 2018.3.0.

Mapping between a Salt node id and the Vagrant machine name (and the path to the Vagrantfile where it is defined) is stored in a Salt sdb database on the Vagrant host (minion) machine. In order to use this module, sdb must be configured. An SQLite database is the recommended storage method. The URI used for the sdb lookup is "sdb://vagrant\_sdb\_data".

**requirements:**

- the VM host machine must have salt-minion, Vagrant and a vm provider installed.
- the VM host must have a valid definition for `sdb://vagrant_sdb_data`

Configuration example:

```
# file /etc/salt/minion.d/vagrant_sdb.conf
vagrant_sdb_data:
  driver: sqlite3
  database: /var/cache/salt/vagrant.sqlite
  table: sdb
  create_table: True
```

**salt.modules.vagrant.destroy**(*name*)

Destroy and delete a virtual machine. (`vagrant destroy -f`)

This also removes the `salt_id` name defined by `vagrant.init`.

CLI Example:

```
salt <host> vagrant.destroy <salt_id>
```

`salt.modules.vagrant.get_machine_id(machine, cwd)`

returns the salt\_id name of the Vagrant VM

**Parameters**

- **machine** -- the Vagrant machine name
- **cwd** -- the path to Vagrantfile

**Returns**

salt\_id name

`salt.modules.vagrant.get_ssh_config(name, network_mask="", get_private_key=False)`

Retrieve hints of how you might connect to a Vagrant VM.

**Parameters**

- **name** -- the salt\_id of the machine
- **network\_mask** -- a CIDR mask to search for the VM's address
- **get\_private\_key** -- (default: False) return the key used for ssh login

**Returns**

a dict of ssh login information for the VM

CLI Example:

```
salt <host> vagrant.get_ssh_config <salt_id>
salt my_laptop vagrant.get_ssh_config quail1 network_mask=10.0.0.0/8 get_
↳private_key=True
```

The returned dictionary contains:

- **key\_filename**: the name of the private key file on the VM host computer
- **ssh\_username**: the username to be used to log in to the VM
- **ssh\_host**: the IP address used to log in to the VM. (This will usually be *127.0.0.1*)
- **ssh\_port**: the TCP port used to log in to the VM. (This will often be *2222*)
- [**ip\_address**:] (if *network\_mask* is defined. see below)
- [**private\_key**:] (if *get\_private\_key* is True) the private key for ssh\_username

About *network\_mask*:

Vagrant usually uses a redirected TCP port on its host computer to log in to a VM using ssh. This redirected port and its IP address are "ssh\_port" and "ssh\_host". The ssh\_host is usually the localhost (127.0.0.1). This makes it impossible for a third machine (such as a salt-cloud master) to contact the VM unless the VM has another network interface defined. You will usually want a bridged network defined by having a *config.vm.network "public\_network"* statement in your *Vagrantfile*.

The IP address of the bridged adapter will typically be assigned by DHCP and unknown to you, but you should be able to determine what IP network the address will be chosen from. If you enter a CIDR network mask, Salt will attempt to find the VM's address for you. The host machine will send an "ip link show" or "ifconfig" command to the VM (using ssh to *ssh\_host:ssh\_port*) and return the IP address of the first interface it can find which matches your mask.

`salt.modules.vagrant.get_vm_info(name)`

get the information for a VM.

**Parameters**

**name** -- salt\_id name

**Returns**

dictionary of {'machine': x, 'cwd': y, ...}.

`salt.modules.vagrant.init(name, cwd=None, machine="", runas=None, start=False, vagrant_provider="", vm=None)`

Initialize a new Vagrant VM.

This inputs all the information needed to start a Vagrant VM. These settings are stored in a Salt sdb database on the Vagrant host minion and used to start, control, and query the guest VMs. The salt\_id assigned here is

the key field for that database and must be unique.

#### Parameters

- **name** -- The salt\_id name you will use to control this VM
- **cwd** -- The path to the directory where the Vagrantfile is located
- **machine** -- The machine name in the Vagrantfile. If blank, the primary machine will be used.
- **runas** -- The username on the host who owns the Vagrant work files.
- **start** -- (default: False) Start the virtual machine now.
- **vagrant\_provider** -- The name of a Vagrant VM provider (if not the default).
- **vm** -- Optionally, all the above information may be supplied in this dictionary.

#### Returns

A string indicating success, or False.

CLI Example:

```
salt <host> vagrant.init <salt_id> /path/to/Vagrantfile
salt my_laptop vagrant.init x1 /projects/bevy_master machine=quail1
```

`salt.modules.vagrant.list_active_vms(cwd=None)`

Return a list of machine names for active virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:

```
salt '*' vagrant.list_active_vms cwd=/projects/project_1
```

`salt.modules.vagrant.list_domains()`

Return a list of the salt\_id names of all available Vagrant VMs on this host without regard to the path where they are defined.

CLI Example:

```
salt '*' vagrant.list_domains --log-level=info
```

The log shows information about all known Vagrant environments on this machine. This data is cached and may not be completely up-to-date.

`salt.modules.vagrant.list_inactive_vms(cwd=None)`

Return a list of machine names for inactive virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:

```
salt '*' virt.list_inactive_vms cwd=/projects/project_1
```

`salt.modules.vagrant.pause(name)`

Pause (vagrant suspend) the named VM.

CLI Example:

```
salt <host> vagrant.pause <salt_id>
```

`salt.modules.vagrant.reboot(name, provision=False)`

Reboot a VM. (vagrant reload)

CLI Example:

```
salt <host> vagrant.reboot <salt_id> provision=True
```

**Parameters**

- **name** -- The salt\_id name you will use to control this VM
- **provision** -- (False) also re-run the Vagrant provisioning scripts.

`salt.modules.vagrant.shutdown(name)`

Send a soft shutdown (vagrant halt) signal to the named vm.

This does the same thing as `vagrant.stop`. Other-VM control modules use "stop" and "shutdown" to differentiate between hard and soft shutdowns.

CLI Example:

```
salt <host> vagrant.shutdown <salt_id>
```

`salt.modules.vagrant.start(name)`

Start (vagrant up) a virtual machine defined by salt\_id name. The machine must have been previously defined using "vagrant.init".

CLI Example:

```
salt <host> vagrant.start <salt_id>
```

`salt.modules.vagrant.stop(name)`

Hard shutdown the virtual machine. (vagrant halt)

CLI Example:

```
salt <host> vagrant.stop <salt_id>
```

`salt.modules.vagrant.version()`

Return the version of Vagrant on the minion

CLI Example:

```
salt '*' vagrant.version
```

`salt.modules.vagrant.vm_state(name="", cwd=None)`

Return list of information for all the vms indicating their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs defined by the Vagrantfile in the `cwd` directory.

CLI Example:

```
salt '*' vagrant.vm_state <name> cwd=/projects/project_1
```

returns a list of dictionaries with machine name, state, provider, and salt\_id name.

```
datum = {'machine': _, # Vagrant machine name,
        'state': _, # string indicating machine state, like 'running'
        'provider': _, # the Vagrant VM provider
        'name': _} # salt_id name
```

Known bug: if there are multiple machines in your Vagrantfile, and you request the status of the primary machine, which you defined by leaving the `machine` parameter blank, then you may receive the status of all of them. Please specify the actual machine name for each VM if there are more than one.

## 26.6.468 salt.modules.varnish

Support for Varnish

New in version 2014.7.0.

---

**Note:** These functions are designed to work with all implementations of Varnish from 3.x onwards

---

`salt.modules.varnish.ban(ban_expression)`

Add ban to the varnish cache

CLI Example:

```
salt '*' varnish.ban ban_expression
```

`salt.modules.varnish.ban_list()`

List varnish cache current bans

CLI Example:

```
salt '*' varnish.ban_list
```

`salt.modules.varnish.param_set(param, value)`

Set a param in varnish cache

CLI Example:

```
salt '*' varnish.param_set param value
```

`salt.modules.varnish.param_show(param=None)`

Show params of varnish cache

CLI Example:

```
salt '*' varnish.param_show param
```

`salt.modules.varnish.purge()`

Purge the varnish cache

CLI Example:

```
salt '*' varnish.purge
```

`salt.modules.varnish.version()`

Return server version from varnishd -V

CLI Example:

```
salt '*' varnish.version
```

## 26.6.469 salt.modules.vault

**Warning:** This module will be removed from Salt in version 3009 in favor of the [vault Salt Extension](#).

## Functions to interact with Hashicorp Vault.

**maintainer**  
SaltStack

**maturity**  
new

**platform**  
all

**note**  
If you see the following error, you'll need to upgrade `requests` to at least 2.4.2

```
<timestamp> [salt.pillar][CRITICAL][14337] Pillar render error: Failed to
↳load ext_pillar vault: {'error': "request() got an unexpected keyword
↳argument 'json'"}

```

## Configuration

In addition to the module configuration, it is required for the Salt master to be configured to allow peer runs in order to use the Vault integration.

Changed in version 3007.0: The `vault` configuration structure has changed significantly to account for many new features. If found, the old structure will be automatically translated to the new one.

Please update your `peer_run` configuration to take full advantage of the updated modules. The old endpoint (`vault.generate_token`) will continue to work, but result in unnecessary roundtrips once your minions have been updated.

To allow minions to pull configuration and credentials from the Salt master, add this segment to the master configuration file:

```
peer_run:
  .*:
    - vault.get_config           # always
    - vault.generate_new_token  # relevant when `token` == `issue:type`
    - vault.generate_secret_id  # relevant when `aprole` == `issue:type`

```

Minimally required configuration:

```
vault:
  auth:
    token: abcdefg-hijklmnop-qrstuvwxyz
  server:
    url: https://vault.example.com:8200

```

A sensible example configuration, e.g. in `/etc/salt/master.d/vault.conf`:

```

vault:
  auth:
    method: approle
    role_id: e5a7b66e-5d08-da9c-7075-71984634b882
    secret_id: 841771dc-11c9-bbc7-bcac-6a3945a69cd9
  cache:
    backend: file
  issue:
    token:
      role_name: salt_minion
      params:
        explicit_max_ttl: 30
        num_uses: 10
  policies:
    assign:
      - salt_minion
      - salt_role_{pillar[roles]}
  server:
    url: https://vault.example.com:8200

```

The above configuration requires the following policies for the master:

```

# Issue tokens
path "auth/token/create" {
  capabilities = ["create", "read", "update"]
}

# Issue tokens with token roles
path "auth/token/create/*" {
  capabilities = ["create", "read", "update"]
}

```

A sensible example configuration that issues AppRoles to minions from a separate authentication endpoint (notice differing mounts):

```

vault:
  auth:
    method: approle
    mount: approle      # <-- mount the salt master authenticates at
    role_id: e5a7b66e-5d08-da9c-7075-71984634b882
    secret_id: 841771dc-11c9-bbc7-bcac-6a3945a69cd9
  cache:
    backend: file
  issue:
    type: approle
    approle:
      mount: salt-minions # <-- mount the salt master manages
  metadata:
    entity:
      minion-id: '{minion}'
      role: '{pillar[role]}'
  server:
    url: https://vault.example.com:8200

```

(continues on next page)

```
ext_pillar:
- vault: path=salt/minions/{minion}
- vault: path=salt/roles/{pillar[role]}
```

The above configuration requires the following policies for the master:

```
# List existing AppRoles
path "auth/salt-minions/role" {
  capabilities = ["list"]
}

# Manage AppRoles
path "auth/salt-minions/role/*" {
  capabilities = ["read", "create", "update", "delete"]
}

# Lookup mount accessor
path "sys/auth/salt-minions" {
  capabilities = ["read", "sudo"]
}

# Lookup entities by alias name (role-id) and alias mount accessor
path "identity/lookup/entity" {
  capabilities = ["create", "update"]
  allowed_parameters = {
    "alias_name" = []
    "alias_mount_accessor" = ["auth_approle_0a1b2c3d"]
  }
}

# Manage entities with name prefix salt_minion_
path "identity/entity/name/salt_minion_*" {
  capabilities = ["read", "create", "update", "delete"]
}

# Create entity aliases - you can restrict the mount_accessor
# This might allow privilege escalation in case the salt master
# is compromised and the attacker knows the entity ID of an
# entity with relevant policies attached - although you might
# have other problems at that point.
path "identity/entity-alias" {
  capabilities = ["create", "update"]
  allowed_parameters = {
    "id" = []
    "canonical_id" = []
    "mount_accessor" = ["auth_approle_0a1b2c3d"]
    "name" = []
  }
}
```

This enables you to write templated ACL policies like:

```

path "salt/data/minions/{{identity.entity.metadata.minion-id}}" {
    capabilities = ["read"]
}

path "salt/data/roles/{{identity.entity.metadata.role}}" {
    capabilities = ["read"]
}

```

**Note:** AppRole policies and entity metadata are generally not updated automatically. After a change, you will need to synchronize them by running *vault.sync\_approles* or *vault.sync\_entities* respectively.

All possible master configuration options with defaults:

```

vault:
  auth:
    approle_mount: approle
    approle_name: salt-master
    method: token
    role_id: <required if auth:method == approle>
    secret_id: null
    token: <required if auth:method == token>
    token_lifecycle:
      minimum_ttl: 10
      renew_increment: null
  cache:
    backend: session
    config: 3600
    kv_metadata: connection
    secret: ttl
  issue:
    allow_minion_override_params: false
    type: token
    approle:
      mount: salt-minions
      params:
        bind_secret_id: true
        secret_id_num_uses: 1
        secret_id_ttl: 60
        token_explicit_max_ttl: 60
        token_num_uses: 10
        secret_id_bound_cidrs: null
        token_ttl: null
        token_max_ttl: null
        token_no_default_policy: false
        token_period: null
        token_bound_cidrs: null
    token:
      role_name: null
      params:
        explicit_max_ttl: null
        num_uses: 1

```

(continues on next page)

```

    ttl: null
    period: null
    no_default_policy: false
    renewable: true
  wrap: 30s
  keys: []
  metadata:
    entity:
      minion-id: '{minion}'
    secret:
      saltstack-jid: '{jid}'
      saltstack-minion: '{minion}'
      saltstack-user: '{user}'
  policies:
    assign:
      - saltstack/minions
      - saltstack/{minion}
    cache_time: 60
    refresh_pillar: null
  server:
    url: <required, e. g. https://vault.example.com:8200>
    namespace: null
    verify: null

```

## auth

Contains authentication information for the local machine.

### approle\_mount

New in version 3007.0.

The name of the AppRole authentication mount point. Defaults to `approle`.

### approle\_name

New in version 3007.0.

The name of the AppRole. Defaults to `salt-master`.

---

**Note:** Only relevant when a locally configured `role_id/secret_id` uses response wrapping.

---

### method

Currently only `token` and `approle` auth types are supported. Defaults to `token`.

AppRole is the preferred way to authenticate with Vault as it provides some advanced options to control the authentication process. Please see the [Vault documentation](#) for more information.

### role\_id

The role ID of the AppRole. Required if `auth:method == approle`.

Changed in version 3007.0: In addition to a plain string, this can also be specified as a dictionary that includes `wrap_info`, i.e. the return payload of a wrapping request.

### secret\_id

The secret ID of the AppRole. Only required if the configured AppRole requires it.

Changed in version 3007.0: In addition to a plain string, this can also be specified as a dictionary that includes `wrap_info`, i.e. the return payload of a wrapping request.

#### token

Token to authenticate to Vault with. Required if `auth:method == token`.

The token must be able to create tokens with the policies that should be assigned to minions. You can still use the token auth via a OS environment variable via this config example:

```
vault:
  auth:
    method: token
    token: sdb://osenv/VAULT_TOKEN
  server:
    url: https://vault.service.domain:8200

osenv:
  driver: env
```

And then export the VAULT\_TOKEN variable in your OS:

```
export VAULT_TOKEN=11111111-1111-1111-1111-111111111111
```

Changed in version 3007.0: In addition to a plain string, this can also be specified as a dictionary that includes `wrap_info`, i.e. the return payload of a wrapping request.

#### token\_lifecycle

Token renewal settings.

---

**Note:** This setting can be specified inside a minion's configuration as well and will override the master's default for the minion.

Token lifecycle settings have significance for any authentication method, not just `token`.

---

`minimum_ttl` specifies the time (in seconds or as a time string like 24h) an in-use token should be valid for. If the current validity period is less than this and the token is renewable, a renewal will be attempted. If it is not renewable or a renewal does not extend the ttl beyond the specified minimum, a new token will be generated.

---

**Note:** Since leases like database credentials are tied to a token, setting this to a much higher value than the default can be necessary, depending on your specific use case and configuration.

---

`renew_increment` specifies the amount of time the token's validity should be requested to be renewed for when renewing a token. When unset, will extend the token's validity by its default ttl. Set this to `false` to disable token renewals.

---

**Note:** The Vault server is allowed to disregard this request.

---

## cache

Configures token/lease and metadata cache (for KV secrets) on all hosts as well as configuration cache on minions that receive issued credentials.

### backend

Changed in version 3007.0: This used to be found in `auth:token_backend`.

The cache backend in use. Defaults to `session`, which will store the Vault configuration in memory only for that specific Salt run. `disk/file/localfs` will force using the `localfs` driver, regardless of configured minion data cache. Setting this to anything else will use the default configured cache for minion data (`cache`), by default the local filesystem as well.

### clear\_attempt\_revocation

New in version 3007.0.

When flushing still valid cached tokens and leases, attempt to have them revoked after a (short) delay. Defaults to `60`. Set this to `false` to disable revocation (not recommended).

### clear\_on\_unauthorized

New in version 3007.0.

When encountering an `Unauthorized` response with an otherwise valid token, flush the cache and request new credentials. Defaults to `true`. If your policies are relatively stable, disabling this will prevent a lot of unnecessary overhead, with the tradeoff that once they change, you might have to clear the cache manually or wait for the token to expire.

### config

New in version 3007.0.

The time in seconds to cache queried configuration from the master. Defaults to `3600` (one hour). Set this to `null` to disable cache expiration. Changed `server` configuration on the master will still be recognized, but changes in `auth` and `cache` will need a manual update using `vault.update_config` or cache clearance using `vault.clear_cache`.

---

**Note:** Expiring the configuration will also clear cached authentication credentials and leases.

---

### expire\_events

New in version 3007.0.

Fire an event when the session cache containing leases is cleared (`vault/cache/<scope>/clear`) or cached leases have expired (`vault/lease/<cache_key>/expire`). A reactor can be employed to ensure fresh leases are issued. Defaults to `false`.

### kv\_metadata

New in version 3007.0.

The time in seconds to cache KV metadata used to determine if a path is using version 1/2 for. Defaults to `connection`, which will clear the metadata cache once a new configuration is requested from the master. Setting this to `null` will keep the information indefinitely until the cache is cleared manually using `vault.clear_cache` with `connection=false`.

### secret

New in version 3007.0.

The time in seconds to cache tokens/secret IDs for. Defaults to `ttl`, which caches the secret for as long as it is valid, unless a new configuration is requested from the master.

## issue

Configures authentication data issued by the master to minions.

### type

New in version 3007.0.

The type of authentication to issue to minions. Can be `token` or `aprole`. Defaults to `token`.

To be able to issue AppRoles to minions, the master needs to be able to create new AppRoles on the configured auth mount (see policy example above). It is strongly encouraged to create a separate mount dedicated to minions.

### aprole

New in version 3007.0.

Configuration regarding issued AppRoles.

`mount` specifies the name of the auth mount the master manages. Defaults to `salt-minions`. This mount should be exclusively dedicated to the Salt master.

`params` configures the AppRole the master creates for minions. See the [Vault AppRole API docs](#) for details. If you update these params, you can update the minion AppRoles manually using the vault runner: `salt-run vault.sync_aproles`, but they will be updated automatically during a request by a minion as well.

### token

New in version 3007.0.

Configuration regarding issued tokens.

`role_name` specifies the role name for minion tokens created. Optional.

Changed in version 3007.0: This used to be found in `role_name`.

If omitted, minion tokens will be created without any role, thus being able to inherit any master token policy (including token creation capabilities).

Example configuration: <https://www.nomadproject.io/docs/vault-integration/index.html#vault-token-role-configuration>

`params` configures the tokens the master issues to minions.

Changed in version 3007.0: This used to be found in `auth:ttl` and `auth:uses`. The possible parameters were synchronized with the Vault nomenclature:

- `ttl` previously was mapped to `explicit_max_ttl` on Vault, not `ttl`. For the same behavior as before, you will need to set `explicit_max_ttl` now.
- `uses` is now called `num_uses`.

See the [Vault token API docs](#) for details. To make full use of multi-use tokens, you should configure a cache that survives a single session (e.g. `disk`).

---

**Note:** If unset, the master issues single-use tokens to minions, which can be quite expensive.

---

### allow\_minion\_override\_params

Changed in version 3007.0: This used to be found in `auth:allow_minion_override`.

Whether to allow minions to request to override parameters for issuing credentials. See `issue_params` below.

## wrap

New in version 3007.0.

The time a minion has to unwrap a wrapped secret issued by the master. Set this to false to disable wrapping, otherwise a time string like 30s can be used. Defaults to 30s.

## keys

List of keys to use to unseal vault server with the `vault.unseal` runner.

## metadata

New in version 3007.0.

Configures metadata for the issued entities/secrets. Values have to be strings and can be templated with the following variables:

- `{jid}` Salt job ID that issued the secret.
- `{minion}` The minion ID the secret was issued for.
- `{user}` The user the Salt daemon issuing the secret was running as.
- `{pillar[<var>]}` A minion pillar value that does not depend on Vault.
- `{grains[<var>]}` A minion grain value.

---

**Note:** Values have to be strings, hence templated variables that resolve to lists will be concatenated to a lexicographically sorted comma-separated list (Python `list.sort()`).

---

## entity

Configures the metadata associated with the minion entity inside Vault. Entities are only created when issuing AppRoles to minions.

## secret

Configures the metadata associated with issued tokens/secret IDs. They are logged in plaintext to the Vault audit log.

## policies

Changed in version 3007.0: This used to specify the list of policies associated with a minion token only. The equivalent is found in `assign`.

## assign

List of policies that are assigned to issued minion authentication data, either token or AppRole.

They can be static strings or string templates with

- `{minion}` The minion ID.
- `{pillar[<var>]}` A minion pillar value.
- `{grains[<var>]}` A minion grain value.

For pillar and grain values, lists are expanded, so `salt_role_{pillar[roles]}` with `[a, b]` results in `salt_role_a` and `salt_role_b` to be issued.

Defaults to `[saltstack/minions, saltstack/{minion}]`.

New in version 3006.0: Policies can be templated with pillar values as well: `salt_role_{pillar[roles]}`. Make sure to only reference pillars that are not sourced from Vault since the latter ones might be unavailable during policy rendering. If you use the Vault integration in one of your pillar `sls` files, all values from that file will be absent during policy rendering, even the ones that do not depend on Vault.

---

**Important:** See *Is Targeting using Grain Data Secure?* for important security information. In short, everything except `grains[id]` is minion-controlled.

---

---

**Note:** List members which do not have simple string representations, such as dictionaries or objects, do not work and will throw an exception. Strings and numbers are examples of types which work well.

---

### `cache_time`

New in version 3007.0.

Number of seconds compiled templated policies are cached on the master. This is important when using pillar values in templates, since compiling the pillar is an expensive operation.

---

**Note:** Only effective when issuing tokens to minions. Token policies need to be compiled every time a token is requested, while AppRole-associated policies are written to Vault configuration the first time authentication data is requested (they can be refreshed on demand by running `salt-run vault.sync_approles`).

They will also be refreshed in case other issuance parameters are changed (such as `uses/ttl`), either on the master or the minion (if `allow_minion_override_params` is `True`).

---

### `refresh_pillar`

New in version 3007.0.

Whether to refresh the minion pillar when compiling templated policies that contain pillar variables. Only effective when issuing tokens to minions (see note on `cache_time` above).

- `null` (default) only compiles the pillar when no cached pillar is found.
- `false` never compiles the pillar. This means templated policies that contain pillar values are skipped if no cached pillar is found.
- `true` always compiles the pillar. This can cause additional strain on the master since the compilation is costly.

---

**Note:** Hardcoded to `True` when issuing AppRoles.

Using cached pillar data only (`refresh_pillar=False`) might cause the policies to be out of sync. If there is no cached pillar data available for the minion, pillar templates will fail to render at all.

If you use pillar values for templating policies and do not disable refreshing pillar data, make sure the relevant values are not sourced from Vault (`ext_pillar`, `sdb`) or from a pillar `sls` file that uses the `vault execution/sdb` module. Although this will often work when cached pillar data is available, if the master needs to compile the pillar data during policy rendering, all Vault modules will be broken to prevent an infinite loop.

---

## server

Changed in version 3007.0: The values found in here were found in the `vault` root namespace previously.

Configures Vault server details.

### url

URL of your Vault installation. Required.

### verify

Configures certificate verification behavior when issuing requests to the Vault server. If unset, requests will use the CA certificates bundled with `certifi`.

For details, please see [the requests documentation](#).

New in version 2018.3.0.

Changed in version 3007.0: Minions again respect the master configuration value, which was changed implicitly in v3001. If this value is set in the minion configuration as well, it will take precedence.

In addition, this value can now be set to a PEM-encoded CA certificate to use as the sole trust anchor for certificate chain verification.

### namespace

Optional Vault namespace. Used with Vault Enterprise.

For details please see: <https://www.vaultproject.io/docs/enterprise/namespaces>

New in version 3004.

Minion configuration (optional):

## config\_location

Where to get the connection details for calling vault. By default, vault will try to determine if it needs to request the connection details from the master or from the local config. This optional option will force vault to use the connection details from the master or the local config. Can only be either `master` or `local`.

New in version 3006.0.

## issue\_params

Request overrides for token/AppRole issuance. This needs to be allowed on the master by setting `issue:allow_minion_override_params` to true. See the master configuration `issue:token:params` or `issue:approle:params` for reference.

Changed in version 3007.0: For token issuance, this used to be found in `auth:ttl` and `auth:uses`. Mind that the parameter names have been synchronized with Vault, see notes above (TLDR: `ttl => explicit_max_ttl`, `uses => num_uses`).

---

**Note:** `auth:token_lifecycle` and `server:verify` can be set on the minion as well.

---

`salt.modules.vault.clear_cache` (*connection=True, session=False*)

New in version 3007.0.

Delete Vault caches. Will ensure the current token and associated leases are revoked by default.

The cache is organized in a hierarchy: `/vault/connection/session/leases`. (*italics* mark data that is only cached when receiving configuration from a master)

`connection` contains KV metadata (by default), *configuration* and (*AppRole*) *auth credentials*. `session` contains the currently active token. `leases` contains leases issued to the currently active token like database credentials.

CLI Example:

```
salt '*' vault.clear_cache
salt '*' vault.clear_cache session=True
```

#### **connection**

Only clear the cached data scoped to a connection. This includes configuration, auth credentials, the currently active auth token as well as leases and KV metadata (by default). Defaults to true. Set this to false to clear all Vault caches.

#### **session**

Only clear the cached data scoped to a session. This only includes leases and the currently active auth token, but not configuration or (AppRole) auth credentials. Defaults to false. Setting this to true will keep the connection cache, regardless of `connection`.

### `salt.modules.vault.clear_token_cache()`

Changed in version 3001.

Changed in version 3007.0: This is now an alias for `vault.clear_cache` with `connection=True`.

Delete minion Vault token cache.

CLI Example:

```
salt '*' vault.clear_token_cache
```

### `salt.modules.vault.delete_secret(path, *args)`

Delete secret at `<path>`. The vault policy used must allow this. If `<path>` is on KV v2, the secret will be soft-deleted.

CLI Example:

```
salt '*' vault.delete_secret "secret/my/secret"
salt '*' vault.delete_secret "secret/my/secret" 1 2 3
```

Required policy:

```
path "<mount>/<secret>" {
    capabilities = ["delete"]
}

# or KV v2
path "<mount>/data/<secret>" {
    capabilities = ["delete"]
}

# KV v2 versions
path "<mount>/delete/<secret>" {
    capabilities = ["update"]
}
```

**path**

The path to the secret, including mount.

New in version 3007.0: For KV v2, you can specify versions to soft-delete as supplemental positional arguments.

`salt.modules.vault.destroy_secret(path, *args)`

New in version 3001.

Destroy specified secret versions <path>. The vault policy used must allow this. Only supported on Vault KV version 2.

CLI Example:

```
salt '*' vault.destroy_secret "secret/my/secret" 1 2
```

Required policy:

```
path "<mount>/destroy/<secret>" {
  capabilities = ["update"]
}
```

**path**

The path to the secret, including mount.

You can specify versions to destroy as supplemental positional arguments. At least one is required.

`salt.modules.vault.get_server_config()`

New in version 3007.0.

Return the server connection configuration that's currently in use by Salt. Contains url, verify and namespace.

CLI Example:

```
salt '*' vault.get_server_config
```

`salt.modules.vault.list_secrets(path, default=<Constant.NOT_SET>, keys_only=False)`

List secret keys at <path>. The vault policy used must allow this. The path should end with a trailing slash.

Changed in version 3001: The default argument has been added. When the path or path/key combination is not found, an exception will be raised, unless a default is provided.

CLI Example:

```
salt '*' vault.list_secrets "secret/my/"
```

Required policy:

```
path "<mount>/<path>" {
  capabilities = ["list"]
}

# or KV v2
path "<mount>/metadata/<path>" {
  capabilities = ["list"]
}
```

**path**

The path to the secret, including mount.

**default**

New in version 3001.

When the path is not found, an exception will be raised, unless a default is provided here.

**keys\_only**

New in version 3007.0.

This function used to return a dictionary like `{"keys": ["some/", "some/key"]}`. Setting this to True will only return the list of keys. For backwards-compatibility reasons, this defaults to False.

`salt.modules.vault.patch_secret(path, **kwargs)`

Patch secret dataset at <path>. Fields are specified as arbitrary keyword arguments.

---

**Note:** This works even for older Vault versions, KV v1 and with missing `patch` capability, but will use more than one request to simulate the functionality by issuing a read and update request.

For proper, single-request patching, requires versions of KV v2 that support the `patch` capability and the `patch` capability to be available for the path.

---

---

**Note:** This uses JSON Merge Patch format internally. Keys set to `null` (JSON/YAML)/None (Python) will be deleted.

---

CLI Example:

```
salt '*' vault.patch_secret "secret/my/secret" password="baz"
```

Required policy:

```
# Proper patching
path "<mount>/data/<secret>" {
    capabilities = ["patch"]
}

# OR (!), for older KV v2 setups:
path "<mount>/data/<secret>" {
    capabilities = ["read", "update"]
}

# OR (!), for KV v1 setups:
path "<mount>/<secret>" {
    capabilities = ["read", "update"]
}
```

**path**

The path to the secret, including mount.

`salt.modules.vault.policies_list()`

New in version 3007.0.

List all ACL policies.

CLI Example:

```
salt '*' vault.policies_list
```

Required policy:

```
path "sys/policy" {  
    capabilities = ["read"]  
}
```

`salt.modules.vault.policy_delete`(*policy*)

New in version 3007.0.

Delete an ACL policy. Returns False if the policy did not exist.

CLI Example:

```
salt '*' vault.policy_delete salt_minion
```

Required policy:

```
path "sys/policy/<policy>" {  
    capabilities = ["delete"]  
}
```

**policy**

The name of the policy to delete.

`salt.modules.vault.policy_fetch`(*policy*)

New in version 3007.0.

Fetch the rules associated with an ACL policy. Returns None if the policy does not exist.

CLI Example:

```
salt '*' vault.policy_fetch salt_minion
```

Required policy:

```
path "sys/policy/<policy>" {  
    capabilities = ["read"]  
}
```

**policy**

The name of the policy to fetch.

`salt.modules.vault.policy_write`(*policy*, *rules*)

New in version 3007.0.

Create or update an ACL policy.

CLI Example:

```
salt '*' vault.policy_write salt_minion 'path "secret/foo" {...}'
```

Required policy:

```
path "sys/policy/<policy>" {  
    capabilities = ["create", "update"]  
}
```

**policy**

The name of the policy to create/update.

**rules**

Rules to write, formatted as in-line HCL.

`salt.modules.vault.query` (*method*, *endpoint*, *payload=None*)

New in version 3007.0.

Issue arbitrary queries against the Vault API.

CLI Example:

```
salt '*' vault.query GET auth/token/lookup-self
```

Required policy: Depends on the query.

You can ask the vault CLI to output the necessary policy:

```
vault read -output-policy auth/token/lookup-self
```

**method**

HTTP method to use.

**endpoint**

Vault API endpoint to issue the request against. Do not include `/v1/`.

**payload**

Optional dictionary to use as JSON payload.

`salt.modules.vault.read_secret` (*path*, *key=None*, *metadata=False*, *default=<Constant.NOT\_SET>*)

Return the value of `<key>` at `<path>` in vault, or entire secret.

Changed in version 3001: The `default` argument has been added. When the path or path/key combination is not found, an exception will be raised, unless a default is provided.

CLI Example:

```
salt '*' vault.read_secret salt/kv/secret
```

Required policy:

```
path "<mount>/<secret>" {
  capabilities = ["read"]
}

# or KV v2
path "<mount>/data/<secret>" {
  capabilities = ["read"]
}
```

**path**

The path to the secret, including mount.

**key**

The data field at `<path>` to read. If unspecified, returns the whole dataset.

**metadata**

New in version 3001.

If using KV v2 backend, display full results, including metadata. Defaults to False.

**default**

New in version 3001.

When the path or path/key combination is not found, an exception will be raised, unless a default is provided here.

`salt.modules.vault.update_config(keep_session=False)`

New in version 3007.0.

Attempt to update the cached configuration without clearing the currently active Vault session.

CLI Example:

```
salt '*' vault.update_config
```

**keep\_session**

Only update configuration that can be updated without creating a new login session. If this is false, still tries to keep the active session, but might clear it if the server configuration has changed significantly. Defaults to False.

`salt.modules.vault.write_raw(path, raw)`

Set raw data at <path>. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.write_raw "secret/my/secret" '{"user":"foo","password":  
→"bar"}'
```

Required policy: see write\_secret

**path**

The path to the secret, including mount.

**raw**

Secret data to write to <path>. Has to be a mapping.

`salt.modules.vault.write_secret(path, **kwargs)`

Set secret dataset at <path>. The vault policy used must allow this. Fields are specified as arbitrary keyword arguments.

CLI Example:

```
salt '*' vault.write_secret "secret/my/secret" user="foo" password="bar"
```

Required policy:

```
path "<mount>/<secret>" {  
    capabilities = ["create", "update"]  
}  
  
# or KV v2  
path "<mount>/data/<secret>" {  
    capabilities = ["create", "update"]  
}
```

**path**

The path to the secret, including mount.

## 26.6.470 salt.modules.vbox\_guest

VirtualBox Guest Additions installer

`salt.modules.vbox_guest.additions_install(**kwargs)`

Install VirtualBox Guest Additions. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

See <https://www.virtualbox.org/manual/ch04.html#idp52733088> for more details.

CLI Example:

```
salt '*' vbox_guest.additions_install
salt '*' vbox_guest.additions_install reboot=True
salt '*' vbox_guest.additions_install upgrade_os=True
```

### Parameters

- **reboot** (*bool*) -- reboot computer to complete installation
- **upgrade\_os** (*bool*) -- upgrade OS (to ensure the latests version of kernel and developer tools are installed)

### Returns

version of VirtualBox Guest Additions or string with error

`salt.modules.vbox_guest.additions_mount()`

Mount VirtualBox Guest Additions CD to the temp directory.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

CLI Example:

```
salt '*' vbox_guest.additions_mount
```

### Returns

True or OSError exception

`salt.modules.vbox_guest.additions_remove(**kwargs)`

Remove VirtualBox Guest Additions.

Firstly it tries to uninstall itself by executing '/opt/VBoxGuestAdditions-VERSION/uninstall.run uninstall'. It uses the CD, connected by VirtualBox if it fails.

CLI Example:

```
salt '*' vbox_guest.additions_remove
salt '*' vbox_guest.additions_remove force=True
```

### Parameters

**force** (*bool*) -- force VirtualBox Guest Additions removing

### Returns

True if VirtualBox Guest Additions were removed successfully else False

`salt.modules.vbox_guest.additions_umount(mount_point)`

Unmount VirtualBox Guest Additions CD from the temp directory.

CLI Example:

```
salt '*' vbox_guest.additions_umount
```

**Parameters**

**mount\_point** -- directory VirtualBox Guest Additions is mounted to

**Returns**

True or an string with error

`salt.modules.vbox_guest.additions_version()`

Check VirtualBox Guest Additions version.

CLI Example:

```
salt '*' vbox_guest.additions_version
```

**Returns**

version of VirtualBox Guest Additions or False if they are not installed

`salt.modules.vbox_guest.grant_access_to_shared_folders_to(name, users=None)`

Grant access to auto-mounted shared folders to the users.

User is specified by its name. To grant access for several users use argument *users*. Access will be denied to the users not listed in *users* argument.

See [https://www.virtualbox.org/manual/ch04.html#sf\\_mount\\_auto](https://www.virtualbox.org/manual/ch04.html#sf_mount_auto) for more details.

CLI Example:

```
salt '*' vbox_guest.grant_access_to_shared_folders_to fred
salt '*' vbox_guest.grant_access_to_shared_folders_to users ['fred',
→ 'roman']
```

**Parameters**

- **name** (*str*) -- name of the user to grant access to auto-mounted shared folders to
- **users** (*list of str*) -- list of names of users to grant access to auto-mounted shared folders to (if specified, *name* will not be taken into account)

**Returns**

list of users who have access to auto-mounted shared folders

`salt.modules.vbox_guest.list_shared_folders_users()`

List users who have access to auto-mounted shared folders.

See [https://www.virtualbox.org/manual/ch04.html#sf\\_mount\\_auto](https://www.virtualbox.org/manual/ch04.html#sf_mount_auto) for more details.

CLI Example:

```
salt '*' vbox_guest.list_shared_folders_users
```

**Returns**

list of users who have access to auto-mounted shared folders

## 26.6.471 salt.modules.vboxmanage

Support for VirtualBox using the VBoxManage command

New in version 2016.3.0.

If the `vboxdrv` kernel module is not loaded, this module can automatically load it by configuring `autoload_vboxdrv` in `/etc/salt/minion`:

```
autoload_vboxdrv: True
```

The default for this setting is `False`.

**depends**  
virtualbox

```
salt.modules.vboxmanage.clonemedium(medium, uuid_in=None, file_in=None, uuid_out=None,
file_out=None, mformat=None, variant=None, existing=False,
**kwargs)
```

Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonemedium <name> <new_name>
```

```
salt.modules.vboxmanage.clonevm(name=None, uuid=None, new_name=None, snapshot_uuid=None,
snapshot_name=None, mode='machine', options=None,
basefolder=None, new_uuid=None, register=False, groups=None,
**kwargs)
```

Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonevm <name> <new_name>
```

```
salt.modules.vboxmanage.create(name, groups=None, ostype=None, register=True, basefolder=None,
new_uuid=None, **kwargs)
```

Create a new VM

CLI Example:

```
salt 'hypervisor' vboxmanage.create <name>
```

```
salt.modules.vboxmanage.destroy(name)
```

Unregister and destroy a VM

CLI Example:

```
salt '*' vboxmanage.destroy my_vm
```

```
salt.modules.vboxmanage.list_items(item, details=False, group_by='UUID')
```

Return a list of a specific type of item. The following items are available:

```
vms runningvms otypes hostdvds hostfloppies intnets bridgedifs hostonlyifs natnets dhcpservers
hostinfo hostcpuids hddbackends hdds dvds floppies usbhost usbfilters systemproperties extpacks
groups webcams screenshotformats
```

CLI Example:

```
salt 'hypervisor' vboxmanage.items <item>
salt 'hypervisor' vboxmanage.items <item> details=True
salt 'hypervisor' vboxmanage.items <item> details=True group_by=Name
```

Some items do not display well, or at all, unless `details` is set to `True`. By default, items are grouped by the UUID field, but not all items contain that field. In those cases, another field must be specified.

`salt.modules.vboxmanage.list_nodes()`

Return a list of registered VMs

CLI Example:

```
salt '*' vboxmanage.list_nodes
```

`salt.modules.vboxmanage.list_nodes_full()`

Return a list of registered VMs, with detailed information

CLI Example:

```
salt '*' vboxmanage.list_nodes_full
```

`salt.modules.vboxmanage.list_nodes_min()`

Return a list of registered VMs, with minimal information

CLI Example:

```
salt '*' vboxmanage.list_nodes_min
```

`salt.modules.vboxmanage.list_ostypes()`

List the available OS Types

CLI Example:

```
salt '*' vboxmanage.list_ostypes
```

`salt.modules.vboxmanage.register(filename)`

Register a VM

CLI Example:

```
salt '*' vboxmanage.register my_vm_filename
```

`salt.modules.vboxmanage.start(name)`

Start a VM

CLI Example:

```
salt '*' vboxmanage.start my_vm
```

`salt.modules.vboxmanage.stop(name)`

Stop a VM

CLI Example:

```
salt '*' vboxmanage.stop my_vm
```

`salt.modules.vboxmanage.unregister(name, delete=False)`

Unregister a VM

CLI Example:

```
salt '*' vboxmanage.unregister my_vm_filename
```

`salt.modules.vboxmanage.vboxcmd()`

Return the location of the VBoxManage command

CLI Example:

```
salt '*' vboxmanage.vboxcmd
```

### 26.6.472 salt.modules.vcenter

Module used to access the vcenter proxy connection methods

**Warning:** This module will be deprecated in a future release of Salt. VMware strongly recommends using the [VMware Salt extensions](#) instead of the vCenter module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.

`salt.modules.vcenter.get_details()`

### 26.6.473 salt.modules.victorops

Support for VictorOps

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

```
victorops:
api_key: '280d4699-a817-4719-ba6f-ca56e573e44f'
```

`salt.modules.victorops.create_event(message_type=None, routing_key='everybody', **kwargs)`

Create an event in VictorOps. Designed for use in states.

The following parameters are required:

Parameters

**message\_type** -- One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:

Parameters

- **routing\_key** -- The key for where messages should be routed. By default, sent to 'everyone' route.
- **entity\_id** -- The name of alerting entity. If not provided, a random name will be assigned.
- **timestamp** -- Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.

:param `timestamp_fmt` The date format for the timestamp parameter.

**Parameters**

- **state\_start\_time** -- The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.
- **state\_start\_time\_fmt** -- The date format for the timestamp parameter.
- **state\_message** -- Any additional status information from the alert item.
- **entity\_is\_host** -- Used within VictorOps to select the appropriate display format for the incident.
- **entity\_display\_name** -- Used within VictorOps to display a human-readable name for the entity.
- **ack\_message** -- A user entered comment for the acknowledgment.
- **ack\_author** -- The user that acknowledged the incident.

**Returns**

A dictionary with result, entity\_id, and message if result was failure.

CLI Example:

```
salt myminion victorops.create_event message_type='CRITICAL' routing_key=
↳ 'everyone'                               entity_id='hostname/diskspace'

salt myminion victorops.create_event message_type='ACKNOWLEDGEMENT'
↳ routing_key='everyone'                   entity_id='hostname/diskspace'
↳ ack_message='Acknowledged' ack_author='username'

salt myminion victorops.create_event message_type='RECOVERY' routing_key=
↳ 'everyone'                               entity_id='hostname/diskspace'
```

The following parameters are required:

message\_type

**26.6.474 salt.modules.virt**

Work with virtual machines managed by libvirt

**depends**

- libvirt Python module
- libvirt client
- qemu-img
- grep

**Connection**

The connection to the virtualization host can be either setup in the minion configuration, pillar data or overridden for each individual call.

By default, the libvirt connection URL will be guessed: the first available libvirt hypervisor driver will be used. This can be overridden like this:

```
virt:
  connection:
    uri: lxc:///
```

If the connection requires an authentication like for ESXi, this can be defined in the minion pillar data like this:

```

virt:
  connection:
    uri: esx://10.1.1.101/?no_verify=1&auto_answer=1
    auth:
      username: user
      password: secret

```

### Connecting with SSH protocol

Libvirt can connect to remote hosts using SSH using one of the `ssh`, `libssh` and `libssh2` transports. Note that `libssh2` is likely to fail as it doesn't read the `known_hosts` file. Libvirt may also have been built without `libssh` or `libssh2` support.

To use the SSH transport, on the minion setup an SSH agent with a key authorized on the remote libvirt machine.

### Per call connection setup

New in version 2019.2.0.

All the calls requiring the libvirt connection configuration as mentioned above can override this configuration using `connection`, `username` and `password` parameters.

This means that the following will list the domains on the local LXC libvirt driver, whatever the `virt:connection` is.

```

salt 'hypervisor' virt.list_domains connection=lxc:///

```

The calls not using the libvirt connection setup are:

- `seed_non_shared_migrate`
- `virt_type`
- `is_*hyper`
- all migration functions
- [libvirt ESX URI format](#)
- [libvirt URI format](#)
- [libvirt authentication configuration](#)

## Units

### Units specification

New in version 3002.

The string should contain a number optionally followed by a unit. The number may have a decimal fraction. If the unit is not given then MiB are set by default. Units can optionally be given in IEC style (such as MiB), although the standard single letter style (such as M) is more convenient.

Valid units include:

Standard Unit	IEC Unit	Standard Name	IEC Name	Factor
B		Bytes		1
K	KiB	Kilobytes	Kibibytes	2**10
M	MiB	Megabytes	Mebibytes	2**20
G	GiB	Gigabytes	Gibibytes	2**30
T	TiB	Terabytes	Tebibytes	2**40
P	PiB	Petabytes	Pebibytes	2**50
E	EiB	Exabytes	Exbibytes	2**60
Z	ZiB	Zettabytes	Zebibytes	2**70
Y	YiB	Yottabytes	Yobibytes	2**80

Additional decimal based units:

Unit	Factor
KB	10**3
MB	10**6
GB	10**9
TB	10**12
PB	10**15
EB	10**18
ZB	10**21
YB	10**24

`salt.modules.virt.all_capabilities(**kwargs)`

Return the host and domain capabilities in a single call.

New in version 3001.

#### Parameters

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

CLI Example:

```
salt '*' virt.all_capabilities
```

`salt.modules.virt.capabilities(**kwargs)`

Return the hypervisor connection capabilities.

#### Parameters

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.capabilities
```

`salt.modules.virt.cpu_baseline(full=False, migratable=False, out='libvirt', **kwargs)`

Return the optimal 'custom' CPU baseline config for VM's on this minion

New in version 2016.3.0.

**Parameters**

- **full** -- Return all CPU features rather than the ones on top of the closest CPU model
- **migratable** -- Exclude CPU features that are unmigratable (libvirt 2.13+)
- **out** -- 'libvirt' (default) for usable libvirt XML definition, 'salt' for nice dict
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.cpu_baseline
```

`salt.modules.virt.create_xml_path(path, **kwargs)`

Start a transient domain based on the XML-file path passed to the function

**Parameters**

- **path** -- path to a file containing the libvirt XML definition of the domain
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.create_xml_path <path to XML file on the node>
```

`salt.modules.virt.create_xml_str(xml, **kwargs)`

Start a transient domain based on the XML passed to the function

**Parameters**

- **xml** -- libvirt XML definition of the domain
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.create_xml_str <XML in string format>
```

`salt.modules.virt.ctrl_alt_del(vm_, **kwargs)`

Sends CTRL+ALT+DEL to a VM

**Parameters**

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.ctrl_alt_del <domain>
```

`salt.modules.virt.define_vol_xml_path(path, pool=None, **kwargs)`

Define a volume based on the XML-file path passed to the function

**Parameters**

- **path** -- path to a file containing the libvirt XML definition of the volume
- **pool** -- storage pool name to define the volume in. If defined, this parameter will override the configuration setting.  
New in version 3001.
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_vol_xml_path <path to XML file on the node>
```

`salt.modules.virt.define_vol_xml_str(xml, pool=None, **kwargs)`

Define a volume based on the XML passed to the function

**Parameters**

- **xml** -- libvirt XML definition of the storage volume
- **pool** -- storage pool name to define the volume in. If defined, this parameter will override the configuration setting.  
New in version 3001.
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_vol_xml_str <XML in string format>
```

The storage pool where the disk image will be defined is `default` unless changed with the `pool` parameter or a configuration like this:

```
virt:  
  storagepool: mine
```

`salt.modules.virt.define_xml_path(path, **kwargs)`

Define a persistent domain based on the XML-file path passed to the function

**Parameters**

- **path** -- path to a file containing the libvirt XML definition of the domain
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_xml_path <path to XML file on the node>
```

`salt.modules.virt.define_xml_str(xml, **kwargs)`

Define a persistent domain based on the XML passed to the function

**Parameters**

- **xml** -- libvirt XML definition of the domain
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_xml_str <XML in string format>
```

`salt.modules.virt.delete_snapshots(name, *names, **kwargs)`

Delete one or more snapshots of the given VM.

**Parameters**

- **name** -- domain name
- **names** -- names of the snapshots to remove
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.delete_snapshots <domain> all=True
salt '*' virt.delete_snapshots <domain> <snapshot>
salt '*' virt.delete_snapshots <domain> <snapshot1> <snapshot2> ...
```

`salt.modules.virt.domain_capabilities(emulator=None, arch=None, machine=None, domain=None, **kwargs)`

Return the domain capabilities given an emulator, architecture, machine or virtualization type.

New in version 2019.2.0.

#### Parameters

- **emulator** -- return the capabilities for the given emulator binary
- **arch** -- return the capabilities for the given CPU architecture
- **machine** -- return the capabilities for the given emulated machine type
- **domain** -- return the capabilities for the given virtualization type.
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

The list of the possible emulator, arch, machine and domain can be found in the host capabilities output.

If none of the parameters is provided, the libvirt default one is returned.

CLI Example:

```
salt '*' virt.domain_capabilities arch='x86_64' domain='kvm'
```

`salt.modules.virt.freecpu(**kwargs)`

Return an int representing the number of unallocated cpus on this hypervisor

#### Parameters

- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.freecpu
```

`salt.modules.virt.freemem(**kwargs)`

Return an int representing the amount of memory (in MB) that has not been given to virtual machines on this node

#### Parameters

- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.freemem
```

`salt.modules.virt.full_info(**kwargs)`

Return the node\_info, vm\_info and freemem

#### Parameters

- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.full_info
```

`salt.modules.virt.get_disks(vm_, **kwargs)`

Return the disks of a named vm

**Parameters**

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_disks <domain>
```

`salt.modules.virt.get_graphics(vm_, **kwargs)`

Returns the information on vnc for a given vm

**Parameters**

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_graphics <domain>
```

`salt.modules.virt.get_hypervisor()`

Returns the name of the hypervisor running on this node or None.

Detected hypervisors:

- kvm
- xen
- bhyve

CLI Example:

```
salt '*' virt.get_hypervisor
```

New in version 2019.2.0: the function and the kvm, xen and bhyve hypervisors support

`salt.modules.virt.get_loader(vm_, **kwargs)`

Returns the information on the loader for a given vm

**Parameters**

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

CLI Example:

```
salt '*' virt.get_loader <domain>
```

New in version 2019.2.0.

`salt.modules.virt.get_macs(vm_, **kwargs)`

Return a list off MAC addresses from the named vm

**Parameters**

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_macs <domain>
```

`salt.modules.virt.get_nics(vm_, **kwargs)`

Return info about the network interfaces of a named vm

**Parameters**

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_nics <domain>
```

`salt.modules.virt.get_profiles(hypervisor=None, **kwargs)`

Return the virt profiles for hypervisor.

Currently there are profiles for:

- nic
- disk

**Parameters**

- **hypervisor** -- override the default machine type.
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_profiles
salt '*' virt.get_profiles hypervisor=vmware
```

`salt.modules.virt.get_xml(vm_, **kwargs)`

Returns the XML for a given vm

#### Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_xml <domain>
```

`salt.modules.virt.init(name, cpu, mem, nic='default', interfaces=None, hypervisor=None, start=True, disk='default', disks=None, saltenv='base', seed=True, install=True, pub_key=None, priv_key=None, seed_cmd='seed.apply', graphics=None, os_type=None, arch=None, boot=None, boot_dev=None, numatune=None, hypervisor_features=None, clock=None, serials=None, consoles=None, stop_on_reboot=False, host_devices=None, **kwargs)`

Initialize a new vm

#### Parameters

- **name** -- name of the virtual machine to create
- **cpu** -- Number of virtual CPUs to assign to the virtual machine or a dictionary with detailed information to configure cpu model and topology, numa node tuning, cpu tuning and iotreads allocation. The structure of the dictionary is documented in *cpu parameters definition*.

```
cpu:
  placement: static
  cpuset: 0-11
  current: 5
  maximum: 12
  vcpus:
    0:
      enabled: True
      hotpluggable: False
      order: 1
    1:
      enabled: False
      hotpluggable: True
```

New in version 3003.

- **mem** -- Amount of memory to allocate to the virtual machine in MiB. Since 3002, a dictionary can be used to contain detailed configuration which support memory allocation or tuning. Supported parameters are `boot`, `current`, `max`, `slots`, `hard_limit`, `soft_limit`, `swap_hard_limit`, `min_guarantee`, `hugepages`, `nosharepages`, `locked`, `source`, `access`, `allocation` and `discard`. The structure of the dictionary is documented in [Memory parameter definition](#). Both decimal and binary base are supported. Detail unit specification is documented in [Units specification](#). Please note that the value for `slots` must be an integer.

```
{
  'boot': 1g,
```

(continues on next page)

(continued from previous page)

```

'current': 1g,
'max': 1g,
'slots': 10,
'hard_limit': '1024',
'soft_limit': '512m',
'swap_hard_limit': '1g',
'min_guarantee': '512mib',
'hugepages': [{'nodeset': '0-3,^2', 'size': '1g'}, {
↪ 'nodeset': '2', 'size': '2m'}],
'nosharepages': True,
'locked': True,
'source': 'file',
'access': 'shared',
'allocation': 'immediate',
'discard': True
}

```

Changed in version 3002.

- **nic** -- NIC profile to use (Default: 'default'). The profile interfaces can be customized / extended with the `interfaces` parameter. If set to `None`, no profile will be used.
- **interfaces** -- List of dictionaries providing details on the network interfaces to create. These data are merged with the ones from the `nic` profile. The structure of each dictionary is documented in *Network Interfaces Definitions*.

New in version 2019.2.0.

- **hypervisor** -- the virtual machine type. By default the value will be computed according to the virtual host capabilities.
- **start** -- True to start the virtual machine after having defined it (Default: True)
- **disk** -- Disk profile to use (Default: 'default'). If set to `None`, no profile will be used.
- **disks** -- List of dictionaries providing details on the disk devices to create. These data are merged with the ones from the disk profile. The structure of each dictionary is documented in *Disks Definitions*.

New in version 2019.2.0.

- **saltenv** -- Fileserver environment (Default: 'base'). See *cp module for more details*
- **seed** -- True to seed the disk image. Only used when the `image` parameter is provided. (Default: True)
- **install** -- install salt minion if absent (Default: True)
- **pub\_key** -- public key to seed with (Default: None)
- **priv\_key** -- public key to seed with (Default: None)
- **seed\_cmd** -- Salt command to execute to seed the image. (Default: 'seed.apply')
- **graphics** -- Dictionary providing details on the graphics device to create. (Default: None) See *Graphics Definition* for more details on the possible values.

New in version 2019.2.0.

- **os\_type** -- type of virtualization as found in the `//os/type` element of the `libvirt` definition. The default value is taken from the host capabilities, with a preference for `hvm`.

New in version 2019.2.0.

- **arch** -- architecture of the virtual machine. The default value is taken from the host capabilities, but `x86_64` is preferred over `i686`.

New in version 2019.2.0.

- **config** -- minion configuration to use when seeding. See [seed module for more details](#)
- **boot\_dev** -- String of space-separated devices to boot from (Default: `'hd'`)
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

- **stop\_on\_reboot** -- If set to `True` the guest will stop instead of rebooting. This is specially useful when creating a virtual machine with an installation cdrom or an autoinstallation needing a special first boot configuration. Defaults to `False`

New in version 3003.

- **boot** -- Specifies kernel, initial ramdisk and kernel command line parameters for the virtual machine. This is an optional parameter, all of the keys are optional within the dictionary. The structure of the dictionary is documented in [Boot parameters definition](#). If a remote path is provided to `kernel` or `initrd`, salt will handle the downloading of the specified remote file and modify the XML accordingly. To boot VM with UEFI, specify `loader` and `nvrampath` or specify `'efi': True` if your libvirtd version is `>= 5.2.0` and QEMU `>= 3.0.0`.

New in version 3000.

```
{
  'kernel': '/root/f8-i386-vmlinuz',
  'initrd': '/root/f8-i386-initrd',
  'cmdline': 'console=ttyS0 ks=http://example.com/f8-
↪i386/os/',
  'loader': '/usr/share/OVMF/OVMF_CODE.fd',
  'nvrampath': '/usr/share/OVMF/OVMF_VARS.ms.fd'
}
```

- **boot\_dev** -- Space separated list of devices to boot from sorted by decreasing priority. Values can be `hd`, `fd`, `cdrom` or `network`.

By default, the value will `"hd"`.

- **numatune** -- The optional `numatune` element provides details of how to tune the performance of a NUMA host via controlling NUMA policy for domain process. The optional `memory` element specifies how to allocate memory for the domain process on a NUMA host. `memnode` elements can specify memory allocation policies per each guest NUMA node. The definition used in the dictionary can be found at [cpu parameters definition](#).

New in version 3003.

```
{
  'memory': {'mode': 'strict', 'nodeset': '0-11'},
  'memnodes': {0: {'mode': 'strict', 'nodeset': 1}, 1:
↪{'mode': 'preferred', 'nodeset': 2}}
}
```

- **hypervisor\_features** -- Enable or disable hypervisor-specific features on the virtual machine.

New in version 3003.

```
hypervisor_features:
  kvm-hint-dedicated: True
```

- **clock** -- Configure the guest clock. The value is a dictionary with the following keys:

**adjustment**

time adjustment in seconds or `reset`

**utc**

set to `False` to use the host local time as the guest clock. Defaults to `True`.

**timezone**

synchronize the guest to the corresponding timezone

**timers**

a dictionary associating the timer name with its configuration. This configuration is a dictionary with the properties `track`, `tickpolicy`, `catchup`, `frequency`, `mode`, `present`, `slew`, `threshold` and `limit`. See [libvirt time keeping documentation](#) for the possible values.

New in version 3003.

Set the clock to local time using an offset in seconds .. code-block:: yaml

```
clock:
  adjustment: 3600 utc: False
```

Set the clock to a specific time zone:

```
clock:
  timezone: CEST
```

Tweak guest timers:

```
clock:
  timers:
    tsc:
      frequency: 3504000000
      mode: native
    rtc:
      track: wall
      tickpolicy: catchup
      slew: 4636
      threshold: 123
      limit: 2342
    hpet:
      present: False
```

- **serials** -- Dictionary providing details on the serials connection to create. (Default: None) See [Serials and Consoles Definitions](#) for more details on the possible values.

New in version 3003.

- **consoles** -- Dictionary providing details on the consoles device to create. (Default: None) See [Serials and Consoles Definitions](#) for more details on the possible values.

New in version 3003.

- **host\_devices** -- List of host devices to passthrough to the guest. The value is a list of device names as provided by the [node\\_devices\(\)](#) function. (Default: None)

New in version 3003.

### cpu parameters definition

The `cpu` parameters dictionary can contain the following properties:

#### **cpuset**

a comma-separated list of physical CPU numbers that domain process and virtual CPUs can be pinned to by default. eg. `1-4,^3` `cpuset 3` is excluded.

#### **current**

the number of virtual cpus available at startup

#### **placement**

indicate the CPU placement mode for domain process. the value can be either `static` or `auto`

#### **vcpus**

specify the state of individual `vcpu`. Possible attribute for each individual `vcpu` include: `id`, `enabled`, `hotpluggable` and `order`. Valid `ids` are from 0 to the maximum vCPU count minus 1. `enabled` takes boolean values which controls the state of the `vcpu`. `hotpluggable` take boolean value which controls whether given vCPU can be hotplugged and hotunplugged. `order` takes an integer value which specifies the order to add the online vCPUs.

#### **match**

The `cpu` attribute `match` attribute specifies how strictly the virtual CPU provided to the guest matches the CPU requirements, possible values are `minimum`, `exact` or `strict`.

#### **check**

Optional `cpu` attribute `check` attribute can be used to request a specific way of checking whether the virtual CPU matches the specification, possible values are `none`, `partial` and `full`.

#### **mode**

Optional `cpu` attribute `mode` attribute may be used to make it easier to configure a guest CPU to be as close to host CPU as possible, possible values are `custom`, `host-model` and `host-passthrough`.

#### **model**

specifies CPU model requested by the guest. An optional `fallback` attribute can be used to forbid libvirt falls back to the closest model supported by the hypervisor, possible values are `allow` or `forbid`. `vendor_id` attribute can be used to set the vendor id seen by the guest, the length must be exactly 12 characters long.

#### **vendor**

specifies CPU vendor requested by the guest.

#### **topology**

specifies requested topology of virtual CPU provided to the guest. Four possible attributes, `sockets`, `dies`, `cores`, and `threads`, accept non-zero positive integer values. They refer to the number of CPU sockets per NUMA node, number of dies per socket, number of cores per die, and number of threads per core, respectively.

#### **features**

A dictionary contains a set of `cpu` features to fine-tune features provided by the selected CPU model. Use `cpu feature name` as the key and the `policy` as the value. `policy` Attribute takes `force`, `require`, `optional`, `disable` or `forbid`.

#### **cache**

describes the virtual CPU cache. Optional attribute `level` takes an integer value which describes cache level `mode` attribute supported three possible values: `emulate`, `passthrough`, `disable`

#### **numa**

specify the guest numa topology. `cell` element specifies a NUMA cell or a NUMA node, `cpus` specifies the CPU or range of CPUs that are part of the node, `memory` specifies the size of the node memory. All cells should have `id` attribute in case referring to some cell is necessary in the code. optional attribute `memAccess` control whether the memory is to be mapped as `shared` or `private`, `discard` attribute which fine tunes the discard feature for given numa node, possible values are `True` or `False`. `distances` element define the distance between NUMA cells and `sibling` sub-element is used to specify the distance value between sibling NUMA cells.

**vcupin**

The optional `vcupin` element specifies which of host's physical CPUs the domain vCPU will be pinned to.

**emulatorpin**

The optional `emulatorpin` element specifies which of host physical CPUs the "emulator", a subset of a domain not including vCPU or iothreads will be pinned to.

**iothreadpin**

The optional `iothreadpin` element specifies which of host physical CPUs the IOThreads will be pinned to.

**shares**

The optional `shares` element specifies the proportional weighted share for the domain.

**period**

The optional `period` element specifies the enforcement interval (unit: microseconds).

**quota**

The optional `quota` element specifies the maximum allowed bandwidth (unit: microseconds).

**global\_period**

The optional `global_period` element specifies the enforcement CFS scheduler interval (unit: microseconds) for the whole domain in contrast with `period` which enforces the interval per vCPU.

**global\_quota**

The optional `global_quota` element specifies the maximum allowed bandwidth (unit: microseconds) within a period for the whole domain.

**emulator\_period**

The optional `emulator_period` element specifies the enforcement interval (unit: microseconds).

**emulator\_quota**

The optional `emulator_quota` element specifies the maximum allowed bandwidth (unit: microseconds) for domain's emulator threads (those excluding vCPUs).

**iothread\_period**

The optional `iothread_period` element specifies the enforcement interval (unit: microseconds) for IOThreads.

**iothread\_quota**

The optional `iothread_quota` element specifies the maximum allowed bandwidth (unit: microseconds) for IOThreads.

**vcpusched**

specify the scheduler type for vCPUs. The value is a list of dictionaries with the `scheduler` key (values `batch`, `idle`, `fifo`, `rr`) and the optional `priority` and `vcpus` keys. The `priority` value usually is a positive integer and the `vcpus` value is a cpu set like `1-4`, `^3,6` or simply the vcpu id.

**iothreadsched**

specify the scheduler type for IO threads. The value is a list of dictionaries with the `scheduler` key (values `batch`, `idle`, `fifo`, `rr`) and the optional `priority` and `vcpus` keys. The `priority` value usually is a positive integer and the `vcpus` value is a cpu set like `1-4`, `^3,6` or simply the vcpu id.

**emulatorsched**

specify the scheduler type (values `batch`, `idle`, `fifo`, `rr`) for particular the emulator. The value is a dictionary with the `scheduler` key (values `batch`, `idle`, `fifo`, `rr`) and the optional `priority` and `vcpus` keys. The `priority` value usually is a positive integer.

**cachetune**

Optional `cachetune` element can control allocations for CPU caches using the `resctrl` on the host.

**monitor**

The optional element `monitor` creates the cache monitor(s) for current cache allocation.

**memorytune**

Optional `memorytune` element can control allocations for memory bandwidth using the `resctrl` on the host.

**iothreads**

Number of threads for supported disk devices to perform I/O requests. `iothread id` will be numbered from 1 to the provided number (Default: None).

### Boot parameters definition

The boot parameters dictionary can contains the following properties:

**kernel**

The URL or path to the kernel to run the virtual machine with.

**initrd**

The URL or path to the initrd file to run the virtual machine with.

**cmdline**

The parameters to pass to the kernel provided in the *kernel* property.

**loader**

The path to the UEFI binary loader to use.

New in version 3001.

**nvramp**

The path to the UEFI data template. The file will be copied when creating the virtual machine.

New in version 3001.

**efi**

A boolean value.

New in version 3001.

### Memory parameter definition

Memory parameter can contain the following properties:

**boot**

The maximum allocation of memory for the guest at boot time

**current**

The actual allocation of memory for the guest

**max**

The run time maximum memory allocation of the guest

**slots**

specifies the number of slots available for adding memory to the guest

**hard\_limit**

the maximum memory the guest can use

**soft\_limit**

memory limit to enforce during memory contention

**swap\_hard\_limit**

the maximum memory plus swap the guest can use

**min\_guarantee**

the guaranteed minimum memory allocation for the guest

**hugepages**

memory allocated using hugepages instead of the normal native page size. It takes a list of dictionaries with `nodeset` and `size` keys. For example `"hugepages": [{"nodeset": "1-4,^3", "size": "2m"}, {"nodeset": "3", "size": "1g"}]`.

**nosharepages**

boolean value to instruct hypervisor to disable shared pages (memory merge, KSM) for this domain

**locked**

boolean value that allows memory pages belonging to the domain will be locked in host's memory and the host will not be allowed to swap them out, which might be required for some workloads such as real-time.

**source**

possible values are `file` which utilizes file memorybacking, `anonymous` by default and `memfd` backing. (QEMU/KVM only)

**access**

specify if the memory is to be shared or private. This can be overridden per numa node by memAccess.

**allocation**

specify when to allocate the memory by supplying either immediate or ondemand.

**discard**

boolean value to ensure the memory content is discarded just before guest shuts down (or when DIMM module is unplugged). Please note that this is just an optimization and is not guaranteed to work in all cases (e.g. when hypervisor crashes). (QEMU/KVM only)

## Network Interfaces Definitions

Network interfaces dictionaries can contain the following properties:

**name**

Name of the network interface. This is only used as a key to merge with the profile data

**type**

Network type. One of 'bridge', 'network'

**source**

The network source, typically the bridge or network name

**mac**

The desired mac address, computed if None (Default: None).

**model**

The network card model (Default: depends on the hypervisor)

## Disks Definitions

Disk dictionaries can contain the following properties:

**name**

Name of the disk. This is mostly used in the name of the disk image and as a key to merge with the profile data.

**format**

Format of the disk image, like 'qcow2', 'raw', 'vmdk'. (Default: depends on the hypervisor)

**size**

Disk size in MiB

**pool**

Path to the folder or name of the pool where disks should be created. (Default: depends on hypervisor and the virt:storagepool configuration)

Changed in version 3001.

If the value contains no '/', it is considered a pool name where to create a volume. Using volumes will be mandatory for some pools types like rdb, iscsi, etc.

**model**

One of the disk busses allowed by libvirt (Default: depends on hypervisor)

See the libvirt [disk element](#) documentation for the allowed bus types.

**image**

Path to the image to use for the disk. If no image is provided, an empty disk will be created (Default: None)

Note that some pool types do not support uploading an image. This list can evolve with libvirt versions.

**overlay\_image**

True to create a QCOW2 disk image with image as backing file. If False the file pointed to by the image property will simply be copied. (Default: False)

Changed in version 3001.

This property is only valid on path-based disks, not on volumes. To create a volume with a backing store, set the `backing_store_path` and `backing_store_format` properties.

#### **backing\_store\_path**

Path to the backing store image to use. This can also be the name of a volume to use as backing store within the same pool.

New in version 3001.

#### **backing\_store\_format**

Image format of the disk or volume to use as backing store. This property is mandatory when using `backing_store_path` to avoid [problems](#)

New in version 3001.

#### **source\_file**

Absolute path to the disk image to use. Not to be confused with `image` parameter. This parameter is useful to use disk images that are created outside of this module. Can also be `None` for devices that have no associated image like cdroms.

Changed in version 3001.

For volume disks, this can be the name of a volume already existing in the storage pool.

#### **device**

Type of device of the disk. Can be one of 'disk', 'cdrom', 'floppy' or 'lun'. (Default: 'disk')

#### **hostname\_property**

When using ZFS volumes, setting this value to a ZFS property ID will make Salt store the name of the virtual machine inside this property. (Default: `None`)

#### **sparse\_volume**

Boolean to specify whether to use a thin provisioned ZFS volume.

Example profile for a bhyve VM with two ZFS disks. The first is cloned from the specified image. The second disk is a thin provisioned volume.

```
virt:
  disk:
    two_zvols:
      - system:
          image: zroot/bhyve/CentOS-7-x86_64-v1@v1.0.5
          hostname_property: virt:hostname
          pool: zroot/bhyve/guests
      - data:
          pool: tank/disks
          size: 20G
          hostname_property: virt:hostname
          sparse_volume: True
```

#### **io**

I/O control policy. String value amongst `native`, `threads` and `io_uring`. (Default: `native`)

New in version 3003.

#### **iothread\_id**

I/O thread id to assign the disk to. (Default: `none assigned`)

New in version 3003.

## Graphics Definition

The graphics dictionary can have the following properties:

### type

Graphics type. The possible values are `none`, `'spice'`, `'vnc'` and other values allowed as a libvirt graphics type (Default: `None`)

See the libvirt [graphics element](#) documentation for more details on the possible types.

### port

Port to export the graphics on for `vnc`, `spice` and `rdp` types.

### tls\_port

Port to export the graphics over a secured connection for `spice` type.

### listen

Dictionary defining on what address to listen on for `vnc`, `spice` and `rdp`. It has a `type` property with `address` and `None` as possible values, and an `address` property holding the IP or hostname to listen on.

By default, not setting the `listen` part of the dictionary will default to listen on all addresses.

## Serials and Consoles Definitions

Serial dictionaries can contain the following properties:

### type

Type of the serial connection, like `'tcp'`, `'pty'`, `'file'`, `'udp'`, `'dev'`, `'pipe'`, `'unix'`.

### path

Path to the source device. Can be a log file, a host character device to pass through, a unix socket, a named pipe path.

### host

The serial UDP or TCP host name. (Default: `23023`)

### port

The serial UDP or TCP port number. (Default: `23023`)

### protocol

Name of the TCP connection protocol. (Default: `telnet`)

### tls

Boolean value indicating whether to use hypervisor TLS certificates environment for TCP devices.

### target\_port

The guest device port number starting from 0

### target\_type

The guest device type. Common values are `serial`, `virtio` or `usb-serial`, but more are documented in [the libvirt documentation](#).

## CLI Example

```
salt 'hypervisor' virt.init vm_name 4 512 salt://path/to/image.raw
salt 'hypervisor' virt.init vm_name 4 512 /var/lib/libvirt/images/img.raw
salt 'hypervisor' virt.init vm_name 4 512 nic=profile disk=profile
```

The disk images will be created in an image folder within the directory defined by the `virt:images` option. Its default value is `/srv/salt-images/` but this can be changed with such a configuration:

```
virt:
  images: /data/my/vm/images/
```

`salt.modules.virt.is_hyper()`

Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:

```
salt '*' virt.is_hyper
```

`salt.modules.virt.list_active_vms(**kwargs)`

Return a list of names for active virtual machine on the minion

Parameters

- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_active_vms
```

`salt.modules.virt.list_domains(**kwargs)`

Return a list of available domains.

Parameters

- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_domains
```

`salt.modules.virt.list_inactive_vms(**kwargs)`

Return a list of names for inactive virtual machine on the minion

Parameters

- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_inactive_vms
```

`salt.modules.virt.list_networks(**kwargs)`

List all virtual networks.

Parameters

- **connection** -- libvirt connection URI, overriding defaults

- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_networks
```

`salt.modules.virt.list_pools(**kwargs)`

List all storage pools.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_pools
```

`salt.modules.virt.list_snapshots(domain=None, **kwargs)`

List available snapshots for certain vm or for all.

Parameters

- **domain** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.list_snapshots
salt '*' virt.list_snapshots <domain>
```

`salt.modules.virt.migrate(vm_, target, **kwargs)`

Shared storage migration

Parameters

- **vm** -- domain name
- **target** -- target libvirt URI or host name
- **kwargs** --
  - **live**: Use live migration. Default value is True.
  - **persistent**: Leave the domain persistent on destination host. Default value is True.
  - **undefinesource**: Undefine the domain on the source host. Default value is True.
  - **offline**: If set to True it will migrate the domain definition without starting the domain on destination and without stopping it on source host. Default value is False.
  - **max\_bandwidth**: The maximum bandwidth (in MiB/s) that will be used.

- **max\_downtime**: Set maximum tolerable downtime for live-migration. The value represents a number of milliseconds the guest is allowed to be down at the end of live migration.
  - **parallel\_connections**: Specify a number of parallel network connections to be used to send memory pages to the destination host.
  - **compressed**: Activate compression.
  - **comp\_methods**: A comma-separated list of compression methods. Supported methods are "mt" and "xbzrle" and can be used in any combination. QEMU defaults to "xbzrle".
  - **comp\_mt\_level**: Set compression level. Values are in range from 0 to 9, where 1 is maximum speed and 9 is maximum compression.
  - **comp\_mt\_threads**: Set number of compress threads on source host.
  - **comp\_mt\_dthreads**: Set number of decompress threads on target host.
  - **comp\_xbzrle\_cache**: Set the size of page cache for xbzrle compression in bytes.
  - **copy\_storage**: Migrate non-shared storage. It must be one of the following values: all (full disk copy) or incremental (Incremental copy)
  - **postcopy**: Enable the use of post-copy migration.
  - **postcopy\_bandwidth**: The maximum bandwidth allowed in post-copy phase. (MiB/s)
  - **username**: Username to connect with target host
  - **password**: Password to connect with target host
- New in version 3002.

CLI Example:

```
salt '*' virt.migrate <domain> <target hypervisor URI>
salt src virt.migrate guest qemu+ssh://dst/system
salt src virt.migrate guest qemu+tls://dst/system
salt src virt.migrate guest qemu+tcp://dst/system
```

A tunnel data migration can be performed by setting this in the configuration:

```
virt:
  tunnel: True
```

For more details on tunnelled data migrations, report to <https://libvirt.org/migration.html#transporttunnel>

`salt.modules.virt.migrate_start_postcopy` (*vm\_*)

Starts post-copy migration. This function has to be called while live migration is in progress and it has been initiated with the *postcopy=True* option.

CLI Example:

```
salt '*' virt.migrate_start_postcopy <domain>
```

`salt.modules.virt.nesthash` (*value=None*)

create default dict that allows arbitrary level of nesting

`salt.modules.virt.network_define` (*name, bridge, forward, ipv4\_config=None, ipv6\_config=None, vport=None, tag=None, autostart=True, start=True, mtu=None, domain=None, nat=None, interfaces=None, addresses=None, physical\_function=None, dns=None, \*\*kwargs*)

Create libvirt network.

Parameters

- **name** -- Network name.

- **bridge** -- Bridge name.
- **forward** -- Forward mode (bridge, router, nat).

Changed in version 3003: a `None` value creates an isolated network with no forwarding at all

- **vport** -- Virtualport type. The value can also be a dictionary with `type` and `parameters` keys. The `parameters` value is a dictionary of virtual port parameters.

```
- vport:
  type: openvswitch
  parameters:
    interfaceid: 09b11c53-8b5c-4eeb-8f00-d84eaa0aaa4f
```

Changed in version 3003: possible dictionary value

- **tag** -- Vlan tag. The value can also be a dictionary with the `tags` and optional `trunk` keys. `trunk` is a boolean value indicating whether to use VLAN trunking. `tags` is a list of dictionaries with keys `id` and `nativeMode`. The `nativeMode` value can be one of `tagged` or `untagged`.

```
- tag:
  trunk: True
  tags:
    - id: 42
      nativeMode: untagged
    - id: 47
```

Changed in version 3003: possible dictionary value

- **autostart** -- Network autostart (default `True`).
- **start** -- Network start (default `True`).
- **ipv4\_config** (*dict or None*) -- IP v4 configuration. Dictionary describing the IP v4 setup like IP range and a possible DHCP configuration. The structure is documented in *net-define-ip*.

New in version 3000.

- **ipv6\_config** (*dict or None*) -- IP v6 configuration. Dictionary describing the IP v6 setup like IP range and a possible DHCP configuration. The structure is documented in *net-define-ip*.

New in version 3000.

- **connection** -- libvirt connection URI, overriding defaults.
- **username** -- username to connect with, overriding defaults.
- **password** -- password to connect with, overriding defaults.
- **mtu** -- size of the Maximum Transmission Unit (MTU) of the network. (default `None`)

New in version 3003.

- **domain** -- DNS domain name of the DHCP server. The value is a dictionary with a mandatory `name` property and an optional `localOnly` boolean one. (default `None`)

```
- domain:
  name: lab.acme.org
  localOnly: True
```

New in version 3003.

- **nat** -- addresses and ports to route in NAT forward mode. The value is a dictionary with optional keys `address` and `port`. Both values are a dictionary with `start` and `end` values. (default `None`)

```
- forward: nat
- nat:
  address:
    start: 1.2.3.4
    end: 1.2.3.10
  port:
    start: 500
    end: 1000
```

New in version 3003.

- **interfaces** -- whitespace separated list of network interfaces devices that can be used for this network. (default None)

```
- forward: passthrough
- interfaces: "eth10 eth11 eth12"
```

New in version 3003.

- **addresses** -- whitespace separated list of addresses of PCI devices that can be used for this network in *hostdev* forward mode. (default None)

```
- forward: hostdev
- interfaces: "0000:04:00.1 0000:e3:01.2"
```

New in version 3003.

- **physical\_function** -- device name of the physical interface to use in *hostdev* forward mode. (default None)

```
- forward: hostdev
- physical_function: "eth0"
```

New in version 3003.

- **dns** -- virtual network DNS configuration. The value is a dictionary described in *net-define-dns*. (default None)

```
- dns:
  forwarders:
    - domain: example.com
      addr: 192.168.1.1
    - addr: 8.8.8.8
      domain: www.example.com
  txt:
    example.com: "v=spf1 a -all"
    _http.tcp.example.com: "name=value,paper=A4"
  hosts:
    192.168.1.2:
      - mirror.acme.lab
      - test.acme.lab
  srvs:
    - name: ldap
      protocol: tcp
      domain: ldapserver.example.com
      target: .
      port: 389
```

(continues on next page)

(continued from previous page)

```
priority: 1
weight: 10
```

New in version 3003.

### IP configuration definition

Both the IPv4 and IPv6 configuration dictionaries can contain the following properties:

#### cidr

CIDR notation for the network. For example '192.168.124.0/24'

#### dhcp\_ranges

A list of dictionaries with 'start' and 'end' properties.

#### hosts

A list of dictionaries with `ip` property and optional `name`, `mac` and `id` properties.

New in version 3003.

#### bootp

A dictionary with a `file` property and an optional `server` one.

New in version 3003.

#### tftp

The path to the TFTP root directory to serve.

New in version 3003.

### DNS configuration definition

The DNS configuration dictionary contains the following optional properties:

#### forwarders

List of alternate DNS forwarders to use. Each item is a dictionary with the optional `domain` and `addr` keys. If both are provided, the requests to the domain are forwarded to the server at the `addr`. If only `domain` is provided the requests matching this domain will be resolved locally. If only `addr` is provided all requests will be forwarded to this DNS server.

#### txt:

Dictionary of TXT fields to set.

#### hosts:

Dictionary of host DNS entries. The key is the IP of the host, and the value is a list of hostnames for it.

#### srvs:

List of SRV DNS entries. Each entry is a dictionary with the mandatory `name` and `protocol` keys. Entries can also have `target`, `port`, `priority`, `domain` and `weight` optional properties.

CLI Example:

```
salt '*' virt.network_define network main bridge openvswitch
```

New in version 2019.2.0.

`salt.modules.virt.network_get_xml`(*name*, *\*\*kwargs*)

Return the XML definition of a virtual network

#### Parameters

- **name** -- libvirt network name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt '*' virt.network_get_xml default
```

`salt.modules.virt.network_info`(*name=None, \*\*kwargs*)

Return information on a virtual network provided its name.

**Parameters**

- **name** -- virtual network name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

If no name is provided, return the infos for all defined virtual networks.

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.network_info default
```

`salt.modules.virt.network_set_autostart`(*name, state='on', \*\*kwargs*)

Set the autostart flag on a virtual network so that the network will start with the host system on reboot.

**Parameters**

- **name** -- virtual network name
- **state** -- 'on' to auto start the network, anything else to mark the virtual network not to be started when the host boots
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt "*" virt.network_set_autostart <pool> <on | off>
```

`salt.modules.virt.network_start`(*name, \*\*kwargs*)

Start a defined virtual network.

**Parameters**

- **name** -- virtual network name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.network_start default
```

`salt.modules.virt.network_stop`(*name, \*\*kwargs*)

Stop a defined virtual network.

**Parameters**

- **name** -- virtual network name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.network_stop default
```

`salt.modules.virt.network_undefine`(*name*, *\*\*kwargs*)

Remove a defined virtual network. This does not stop the virtual network.

#### Parameters

- **name** -- virtual network name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.network_undefine default
```

`salt.modules.virt.network_update`(*name*, *bridge*, *forward*, *ipv4\_config=None*, *ipv6\_config=None*, *vport=None*, *tag=None*, *mtu=None*, *domain=None*, *nat=None*, *interfaces=None*, *addresses=None*, *physical\_function=None*, *dns=None*, *test=False*, *\*\*kwargs*)

Update a virtual network if needed.

#### Parameters

- **name** -- Network name.
- **bridge** -- Bridge name.
- **forward** -- Forward mode (bridge, router, nat). A None value creates an isolated network with no forwarding at all.
- **vport** -- Virtualport type. The value can also be a dictionary with `type` and `parameters` keys. The `parameters` value is a dictionary of virtual port parameters.

```
- vport:
  type: openvswitch
  parameters:
    interfaceid: 09b11c53-8b5c-4eeb-8f00-d84eaa0aaa4f
```

- **tag** -- Vlan tag. The value can also be a dictionary with the `tags` and optional `trunk` keys. `trunk` is a boolean value indicating whether to use VLAN trunking. `tags` is a list of dictionaries with keys `id` and `nativeMode`. The `nativeMode` value can be one of `tagged` or `untagged`.

```
- tag:
  trunk: True
  tags:
    - id: 42
      nativeMode: untagged
    - id: 47
```

- **ipv4\_config**(*dict* or *None*) -- IP v4 configuration. Dictionary describing the IP v4 setup like IP range and a possible DHCP configuration. The structure is documented in *net-define-ip*.
- **ipv6\_config**(*dict* or *None*) -- IP v6 configuration. Dictionary describing the IP v6 setup like IP range and a possible DHCP configuration. The structure is documented in *net-define-ip*.

- **connection** -- libvirt connection URI, overriding defaults.
- **username** -- username to connect with, overriding defaults.
- **password** -- password to connect with, overriding defaults.
- **mtu** -- size of the Maximum Transmission Unit (MTU) of the network. (default None)
- **domain** -- DNS domain name of the DHCP server. The value is a dictionary with a mandatory `name` property and an optional `localOnly` boolean one. (default None)

```
- domain:
  name: lab.acme.org
  localOnly: True
```

- **nat** -- addresses and ports to route in NAT forward mode. The value is a dictionary with optional keys `address` and `port`. Both values are a dictionary with `start` and `end` values. (default None)

```
- forward: nat
- nat:
  address:
    start: 1.2.3.4
    end: 1.2.3.10
  port:
    start: 500
    end: 1000
```

- **interfaces** -- whitespace separated list of network interfaces devices that can be used for this network. (default None)

```
- forward: passthrough
- interfaces: "eth10 eth11 eth12"
```

- **addresses** -- whitespace separated list of addresses of PCI devices that can be used for this network in `hostdev` forward mode. (default None)

```
- forward: hostdev
- interfaces: "0000:04:00.1 0000:e3:01.2"
```

- **physical\_function** -- device name of the physical interface to use in `hostdev` forward mode. (default None)

```
- forward: hostdev
- physical_function: "eth0"
```

- **dns** -- virtual network DNS configuration. The value is a dictionary described in [net-define-dns](#). (default None)

```
- dns:
  forwarders:
    - domain: example.com
      addr: 192.168.1.1
    - addr: 8.8.8.8
      domain: www.example.com
  txt:
    example.com: "v=spf1 a -all"
    _http.tcp.example.com: "name=value,paper=A4"
  hosts:
    192.168.1.2:
      - mirror.acme.lab
```

(continues on next page)

(continued from previous page)

```

- test.acme.lab
srvs:
- name: ldap
  protocol: tcp
  domain: ldapserver.example.com
  target: .
  port: 389
  priority: 1
  weight: 10

```

New in version 3003.

`salt.modules.virt.node_devices(**kwargs)`

List the host available devices.

**Parameters**

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3003.

`salt.modules.virt.node_info(**kwargs)`

Return a dict with information about this node

**Parameters**

- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.node_info
```

`salt.modules.virt.pause(vm_, **kwargs)`

Pause the named vm

**Parameters**

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pause <domain>
```

`salt.modules.virt.pool_build(name, **kwargs)`

Build a defined libvirt storage pool.

**Parameters**

- **name** -- libvirt storage pool name

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_build default
```

`salt.modules.virt.pool_capabilities(**kwargs)`

Return the hypervisor connection storage pool capabilities.

The returned data are either directly extracted from libvirt or computed. In the latter case some pool types could be listed as supported while they are not. To distinguish between the two cases, check the value of the `computed` property.

#### Parameters

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt '*' virt.pool_capabilities
```

`salt.modules.virt.pool_define(name, ptype, target=None, permissions=None, source_devices=None, source_dir=None, source_initiator=None, source_adapter=None, source_hosts=None, source_auth=None, source_name=None, source_format=None, transient=False, start=True, **kwargs)`

Create libvirt pool.

#### Parameters

- **name** -- Pool name
- **ptype** -- Pool type. See [libvirt documentation](#) for the possible values.
- **target** -- Pool full path target
- **permissions** -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See [Permissions definition](#) for more details on this structure.
- **source\_devices** -- List of source devices for pools backed by physical devices. (Default: None)

Each item in the list is a dictionary with `path` and optionally `part_separator` keys. The path is the qualified name for iSCSI devices.

Report to [this libvirt page](#) for more information on the use of `part_separator`

- **source\_dir** -- Path to the source directory for pools of type `dir`, `netfs` or `gluster`. (Default: None)
- **source\_initiator** -- Initiator IQN for libiscsi-direct pool types. (Default: None)

New in version 3000.

- **source\_adapter** -- SCSI source definition. The value is a dictionary with `type`, `name`, `parent`, `managed`, `parent_wwnn`, `parent_wwpn`, `parent_fabric_wwnn`, `wwnn`, `wwpn` and `parent_address` keys.

The `parent_address` value is a dictionary with `unique_id` and `address` keys. The address represents a PCI address and is itself a dictionary with `domain`, `bus`, `slot` and `function` properties. Report to [this libvirt page](#) for the meaning and possible values of these properties.

- **source\_hosts** -- List of source for pools backed by storage from remote servers. Each item is the hostname optionally followed by the port separated by a colon. (Default: None)
- **source\_auth** -- Source authentication details. (Default: None)

The value is a dictionary with `type`, `username` and `secret` keys. The type can be one of `ceph` for Ceph RBD or `chap` for iSCSI sources.

The `secret` value links to a libvirt secret object. It is a dictionary with `type` and `value` keys. The type value can be either `uuid` or `usage`.

Examples:

```
source_auth={
  'type': 'ceph',
  'username': 'admin',
  'secret': {
    'type': 'uuid',
    'value': '2ec115d7-3a88-3ceb-bc12-0ac909a6fd87'
  }
}
```

```
source_auth={
  'type': 'chap',
  'username': 'myname',
  'secret': {
    'type': 'usage',
    'value': 'mycluster_myname'
  }
}
```

Since 3000, instead the source authentication can only contain `username` and `password` properties. In this case the libvirt secret will be defined and used. For Ceph authentications a base64 encoded key is expected.

- **source\_name** -- Identifier of name-based sources.
- **source\_format** -- String representing the source format. The possible values are depending on the source type. See [libvirt documentation](#) for the possible values.
- **start** -- Pool start (default True)
- **transient** -- When True, the pool will be automatically undefined after being stopped. Note that a transient pool will force `start` to True. (Default: False)
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

### Permissions definition

The permissions are described by a dictionary containing the following keys:

#### **mode**

The octal representation of the permissions. (Default: `0711`)

#### **owner**

the numeric user ID of the owner. (Default: from the parent folder)

#### **group**

the numeric ID of the group. (Default: from the parent folder)

#### **label**

the SELinux label. (Default: `None`)

**CLI Example:**

Local folder pool:

```
salt '*' virt.pool_define somepool dir target=/srv/mypool
→                                     permissions="{ 'mode': '0744' 'owner': 107, 'group':
→107 }"
```

CIFS backed pool:

```
salt '*' virt.pool_define myshare netfs source_format=cifs
→                                     source_dir=samba_share source_hosts="['example.com']
→" target=/mnt/cifs
```

New in version 2019.2.0.

**salt.modules.virt.pool\_delete**(*name*, *\*\*kwargs*)

Delete the resources of a defined libvirt storage pool.

**Parameters**

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_delete default
```

**salt.modules.virt.pool\_get\_xml**(*name*, *\*\*kwargs*)

Return the XML definition of a virtual storage pool

**Parameters**

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt '*' virt.pool_get_xml default
```

**salt.modules.virt.pool\_info**(*name=None*, *\*\*kwargs*)

Return information on a storage pool provided its name.

**Parameters**

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

If no name is provided, return the infos for all defined storage pools.

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_info default
```

`salt.modules.virt.pool_list_volumes(name, **kwargs)`

List the volumes contained in a defined libvirt storage pool.

**Parameters**

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt "*" virt.pool_list_volumes <pool>
```

`salt.modules.virt.pool_refresh(name, **kwargs)`

Refresh a defined libvirt storage pool.

**Parameters**

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_refresh default
```

`salt.modules.virt.pool_set_autostart(name, state='on', **kwargs)`

Set the autostart flag on a libvirt storage pool so that the storage pool will start with the host system on reboot.

**Parameters**

- **name** -- libvirt storage pool name
- **state** -- 'on' to auto start the pool, anything else to mark the pool not to be started when the host boots
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt "*" virt.pool_set_autostart <pool> <on | off>
```

`salt.modules.virt.pool_start(name, **kwargs)`

Start a defined libvirt storage pool.

**Parameters**

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_start default
```

`salt.modules.virt.pool_stop(name, **kwargs)`

Stop a defined libvirt storage pool.

**Parameters**

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_stop default
```

`salt.modules.virt.pool_undefine` (*name*, *\*\*kwargs*)

Remove a defined libvirt storage pool. The pool needs to be stopped before calling.

**Parameters**

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_undefine default
```

`salt.modules.virt.pool_update` (*name*, *ptype*, *target=None*, *permissions=None*, *source\_devices=None*, *source\_dir=None*, *source\_initiator=None*, *source\_adapter=None*, *source\_hosts=None*, *source\_auth=None*, *source\_name=None*, *source\_format=None*, *test=False*, *\*\*kwargs*)

Update a libvirt storage pool if needed. If called with `test=True`, this is also reporting whether an update would be performed.

**Parameters**

- **name** -- Pool name
- **ptype** -- Pool type. See [libvirt documentation](#) for the possible values.
- **target** -- Pool full path target
- **permissions** -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See [Permissions definition](#) for more details on this structure.
- **source\_devices** -- List of source devices for pools backed by physical devices. (Default: None)

Each item in the list is a dictionary with `path` and optionally `part_separator` keys. The path is the qualified name for iSCSI devices.

Report to [this libvirt page](#) for more information on the use of `part_separator`

- **source\_dir** -- Path to the source directory for pools of type `dir`, `netfs` or `gluster`. (Default: None)
- **source\_initiator** -- Initiator IQN for libiscsi-direct pool types. (Default: None)

New in version 3000.

- **source\_adapter** -- SCSI source definition. The value is a dictionary with `type`, `name`, `parent`, `managed`, `parent_wwnn`, `parent_wwpn`, `parent_fabric_wwn`, `wwnn`, `wwpn` and `parent_address` keys.

The `parent_address` value is a dictionary with `unique_id` and `address` keys. The address represents a PCI address and is itself a dictionary with `domain`, `bus`, `slot` and `function` properties. Report to [this libvirt page](#) for the meaning and possible values of these properties.

- **source\_hosts** -- List of source for pools backed by storage from remote servers. Each item is the hostname optionally followed by the port separated by a colon. (Default: None)
- **source\_auth** -- Source authentication details. (Default: None)

The value is a dictionary with `type`, `username` and `secret` keys. The type can be one of `ceph` for Ceph RBD or `chap` for iSCSI sources.

The `secret` value links to a libvirt secret object. It is a dictionary with `type` and `value` keys. The type value can be either `uuid` or `usage`.

Examples:

```
source_auth={
  'type': 'ceph',
  'username': 'admin',
  'secret': {
    'type': 'uuid',
    'uuid': '2ec115d7-3a88-3ceb-bc12-0ac909a6fd87'
  }
}
```

```
source_auth={
  'type': 'chap',
  'username': 'myname',
  'secret': {
    'type': 'usage',
    'uuid': 'mycluster_myname'
  }
}
```

Since 3000, instead the source authentication can only contain `username` and `password` properties. In this case the libvirt secret will be defined and used. For Ceph authentications a base64 encoded key is expected.

- **source\_name** -- Identifier of name-based sources.
- **source\_format** -- String representing the source format. The possible values are depending on the source type. See [libvirt documentation](#) for the possible values.
- **test** -- run in dry-run mode if set to True
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

#### Example:

Local folder pool:

```
salt '*' virt.pool_update somepool dir target=/srv/mypool
→ permissions="{ 'mode': '0744' 'owner': 107, 'group':
→ 107 }"
```

CIFS backed pool:

```
salt '*' virt.pool_update myshare netfs source_format=cifs
→ source_dir=samba_share source_hosts=["example.com"]
→ " target=/mnt/cifs"
```

New in version 3000.

`salt.modules.virt.purge`(*vm\_*, *dirs=False*, *removables=False*, *\*\*kwargs*)

Recursively destroy and delete a persistent virtual machine, pass True for dir's to also delete the directories containing the virtual machine disk images - USE WITH EXTREME CAUTION!

#### Parameters

- **vm** -- domain name
  - **dirs** -- pass True to remove containing directories
  - **removables** -- pass True to remove removable devices
- New in version 2019.2.0.
- **connection** -- libvirt connection URI, overriding defaults
- New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
- New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
- New in version 2019.2.0.

CLI Example:

```
salt '*' virt.purge <domain>
```

`salt.modules.virt.reboot`(*name*, *\*\*kwargs*)

Reboot a domain via ACPI request

#### Parameters

- **vm** -- domain name
  - **connection** -- libvirt connection URI, overriding defaults
- New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
- New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
- New in version 2019.2.0.

CLI Example:

```
salt '*' virt.reboot <domain>
```

`salt.modules.virt.reset`(*vm\_*, *\*\*kwargs*)

Reset a VM by emulating the reset button on a physical machine

#### Parameters

- **vm** -- domain name
  - **connection** -- libvirt connection URI, overriding defaults
- New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
- New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
- New in version 2019.2.0.

CLI Example:

```
salt '*' virt.reset <domain>
```

`salt.modules.virt.resume(vm_, **kwargs)`

Resume the named vm

**Parameters**

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.resume <domain>
```

`salt.modules.virt.revert_snapshot(name, vm_snapshot=None, cleanup=False, **kwargs)`

Revert snapshot to the previous from current (if available) or to the specific.

**Parameters**

- **name** -- domain name
- **vm\_snapshot** -- name of the snapshot to revert
- **cleanup** -- Remove all newer than reverted snapshots. Values: True or False (default False).
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.revert <domain>
salt '*' virt.revert <domain> <snapshot>
```

`salt.modules.virt.seed_non_shared_migrate(disks, force=False)`

Non shared migration requires that the disks be present on the migration destination, pass the disks information via this function, to the migration destination before executing the migration.

**Parameters**

- **disks** -- the list of disk data as provided by `virt.get_disks`
- **force** -- skip checking the compatibility of source and target disk images if True. (default: False)

CLI Example:

```
salt '*' virt.seed_non_shared_migrate <disks>
```

`salt.modules.virt.set_autostart(vm_, state='on', **kwargs)`

Set the autostart flag on a VM so that the VM will start with the host system on reboot.

**Parameters**

- **vm** -- domain name
- **state** -- 'on' to auto start the VM, 'off' to mark the VM not to be started when the host boots

- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt "*" virt.set_autostart <domain> <on | off>
```

`salt.modules.virt.setmem`(*vm\_*, *memory*, *config=False*, *\*\*kwargs*)

Changes the amount of memory allocated to VM. The VM must be shutdown for this to work.

#### Parameters

- **vm** -- name of the domain
- **memory** -- memory amount to set in MB
- **config** -- if True then libvirt will be asked to modify the config as well
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.setmem <domain> <size>
salt '*' virt.setmem my_domain 768
```

`salt.modules.virt.setvcpus`(*vm\_*, *vcpus*, *config=False*, *\*\*kwargs*)

Changes the amount of vcpus allocated to VM. The VM must be shutdown for this to work.

If config is True then we ask libvirt to modify the config as well

#### Parameters

- **vm** -- name of the domain
- **vcpus** -- integer representing the number of CPUs to be assigned
- **config** -- if True then libvirt will be asked to modify the config as well
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.setvcpus <domain> <amount>
salt '*' virt.setvcpus my_domain 4
```

`salt.modules.virt.shutdown`(*vm\_*, *\*\*kwargs*)

Send a soft shutdown signal to the named vm

#### Parameters

- **vm** -- domain name

- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.shutdown <domain>
```

`salt.modules.virt.snapshot`(*domain*, *name=None*, *suffix=None*, *\*\*kwargs*)

Create a snapshot of a VM.

**Parameters**

- **domain** -- domain name
- **name** -- Name of the snapshot. If the name is omitted, then will be used original domain name with ISO 8601 time as a suffix.
- **suffix** -- Add suffix for the new name. Useful in states, where such snapshots can be distinguished from manually created.
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.snapshot <domain>
```

`salt.modules.virt.start`(*name*, *\*\*kwargs*)

Start a defined domain

**Parameters**

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.start <domain>
```

`salt.modules.virt.stop`(*name*, *\*\*kwargs*)

Hard power down the virtual machine, this is equivalent to pulling the power.

**Parameters**

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.stop <domain>
```

`salt.modules.virt.undefine`(*vm\_*, *\*\*kwargs*)

Remove a defined vm, this does not purge the virtual machine image, and this only works if the vm is powered down

#### Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.undefine <domain>
```

`salt.modules.virt.update`(*name*, *cpu=0*, *mem=0*, *disk\_profile=None*, *disks=None*, *nic\_profile=None*, *interfaces=None*, *graphics=None*, *live=True*, *boot=None*, *numatune=None*, *test=False*, *boot\_dev=None*, *hypervisor\_features=None*, *clock=None*, *serials=None*, *consoles=None*, *stop\_on\_reboot=False*, *host\_devices=None*, *autostart=False*, *\*\*kwargs*)

Update the definition of an existing domain.

#### Parameters

- **name** -- Name of the domain to update
- **cpu** -- Number of virtual CPUs to assign to the virtual machine or a dictionary with detailed information to configure cpu model and topology, numa node tuning, cpu tuning and iothreads allocation. The structure of the dictionary is documented in [cpu parameters definition](#).

To update any cpu parameters specify the new values to the corresponding tag. To remove any element or attribute, specify None object. Please note that None object is mapped to null in yaml, use null in sls file instead.

- **mem** -- Amount of memory to allocate to the virtual machine in MiB. Since 3002, a dictionary can be used to contain detailed configuration which support memory allocation or tuning. Supported parameters are `boot`, `current`, `max`, `slots`, `hard_limit`, `soft_limit`, `swap_hard_limit`, `min_guarantee`, `hugepages`, `nosharepages`, `locked`, `source`, `access`, `allocation` and `discard`. The structure of the dictionary is documented in [Memory parameter definition](#). Both decimal and binary base are supported. Detail unit specification is documented in [Units specification](#). Please note that the value for `slots` must be an integer.

To remove any parameters, pass a None object, for instance: `'soft_limit': None`. Please note that None is mapped to null in sls file, pass null in sls file instead.

```
- mem:
  hard_limit: null
  soft_limit: null
```

Changed in version 3002.

- **disk\_profile** -- disk profile to use
- **disks** -- Disk definitions as documented in the *init()* function. If neither the profile nor this parameter are defined, the disk devices will not be changed. However to clear disks set this parameter to empty list.
- **nic\_profile** -- network interfaces profile to use
- **interfaces** -- Network interface definitions as documented in the *init()* function. If neither the profile nor this parameter are defined, the interface devices will not be changed. However to clear network interfaces set this parameter to empty list.
- **graphics** -- The new graphics definition as defined in *Graphics Definition*. If not set, the graphics will not be changed. To remove a graphics device, set this parameter to `{'type': 'none'}`.
- **live** -- `False` to avoid trying to live update the definition. In such a case, the new definition is applied at the next start of the virtual machine. If `True`, not all aspects of the definition can be live updated, but as much as possible will be attempted. (Default: `True`)
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults
- **boot** -- Specifies kernel, initial ramdisk and kernel command line parameters for the virtual machine. This is an optional parameter, all of the keys are optional within the dictionary.

Refer to *Boot parameters definition* for the complete boot parameter description.

To update any boot parameters, specify the new path for each. To remove any boot parameters, pass `None` object, for instance: `'kernel': None`. To switch back to BIOS boot, specify `('loader': None and 'nvram': None)` or `'efi': False`. Please note that `None` is mapped to `null` in sls file, pass `null` in sls file instead.

SLS file Example:

```
- boot:
  loader: null
  nvram: null
```

New in version 3000.

- **boot\_dev** -- Space separated list of devices to boot from sorted by decreasing priority. Values can be `hd`, `fd`, `cdrom` or `network`.

By default, the value will `"hd"`.

New in version 3002.

- **numatune** -- The optional numatune element provides details of how to tune the performance of a NUMA host via controlling NUMA policy for domain process. The optional `memory` element specifies how to allocate memory for the domain process on a NUMA host. `memnode` elements can specify memory allocation policies per each guest NUMA node. The definition used in the dictionary can be found at *cpu parameters definition*.

To update any numatune parameters, specify the new value. To remove any numatune parameters, pass a `None` object, for instance: `'numatune': None`. Please note that `None` is mapped to `null` in sls file, pass `null` in sls file instead.

New in version 3003.

- **serials** -- Dictionary providing details on the serials connection to create. (Default: None) See *Serials and Consoles Definitions* for more details on the possible values.

New in version 3003.

- **consoles** -- Dictionary providing details on the consoles device to create. (Default: None) See *Serials and Consoles Definitions* for more details on the possible values.

New in version 3003.

- **stop\_on\_reboot** -- If set to `True` the guest will stop instead of rebooting. This is specially useful when creating a virtual machine with an installation cdrom or an autoinstallation needing a special first boot configuration. Defaults to `False`

New in version 3003.

- **test** -- run in dry-run mode if set to `True`

New in version 3001.

- **hypervisor\_features** -- Enable or disable hypervisor-specific features on the virtual machine.

New in version 3003.

```
hypervisor_features:
  kvm-hint-dedicated: True
```

- **clock** -- Configure the guest clock. The value is a dictionary with the following keys:

**adjustment**

time adjustment in seconds or `reset`

**utc**

set to `False` to use the host local time as the guest clock. Defaults to `True`.

**timezone**

synchronize the guest to the corresponding timezone

**timers**

a dictionary associating the timer name with its configuration. This configuration is a dictionary with the properties `track`, `tickpolicy`, `catchup`, `frequency`, `mode`, `present`, `slew`, `threshold` and `limit`. See [libvirt time keeping documentation](#) for the possible values.

New in version 3003.

Set the clock to local time using an offset in seconds .. code-block:: yaml

```
clock:
  adjustment: 3600 utc: False
```

Set the clock to a specific time zone:

```
clock:
  timezone: CEST
```

Tweak guest timers:

```
clock:
  timers:
    tsc:
      frequency: 3504000000
      mode: native
    rtc:
      track: wall
```

(continues on next page)

(continued from previous page)

```

tickpolicy: catchup
slew: 4636
threshold: 123
limit: 2342
hpet:
present: False

```

- **host\_devices** -- List of host devices to passthrough to the guest. The value is a list of device names as provided by the `node_devices()` function. (Default: None)

New in version 3003.

- **autostart** -- If set to True the host will start the guest after boot. (Default: False)

#### Returns

Returns a dictionary indicating the status of what has been done. It is structured in the following way:

```

{
  'definition': True,
  'cpu': True,
  'mem': True,
  'disks': {'attached': [list of actually attached disks],
            'detached': [list of actually detached disks]},
  'nics': {'attached': [list of actually attached nics],
           'detached': [list of actually detached nics]},
  'errors': ['error messages for failures']
}

```

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.update domain cpu=2 mem=1024
```

#### `salt.modules.virt.virt_type()`

Returns the virtual machine type as a string

CLI Example:

```
salt '*' virt.virt_type
```

#### `salt.modules.virt.vm_cputime(vm_=None, **kwargs)`

Return cputime used by the vms on this hyper in a list of dicts:

##### Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

```
[
  'your-vm': {
    'cputime' <int>
    'cputime_percent' <int>
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_cputime
```

`salt.modules.virt.vm_diskstats`(*vm\_=None, \*\*kwargs*)

Return disk usage counters used by the vms on this hyper in a list of dicts:

#### Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

```
[
  'your-vm': {
    'rd_req' : 0,
    'rd_bytes' : 0,
    'wr_req' : 0,
    'wr_bytes' : 0,
    'errs' : 0
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_blockstats
```

`salt.modules.virt.vm_info`(*vm\_=None, \*\*kwargs*)

Return detailed information about the vms on this hyper in a list of dicts:

#### Parameters

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

```
[
  'your-vm': {
    'cpu': <int>,
    'maxMem': <int>,
    'mem': <int>,
    'state': '<state>',
    'cputime' <int>
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

`salt.modules.virt.vm_netstats` (*vm\_=None, \*\*kwargs*)

Return combined network counters used by the vms on this hyper in a list of dicts:

#### Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

```
[
  'your-vm': {
    'rx_bytes' : 0,
    'rx_packets' : 0,
    'rx_errs' : 0,
    'rx_drop' : 0,
    'tx_bytes' : 0,
    'tx_packets' : 0,
    'tx_errs' : 0,
    'tx_drop' : 0
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

`salt.modules.virt.vm_state`(*vm\_=None, \*\*kwargs*)

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

#### Parameters

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

CLI Example:

```
salt '*' virt.vm_state <domain>
```

`salt.modules.virt.volume_define`(*pool, name, size, allocation=0, format=None, type=None, permissions=None, backing\_store=None, nocow=False, \*\*kwargs*)

Create libvirt volume.

#### Parameters

- **pool** -- name of the pool to create the volume in
- **name** -- name of the volume to define
- **size** -- capacity of the volume to define in MiB
- **allocation** -- allocated size of the volume in MiB. Defaults to 0.
- **format** -- volume format. The allowed values are depending on the pool type. Check the `virt.pool_capabilities` output for the possible values and the default.
- **type** -- type of the volume. One of file, block, dir, network, netdir, ploop or None. By default, the type is guessed by libvirt from the pool type.
- **permissions** -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See [Permissions definition](#) for more details on this structure.
- **backing\_store** -- dictionary describing a backing file for the volume. It must contain a `path` property pointing to the base volume and a `format` property defining the format of the base volume.  
  
The base volume format will not be guessed for security reasons and is thus mandatory.
- **nocow** -- disable COW for the volume.
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

**CLI Example:**

Volume on ESX:

```
salt '*' virt.volume_define "[local-storage]" myvm/myvm.vmdk vmdk 8192
```

QCow2 volume with backing file:

```
salt '*' virt.volume_define default myvm.qcow2 qcow2 8192
→           permissions="{ 'mode': '0775', 'owner': '123', 'group': '345'
→           }"           backing_store="{ 'path': '/path/to/base.
→img', 'format': 'raw' }"           nocow=True
```

New in version 3001.

`salt.modules.virt.volume_delete`(*pool*, *volume*, *\*\*kwargs*)

Delete a libvirt managed volume.

**Parameters**

- **pool** -- libvirt storage pool name
- **volume** -- name of the volume to delete
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt "*" virt.volume_delete <pool> <volume>
```

`salt.modules.virt.volume_infos`(*pool=None*, *volume=None*, *\*\*kwargs*)

Provide details on a storage volume. If no volume name is provided, the infos all the volumes contained in the pool are provided. If no pool is provided, the infos of the volumes of all pools are output.

**Parameters**

- **pool** -- libvirt storage pool name (default: None)
- **volume** -- name of the volume to get infos from (default: None)
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt "*" virt.volume_infos <pool> <volume>
```

`salt.modules.virt.volume_upload`(*pool*, *volume*, *file*, *offset=0*, *length=0*, *sparse=False*, *\*\*kwargs*)

Create libvirt volume.

**Parameters**

- **pool** -- name of the pool to create the volume in
- **name** -- name of the volume to define
- **file** -- the file to upload to the volume
- **offset** -- where to start writing the data in the volume
- **length** -- amount of bytes to transfer to the volume
- **sparse** -- set to True to preserve data sparsiness.
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

**CLI Example:**

```
salt '*' virt.volume_upload default myvm.qcow2 /path/to/disk.qcow2
```

New in version 3001.

**26.6.475 salt.modules.virtualenv**

Create virtualenv environments.

New in version 0.17.0.

```
salt.modules.virtualenv_mod.create(path, venv_bin=None, system_site_packages=False,
                                     distribute=False, clear=False, python=None,
                                     extra_search_dir=None, never_download=None, prompt=None,
                                     pip=False, symlinks=None, upgrade=None, user=None,
                                     use_vt=False, saltenv='base', **kwargs)
```

Create a virtualenv

**path**

The path to the virtualenv to be created

**venv\_bin**

The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`. Defaults to `virtualenv`.

**system\_site\_packages**

[False] Passthrough argument given to virtualenv or pyvenv

**distribute**

[False] Passthrough argument given to virtualenv

**pip**

[False] Install pip after creating a virtual environment. Implies `distribute=True`

**clear**

[False] Passthrough argument given to virtualenv or pyvenv

**python**

[None (default)] Passthrough argument given to virtualenv

**extra\_search\_dir**

[None (default)] Passthrough argument given to virtualenv

**never\_download**

[None (default)] Passthrough argument given to virtualenv if True

**prompt**

[None (default)] Passthrough argument given to virtualenv if not None

**symlinks**

[None] Passthrough argument given to pyvenv if True

**upgrade**

[None] Passthrough argument given to pyvenv if True

**user**

[None] Set ownership for the virtualenv

---

**Note:** On Windows you must also pass a `password` parameter. Additionally, the user must have permissions to the location where the virtual environment is being created

---

**runas**

[None] Set ownership for the virtualenv

Deprecated since version 2014.1.0: `user` should be used instead

**use\_vt**

[False] Use VT terminal emulation (see output while installing)

New in version 2015.5.0.

**saltenv**

['base'] Specify a different environment. The default environment is base.

New in version 2014.1.0.

---

**Note:** The `runas` argument is deprecated as of 2014.1.0. `user` should be used instead.

---

CLI Example:

```
salt '*' virtualenv.create /path/to/new/virtualenv
```

Example of using `--always-copy` environment variable (in case your fs doesn't support symlinks).

This will copy files into the virtualenv instead of symlinking them.

```
.. code-block:: yaml
```

```
- env:
  - VIRTUALENV_ALWAYS_COPY: 1
```

`salt.modules.virtualenv_mod.get_distribution_path(venv, distribution)`

Return the path to a distribution installed inside a virtualenv

New in version 2016.3.0.

**venv**

Path to the virtualenv.

**distribution**

Name of the distribution. Note, all non-alphanumeric characters will be converted to dashes.

CLI Example:

```
salt '*' virtualenv.get_distribution_path /path/to/my/venv my_distribution
```

`salt.modules.virtualenv_mod.get_resource_content(venv, package=None, resource=None)`

Return the content of a package resource installed inside a virtualenv

New in version 2015.5.0.

**venv**

Path to the virtualenv

**package**

Name of the package in which the resource resides

New in version 2016.3.0.

**resource**

Name of the resource of which the content is to be returned

New in version 2016.3.0.

CLI Example:

```
salt '*' virtualenv.get_resource_content /path/to/my/venv my_package my/
↳ resource.xml
```

`salt.modules.virtualenv_mod.get_resource_path(venv, package=None, resource=None)`

Return the path to a package resource installed inside a virtualenv

New in version 2015.5.0.

**venv**

Path to the virtualenv

**package**

Name of the package in which the resource resides

New in version 2016.3.0.

**resource**

Name of the resource of which the path is to be returned

New in version 2016.3.0.

CLI Example:

```
salt '*' virtualenv.get_resource_path /path/to/my/venv my_package my/
→ resource.xml
```

`salt.modules.virtualenv_mod.get_site_packages(venv)`

Return the path to the site-packages directory of a virtualenv

**venv**

Path to the virtualenv.

CLI Example:

```
salt '*' virtualenv.get_site_packages /path/to/my/venv
```

`salt.modules.virtualenv_mod.virtualenv_ver(venv_bin, user=None, **kwargs)`

return virtualenv version if exists

## 26.6.476 salt.modules.vmctl

Manage vms running on the OpenBSD VMM hypervisor using vmctl(8).

New in version 2019.2.0.

**codeauthor**

Jasper Lievisse Adriaanse <jasper@openbsd.org>

---

**Note:** This module requires the `vmd` service to be running on the OpenBSD target machine.

---

`salt.modules.vmctl.create_disk(name, size)`

Create a VMM disk with the specified `name` and `size`.

**size:**

Size in megabytes, or use a specifier such as M, G, T.

CLI Example:

```
salt '*' vmctl.create_disk /path/to/disk.img size=10G
```

`salt.modules.vmctl.load(path)`

Load additional configuration from the specified file.

**path**

Path to the configuration file.

CLI Example:

```
salt '*' vmctl.load path=/etc/vm.switches.conf
```

`salt.modules.vmctl.reload()`

Remove all stopped VMs and reload configuration from the default configuration file.

CLI Example:

```
salt '*' vmctl.reload
```

`salt.modules.vmctl.reset` (*all=False, vms=False, switches=False*)

Reset the running state of VMM or a subsystem.

**all:**

Reset the running state.

**switches:**

Reset the configured switches.

**vms:**

Reset and terminate all VMs.

CLI Example:

```
salt '*' vmctl.reset all=True
```

`salt.modules.vmctl.start` (*name=None, id=None, bootpath=None, disk=None, disks=None, local\_iface=False, memory=None, nics=0, switch=None*)

Starts a VM defined by the specified parameters. When both a name and id are provided, the id is ignored.

**name:**

Name of the defined VM.

**id:**

VM id.

**bootpath:**

Path to a kernel or BIOS image to load.

**disk:**

Path to a single disk to use.

**disks:**

List of multiple disks to use.

**local\_iface:**

Whether to add a local network interface. See "LOCAL INTERFACES" in the `vmctl(8)` manual page for more information.

**memory:**

Memory size of the VM specified in megabytes.

**switch:**

Add a network interface that is attached to the specified virtual switch on the host.

CLI Example:

```
salt '*' vmctl.start 2 # start VM with id 2
salt '*' vmctl.start name=web1 bootpath='/bsd.rd' nics=2 memory=512M disk=
→ '/disk.img'
```

`salt.modules.vmctl.status` (*name=None, id=None*)

List VMs running on the host, or only the VM specified by `id`. When both a name and id are provided, the id is ignored.

**name:**

Name of the defined VM.

**id:**

VM id.

CLI Example:

```
salt '*' vmctl.status           # to list all VMs
salt '*' vmctl.status name=web1 # to get a single VM
```

`salt.modules.vmctl.stop`(*name=None, id=None*)

Stop (terminate) the VM identified by the given id or name. When both a name and id are provided, the id is ignored.

**name:**

Name of the defined VM.

**id:**

VM id.

CLI Example:

```
salt '*' vmctl.stop name=alpine
```

## 26.6.477 salt.modules.vsphere

Manage VMware vCenter servers and ESXi hosts.

New in version 2015.8.4.

**codeauthor**

Alexandru Bleotu <alexandru.bleotu@morganstaley.com>

### Dependencies

- pyVmomi Python Module
- ESXCLI

### pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original vSphere Execution Module was developed against.

## vSphere Automation SDK

vSphere Automation SDK can be installed via pip:

```
pip install --upgrade pip setuptools
pip install --upgrade git+https://github.com/vmware/vsphere-automation-sdk-
↳python.git
```

---

**Note:** The SDK also requires OpenSSL 1.0.1+ if you want to connect to vSphere 6.5+ in order to support TLS1.1 & 1.2.

In order to use the tagging functions in this module, vSphere Automation SDK is necessary to install.

---

The module is currently in version 1.0.3 (as of 8/26/2019)

## ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

---

**Note:** Be aware that some functionality in this execution module may depend on the type of license attached to a vCenter Server or ESXi host(s).

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The `ntpd` service is restricted to an Enterprise Plus license, while `ssh` is available via the Standard license.

Please see the [vSphere Comparison](#) page for more information.

---

## About

This execution module was designed to be able to handle connections both to a vCenter Server, as well as to an ESXi host. It utilizes the `pyVmomi` Python library and the ESXCLI package to run remote execution functions against either the defined vCenter server or the ESXi host.

Whether or not the function runs against a vCenter Server or an ESXi host depends entirely upon the arguments passed into the function. Each function requires a `host` location, `username`, and `password`. If the credentials provided apply to a vCenter Server, then the function will be run against the vCenter Server. For example, when listing hosts using vCenter credentials, you'll get a list of hosts associated with that vCenter Server:

```
# salt my-minion vsphere.list_hosts <vcenter-ip> <vcenter-user> <vcenter-
->password>
my-minion:
- esxi-1.example.com
- esxi-2.example.com
```

However, some functions should be used against ESXi hosts, not vCenter Servers. Functionality such as getting a host's coredump network configuration should be performed against a host and not a vCenter server. If the authentication information you're using is against a vCenter server and not an ESXi host, you can provide the host name that is associated with the vCenter server in the command, as a list, using the `host_names` or `esxi_host` kwarg. For example:

```
# salt my-minion vsphere.get_coredump_network_config <vcenter-ip> <vcenter-
->user> <vcenter-password> esxi_hosts='[esxi-1.example.com, esxi-2.
->example.com]'
```

```
my-minion:
-----
  esxi-1.example.com:
    -----
      Coredump Config:
        -----
          enabled:
            False
  esxi-2.example.com:
    -----
      Coredump Config:
        -----
          enabled:
            True
          host_vnic:
            vmk0
          ip:
            coredump-location.example.com
          port:
            6500
```

You can also use these functions against an ESXi host directly by establishing a connection to an ESXi host using the host's location, username, and password. If ESXi connection credentials are used instead of vCenter credentials, the `host_names` and `esxi_hosts` arguments are not needed.

```
# salt my-minion vsphere.get_coredump_network_config esxi-1.example.com root
-><host-password>
```

```
local:
-----
  10.4.28.150:
    -----
      Coredump Config:
        -----
          enabled:
            True
          host_vnic:
            vmk0
          ip:
```

(continues on next page)

(continued from previous page)

```

    coredump-location.example.com
    port:
        6500

```

```

salt.modules.vsphere.add_capacity_to_diskgroup(cache_disk_id, capacity_disk_ids,
                                              safety_checks=True, service_instance=None)

```

Adds capacity disks to the disk group with the specified cache disk.

**cache\_disk\_id**

The canonical name of the cache disk.

**capacity\_disk\_ids**

A list containing canonical names of the capacity disks to add.

**safety\_checks**

Specify whether to perform safety check or to skip the checks and try performing the required task.

Default value is True.

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```

salt '*' vsphere.add_capacity_to_diskgroup
  cache_disk_id='naa.0000000000000001'
  capacity_disk_ids='[naa.0000000000000002, naa.0000000000000003]'

```

```

salt.modules.vsphere.add_host_to_dvs(host, username, password, vmknic_name, vmnic_name,
                                     dvs_name, target_portgroup_name, uplink_portgroup_name,
                                     protocol=None, port=None, host_names=None,
                                     verify_ssl=True)

```

Adds an ESXi host to a vSphere Distributed Virtual Switch and migrates the desired adapters to the DVS from the standard switch.

**host**

The location of the vCenter server.

**username**

The username used to login to the vCenter server.

**password**

The password used to login to the vCenter server.

**vmknic\_name**

The name of the virtual NIC to migrate.

**vmnic\_name**

The name of the physical NIC to migrate.

**dvs\_name**

The name of the Distributed Virtual Switch.

**target\_portgroup\_name**

The name of the distributed portgroup in which to migrate the virtual NIC.

**uplink\_portgroup\_name**

The name of the uplink portgroup in which to migrate the physical NIC.

**protocol**

Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is 443.

**host\_names:**

An array of VMware host names to migrate

**verify\_ssl**

Verify the SSL certificate. Default: True

CLI Example:

```
salt some_host vsphere.add_host_to_dvs host='vsphere.corp.com'
  username='administrator@vsphere.corp.com' password='vsphere_password'
  vmknick_name='vmk0' vmnic_name='vmnic0' dvs_name='DSwitch'
  target_portgroup_name='DPortGroup' uplink_portgroup_name='DSwitch1-
  →DVUplinks-181'
  protocol='https' port='443', host_names="['esxi1.corp.com','esxi2.
  →corp.com','esxi3.corp.com']"
```

Return Example:

```
somehost:
-----
esxi1.corp.com:
-----
  dvs:
    DSwitch
  portgroup:
    DPortGroup
  status:
    True
  uplink:
    DSwitch-DVUplinks-181
  vmknick:
    vmk0
  vmnic:
    vmnic0
esxi2.corp.com:
-----
  dvs:
    DSwitch
  portgroup:
    DPortGroup
  status:
    True
  uplink:
    DSwitch-DVUplinks-181
  vmknick:
    vmk0
  vmnic:
    vmnic0
esxi3.corp.com:
-----
  dvs:
    DSwitch
  portgroup:
    DPortGroup
  status:
    True
  uplink:
    DSwitch-DVUplinks-181
```

(continues on next page)

(continued from previous page)

```

vmknic:
    vmk0
vmnic:
    vmnic0
message:
success:
    True

```

This was very difficult to figure out. VMware's PyVmomi documentation at

<https://github.com/vmware/pyvmomi/blob/master/docs/vim/DistributedVirtualSwitch.rst> (which is a copy of the official documentation here: [https://www.vmware.com/support/developer/converter-sdk/conv60\\_apireference/vim.DistributedVirtualSwitch.html](https://www.vmware.com/support/developer/converter-sdk/conv60_apireference/vim.DistributedVirtualSwitch.html))

says to create the DVS, create distributed portgroups, and then add the host to the DVS specifying which physical NIC to use as the port backing. However, if the physical NIC is in use as the only link from the host to vSphere, this will fail with an unhelpful "busy" error.

There is, however, a Powershell PowerCLI cmdlet called `Add-VDSwitchPhysicalNetworkAdapter` that does what we want. I used Onyx (<https://labs.vmware.com/flings/onyx>) to sniff the SOAP stream from Powershell to our vSphere server and got this snippet out:

```

<UpdateNetworkConfig xmlns="urn:vim25">
  <_this type="HostNetworkSystem">networkSystem-187</_this>
  <config>
    <vswitch>
      <changeOperation>edit</changeOperation>
      <name>vSwitch0</name>
      <spec>
        <numPorts>7812</numPorts>
      </spec>
    </vswitch>
    <proxySwitch>
      <changeOperation>edit</changeOperation>
      <uuid>73 a4 05 50 b0 d2 7e b9-38 80 5d 24 65 8f da 70</uuid>
      <spec>
        <backing xsi:type="DistributedVirtualSwitchHostMemberPnicBacking">
          <pnicSpec><pnicDevice>vmnic0</pnicDevice></pnicSpec>
        </backing>
      </spec>
    </proxySwitch>
    <portgroup>
      <changeOperation>remove</changeOperation>
      <spec>
        <name>Management Network</name><vlanId>-1</vlanId><vswitchName />
      </spec>
    </portgroup>
    <vnic>
      <changeOperation>edit</changeOperation>
      <device>vmk0</device>
      <portgroup />
      <spec>
        <distributedVirtualPort>

```

(continues on next page)

(continued from previous page)

```

        <switchUuid>73 a4 05 50 b0 d2 7e b9-38 80 5d 24 65 8f da 70</
→switchUuid>
        <portgroupKey>dvportgroup-191</portgroupKey>
    </distributedVirtualPort>
    </spec>
</vnic>
</config>
<changeMode>modify</changeMode>
</UpdateNetworkConfig>

```

The SOAP API maps closely to PyVmomi, so from there it was (relatively) easy to figure out what Python to write.

`salt.modules.vsphere.add_license` (*key, description, safety\_checks=True, service\_instance=None*)

Adds a license to the vCenter or ESXi host

**key**

License key.

**description**

License description added in as a label.

**safety\_checks**

Specify whether to perform safety check or to skip the checks and try performing the required task

**service\_instance**

Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is `None`.

CLI Example:

```

salt '*' vsphere.add_license key=<license_key> desc='License desc'

```

`salt.modules.vsphere.assign_default_storage_policy_to_datastore` (*policy, datastore, service\_instance=None*)

Assigns a storage policy as the default policy to a datastore.

**policy**

Name of the policy to assign.

**datastore**

Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.

**service\_instance**

Service instance (`vim.ServiceInstance`) of the vCenter. Default is `None`.

CLI Example:

```

salt '*' vsphere.assign_storage_policy_to_datastore
policy='policy name' datastore=ds1

```

`salt.modules.vsphere.assign_license` (*license\_key, license\_name, entity, entity\_display\_name, safety\_checks=True, service\_instance=None*)

Assigns a license to an entity

**license\_key**

Key of the license to assign See `_get_entity` docstrings for format.

**license\_name**

Display name of license

**entity**

Dictionary representation of an entity

**entity\_display\_name**

Entity name used in logging

**safety\_checks**

Specify whether to perform safety check or to skip the checks and try performing the required task. Default is False.

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.assign_license license_key=AAAAA-11111-AAAAA-11111-AAAAA
license_name=test entity={type:cluster,datacenter:dc,cluster:cl}
```

```
salt.modules.vsphere.attach_tag(object_id, tag_id, managed_obj='ClusterComputeResource',
server=None, username=None, password=None,
service_instance=None, verify_ssl=None, ca_bundle=None)
```

Attach an existing tag to an input object.

The tag needs to meet the cardinality (*CategoryModel.cardinality*) and associability (*Category-Model.associable\_types*) criteria in order to be eligible for attachment. If the tag is already attached to the object, then this method is a no-op and an error will not be thrown. To invoke this method, you need the attach tag privilege on the tag and the read privilege on the object.

CLI Example:

```
salt vm_minion vsphere.attach_tag domain-c2283
→urn:vmomi:InventoryServiceTag:b55ecc77-f4a5-49f8-ab52-
→38865467cfbe:GLOBAL
```

**Parameters**

- **object\_id** (*str*) -- The identifier of the input object.
- **tag\_id** (*str*) -- The identifier of the tag object.
- **managed\_obj** (*str*) -- Classes that contain methods for creating and deleting resources typically contain a class attribute specifying the resource type for the resources being created and deleted.
- **server** (*basestring*) -- Target DNS or IP of vCenter center.
- **username** (*basestring*) -- Username associated with the vCenter center.
- **password** (*basestring*) -- Password associated with the vCenter center.
- **verify\_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca\_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

**Returns**

The list of all tag identifiers that correspond to the tags attached to the given object.

**Return type**

list of tags

**Raise**

Unauthorized if you do not have the privilege to read the object.

**Raise**

Unauthenticated if the user can not be authenticated.

```
salt.modules.vsphere.compare_vm_configs(new_config, current_config)
```

Compares virtual machine current and new configuration, the current is the one which is deployed now, and the new is the target config. Returns the differences between the objects in a dictionary, the keys are the configuration parameter keys and the values are differences objects: either list or recursive difference

**new\_config:**

New config dictionary with every available parameter

**current\_config**

Currently deployed configuration

`salt.modules.vsphere.configure_host_cache` (*enabled, datastore=None, swap\_size\_MiB=None, service\_instance=None*)

Configures the host cache on the selected host.

**enabled**

Boolean flag specifying whether the host cache is enabled.

**datastore**

Name of the datastore that contains the host cache. Must be set if `enabled` is `true`.

**swap\_size\_MiB**

Swap size in Mibibytes. Needs to be set if `enabled` is `true`. Must be smaller than the datastore size.

**service\_instance**

Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is `None`.

CLI Example:

```
salt '*' vsphere.configure_host_cache enabled=False

salt '*' vsphere.configure_host_cache enabled=True datastore=ds1
      swap_size_MiB=1024
```

`salt.modules.vsphere.coredump_network_enable` (*host, username, password, enabled, protocol=None, port=None, esxi\_hosts=None, credstore=None*)

Enable or disable ESXi core dump collection. Returns `True` if coredump is enabled and returns `False` if core dump is not enabled. If there was an error, the error will be the value printed in the `ERROR` key dictionary for the given host.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**enabled**

Python `True` or `False` to enable or disable coredumps.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**esxi\_hosts**

If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore**

Optionally set to path to the credential store file.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.coredump_network_enable my.esxi.host root bad-password
→ True

# Used for connecting to a vCenter Server
salt '*' vsphere.coredump_network_enable my.vcenter.location root bad-
→ password True      esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
→ '
```

`salt.modules.vsphere.create_cluster` (*cluster\_dict, datacenter=None, cluster=None, service\_instance=None*)

Creates a cluster.

Note: `cluster_dict['name']` will be overridden by the `cluster` param value

**config\_dict**

Dictionary with the config values of the new cluster.

**datacenter**

Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.

**cluster**

Name of cluster. Ignored if already contained by proxy details. Default value is None.

**service\_instance**

Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

CLI Example:

```
# esxdatacenter proxy
salt '*' vsphere.create_cluster cluster_dict=$cluster_dict cluster=cl1

# esxcluster proxy
salt '*' vsphere.create_cluster cluster_dict=$cluster_dict
```

`salt.modules.vsphere.create_datacenter` (*datacenter\_name*, *service\_instance=None*)

Creates a datacenter.

Supported proxies: `esxdatacenter`

**datacenter\_name**

The datacenter name

**service\_instance**

Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.create_datacenter dc1
```

`salt.modules.vsphere.create_diskgroup` (*cache\_disk\_id*, *capacity\_disk\_ids*, *safety\_checks=True*, *service\_instance=None*)

Creates disk group on an ESXi host with the specified cache and capacity disks.

**cache\_disk\_id**

The canonical name of the disk to be used as a cache. The disk must be `ssd`.

**capacity\_disk\_ids**

A list containing canonical names of the capacity disks. Must contain at least one id. Default is `True`.

**safety\_checks**

Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is `True`.

**service\_instance**

Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.create_diskgroup cache_disk_id='naa.0000000000000001'
capacity_disk_ids=['naa.0000000000000002, naa.0000000000000003']
```

`salt.modules.vsphere.create_dvportgroup` (*portgroup\_dict*, *portgroup\_name*, *dvs*, *service\_instance=None*)

Creates a distributed virtual portgroup.

Note: The `portgroup_name` param will override any name already set in `portgroup_dict`.

**portgroup\_dict**

Dictionary with the config values the portgroup should be created with (example in salt.states.dvs).

**portgroup\_name**

Name of the portgroup to be created.

**dvs**

Name of the DVS that will contain the portgroup.

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.create_dvportgroup portgroup_dict=<dict>
portgroup_name=pg1 dvs=dvs1
```

`salt.modules.vsphere.create_dvs(dvs_dict, dvs_name, service_instance=None)`

Creates a distributed virtual switch (DVS).

Note: The `dvs_name` param will override any name set in `dvs_dict`.

**dvs\_dict**

Dict representation of the new DVS (example in salt.states.dvs)

**dvs\_name**

Name of the DVS to be created.

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.create_dvs dvs dict=$dvs_dict dvs_name=dvs_name
```

`salt.modules.vsphere.create_storage_policy(policy_name, policy_dict, service_instance=None)`

Creates a storage policy.

Supported capability types: scalar, set, range.

**policy\_name**

Name of the policy to create. The value of the argument will override any existing name in `policy_dict`.

**policy\_dict**

Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.create_storage_policy policy_name='policy name'
policy_dict="$policy_dict"
```

`salt.modules.vsphere.create_tag(name, description, category_id, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)`

Create a tag under a category with given description.

CLI Example:

```
salt vm_minion vsphere.create_tag
```

**Parameters**

- **server** (*basestring*) -- Target DNS or IP of vCenter client.
- **username** (*basestring*) -- Username associated with the vCenter client.
- **password** (*basestring*) -- Password associated with the vCenter client.

- **name** (*str*) -- Name of tag category to create (ex. Machine, OS, Availability, etc.)
- **description** (*str*) -- Given description of tag category.
- **category\_id** (*str*) -- Value of category\_id representative of the category created previously.
- **verify\_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca\_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

**Returns**

The identifier of the created tag.

**Return type**

*str*

**Raise**

AlreadyExists if the name provided in the create\_spec is the name of an already existing tag in the input category.

**Raise**

InvalidArgument if any of the input information in the create\_spec is invalid.

**Raise**

NotFound if the category for in the given create\_spec does not exist in the system.

**Raise**

Unauthorized if you do not have the privilege to create tag.

```
salt.modules.vsphere.create_tag_category(name, description, cardinality, server=None,
                                         username=None, password=None,
                                         service_instance=None, verify_ssl=None,
                                         ca_bundle=None)
```

Create a category with given cardinality.

CLI Example:

```
salt vm_minion vsphere.create_tag_category
```

**Parameters**

- **name** (*str*) -- Name of tag category to create (ex. Machine, OS, Availability, etc.)
- **description** (*str*) -- Given description of tag category.
- **cardinality** (*str*) -- The associated cardinality (SINGLE, MULTIPLE) of the category.
- **server** (*basestring*) -- Target DNS or IP of vCenter center.
- **username** (*basestring*) -- Username associated with the vCenter center.
- **password** (*basestring*) -- Password associated with the vCenter center.
- **verify\_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca\_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

**Returns**

Identifier of the created category.

**Return type**

*str*

**Raise**

AlreadyExists if the name` provided in the create\_spec is the name of an already existing category.

**Raise**

InvalidArgument if any of the information in the create\_spec is invalid.

**Raise**

Unauthorized if you do not have the privilege to create a category.

```
salt.modules.vsphere.create_vm(vm_name, cpu, memory, image, version, datacenter, datastore,
                               placement, interfaces, disks, scsi_devices, serial_ports=None,
                               ide_controllers=None, sata_controllers=None, cd_drives=None,
                               advanced_configs=None, service_instance=None)
```

Creates a virtual machine container.

CLI Example:

```
salt vm_minion vsphere.create_vm vm_name=vmname cpu='{count: 2, nested:
→True}' ...
```

#### vm\_name

Name of the virtual machine

#### cpu

Properties of CPUs for freshly created machines

#### memory

Memory size for freshly created machines

#### image

Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier

#### version

Virtual machine container hardware version

#### datacenter

Datacenter where the virtual machine will be deployed (mandatory)

#### datastore

Datastore where the virtual machine files will be placed

#### placement

Resource pool or cluster or host or folder where the virtual machine will be deployed

#### devices

interfaces

```
interfaces:
  adapter: 'Network adapter 1'
  name: vlan100
  switch_type: distributed or standard
  adapter_type: vmxnet3 or vmxnet, vmxnet2, vmxnet3, e1000, e1000e
  mac: '00:11:22:33:44:55'
  connectable:
    allow_guest_control: True
    connected: True
    start_connected: True
```

disks

```
disks:
  adapter: 'Hard disk 1'
  size: 16
  unit: GB
  address: '0:0'
  controller: 'SCSI controller 0'
  thin_provision: False
  eagerly_scrub: False
  datastore: 'myshare'
  filename: 'vm/mydisk.vmdk'
```

scsi\_devices

```
scsi_devices:
  controller: 'SCSI controller 0'
  type: paravirtual
  bus_sharing: no_sharing
```

serial\_ports

```
serial_ports:
  adapter: 'Serial port 1'
  type: network
  backing:
    uri: 'telnet://something:port'
    direction: <client|server>
    filename: 'service_uri'
  connectable:
    allow_guest_control: True
    connected: True
    start_connected: True
  yield: False
```

cd\_drives

```
cd_drives:
  adapter: 'CD/DVD drive 0'
  controller: 'IDE 0'
  device_type: datastore_iso_file
  datastore_iso_file:
    path: path_to_iso
  connectable:
    allow_guest_control: True
    connected: True
    start_connected: True
```

#### advanced\_config

Advanced config parameters to be set for the virtual machine

`salt.modules.vsphere.create_vmfs_datastore` (*datastore\_name*, *disk\_id*, *vmfs\_major\_version*, *safety\_checks=True*, *service\_instance=None*)

Creates a ESXi host disk group with the specified cache and capacity disks.

#### datastore\_name

The name of the datastore to be created.

#### disk\_id

The disk id (canonical name) on which the datastore is created.

#### vmfs\_major\_version

The VMFS major version.

#### safety\_checks

Specify whether to perform safety check or to skip the checks and try performing the required task. Default is True.

#### service\_instance

Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.create_vmfs_datastore datastore_name=ds1 disk_id=
vmfs_major_version=5
```

`salt.modules.vsphere.delete_advanced_configs` (*vm\_name*, *datacenter*, *advanced\_configs*,  
*service\_instance=None*)

Removes extra config parameters from a virtual machine

**vm\_name**

Virtual machine name

**datacenter**

Datacenter name where the virtual machine is available

**advanced\_configs**

List of advanced config values to be removed

**service\_instance**

vCenter service instance for connection and configuration

`salt.modules.vsphere.delete_tag` (*tag\_id*, *server=None*, *username=None*, *password=None*,  
*service\_instance=None*, *verify\_ssl=None*, *ca\_bundle=None*)

Delete a tag.

CLI Example:

```
salt vm_minion vsphere.delete_tag
```

#### Parameters

- **tag\_id** (*str*) -- The identifier of tag to be deleted. The parameter must be an identifier for the resource type: `com.vmware.cis.tagging.Tag`.
- **server** (*basestring*) -- Target DNS or IP of vCenter center.
- **username** (*basestring*) -- Username associated with the vCenter center.
- **password** (*basestring*) -- Password associated with the vCenter center.
- **verify\_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca\_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

#### Raise

AlreadyExists if the name provided in the `create_spec` is the name of an already existing category.

#### Raise

InvalidArgument if any of the information in the `create_spec` is invalid.

#### Raise

Unauthorized if you do not have the privilege to create a category.

`salt.modules.vsphere.delete_tag_category` (*category\_id*, *server=None*, *username=None*,  
*password=None*, *service\_instance=None*,  
*verify\_ssl=None*, *ca\_bundle=None*)

Delete a category.

CLI Example:

```
salt vm_minion vsphere.delete_tag_category
```

#### Parameters

- **category\_id** (*str*) -- The identifier of category to be deleted. The parameter must be an identifier for the resource type: `com.vmware.cis.tagging.Category`.
- **server** (*basestring*) -- Target DNS or IP of vCenter center.
- **username** (*basestring*) -- Username associated with the vCenter center.
- **password** (*basestring*) -- Password associated with the vCenter center.
- **verify\_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca\_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

**Raise**

NotFound if the tag for the given tag\_id does not exist in the system.

**Raise**

Unauthorized if you do not have the privilege to delete the tag.

**Raise**

Unauthenticated if the user can not be authenticated.

```
salt.modules.vsphere.delete_vm(name, datacenter, placement=None, power_off=False,
                                service_instance=None)
```

Deletes a virtual machine defined by name and placement

**name**

Name of the virtual machine

**datacenter**

Datacenter of the virtual machine

**placement**

Placement information of the virtual machine

**service\_instance**

vCenter service instance for connection and configuration

CLI Example:

```
salt '*' vsphere.delete_vm name=my_vm datacenter=my_datacenter
```

```
salt.modules.vsphere.disconnect(service_instance)
```

Disconnects from a vCenter or ESXi host

---

**Note:** Should be used by state functions, not invoked directly.

---

**service\_instance**

Service instance (vim.ServiceInstance)

CLI Example:

See note above.

```
salt.modules.vsphere.enable_firewall_ruleset(host, username, password, ruleset_enable,
                                               ruleset_name, protocol=None, port=None,
                                               esxi_hosts=None, credstore=None)
```

Enable or disable an ESXi firewall rule set.

**host**

The location of the host.

**username**

The username used to login to the host, such as root.

**password**

The password used to login to the host.

**ruleset\_enable**

True to enable the ruleset, false to disable.

**ruleset\_name**

Name of ruleset to target.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts**

If host is a vCenter host, then use esxi\_hosts to execute this function on a list of one or more ESXi

machines.

**credstore**

Optionally set to path to the credential store file.

**Returns**

A standard `cmd.run_all` dictionary, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.enable_firewall_ruleset my.esxi.host root bad-password
↳ True 'syslog'

# Used for connecting to a vCenter Server
salt '*' vsphere.enable_firewall_ruleset my.vcenter.location root bad-
↳ password True 'syslog' esxi_hosts='[esxi-1.host.com, esxi-2.
↳ host.com]'
```

`salt.modules.vsphere.erase_disk_partitions` (*disk\_id=None, scsi\_address=None, service\_instance=None*)

Erases the partitions on a disk. The disk can be specified either by the canonical name, or by the `scsi_address`.

**disk\_id**

Canonical name of the disk. Either `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`).

**scsi\_address**

Scsi address of the disk. `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`).

**service\_instance**

Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is `None`.

CLI Example:

```
salt '*' vsphere.erase_disk_partitions scsi_address='vmhba0:C0:T0:L0'
salt '*' vsphere.erase_disk_partitions disk_id='naa.0000000000000001'
```

`salt.modules.vsphere.esxcli_cmd` (*cmd\_str, host=None, username=None, password=None, protocol=None, port=None, esxi\_hosts=None, credstore=None*)

Run an ESXCLI command directly on the host or list of hosts.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**cmd\_str**

The ESXCLI command to run. Note: This should not include the `-s`, `-u`, `-p`, `-h`, `--protocol`, or `--portnumber` arguments that are frequently passed when using a bare ESXCLI command from the command line. Those arguments are handled by this function via the other args and kwargs.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts**

If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi

machines.

**credstore**

Optionally set to path to the credential store file.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.esxcli_cmd my.esxi.host root bad-password
→ 'system coredump network get'

# Used for connecting to a vCenter Server
salt '*' vsphere.esxcli_cmd my.vcenter.location root bad-password
→ 'system coredump network get' esxi_hosts='[esxi-1.host.com, esxi-2.
→ host.com]'
```

`salt.modules.vsphere.get_advanced_configs`(*vm\_name*, *datacenter*, *service\_instance=None*)

Returns extra config parameters from a virtual machine advanced config list

**vm\_name**

Virtual machine name

**datacenter**

Datacenter name where the virtual machine is available

**service\_instance**

vCenter service instance for connection and configuration

`salt.modules.vsphere.get_coredump_network_config`(*host*, *username*, *password*, *protocol=None*,  
*port=None*, *esxi\_hosts=None*,  
*credstore=None*)

Retrieve information on ESXi or vCenter network dump collection and format it into a dictionary.

**host**

The location of the host.

**username**

The username used to login to the host, such as root.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts**

If host is a vCenter host, then use esxi\_hosts to execute this function on a list of one or more ESXi machines.

**credstore**

Optionally set to path to the credential store file.

**Returns**

A dictionary with the network configuration, or, if getting the network config failed, a an error message retrieved from the standard cmd.run\_all dictionary, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_coredump_network_config my.esxi.host root bad-
→ password

# Used for connecting to a vCenter Server
```

(continues on next page)

(continued from previous page)

```
salt '*' vsphere.get_coredump_network_config my.vcenter.location root bad-
↳password                esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_firewall_status` (*host, username, password, protocol=None, port=None, esxi\_hosts=None, credstore=None*)

Show status of all firewall rule sets.

**host**

The location of the host.

**username**

The username used to login to the host, such as root.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts**

If *host* is a vCenter host, then use *esxi\_hosts* to execute this function on a list of one or more ESXi machines.

**credstore**

Optionally set to path to the credential store file.

**Returns**

Nested dictionary with two toplevel keys `rulesets` and `success`. `success` will be True or False depending on query success. `rulesets` will list the rulesets and their statuses if `success` was true, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_firewall_status my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_firewall_status my.vcenter.location root bad-
↳password                esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_host_cache` (*service\_instance=None*)

Returns the host cache configuration on the proxy host.

**service\_instance**

Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.get_host_cache
```

`salt.modules.vsphere.get_host_datetime` (*host, username, password, protocol=None, port=None, host\_names=None, verify\_ssl=True*)

Get the date/time information for a given host or list of *host\_names*.

**host**

The location of the host.

**username**

The username used to login to the host, such as root.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names**

List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to get date/time information.

If `host_names` is not provided, the date/time information will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify\_ssl**

Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_host_datetime my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_host_datetime my.vcenter.location root bad-password
→      host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.get_ntp_config(host, username, password, protocol=None, port=None,
                                   host_names=None, verify_ssl=True)
```

Get the NTP configuration information for a given host or list of `host_names`.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names**

List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to get ntp configuration information.

If `host_names` is not provided, the NTP configuration will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify\_ssl**

Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_ntp_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
```

(continues on next page)

(continued from previous page)

```
salt '*' vsphere.get_ntp_config my.vcenter.location root bad-password
↳ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

**salt.modules.vsphere.get\_proxy\_type()**

Returns the proxy type retrieved either from the pillar or from the proxy minion's config. Returns <undefined> otherwise.

CLI Example:

```
salt '*' vsphere.get_proxy_type
```

**salt.modules.vsphere.get\_service\_instance\_via\_proxy** (*service\_instance=None*)

Returns a service instance to the proxied endpoint (vCenter/ESXi host).

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

---

**Note:** Should be used by state functions not invoked directly.

---

CLI Example:

See note above

**salt.modules.vsphere.get\_service\_policy** (*host, username, password, service\_name, protocol=None, port=None, host\_names=None, verify\_ssl=True*)

Get the service name's policy for a given host or list of hosts.

**host**

The location of the host.

**username**

The username used to login to the host, such as root.

**password**

The password used to login to the host.

**service\_name**

The name of the service for which to retrieve the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbt
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names**

List of ESXi host names. When the host, username, and password credentials are provided for a vCenter

Server, the `host_names` argument is required to tell vCenter the hosts for which to get service policy information.

If `host_names` is not provided, the service policy information will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

#### **verify\_ssl**

Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_service_policy my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_policy my.vcenter.location root bad-password
→ 'ntpd'          host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_service_running(host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True)`

Get the service name's running state for a given host or list of hosts.

#### **host**

The location of the host.

#### **username**

The username used to login to the host, such as `root`.

#### **password**

The password used to login to the host.

#### **service\_name**

The name of the service for which to retrieve the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

#### **protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

#### **port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

#### **host\_names**

List of ESXi host names. When the `host`, `username`, and `password` credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to get the service's running state.

If `host_names` is not provided, the service's running state will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

#### **verify\_ssl**

Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_service_running my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_running my.vcenter.location root bad-
→password 'ntpd'          host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_ssh_key`(*host, username, password, protocol=None, port=None, certificate\_verify=None*)

Retrieve the `authorized_keys` entry for root. This function only works for ESXi, not vCenter.

#### Parameters

- **host** -- The location of the ESXi Host
- **username** -- Username to connect as
- **password** -- Password for the ESXi web endpoint
- **protocol** -- defaults to https, can be http if ssl is disabled on ESXi
- **port** -- defaults to 443 for https
- **certificate\_verify** -- If true require that the SSL connection present a valid certificate. Default: True

#### Returns

True if upload is successful

CLI Example:

```
salt '*' vsphere.get_ssh_key my.esxi.host root bad-password certificate_
→verify=True
```

`salt.modules.vsphere.get_syslog_config`(*host, username, password, protocol=None, port=None, esxi\_hosts=None, credstore=None*)

Retrieve the syslog configuration.

#### host

The location of the host.

#### username

The username used to login to the host, such as root.

#### password

The password used to login to the host.

#### protocol

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

#### port

Optionally set to alternate port if the host is not using the default port. Default port is 443.

#### esxi\_hosts

If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

#### credstore

Optionally set to path to the credential store file.

#### Returns

Dictionary with keys and values corresponding to the syslog configuration, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_syslog_config my.esxi.host root bad-password
```

(continues on next page)

(continued from previous page)

```
# Used for connecting to a vCenter Server
salt '*' vsphere.get_syslog_config my.vcenter.location root bad-password
→      esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_vm`(*name*, *datacenter=None*, *vm\_properties=None*, *traversal\_spec=None*, *parent\_ref=None*, *service\_instance=None*)

Returns vm object properties.

**name**

Name of the virtual machine.

**datacenter**

Datacenter name

**vm\_properties**

List of vm properties.

**traversal\_spec**

Traversal Spec object(s) for searching.

**parent\_ref**

Container Reference object for searching under a given object.

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

`salt.modules.vsphere.get_vm_config`(*name*, *datacenter=None*, *objects=True*, *service\_instance=None*)

Queries and converts the virtual machine properties to the available format from the schema. If the objects attribute is True the config objects will have extra properties, like 'object' which will include the vim.vm.device.VirtualDevice, this is necessary for deletion and update actions.

**name**

Name of the virtual machine

**datacenter**

Datacenter's name where the virtual machine is available

**objects**

Indicates whether to return the vmware object properties (eg. object, key) or just the properties which can be set

**service\_instance**

vCenter service instance for connection and configuration

`salt.modules.vsphere.get_vm_config_file`(*name*, *datacenter*, *placement*, *datastore*, *service\_instance=None*)

Queries the virtual machine config file and returns vim.host.DatastoreBrowser.SearchResults object on success None on failure

**name**

Name of the virtual machine

**datacenter**

Datacenter name

**datastore**

Datastore where the virtual machine files are stored

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

`salt.modules.vsphere.get_vmotion_enabled`(*host*, *username*, *password*, *protocol=None*, *port=None*, *host\_names=None*, *verify\_ssl=True*)

Get the VMotion enabled status for a given host or a list of host\_names. Returns True if VMotion is enabled, False if it is not enabled.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**host\_names**

List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts to check if VMotion is enabled.

If `host_names` is not provided, the VMotion status will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify\_ssl**

Verify the SSL certificate. Default: `True`

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vmotion_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vmotion_enabled my.vcenter.location root bad-
password          host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_vsan_eligible_disks` (*host, username, password, protocol=None, port=None, host\_names=None, verify\_ssl=True*)

Returns a list of VSAN-eligible disks for a given host or list of `host_names`.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**host\_names**

List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts to check if any VSAN-eligible disks are available.

If `host_names` is not provided, the VSAN-eligible disks will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify\_ssl**

Verify the SSL certificate. Default: `True`

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vsan_eligible_disks my.esxi.host root bad-password
```

(continues on next page)

(continued from previous page)

```
# Used for connecting to a vCenter Server
salt '*' vsphere.get_vsan_eligible_disks my.vcenter.location root bad-
↳password          host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_vsan_enabled`(*host, username, password, protocol=None, port=None, host\_names=None, verify\_ssl=True*)

Get the VSAN enabled status for a given host or a list of `host_names`. Returns `True` if VSAN is enabled, `False` if it is not enabled, and `None` if a VSAN Host Config is unset, per host.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names**

List of ESXi host names. When the `host`, `username`, and `password` credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts to check if VSAN enabled.

If `host_names` is not provided, the VSAN status will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify\_ssl**

Verify the SSL certificate. Default: `True`

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vsan_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vsan_enabled my.vcenter.location root bad-password ✘
↳          host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.list_assigned_licenses`(*entity, entity\_display\_name, license\_keys=None, service\_instance=None*)

Lists the licenses assigned to an entity

**entity**

Dictionary representation of an entity. See `_get_entity` docstrings for format.

**entity\_display\_name**

Entity name used in logging

**license\_keys:**

List of license keys to be retrieved. Default is `None`.

**service\_instance**

Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is `None`.

CLI Example:

```
salt '*' vsphere.list_assigned_licenses
entity={type:cluster,datacenter:dc,cluster:cl}
entity_display_name=cl
```

`salt.modules.vsphere.list_attached_tags` (*object\_id*, *managed\_obj*='ClusterComputeResource', *server*=None, *username*=None, *password*=None, *service\_instance*=None, *verify\_ssl*=None, *ca\_bundle*=None)

List existing tags a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_attached_tags domain-c2283
```

#### Parameters

- **object\_id** (*str*) -- The identifier of the input object.
- **managed\_obj** (*str*) -- Classes that contain methods for creating and deleting resources typically contain a class attribute specifying the resource type for the resources being created and deleted.
- **server** (*basestring*) -- Target DNS or IP of vCenter center.
- **username** (*basestring*) -- Username associated with the vCenter center.
- **password** (*basestring*) -- Password associated with the vCenter center.
- **verify\_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca\_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

#### Returns

The list of all tag identifiers that correspond to the tags attached to the given object.

#### Return type

list of tags

#### Raise

Unauthorized if you do not have the privilege to read the object.

#### Raise

Unauthenticated if the user can not be authenticated.

`salt.modules.vsphere.list_capability_definitions` (*service\_instance*=None)

Returns a list of the metadata of all capabilities in the vCenter.

#### service\_instance

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_capabilities
```

`salt.modules.vsphere.list_cluster` (*datacenter*=None, *cluster*=None, *service\_instance*=None)

Returns a dict representation of an ESX cluster.

#### datacenter

Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.

#### cluster

Name of cluster. Ignored if already contained by proxy details. Default value is None.

#### service\_instance

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
# vcenter proxy
salt '*' vsphere.list_cluster datacenter=dc1 cluster=cl1

# esxdatacenter proxy
salt '*' vsphere.list_cluster cluster=cl1
```

(continues on next page)

(continued from previous page)

```
# esxcluster proxy
salt '*' vsphere.list_cluster
```

`salt.modules.vsphere.list_clusters` (*host, username, password, protocol=None, port=None, verify\_ssl=True*)

Returns a list of clusters for the specified host.

**host**

The location of the host.

**username**

The username used to login to the host, such as root.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**verify\_ssl**

Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_clusters 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_datacenters` (*host, username, password, protocol=None, port=None, verify\_ssl=True*)

Returns a list of datacenters for the specified host.

**host**

The location of the host.

**username**

The username used to login to the host, such as root.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**verify\_ssl**

Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_datacenters 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_datacenters_via_proxy` (*datacenter\_names=None, service\_instance=None*)

Returns a list of dict representations of VMware datacenters. Connection is done via the proxy details.

Supported proxies: esxdatacenter

**datacenter\_names**

List of datacenter names. Default is None.

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_datacenters_via_proxy
salt '*' vsphere.list_datacenters_via_proxy dc1
salt '*' vsphere.list_datacenters_via_proxy dc1,dc2
salt '*' vsphere.list_datacenters_via_proxy datacenter_names=[dc1, dc2]
```

`salt.modules.vsphere.list_datastore_clusters` (*host, username, password, protocol=None, port=None, verify\_ssl=True*)

Returns a list of datastore clusters for the specified host.

**host**

The location of the host.

**username**

The username used to login to the host, such as root.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**verify\_ssl**

Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_datastore_clusters 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_datastores` (*host, username, password, protocol=None, port=None, verify\_ssl=True*)

Returns a list of datastores for the specified host.

**host**

The location of the host.

**username**

The username used to login to the host, such as root.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**verify\_ssl**

Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_datastores 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_datastores_via_proxy` (*datastore\_names=None, backing\_disk\_ids=None, backing\_disk\_scsi\_addresses=None, service\_instance=None*)

Returns a list of dict representations of the datastores visible to the proxy object. The list of datastores can be filtered by datastore names, backing disk ids (canonical names) or backing disk scsi addresses.

Supported proxy types: esxi, esxcluster, esxdatacenter

**datastore\_names**

List of the names of datastores to filter on

**backing\_disk\_ids**

List of canonical names of the backing disks of the datastores to filter. Default is None.

**backing\_disk\_scsi\_addresses**

List of scsi addresses of the backing disks of the datastores to filter. Default is None.

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_datastores_via_proxy
salt '*' vsphere.list_datastores_via_proxy datastore_names=[ds1, ds2]
```

`salt.modules.vsphere.list_default_storage_policy_of_datastore` (*datastore*,  
*service\_instance=None*)

Returns a list of datastores assign the storage policies.

**datastore**

Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_default_storage_policy_of_datastore datastore=ds1
```

`salt.modules.vsphere.list_default_vsan_policy` (*service\_instance=None*)

Returns the default vsan storage policy.

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_default_vsan_policy
```

`salt.modules.vsphere.list_disk_partitions` (*disk\_id=None*, *scsi\_address=None*,  
*service\_instance=None*)

Lists the partitions on a disk. The disk can be specified either by the canonical name, or by the scsi\_address.

**disk\_id**

Canonical name of the disk. Either `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`).

**scsi\_address**

Scsi address of the disk. `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`).

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_disk_partitions scsi_address='vmhba0:C0:T0:L0'
```

(continues on next page)

(continued from previous page)

```
salt '*' vsphere.list_disk_partitions disk_id='naa.0000000000000001'
```

`salt.modules.vsphere.list_diskgroups` (*cache\_disk\_ids=None, service\_instance=None*)

Returns a list of disk group dict representation on an ESXi host. The list of disk groups can be filtered by the cache disks canonical names. If no filtering is applied, all disk groups are returned.

**cache\_disk\_ids:**

List of cache disk canonical names of the disk groups to be retrieved. Default is None.

**use\_proxy\_details**

Specify whether to use the proxy minion's details instead of the arguments

**service\_instance**

Service instance (*vim.ServiceInstance*) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_diskgroups
salt '*' vsphere.list_diskgroups cache_disk_ids='[naa.0000000000000001]'
```

`salt.modules.vsphere.list_disks` (*disk\_ids=None, scsi\_addresses=None, service\_instance=None*)

Returns a list of dict representations of the disks in an ESXi host. The list of disks can be filtered by disk canonical names or scsi addresses.

**disk\_ids:**

List of disk canonical names to be retrieved. Default is None.

**scsi\_addresses**

List of scsi addresses of disks to be retrieved. Default is None

**service\_instance**

Service instance (*vim.ServiceInstance*) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_disks
salt '*' vsphere.list_disks disk_ids='[naa.00, naa.001]'
salt '*' vsphere.list_disks
      scsi_addresses='[vmhba0:C0:T0:L0, vmhba1:C0:T0:L0]'
```

`salt.modules.vsphere.list_dvportgroups` (*dvs=None, portgroup\_names=None, service\_instance=None*)

Returns a list of distributed virtual switch portgroups. The list can be filtered by the portgroup names or by the DVS.

**dvs**

Name of the DVS containing the portgroups. Default value is None.

**portgroup\_names**

List of portgroup names to look for. If None, all portgroups are returned. Default value is None

**service\_instance**

Service instance (*vim.ServiceInstance*) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_dvportgroups
salt '*' vsphere.list_dvportgroups dvs=dvs1
salt '*' vsphere.list_dvportgroups portgroup_names=[pg1]
```

(continues on next page)

(continued from previous page)

```
salt '*' vsphere.list_dvportgroups dvs=dvs1 portgroup_names=[pg1]
```

`salt.modules.vsphere.list_dvs`(*host, username, password, protocol=None, port=None, verify\_ssl=True*)

Returns a list of distributed virtual switches for the specified host.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**verify\_ssl**

Verify the SSL certificate. Default: `True`

CLI Example:

```
salt '*' vsphere.list_dvs 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_dvss`(*datacenter=None, dvs\_names=None, service\_instance=None*)

Returns a list of distributed virtual switches (DVSs). The list can be filtered by the datacenter or DVS names.

**datacenter**

The datacenter to look for DVSs in. Default value is `None`.

**dvs\_names**

List of DVS names to look for. If `None`, all DVSs are returned. Default value is `None`.

CLI Example:

```
salt '*' vsphere.list_dvss
salt '*' vsphere.list_dvss dvs_names=[dvs1,dvs2]
```

`salt.modules.vsphere.list_folders`(*host, username, password, protocol=None, port=None, verify\_ssl=True*)

Returns a list of folders for the specified host.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**verify\_ssl**

Verify the SSL certificate. Default: `True`

CLI Example:

```
salt '*' vsphere.list_folders 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_hosts` (*host, username, password, protocol=None, port=None, verify\_ssl=True*)

Returns a list of hosts for the specified VMware environment.

**host**

The location of the host.

**username**

The username used to login to the host, such as root.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**verify\_ssl**

Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_hosts 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_hosts_via_proxy` (*hostnames=None, datacenter=None, cluster=None, service\_instance=None*)

Returns a list of hosts for the specified VMware environment. The list of hosts can be filtered by datacenter name and/or cluster name

**hostnames**

Hostnames to filter on.

**datacenter\_name**

Name of datacenter. Only hosts in this datacenter will be retrieved. Default is None.

**cluster\_name**

Name of cluster. Only hosts in this cluster will be retrieved. If a datacenter is not specified the first cluster with this name will be considered. Default is None.

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_hosts_via_proxy
```

```
salt '*' vsphere.list_hosts_via_proxy hostnames=[esxi1.example.com]
```

```
salt '*' vsphere.list_hosts_via_proxy datacenter=dc1 cluster=cluster1
```

`salt.modules.vsphere.list_licenses` (*service\_instance=None*)

Lists all licenses on a vCenter.

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_licenses
```

`salt.modules.vsphere.list_networks` (*host, username, password, protocol=None, port=None, verify\_ssl=True*)

Returns a list of networks for the specified host.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**verify\_ssl**

Verify the SSL certificate. Default: `True`

CLI Example:

```
salt '*' vsphere.list_networks 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_non_ssds` (*host, username, password, protocol=None, port=None, host\_names=None, verify\_ssl=True*)

Returns a list of Non-SSD disks for the given host or list of `host_names`.

---

**Note:** In the `pyVmomi StorageSystem`, `ScsiDisks` may, or may not have an `ssd` attribute. This attribute indicates if the `ScsiDisk` is SSD backed. As this option is optional, if a relevant disk in the `StorageSystem` does not have `ssd = true`, it will end up in the `non_ssds` list here.

---

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**host\_names**

List of ESXi host names. When the `host`, `username`, and `password` credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to retrieve Non-SSD disks.

If `host_names` is not provided, Non-SSD disks will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify\_ssl**

Verify the SSL certificate. Default: `True`

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.list_non_ssds my.esxi.host root bad-password
```

(continues on next page)

(continued from previous page)

```
# Used for connecting to a vCenter Server
salt '*' vsphere.list_non_ssds my.vcenter.location root bad-password
→ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.list_resourcepools` (*host, username, password, protocol=None, port=None, verify\_ssl=True*)

Returns a list of resource pools for the specified host.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**verify\_ssl**

Verify the SSL certificate. Default: `True`

CLI Example:

```
salt '*' vsphere.list_resourcepools 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_ssds` (*host, username, password, protocol=None, port=None, host\_names=None, verify\_ssl=True*)

Returns a list of SSDs for the given host or list of `host_names`.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names**

List of ESXi host names. When the `host`, `username`, and `password` credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to retrieve SSDs.

If `host_names` is not provided, SSDs will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify\_ssl**

Verify the SSL certificate. Default: `True`

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.list_ssds my.esxi.host root bad-password

# Used for connecting to a vCenter Server
```

(continues on next page)

(continued from previous page)

```
salt '*' vsphere.list_ssds my.vcenter.location root bad-password
↳host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.list_storage_policies` (*policy\_names=None, service\_instance=None*)

Returns a list of storage policies.

**policy\_names**

Names of policies to list. If None, all policies are listed. Default is None.

**service\_instance**

Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_storage_policies
salt '*' vsphere.list_storage_policies policy_names=[policy_name]
```

`salt.modules.vsphere.list_tag_categories` (*server=None, username=None, password=None, service\_instance=None, verify\_ssl=None, ca\_bundle=None*)

List existing categories a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_tag_categories
```

**Parameters**

- **server** (*basestring*) -- Target DNS or IP of vCenter center.
- **username** (*basestring*) -- Username associated with the vCenter center.
- **password** (*basestring*) -- Password associated with the vCenter center.
- **verify\_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca\_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

**Returns**

Value(s) of category\_id.

**Return type**

list of str

`salt.modules.vsphere.list_tags` (*server=None, username=None, password=None, service\_instance=None, verify\_ssl=None, ca\_bundle=None*)

List existing tags a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_tags
```

**Parameters**

- **server** (*basestring*) -- Target DNS or IP of vCenter center.
- **username** (*basestring*) -- Username associated with the vCenter center.
- **password** (*basestring*) -- Password associated with the vCenter center.
- **verify\_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca\_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

**Returns**

Value(s) of tag\_id.

**Return type**

list of str

`salt.modules.vsphere.list_uplink_dvportgroup` (*dvs*, *service\_instance=None*)

Returns the uplink portgroup of a distributed virtual switch.

**dvs**

Name of the DVS containing the portgroup.

**service\_instance**

Service instance (`vim.ServiceInstance`) of the vCenter. Default is `None`.

CLI Example:

```
salt '*' vsphere.list_uplink_dvportgroup dvs=dvs_name
```

`salt.modules.vsphere.list_vapps` (*host*, *username*, *password*, *protocol=None*, *port=None*, *verify\_ssl=True*)

Returns a list of vApps for the specified host.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**verify\_ssl**

Verify the SSL certificate. Default: `True`

CLI Example:

```
# List vapps from all minions
salt '*' vsphere.list_vapps 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_vms` (*host*, *username*, *password*, *protocol=None*, *port=None*, *verify\_ssl=True*)

Returns a list of VMs for the specified host.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**verify\_ssl**

Verify the SSL certificate. Default: `True`

CLI Example:

```
salt '*' vsphere.list_vms 1.2.3.4 root bad-password
```

`salt.modules.vsphere.power_off_vm` (*name*, *datacenter=None*, *service\_instance=None*)

Powers off a virtual machine specified by its name.

**name**

Name of the virtual machine

**datacenter**

Datacenter of the virtual machine

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.power_off_vm name=my_vm
```

`salt.modules.vsphere.power_on_vm`(*name*, *datacenter=None*, *service\_instance=None*)

Powers on a virtual machine specified by its name.

**name**

Name of the virtual machine

**datacenter**

Datacenter of the virtual machine

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.power_on_vm name=my_vm
```

`salt.modules.vsphere.register_vm`(*name*, *datacenter*, *placement*, *vmx\_path*, *service\_instance=None*)

Registers a virtual machine to the inventory with the given vmx file. Returns comments and change list

**name**

Name of the virtual machine

**datacenter**

Datacenter of the virtual machine

**placement**

Placement dictionary of the virtual machine, host or cluster

**vmx\_path:**

Full path to the vmx file, datastore name should be included

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

`salt.modules.vsphere.remove_capacity_from_diskgroup`(*cache\_disk\_id*, *capacity\_disk\_ids*,  
*data\_evacuation=True*,  
*safety\_checks=True*,  
*service\_instance=None*)

Remove capacity disks from the disk group with the specified cache disk.

**cache\_disk\_id**

The canonical name of the cache disk.

**capacity\_disk\_ids**

A list containing canonical names of the capacity disks to add.

**data\_evacuation**

Specifies whether to gracefully evacuate the data on the capacity disks before removing them from the disk group. Default value is True.

**safety\_checks**

Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.remove_capacity_from_diskgroup
  cache_disk_id='naa.0000000000000001'
  capacity_disk_ids='[naa.0000000000000002, naa.0000000000000003]'
```

`salt.modules.vsphere.remove_datastore` (*datastore*, *service\_instance=None*)

Removes a datastore. If multiple datastores an error is raised.

**datastore**

Datastore name

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.remove_datastore ds_name
```

`salt.modules.vsphere.remove_diskgroup` (*cache\_disk\_id*, *data\_accessibility=True*,  
*service\_instance=None*)

Remove the diskgroup with the specified cache disk.

**cache\_disk\_id**

The canonical name of the cache disk.

**data\_accessibility**

Specifies whether to ensure data accessibility. Default value is True.

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.remove_diskgroup cache_disk_id='naa.0000000000000001'
```

`salt.modules.vsphere.remove_dvportgroup` (*portgroup*, *dvs*, *service\_instance=None*)

Removes a distributed virtual portgroup.

**portgroup**

Name of the portgroup to be removed.

**dvs**

Name of the DVS containing the portgroups.

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.remove_dvportgroup portgroup=pg1 dvs=dvs1
```

`salt.modules.vsphere.rename_datastore` (*datastore\_name*, *new\_datastore\_name*,  
*service\_instance=None*)

Renames a datastore. The datastore needs to be visible to the proxy.

**datastore\_name**

Current datastore name.

**new\_datastore\_name**

New datastore name.

**service\_instance**

Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.rename_datastore old_name new_name
```

`salt.modules.vsphere.reset_syslog_config`(*host, username, password, protocol=None, port=None, syslog\_config=None, esxi\_hosts=None, credstore=None*)

Reset the syslog service to its default settings.

Valid `syslog_config` values are `logdir`, `loghost`, `logdir-unique`, `default-rotate`, `default-size`, `default-timeout`, or `all` for all of these.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**syslog\_config**

List of parameters to reset, provided as a comma-delimited string, or `'all'` to reset all syslog configuration parameters. Required.

**esxi\_hosts**

If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore**

Optionally set to path to the credential store file.

**Returns**

Dictionary with a top-level key of `'success'` which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

---

**Note:** `syslog_config` can be passed as a quoted, comma-separated string. See CLI Example for details.

---

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.reset_syslog_config my.esxi.host root bad-password
→      syslog_config='logdir,loghost'

# Used for connecting to a vCenter Server
salt '*' vsphere.reset_syslog_config my.vcenter.location root bad-
→password      syslog_config='logdir,loghost' esxi_hosts='[esxi-1.
→host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.service_restart`(*host, username, password, service\_name, protocol=None, port=None, host\_names=None, verify\_ssl=True*)

Restart the named service for the given host or list of hosts.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**service\_name**

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names**

List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to restart the service.

If `host_names` is not provided, the service will be restarted for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify\_ssl**

Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.service_restart my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_restart my.vcenter.location root bad-password
→ 'ntpd'          host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.service_start`(*host, username, password, service\_name, protocol=None, port=None, host\_names=None, verify\_ssl=True*)

Start the named service for the given host or list of hosts.

**host**

The location of the host.

**username**

The username used to login to the host, such as root.

**password**

The password used to login to the host.

**service\_name**

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd

- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names**

List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to start the service.

If `host_names` is not provided, the service will be started for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify\_ssl**

Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.service_start my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_start my.vcenter.location root bad-password 'ntpd'
→ '          host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.service_stop`(*host, username, password, service\_name, protocol=None, port=None, host\_names=None, verify\_ssl=True*)

Stop the named service for the given host or list of hosts.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**service\_name**

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names**

List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to stop the service.

If `host_names` is not provided, the service will be stopped for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify\_ssl**

Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.service_stop my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_stop my.vcenter.location root bad-password 'ssh'
→      host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.set_advanced_configs`(*vm\_name*, *datacenter*, *advanced\_configs*,  
*service\_instance=None*)

Appends extra config parameters to a virtual machine advanced config list

**vm\_name**

Virtual machine name

**datacenter**

Datacenter name where the virtual machine is available

**advanced\_configs**

Dictionary with advanced parameter key value pairs

**service\_instance**

vCenter service instance for connection and configuration

`salt.modules.vsphere.set_coredump_network_config`(*host*, *username*, *password*, *dump\_ip*,  
*protocol=None*, *port=None*,  
*host\_vnic='vmk0'*, *dump\_port=6500*,  
*esxi\_hosts=None*, *credstore=None*)

Set the network parameters for a network coredump collection. Note that ESXi requires that the dumps first be enabled (see `coredump_network_enable`) before these parameters may be set.

**host**

The location of the host.

**username**

The username used to login to the host, such as root.

**password**

The password used to login to the host.

**dump\_ip**

IP address of host that will accept the dump.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts**

If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**host\_vnic**

Host VNIC port through which to communicate. Defaults to vmk0.

**dump\_port**

TCP port to use for the dump, defaults to 6500.

**credstore**

Optionally set to path to the credential store file.

**Returns**

A standard `cmd.run_all` dictionary with a `success` key added, per host. `success` will be `True` if the set succeeded, `False` otherwise.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.set_coredump_network_config my.esxi.host root bad-
↳password 'dump_ip.host.com'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_coredump_network_config my.vcenter.location root bad-
↳password 'dump_ip.host.com' esxi_hosts='[esxi-1.host.com,
↳esxi-2.host.com]'
```

`salt.modules.vsphere.set_ntp_config`(*host, username, password, ntp\_servers, protocol=None, port=None, host\_names=None, verify\_ssl=True*)

Set NTP configuration for a given host or list of `host_names`.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**ntp\_servers**

A list of servers that should be added to and configured for the specified host's NTP configuration.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names**

List of ESXi host names. When the `host`, `username`, and `password` credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts to configure ntp servers.

If `host_names` is not provided, the NTP servers will be configured for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify\_ssl**

Verify the SSL certificate. Default: `True`

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.ntp_configure my.esxi.host root bad-password '[192.174.1.
↳100, 192.174.1.200]'
```

```
# Used for connecting to a vCenter Server
salt '*' vsphere.ntp_configure my.vcenter.location root bad-password
↳'[192.174.1.100, 192.174.1.200]' host_names='[esxi-1.host.com,
↳esxi-2.host.com]'
```

`salt.modules.vsphere.set_service_policy` (*host, username, password, service\_name, service\_policy, protocol=None, port=None, host\_names=None, verify\_ssl=True*)

Set the service name's policy for a given host or list of hosts.

**host**

The location of the host.

**username**

The username used to login to the host, such as root.

**password**

The password used to login to the host.

**service\_name**

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbt
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

**service\_policy**

The policy to set for the service. For example, 'automatic'.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names**

List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host\_names argument is required to tell vCenter the hosts for which to set the service policy.

If host\_names is not provided, the service policy information will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify\_ssl**

Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.set_service_policy my.esxi.host root bad-password 'ntpd'
→ 'automatic'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_service_policy my.vcenter.location root bad-password
→ 'ntpd' 'automatic' host_names='[esxi-1.host.com, esxi-2.host.
→ com]'
```

`salt.modules.vsphere.set_syslog_config` (*host, username, password, syslog\_config, config\_value, protocol=None, port=None, firewall=True, reset\_service=True, esxi\_hosts=None, credstore=None*)

Set the specified syslog configuration parameter. By default, this function will reset the syslog service after the configuration is set.

**host**

ESXi or vCenter host to connect to.

**username**

User to connect as, usually root.

**password**

Password to connect with.

**syslog\_config**

Name of parameter to set (corresponds to the command line switch for esxcli without the double dashes (--))

Valid `syslog_config` values are `logdir`, `loghost`, `default-rotate``, ``default-size`, `default-timeout`, and `logdir-unique`.

**config\_value**

Value for the above parameter. For `loghost`, URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas.

(reference: <https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html>)

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**firewall**

Enable the firewall rule set for syslog. Defaults to `True`.

**reset\_service**

After a successful parameter set, reset the service. Defaults to `True`.

**esxi\_hosts**

If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore**

Optionally set to path to the credential store file.

**Returns**

Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.set_syslog_config my.esxi.host root bad-password ❌
→ loghost ssl://localhost:5432,tcp://10.1.0.1:1514

# Used for connecting to a vCenter Server
salt '*' vsphere.set_syslog_config my.vcenter.location root bad-password ❌
→ loghost ssl://localhost:5432,tcp://10.1.0.1:1514 ❌
→ esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.syslog_service_reload`(*host*, *username*, *password*, *protocol=None*, *port=None*, *esxi\_hosts=None*, *credstore=None*)

Reload the syslog service so it will pick up any changes.

**host**

The location of the host.

**username**

The username used to login to the host, such as root.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi\_hosts**

If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore**

Optionally set to path to the credential store file.

**Returns**

A standard `cmd.run_all` dictionary. This dictionary will at least have a `retcode` key. If `retcode` is 0 the command was successful.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.syslog_service_reload my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.syslog_service_reload my.vcenter.location root bad-
→password                esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.system_info`(*host, username, password, protocol=None, port=None, verify\_ssl=True*)

Return system information about a VMware environment.

**host**

The location of the host.

**username**

The username used to login to the host, such as root.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**verify\_ssl**

Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.system_info 1.2.3.4 root bad-password
```

`salt.modules.vsphere.test_vcenter_connection`(*service\_instance=None*)

Checks if a connection is to a vCenter

CLI Example:

```
salt '*' vsphere.test_vcenter_connection
```

`salt.modules.vsphere.unregister_vm`(*name*, *datacenter*, *placement=*None, *power\_off=*False, *service\_instance=*None)

Unregisters a virtual machine defined by name and placement

**name**

Name of the virtual machine

**datacenter**

Datacenter of the virtual machine

**placement**

Placement information of the virtual machine

**service\_instance**

vCenter service instance for connection and configuration

CLI Example:

```
salt '*' vsphere.unregister_vm name=my_vm datacenter=my_datacenter
```

`salt.modules.vsphere.update_cluster`(*cluster\_dict*, *datacenter=*None, *cluster=*None, *service\_instance=*None)

Updates a cluster.

**config\_dict**

Dictionary with the config values of the new cluster.

**datacenter**

Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.

**cluster**

Name of cluster. Ignored if already contained by proxy details. Default value is None.

**service\_instance**

Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

CLI Example:

```
# esxdatacenter proxy
salt '*' vsphere.update_cluster cluster_dict=$cluster_dict cluster=cl1

# esxcluster proxy
salt '*' vsphere.update_cluster cluster_dict=$cluster_dict
```

`salt.modules.vsphere.update_dvportgroup`(*portgroup\_dict*, *portgroup*, *dvs*, *service\_instance=*True)

Updates a distributed virtual portgroup.

**portgroup\_dict**

Dictionary with the values the portgroup should be update with (example in `salt.states.dvs`).

**portgroup**

Name of the portgroup to be updated.

**dvs**

Name of the DVS containing the portgroups.

**service\_instance**

Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.update_dvportgroup portgroup_dict=<dict>
    portgroup=pg1

salt '*' vsphere.update_dvportgroup portgroup_dict=<dict>
    portgroup=pg1 dvs=dvs1
```

`salt.modules.vsphere.update_dvs`(*dvs\_dict*, *dvs*, *service\_instance=*None)

Updates a distributed virtual switch (DVS).

**Note: Updating the product info, capability, uplinks of a DVS is not supported so the corresponding entries in `dvs_dict` will be ignored.**

**dvs\_dict**

Dictionary with the values the DVS should be update with (example in `salt.states.dvs`)

**dvs**

Name of the DVS to be updated.

**service\_instance**

Service instance (`vim.ServiceInstance`) of the vCenter. Default is `None`.

CLI Example:

```
salt '*' vsphere.update_dvs dvs_dict=$dvs_dict dvs=dvs1
```

`salt.modules.vsphere.update_host_datetime` (*host, username, password, protocol=None, port=None, host\_names=None, verify\_ssl=True*)

Update the date/time on the given host or list of `host_names`. This function should be used with caution since network delays and execution delays can result in time skews.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**host\_names**

List of ESXi host names. When the `host`, `username`, and `password` credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts should update their date/time.

If `host_names` is not provided, the date/time will be updated for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify\_ssl**

Verify the SSL certificate. Default: `True`

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.update_date_time my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.update_date_time my.vcenter.location root bad-password
→      host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.update_host_password` (*host, username, password, new\_password, protocol=None, port=None, verify\_ssl=True*)

Update the password for a given host.

---

**Note:** Currently only works with connections to ESXi hosts. Does not work with vCenter servers.

---

**host**

The location of the ESXi host.

**username**

The username used to login to the ESXi host, such as `root`.

**password**

The password used to login to the ESXi host.

**new\_password**

The new password that will be updated for the provided username on the ESXi host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**verify\_ssl**

Verify the SSL certificate. Default: `True`

CLI Example:

```
salt '*' vsphere.update_host_password my.esxi.host root original-bad-
↳password new-bad-password
```

`salt.modules.vsphere.update_storage_policy`(*policy*, *policy\_dict*, *service\_instance=None*)

Updates a storage policy.

Supported capability types: scalar, set, range.

**policy**

Name of the policy to update.

**policy\_dict**

Dictionary containing the changes to apply to the policy. (example in `salt.states.pbm`)

**service\_instance**

Service instance (`vim.ServiceInstance`) of the vCenter. Default is `None`.

CLI Example:

```
salt '*' vsphere.update_storage_policy policy='policy name'
policy_dict="$policy_dict"
```

`salt.modules.vsphere.update_vm`(*vm\_name*, *cpu=None*, *memory=None*, *image=None*, *version=None*, *interfaces=None*, *disks=None*, *scsi\_devices=None*, *serial\_ports=None*, *datacenter=None*, *datastore=None*, *cd\_dvd\_drives=None*, *sata\_controllers=None*, *advanced\_configs=None*, *service\_instance=None*)

Updates the configuration of the virtual machine if the config differs

**vm\_name**

Virtual Machine name to be updated

**cpu**

CPU configuration options

**memory**

Memory configuration options

**version**

Virtual machine container hardware version

**image**

Virtual machine guest OS version identifier `VirtualMachineGuestOsIdentifier`

**interfaces**

Network interfaces configuration options

**disks**

Disks configuration options

<b>scsi_devices</b>	SCSI devices configuration options
<b>serial_ports</b>	Serial ports configuration options
<b>datacenter</b>	Datacenter where the virtual machine is available
<b>datastore</b>	Datastore where the virtual machine config files are available
<b>cd_dvd_drives</b>	CD/DVD drives configuration options
<b>advanced_config</b>	Advanced config parameters to be set for the virtual machine
<b>service_instance</b>	vCenter service instance for connection and configuration

`salt.modules.vsphere.upload_ssh_key` (*host, username, password, ssh\_key=None, ssh\_key\_file=None, protocol=None, port=None, certificate\_verify=None*)

Upload an ssh key for root to an ESXi host via http PUT. This function only works for ESXi, not vCenter. Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

#### Parameters

- **host** -- The location of the ESXi Host
- **username** -- Username to connect as
- **password** -- Password for the ESXi web endpoint
- **ssh\_key** -- Public SSH key, will be added to `authorized_keys` on ESXi
- **ssh\_key\_file** -- File containing the SSH key. Use 'ssh\_key' or `ssh_key_file`, but not both.
- **protocol** -- defaults to https, can be http if ssl is disabled on ESXi
- **port** -- defaults to 443 for https
- **certificate\_verify** -- If true require that the SSL connection present a valid certificate. Default: True

#### Returns

Dictionary with a 'status' key, True if upload is successful. If upload is unsuccessful, 'status' key will be False and an 'Error' key will have an informative message.

CLI Example:

```
salt '*' vsphere.upload_ssh_key my.esxi.host root bad-password ssh_key_
→file='/etc/salt/my_keys/my_key.pub'
```

`salt.modules.vsphere.vmotion_disable` (*host, username, password, protocol=None, port=None, host\_names=None, verify\_ssl=True*)

Disable vMotion for a given host or list of `host_names`.

#### host

The location of the host.

#### username

The username used to login to the host, such as root.

#### password

The password used to login to the host.

#### protocol

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

#### port

Optionally set to alternate port if the host is not using the default port. Default port is 443.

#### host\_names

List of ESXi host names. When the host, username, and password credentials are provided for a vCenter

Server, the `host_names` argument is required to tell vCenter which hosts should disable VMotion.

If `host_names` is not provided, VMotion will be disabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

#### `verify_ssl`

Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_disable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_disable my.vcenter.location root bad-password
↪      host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.vmotion_enable` (*host, username, password, protocol=None, port=None, host\_names=None, device='vmk0', verify\_ssl=True*)

Enable vMotion for a given host or list of `host_names`.

#### `host`

The location of the host.

#### `username`

The username used to login to the host, such as `root`.

#### `password`

The password used to login to the host.

#### `protocol`

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

#### `port`

Optionally set to alternate port if the host is not using the default port. Default port is 443.

#### `host_names`

List of ESXi host names. When the `host`, `username`, and `password` credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts should enable VMotion.

If `host_names` is not provided, VMotion will be enabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

#### `device`

The device that uniquely identifies the VirtualNic that will be used for VMotion for each host. Defaults to `vmk0`.

#### `verify_ssl`

Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_enable my.vcenter.location root bad-password
↪      host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.vsan_add_disks` (*host, username, password, protocol=None, port=None, host\_names=None, verify\_ssl=True*)

Add any VSAN-eligible disks to the VSAN System for the given host or list of `host_names`.

#### `host`

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**host\_names**

List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts need to add any VSAN-eligible disks to the host's VSAN system.

If `host_names` is not provided, VSAN-eligible disks will be added to the hosts's VSAN system for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify\_ssl**

Verify the SSL certificate. Default: `True`

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_add_disks my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_add_disks my.vcenter.location root bad-password
→ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.vsan_disable` (*host, username, password, protocol=None, port=None, host\_names=None, verify\_ssl=True*)

Disable VSAN for a given host or list of `host_names`.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**host\_names**

List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts should disable VSAN.

If `host_names` is not provided, VSAN will be disabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify\_ssl**

Verify the SSL certificate. Default: `True`

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_disable my.esxi.host root bad-password
```

(continues on next page)

(continued from previous page)

```
# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_disable my.vcenter.location root bad-password
→ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.vsan_enable`(*host, username, password, protocol=None, port=None, host\_names=None, verify\_ssl=True*)

Enable VSAN for a given host or list of `host_names`.

**host**

The location of the host.

**username**

The username used to login to the host, such as `root`.

**password**

The password used to login to the host.

**protocol**

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**

Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host\_names**

List of ESXi host names. When the `host`, `username`, and `password` credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts should enable VSAN.

If `host_names` is not provided, VSAN will be enabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify\_ssl**

Verify the SSL certificate. Default: `True`

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_enable my.vcenter.location root bad-password
→ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

## 26.6.478 salt.modules.webutil

Support for `htpasswd` command. Requires the `apache2-utils` package for Debian-based distros.

New in version 2014.1.0.

The functions here will load inside the `webutil` module. This allows other functions that don't use `htpasswd` to use the `webutil` module name.

`salt.modules.webutil.useradd`(*pwfile, user, password, opts="", runas=None*)

Add a user to `htpasswd` file using the `htpasswd` command. If the `htpasswd` file does not exist, it will be created.

**pwfile**

Path to `htpasswd` file

**user**

User name

**password**

User password

**opts**

Valid options that can be passed are:

- *n* Don't update file; display results on stdout.
- *m* Force MD5 encryption of the password (default).
- *d* Force CRYPT encryption of the password.
- *p* Do not encrypt the password (plaintext).
- *s* Force SHA encryption of the password.

**runas**

The system user to run htpasswd command with

CLI Examples:

```
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpassword
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpass opts=ns
```

`salt.modules.webutil.userdel` (*pwfile*, *user*, *runas=None*, *all\_results=False*)

Delete a user from the specified htpasswd file.

**pwfile**

Path to htpasswd file

**user**

User name

**runas**

The system user to run htpasswd command with

**all\_results**

Return stdout, stderr, and retcode, not just stdout

CLI Examples:

```
salt '*' webutil.userdel /etc/httpd/htpasswd larry
```

`salt.modules.webutil.verify` (*pwfile*, *user*, *password*, *opts=""*, *runas=None*)

Return True if the htpasswd file exists, the user has an entry, and their password matches.

**pwfile**

Fully qualified path to htpasswd file

**user**

User name

**password**

User password

**opts**

Valid options that can be passed are:

- *m* Force MD5 encryption of the password (default).
- *d* Force CRYPT encryption of the password.
- *p* Do not encrypt the password (plaintext).
- *s* Force SHA encryption of the password.

**runas**

The system user to run htpasswd command with

CLI Examples:

```
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword opts=ns
```

## 26.6.479 salt.modules.win\_appx

### Manage provisioned apps

New in version 3007.0.

Provisioned apps are part of the image and are installed for every user the first time the user logs on. Provisioned apps are also updated and sometimes reinstalled when the system is updated.

Apps removed with this module will remove the app for all users and deprovision the app. Deprovisioned apps will neither be installed for new users nor will they be upgraded.

An app removed with this module can only be re-provisioned on the machine, but it can't be re-installed for all users. Also, once a package has been deprovisioned, the only way to reinstall it is to download the package. This is difficult. The steps are outlined below:

1. **Obtain the Microsoft Store URL for the app:**
  - Open the page for the app in the Microsoft Store
  - Click the share button and copy the URL
2. **Look up the packages on <https://store.rg-adguard.net/>:**
  - Ensure URL (link) is selected in the first dropdown
  - Paste the URL in the search field
  - Ensure Retail is selected in the 2nd dropdown
  - Click the checkmark button

This should return a list of URLs for the package and all dependencies for all architectures. Download the package and all dependencies for your system architecture. These will usually have one of the following file extensions:

- .appx
- .appxbundle
- .msix
- .msixbundle

Dependencies will need to be installed first.

Not all packages can be found this way, but it seems like most of them can.

Use the `appx.install` function to provision the new app.

`salt.modules.win_appx.install(package)`

This function uses `dism` to provision a package. This means that it will be made a part of the online image and added to new users on the system. If a package has dependencies, those must be installed first.

If a package installed using this function has been deprovisioned previously, the registry entry marking it as deprovisioned will be removed.

---

**Note:** There is no `appx.present` state. Instead, use the `dism.provisioned_package_installed` state.

---

#### Parameters

**package** (*str*) -- The full path to the package to install. Can be one of the following:

- .appx or .appxbundle
- .msix or .msixbundle

- .ppkg

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt "*" appx.install "C:\Temp\Microsoft.ZuneMusic.msixbundle"
```

```
salt.modules.win_appx.list_(query=None, field='Name', include_store=False, frameworks=False,
                             bundles=True)
```

Get a list of Microsoft Store packages installed on the system.

**Parameters**

- **query** (*str*) -- The query string to use to filter packages to be listed. The string can match multiple packages. `None` will return all packages. Here are some example strings:
  - `*teams*` - Returns Microsoft Teams
  - `*zune*` - Returns Windows Media Player and ZuneVideo
  - `*zuneMusic*` - Only returns Windows Media Player
  - `*xbox*` - Returns all xbox packages, there are 5 by default
  - `*` - Returns everything but the Microsoft Store, unless `include_store=True`
- **field** (*str*) -- This function returns a list of packages on the system. It can display a short name or a full name. If `None` is passed, a dictionary will be returned with some common fields. The default is `Name`. Valid options are any fields returned by the powershell command `Get-AppxPackage`. Here are some useful fields:
  - `Name`
  - `Version`
  - `PackageFullName`
  - `PackageFamilyName`
- **include\_store** (*bool*) -- Include the Microsoft Store in the results. Default is `False`
- **frameworks** (*bool*) -- Include frameworks in the results. Default is `False`
- **bundles** (*bool*) -- If `True`, this will return application bundles only. If `False`, this will return individual packages only, even if they are part of a bundle.

**Returns**

A list of packages ordered by the string passed in field list: A list of dictionaries of package information if field is `None`

**Return type**

list

**Raises**

**CommandExecutionError** -- If an error is encountered retrieving packages

CLI Example:

```
# List installed apps that contain the word "candy"
salt '*' appx.list *candy*

# Return more information about the package
salt '*' appx.list *candy* field=None

# List all installed apps, including the Microsoft Store
salt '*' appx.list include_store=True
```

(continues on next page)

(continued from previous page)

```
# List all installed apps, including frameworks
salt '*' appx.list frameworks=True

# List all installed apps that are bundles
salt '*' appx.list bundles=True
```

`salt.modules.win_appx.list_deprovisioned(query=None)`

When an app is deprovisioned, a registry key is created that will keep it from being reinstalled during a major system update. This function returns a list of keys for apps that have been deprovisioned.

#### Parameters

**query** (*str*) -- The query string to use to filter packages to be listed. The string can match multiple packages. None will return all packages. Here are some example strings:

- `*teams*` - Returns Microsoft Teams
- `*zune*` - Returns Windows Media Player and ZuneVideo
- `*zuneMusic*` - Only returns Windows Media Player
- `*xbox*` - Returns all xbox packages, there are 5 by default
- `*` - Returns everything but the Microsoft Store, unless `include_store=True`

#### Returns

A list of packages matching the query criteria

#### Return type

list

CLI Example:

```
salt "*" appx.list_deprovisioned *zune*
```

`salt.modules.win_appx.remove(query=None, include_store=False, frameworks=False, deprovision_only=False)`

Removes Microsoft Store packages from the system. If the package is part of a bundle, the entire bundle will be removed.

This function removes the package for all users on the system. It also deprovisions the package so that it isn't re-installed by later system updates. To only deprovision a package and not remove it for all users, set `deprovision_only=True`.

#### Parameters

- **query** (*str*) -- The query string to use to select the packages to be removed. If the string matches multiple packages, they will all be removed. Here are some example strings:
  - `*teams*` - Remove Microsoft Teams
  - `*zune*` - Remove Windows Media Player and ZuneVideo
  - `*zuneMusic*` - Only remove Windows Media Player
  - `*xbox*` - Remove all xbox packages, there are 5 by default
  - `*` - Remove everything but the Microsoft Store, unless `include_store=True`

---

**Note:** Use the `appx.list` function to make sure your query is returning what you expect. Then use the same query to remove those packages

---

- **include\_store** (*bool*) -- Include the Microsoft Store in the results of the query to be removed. Use this with caution. It is difficult to reinstall the Microsoft Store once it has been removed with this function. Default is `False`
- **frameworks** (*bool*) -- Include frameworks in the results of the query to be removed. Default is `False`
- **deprovision\_only** (*bool*) -- Only deprovision the package. The package will be

removed from the current user and added to the list of deprovisioned packages. The package will not be re-installed in future system updates. New users of the system will not have the package installed. However, the package will still be installed for existing users. Default is `False`

**Returns**

True if successful, None if no packages found

**Return type**

bool

**Raises**

**CommandExecutionError** -- On errors encountered removing the package

CLI Example:

```
salt "*" appx.remove *candy*
```

## 26.6.480 salt.modules.win\_auditpol

A salt module for modifying the audit policies on the machine

Though this module does not set group policy for auditing, it displays how all auditing configuration is applied on the machine, either set directly or via local or domain group policy.

New in version 2018.3.4.

New in version 2019.2.1.

This module allows you to view and modify the audit settings as they are applied on the machine. The audit settings are broken down into nine categories:

- Account Logon
- Account Management
- Detailed Tracking
- DS Access
- Logon/Logoff
- Object Access
- Policy Change
- Privilege Use
- System

The `get_settings` function will return the subcategories for all nine of the above categories in one dictionary along with their auditing status.

To modify a setting you only need to specify the subcategory name and the value you wish to set. Valid settings are:

- No Auditing
- Success
- Failure
- Success and Failure

CLI Example:

```

# Get current state of all audit settings
salt * auditpol.get_settings

# Get the current state of all audit settings in the "Account Logon"
# category
salt * auditpol.get_settings category="Account Logon"

# Get current state of the "Credential Validation" setting
salt * auditpol.get_setting name="Credential Validation"

# Set the state of the "Credential Validation" setting to Success and
# Failure
salt * auditpol.set_setting name="Credential Validation" value="Success and
→Failure"

# Set the state of the "Credential Validation" setting to No Auditing
salt * auditpol.set_setting name="Credential Validation" value="No Auditing"

```

`salt.modules.win_auditpol.get_setting(name)`

Get the current configuration for the named audit setting

**Parameters**

**name** (*str*) -- The name of the setting to retrieve

**Returns**

The current configuration for the named setting

**Return type**

*str*

**Raises**

- **KeyError** -- On invalid setting name
- **CommandExecutionError** -- If an error is encountered retrieving the settings

CLI Example:

```

# Get current state of the "Credential Validation" setting
salt * auditpol.get_setting "Credential Validation"

```

`salt.modules.win_auditpol.get_settings(category='All')`

Get the current configuration for all audit settings specified in the category

**Parameters**

**category** (*str*) -- One of the nine categories to return. Can also be All to return the settings for all categories. Valid options are:

- Account Logon
- Account Management
- Detailed Tracking
- DS Access
- Logon/Logoff
- Object Access
- Policy Change
- Privilege Use
- System
- All

Default value is All

**Returns**

A dictionary containing all subcategories for the specified category along with their current configuration

**Return type**

dict

**Raises**

- **KeyError** -- On invalid category
- **CommandExecutionError** -- If an error is encountered retrieving the settings

CLI Example:

```
# Get current state of all audit settings
salt * auditpol.get_settings

# Get the current state of all audit settings in the "Account Logon"
# category
salt * auditpol.get_settings "Account Logon"
```

`salt.modules.win_auditpol.set_setting(name, value)`

Set the configuration for the named audit setting

**Parameters**

- **name** (*str*) -- The name of the setting to configure
- **value** (*str*) -- The configuration for the named value. Valid options are:
  - No Auditing
  - Success
  - Failure
  - Success and Failure

**Returns**

True if successful

**Return type**

bool

**Raises**

- **KeyError** -- On invalid name or value
- **CommandExecutionError** -- If an error is encountered modifying the setting

CLI Example:

```
# Set the state of the "Credential Validation" setting to Success and
# Failure
salt * auditpol.set_setting "Credential Validation" "Success and Failure"

# Set the state of the "Credential Validation" setting to No Auditing
salt * auditpol.set_setting "Credential Validation" "No Auditing"
```

**26.6.481 salt.modules.win\_autoruns**

Module for listing programs that automatically run on startup (very alpha...not tested on anything but my Win 7x64)

`salt.modules.win_autoruns.list_()`

Get a list of automatically running programs

CLI Example:

```
salt '*' autoruns.list
```

## 26.6.482 salt.modules.win\_certutil

This module allows you to install certificates into the windows certificate manager.

```
salt '*' certutil.add_store salt://cert.cer "TrustedPublisher"
```

**salt.modules.win\_certutil.add\_store** (*source, store, retcode=False, saltenv='base'*)

Add the cert to the given Certificate Store

**source (str):**

The source certificate file. This is either the path to a local file or a file from the file server in the form of salt://path/to/file

**store (str):**

The certificate store to add the certificate to

**retcode (bool):**

If True, return the retcode instead of stdout. Default is False

**saltenv (str):**

The salt environment to use. This is ignored if the path is local

CLI Example:

```
salt '*' certutil.add_store salt://cert.cer TrustedPublisher
salt '*' certutil.add_store C:\path\to\local.cer TrustedPublisher
```

**salt.modules.win\_certutil.del\_store** (*source, store, retcode=False, saltenv='base'*)

Delete the cert from the given Certificate Store

**source (str):**

The source certificate file. This is either the path to a local file or a file from the file server in the form of salt://path/to/file

**store (str):**

The certificate store to delete the certificate from

**retcode (bool):**

If True, return the retcode instead of stdout. Default is False

**saltenv (str):**

The salt environment to use. This is ignored if the path is local

CLI Example:

```
salt '*' certutil.del_store salt://cert.cer TrustedPublisher
salt '*' certutil.del_store C:\path\to\local.cer TrustedPublisher
```

**salt.modules.win\_certutil.get\_cert\_serial** (*cert\_file, saltenv='base'*)

Get the serial number of a certificate file

**cert\_file (str):**

The certificate file to find the serial for. Can be a local file or a file on the file server (salt://)

**Returns**

The serial number of the certificate if found, otherwise None

**Return type**

str

CLI Example:

```
salt '*' certutil.get_cert_serial <certificate name>
```

**salt.modules.win\_certutil.get\_stored\_cert\_serials** (*store*)

Get all of the certificate serials in the specified store

**store (str):**

The store to get all the certificate serials from

**Returns**

A list of serial numbers found, or an empty list if none found

**Return type**

list

CLI Example:

```
salt '*' certutil.get_stored_cert_serials <store>
```

## 26.6.483 salt.modules.win\_dacl

Manage DACLs on Windows

**depends**

- winreg Python module

**salt.modules.win\_dacl.add\_ace** (*path, objectType, user, permission, acetype, propagation*)

add an ace to an object

**path:** path to the object (i.e. c:\temp\file, HKEY\_LOCAL\_MACHINE\SOFTWARE\KEY, etc) **user:** user to add  
**permission:** permissions for the user **acetype:** either allow/deny for each user/permission (ALLOW, DENY)  
**propagation:** how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

CLI Example:

```
allow domain\fakeuser full control on HKLM\\SOFTWARE\\somekey, propagate
→to this key and subkeys
  salt 'myminion' win_dacl.add_ace 'HKEY_LOCAL_MACHINE\\SOFTWARE\\
→somekey' 'Registry' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS
→'
```

**salt.modules.win\_dacl.check\_ace** (*path, objectType, user, permission=None, acetype=None, propagation=None, exactPermissionMatch=False*)

Checks a path to verify the ACE (access control entry) specified exists

**Parameters**

- **path** -- path to the file/reg key
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- user that the ACL is for
- **permission** -- permission to test for (READ, FULLCONTROL, etc)
- **acetype** -- the type of ACE (ALLOW or DENY)
- **propagation** -- the propagation type of the ACE (FILES, FOLDERS, KEY, KEY&SUBKEYS, SUBKEYS, etc)
- **exactPermissionMatch** -- the ACL must match exactly, IE if READ is specified, the user must have READ exactly and not FULLCONTROL (which also has the READ permission obviously)

Returns (dict): 'Exists' true if the ACE exists, false if it does not

CLI Example:

```
salt 'minion-id' win_dacl.check_ace c: emp directory <username>
→fullcontrol
```

`salt.modules.win_dacl.check_inheritance` (*path*, *objectType*, *user=None*)

Check a specified path to verify if inheritance is enabled

Parameters

- **path** -- path of the registry key or file system object to check
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- if provided, will consider only the ACEs for that user

Returns (bool): 'Inheritance' of True/False

CLI Example:

```
salt 'minion-id' win_dacl.check_inheritance c: emp directory <username>
```

**class** `salt.modules.win_dacl.daclConstants`

DACL constants used throughout the module

**getAceTypeBit** (*t*)

returns the acetype bit of a text value

**getAceTypeText** (*t*)

returns the textual representation of a acetype bit

**getObjectTypeBit** (*t*)

returns the bit value of the string object type

**getPermissionBit** (*t*, *m*)

returns a permission bit of the string permission value for the specified object type

**getPermissionText** (*t*, *m*)

returns the permission textual representation of a specified permission bit/object type

**getPropagationBit** (*t*, *p*)

returns the propagation bit of a text value

**getPropagationText** (*t*, *p*)

returns the textual representation of a propagation bit

**getSecurityHkey** (*s*)

returns the necessary string value for an HKEY for the win32security module

**processPath** (*path*, *objectType*)

processes a path/object type combo and returns:

registry types with the correct HKEY text representation files/directories with environment variables expanded

`salt.modules.win_dacl.disable_inheritance` (*path*, *objectType*, *copy=True*)

Disable inheritance on an object

Parameters

- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **copy** -- True will copy the Inherited ACEs to the DACL before disabling inheritance

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.disable_inheritance c: emp directory
```

`salt.modules.win_dacl.enable_inheritance`(*path*, *objectType*, *clear=False*)

enable/disable inheritance on an object

**Parameters**

- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **clear** -- True will remove non-Inherited ACEs from the ACL

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.enable_inheritance c: emp directory
```

`salt.modules.win_dacl.get`(*path*, *objectType*, *user=None*)

Get the ACL of an object. Will filter by user if one is provided.

**Parameters**

- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- A user name to filter by

Returns (dict): A dictionary containing the ACL

CLI Example:

```
salt 'minion-id' win_dacl.get c: emp directory
```

`salt.modules.win_dacl.rm_ace`(*path*, *objectType*, *user*, *permission=None*, *acetype=None*, *propagation=None*)

remove an ace to an object

*path*: path to the object (i.e. c:\temp\file, HKEY\_LOCAL\_MACHINE\SOFTWARE\KEY, etc) *user*: user to remove  
*permission*: permissions for the user *acetypes*: either allow/deny for each user/permission (ALLOW, DENY)  
*propagation*: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

If any of the optional parameters are omitted (or set to None) they act as wildcards.

CLI Example:

```
remove allow domain\fakeuser full control on HKLM\SOFTWARE\somekey
→propagated to this key and subkeys
salt 'myminion' win_dacl.rm_ace 'Registry' 'HKEY_LOCAL_MACHINE\
→SOFTWARE\somekey' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'
```

## 26.6.484 salt.modules.win\_disk

Module for gathering disk information on Windows

**depends**

- win32api Python module

`salt.modules.win_disk.usage`()

Return usage information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.usage
```

## 26.6.485 salt.modules.win\_dism

Install features/packages for Windows using DISM, which is useful for minions not running server versions of Windows. Some functions are only available on Windows 10.

`salt.modules.win_dism.add_capability` (*capability*, *source=None*, *limit\_access=False*, *image=None*, *restart=False*)

Install a capability

### Parameters

- **capability** (*str*) -- The capability to install
- **source** (*Optional[str]*) -- The optional source of the capability. Default is set by group policy and can be Windows Update.
- **limit\_access** (*Optional[bool]*) -- Prevent DISM from contacting Windows Update for the source package
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

### Raises

- **NotImplementedError** -- For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** --

### Returns

A dictionary containing the results of the command

### Return type

dict

CLI Example:

```
salt '*' dism.add_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

`salt.modules.win_dism.add_feature` (*feature*, *package=None*, *source=None*, *limit\_access=False*, *enable\_parent=False*, *image=None*, *restart=False*)

Install a feature using DISM

### Parameters

- **feature** (*str*) -- The feature to install
- **package** (*Optional[str]*) -- The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- **source** (*Optional[str]*) -- The optional source of the capability. Default is set by group policy and can be Windows Update
- **limit\_access** (*Optional[bool]*) -- Prevent DISM from contacting Windows Update for the source package
- **enable\_parent** (*Optional[bool]*) -- True will enable all parent features of the specified feature
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

### Returns

A dictionary containing the results of the command

### Return type

dict

CLI Example:

```
salt '*' dism.add_feature NetFx3
```

`salt.modules.win_dism.add_package` (*package*, *ignore\_check=False*, *prevent\_pending=False*, *image=None*, *restart=False*)

Install a package using DISM

**Parameters**

- **package** (*str*) -- The package to install. Can be a .cab file, a .msu file, or a folder

---

**Note:** An .msu package is supported only when the target image is offline, either mounted or applied.

---

- **ignore\_check** (*Optional[bool]*) -- Skip installation of the package if the applicability checks fail
- **prevent\_pending** (*Optional[bool]*) -- Skip the installation of the package if there are pending online actions
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

**Returns**

A dictionary containing the results of the command

**Return type**

dict

CLI Example:

```
salt '*' dism.add_package C:\Packages\package.cab
```

`salt.modules.win_dism.add_provisioned_package` (*package*, *image=None*, *restart=False*)

Provision a package using DISM. A provisioned package will install for new users on the system. It will also be reinstalled on each user if the system is updated.

New in version 3007.0.

**Parameters**

- **package** (*str*) -- The package to install. Can be one of the following:
  - .appx or .appxbundle
  - .msix or .msixbundle
  - .ppkg
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the installation. Default is False

**Returns**

A dictionary containing the results of the command

**Return type**

dict

CLI Example:

```
salt '*' dism.add_provisioned_package C:\Packages\package.appx
salt '*' dism.add_provisioned_package C:\Packages\package.appxbundle
salt '*' dism.add_provisioned_package C:\Packages\package.msix
salt '*' dism.add_provisioned_package C:\Packages\package.msixbundle
salt '*' dism.add_provisioned_package C:\Packages\package.ppkg
```

`salt.modules.win_dism.available_capabilities` (*image=None*)

List the capabilities available on the system

**Parameters**

- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image.

If *None* is passed, the running operating system is targeted. Default is *None*.

**Raises**

- **NotImplementedError** -- For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** --

**Returns**

A list of available capabilities

**Return type**

list

CLI Example:

```
salt '*' dism.installed_capabilities
```

`salt.modules.win_dism.available_features`(*image=None*)

List the features available on the system

**Parameters**

**image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Returns**

A list of available features

**Return type**

list

CLI Example:

```
salt '*' dism.available_features
```

`salt.modules.win_dism.get_capabilities`(*image=None*)

List all capabilities on the system

**Parameters**

**image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Raises**

- **NotImplementedError** -- For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** --

**Returns**

A list of capabilities

**Return type**

list

CLI Example:

```
salt '*' dism.get_capabilities
```

`salt.modules.win_dism.get_features`(*package=None, image=None*)

List features on the system or in a package

**Parameters**

- **package** (*Optional[str]*) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files

This can also be the name of a package as listed in `dism.installed_packages`

- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Returns**

A list of features

**Return type**

list

CLI Example:

```
# Return all features on the system
salt '*' dism.get_features

# Return all features in package.cab
salt '*' dism.get_features C:\packages\package.cab

# Return all features in the calc package
salt '*' dism.get_features Microsoft.Windows.Calc.Demo~
↪6595b6144ccf1df~x86~en~1.0.0.0
```

`salt.modules.win_dism.get_kb_package_name(kb, image=None)`

Get the actual package name on the system based on the KB name

New in version 3006.0.

**Parameters**

- **kb** (*str*) -- The name of the KB to remove. Can also be just the KB number
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Returns**

The name of the package found on the system *None*: If the package is not installed on the system

**Return type**

str

CLI Example:

```
# Get the package name for KB1231231
salt '*' dism.get_kb_package_name KB1231231

# Get the package name for KB1231231 using just the number
salt '*' dism.get_kb_package_name 1231231
```

`salt.modules.win_dism.installed_capabilities(image=None)`

List the capabilities installed on the system

**Parameters**

**image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Raises**

- **NotImplementedError** -- For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** --

**Returns**

A list of installed capabilities

**Return type**

list

CLI Example:

```
salt '*' dism.installed_capabilities
```

`salt.modules.win_dism.installed_features` (*image=None*)

List the features installed on the system

**Parameters**

**image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Returns**

A list of installed features

**Return type**

list

CLI Example:

```
salt '*' dism.installed_features
```

`salt.modules.win_dism.installed_packages` (*image=None*)

List the packages installed on the system

**Parameters**

**image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Returns**

A list of installed packages

**Return type**

list

CLI Example:

```
salt '*' dism.installed_packages
```

`salt.modules.win_dism.package_info` (*package, image=None*)

Display information about a package

**Parameters**

- **package** (*str*) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Returns**

A dictionary containing the results of the command

**Return type**

dict

CLI Example:

```
salt '*' dism.package_info C:\packages\package.cab
```

`salt.modules.win_dism.provisioned_packages` (*image=None*)

List the packages installed on the system

New in version 3007.0.

**Parameters**

**image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

**Returns**

A list of installed packages

**Return type**

list

CLI Example:

```
salt '*' dism.installed_packages
```

`salt.modules.win_dism.remove_capability`(*capability*, *image=None*, *restart=False*)

Uninstall a capability

**Parameters**

- **capability** (*str*) -- The capability to be removed
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

**Raises**

- **NotImplementedError** -- For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** --

**Returns**

A dictionary containing the results of the command

**Return type**

dict

CLI Example:

```
salt '*' dism.remove_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

`salt.modules.win_dism.remove_feature`(*feature*, *remove\_payload=False*, *image=None*, *restart=False*)

Disables the feature.

**Parameters**

- **feature** (*str*) -- The feature to uninstall
- **remove\_payload** (*Optional[bool]*) -- Remove the feature's payload. Must supply source when enabling in the future.
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

**Returns**

A dictionary containing the results of the command

**Return type**

dict

CLI Example:

```
salt '*' dism.remove_feature NetFx3
```

`salt.modules.win_dism.remove_kb`(*kb*, *image=None*, *restart=False*)

Remove a package by passing a KB number. This searches the installed packages to get the full package name of the KB. It then calls the `dism.remove_package` function to remove the package.

New in version 3006.0.

**Parameters**

- **kb** (*str*) -- The name of the KB to remove. Can also be just the KB number
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the uninstall

**Returns**

A dictionary containing the results of the command

**Return type**

dict

CLI Example:

```
# Remove the KB5007575 just passing the number
salt '*' dism.remove_kb 5007575

# Remove the KB5007575 just passing the full name
salt '*' dism.remove_kb KB5007575
```

`salt.modules.win_dism.remove_package(package, image=None, restart=False)`

Uninstall a package

#### Parameters

- **package** (*str*) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in `dism.installed_packages`
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the uninstall

#### Returns

A dictionary containing the results of the command

#### Return type

dict

CLI Example:

```
# Remove the Calc Package
salt '*' dism.remove_package Microsoft.Windows.Calc.Demo~6595b6144ccf1df~
→x86~en~1.0.0.0

# Remove the package.cab (does not remove C:\packages\package.cab)
salt '*' dism.remove_package C:\packages\package.cab
```

## 26.6.486 salt.modules.win\_dns\_client

Module for configuring DNS Client on Windows systems

`salt.modules.win_dns_client.add_dns(ip, interface='Local Area Connection', index=1)`

Add the DNS server to the network interface (index starts from 1)

Note: if the interface DNS is configured by DHCP, all the DNS servers will be removed from the interface and the requested DNS will be the only one

CLI Example:

```
salt '*' win_dns_client.add_dns <ip> <interface> <index>
```

`salt.modules.win_dns_client.dns_dhcp(interface='Local Area Connection')`

Configure the interface to get its DNS servers from the DHCP server

CLI Example:

```
salt '*' win_dns_client.dns_dhcp <interface>
```

`salt.modules.win_dns_client.get_dns_config(interface='Local Area Connection')`

Get the type of DNS configuration (dhcp / static).

#### Parameters

- **interface** (*str*) -- The name of the network interface. This is the

- **device** (Description in the Network Connection Details for the) --

**Returns**

True if DNS is configured, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_dns_client.get_dns_config 'Local Area Connection'
```

`salt.modules.win_dns_client.get_dns_servers(interface='Local Area Connection')`

Return a list of the configured DNS servers of the specified interface

**Parameters**

- **interface** (*str*) -- The name of the network interface. This is the name as
- **Connections** (it appears in the Control Panel under Network)
- 

**Returns**

A list of dns servers

**Return type**

list

CLI Example:

```
salt '*' win_dns_client.get_dns_servers 'Local Area Connection'
```

`salt.modules.win_dns_client.rm_dns(ip, interface='Local Area Connection')`

Remove the DNS server from the network interface

CLI Example:

```
salt '*' win_dns_client.rm_dns <ip> <interface>
```

## 26.6.487 salt.modules.win\_dsc

Module for working with Windows PowerShell DSC (Desired State Configuration)

This module is Alpha

This module applies DSC Configurations in the form of PowerShell scripts or MOF (Managed Object Format) schema files.

Use the `psget` module to manage PowerShell resources.

The idea is to leverage Salt to push DSC configuration scripts or MOF files to the Minion.

**depends**

- PowerShell 5.0

`salt.modules.win_dsc.apply_config(path, source=None, salt_env='base')`

Run an compiled DSC configuration (a folder containing a .mof file). The folder can be cached from the salt master using the source option.

**Parameters**

- **path** (*str*) -- Local path to the directory that contains the .mof configuration file to apply. Required.
- **source** (*str*) -- Path to the directory that contains the .mof file on the file\_roots. The source directory will be copied to the path directory and then

executed. If the path and source directories differ, the source directory will be applied. If source is not passed, the config located at `path` will be applied. Optional.

- **salt\_env** (*str*) -- The salt environment to use when copying your source. Default is 'base'

#### Returns

True if successful, otherwise False

#### Return type

bool

CLI Example:

To apply a config that already exists on the system

```
salt '*' dsc.apply_config C:\\DSC\\WebSiteConfiguration
```

To cache a configuration from the master and apply it:

```
salt '*' dsc.apply_config C:\\DSC\\WebSiteConfiguration salt://dsc/
→ configs/WebSiteConfiguration
```

`salt.modules.win_dsc.compile_config` (*path*, *source=None*, *config\_name=None*, *config\_data=None*, *config\_data\_source=None*, *script\_parameters=None*, *salt\_env='base'*)

Compile a config from a PowerShell script (.ps1)

#### Parameters

- **path** (*str*) -- Path (local) to the script that will create the .mof configuration file. If no source is passed, the file must exist locally. Required.
- **source** (*str*) -- Path to the script on `file_roots` to cache at the location specified by path. The source file will be cached locally and then executed. If source is not passed, the config script located at `path` will be compiled. Optional.
- **config\_name** (*str*) -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a `config_name` must be specified. If the `config_name` is not specified, the name of the file will be used as the `config_name` to run. Optional.
- **config\_data** (*str*) -- Configuration data in the form of a hash table that will be passed to the `ConfigurationData` parameter when the `config_name` is compiled. This can be the path to a .psd1 file containing the proper hash table or the PowerShell code to create the hash table.

New in version 2017.7.0.

- **config\_data\_source** (*str*) -- The path to the .psd1 file on `file_roots` to cache at the location specified by `config_data`. If this is specified, `config_data` must be a local path instead of a hash table.

New in version 2017.7.0.

- **script\_parameters** (*str*) -- Any additional parameters expected by the configuration script. These must be defined in the script itself.

New in version 2017.7.0.

- **salt\_env** (*str*) -- The salt environment to use when copying the source. Default is 'base'

#### Returns

A dictionary containing the results of the compilation

#### Return type

dict

CLI Example:

To compile a config from a script that already exists on the system:

```
salt '*' dsc.compile_config C:\\DSC\\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.compile_config C:\\DSC\\WebsiteConfig.ps1 salt://dsc/configs/
↳WebsiteConfig.ps1
```

### `salt.modules.win_dsc.get_config()`

Get the current DSC Configuration

#### Returns

A dictionary representing the DSC Configuration on the machine

#### Return type

dict

#### Raises

**CommandExecutionError** -- On failure

CLI Example:

```
salt '*' dsc.get_config
```

### `salt.modules.win_dsc.get_config_status()`

Get the status of the current DSC Configuration

#### Returns

A dictionary representing the status of the current DSC Configuration on the machine

#### Return type

dict

CLI Example:

```
salt '*' dsc.get_config_status
```

### `salt.modules.win_dsc.get_lcm_config()`

Get the current Local Configuration Manager settings

#### Returns

A dictionary representing the Local Configuration Manager settings on the machine

#### Return type

dict

CLI Example:

```
salt '*' dsc.get_lcm_config
```

### `salt.modules.win_dsc.remove_config(reset=False)`

Remove the current DSC Configuration. Removes current, pending, and previous dsc configurations.

New in version 2017.7.5.

#### Parameters

**reset** (*bool*) -- Attempts to reset the DSC configuration by removing the following from C:\Windows\System32\Configuration:

- File: DSCStatusHistory.mof
- File: DSCEngineCache.mof
- Dir: ConfigurationStatus

Default is False

**Warning:** `remove_config` may fail to reset the DSC environment if any of the files in the `ConfigurationStatus` directory are in use. If you wait a few minutes and run again, it may complete successfully.

**Returns**

True if successful

**Return type**

bool

**Raises****`CommandExecutionError`** -- On failure

CLI Example:

```
salt '*' dsc.remove_config True
```

**salt.modules.win\_dsc.restore\_config()**

Reapplies the previous configuration.

New in version 2017.7.5.

---

**Note:** The current configuration will be come the previous configuration. If run a second time back-to-back it is like toggling between two configs.

---

**Returns**

True if successfully restored

**Return type**

bool

**Raises****`CommandExecutionError`** -- On failure

CLI Example:

```
salt '*' dsc.restore_config
```

**salt.modules.win\_dsc.run\_config**(*path*, *source=None*, *config\_name=None*, *config\_data=None*, *config\_data\_source=None*, *script\_parameters=None*, *salt\_env='base'*)

Compile a DSC Configuration in the form of a PowerShell script (.ps1) and apply it. The PowerShell script can be cached from the master using the `source` option. If there is more than one config within the PowerShell script, the desired configuration can be applied by passing the name in the `config` option.

This command would be the equivalent of running `dsc.compile_config` followed by `dsc.apply_config`.

**Parameters**

- **path** (*str*) -- The local path to the PowerShell script that contains the DSC Configuration. Required.
- **source** (*str*) -- The path to the script on `file_roots` to cache at the location specified by `path`. The source file will be cached locally and then executed. If source is not passed, the config script located at `path` will be compiled. Optional.
- **config\_name** (*str*) -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a `config_name` must be specified. If the `config_name` is not specified, the name of the file will be used as the `config_name` to run. Optional.
- **config\_data** (*str*) -- Configuration data in the form of a hash table that will be passed to the `ConfigurationData` parameter when the `config_name` is com-

piled. This can be the path to a `.psd1` file containing the proper hash table or the PowerShell code to create the hash table.

New in version 2017.7.0.

- **config\_data\_source** (*str*) -- The path to the `.psd1` file on `file_roots` to cache at the location specified by `config_data`. If this is specified, `config_data` must be a local path instead of a hash table.

New in version 2017.7.0.

- **script\_parameters** (*str*) -- Any additional parameters expected by the configuration script. These must be defined in the script itself. Note that these are passed to the script (the outermost scope), and not to the dsc configuration inside the script (the inner scope).

New in version 2017.7.0.

- **salt\_env** (*str*) -- The salt environment to use when copying the source. Default is 'base'

#### Returns

True if successfully compiled and applied, otherwise False

#### Return type

bool

CLI Example:

To compile a config from a script that already exists on the system:

```
salt '*' dsc.run_config C:\\DSC\\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.run_config C:\\DSC\\WebsiteConfig.ps1 salt://dsc/configs/
↳WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it, passing in `script_parameters`:

```
salt '*' dsc.run_config path=C:\\DSC\\WebsiteConfig.ps1 source=salt://dsc/
↳configs/WebsiteConfig.ps1 script_parameters="-hostname 'my-computer' -
↳ip '192.168.1.10' -DnsArray '192.168.1.3','192.168.1.4','1.1.1.1'"
```

```
salt.modules.win_dsc.set_lcm_config(config_mode=None, config_mode_freq=None,
refresh_freq=None, reboot_if_needed=None,
action_after_reboot=None, refresh_mode=None,
certificate_id=None, configuration_id=None,
allow_module_overwrite=None, debug_mode=False,
status_retention_days=None)
```

For detailed descriptions of the parameters see: <https://msdn.microsoft.com/en-us/PowerShell/DSC/metaConfig>

**config\_mode** (str): How the LCM applies the configuration. Valid values

are:

- ApplyOnly
- ApplyAndMonitor
- ApplyAndAutoCorrect

**config\_mode\_freq** (int): How often, in minutes, the current configuration

is checked and applied. Ignored if `config_mode` is set to `ApplyOnly`. Default is 15.

**refresh\_mode** (str): How the LCM gets configurations. Valid values are:

- Disabled
- Push

- Pull

**refresh\_freq (int):** How often, in minutes, the LCM checks for updated configurations. (pull mode only) Default is 30.

**reboot\_if\_needed (bool):** Reboot the machine if needed after a configuration is applied. Default is False.

**action\_after\_reboot (str):** Action to take after reboot. Valid values are:

- ContinueConfiguration
- StopConfiguration

**certificate\_id (guid):** A GUID that specifies a certificate used to access the configuration: (pull mode)

**configuration\_id (guid):** A GUID that identifies the config file to get from a pull server. (pull mode)

**allow\_module\_overwrite (bool):** New configs are allowed to overwrite old ones on the target node.

**debug\_mode (str):** Sets the debug level. Valid values are:

- None
- ForceModuleImport
- All

**status\_retention\_days (int):** Number of days to keep status of the current config.

---

**Note:** Either `config_mode_freq` or `refresh_freq` needs to be a multiple of the other. See documentation on MSDN for more details.

---

#### Returns

True if successful, otherwise False

#### Return type

bool

CLI Example:

```
salt '*' dsc.set_lcm_config ApplyOnly
```

`salt.modules.win_dsc.test_config()`

Tests the current applied DSC Configuration

#### Returns

True if successfully applied, otherwise False

#### Return type

bool

CLI Example:

```
salt '*' dsc.test_config
```

## 26.6.488 salt.modules.win\_event

A module for working with the Windows Event log system. .. versionadded:: 3006.0

```
salt.modules.win_event.add(log_name, event_id, event_category=0, event_type=None,
                           event_strings=None, event_data=None, event_sid=None)
```

Adds an event to the application event log.

### Parameters

- **log\_name** (*str*) -- The name of the application or source
- **event\_id** (*int*) -- The event ID
- **event\_category** (*int*) -- The event category
- **event\_type** (*str*) -- The event category. Must be one of:
  - Success
  - Error
  - Warning
  - Information
  - AuditSuccess
  - AuditFailure
- **event\_strings** (*list*) -- A list of strings
- **event\_data** (*bytes*) -- Event data. Strings will be converted to bytes
- **event\_sid** (*sid*) -- The SID for the event

### Raises

- **CommandExecutionError** -- event\_id is not an integer
- **CommandExecutionError** -- event\_category is not an integer
- **CommandExecutionError** -- event\_type is not one of the valid event types
- **CommandExecutionError** -- event\_strings is not a list or string

CLI Example:

```
# A simple Application event log warning entry
salt '*' win_event.add Application 1234 12 Warning

# A more complex System event log information entry
salt '*' win_event.add System 1234 12 Information ["Event string data 1",
→ 'Event string data 2'] "Some event data"

# Log to the System Event log with the source "Service Control Manager"
salt '*' win_event.add "Service Control Manager" 1234 12 Warning ["Event
→ string data 1', 'Event string data 2'] "Some event data"

# Log to the PowerShell event log with the source "PowerShell (PowerShell)
→"
salt-call --local win_event.add "PowerShell" 6969 12 Warning
```

```
salt.modules.win_event.clear(log_name, backup=None)
```

Clears the specified event log.

---

**Note:** A clear log event will be added to the log after it is cleared.

---

### Parameters

- **log\_name** (*str*) -- The name of the log to clear
- **backup** (*str*) -- Path to backup file

CLI Example:

```
salt "*" win_event.clear Application
```

`salt.modules.win_event.count(log_name)`

Gets the number of events in the specified.

**Parameters**

**log\_name** (*str*) -- The name of the log

**Returns**

The number of events the log contains

**Return type**

int

CLI Example:

```
salt "*" win_event.count Application
```

`salt.modules.win_event.get(log_name)`

Get events from the specified log. Get a list of available logs using the `win_event.get_log_names` function.

**Warning:** Running this command on a log with thousands of events, such as the Applications log, can take a long time.

**Parameters**

**log\_name** (*str*) -- The name of the log to retrieve.

**Returns**

tuple: A tuple of events as dictionaries

CLI Example:

```
salt '*' win_event.get Application
```

`salt.modules.win_event.get_filtered(log_name, all_requirements=True, **kwargs)`

Will find events that match the fields and values specified in the kwargs. Kwargs can be any item in the return for the event.

**Warning:** Running this command on a log with thousands of events, such as the Applications log, can take a long time.

**Parameters**

- **log\_name** (*str*) -- The name of the log to retrieve
- **all\_requirements** (*bool*) -- True matches all requirements. False matches any requirement. Default is True

Kwargs:

**eventID** (*int*): The event ID number

**eventType** (*int*): The event type number. Valid options and their corresponding meaning are:

- 0 : Success
- 1 : Error
- 2 : Warning
- 4 : Information
- 8 : Audit Success
- 10 : Audit Failure

year (int): The year  
 month (int): The month  
 day (int): The day of the month  
 hour (int): The hour  
 minute (int): The minute  
 second (int): The second  
 eventCategory (int): The event category number  
 sid (sid): The SID of the user that created the event  
 sourceName (str): The name of the event source

**Returns**

A tuple of dicts of each filtered event

**Return type**

tuple

CLI Example:

```

# Return all events from the Security log with an ID of 1100
salt "*" win_event.get_filtered Security eventID=1100

# Return all events from the System log with an Error (1) event type
salt "*" win_event.get_filtered System eventType=1

# Return all events from System log with an Error (1) type, source is
↳Service Control Manager, and data is netprofm
salt "*" win_event.get_filtered System eventType=1 sourceName="Service
↳Control Manager" data="netprofm"

# Return events from the System log that match any of the kwargs below
salt "*" win_event.get_filtered System eventType=1 sourceName="Service
↳Control Manager" data="netprofm" all_requirements=False
  
```

**salt.modules.win\_event.get\_log\_names()**

Get a list of event logs available on the system

**Returns**

A list of event logs available on the system

**Return type**

list

CLI Example:

```
salt "*" win_event.get_log_names
```

**salt.modules.win\_event.query**(log\_name, query\_text=None, records=20, latest=True, raw=False)

Query a log for a specific event\_id. Return the top number of records specified. Use the *win\_event.get\_log\_names* to see a list of available logs on the system.

**Note:** You can use the Windows Event Viewer to create the XPath query for the *query\_text* parameter. Click on **Filter** **Current Log**, configure the filter, then click on the **XML** tab. Copy the text between the two **<Select>** tags. This will be the contents of the *query\_text* parameter. You will have to convert

some codes. For example, `&gt;` becomes `>`, `&lt;` becomes `<`. Additionally, you'll need to put spaces between comparison operators. For example: `this >= that`.

#### Parameters

- **log\_name** (*str*) -- The name of the log to query
- **query\_text** (*str*) -- The filter to apply to the log
- **records** (*int*) -- The number of records to return
- **latest** (*bool*) -- True will return the newest events. False will return the oldest events. Default is True
- **raw** (*bool*) -- True will return the raw xml results. False will return the xml converted to a dictionary. Default is False

#### Returns

A list of dict objects that contain information about the event

#### Return type

list

CLI Example:

```
# Return the 20 most recent events from the Application log with an event ID
→ID of 22
salt '*' win_event.query Application "[System[(EventID=22)]]"

# Return the 20 most recent events from the Application log with an event ID
→ID of 22
# Return raw xml
salt '*' win_event.query Application "[System[(EventID=22)]]" raw=True

# Return the 20 oldest events from the Application log with an event ID
→of 22
salt '*' win_event.query Application "[System[(EventID=22)]]"
→latest=False

# Return the 20 most recent Critical (1) events from the Application log
→in the last 12 hours
salt '*' win_event.query Application "[System[(Level=1) and
→TimeCreated[timediff(@SystemTime) <= 43200000]]]"

# Return the 5 most recent Error (2) events from the application log
salt '*' win_event.query Application "[System[(Level=2)]]" records=5

# Return the 20 most recent Warning (3) events from the Windows
→PowerShell log where the Event Source is PowerShell
salt '*' win_event.query "Windows PowerShell" "[System[Provider[@Name=
→'PowerShell'] and (Level=3)]]"

# Return the 20 most recent Information (0 or 4) events from the
→Microsoft-Windows-PowerShell/Operational on 2022-08-24 with an Event ID
→of 4103
salt '*' win_event.query "Microsoft-Windows-PowerShell/Operational"
→"[System[(Level=4 or Level=0) and (EventID=4103) and
→TimeCreated[@SystemTime >= '2022-08-24T06:00:00.000Z']]"

# Return the 20 most recent Information (0 or 4) events from the
```

(continues on next page)

(continued from previous page)

```

→Microsoft-Windows-PowerShell/Operational within the last hour
salt '*' win_event.query "Microsoft-Windows-PowerShell/Operational"
→"*[System[(Level=4 or Level=0) and TimeCreated[timediff(@SystemTime) <=
→3600000]]]"

```

## 26.6.489 salt.modules.win\_file

Manage information about files on the minion, set/read user, group data, modify the ACL of files/directories

### depends

- win32api
- win32file
- win32con
- salt.utils.win\_dacl

`salt.modules.win_file.check_perms` (*path*, *ret=None*, *owner=None*, *grant\_perms=None*, *deny\_perms=None*, *inheritance=True*, *reset=False*)

Check owner and permissions for the passed directory. This function checks the permissions and sets them, returning the changes made. Used by the file state to populate the return dict

### Parameters

- **path** (*str*) -- The full path to the directory.
- **ret** (*dict*) -- A dictionary to append changes to and return. If not passed, will create a new dictionary to return.
- **owner** (*str*) -- The owner to set for the directory.
- **grant\_perms** (*dict*) -- A dictionary containing the user/group and the basic permissions to check/grant, ie: `{'user': {'perms': 'basic_permission'}}`. Default is None.
- **deny\_perms** (*dict*) -- A dictionary containing the user/group and permissions to check/deny. Default is None.
- **inheritance** (*bool*) -- True will check if inheritance is enabled and enable it. ``False will check if inheritance is disabled and disable it. Default is True.
- **reset** (*bool*) -- True will show what permissions will be removed by resetting the DACL. False will do nothing. Default is False.

### Returns

A dictionary of changes that have been made

### Return type

dict

CLI Example:

```

# To see changes to ``C:\Temp`` if the 'Users' group is given 'read &
→execute' permissions.
salt '*' file.check_perms C:\Temp\ {} Administrators "{ 'Users': { 'perms':
→'read_execute' }}"

# Locally using salt call
salt-call file.check_perms C:\Temp\ {} Administrators "{ 'Users': { 'perms
→': 'read_execute', 'applies_to': 'this_folder_only' }}"

```

(continues on next page)

(continued from previous page)

```
# Specify advanced attributes with a list
salt '*' file.check_perms C:\Temp\ {} Administrators '{"jsnuffy": {"perms
→': ['read_attributes', 'read_ea'], 'applies_to': 'files_only'}}"
```

`salt.modules.win_file.chgrp`(*path*, *group*)

Change the group of a file

Under Windows, this will do nothing.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to do nothing while still being compatible with Unix behavior. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to set the 'primary group' of a file, use `file.chgrp`.

To set group permissions use `file.set_perms`

#### Parameters

- **path** (*str*) -- The path to the file or directory
- **group** (*str*) -- The group (unused)

#### Returns

None

CLI Example:

```
salt '*' file.chgrp c:\temp\test.txt administrators
```

`salt.modules.win_file.chown`(*path*, *user*, *group=*None, *pgroup=*None, *follow\_symlinks=*True)

Chown a file, pass the file the desired user and group

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, `pgroup`, instead.

#### Parameters

- **path** (*str*) -- The path to the file or directory
- **user** (*str*) -- The name of the user to own the file
- **group** (*str*) -- The group (not used)
- **pgroup** (*str*) -- The primary group to assign
- **follow\_symlinks** (*bool*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

#### Returns

True if successful, otherwise error

#### Return type

bool

CLI Example:

```
salt '*' file.chown c:\temp\test.txt myusername
salt '*' file.chown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.chown c:\temp\test.txt myusername "pgroup='None'"
```

`salt.modules.win_file.chpgrp(path, group)`

Change the group of a file

Under Windows, this will set the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

**Parameters**

- **path** (*str*) -- The path to the file or directory
- **pgroup** (*str*) -- The primary group to assign

**Returns**

True if successful, otherwise error

**Return type**

bool

CLI Example:

```
salt '*' file.chpgrp c:\temp\test.txt Administrators
salt '*' file.chpgrp c:\temp\test.txt "None"
```

`salt.modules.win_file.get_attributes(path)`

Return a dictionary object with the Windows file attributes for a file.

**Parameters**

**path** (*str*) -- The path to the file or directory

**Returns**

A dictionary of file attributes

**Return type**

dict

CLI Example:

```
salt '*' file.get_attributes c:\temp\a.txt
```

`salt.modules.win_file.get_gid(path, follow_symlinks=True)`

Return the id of the group that owns a given file

Under Windows, this will return the uid of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use `file.get_pgid`.

**Parameters**

- **path** (*str*) -- The path to the file or directory
- **follow\_symlinks** (*bool*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns**

The gid of the owner

**Return type**

str

CLI Example:

```
salt '*' file.get_gid c:\temp\test.txt
```

`salt.modules.win_file.get_group` (*path*, *follow\_symlinks=True*)

Return the group that owns a given file

Under Windows, this will return the user (owner) of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use `file.get_pgroup`.

#### Parameters

- **path** (*str*) -- The path to the file or directory
- **follow\_symlinks** (*bool*) -- If the object specified by *path* is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

#### Returns

The name of the owner

#### Return type

*str*

CLI Example:

```
salt '*' file.get_group c:\temp\test.txt
```

`salt.modules.win_file.get_mode` (*path*)

Return the mode of a file

Right now we're just returning None because Windows' doesn't have a mode like Linux

#### Parameters

**path** (*str*) -- The path to the file or directory

#### Returns

None

CLI Example:

```
salt '*' file.get_mode /etc/passwd
```

`salt.modules.win_file.get_pgid` (*path*, *follow\_symlinks=True*)

Return the id of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

#### Parameters

- **path** (*str*) -- The path to the file or directory
- **follow\_symlinks** (*bool*) -- If the object specified by *path* is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

#### Returns

The gid of the primary group

#### Return type

*str*

CLI Example:

```
salt '*' file.get_pgid c:\temp\test.txt
```

`salt.modules.win_file.get_pgroup`(*path*, *follow\_symlinks=True*)

Return the name of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

The return value may be 'None', e.g. if the user is not on a domain. This is a valid group - do not confuse this with the Salt/Python value of None which means no value was returned. To be certain, use the `get_pgid` function which will return the SID, including for the system 'None' group.

#### Parameters

- **path** (*str*) -- The path to the file or directory
- **follow\_symlinks** (*bool*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

#### Returns

The name of the primary group

#### Return type

*str*

CLI Example:

```
salt '*' file.get_pgroup c:\temp\test.txt
```

`salt.modules.win_file.get_uid`(*path*, *follow\_symlinks=True*)

Return the id of the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify `follow_symlinks=False` to turn off this behavior.

#### Parameters

- **path** (*str*) -- The path to the file or directory
- **follow\_symlinks** (*bool*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

#### Returns

The uid of the owner

#### Return type

*str*

CLI Example:

```
salt '*' file.get_uid c:\temp\test.txt
salt '*' file.get_uid c:\temp\test.txt follow_symlinks=False
```

`salt.modules.win_file.get_user`(*path*, *follow\_symlinks=True*)

Return the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify `follow_symlinks=False` to turn off this behavior.

#### Parameters

- **path** (*str*) -- The path to the file or directory
- **follow\_symlinks** (*bool*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

#### Returns

The name of the owner

**Return type**`str`

CLI Example:

```
salt '*' file.get_user c:\temp\test.txt
salt '*' file.get_user c:\temp\test.txt follow_symlinks=False
```

**salt.modules.win\_file.gid\_to\_group(*gid*)**

Convert the group id to the group name on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as `uid_to_user`.For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the `uid_to_user` function instead; an info level log entry will be generated if this function is used directly.**Parameters****gid** (*str*) -- The gid of the group**Returns**

The name of the group

**Return type**`str`

CLI Example:

```
salt '*' file.gid_to_group S-1-5-21-626487655-2533044672-482107328-1010
```

**salt.modules.win\_file.group\_to\_gid(*group*)**

Convert the group to the gid on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as `user_to_uid`, except if None is given, "" is returned.For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the `user_to_uid` function instead; an info level log entry will be generated if this function is used directly.**Parameters****group** (*str*) -- The name of the group**Returns**

The gid of the group

**Return type**`str`

CLI Example:

```
salt '*' file.group_to_gid administrators
```

**salt.modules.win\_file.is\_link(*path*)**

Check if the path is a symlink

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a `SaltInvocationError`, not an `OSError`.**Parameters****path** (*str*) -- The path to a file or directory**Returns**

True if path is a symlink, otherwise False

**Return type**`bool`

CLI Example:

```
salt '*' file.is_link /path/to/link
```

`salt.modules.win_file.lchown`(*path*, *user*, *group=None*, *pgroup=None*)

Chown a file, pass the file the desired user and group without following any symlinks.

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, `pgroup`, instead.

To set the primary group to 'None', it must be specified in quotes. Otherwise Salt will interpret it as the Python value of None and no primary group changes will occur. See the example below.

#### Parameters

- **path** (*str*) -- The path to the file or directory
- **user** (*str*) -- The name of the user to own the file
- **group** (*str*) -- The group (not used)
- **pgroup** (*str*) -- The primary group to assign

#### Returns

True if successful, otherwise error

#### Return type

bool

CLI Example:

```
salt '*' file.lchown c:\temp\test.txt myusername
salt '*' file.lchown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.lchown c:\temp\test.txt myusername "pgroup='None'"
```

`salt.modules.win_file.makedirs_`(*path*, *owner=None*, *grant\_perms=None*, *deny\_perms=None*, *inheritance=True*, *reset=False*)

Ensure that the parent directory containing this path is available.

#### Parameters

- **path** (*str*) -- The full path to the directory.

---

**Note:** The path must end with a trailing slash otherwise the directory(s) will be created up to the parent directory. For example if path is `C:\temp\test`, then it would be treated as `C:\temp\` but if the path ends with a trailing slash like `C:\temp\test\`, then it would be treated as `C:\temp\test\`.

---

- **owner** (*str*) -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.
- **grant\_perms** (*dict*) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_
↪ folder'}}
```

To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'],
↪ 'applies_to': 'this_folder'}}
```

- **deny\_perms** (*dict*) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** (*bool*) -- If `True` the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.
- **reset** (*bool*) -- If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

#### Returns

True if successful

#### Return type

bool

#### Raises

**CommandExecutionError** -- If unsuccessful

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs C:\Temp\ Administrators '{"Users': {'perms': 'read_
↪execute'}}"

# Locally using salt call
salt-call file.makedirs C:\Temp\ Administrators '{"Users': {'perms':
↪'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.makedirs C:\Temp\ Administrators '{"jsnuffy': {'perms': [
↪'read_attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

`salt.modules.win_file.makedirs_perms`(*path*, *owner=None*, *grant\_perms=None*, *deny\_perms=None*, *inheritance=True*, *reset=True*)

Set owner and permissions for each directory created.

#### Parameters

- **path** (*str*) -- The full path to the directory.
- **owner** (*str*) -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.
- **grant\_perms** (*dict*) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_
↪folder'}}
```

To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'],
  ↳ 'applies_to': 'this_folder'}}
```

- **deny\_perms** (*dict*) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** (*bool*) -- If `True` the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created
- **reset** (*bool*) -- If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

#### Returns

True if successful, otherwise raises an error

#### Return type

bool

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs_perms C:\Temp\ Administrators '{"Users': {'perms':
  ↳ 'read_execute'}}"

# Locally using salt call
salt-call file.makedirs_perms C:\Temp\ Administrators '{"Users': {'perms
  ↳ ': 'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.makedirs_perms C:\Temp\ Administrators '{"jsnuffy': {'perms
  ↳ ': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_files'}}"
```

`salt.modules.win_file.mkdir` (*path*, *owner=None*, *grant\_perms=None*, *deny\_perms=None*, *inheritance=True*, *reset=False*)

Ensure that the directory is available and permissions are set.

#### Parameters

- **path** (*str*) -- The full path to the directory.
- **owner** (*str*) -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM
- **grant\_perms** (*dict*) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_
  ↳ folder'}}
```

To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'],
  ↳ 'applies_to': 'this_folder'}}
```

- **deny\_perms** (*dict*) -- A dictionary containing the user/group and permissions

to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.

- **inheritance** (*bool*) -- If `True` the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.
- **reset** (*bool*) -- If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

#### Returns

True if successful

#### Return type

bool

#### Raises

**CommandExecutionError** -- If unsuccessful

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.mkdir C:\Temp\ Administrators '{"Users': {'perms': 'read_
↪execute'}}"

# Locally using salt call
salt-call file.mkdir C:\Temp\ Administrators '{"Users': {'perms': 'read_
↪execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.mkdir C:\Temp\ Administrators '{"jsnuffy': {'perms': ['read_
↪attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

`salt.modules.win_file.remove`(*path*, *force=False*)

Remove the named file or directory

#### Parameters

- **path** (*str*) -- The path to the file or directory to remove.
- **force** (*bool*) -- Remove even if marked Read-Only. Default is `False`

#### Returns

True if successful, False if unsuccessful

#### Return type

bool

CLI Example:

```
salt '*' file.remove C:\Temp
```

`salt.modules.win_file.set_attributes`(*path*, *archive=None*, *hidden=None*, *normal=None*, *notIndexed=None*, *readonly=None*, *system=None*, *temporary=None*)

Set file attributes for a file. Note that the normal attribute means that all others are false. So setting it will clear all others.

#### Parameters

- **path** (*str*) -- The path to the file or directory
- **archive** (*bool*) -- Sets the archive attribute. Default is `None`
- **hidden** (*bool*) -- Sets the hidden attribute. Default is `None`
- **normal** (*bool*) -- Resets the file attributes. Cannot be used in conjunction with any

- other attribute. Default is None
- **notIndexed** (*bool*) -- Sets the indexed attribute. Default is None
- **readonly** (*bool*) -- Sets the readonly attribute. Default is None
- **system** (*bool*) -- Sets the system attribute. Default is None
- **temporary** (*bool*) -- Sets the temporary attribute. Default is None

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' file.set_attributes c:\temp\a.txt normal=True
salt '*' file.set_attributes c:\temp\a.txt readonly=True hidden=True
```

`salt.modules.win_file.set_mode(path, mode)`

Set the mode of a file

This just calls `get_mode`, which returns None because we don't use mode on Windows

**Parameters**

- **path** -- The path to the file or directory
- **mode** -- The mode (not used)

**Returns**

None

CLI Example:

```
salt '*' file.set_mode /etc/passwd 0644
```

`salt.modules.win_file.set_perms(path, grant_perms=None, deny_perms=None, inheritance=True, reset=False)`

Set permissions for the given path

**Parameters**

- **path** (*str*) -- The full path to the directory.
- **grant\_perms** (*dict*) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here for directories. The default for `applies_to` is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_
↪ folder'}}
```

To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'],
↪ 'applies_to': 'this_folder'}}
```

To see a list of available attributes and applies to settings see the documentation for `salt.utils.win_dacl`.

A value of None will make no changes to the `grant` portion of the DACL. Default is None.

- **deny\_perms** (*dict*) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.

A value of `None` will make no changes to the deny portion of the DACL. Default is `None`.

- **inheritance** (*bool*) -- If `True` the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created. Default is `False`.
- **reset** (*bool*) -- If `True` the existing DCL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

#### Returns

True if successful

#### Return type

bool

#### Raises

**CommandExecutionError** -- If unsuccessful

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.set_perms C:\Temp\ '{"Users': {'perms': 'read_execute'}}"

# Locally using salt call
salt-call file.set_perms C:\Temp\ '{"Users': {'perms': 'read_execute',
→ 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.set_perms C:\Temp\ '{"jsnuffy': {'perms': ['read_attributes
→', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

`salt.modules.win_file.stats` (*path*, *hash\_type='sha256'*, *follow\_symlinks=True*)

Return a dict containing the stats about a given file

Under Windows, *gid* will equal *uid* and *group* will equal *user*.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps these properties to keep some kind of compatibility with Unix behavior. If the 'primary group' is required, it can be accessed in the *pgroup* and *pgid* properties.

#### Parameters

- **path** (*str*) -- The path to the file or directory
- **hash\_type** (*str*) -- The type of hash to return
- **follow\_symlinks** (*bool*) -- If the object specified by *path* is a symlink, get attributes of the linked file instead of the symlink itself. Default is `True`

#### Returns

A dictionary of file/directory stats

#### Return type

dict

CLI Example:

```
salt '*' file.stats /etc/passwd
```

`salt.modules.win_file.symlink` (*src*, *link*, *force=False*, *atomic=False*, *follow\_symlinks=True*)

Create a symbolic link to a file

This is only supported with Windows Vista or later and must be executed by a user with the SeCreateSymbolicLink privilege.

The behavior of this function matches the Unix equivalent, with one exception - invalid symlinks cannot be created. The source path must exist. If it doesn't, an error will be raised.

#### Parameters

- **src** (*str*) -- The path to a file or directory
- **link** (*str*) -- The path to the link. Must be an absolute path
- **force** (*bool*) -- Overwrite an existing symlink with the same name .. versionadded:: 3005
- **atomic** (*bool*) -- Use atomic file operations to create the symlink .. versionadded:: 3006.0
- **follow\_symlinks** (*bool*) -- If set to False, use `os.path.lexists()` for existence checks instead of `os.path.exists()` .. versionadded:: 3007.0

#### Returns

True if successful, otherwise raises `CommandExecutionError`

#### Return type

`bool`

CLI Example:

```
salt '*' file.symlink /path/to/file /path/to/link
```

`salt.modules.win_file.uid_to_user(oid)`

Convert a uid to a user name

#### Parameters

- **uid** (*str*) -- The user id to lookup

#### Returns

The name of the user

#### Return type

`str`

CLI Example:

```
salt '*' file.uid_to_user S-1-5-21-626487655-2533044672-482107328-1010
```

`salt.modules.win_file.user_to_uid(user)`

Convert user name to a uid

#### Parameters

- **user** (*str*) -- The user to lookup

#### Returns

The user id of the user

#### Return type

`str`

CLI Example:

```
salt '*' file.user_to_uid myusername
```

`salt.modules.win_file.version(path)`

New in version 3005.

Get the version of a file.

---

**Note:** Not all files have version information. The following are common file types that contain version information:

- `.exe`

- .dll
  - .sys
- 

**Parameters**

**path** (*str*) -- The path to the file.

**Returns**

The version of the file if the file contains it. Otherwise, an empty string will be returned.

**Return type**

*str*

**Raises**

- **CommandExecutionError** -- If the file does not exist
- **CommandExecutionError** -- If the path is not a file

CLI Example:

```
salt * file.version C:\Windows\notepad.exe
```

`salt.modules.win_file.version_details`(*path*)

New in version 3005.

Get file details for a file. Similar to what's in the details tab on the file properties.

---

**Note:** Not all files have version information. The following are common file types that contain version information:

- .exe
  - .dll
  - .sys
- 

**Parameters**

**path** (*str*) -- The path to the file.

**Returns**

A dictionary containing details about the file related to version.  
An empty dictionary if the file contains no version information.

**Return type**

*dict*

**Raises**

- **CommandExecutionError** -- If the file does not exist
- **CommandExecutionError** -- If the path is not a file

CLI Example:

```
salt * file.version_details C:\Windows\notepad.exe
```

## 26.6.490 salt.modules.win\_firewall

Module for configuring Windows Firewall using netsh

`salt.modules.win_firewall.add_rule` (*name*, *localport*, *protocol*='tcp', *action*='allow', *dir*='in', *remoteip*='any')

New in version 2015.5.0.

Add a new inbound or outbound rule to the firewall policy

### Parameters

- **name** (*str*) -- The name of the rule. Must be unique and cannot be "all". Required.
- **localport** (*int*) -- The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- **protocol** (*Optional[str]*) -- The protocol. Can be any of the following:
  - A number between 0 and 255
  - icmpv4
  - icmpv6
  - tcp
  - udp
  - any
- **action** (*Optional[str]*) -- The action the rule performs. Can be any of the following:
  - allow
  - block
  - bypass
- **dir** (*Optional[str]*) -- The direction. Can be in or out.
- **remoteip** (*Optional [str]*) -- The remote IP. Can be any of the following:
  - any
  - localsubnet
  - dns
  - dhcp
  - wins
  - defaultgateway
  - Any valid IPv4 address (192.168.0.12)
  - Any valid IPv6 address (2002:9b3b:1a31:4:208:74ff:fe39:6c43)
  - Any valid subnet (192.168.1.0/24)
  - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
  - A list of valid IP addresses

Can be combinations of the above separated by commas.

### Returns

True if successful

### Return type

bool

### Raises

**CommandExecutionError** -- If the command fails

CLI Example:

```

salt '*' firewall.add_rule 'test' '8080' 'tcp'
salt '*' firewall.add_rule 'test' '1' 'icmpv4'
salt '*' firewall.add_rule 'test_remote_ip' '8000' 'tcp' 'allow' 'in'
→ '192.168.0.1'

```

`salt.modules.win_firewall.delete_rule` (*name*=None, *localport*=None, *protocol*=None, *dir*=None, *remoteip*=None)

New in version 2015.8.0.

Delete an existing firewall rule identified by name and optionally by ports, protocols, direction, and remote IP.

#### Parameters

- **name** (*str*) -- The name of the rule to delete. If the name `all` is used you must specify additional parameters.
- **localport** (*Optional[str]*) -- The port of the rule. If protocol is not specified, protocol will be set to `tcp`
- **protocol** (*Optional[str]*) -- The protocol of the rule. Default is `tcp` when `localport` is specified
- **dir** (*Optional[str]*) -- The direction of the rule.
- **remoteip** (*Optional[str]*) -- The remote IP of the rule.

#### Returns

True if successful

#### Return type

bool

#### Raises

**CommandExecutionError** -- If the command fails

CLI Example:

```
# Delete incoming tcp port 8080 in the rule named 'test'
salt '*' firewall.delete_rule 'test' '8080' 'tcp' 'in'

# Delete the incoming tcp port 8000 from 192.168.0.1 in the rule named
# 'test_remote_ip'
salt '*' firewall.delete_rule 'test_remote_ip' '8000' 'tcp' 'in' '192.168.
→0.1'

# Delete all rules for local port 80:
salt '*' firewall.delete_rule all 80 tcp

# Delete a rule called 'allow80':
salt '*' firewall.delete_rule allow80
```

`salt.modules.win_firewall.disable(profile='allprofiles')`

Disable firewall profile

#### Parameters

**profile** (*Optional[str]*) -- The name of the profile to disable. Default is `allprofiles`. Valid options are:

- `allprofiles`
- `domainprofile`
- `privateprofile`
- `publicprofile`

#### Returns

True if successful

#### Return type

bool

#### Raises

**CommandExecutionError** -- If the command fails

CLI Example:

```
salt '*' firewall.disable
```

`salt.modules.win_firewall.enable(profile='allprofiles')`

New in version 2015.5.0.

Enable firewall profile

**Parameters**

**profile** (*Optional[str]*) -- The name of the profile to enable. Default is allprofiles. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

**Returns**

True if successful

**Return type**

bool

**Raises**

**CommandExecutionError** -- If the command fails

CLI Example:

```
salt '*' firewall.enable
```

`salt.modules.win_firewall.get_all_profiles(store='local')`

Gets all properties for all profiles in the specified store

New in version 2018.3.4.

New in version 2019.2.0.

**Parameters**

**store** (*str*) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:

- lgpo
- local

Default is local

**Returns**

A dictionary containing the specified settings for each profile

**Return type**

dict

CLI Example:

```
# Get all firewall settings for all profiles
salt * firewall.get_all_settings

# Get all firewall settings for all profiles as defined by local group
# policy

salt * firewall.get_all_settings lgpo
```

`salt.modules.win_firewall.get_all_settings(domain, store='local')`

Gets all the properties for the specified profile in the specified store

New in version 2018.3.4.

New in version 2019.2.0.

**Parameters**

- **profile** (*str*) -- The firewall profile to query. Valid options are:
  - domain
  - public
  - private
- **store** (*str*) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:

- lgpo
- local

Default is local**Returns**

A dictionary containing the specified settings

**Return type**

dict

CLI Example:

```
# Get all firewall settings for connections on the domain profile
salt * win_firewall.get_all_settings domain

# Get all firewall settings for connections on the domain profile as
# defined by local group policy
salt * win_firewall.get_all_settings domain lgpo
```

**salt.modules.win\_firewall.get\_config()**

Get the status of all the firewall profiles

**Returns**

A dictionary of all profiles on the system

**Return type**

dict

**Raises****CommandExecutionError** -- If the command fails

CLI Example:

```
salt '*' firewall.get_config
```

**salt.modules.win\_firewall.get\_rule(name='all')**

New in version 2015.5.0.

Display all matching rules as specified by name

**Parameters****name** (*Optional[str]*) -- The full name of the rule. all will return all rules. Default is all**Returns**

A dictionary of all rules or rules that match the name exactly

**Return type**

dict

**Raises****CommandExecutionError** -- If the command fails

CLI Example:

```
salt '*' firewall.get_rule 'MyAppPort'
```

**salt.modules.win\_firewall.get\_settings(profile, section, store='local')**

Get the firewall property from the specified profile in the specified store as returned by netsh advfirewall.

New in version 2018.3.4.

New in version 2019.2.0.

**Parameters**

- **profile** (*str*) -- The firewall profile to query. Valid options are:
  - domain

- public
- private
- **section** (*str*) -- The property to query within the selected profile. Valid options are:
  - firewallpolicy : inbound/outbound behavior
  - logging : firewall logging settings
  - settings : firewall properties
  - state : firewalls state (on | off)
- **store** (*str*) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
 Default is local

**Returns**

A dictionary containing the properties for the specified profile

**Return type**

dict

**Raises**

- **CommandExecutionError** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```
# Get the inbound/outbound firewall settings for connections on the
# local domain profile
salt * win_firewall.get_settings domain firewallpolicy

# Get the inbound/outbound firewall settings for connections on the
# domain profile as defined by local group policy
salt * win_firewall.get_settings domain firewallpolicy lgpo
```

**salt.modules.win\_firewall.rule\_exists**(*name*)

New in version 2016.11.6.

Checks if a firewall rule exists in the firewall policy

**Parameters**

**name** (*str*) -- The name of the rule

**Returns**

True if exists, otherwise False

**Return type**

bool

CLI Example:

```
# Is there a rule named RemoteDesktop
salt '*' firewall.rule_exists RemoteDesktop
```

**salt.modules.win\_firewall.set\_firewall\_settings**(*profile*, *inbound*=None, *outbound*=None, *store*='local')

Set the firewall inbound/outbound settings for the specified profile and store

New in version 2018.3.4.

New in version 2019.2.0.

**Parameters**

- **profile** (*str*) -- The firewall profile to query. Valid options are:
  - domain

- public
- private
- **inbound** (*str*) -- The inbound setting. If None is passed, the setting will remain unchanged. Valid values are:
  - blockinbound
  - blockinboundalways
  - allowinbound
  - notconfigured
 Default is None
- **outbound** (*str*) -- The outbound setting. If None is passed, the setting will remain unchanged. Valid values are:
  - allowoutbound
  - blockoutbound
  - notconfigured
 Default is None
- **store** (*str*) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
 Default is local

**Returns**

True if successful

**Return type**

bool

**Raises**

- **CommandExecutionError** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```
# Set the inbound setting for the domain profile to block inbound
# connections
salt * firewall.set_firewall_settings domain='domain' inbound=
→ 'blockinbound'

# Set the outbound setting for the domain profile to allow outbound
# connections
salt * firewall.set_firewall_settings domain='domain' outbound=
→ 'allowoutbound'

# Set inbound/outbound settings for the domain profile in the group
# policy to block inbound and allow outbound
salt * firewall.set_firewall_settings domain='domain' inbound=
→ 'blockinbound' outbound='allowoutbound' store='lgpo'
```

`salt.modules.win_firewall.set_logging_settings` (*profile, setting, value, store='local'*)

Configure logging settings for the Windows firewall.

New in version 2018.3.4.

New in version 2019.2.0.

**Parameters**

- **profile** (*str*) -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private

- **setting** (*str*) -- The logging setting to configure. Valid options are:
  - allowedconnections
  - droppedconnections
  - filename
  - maxfilesize
- **value** (*str*) -- The value to apply to the setting. Valid values are dependent upon the setting being configured. Valid options are:

allowedconnections:

- enable
- disable
- notconfigured

droppedconnections:

- enable
- disable
- notconfigured

filename:

- Full path and name of the firewall log file
- notconfigured

maxfilesize:

- 1 - 32767
- notconfigured

---

**Note:** notconfigured can only be used when using the lgpo store

---

- **store** (*str*) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
 Default is local

#### Returns

True if successful

#### Return type

bool

#### Raises

- **CommandExecutionError** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```
# Log allowed connections and set that in local group policy
salt * firewall.set_logging_settings domain allowedconnections enable lgpo

# Don't log dropped connections
salt * firewall.set_logging_settings profile=private
  →setting=droppedconnections value=disable

# Set the location of the log file
salt * firewall.set_logging_settings domain filename C:\windows\logs\
  →firewall.log

# You can also use environment variables
salt * firewall.set_logging_settings domain filename %systemroot%\
  →system32\LogFiles\Firewall\pffirewall.log
```

(continues on next page)

(continued from previous page)

```
# Set the max file size of the log to 2048 Kb
salt * firewall.set_logging_settings domain maxfilesize 2048
```

`salt.modules.win_firewall.set_settings` (*profile, setting, value, store='local'*)

Configure firewall settings.

New in version 2018.3.4.

New in version 2019.2.0.

#### Parameters

- **profile** (*str*) -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
- **setting** (*str*) -- The firewall setting to configure. Valid options are:
  - localfirewallrules
  - localconsecrules
  - inboundusernotification
  - remotemanagement
  - unicastresponsetomulticast
- **value** (*str*) -- The value to apply to the setting. Valid options are
  - enable
  - disable
  - notconfigured

---

**Note:** `notconfigured` can only be used when using the `lgpo` store

---

- **store** (*str*) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
 Default is `local`

#### Returns

True if successful

#### Return type

bool

#### Raises

- **CommandExecutionError** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```
# Merge local rules with those distributed through group policy
salt * firewall.set_settings domain localfirewallrules enable

# Allow remote management of Windows Firewall
salt * firewall.set_settings domain remotemanagement enable
```

`salt.modules.win_firewall.set_state` (*profile, state, store='local'*)

Configure the firewall state.

New in version 2018.3.4.

New in version 2019.2.0.

#### Parameters

- **profile** (*str*) -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
- **state** (*str*) -- The firewall state. Valid options are:
  - on
  - off
  - notconfigured

---

**Note:** `notconfigured` can only be used when using the `lgpo` store

---

- **store** (*str*) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
 Default is `local`

**Returns**

True if successful

**Return type**

bool

**Raises**

- **CommandExecutionError** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```
# Turn the firewall off when the domain profile is active
salt * firewall.set_state domain off

# Turn the firewall on when the public profile is active and set that in
# the local group policy
salt * firewall.set_state public on lgpo
```

## 26.6.491 salt.modules.win\_groupadd

Manage groups on Windows

---

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info' is not available`), see [here](#).

---

`salt.modules.win_groupadd.add(name, **kwargs)`

Add the specified group

**Parameters**

**name** (*str*) -- The name of the group to add

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' group.add foo
```

`salt.modules.win_groupadd.adduser` (*name*, *username*, *\*\*kwargs*)

Add a user to a group

**Parameters**

- **name** (*str*) -- The name of the group to modify
- **username** (*str*) -- The name of the user to add to the group

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' group.adduser foo username
```

`salt.modules.win_groupadd.delete` (*name*, *\*\*kwargs*)

Remove the named group

**Parameters**

**name** (*str*) -- The name of the group to remove

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.win_groupadd.deluser` (*name*, *username*, *\*\*kwargs*)

Remove a user from a group

**Parameters**

- **name** (*str*) -- The name of the group to modify
- **username** (*str*) -- The name of the user to remove from the group

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' group.deluser foo username
```

`salt.modules.win_groupadd.getent` (*refresh=False*)

Return info on all groups

**Parameters**

**refresh** (*bool*) -- Refresh the info for all groups in `__context__`. If False only the groups in `__context__` will be returned. If True the `__context__` will be refreshed with current data and returned. Default is False

**Returns**

A list of groups and their information

CLI Example:

```
salt '*' group.getent
```

`salt.modules.win_groupadd.info` (*name*)

Return information about a group

**Parameters**

**name** (*str*) -- The name of the group for which to get information

**Returns**

A dictionary of information about the group

**Return type**

dict

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.win_groupadd.list_groups(refresh=False)`

Return a list of groups

**Parameters**

**refresh** (*bool*) -- Refresh the info for all groups in `__context__`. If False only the groups in `__context__` will be returned. If True, the `__context__` will be refreshed with current data and returned. Default is False

**Returns**

A list of groups on the machine

**Return type**

list

CLI Example:

```
salt '*' group.list_groups
```

`salt.modules.win_groupadd.members(name, members_list, **kwargs)`

Ensure a group contains only the members in the list

**Parameters**

- **name** (*str*) -- The name of the group to modify
- **members\_list** (*str*) -- A single user or a comma separated list of users. The group will contain only the users specified in this list.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3'
```

## 26.6.492 salt.modules.win\_iis

Microsoft IIS site management via WebAdministration powershell module

**maintainer**

Shane Lee <slee@saltstack.com>, Robert Booth <rbooth@saltstack.com>

**platform**

Windows

**depends**

PowerShell

**depends**

WebAdministration module (PowerShell) (IIS)

New in version 2016.3.0.

`salt.modules.win_iis.create_app(name, site, sourcepath, apppool=None)`

Create an IIS application.

---

**Note:** This function only validates against the application name, and will return True even if the application already exists with a different configuration. It will not modify the configuration of an existing application.

---

**Parameters**

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **apppool** (*str*) -- The name of the IIS application pool.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_iis.create_app name='app0' site='site0' sourcepath='C:\site0
→' apppool='site0'
```

`salt.modules.win_iis.create_apppool(name)`

Create an IIS application pool.

---

**Note:** This function only validates against the application pool name, and will return True even if the application pool already exists with a different configuration. It will not modify the configuration of an existing application pool.

---

**Parameters**

**name** (*str*) -- The name of the IIS application pool.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_iis.create_apppool name='MyTestPool'
```

`salt.modules.win_iis.create_backup(name)`

Backup an IIS Configuration on the System.

New in version 2017.7.0.

---

**Note:** Backups are stored in the `$env:Windir\System32\inetsrv\backup` folder.

---

**Parameters**

**name** (*str*) -- The name to give the backup

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_iis.create_backup good_config_20170209
```

```
salt.modules.win_iis.create_binding(site, hostheader="", ipaddress="*", port=80, protocol='http',
                                   sslflags=None)
```

Create an IIS Web Binding.

---

**Note:** This function only validates against the binding ipaddress:port:hostheader combination, and will return True even if the binding already exists with a different configuration. It will not modify the configuration of an existing binding.

---

#### Parameters

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding. Usually a hostname.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding.
- **sslflags** (*str*) -- The flags representing certificate type and storage of the binding.

#### Returns

True if successful, otherwise False

#### Return type

bool

CLI Example:

```
salt '*' win_iis.create_binding site='site0' hostheader='example.com'
↳ ipaddress='*' port='80'
```

```
salt.modules.win_iis.create_cert_binding(name, site, hostheader="", ipaddress="*", port=443,
                                         sslflags=0)
```

Assign a certificate to an IIS Web Binding.

New in version 2016.11.0.

---

**Note:** The web binding that the certificate is being assigned to must already exist.

---

#### Parameters

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.
- **sslflags** (*int*) -- Flags representing certificate type and certificate storage of the binding.

#### Returns

True if successful, otherwise False

#### Return type

bool

CLI Example:

```
salt '*' win_iis.create_cert_binding name='AAA000' site='site0'
→hostheader='example.com' ipaddress='*' port='443'
```

```
salt.modules.win_iis.create_site(name, sourcepath, apppool="", hostheader="", ipaddress="*", port=80,
                                protocol='http')
```

Create a basic website in IIS.

---

**Note:** This function only validates against the site name, and will return True even if the site already exists with a different configuration. It will not modify the configuration of an existing site.

---

#### Parameters

- **name** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path of the IIS site.
- **apppool** (*str*) -- The name of the IIS application pool.
- **hostheader** (*str*) -- The host header of the binding. Usually the hostname or website name, ie: www.contoso.com
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding. (http, https, etc.)

#### Returns

True if successful, otherwise False.

#### Return type

bool

---

**Note:** If an application pool is specified, and that application pool does not already exist, it will be created.

---

CLI Example:

```
salt '*' win_iis.create_site name='My Test Site' sourcepath='c:\stage'
→apppool='TestPool'
```

```
salt.modules.win_iis.create_vdir(name, site, sourcepath, app='')
```

Create an IIS virtual directory.

---

**Note:** This function only validates against the virtual directory name, and will return True even if the virtual directory already exists with a different configuration. It will not modify the configuration of an existing virtual directory.

---

#### Parameters

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **app** (*str*) -- The IIS application.

#### Returns

True if successful, otherwise False

#### Return type

bool

CLI Example:

```
salt '*' win_iis.create_vdir name='vd0' site='site0' sourcepath='C:\
→inetpub\vdirs\vd0'
```

`salt.modules.win_iis.get_container_setting(name, container, settings)`

Get the value of the setting for the IIS container.

New in version 2016.11.0.

**Parameters**

- **name** (*str*) -- The name of the IIS container.
- **container** (*str*) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*dict*) -- A dictionary of the setting names and their values.

**Returns**

A dictionary of the provided settings and their values.

**Return type**

dict

CLI Example:

```
salt '*' win_iis.get_container_setting name='MyTestPool' container=
→'AppPools'
settings="['processModel.identityType']"
```

`salt.modules.win_iis.get_webapp_settings(name, site, settings)`

New in version 2017.7.0.

Get the value of the setting for the IIS web application.

---

**Note:** Params are case sensitive

---

**Parameters**

- **name** (*str*) -- The name of the IIS web application.
- **site** (*str*) -- The site name contains the web application. Example: Default Web Site
- **settings** (*str*) -- A dictionary of the setting names and their values. Available settings: physicalPath, applicationPool, userName, password

**Returns**

A dictionary of the provided settings and their values.

**Return type**

dict

CLI Example:

```
salt '*' win_iis.get_webapp_settings name='app0' site='Default Web Site'
settings="['physicalPath','applicationPool']"
```

`salt.modules.win_iis.get_webconfiguration_settings(name, settings)`

Get the webconfiguration settings for the IIS PSPATH.

**Parameters**

- **name** (*str*) -- The PSPATH of the IIS webconfiguration settings.
- **settings** (*list*) -- A list of dictionaries containing setting name and filter.

**Returns**

A list of dictionaries containing setting name, filter and value.

**Return type**

dict

CLI Example:

```
salt '*' win_iis.get_webconfiguration_settings name='IIS:\' settings="[{
  ↳'name': 'enabled', 'filter': 'system.webServer/security/authentication/
  ↳anonymousAuthentication'}]"
```

`salt.modules.win_iis.list_appools()`

List all configured IIS application pools.

**Returns**

A dictionary of IIS application pools and their details.

**Return type**

dict

CLI Example:

```
salt '*' win_iis.list_appools
```

`salt.modules.win_iis.list_apps(site)`

Get all configured IIS applications for the specified site.

**Parameters**

**site** (*str*) -- The IIS site name.

Returns: A dictionary of the application names and properties.

CLI Example:

```
salt '*' win_iis.list_apps site
```

`salt.modules.win_iis.list_backups()`

List the IIS Configuration Backups on the System.

New in version 2017.7.0.

---

**Note:** Backups are made when a configuration is edited. Manual backups are stored in the `$env:Windir\System32\inetsrv\backup` folder.

---

**Returns**

A dictionary of IIS Configurations backed up on the system.

**Return type**

dict

CLI Example:

```
salt '*' win_iis.list_backups
```

`salt.modules.win_iis.list_bindings(site)`

Get all configured IIS bindings for the specified site.

**Parameters**

**site** (*str*) -- The name of the IIS Site

**Returns**

A dictionary of the binding names and properties.

**Return type**

dict

CLI Example:

```
salt '*' win_iis.list_bindings site
```

`salt.modules.win_iis.list_cert_bindings`(*site*)

List certificate bindings for an IIS site.

New in version 2016.11.0.

**Parameters**

**site** (*str*) -- The IIS site name.

**Returns**

A dictionary of the binding names and properties.

**Return type**

dict

CLI Example:

```
salt '*' win_iis.list_bindings site
```

`salt.modules.win_iis.list_sites`()

List all the currently deployed websites.

**Returns**

A dictionary of the IIS sites and their properties.

**Return type**

dict

CLI Example:

```
salt '*' win_iis.list_sites
```

`salt.modules.win_iis.list_vdirs`(*site*, *app*='')

Get all configured IIS virtual directories for the specified site, or for the combination of site and application.

**Parameters**

- **site** (*str*) -- The IIS site name.
- **app** (*str*) -- The IIS application.

**Returns**

A dictionary of the virtual directory names and properties.

**Return type**

dict

CLI Example:

```
salt '*' win_iis.list_vdirs site
```

`salt.modules.win_iis.list_worker_processes`(*apppool*)

Returns a list of worker processes that correspond to the passed application pool.

New in version 2017.7.0.

**Parameters**

**apppool** (*str*) -- The application pool to query

**Returns**

A dictionary of worker processes with their process IDs

**Return type**

dict

CLI Example:

```
salt '*' win_iis.list_worker_processes 'My App Pool'
```

`salt.modules.win_iis.modify_binding`(*site*, *binding*, *hostheader*=None, *ipaddress*=None, *port*=None, *sslflags*=None)

Modify an IIS Web Binding. Use `site` and `binding` to target the binding.

New in version 2017.7.0.

#### Parameters

- **site** (*str*) -- The IIS site name.
- **binding** (*str*) -- The binding to edit. This is a combination of the IP address, port, and hostheader. It is in the following format: `ipaddress:port:hostheader`. For example, `*:80:` or `*:80:salt.com`
- **hostheader** (*str*) -- The host header of the binding. Usually the hostname.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.
- **sslflags** (*str*) -- The flags representing certificate type and storage of the binding.

#### Returns

True if successful, otherwise False

#### Return type

bool

CLI Example:

The following will set the host header of binding `*:80:` for `site0` to `example.com`

```
salt '*' win_iis.modify_binding site='site0' binding='*:80:' hostheader=
↳ 'example.com'
```

`salt.modules.win_iis.modify_site` (*name*, *sourcepath*=None, *apppool*=None)

Modify a basic website in IIS.

New in version 2017.7.0.

#### Parameters

- **name** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path of the IIS site.
- **apppool** (*str*) -- The name of the IIS application pool.

#### Returns

True if successful, otherwise False.

#### Return type

bool

---

**Note:** If an application pool is specified, and that application pool does not already exist, it will be created.

---

CLI Example:

```
salt '*' win_iis.modify_site name='My Test Site' sourcepath='c:\new_path'
↳ apppool='NewTestPool'
```

`salt.modules.win_iis.remove_app` (*name*, *site*)

Remove an IIS application.

#### Parameters

- **name** (*str*) -- The application name.
- **site** (*str*) -- The IIS site name.

#### Returns

True if successful, otherwise False

#### Return type

bool

CLI Example:

```
salt '*' win_iis.remove_app name='app0' site='site0'
```

`salt.modules.win_iis.remove_appool`(*name*)

Remove an IIS application pool.

**Parameters**

**name** (*str*) -- The name of the IIS application pool.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_iis.remove_appool name='MyTestPool'
```

`salt.modules.win_iis.remove_backup`(*name*)

Remove an IIS Configuration backup from the System.

New in version 2017.7.0.

**Parameters**

**name** (*str*) -- The name of the backup to remove

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_iis.remove_backup backup_20170209
```

`salt.modules.win_iis.remove_binding`(*site*, *hostheader=""*, *ipaddress=""*, *port=80*)

Remove an IIS binding.

**Parameters**

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_iis.remove_binding site='site0' hostheader='example.com'
→ipaddress='*' port='80'
```

`salt.modules.win_iis.remove_cert_binding`(*name*, *site*, *hostheader=""*, *ipaddress=""*, *port=443*)

Remove a certificate from an IIS Web Binding.

New in version 2016.11.0.

---

**Note:** This function only removes the certificate from the web binding. It does not remove the web binding itself.

---

**Parameters**

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_iis.remove_cert_binding name='AAA000' site='site0'
→hostheader='example.com' ipaddress='*' port='443'
```

**salt.modules.win\_iis.remove\_site**(*name*)

Delete a website from IIS.

**Parameters**

**name** (*str*) -- The IIS site name.

**Returns**

True if successful, otherwise False

**Return type**

bool

---

**Note:** This will not remove the application pool used by the site.

---

CLI Example:

```
salt '*' win_iis.remove_site name='My Test Site'
```

**salt.modules.win\_iis.remove\_vdir**(*name*, *site*, *app*='')

Remove an IIS virtual directory.

**Parameters**

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **app** (*str*) -- The IIS application.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_iis.remove_vdir name='vdir0' site='site0'
```

**salt.modules.win\_iis.restart\_appool**(*name*)

Restart an IIS application pool.

New in version 2016.11.0.

**Parameters**

**name** (*str*) -- The name of the IIS application pool.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_iis.restart_appool name='MyTestPool'
```

`salt.modules.win_iis.restart_site(name)`

Restart a Web Site in IIS.

New in version 2017.7.0.

**Parameters**

**name** (*str*) -- The name of the website to restart.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_iis.restart_site name='My Test Site'
```

`salt.modules.win_iis.set_container_setting(name, container, settings)`

Set the value of the setting for an IIS container.

New in version 2016.11.0.

**Parameters**

- **name** (*str*) -- The name of the IIS container.
- **container** (*str*) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*dict*) -- A dictionary of the setting names and their values.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_iis.set_container_setting name='MyTestPool' container=
→ 'AppPools'
settings="{ 'managedPipeLineMode': 'Integrated' }"
```

`salt.modules.win_iis.set_webapp_settings(name, site, settings)`

New in version 2017.7.0.

Configure an IIS application.

---

**Note:** This function only configures an existing app. Params are case sensitive.

---

**Parameters**

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **settings** (*str*) -- A dictionary of the setting names and their values. - physicalPath: The physical path of the webapp. - applicationPool: The application pool for the webapp. - userName: "connectAs" user - password: "connectAs" password for user

**Returns**

A boolean representing whether all changes succeeded.

**Return type**

bool

CLI Example:

```
salt '*' win_iis.set_webapp_settings name='app0' site='site0' settings="{
  ↳'physicalPath': 'C:\site0', 'apppool': 'site0'}"
```

**salt.modules.win\_iis.set\_webconfiguration\_settings**(*name*, *settings*)

Set the value of the setting for an IIS container.

**Parameters**

- **name** (*str*) -- The PSPATH of the IIS webconfiguration settings.
- **settings** (*list*) -- A list of dictionaries containing setting name, filter and value.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_iis.set_webconfiguration_settings name='IIS:\' settings="[
  ↳'name': 'enabled', 'filter': 'system.webServer/security/authentication/
  ↳anonymousAuthentication', 'value': False]"
```

**salt.modules.win\_iis.start\_appool**(*name*)

Start an IIS application pool.

New in version 2017.7.0.

**Parameters**

**name** (*str*) -- The name of the App Pool to start.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_iis.start_appool name='MyTestPool'
```

**salt.modules.win\_iis.start\_site**(*name*)

Start a Web Site in IIS.

New in version 2017.7.0.

**Parameters**

**name** (*str*) -- The name of the website to start.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_iis.start_site name='My Test Site'
```

**salt.modules.win\_iis.stop\_appool**(*name*)

Stop an IIS application pool.

New in version 2017.7.0.

**Parameters**

**name** (*str*) -- The name of the App Pool to stop.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_iis.stop_appool name='MyTestPool'
```

`salt.modules.win_iis.stop_site(name)`

Stop a Web Site in IIS.

New in version 2017.7.0.

**Parameters**

**name** (*str*) -- The name of the website to stop.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_iis.stop_site name='My Test Site'
```

### 26.6.493 salt.modules.win\_ip

The networking module for Windows based systems

`salt.modules.win_ip.disable(iface)`

Disable an interface

CLI Example:

```
salt -G 'os_family:Windows' ip.disable 'Local Area Connection #2'
```

`salt.modules.win_ip.enable(iface)`

Enable an interface

CLI Example:

```
salt -G 'os_family:Windows' ip.enable 'Local Area Connection #2'
```

`salt.modules.win_ip.get_all_interfaces()`

Return configs for all interfaces

CLI Example:

```
salt -G 'os_family:Windows' ip.get_all_interfaces
```

`salt.modules.win_ip.get_default_gateway()`

Set DNS source to DHCP on Windows

CLI Example:

```
salt -G 'os_family:Windows' ip.get_default_gateway
```

`salt.modules.win_ip.get_interface(iface)`

Return the configuration of a network interface

CLI Example:

```
salt -G 'os_family:Windows' ip.get_interface 'Local Area Connection'
```

`salt.modules.win_ip.get_subnet_length(mask)`

Convenience function to convert the netmask to the CIDR subnet length

CLI Example:

```
salt -G 'os_family:Windows' ip.get_subnet_length 255.255.255.0
```

`salt.modules.win_ip.is_disabled(iface)`

Returns True if interface is disabled, otherwise False

CLI Example:

```
salt -G 'os_family:Windows' ip.is_disabled 'Local Area Connection #2'
```

`salt.modules.win_ip.is_enabled(iface)`

Returns True if interface is enabled, otherwise False

CLI Example:

```
salt -G 'os_family:Windows' ip.is_enabled 'Local Area Connection #2'
```

`salt.modules.win_ip.raw_interface_configs()`

Return raw configs for all interfaces

CLI Example:

```
salt -G 'os_family:Windows' ip.raw_interface_configs
```

`salt.modules.win_ip.set_dhcp_all(iface)`

Set both IP Address and DNS to DHCP

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_all 'Local Area Connection'
```

`salt.modules.win_ip.set_dhcp_dns(iface)`

Set DNS source to DHCP on Windows

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_dns 'Local Area Connection'
```

`salt.modules.win_ip.set_dhcp_ip(iface)`

Set Windows NIC to get IP from DHCP

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_ip 'Local Area Connection'
```

`salt.modules.win_ip.set_static_dns(iface, *addrs)`

Set static DNS configuration on a Windows NIC

**Parameters**

- **iface** (*str*) -- The name of the interface to set
- **addrs** -- One or more DNS servers to be added. To clear the list of DNS servers pass an empty list ([]). If undefined or None no changes will be made.

**Returns**

A dictionary containing the new DNS settings

**Return type**

dict

CLI Example:

```
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection'
↳ '192.168.1.1'
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection'
↳ '192.168.1.252' '192.168.1.253'
```

`salt.modules.win_ip.set_static_ip`(*iface*, *addr*, *gateway=None*, *append=False*)

Set static IP configuration on a Windows NIC

**iface**

The name of the interface to manage

**addr**

IP address with subnet length (ex. 10.1.2.3/24). The `ip.get_subnet_length` function can be used to calculate the subnet length from a netmask.

**gateway**

[None] If specified, the default gateway will be set to this value.

**append**

[False] If True, this IP address will be added to the interface. Default is False, which overrides any existing configuration for the interface and sets `addr` as the only address on the interface.

CLI Example:

```
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.
↳ 2.3/24 gateway=10.1.2.1
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.
↳ 2.4/24 append=True
```

## 26.6.494 salt.modules.win\_lgpo

Manage Local Policy on Windows

This module allows configuring local group policy (i.e. `gpedit.msc`) on a Windows machine.

New in version 2016.11.0.

**Warning:** Local Group Policy will always be superseded by Domain Group policy. If policies are configured with Local Group Policy that are also configured with Domain Group policy, the Domain Group policy will take precedence.

### Administrative Templates

Administrative template policies are dynamically read from ADMX/ADML files on the server.

## Windows Settings

Policies contained in the "Windows Settings" section of the `gpedit.msc` GUI are statically defined in this module. Each policy is configured for the section (Machine/User) in the module's `_policy_info` class. The `_policy_info` class contains a "policies" dict on how the module will configure the policy, where the policy resides in the GUI (for display purposes), data validation data, data transformation data, etc.

### Current known limitations

- At this time, start/shutdown scripts policies are displayed, but are not configurable.
- Not all "Security Settings" policies exist in the `_policy_info` class

#### depends

- `pywin32` Python module
- `lxml`
- `uuid`
- `struct`
- `salt.utils.win_reg`

`salt.modules.win_lgpo.clear_policy_cache()`

Clears the policy definitions and resource stored in `__context__`. They will be rebuilt the next time a policy is applied.

CLI Example:

```
salt '*' lgpo.clear_policy_cache
```

`salt.modules.win_lgpo.get(policy_class=None, return_full_policy_names=True, hierarchical_return=False, adml_language='en-US', return_not_configured=False)`

Get a policy value

#### Parameters

- **policy\_class** (*str*) -- Some policies are both user and computer, by default all policies will be pulled, but this can be used to retrieve only a specific policy class `User/USER/user` = retrieve user policies `Machine/MACHINE/machine/Computer/COMPUTER/computer` = retrieve machine/computer policies
- **return\_full\_policy\_names** (*bool*) -- True/False to return the policy name as it is seen in the `gpedit.msc` GUI or to only return the policy key/id.
- **hierarchical\_return** (*bool*) -- True/False to return the policy data in the hierarchy as seen in the `gpedit.msc` GUI. The default of False will return data split only into User/Computer configuration sections
- **adml\_language** (*str*) -- The ADML language to use for processing display/descriptive names and enumeration values of ADMX template data, defaults to en-US
- **return\_not\_configured** (*bool*) -- Include Administrative Template policies that are 'Not Configured' in the return data

#### Returns

A dictionary containing the policy values for the specified class

#### Return type

`dict`

CLI Example:

```
salt '*' lgpo.get machine return_full_policy_names=True
```

```
salt.modules.win_lgpo.get_policy(policy_name, policy_class, adm_l_language='en-US',
                                return_value_only=True, return_full_policy_names=True,
                                hierarchical_return=False)
```

Get the current settings for a single policy on the machine

#### Parameters

- **policy\_name** (*str*) -- The name of the policy to retrieve. Can be the any of the names or aliases returned by `lgpo.get_policy_info`
- **policy\_class** (*str*) -- The policy class. Must be one of `machine` or `user`
- **adm\_l\_language** (*str*) -- The language code for the adml file to use for localization. The default is `en-US`
- **return\_value\_only** (*bool*) -- True will return only the value for the policy, without the name of the policy. `return_full_policy_names` and `hierarchical_return` will be ignored. Default is `True`
- **return\_full\_policy\_names** (*bool*) -- Returns the full policy name regardless of what was passed in `policy_name`

---

**Note:** This setting applies to sub-elements of the policy if they exist. The value passed in `policy_name` will always be used as the policy name when this setting is `False`

---

- **hierarchical\_return** (*bool*) -- Returns a hierarchical view of the policy showing its parents

#### Returns

A dictionary containing the policy settings

#### Return type

dict

CLI Example:

```
# Using the policy id
salt * lgpo.get_policy LockoutDuration machine
salt * lgpo.get_policy AutoUpdateCfg machine

# Using the full name
salt * lgpo.get_policy "Account lockout duration" machine
salt * lgpo.get_policy "Configure Automatic Updates" machine

# Using full path and name
salt * lgpo.get_policy "Windows Components\Windows Update\Configure
→Automatic Updates" machine
```

```
salt.modules.win_lgpo.get_policy_info(policy_name, policy_class, adm_l_language='en-US')
```

Returns information about a specified policy

#### Parameters

- **policy\_name** (*str*) -- The name of the policy to lookup
- **policy\_class** (*str*) -- The class of policy, i.e. `machine`, `user`, both
- **adm\_l\_language** (*str*) -- The ADML language to use for Administrative Template data lookup

#### Returns

Information about the specified policy

#### Return type

dict

CLI Example:

```
salt '*' lgpo.get_policy_info 'Maximum password age' machine
```

You can use `lgpo.get_policy_info` to get all the possible names that could be used in a state file or from the command line (along with elements that need to be set/etc). The key is to match the text you see in the `gpedit.msc` gui exactly, including quotes around words or phrases. The "full path" style is really only needed when there are multiple policies that use the same base name. For example, `Access data sources across domains` exists in ~10 different paths. If you put that through `get_policy_info` you'll get back a message that it is used for multiple policies and you need to be more specific.

CLI Example:

```
salt-call --local lgpo.get_policy_info ShellRemoveOrderPrints_2 machine

local:
-----
message:
policy_aliases:
  - Turn off the "Order Prints" picture task
  - ShellRemoveOrderPrints_2
  - System\Internet Communication Management\Internet Communication
→settings\Turn off the "Order Prints" picture task
policy_class:
  machine
policy_elements:
policy_found:
  True
policy_name:
  ShellRemoveOrderPrints_2
rights_assignment:
  False
```

Escaping can get tricky in cmd/Powershell. The following is an example of escaping in Powershell using backquotes:

```
PS>salt-call --local lgpo.get_policy_info "Turn off the ``"Order Prints``
→`" picture task" machine

local:
-----
message:
policy_aliases:
  - Turn off the "Order Prints" picture task
  - ShellRemoveOrderPrints_2
  - System\Internet Communication Management\Internet Communication
→settings\Turn off the "Order Prints" picture task
policy_class:
  machine
policy_elements:
policy_found:
  True
policy_name:
  Turn off the "Order Prints" picture task
rights_assignment:
  False
```

This function can then be used to get the options available for specifying Group Policy Objects to be used in state files. Based on the above any of these *should* be usable:

```
internet_communications_settings:
  lgpo.set:
    - computer_policy:
        Turn off the "Order Prints" picture task: Enabled
```

```
internet_communications_settings:
  lgpo.set:
    - computer_policy:
        ShellRemoveOrderPrints_2: Enabled
```

When using the full path, it might be a good idea to use single quotes around the path:

```
internet_communications_settings:
  lgpo.set:
    - computer_policy:
        'System\Internet Communication Management\Internet Communication
        ↪settings\Turn off the "Order Prints" picture task': 'Enabled'
```

If you struggle to find the policy from `get_policy_info` using the name as you see in `gpedit.msc`, the names such as "ShellRemoveOrderPrints\_2" come from the `.admx` files. If you know nothing about `.admx`/`.adml` relationships (ADML holds what you see in the GUI, ADMX holds the more technical details), then this may be a little bit too much info, but here is an example with the above policy using Powershell:

```
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.
↪adml | Select-String "Order Prints"

C:\windows\PolicyDefinitions\en-US\ICM.adml:152:      <string id=
↪"ShellRemoveOrderPrints">Turn off the "Order Prints" picture task</
↪string>
C:\windows\PolicyDefinitions\en-US\ICM.adml:153:      <string id=
↪"ShellRemoveOrderPrints_Help">This policy setting specifies whether the
↪"Order Prints Online" task is available from Picture Tasks in Windows
↪folders.
C:\windows\PolicyDefinitions\en-US\ICM.adml:155:The Order Prints Online
↪Wizard is used to download a list of providers and allow users to order
↪prints online.
C:\windows\PolicyDefinitions\en-US\ICM.adml:157:If you enable this policy
↪setting, the task "Order Prints Online" is removed from Picture Tasks
↪in File Explorer folders.
```

From this `grep`, we can see id "ShellRemoveOrderPrints" is the ID of the string used to describe this policy, then we search for it in the ADMX:

```
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.
↪admx | Select-String "ShellRemoveOrderPrints"

C:\windows\PolicyDefinitions\ICM.admx:661:      <policy name=
↪"ShellRemoveOrderPrints_1" class="User" displayName="$(string.
↪ShellRemoveOrderPrints)" explainText="$(string.ShellRemoveOrderPrints_
↪Help)" key="Software\Microsoft\Windows\CurrentVersion\Policies\Explorer
↪" valueName="NoOnlinePrintsWizard">
```

(continues on next page)

(continued from previous page)

```
C:\windows\PolicyDefinitions\ICM.admx:671: <policy name=
→"ShellRemoveOrderPrints_2" class="Machine" displayName="$ (string.
→ShellRemoveOrderPrints)" explainText="$ (string.ShellRemoveOrderPrints_
→Help)" key="Software\Microsoft\Windows\CurrentVersion\Policies\Explorer
→" valueName="NoOnlinePrintsWizard">
```

Now we have two to pick from. And if you notice the `class="Machine"` and `class="User"` (which details if it is a computer policy or user policy respectively) the `ShellRemoveOrderPrints_2` is the "short name" we could use to pass through `get_policy_info` to see what the module itself is expecting.

```
salt.modules.win_lgpo.set_(computer_policy=None, user_policy=None,
                           cumulative_rights_assignments=True, adml_language='en-US')
```

Set a local server policy.

#### Parameters

- **computer\_policy** (*dict*) -- A dictionary of "policyname: value" pairs of computer policies to set. 'value' should be how it is displayed in the gpedit GUI, i.e. if a setting can be 'Enabled'/'Disabled', then that should be passed

Administrative Template data may require dicts within dicts, to specify each element of the Administrative Template policy. Administrative Templates policies are always cumulative.

Policy names can be specified in a number of ways based on the type of policy:

Windows Settings Policies:

These policies can be specified using the GUI display name or the key name from the `_policy_info` class in this module. The GUI display name is also contained in the `_policy_info` class in this module.

Administrative Template Policies:

These can be specified using the policy name as displayed in the GUI (case sensitive). Some policies have the same name, but a different location (for example, "Access data sources across domains"). These can be differentiated by the "path" in the GUI (for example, "Windows ComponentsInternet ExplorerInternet Control PanelSecurity PageInternet ZoneAccess data sources across domains").

Additionally, policies can be specified using the "name" and "id" attributes from the ADMX files.

For Administrative Templates that have policy elements, each element can be specified using the text string as seen in the GUI or using the ID attribute from the ADMX file. Due to the way some of the GUI text is laid out, some policy element names could include descriptive text that appears before the policy element in the GUI.

Use the `get_policy_info` function for the policy name to view the element ID/names that the module will accept.

- **user\_policy** (*dict*) -- The same setup as the `computer_policy`, except with data to configure the local user policy.
- **cumulative\_rights\_assignments** (*bool*) -- Determine how user rights assignment policies are configured.

If True, user right assignment specifications are simply added to the existing policy

If False, only the users specified will get the right (any existing will have the right revoked)

- **adml\_language** (*str*) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

#### Returns

True is successful, otherwise False

#### Return type

bool

CLI Example:

```
salt '*' lgpo.set computer_policy="{ 'LockoutDuration': 2,
  ↳ 'RestrictAnonymous': 'Enabled', 'AuditProcessTracking': 'Success, Failure
  ↳ }"
```

`salt.modules.win_lgpo.set_computer_policy` (*name*, *setting*, *cumulative\_rights\_assignments*=True, *adml\_language*='en-US')

Set a single computer policy

#### Parameters

- **name** (*str*) -- The name of the policy to configure
- **setting** (*str*) -- The setting to configure the named policy with
- **cumulative\_rights\_assignments** (*bool*) -- Determine how user rights assignment policies are configured. If True, user right assignment specifications are simply added to the existing policy. If False, only the users specified will get the right (any existing will have the right revoked)
- **adml\_language** (*str*) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

#### Returns

True if successful, otherwise False

#### Return type

bool

CLI Example:

```
salt '*' lgpo.set_computer_policy LockoutDuration 1440
```

`salt.modules.win_lgpo.set_user_policy` (*name*, *setting*, *adml\_language*='en-US')

Set a single user policy

#### Parameters

- **name** (*str*) -- The name of the policy to configure
- **setting** (*str*) -- The setting to configure the named policy with
- **adml\_language** (*str*) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

#### Returns

True if successful, Otherwise False

#### Return type

bool

CLI Example:

```
salt '*' lgpo.set_user_policy "Control Panel\Display\Disable the Display
  ↳ Control Panel" Enabled
```

## 26.6.495 salt.modules.win\_lgpo\_reg

### LGPO - Registry.pol

New in version 3006.0.

A module for working with registry based policies in Windows Local Group Policy (LGPO). This module contains functions for working with the `Registry.pol` file. The `Registry.pol` file is the source of truth for registry settings and LGPO.

Group Policy is refreshed every 90 seconds by default. During that refresh the contents of the `Registry.pol` file are applied to the Registry. If the setting is changed outside of Group Policy to something other than what is contained in the `Registry.pol` file, it will be changed back during the next refresh.

In the Group Policy Editor (`gpedit.msc`) these policies can be set to three states:

- Not Configured
- Enabled
- Disabled

A policy that is "Not Configured" does not have an entry in the `Registry.pol` file. A Group Policy refresh will not make any changes to key/value pairs in the registry that are not specified in the `Registry.pol` file.

An "Enabled" policy will have an entry in the `Registry.pol` files that contains its key path, value name, value type, value size, and value data. When Group Policy is refreshed, existing values will be overwritten with those contained in the `Registry.pol` file.

A "Disabled" policy will have an entry in the `Registry.pol` file with the key path and the value name, but the value name will be prepended with `**del.`. When Group Policy is refreshed the key/value will be deleted from the registry. If the key contains no values, it will also be deleted.

### Working with LGPO Reg

The easiest way to figure out the values needed for this module is to set the policy using the Group Policy Editor (`gpedit.msc`) and then run the `lgpo_reg.read_reg_pol` function. This function will display a dictionary of all registry-based policies in the `Registry.pol` file. From its return you can get the `key`, `v_name`, `v_type`, and `v_data` required to "enable" that policy. Use those values to set/disable/delete policies using this module. The same values can also be used to create states for setting these policies.

---

**Note:** Not all policies in the Group Policy Editor (`gpedit.msc`) that write to the registry make that change in the `Registry.pol` file. Those policies could still be enforced via the `Registry.pol` file... theoretically. But you will have to find the values needed to set them with this module using a different method.

---

`salt.modules.win_lgpo_reg.delete_value` (*key*, *v\_name*, *policy\_class*='Machine')

Delete a key/value pair from the `Registry.pol` file. This bypasses the `admx/adml` style policies. This is the equivalent of setting the policy to `Not Configured`.

#### Parameters

- **key** (*str*) -- The registry key path
- **v\_name** (*str*) -- The registry value name within the key
- **policy\_class** (*str*) -- The registry class to write to. Can be one of the following:
  - Computer
  - Machine
  - User

Default is `Machine`

**Raises**

- ***SaltInvocationError*** -- Invalid policy\_class
- ***CommandExecutionError*** -- On failure

**Returns**

True if successful, otherwise False None: Key/value not present

**Return type**

bool

CLI Example:

```
# Delete all values under a key
salt '*' lgpo_reg.delete_value "SOFTWARE\MyKey" "MyValue"
```

`salt.modules.win_lgpo_reg.disable_value`(*key*, *v\_name*, *policy\_class*='machine')

Mark a registry value for deletion in the registry.pol file. This bypasses the admx/adml style policies. This is the equivalent of setting the policy to Disabled in the Group Policy editor (gpedit.msc)

**Parameters**

- **key** (*str*) -- The registry key path
- **v\_name** (*str*) -- The registry value name within the key
- **policy\_class** (*str*) -- The registry class to write to. Can be one of the following:
  - Computer
  - Machine
  - User

Default is Machine

**Raises**

- ***SaltInvocationError*** -- Invalid policy\_class
- ***CommandExecutionError*** -- On failure

**Returns**

True if successful, otherwise False None: If already disabled

**Return type**

bool

CLI Example:

```
# Delete a value
salt '*' lgpo_reg.delete_value "SOFTWARE\MyKey" "MyValue"
```

`salt.modules.win_lgpo_reg.get_key`(*key*, *policy\_class*='Machine')

Get all the values set in a key in the Registry.pol file.

**Parameters**

- **key** (*str*) -- The registry key where the values reside
- **policy\_class** (*str*) -- The registry class to read from. Can be one of the following:

**Raises**

***SaltInvocationError*** -- Invalid policy class

**Returns**

A dictionary containing the value data and the value type

**Return type**

dict

CLI Example:

```
# Get all values from a key
salt '*' lgpo_reg.get_key "SOFTWARE\MyKey"
```

`salt.modules.win_lgpo_reg.get_value`(*key*, *v\_name*, *policy\_class*='Machine')

Get the value of a single value pair as set in the Registry.pol file.

**Parameters**

- **key** (*str*) -- The registry key where the value name resides
- **v\_name** (*str*) -- The value name to retrieve
- **policy\_class** (*str*) -- The registry class to read from. Can be one of the following:

**Raises**

***SaltInvocationError*** -- Invalid policy class

**Returns**

A dictionary containing the value data and the value type found

**Return type**

dict

CLI Example:

```
# Get a value
salt '*' lgpo_reg.get_value "SOFTWARE\MyKey" "MyValue"
```

`salt.modules.win_lgpo_reg.read_reg_pol(policy_class='Machine')`

Read the contents of the Registry.pol file. Display the contents as a human-readable dictionary.

**Parameters**

- **policy\_class** (*str*) -- The registry class to retrieve. Can be one of the following:
  - Computer
  - Machine
  - User

Default is Machine

**Raises**

***SaltInvocationError*** -- Invalid policy class

**Returns**

A dictionary representing the contents of the Registry.pol file

**Return type**

dict

CLI Example:

```
# Read the machine Registry.pol
salt '*' lgpo_reg.read_reg_pol
```

`salt.modules.win_lgpo_reg.set_value(key, v_name, v_data, v_type='REG_DWORD', policy_class='Machine')`

Add a key/value pair to the registry.pol file. This bypasses the admx/adml style policies. This is the equivalent of setting a policy to Enabled

**Parameters**

- **key** (*str*) -- The registry key path
- **v\_name** (*str*) -- The registry value name within the key
- **v\_data** (*str*) -- The registry value
- **v\_type** (*str*) -- The registry value type. Must be one of the following:
  - REG\_BINARY
  - REG\_DWORD
  - REG\_EXPAND\_SZ
  - REG\_MULTI\_SZ
  - REG\_QWORD
  - REG\_SZ

Default is REG\_DWORD

- **policy\_class** (*str*) -- The registry class to write to. Can be one of the following:
  - Computer
  - Machine

- User  
Default is Machine

**Raises**

- ***SaltInvocationError*** -- Invalid policy\_class
- ***SaltInvocationError*** -- Invalid v\_type
- ***SaltInvocationError*** -- v\_data doesn't match v\_type

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
# Set REG_DWORD value (default)
salt '*' lgpo_reg.set_value "SOFTWARE\MyKey" "MyValue" 1

# Set REG_SZ value
salt '*' lgpo_reg.set_value "SOFTWARE\MyKey" "MyValue" "string value"
→ "REG_SZ"
```

`salt.modules.win_lgpo_reg.write_reg_pol(data, policy_class='Machine')`

Write data to the Registry.pol file. The data is a dictionary that is then converted to the appropriate bytes format expected by Registry.pol

**Parameters**

- **data** (*dict*) -- A dictionary containing Registry.pol data
- **policy\_class** (*str*) -- The registry class to write to. Can be one of the following:
  - Computer
  - Machine
  - User

Default is Machine

**Raises**

- ***SaltInvocationError*** -- Invalid policy class
- ***CommandExecutionError*** -- On failure

**Returns**

True if successful

**Return type**

bool

CLI Example:

```
# Write to Machine Registry.pol
salt '*' lgpo_reg.write_reg_pol '{"SOFTWARE\MyKey': {'MyValue': 'data': 1,
→ 'type': 'REG_DWORD'}}"
```

## 26.6.496 salt.modules.win\_license

This module allows you to manage windows licensing via slmgr.vbs

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

`salt.modules.win_license.activate()`

Attempt to activate the current machine via Windows Activation

CLI Example:

```
salt '*' license.activate
```

`salt.modules.win_license.info()`

Return information about the license, if the license is not correctly activated this will return None.

CLI Example:

```
salt '*' license.info
```

`salt.modules.win_license.install(product_key)`

Install the given product key

CLI Example:

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

`salt.modules.win_license.installed(product_key)`

Check to see if the product key is already installed.

**Note: This is not 100% accurate as we can only see the last 5 digits of the license.**

CLI Example:

```
salt '*' license.installed XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

`salt.modules.win_license.licensed()`

Return true if the current machine is licensed correctly

CLI Example:

```
salt '*' license.licensed
```

`salt.modules.win_license.uninstall()`

Uninstall the current product key

CLI Example:

```
salt '*' license.uninstall
```

## 26.6.497 salt.modules.win\_network

Module for gathering and managing network information

`salt.modules.win_network.connect(host, port=None, **kwargs)`

Test connectivity to a host using a particular port from the minion.

New in version 2016.3.0.

CLI Example:

```
salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
```

(continues on next page)

(continued from previous page)

```
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp  
→timeout=3
```

`salt.modules.win_network.dig(host)`

Performs a DNS lookup with dig

Note: dig must be installed on the Windows minion

CLI Example:

```
salt '*' network.dig archlinux.org
```

`salt.modules.win_network.get_route(ip)`

Return routing information for given destination ip

New in version 2016.11.5.

CLI Example:

```
salt '*' network.get_route 10.10.10.10
```

`salt.modules.win_network.hw_addr(iface)`

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr 'Wireless Connection #1'
```

`salt.modules.win_network.hwaddr(iface)`

This function is an alias of `hw_addr`.

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr 'Wireless Connection #1'
```

`salt.modules.win_network.in_subnet(cidr)`

Returns True if host is within specified subnet, otherwise False

CLI Example:

```
salt '*' network.in_subnet 10.0.0.0/16
```

`salt.modules.win_network.interfaces()`

Return a dictionary of information about all the interfaces on the minion

CLI Example:

```
salt '*' network.interfaces
```

`salt.modules.win_network.interfaces_names()`

Return a list of all the interfaces names

CLI Example:

```
salt '*' network.interfaces_names
```

`salt.modules.win_network.ip_addrs` (*interface=None, include\_loopback=False, cidr=None, type=None*)

Returns a list of IPv4 addresses assigned to the host.

**interface**

Only IP addresses from that interface will be returned.

**include\_loopback**

[False] Include loopback 127.0.0.1 IPv4 address.

**cidr**

Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

**type**

If option set to 'public' then only public addresses will be returned. Ditto for 'private'.

Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs
salt '*' network.ip_addrs cidr=10.0.0.0/8
salt '*' network.ip_addrs cidr=192.168.0.0/16 type=private
```

`salt.modules.win_network.ip_addrs6` (*interface=None, include\_loopback=False, cidr=None*)

Returns a list of IPv6 addresses assigned to the host.

**interface**

Only IP addresses from that interface will be returned.

**include\_loopback**

[False] Include loopback ::1 IPv6 address.

**cidr**

Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs6
salt '*' network.ip_addrs6 cidr=2000::/3
```

`salt.modules.win_network.ipaddrs` (*interface=None, include\_loopback=False, cidr=None, type=None*)

This function is an alias of `ip_addrs`.

Returns a list of IPv4 addresses assigned to the host.

**interface**

Only IP addresses from that interface will be returned.

**include\_loopback**

[False] Include loopback 127.0.0.1 IPv4 address.

**cidr**

Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

**type**

If option set to 'public' then only public addresses will be returned. Ditto for 'private'.

Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs
salt '*' network.ip_addrs cidr=10.0.0.0/8
salt '*' network.ip_addrs cidr=192.168.0.0/16 type=private
```

`salt.modules.win_network.ipaddrs6`(*interface=None, include\_loopback=False, cidr=None*)

This function is an alias of `ip_addrs6`.

Returns a list of IPv6 addresses assigned to the host.

**interface**

Only IP addresses from that interface will be returned.

**include\_loopback**

[False] Include loopback ::1 IPv6 address.

**cidr**

Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs6
salt '*' network.ip_addrs6 cidr=2000::/3
```

`salt.modules.win_network.is_private`(*ip\_addr*)

Check if the given IP address is a private address

New in version 2019.2.0.

CLI Example:

```
salt '*' network.is_private 10.0.0.3
```

`salt.modules.win_network.netstat`()

Return information on open ports and states

CLI Example:

```
salt '*' network.netstat
```

`salt.modules.win_network.nslookup`(*host*)

Query DNS for information about a domain or ip address

CLI Example:

```
salt '*' network.nslookup archlinux.org
```

`salt.modules.win_network.ping`(*host, timeout=False, return\_boolean=False*)

Performs a ping to a host

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2016.11.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

`salt.modules.win_network.subnets()`

Returns a list of subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
```

`salt.modules.win_network.traceroute(host)`

Performs a traceroute to a 3rd party host

CLI Example:

```
salt '*' network.traceroute archlinux.org
```

### 26.6.498 salt.modules.win\_ntp

Management of NTP servers on Windows

New in version 2014.1.0.

`salt.modules.win_ntp.get_servers()`

Get list of configured NTP servers

CLI Example:

```
salt '*' ntp.get_servers
```

`salt.modules.win_ntp.set_servers(*servers)`

Set Windows to use a list of NTP servers

CLI Example:

```
salt '*' ntp.set_servers 'pool.ntp.org' 'us.pool.ntp.org'
```

### 26.6.499 salt.modules.win\_path

Manage the Windows System PATH

Note that not all Windows applications will rehash the PATH environment variable, Only the ones that listen to the WM\_SETTINGCHANGE message.

`salt.modules.win_path.add(path, index=None, **kwargs)`

Add the directory to the SYSTEM path in the index location. Returns True if successful, otherwise False.

**path**

Directory to add to path

**index**

Optionally specify an index at which to insert the directory

**rehash**

[True] If the registry was updated, and this value is set to True, sends a WM\_SETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

CLI Examples:

```
# Will add to the beginning of the path
salt '*' win_path.add 'c:\python27' 0

# Will add to the end of the path
salt '*' win_path.add 'c:\python27' index='-1'
```

`salt.modules.win_path.exists(path)`

Check if the directory is configured in the SYSTEM path Case-insensitive and ignores trailing backslash

**Returns**

boolean True if path exists, False if not

CLI Example:

```
salt '*' win_path.exists 'c:\python27'
salt '*' win_path.exists 'c:\python27\'
salt '*' win_path.exists 'C:\pyThon27'
```

`salt.modules.win_path.get_path()`

Returns a list of items in the SYSTEM path

CLI Example:

```
salt '*' win_path.get_path
```

`salt.modules.win_path.rehash()`

Send a WM\_SETTINGCHANGE Broadcast to Windows to refresh the Environment variables for new processes.

---

**Note:** This will only affect new processes that aren't launched by services. To apply changes to the path to services, the host must be restarted. The `salt-minion`, if running as a service, will not see changes to the environment until the system is restarted. See [MSDN Documentation](#)

---

CLI Example:

```
salt '*' win_path.rehash
```

`salt.modules.win_path.remove(path, **kwargs)`

Remove the directory from the SYSTEM path

**Returns**

boolean True if successful, False if unsuccessful

**rehash**

[True] If the registry was updated, and this value is set to True, sends a WM\_SETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

CLI Example:

```
# Will remove C:\Python27 from the path
salt '*' win_path.remove 'c:\\python27'
```

## 26.6.500 salt.modules.win\_pkg

A module to manage software on Windows

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

The following functions require the existence of a `windows repository` metadata DB, typically created by running `pkg.refresh_db`:

- `pkg.get_repo_data`
- `pkg.install`
- `pkg.latest_version`
- `pkg.list_available`
- `pkg.list_pkgs`
- `pkg.list_upgrades`
- `pkg.remove`

If a metadata DB does not already exist and one of these functions is run, then one will be created from the repo SLS files that are present.

As the creation of this metadata can take some time, the `winrepo_cache_expire_min` minion config option can be used to suppress refreshes when the metadata is less than a given number of seconds old.

---

**Note:** Version numbers can be version number string, latest and Not Found, where Not Found means this module was not able to determine the version of the software installed, it can also be used as the version number in sls definitions file in these cases. Versions numbers are sorted in order of 0, Not Found, order version numbers, ..., latest.

---

`salt.modules.win_pkg.compare_versions(ver1="", oper='==', ver2="")`

Compare software package versions. Made public for use with Jinja

**Parameters**

- **ver1** (*str*) -- A software version to compare
- **oper** (*str*) -- The operand to use to compare
- **ver2** (*str*) -- A software version to compare

**Returns**

True if the comparison is valid, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' pkg.compare_versions 1.2 >= 1.3
```

`salt.modules.win_pkg.genrepo(**kwargs)`

Generate package metadata db based on files within the `winrepo_source_dir`

Kwargs:

**saltenv** (*str*): Salt environment. Default: base

**verbose** (*bool*):

Return verbose data structure which includes 'success\_list', a list of all sls files and the package names contained within. Default False.

**failhard (bool):**

If `True`, an error will be raised if any repo SLS files failed to process. If `False`, no error will be raised, and a dictionary containing the full results will be returned.

**Note:**

- Hidden directories (directories beginning with '.', such as '.git') will be ignored.

**Returns**

A dictionary of the results of the command

**Return type**

dict

## CLI Example:

```
salt-run pkg.genrepo
salt -G 'os:windows' pkg.genrepo verbose=true failhard=false
salt -G 'os:windows' pkg.genrepo saltenv=base
```

`salt.modules.win_pkg.get_package_info(name, saltenv='base')`

Get information about the package as found in the winrepo database

**Parameters**

- **name** (*str*) -- The name of the package
- **saltenv** (*str*) -- The salt environment to use. Default is "base"

**Returns**

A dictionary of package info, empty if package not available

**Return type**

dict

## CLI Example:

```
salt '*' pkg.get_package_info chrome
```

`salt.modules.win_pkg.get_repo_data(saltenv='base')`

Returns the existing package metadata db. Will create it, if it does not exist, however will not refresh it.

**Parameters**

**saltenv** (*str*) -- Salt environment. Default base

**Returns**

A dict containing contents of metadata db.

**Return type**

dict

## CLI Example:

```
salt '*' pkg.get_repo_data
```

`salt.modules.win_pkg.install(name=None, refresh=False, pkgs=None, **kwargs)`

Install the passed package(s) on the system using winrepo

**Parameters**

- **name** (*str*) -- The name of a single package, or a comma-separated list of packages to install. (no spaces after the commas)
- **refresh** (*bool*) -- Boolean value representing whether or not to refresh the winrepo db. Default `False`.
- **pkgs** (*list*) -- A list of packages to install from a software repository. All packages listed under `pkgs` will be installed via a single command.

You can specify a version by passing the item as a dict:

CLI Example:

```
# will install the latest version of foo and bar
salt '*' pkg.install pkgs='["foo", "bar"]'

# will install the latest version of foo and version 1.2.
↪3 of bar
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
```

Kwargs:

**version (str):**

The specific version to install. If omitted, the latest version will be installed. Recommend for use when installing a single package.

If passed with a list of packages in the `pkgs` parameter, the version will be ignored.

CLI Example:

```
# Version is ignored
salt '*' pkg.install pkgs="['foo', 'bar']" version=1.
↪2.3
```

If passed with a comma separated list in the `name` parameter, the version will apply to all packages in the list.

CLI Example:

```
# Version 1.2.3 will apply to packages foo and bar
salt '*' pkg.install foo,bar version=1.2.3
```

**extra\_install\_flags (str):**

Additional install flags that will be appended to the `install_flags` defined in the software definition file. Only applies when single package is passed.

**saltenv (str):**

Salt environment. Default 'base'

**report\_reboot\_exit\_codes (bool):**

If the installer exits with a recognized exit code indicating that a reboot is required, the module function

```
win_system.set_reboot_required_witnessed
```

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code. The value of this param defaults to True.

New in version 2016.11.0.

**Returns**

Return a dict containing the new package names and versions. If the package is already installed, an empty dict is returned.

If the package is installed by `pkg.install`:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

**Return type**

dict

The following example will refresh the winrepo and install a single package, 7zip.

CLI Example:

```
salt '*' pkg.install 7zip refresh=True
```

CLI Example:

```
salt '*' pkg.install 7zip
salt '*' pkg.install 7zip,filezilla
salt '*' pkg.install pkgs='["7zip","filezilla"]'
```

WinRepo Definition File Examples:

The following example demonstrates the use of `cache_file`. This would be used if you have multiple installers in the same directory that use the same `install.ini` file and you don't want to download the additional installers.

```
ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_file: 'salt://win/repo/ntp/install.ini'
    install_flags: '/USEFILE=C:\salt\var\cache\salt\minion\files\base\win\
→repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

The following example demonstrates the use of `cache_dir`. It assumes a file named `install.ini` resides in the same directory as the installer.

```
ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_dir: True
    install_flags: '/USEFILE=C:\salt\var\cache\salt\minion\files\base\win\
→repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

`salt.modules.win_pkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

**Note:** Since this is looking for the latest version available, a `refresh_db` will be triggered by default. This can take some time. To avoid this set `refresh` to `False`.

#### Parameters

**names** (*str*) -- A single or multiple names to lookup

#### Kwargs:

`saltenv` (*str*): Salt environment. Default `base` `refresh` (*bool*): Refresh package metadata. Default `True`

**Returns**

A dictionary of packages with the latest version available

**Return type**

dict

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.win_pkg.list_available(*names, **kwargs)`

Return a list of available versions of the specified package.

**Parameters**

**names** (*str*) -- One or more package names

Kwargs:

**saltenv** (*str*): The salt environment to use. Default base.

**refresh** (*bool*): Refresh package metadata. Default False.

**return\_dict\_always** (*bool*):

Default False dict when a single package name is queried.

**Returns**

The package name with its available versions

**Return type**

dict

```
{'<package name>': ['<version>', '<version>', ...]}
```

CLI Example:

```
salt '*' pkg.list_available <package name> return_dict_always=True
salt '*' pkg.list_available <package name01> <package name02>
```

`salt.modules.win_pkg.list_pkgs(versions_as_list=False, include_components=True, include_updates=True, **kwargs)`

List the packages currently installed.

---

**Note:** To view installed software as displayed in the Add/Remove Programs, set `include_components` and `include_updates` to False.

---

**Parameters**

- **versions\_as\_list** (*bool*) -- Returns the versions as a list
- **include\_components** (*bool*) -- Include sub components of installed software. Default is True
- **include\_updates** (*bool*) -- Include software updates and Windows updates. Default is True

Kwargs:

**saltenv** (*str*):

The salt environment to use. Default base

**refresh** (*bool*):

Refresh package metadata. Default False

**Returns**

A dictionary of installed software with versions installed

**Return type**  
dict

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.win_pkg.list_upgrades` (*refresh=True, \*\*kwargs*)

List all available package upgrades on this system

**Parameters**

**refresh** (*bool*) -- Refresh package metadata. Default True

**Kwargs:**

saltenv (*str*): Salt environment. Default base

**Returns**

A dictionary of packages with available upgrades

**Return type**

dict

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.win_pkg.normalize_name` (*name*)

Nothing to do on Windows. We need this function so that Salt doesn't go through every module looking for `pkg.normalize_name`.

New in version 3006.0.

**Parameters**

**name** (*str*) -- The name of the package

**Returns**

The name of the package

**Return type**

str

CLI Example:

```
salt '*' pkg.normalize_name git
```

`salt.modules.win_pkg.purge` (*name=None, pkgs=None, \*\*kwargs*)

Package purges are not supported on Windows, this function is identical to `remove()`.

---

**Note:** At some point in the future, `pkg.purge` may direct the installer to remove all configs and settings for software packages that support that option.

---

New in version 0.16.0.

**Parameters**

- **name** (*str*) -- The name of the package to be deleted.
- **version** (*str*) -- The version of the package to be deleted. If this option is used in combination with the `pkgs` option below, then this version will be applied to all targeted packages.

- **pkgs** (*list*) -- A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

**Kwargs:**

saltenv (str): Salt environment. Default base refresh (bool): Refresh package metadata. Default False

**Returns**

A dict containing the changes.

**Return type**

dict

**CLI Example:**

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['"foo"', "bar"]'
```

**salt.modules.win\_pkg.refresh\_db(\*\*kwargs)**

Generates the local software metadata database (*winrepo.p*) on the minion. The database is stored in a serialized format located by default at the following location:

```
C:\ProgramData\Salt Project\Salt\var\cache\salt\minion\files\base\win\
repo-ng\winrepo.p
```

This module performs the following steps to generate the software metadata database:

- Fetch the package definition files (.sls) from *winrepo\_source\_dir* (default *salt://win/repo-ng*) and cache them in *<cachedir>files<saltenv><winrepo\_source\_dir>* (default: *C:\ProgramData\Salt Project\Salt\var\cache\salt\minion\files\base\win\repo-ng*)
- Call *pkg.genrepo* to parse the package definition files and generate the repository metadata database file (*winrepo.p*)
- Return the report received from *pkg.genrepo*

The default winrepo directory on the master is */srv/salt/win/repo-ng*. All files that end with *.sls* in this and all subdirectories will be used to generate the repository metadata database (*winrepo.p*).

**Note:**

- Hidden directories (directories beginning with '.', such as '.git') will be ignored.

**Note:** There is no need to call *pkg.refresh\_db* every time you work with the pkg module. Automatic refresh will occur based on the following minion configuration settings:

- *winrepo\_cache\_expire\_min*
- *winrepo\_cache\_expire\_max*

However, if the package definition files have changed, as would be the case if you are developing a new package definition, this function should be called to ensure the minion has the latest information about packages available to it.

**Warning:** Directories and files fetched from *<winrepo\_source\_dir>* (*/srv/salt/win/repo-ng*) will be processed in alphabetical order. If two or more software definition files contain the same name, the last one processed replaces all data from the files processed before it.

For more information see *Windows Software Repository*

Arguments:

saltenv (str): Salt environment. Default: base

**verbose (bool):**

Return a verbose data structure which includes 'success\_list', a list of all sls files and the package names contained within. Default is 'False'

**failhard (bool):**

If True, an error will be raised if any repo SLS files fails to process. If False, no error will be raised, and a dictionary containing the full results will be returned.

**Returns**

A dictionary containing the results of the database refresh.

**Return type**

dict

---

**Note:** A result with a *total: 0* generally means that the files are in the wrong location on the master. Try running the following command on the minion: `salt-call -l debug pkg.refresh saltenv=base`

---

**Warning:** When calling this command from a state using `module.run` be sure to pass `failhard: False`. Otherwise, the state will report failure if it encounters a bad software definition file.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db saltenv=base
```

`salt.modules.win_pkg.remove` (*name=None, pkgs=None, \*\*kwargs*)

Remove the passed package(s) from the system using winrepo

New in version 0.16.0.

**Parameters**

- **name** (*str*) -- The name(s) of the package(s) to be uninstalled. Can be a single package or a comma delimited list of packages, no spaces.
- **pkgs** (*list*) -- A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

**Kwargs:**

**version (str):**

The version of the package to be uninstalled. If this option is used to to uninstall multiple packages, then this version will be applied to all targeted packages. Recommended using only when uninstalling a single package. If this parameter is omitted, the latest version will be uninstalled.

saltenv (str): Salt environment. Default base refresh (bool): Refresh package metadata. Default False

**Returns**

Returns a dict containing the changes.

If the package is removed by `pkg.remove`:

```
{<package>: {'old': '<old-version>',
             'new': '<new-version>'}}
```

If the package is already uninstalled:

```
{<package>: {'current': 'not installed'}}
```

**Return type**

dict

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.win_pkg.upgrade(**kwargs)`

Upgrade all software. Currently not implemented

**Kwargs:**

saltenv (str): The salt environment to use. Default base. refresh (bool): Refresh package metadata. Default True.

---

**Note:** This feature is not yet implemented for Windows.

---

**Returns**

Empty dict, until implemented

**Return type**

dict

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.win_pkg.upgrade_available(name, **kwargs)`

Check whether or not an upgrade is available for a given package

**Parameters**

**name** (str) -- The name of a single package

**Kwargs:**

refresh (bool): Refresh package metadata. Default True saltenv (str): The salt environment. Default base

**Returns**

True if new version available, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.win_pkg.versioin(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**Parameters**

**name** (str) -- One or more package names

**Kwargs:**

saltenv (str): The salt environment to use. Default base. refresh (bool): Refresh package metadata. Default False.

**Returns**

version string when a single package is specified. dict: The package name(s) with the installed versions.

**Return type**

str

```
{['<version>', '<version>', ]} OR
{'<package name>': ['<version>', '<version>', ]}
```

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name01> <package name02>
```

### 26.6.501 salt.modules.win\_pki

Microsoft certificate management via the PKI Client PowerShell module. <https://technet.microsoft.com/en-us/itpro/powershell/windows/pkiclient/pkiclient>

The PKI Client PowerShell module is only available on Windows 8+ and Windows Server 2012+. [https://technet.microsoft.com/en-us/library/hh848636\(v=wps.620\).aspx](https://technet.microsoft.com/en-us/library/hh848636(v=wps.620).aspx)

#### platform

Windows

#### depends

- PowerShell 4
- PKI Client Module (Windows 8+ / Windows Server 2012+)

New in version 2016.11.0.

```
salt.modules.win_pki.export_cert(name, thumbprint, cert_format='cer', context='LocalMachine',
                                store='My', password="")
```

Export the certificate to a file from the given certificate store.

#### Parameters

- **name** (*str*) -- The destination path for the exported certificate file.
- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **cert\_format** (*str*) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.
- **password** (*str*) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

#### Returns

A boolean representing whether all changes succeeded.

#### Return type

bool

CLI Example:

```
salt '*' win_pki.export_cert name='C:\certs\example.cer' thumbprint=
→ 'AAA000'
```

```
salt.modules.win_pki.get_cert_file(name, cert_format='cer', password="")
```

Get the details of the certificate file.

#### Parameters

- **name** (*str*) -- The filesystem path of the certificate file.
- **cert\_format** (*str*) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.

- **password** (*str*) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

**Returns**

A dictionary of the certificate thumbprints and properties.

**Return type**

dict

CLI Example:

```
salt '*' win_pki.get_cert_file name='C:\certs\example.cer'
```

`salt.modules.win_pki.get_certs(context='LocalMachine', store='My')`

Get the available certificates in the given store.

**Parameters**

- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.

**Returns**

A dictionary of the certificate thumbprints and properties.

**Return type**

dict

CLI Example:

```
salt '*' win_pki.get_certs
```

`salt.modules.win_pki.get_stores()`

Get the certificate location contexts and their corresponding stores.

**Returns**

A dictionary of the certificate location contexts and stores.

**Return type**

dict

CLI Example:

```
salt '*' win_pki.get_stores
```

`salt.modules.win_pki.import_cert(name, cert_format='cer', context='LocalMachine', store='My', exportable=True, password='', saltenv='base')`

Import the certificate file into the given certificate store.

**Parameters**

- **name** (*str*) -- The path of the certificate file to import.
- **cert\_format** (*str*) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.
- **exportable** (*bool*) -- Mark the certificate as exportable. Only applicable to pfx format.
- **password** (*str*) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.
- **saltenv** (*str*) -- The environment the file resides in.

**Returns**

A boolean representing whether all changes succeeded.

**Return type**

bool

CLI Example:

```
salt '*' win_pki.import_cert name='salt://cert.cer'
```

`salt.modules.win_pki.remove_cert(thumbprint, context='LocalMachine', store='My')`

Remove the certificate from the given certificate store.

**Parameters**

- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.

**Returns**

A boolean representing whether all changes succeeded.

**Return type**

bool

CLI Example:

```
salt '*' win_pki.remove_cert thumbprint='AAA000'
```

`salt.modules.win_pki.test_cert(thumbprint, context='LocalMachine', store='My', untrusted_root=False, dns_name="", eku=")`

Check the certificate for validity.

**Parameters**

- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.
- **untrusted\_root** (*bool*) -- Whether the root certificate is required to be trusted in chain building.
- **dns\_name** (*str*) -- The DNS name to verify as valid for the certificate.
- **eku** (*str*) -- The enhanced key usage object identifiers to verify for the certificate chain.

**Returns**

A boolean representing whether the certificate was considered valid.

**Return type**

bool

CLI Example:

```
salt '*' win_pki.test_cert thumbprint='AAA000' dns_name='example.test'
```

## 26.6.502 salt.modules.win\_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```
# Set monitor to never turn off on Battery power
salt '*' powercfg.set_monitor_timeout 0 power=dc
# Set disk timeout to 120 minutes on AC power
salt '*' powercfg.set_disk_timeout 120 power=ac
```

`salt.modules.win_powercfg.get_disk_timeout(scheme=None)`

Get the current disk timeout of the given scheme

**Parameters**

- **scheme** (*str*) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- SCHEME\_BALANCED - Balanced
- SCHEME\_MAX - Power saver
- SCHEME\_MIN - High performance

**Returns**

A dictionary of both the AC and DC settings

**Return type**

dict

CLI Example:

```
salt '*' powercfg.get_disk_timeout
```

`salt.modules.win_powercfg.get_hibernate_timeout` (*scheme=None*)

Get the current hibernate timeout of the given scheme

**scheme (str):**

The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- SCHEME\_BALANCED - Balanced
- SCHEME\_MAX - Power saver
- SCHEME\_MIN - High performance

**Returns**

A dictionary of both the AC and DC settings

**Return type**

dict

CLI Example:

```
salt '*' powercfg.get_hibernate_timeout
```

`salt.modules.win_powercfg.get_monitor_timeout` (*scheme=None*)

Get the current monitor timeout of the given scheme

**Parameters**

**scheme (str)** -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- SCHEME\_BALANCED - Balanced
- SCHEME\_MAX - Power saver
- SCHEME\_MIN - High performance

**Returns**

A dictionary of both the AC and DC settings

**Return type**

dict

CLI Example:

```
salt '*' powercfg.get_monitor_timeout
```

`salt.modules.win_powercfg.get_standby_timeout` (*scheme=None*)

Get the current standby timeout of the given scheme

**scheme (str):**

The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- SCHEME\_BALANCED - Balanced
- SCHEME\_MAX - Power saver
- SCHEME\_MIN - High performance

**Returns**

A dictionary of both the AC and DC settings

**Return type**  
dict

CLI Example:

```
salt '*' powercfg.get_standby_timeout
```

`salt.modules.win_powercfg.set_disk_timeout`(*timeout*, *power*='ac', *scheme*=None)

Set the disk timeout in minutes for the given power scheme

**Parameters**

- **timeout** (*int*) -- The amount of time in minutes before the disk will timeout
- **power** (*str*) -- Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme** (*str*) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME\_BALANCED - Balanced
  - SCHEME\_MAX - Power saver
  - SCHEME\_MIN - High performance

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
# Sets the disk timeout to 30 minutes on battery
salt '*' powercfg.set_disk_timeout 30 power=dc
```

`salt.modules.win_powercfg.set_hibernate_timeout`(*timeout*, *power*='ac', *scheme*=None)

Set the hibernate timeout in minutes for the given power scheme

**Parameters**

- **timeout** (*int*) -- The amount of time in minutes before the computer hibernates
- **power** (*str*) -- Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme** (*str*) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME\_BALANCED - Balanced
  - SCHEME\_MAX - Power saver
  - SCHEME\_MIN - High performance

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
# Sets the hibernate timeout to 30 minutes on Battery
salt '*' powercfg.set_hibernate_timeout 30 power=dc
```

`salt.modules.win_powercfg.set_monitor_timeout`(*timeout*, *power*='ac', *scheme*=None)

Set the monitor timeout in minutes for the given power scheme

**Parameters**

- **timeout** (*int*) -- The amount of time in minutes before the monitor will timeout
- **power** (*str*) -- Set the value for AC or DC power. Default is ac. Valid options are:

- ac (AC Power)
- dc (Battery)
- **scheme** (*str*) -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME\_BALANCED - Balanced
  - SCHEME\_MAX - Power saver
  - SCHEME\_MIN - High performance

**Returns**

True if successful, otherwise `False`

**Return type**

`bool`

CLI Example:

```
# Sets the monitor timeout to 30 minutes
salt '*' powercfg.set_monitor_timeout 30
```

`salt.modules.win_powercfg.set_standby_timeout` (*timeout*, *power='ac'*, *scheme=None*)

Set the standby timeout in minutes for the given power scheme

**Parameters**

- **timeout** (*int*) -- The amount of time in minutes before the computer sleeps
- **power** (*str*) -- Set the value for AC or DC power. Default is `ac`. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme** (*str*) -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME\_BALANCED - Balanced
  - SCHEME\_MAX - Power saver
  - SCHEME\_MIN - High performance

**Returns**

True if successful, otherwise `False`

**Return type**

`bool`

CLI Example:

```
# Sets the system standby timeout to 30 minutes on Battery
salt '*' powercfg.set_standby_timeout 30 power=dc
```

### 26.6.503 salt.modules.win\_psget

Module for managing PowerShell through PowerShellGet (PSGet)

**depends**

- PowerShell 5.0
- PSGet

Support for PowerShell

`salt.modules.win_psget.avail_modules` (*desc=False*)

List available modules in registered Powershell module repositories.

**Parameters**

**desc** (`bool`) -- If `True`, the verbose description will be returned.

CLI Example:

```
salt 'win01' psget.avail_modules
salt 'win01' psget.avail_modules desc=True
```

### salt.modules.win\_psget.bootstrap()

Make sure that nuget-anycpu.exe is installed. This will download the official nuget-anycpu.exe from the internet.

CLI Example:

```
salt 'win01' psget.bootstrap
```

### salt.modules.win\_psget.get\_repository(name)

Get the details of a local PSGet repository

#### Parameters

**name** (str) -- Name of the repository

CLI Example:

```
salt 'win01' psget.get_repository MyRepo
```

### salt.modules.win\_psget.install(name, minimum\_version=None, required\_version=None, scope=None, repository=None)

Install a Powershell module from powershell gallery on the system.

#### Parameters

- **name** (str) -- Name of a Powershell module
- **minimum\_version** (str) -- The maximum version to install, e.g. 1.23.2
- **required\_version** (str) -- Install a specific version
- **scope** (str) -- The scope to install the module to, e.g. CurrentUser, Computer
- **repository** (str) -- The friendly name of a private repository, e.g. MyREpo

CLI Example:

```
salt 'win01' psget.install PowerPlan
```

### salt.modules.win\_psget.list\_modules(desc=False)

List currently installed PSGet Modules on the system.

#### Parameters

**desc** (bool) -- If True, the verbose description will be returned.

CLI Example:

```
salt 'win01' psget.list_modules
salt 'win01' psget.list_modules desc=True
```

### salt.modules.win\_psget.register\_repository(name, location, installation\_policy=None)

Register a PSGet repository on the local machine

#### Parameters

- **name** (str) -- The name for the repository
- **location** (str) -- The URI for the repository
- **installation\_policy** (str) -- The installation policy for packages, e.g. Trusted, Untrusted

CLI Example:

```
salt 'win01' psget.register_repository MyRepo https://myrepo.mycompany.
↳com/packages
```

`salt.modules.win_psget.remove(name)`

Remove a Powershell DSC module from the system.

**Parameters**

**name** (str) -- Name of a Powershell DSC module

CLI Example:

```
salt 'win01' psget.remove PowerPlan
```

`salt.modules.win_psget.update(name, maximum_version=None, required_version=None)`

Update a PowerShell module to a specific version, or the newest

**Parameters**

- **name** (str) -- Name of a Powershell module
- **maximum\_version** (str) -- The maximum version to install, e.g. 1.23.2
- **required\_version** (str) -- Install a specific version

CLI Example:

```
salt 'win01' psget.update PowerPlan
```

### 26.6.504 salt.modules.win\_servermanager

Manage Windows features via the ServerManager powershell module. Can list available and installed roles/features. Can install and remove roles/features.

**maintainer**

Shane Lee <[slee@saltstack.com](mailto:slee@saltstack.com)>

**platform**

Windows Server 2008R2 or greater

**depends**

PowerShell module ServerManager

`salt.modules.win_servermanager.install(feature, recurse=False, restart=False, source=None, exclude=None)`

Install a feature

---

**Note:** Some features require reboot after un/installation, if so until the server is restarted other features can not be installed!

---

---

**Note:** Some features take a long time to complete un/installation, set -t with a long timeout

---

**Parameters**

- **feature** (str, list) -- The name of the feature(s) to install. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.  
New in version 2018.3.0: Added the ability to pass a list of features to be installed.
- **recurse** (Optional[bool]) -- Install all sub-features. Default is False
- **restart** (Optional[bool]) -- Restarts the computer when installation is complete, if required by the role/feature installed. Will also trigger a reboot if an item in exclude requires a reboot to be properly removed. Default is False

- **source** (*Optional[str]*) -- Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None
- **exclude** (*Optional[str]*) -- The name of the feature to exclude when installing the named feature. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

**Warning:** As there is no exclude option for the Add-WindowsFeature or Install-WindowsFeature PowerShell commands the features named in exclude will be installed with other sub-features and will then be removed. If the feature named in ``exclude`` is not a sub-feature of one of the installed items it will still be removed.

**Returns**

A dictionary containing the results of the install

**Return type**

dict

CLI Example:

```
# Install the Telnet Client passing a single string
salt '*' win_servermanager.install Telnet-Client

# Install the TFTP Client and the SNMP Service passing a comma-delimited
# string. Install all sub-features
salt '*' win_servermanager.install TFTP-Client,SNMP-Service recurse=True

# Install the TFTP Client from d:\side-by-side
salt '*' win_servermanager.install TFTP-Client source=d:\\side-by-side

# Install the XPS Viewer, SNMP Service, and Remote Access passing a
# list. Install all sub-features, but exclude the Web Server
salt '*' win_servermanager.install ["XPS-Viewer', 'SNMP-Service',
↪ 'RemoteAccess']" True recurse=True exclude="Web-Server"
```

`salt.modules.win_servermanager.list_available()`

List available features to install

**Returns**

A list of available features as returned by the Get-WindowsFeature PowerShell command

**Return type**

str

CLI Example:

```
salt '*' win_servermanager.list_available
```

`salt.modules.win_servermanager.list_installed()`

List installed features. Supported on Windows Server 2008 and Windows 8 and newer.

**Returns**

A dictionary of installed features

**Return type**

dict

CLI Example:

```
salt '*' win_servermanager.list_installed
```

`salt.modules.win_servermanager.remove`(*feature*, *remove\_payload=False*, *restart=False*)

Remove an installed feature

---

**Note:** Some features require a reboot after installation/uninstallation. If one of these features are modified, then other features cannot be installed until the server is restarted. Additionally, some features take a while to complete installation/uninstallation, so it is a good idea to use the `-t` option to set a longer timeout.

---

#### Parameters

- **feature** (*str*, *list*) -- The name of the feature(s) to remove. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.  
New in version 2018.3.0: Added the ability to pass a list of features to be removed.
- **remove\_payload** (*Optional[bool]*) -- True will cause the feature to be removed from the side-by-side store (%SystemDrive%\Windows\WinSxS). Default is False
- **restart** (*Optional[bool]*) -- Restarts the computer when uninstall is complete, if required by the role/feature removed. Default is False

#### Returns

A dictionary containing the results of the uninstall

#### Return type

dict

CLI Example:

```
salt -t 600 '*' win_servermanager.remove Telnet-Client
```

## 26.6.505 salt.modules.win\_service

Windows Service module.

Changed in version 2016.11.0: Rewritten to use PyWin32

`salt.modules.win_service.available`(*name*)

Check if a service is available on the system.

#### Parameters

**name** (*str*) -- The name of the service to check

#### Returns

True if the service is available, False otherwise

#### Return type

bool

CLI Example:

```
salt '*' service.available <service name>
```

`salt.modules.win_service.create`(*name*, *bin\_path*, *exe\_args=None*, *display\_name=None*, *description=None*, *service\_type='own'*, *start\_type='manual'*, *start\_delayed=False*, *error\_control='normal'*, *load\_order\_group=None*, *dependencies=None*, *account\_name='.\LocalSystem'*, *account\_password=None*, *run\_interactive=False*, *\*\*kwargs*)

Create the named service.

New in version 2015.8.0.

#### Parameters

- **name** (*str*) -- Specifies the service name. This is not the `display_name`
- **bin\_path** (*str*) -- Specifies the path to the service binary file. Backslashes must be escaped, eg: `C:\path\to\binary.exe`
- **exe\_args** (*str*) -- Any additional arguments required by the service binary.
- **display\_name** (*str*) -- The name to be displayed in the service manager. If not passed, the name will be used
- **description** (*str*) -- A description of the service
- **service\_type** (*str*) -- Specifies the service type. Default is `own`. Valid options are as follows:
  - `kernel`: Driver service
  - `filesystem`: File system driver service
  - `adapter`: Adapter driver service (reserved)
  - `recognizer`: Recognizer driver service (reserved)
  - `own` (default): Service runs in its own process
  - `share`: Service shares a process with one or more other services
- **start\_type** (*str*) -- Specifies the service start type. Valid options are as follows:
  - `boot`: Device driver that is loaded by the boot loader
  - `system`: Device driver that is started during kernel initialization
  - `auto`: Service that automatically starts
  - `manual` (default): Service must be started manually
  - `disabled`: Service cannot be started
- **start\_delayed** (*bool*) -- Set the service to `Auto(Delayed Start)`. Only valid if the `start_type` is set to `Auto`. If `service_type` is not passed, but the service is already set to `Auto`, then the flag will be set. Default is `False`
- **error\_control** (*str*) -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - `normal` (normal): Error is logged and a message box is displayed
  - `severe`: Error is logged and computer attempts a restart with the last known good configuration
  - `critical`: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - `ignore`: Error is logged and startup continues, no notification is given to the user
- **load\_order\_group** (*str*) -- The name of the load order group to which this service belongs
- **dependencies** (*list*) -- A list of services or load ordering groups that must start before this service
- **account\_name** (*str*) -- The name of the account under which the service should run. For `own` type services this should be in the `domain\username` format. The following are examples of valid built-in service accounts:
  - `NT AuthorityLocalService`
  - `NT AuthorityNetworkService`
  - `NT AuthorityLocalSystem`
  - `.LocalSystem`
- **account\_password** (*str*) -- The password for the account name specified in `account_name`. For the above built-in accounts, this can be `None`. Otherwise a password must be specified.
- **run\_interactive** (*bool*) -- If this setting is `True`, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

#### Returns

A dictionary containing information about the new service

**Return type**

dict

CLI Example:

```
salt '*' service.create <service name> <path to exe> display_name='
↳<display name>'
```

**salt.modules.win\_service.create\_win\_salt\_restart\_task()**

Create a task in Windows task scheduler to enable restarting the salt-minion

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' service.create_win_salt_restart_task()
```

**salt.modules.win\_service.delete(name, timeout=90)**

Delete the named service

**Parameters**

- **name** (*str*) -- The name of the service to delete
- **timeout** (*int*) -- The time in seconds to wait for the service to be deleted before returning. This is necessary because a service must be stopped before it can be deleted. Default is 90 seconds

New in version 2017.7.9,2018.3.4.

**Returns****True** if successful, otherwise **False**. Also returns **True** if the service is not present**Return type**

bool

CLI Example:

```
salt '*' service.delete <service name>
```

**salt.modules.win\_service.disable(name, \*\*kwargs)**

Disable the named service to start at boot

**Parameters****name** (*str*) -- The name of the service to disable**Returns**

True if disabled, False otherwise

**Return type**

bool

CLI Example:

```
salt '*' service.disable <service name>
```

**salt.modules.win\_service.disabled(name)**

Check to see if the named service is disabled to start on boot

**Parameters****name** (*str*) -- The name of the service to check**Returns**

True if the service is disabled

**Return type**

bool

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.win_service.enable`(*name*, *start\_type*='auto', *start\_delayed*=False, *\*\*kwargs*)

Enable the named service to start at boot

**Parameters**

- **name** (*str*) -- The name of the service to enable.
- **start\_type** (*str*) -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual: Service must be started manually
  - disabled: Service cannot be started
- **start\_delayed** (*bool*) -- Set the service to Auto(Delayed Start). Only valid if the *start\_type* is set to Auto. If *service\_type* is not passed, but the service is already set to Auto, then the flag will be set.

**Returns**

True if successful, False otherwise

**Return type**

bool

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.win_service.enabled`(*name*, *\*\*kwargs*)

Check to see if the named service is enabled to start on boot

**Parameters**

**name** (*str*) -- The name of the service to check

**Returns**

True if the service is set to start

**Return type**

bool

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.win_service.execute_salt_restart_task`()

Run the Windows Salt restart task

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' service.execute_salt_restart_task()
```

`salt.modules.win_service.get_all`()

Return all installed services

**Returns**

Returns a list of all services on the system.

**Return type**

list

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.win_service.get_disabled()`

Return a list of disabled services. Disabled is defined as a service that is marked 'Disabled' or 'Manual'.

**Returns**

A list of disabled services.

**Return type**

list

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.win_service.get_enabled()`

Return a list of enabled services. Enabled is defined as a service that is marked to Auto Start.

**Returns**

A list of enabled services

**Return type**

list

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.win_service.get_service_name(*args)`

The Display Name is what is displayed in Windows when services.msc is executed. Each Display Name has an associated Service Name which is the actual name of the service. This function allows you to discover the Service Name by returning a dictionary of Display Names and Service Names, or filter by adding arguments of Display Names.

If no args are passed, return a dict of all services where the keys are the service Display Names and the values are the Service Names.

If arguments are passed, create a dict of Display Names and Service Names

**Returns**

A dictionary of display names and service names

**Return type**

dict

CLI Examples:

```
salt '*' service.get_service_name
salt '*' service.get_service_name 'Google Update Service (gupdate)' 'DHCP
→Client'
```

`salt.modules.win_service.getsid(name)`

Return the SID for this windows service

**Parameters**

**name** (*str*) -- The name of the service for which to return the SID

**Returns**

A string representing the SID for the service

**Return type**

str

CLI Example:

```
salt '*' service.getsid <service name>
```

`salt.modules.win_service.info(name)`

Get information about a service on the system

**Parameters**

**name** (*str*) -- The name of the service. This is not the display name. Use `get_service_name` to find the service name.

**Returns**

A dictionary containing information about the service.

**Return type**

`dict`

CLI Example:

```
salt '*' service.info spooler
```

`salt.modules.win_service.missing(name)`

The inverse of `service.available`.

**Parameters**

**name** (*str*) -- The name of the service to check

**Returns**

True if the service is missing, False otherwise

**Return type**

`bool`

CLI Example:

```
salt '*' service.missing <service name>
```

`salt.modules.win_service.modify(name, bin_path=None, exe_args=None, display_name=None, description=None, service_type=None, start_type=None, start_delayed=None, error_control=None, load_order_group=None, dependencies=None, account_name=None, account_password=None, run_interactive=None)`

Modify a service's parameters. Changes will not be made for parameters that are not passed.

New in version 2016.11.0.

**Parameters**

- **name** (*str*) -- The name of the service. Can be found using the `service.get_service_name` function
- **bin\_path** (*str*) -- The path to the service executable. Backslashes must be escaped, eg: `C:\path\to\binary.exe`
- **exe\_args** (*str*) -- Any arguments required by the service executable
- **display\_name** (*str*) -- The name to display in the service manager
- **description** (*str*) -- The description to display for the service
- **service\_type** (*str*) -- Specifies the service type. Default is `own`. Valid options are as follows:
  - `kernel`: Driver service
  - `filesystem`: File system driver service
  - `adapter`: Adapter driver service (reserved)
  - `recognizer`: Recognizer driver service (reserved)
  - `own` (default): Service runs in its own process
  - `share`: Service shares a process with one or more other services
- **start\_type** (*str*) -- Specifies the service start type. Valid options are as follows:
  - `boot`: Device driver that is loaded by the boot loader
  - `system`: Device driver that is started during kernel initialization
  - `auto`: Service that automatically starts
  - `manual`: Service must be started manually

- disabled: Service cannot be started
- **start\_delayed** (*bool*) -- Set the service to Auto(Delayed Start). Only valid if the `start_type` is set to `Auto`. If `service_type` is not passed, but the service is already set to `Auto`, then the flag will be set.
- **error\_control** (*str*) -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal: Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues, no notification is given to the user
- **load\_order\_group** (*str*) -- The name of the load order group to which this service belongs
- **dependencies** (*list*) -- A list of services or load ordering groups that must start before this service
- **account\_name** (*str*) -- The name of the account under which the service should run. For own type services this should be in the `domain\username` format. The following are examples of valid built-in service accounts:
  - NT AuthorityLocalService
  - NT AuthorityNetworkService
  - NT AuthorityLocalSystem
  - .LocalSystem
- **account\_password** (*str*) -- The password for the account name specified in `account_name`. For the above built-in accounts, this can be `None`. Otherwise a password must be specified.
- **run\_interactive** (*bool*) -- If this setting is `True`, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

**Returns**

a dictionary of changes made

**Return type**

`dict`

CLI Example:

```
salt '*' service.modify spooler start_type=disabled
```

`salt.modules.win_service.restart`(*name*, *timeout=90*)

Restart the named service. This issues a stop command followed by a start.

**Parameters**

- **name** -- The name of the service to restart.

---

**Note:** If the name passed is `salt-minion` a scheduled task is created and executed to restart the salt-minion service.

---

- **timeout** (*int*) -- The time in seconds to wait for the service to stop and start before returning. Default is 90 seconds

---

**Note:** The timeout is cumulative meaning it is applied to the stop and then to the start command. A timeout of 90 could take up to 180 seconds if the service is long in stopping and starting

---

New in version 2017.7.9,2018.3.4.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.win_service.start(name, timeout=90)`

Start the specified service.

**Warning:** You cannot start a disabled service in Windows. If the service is disabled, it will be changed to Manual start.

**Parameters**

- **name** (*str*) -- The name of the service to start
- **timeout** (*int*) -- The time in seconds to wait for the service to start before returning. Default is 90 seconds

New in version 2017.7.9,2018.3.4.

**Returns**

**True if successful, otherwise False. Also returns True** if the service is already started

**Return type**

bool

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.win_service.status(name, *args, **kwargs)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt\*)

Changed in version 3006.0: Returns "Not Found" if the service is not found on the system

**Parameters**

**name** (*str*) -- The name of the service to check

**Returns**

True if running, False otherwise dict: Maps service name to True if running, False otherwise  
str: Not Found if the service is not found on the system

**Return type**

bool

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.win_service.stop(name, timeout=90)`

Stop the specified service

**Parameters**

- **name** (*str*) -- The name of the service to stop
- **timeout** (*int*) -- The time in seconds to wait for the service to stop before returning. Default is 90 seconds

New in version 2017.7.9,2018.3.4.

**Returns**

**True** if successful, otherwise **False**. Also returns **True** if the service is already stopped

**Return type**

bool

CLI Example:

```
salt '*' service.stop <service name>
```

## 26.6.506 salt.modules.win\_shadow

Manage the shadow file

---

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to *'shadow.info' is not available*), see [here](#).

---

**salt.modules.win\_shadow.info**(*name*)

Return information for the specified user This is just returns dummy data so that salt states can work.

**Parameters**

**name** (*str*) -- The name of the user account to show.

CLI Example:

```
salt '*' shadow.info root
```

**salt.modules.win\_shadow.require\_password\_change**(*name*)

Require the user to change their password the next time they log in.

**Parameters**

**name** -- The name of the user account to require a password change.

**Returns**

True if successful. False if unsuccessful.

**Return type**

bool

CLI Example:

```
salt '*' shadow.require_password_change <username>
```

**salt.modules.win\_shadow.set\_expire**(*name*, *expire*)

Set the expiration date for a user account.

**Parameters**

- **name** -- The name of the user account to edit.
- **expire** -- The date the account will expire.

**Returns**

True if successful. False if unsuccessful.

**Return type**

bool

CLI Example:

```
salt '*' shadow.set_expire <username> 2016/7/1
```

**salt.modules.win\_shadow.set\_password**(*name*, *password*)

Set the password for a named user.

**Parameters**

- **name** (*str*) -- The name of the user account
- **password** (*str*) -- The new password

**Returns**

True if successful. False if unsuccessful.

**Return type**

bool

CLI Example:

```
salt '*' shadow.set_password root mysecretpassword
```

`salt.modules.win_shadow.unlock_account` (*name*)

Unlocks a user account.

**Parameters**

**name** -- The name of the user account to unlock.

**Returns**

True if successful. False if unsuccessful.

**Return type**

bool

CLI Example:

```
salt '*' shadow.unlock_account <username>
```

### 26.6.507 salt.modules.win\_shortcut

Execution module for creating shortcuts on Windows. Handles file shortcuts (*.lnk*) and url shortcuts (*.url*). Allows for the configuration of icons and hot keys on file shortcuts. Changing the icon and hot keys are unsupported for url shortcuts.

New in version 3005.

`salt.modules.win_shortcut.create` (*path*, *target*, *arguments=""*, *description=""*, *hot\_key=""*, *icon\_index=0*, *icon\_location=""*, *window\_style='Normal'*, *working\_dir=""*, *backup=False*, *force=False*, *make\_dirs=False*, *user=None*)

Create a new shortcut. This can be a file shortcut (*.lnk*) or a url shortcut (*.url*).

**Parameters**

- **path** (*str*) -- The full path to the shortcut. Must have a *.lnk* or *.url* file extension.
- **target** (*str*) -- The full path to the target
- **arguments** (*str*, *optional*) -- Any arguments to be passed to the target
- **description** (*str*, *optional*) -- The description for the shortcut. This is shown in the Comment field of the dialog box. Default is an empty string
- **hot\_key** (*str*, *optional*) -- A combination of hot Keys to trigger this shortcut. This is something like Ctrl+Alt+D. This is shown in the Shortcut key field in the dialog box. Default is an empty string. Available options are:
  - Ctrl
  - Alt
  - Shift
  - Ext
- **icon\_index** (*int*, *optional*) -- The index for the icon to use in files that contain multiple icons. Default is 0
- **icon\_location** (*str*, *optional*) -- The full path to a file containing icons. This is shown in the Change Icon dialog box by clicking the Change Icon button. If no file is specified and a binary is passed as the target, Windows will attempt to get the icon from the binary file. Default is an empty string

- **window\_style**(*str*, *optional*) -- The window style the program should start in. This is shown in the Run field of the dialog box. Default is Normal. Valid options are:
  - Normal
  - Minimized
  - Maximized
- **working\_dir**(*str*, *optional*) -- The full path to the working directory for the program to run in. This is shown in the Start in field of the dialog box.
- **backup**(*bool*, *optional*) -- If there is already a shortcut with the same name, set this value to True to backup the existing shortcut and continue creating the new shortcut. Default is False
- **force**(*bool*, *optional*) -- If there is already a shortcut with the same name and you aren't backing up the shortcut, set this value to True to remove the existing shortcut and create a new with these settings. Default is False
- **make\_dirs**(*bool*, *optional*) -- If the parent directory structure does not exist for the new shortcut, create it. Default is False
- **user**(*str*, *optional*) -- The user to be the owner of any directories created by setting make\_dirs to True. If no value is passed Salt will use the user account that it is running under. Default is an empty string.

**Returns**

True if successful

**Return type**

bool

**Raises**

- **CommandExecutionError** -- If the path is not a .lnk or .url file extension.
- **CommandExecutionError** -- If there is an existing shortcut with the same name and backup and force are both False
- **CommandExecutionError** -- If the parent directory is not created and make\_dirs is False
- **CommandExecutionError** -- If there was an error creating the parent directories

CLI Example:

```
# Create a shortcut and set the ``Shortcut key`` (``hot_key``)
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"
  ↳hot_key="Ctrl+Alt+N"

# Create a shortcut and change the icon to the 3rd one in the icon file
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"
  ↳icon_location="C:\path\to\icon.ico" icon_index=2

# Create a shortcut and change the startup mode to full screen
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"
  ↳window_style="Maximized"

# Create a shortcut and change the icon
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"
  ↳icon_location="C:\path\to\icon.ico"

# Create a shortcut and force it to overwrite an existing shortcut
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"
  ↳force=True

# Create a shortcut and create any parent directories if they are missing
```

(continues on next page)

(continued from previous page)

```
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"
↳make_dirs=True
```

`salt.modules.win_shortcut.get(path)`

Gets the properties for a shortcut

**Parameters**

**path** (*str*) -- The path to the shortcut. Must have a *.lnk* or *.url* file extension.

**Returns**

A dictionary containing all available properties for the specified shortcut

**Return type**

dict

CLI Example:

```
salt * shortcut.get path="C:\path\to\shortcut.lnk"
```

`salt.modules.win_shortcut.modify(path, target="", arguments="", description="", hot_key="", icon_index=0, icon_location="", window_style='Normal', working_dir="")`

Modify an existing shortcut. This can be a file shortcut (*.lnk*) or a url shortcut (*.url*).

**Parameters**

- **path** (*str*) -- The full path to the shortcut. Must have a *.lnk* or *.url* file extension.
- **target** (*str, optional*) -- The full path to the target
- **arguments** (*str, optional*) -- Any arguments to be passed to the target
- **description** (*str, optional*) -- The description for the shortcut. This is shown in the Comment field of the dialog box. Default is an empty string
- **hot\_key** (*str, optional*) -- A combination of hot Keys to trigger this shortcut. This is something like Ctrl+Alt+D. This is shown in the Shortcut key field in the dialog box. Default is an empty string. Available options are:
  - Ctrl
  - Alt
  - Shift
  - Ext
- **icon\_index** (*int, optional*) -- The index for the icon to use in files that contain multiple icons. Default is 0
- **icon\_location** (*str, optional*) -- The full path to a file containing icons. This is shown in the Change Icon dialog box by clicking the Change Icon button. If no file is specified and a binary is passed as the target, Windows will attempt to get the icon from the binary file. Default is an empty string
- **window\_style** (*str, optional*) -- The window style the program should start in. This is shown in the Run field of the dialog box. Default is Normal. Valid options are:
  - Normal
  - Minimized
  - Maximized
- **working\_dir** (*str, optional*) -- The full path to the working directory for the program to run in. This is shown in the Start in field of the dialog box.

**Returns**

True if successful

**Return type**

bool

CLI Example:

```
# Modify an existing shortcut. Set it to target notepad.exe
salt * shortcut.modify "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"
```

## 26.6.508 salt.modules.win\_smtp\_server

Module for managing IIS SMTP server configuration on Windows servers. The Windows features 'SMTP-Server' and 'Web-WMI' must be installed.

### depends

wmi

`salt.modules.win_smtp_server.get_connection_ip_list` (*as\_wmi\_format=False*,  
*server='SmtpSvc/1'*)

Get the IPGrant list for the SMTP virtual server.

### Parameters

- **as\_wmi\_format** (*bool*) -- Returns the connection IPs as a list in the format WMI expects.
- **server** (*str*) -- The SMTP server name.

### Returns

A dictionary of the IP and subnet pairs.

### Return type

dict

CLI Example:

```
salt '*' win_smtp_server.get_connection_ip_list
```

`salt.modules.win_smtp_server.get_log_format` (*server='SmtpSvc/1'*)

Get the active log format for the SMTP virtual server.

### Parameters

**server** (*str*) -- The SMTP server name.

### Returns

A string of the log format name.

### Return type

str

CLI Example:

```
salt '*' win_smtp_server.get_log_format
```

`salt.modules.win_smtp_server.get_log_format_types` ()

Get all available log format names and ids.

### Returns

A dictionary of the log format names and ids.

### Return type

dict

CLI Example:

```
salt '*' win_smtp_server.get_log_format_types
```

`salt.modules.win_smtp_server.get_relay_ip_list` (*server='SmtpSvc/1'*)

Get the RelayIpList list for the SMTP virtual server.

### Parameters

**server** (*str*) -- The SMTP server name.

**Returns**

A list of the relay IPs.

**Return type**

list

---

**Note:** A return value of None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

---

CLI Example:

```
salt '*' win_smtp_server.get_relay_ip_list
```

`salt.modules.win_smtp_server.get_server_setting(settings, server='SmtSvc/1')`

Get the value of the setting for the SMTP virtual server.

**Parameters**

- **settings** (*str*) -- A list of the setting names.
- **server** (*str*) -- The SMTP server name.

**Returns**

A dictionary of the provided settings and their values.

**Return type**

dict

CLI Example:

```
salt '*' win_smtp_server.get_server_setting settings="['MaxRecipients']"
```

`salt.modules.win_smtp_server.get_servers()`

Get the SMTP virtual server names.

**Returns**

A list of the SMTP virtual servers.

**Return type**

list

CLI Example:

```
salt '*' win_smtp_server.get_servers
```

`salt.modules.win_smtp_server.set_connection_ip_list(addresses=None, grant_by_default=False, server='SmtSvc/1')`

Set the IPGrant list for the SMTP virtual server.

**Parameters**

- **addresses** (*str*) -- A dictionary of IP + subnet pairs.
- **grant\_by\_default** (*bool*) -- Whether the addresses should be a blacklist or whitelist.
- **server** (*str*) -- The SMTP server name.

**Returns**

A boolean representing whether the change succeeded.

**Return type**

bool

CLI Example:

```
salt '*' win_smtp_server.set_connection_ip_list addresses="{ '127.0.0.1':
→ '255.255.255.255' }"
```

`salt.modules.win_smtp_server.set_log_format(log_format, server='SmtpSvc/1')`

Set the active log format for the SMTP virtual server.

**Parameters**

- **log\_format** (*str*) -- The log format name.
- **server** (*str*) -- The SMTP server name.

**Returns**

A boolean representing whether the change succeeded.

**Return type**

bool

CLI Example:

```
salt '*' win_smtp_server.set_log_format 'Microsoft IIS Log File Format'
```

`salt.modules.win_smtp_server.set_relay_ip_list(addresses=None, server='SmtpSvc/1')`

Set the RelayIpList list for the SMTP virtual server.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting '127.0.0.1' as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.0.0',  
→'0.0.0.0',  
'0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.0',  
→'0',  
'0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0',  
'255.255.255.255', '127.0.0.1']
```

---

**Note:** Setting the list to None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

---

**Parameters**

- **addresses** (*str*) -- A list of the relay IPs. The order of the list is important.
- **server** (*str*) -- The SMTP server name.

**Returns**

A boolean representing whether the change succeeded.

**Return type**

bool

CLI Example:

```
salt '*' win_smtp_server.set_relay_ip_list addresses="['192.168.1.1',  
→'172.16.1.1']"
```

`salt.modules.win_smtp_server.set_server_setting(settings, server='SmtpSvc/1')`

Set the value of the setting for the SMTP virtual server.

---

**Note:** The setting names are case-sensitive.

---

**Parameters**

- **settings** (*str*) -- A dictionary of the setting names and their values.

- **server** (*str*) -- The SMTP server name.

**Returns**

A boolean representing whether all changes succeeded.

**Return type**

bool

CLI Example:

```
salt '*' win_smtp_server.set_server_setting settings="{ 'MaxRecipients':
→ '500' }"
```

### 26.6.509 salt.modules.win\_snmp

Module for managing SNMP service settings on Windows servers. The Windows feature 'SNMP-Service' must be installed.

#### salt.modules.win\_snmp.get\_agent\_service\_types()

Get the sysServices types that can be configured.

**Returns**

A list of service types.

**Return type**

list

CLI Example:

```
salt '*' win_snmp.get_agent_service_types
```

#### salt.modules.win\_snmp.get\_agent\_settings()

Determine the value of the SNMP sysContact, sysLocation, and sysServices settings.

**Returns**

A dictionary of the agent settings.

**Return type**

dict

CLI Example:

```
salt '*' win_snmp.get_agent_settings
```

#### salt.modules.win\_snmp.get\_auth\_traps\_enabled()

Determine whether the host is configured to send authentication traps.

**Returns**

True if traps are enabled, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_snmp.get_auth_traps_enabled
```

#### salt.modules.win\_snmp.get\_community\_names()

Get the current accepted SNMP community names and their permissions.

If community names are being managed by Group Policy, those values will be returned instead like this:

```
TestCommunity:
  Managed by GPO
```

Community names managed normally will denote the permission instead:

```
TestCommunity:
  Read Only
```

**Returns**

A dictionary of community names and permissions.

**Return type**

dict

CLI Example:

```
salt '*' win_snmp.get_community_names
```

`salt.modules.win_snmp.get_permission_types()`

Get the permission types that can be configured for communities.

**Returns**

A list of permission types.

**Return type**

list

CLI Example:

```
salt '*' win_snmp.get_permission_types
```

`salt.modules.win_snmp.set_agent_settings(contact=None, location=None, services=None)`

Manage the SNMP sysContact, sysLocation, and sysServices settings.

**Parameters**

- **contact** (*str*, *optional*) -- The SNMP contact.
- **location** (*str*, *optional*) -- The SNMP location.
- **services** (*list*, *optional*) -- A list of selected services. The possible service names can be found via `win_snmp.get_agent_service_types`. To disable all services pass a list of None, ie: ['None']

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_snmp.set_agent_settings contact='Contact Name' location=
→ 'Place' services="['Physical']"
```

`salt.modules.win_snmp.set_auth_traps_enabled(status=True)`

Manage the sending of authentication traps.

**Parameters**

**status** (*bool*) -- True to enable traps. False to disable.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' win_snmp.set_auth_traps_enabled status='True'
```

`salt.modules.win_snmp.set_community_names(communities)`

Manage the SNMP accepted community names and their permissions.

---

**Note:** Settings managed by Group Policy will always take precedence over those set using the SNMP interface. Therefore if this function finds Group Policy settings it will raise a `CommandExecutionError`

---

**Parameters**

**communities** (*dict*) -- A dictionary of SNMP community names and permissions. The possible permissions can be found via `win_snmp.get_permission_types`.

**Returns**

True if successful, otherwise False

**Return type**

bool

**Raises**

**CommandExecutionError** -- If SNMP settings are being managed by Group Policy

CLI Example:

```
salt '*' win_snmp.set_community_names communities="{ 'TestCommunity':
↳ 'Read Only' }"
```

### 26.6.510 salt.modules.win\_status

Module for returning various status data about a minion. These data can be useful for compiling into stats later, or for problem solving if your minion is having problems.

New in version 0.12.0.

**depends**

- wmi

`salt.modules.win_status.cpuload()`

New in version 2015.8.0.

Return the processor load as a percentage

CLI Example:

```
salt '*' status.cpuload
```

`salt.modules.win_status.cputats()`

Return information about the CPU.

**Returns**

dict: A dictionary containing information about the CPU stats

CLI Example:

```
salt * status.cputats
```

`salt.modules.win_status.diskusage(human_readable=False, path=None)`

New in version 2015.8.0.

Return the disk usage for this minion

**human\_readable**

[False] If True, usage will be in KB/MB/GB etc.

CLI Example:

```
salt '*' status.diskusage path=c:/salt
```

**salt.modules.win\_status.loadavg()**

Returns counter information related to the load of the machine

**Returns**

A dictionary of counters

**Return type**

dict

CLI Example:

```
salt * status.loadavg
```

**salt.modules.win\_status.master**(*master=None, connected=True*)

New in version 2015.5.0.

Fire an event if the minion gets disconnected from its master. This function is meant to be run via a scheduled job from the minion. If *master\_ip* is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

CLI Example:

```
salt '*' status.master
```

**salt.modules.win\_status.meminfo()**

Return information about physical and virtual memory on the system

**Returns**

A dictionary of information about memory on the system

**Return type**

dict

CLI Example:

```
salt * status.meminfo
```

**salt.modules.win\_status.procs**(*count=False*)

Return the process data

**count**

[False] If True, this function will simply return the number of processes.

New in version 2015.8.0.

CLI Example:

```
salt '*' status.procs
salt '*' status.procs count
```

**salt.modules.win\_status.saltmem**(*human\_readable=False*)

New in version 2015.8.0.

Returns the amount of memory that salt is using

**human\_readable**

[False] return the value in a nicely formatted number

CLI Example:

```
salt '*' status.saltmem
salt '*' status.saltmem human_readable=True
```

**salt.modules.win\_status.uptime**(*human\_readable=False*)

New in version 2015.8.0.

Return the system uptime for the machine

**Parameters**

**human\_readable** (*bool*) -- Return uptime in human readable format if `True`, otherwise return seconds. Default is `False`

---

**Note:** Human readable format is `days, hours:min:sec`. Days will only be displayed if more than 0

---

**Returns**

The uptime in seconds or human readable format depending on the value of `human_readable`

**Return type**

`str`

CLI Example:

```
salt '*' status.uptime
salt '*' status.uptime human_readable=True
```

**salt.modules.win\_status.vfstats()**

Return information about the virtual memory on the machine

**Returns**

A dictionary of virtual memory stats

**Return type**

`dict`

CLI Example:

```
salt * status.vfstats
```

**26.6.511 salt.modules.win\_system**

Module for managing Windows systems and getting Windows system information. Support for reboot, shutdown, join domain, rename

**depends**

- pywintypes
- win32api
- win32con
- win32net
- wmi

**salt.modules.win\_system.get\_computer\_desc()**

Get the Windows computer description

**Returns**

Returns the computer description if found. Otherwise returns `False`.

**Return type**

`str`

CLI Example:

```
salt 'minion-id' system.get_computer_desc
```

**salt.modules.win\_system.get\_computer\_description()**

This function is an alias of `get_computer_desc`.

Get the Windows computer description

**Returns:**

str: Returns the computer description if found. Otherwise returns `False`.

CLI Example:

```
salt 'minion-id' system.get_computer_desc
```

**salt.modules.win\_system.get\_computer\_name()**

Get the Windows computer name

**Returns**

Returns the computer name if found. Otherwise returns `False`.

**Return type**

str

CLI Example:

```
salt 'minion-id' system.get_computer_name
```

**salt.modules.win\_system.get\_domain\_workgroup()**

Get the domain or workgroup the computer belongs to.

New in version 2015.5.7.

New in version 2015.8.2.

**Returns**

The name of the domain or workgroup

**Return type**

str

CLI Example:

```
salt 'minion-id' system.get_domain_workgroup
```

**salt.modules.win\_system.get\_hostname()**

Get the hostname of the windows minion

New in version 2016.3.0.

**Returns**

Returns the hostname of the windows minion

**Return type**

str

CLI Example:

```
salt 'minion-id' system.get_hostname
```

**salt.modules.win\_system.get\_pending\_component\_servicing()**

Determine whether there are pending Component Based Servicing tasks that require a reboot.

New in version 2016.11.0.

**Returns**

True if there are pending Component Based Servicing tasks, otherwise `False`

**Return type**

bool

CLI Example:

```
salt '*' system.get_pending_component_servicing
```

**salt.modules.win\_system.get\_pending\_computer\_name()**

Get a pending computer name. If the computer name has been changed, and the change is pending a system reboot, this function will return the pending computer name. Otherwise, `None` will be returned. If there was an error retrieving the pending computer name, `False` will be returned, and an error message will be logged to the minion log.

**Returns**

Returns the pending name if pending restart. Returns `None` if not pending restart.

**Return type**

`str`

CLI Example:

```
salt 'minion-id' system.get_pending_computer_name
```

**salt.modules.win\_system.get\_pending\_domain\_join()**

Determine whether there is a pending domain join action that requires a reboot.

New in version 2016.11.0.

**Returns**

`True` if there is a pending domain join action, otherwise `False`

**Return type**

`bool`

CLI Example:

```
salt '*' system.get_pending_domain_join
```

**salt.modules.win\_system.get\_pending\_file\_rename()**

Determine whether there are pending file rename operations that require a reboot.

New in version 2016.11.0.

**Returns**

`True` if there are pending file rename operations, otherwise `False`

**Return type**

`bool`

CLI Example:

```
salt '*' system.get_pending_file_rename
```

**salt.modules.win\_system.get\_pending\_reboot()**

Determine whether there is a reboot pending.

New in version 2016.11.0.

**Returns**

`True` if the system is pending reboot, otherwise `False`

**Return type**

`bool`

CLI Example:

```
salt '*' system.get_pending_reboot
```

**salt.modules.win\_system.get\_pending\_reboot\_details()**

Determine which check is signalling that the system is pending a reboot. Useful in determining why your system is signalling that it needs a reboot.

New in version 3001.

**Returns**

A dictionary of the results of each system that would indicate a pending reboot

**Return type**

dict

CLI Example:

```
salt '*' system.get_pending_reboot_details
```

`salt.modules.win_system.get_pending_servermanager()`

Determine whether there are pending Server Manager tasks that require a reboot.

New in version 2016.11.0.

**Returns**

True if there are pending Server Manager tasks, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' system.get_pending_servermanager
```

`salt.modules.win_system.get_pending_update()`

Determine whether there are pending updates that require a reboot.

New in version 2016.11.0.

**Returns**

True if there are pending updates, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' system.get_pending_update
```

`salt.modules.win_system.get_pending_windows_update()`

Check the Windows Update system for a pending reboot state.

This leverages the Windows Update System to determine if the system is pending a reboot.

New in version 3001.

**Returns**

True if the Windows Update system reports a pending update, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' system.get_pending_windows_update
```

`salt.modules.win_system.get_reboot_required_witnessed()`

Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.

This function will return True if an install completed with exit code 3010 during the current boot session and can be extended where appropriate in the future.

New in version 2016.11.0.

**Returns**

True if the Requires\_reboot registry flag is set to 1, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' system.get_reboot_required_witnessed
```

`salt.modules.win_system.get_system_date()`

Get the Windows system date

**Returns**

Returns the system date

**Return type**

str

CLI Example:

```
salt '*' system.get_system_date
```

`salt.modules.win_system.get_system_info()`

Get system information.

---

**Note:** Not all system info is available across all versions of Windows. If it is not available on an older version, it will be skipped

---

**Returns**

Dictionary containing information about the system to include name, description, version, etc...

**Return type**

dict

CLI Example:

```
salt 'minion-id' system.get_system_info
```

`salt.modules.win_system.get_system_time()`

Get the system time.

**Returns**

Returns the system time in HH:MM:SS AM/PM format.

**Return type**

str

CLI Example:

```
salt 'minion-id' system.get_system_time
```

`salt.modules.win_system.halt(timeout=5, in_seconds=False)`

Halt a running system.

**Parameters**

- **timeout** (*int*) -- Number of seconds before halting the system. Default is 5 seconds.
- **in\_seconds** (*bool*) -- Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' system.halt 5 True
```

`salt.modules.win_system.init`(*runlevel*)

Change the system runlevel on sysV compatible systems. Not applicable to Windows

CLI Example:

```
salt '*' system.init 3
```

`salt.modules.win_system.join_domain`(*domain*, *username=None*, *password=None*, *account\_ou=None*, *account\_exists=False*, *restart=False*)

Join a computer to an Active Directory domain. Requires a reboot.

**Parameters**

- **domain** (*str*) -- The domain to which the computer should be joined, e.g. `example.com`
- **username** (*str*) -- Username of an account which is authorized to join computers to the specified domain. Needs to be either fully qualified like `user@domain.tld` or simply `user`
- **password** (*str*) -- Password of the specified user
- **account\_ou** (*str*) -- The DN of the OU below which the account for this computer should be created when joining the domain, e.g. `ou=computers, ou=departm_432, dc=my-company, dc=com`
- **account\_exists** (*bool*) -- If set to `True` the computer will only join the domain if the account already exists. If set to `False` the computer account will be created if it does not exist, otherwise it will use the existing account. Default is `False`
- **restart** (*bool*) -- `True` will restart the computer after a successful join. Default is `False`

New in version 2015.5.7,2015.8.2.

**Returns**

Returns a dictionary if successful, otherwise `False`

**Return type**

`dict`

CLI Example:

```
salt 'minion-id' system.join_domain domain='domain.tld' \
    username='joinuser' password='joinpassword' \
    account_ou='ou=clients,ou=org,dc=domain,dc=tld' \
    account_exists=False, restart=True
```

`salt.modules.win_system.lock`()

Lock the workstation.

**Returns**

`True` if successful, otherwise `False`

**Return type**

`bool`

CLI Example:

```
salt 'minion-id' system.lock
```

`salt.modules.win_system.poweroff`(*timeout=5*, *in\_seconds=False*)

Power off a running system.

**Parameters**

- **timeout** (*int*) -- Number of seconds before powering off the system. Default is 5 seconds.
- **in\_seconds** (*bool*) -- Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

#### Returns

True if successful, otherwise False

#### Return type

bool

CLI Example:

```
salt '*' system.poweroff 5
```

```
salt.modules.win_system.reboot(timeout=5, in_seconds=False, wait_for_reboot=False,
                                only_on_pending_reboot=False)
```

Reboot a running system.

#### Parameters

- **timeout** (*int*) -- The number of minutes/seconds before rebooting the system. Use of minutes or seconds depends on the value of `in_seconds`. Default is 5 minutes.
- **in\_seconds** (*bool*) --  
**True** will cause the **timeout** parameter to be in seconds.  
**False** will be in minutes. Default is False.

New in version 2015.8.0.

- **wait\_for\_reboot** (*bool*) -- True will sleep for timeout + 30 seconds after reboot has been initiated. This is useful for use in a highstate. For example, you may have states that you want to apply only after the reboot. Default is False.

New in version 2015.8.0.

- **only\_on\_pending\_reboot** (*bool*) -- If this is set to True, then the reboot will only proceed if the system reports a pending reboot. Setting this parameter to True could be useful when calling this function from a final housekeeping state intended to be executed at the end of a state run (using *order: last*). Default is False.

#### Returns

True if successful (a reboot will occur), otherwise False

#### Return type

bool

CLI Example:

```
salt '*' system.reboot 5
salt '*' system.reboot 5 True
```

Invoking this function from a final housekeeping state:

```
final_housekeeping:
  module.run:
    - name: system.reboot
    - only_on_pending_reboot: True
    - order: last
```

```
salt.modules.win_system.set_computer_desc(desc=None)
```

Set the Windows computer description

#### Parameters

**desc** (*str*) -- The computer description

#### Returns

Description if successful, otherwise False

**Return type**`str`

CLI Example:

```
salt 'minion-id' system.set_computer_desc 'This computer belongs to Dave!'
```

`salt.modules.win_system.set_computer_description(desc=None)`This function is an alias of `set_computer_desc`.

Set the Windows computer description

Args:

**desc (str):**

The computer description

**Returns:**

str: Description if successful, otherwise False

CLI Example:

```
salt 'minion-id' system.set_computer_desc 'This computer belongs
↳to Dave!'
```

`salt.modules.win_system.set_computer_name(name)`

Set the Windows computer name

**Parameters****name (str)** -- The new name to give the computer. Requires a reboot to take effect.**Returns**

Returns a dictionary containing the old and new names if successful. False if not.

**Return type**`dict`

CLI Example:

```
salt 'minion-id' system.set_computer_name 'DavesComputer'
```

`salt.modules.win_system.set_domain_workgroup(workgroup)`

Set the domain or workgroup the computer belongs to.

New in version 3001.

**Returns**

True if successful, otherwise False

**Return type**`bool`

CLI Example:

```
salt 'minion-id' system.set_domain_workgroup LOCAL
```

`salt.modules.win_system.set_hostname(hostname)`

Set the hostname of the windows minion, requires a restart before this will be updated.

New in version 2016.3.0.

**Parameters****hostname (str)** -- The hostname to set**Returns**

True if successful, otherwise False

**Return type**`bool`

CLI Example:

```
salt 'minion-id' system.set_hostname newhostname
```

`salt.modules.win_system.set_reboot_required_witnessed()`

This function is used to remember that an event indicating that a reboot is required was witnessed. This function relies on the salt-minion's ability to create the following volatile registry key in the *HKLM* hive:

```
SYSTEM\CurrentControlSet\Services\salt-minion\Volatile-Data
```

Because this registry key is volatile, it will not persist beyond the current boot session. Also, in the scope of this key, the name *'Reboot required'* will be assigned the value of *1*.

For the time being, this function is being used whenever an install completes with exit code 3010 and can be extended where appropriate in the future.

New in version 2016.11.0.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' system.set_reboot_required_witnessed
```

`salt.modules.win_system.set_system_date(newdate)`

Set the Windows system date. Use <mm-dd-yy> format for the date.

**Parameters**

**newdate** (*str*) -- The date to set. Can be any of the following formats

- YYYY-MM-DD
- MM-DD-YYYY
- MM-DD-YY
- MM/DD/YYYY
- MM/DD/YY
- YYYY/MM/DD

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

`salt.modules.win_system.set_system_date_time(years=None, months=None, days=None, hours=None, minutes=None, seconds=None)`

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by `set_system_date` and `set_system_time`)

**Parameters**

- **years** (*int*) -- Years digit, ie: 2015
- **months** (*int*) -- Months digit: 1 - 12
- **days** (*int*) -- Days digit: 1 - 31
- **hours** (*int*) -- Hours digit: 0 - 23
- **minutes** (*int*) -- Minutes digit: 0 - 59
- **seconds** (*int*) -- Seconds digit: 0 - 59

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' system.set_system_date_ time 2015 5 12 11 37 53
```

`salt.modules.win_system.set_system_time(newtime)`

Set the system time.

**Parameters****newtime** (*str*) -- The time to set. Can be any of the following formats:

- HH:MM:SS AM/PM
- HH:MM AM/PM
- HH:MM:SS (24 hour)
- HH:MM (24 hour)

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt 'minion-id' system.set_system_time 12:01
```

`salt.modules.win_system.shutdown(message=None, timeout=5, force_close=True, reboot=False, in_seconds=False, only_on_pending_reboot=False)`

Shutdown a running system.

**Parameters**

- **message** (*str*) -- The message to display to the user before shutting down.
- **timeout** (*int*) -- The length of time (in seconds) that the shutdown dialog box should be displayed. While this dialog box is displayed, the shutdown can be aborted using the `system.shutdown_abort` function.

If timeout is not zero, `InitiateSystemShutdown` displays a dialog box on the specified computer. The dialog box displays the name of the user who called the function, the message specified by the `lpMessage` parameter, and prompts the user to log off. The dialog box beeps when it is created and remains on top of other windows (system modal). The dialog box can be moved but not closed. A timer counts down the remaining time before the shutdown occurs.

If timeout is zero, the computer shuts down immediately without displaying the dialog box and cannot be stopped by `system.shutdown_abort`.

Default is 5 minutes

- **in\_seconds** (*bool*) --  
**True** will cause the **timeout** parameter to be in seconds.  
**False** will be in minutes. Default is **False**.  
 New in version 2015.8.0.
- **force\_close** (*bool*) -- **True** will force close all open applications. **False** will display a dialog box instructing the user to close open applications. Default is **True**.
- **reboot** (*bool*) -- **True** restarts the computer immediately after shutdown. **False** powers down the system. Default is **False**.
- **only\_on\_pending\_reboot** (*bool*) -- If this is set to **True**, then the shutdown will only proceed if the system reports a pending reboot. To optionally shutdown in a highstate, consider using the shutdown state instead of this module.
- **only\_on\_pending\_reboot** -- If **True** the shutdown will only proceed if there is a reboot pending. **False** will shutdown the system. Default is **False**.

**Returns**

True if successful (a shutdown or reboot will occur), otherwise False

**Return type**

bool

CLI Example:

```
salt '*' system.shutdown "System will shutdown in 5 minutes"
```

**salt.modules.win\_system.shutdown\_abort()**

Abort a shutdown. Only available while the dialog box is being displayed to the user. Once the shutdown has initiated, it cannot be aborted.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt 'minion-id' system.shutdown_abort
```

**salt.modules.win\_system.shutdown\_hard()**

Shutdown a running system with no timeout or warning.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' system.shutdown_hard
```

**salt.modules.win\_system.start\_time\_service()**

Start the Windows time service

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' system.start_time_service
```

**salt.modules.win\_system.stop\_time\_service()**

Stop the Windows time service

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' system.stop_time_service
```

**salt.modules.win\_system.unjoin\_domain(*username=None, password=None, domain=None, workgroup='WORKGROUP', disable=False, restart=False*)**

Unjoin a computer from an Active Directory Domain. Requires a restart.

**Parameters**

- **username** (*str*) -- Username of an account which is authorized to manage computer accounts on the domain. Needs to be a fully qualified name like `user@domain.tld` or `domain.tld\user`. If the domain is not specified, the passed domain will be used. If the computer account doesn't need to be disabled after the computer is unjoined, this can be `None`.
  - **password** (*str*) -- The password of the specified user
  - **domain** (*str*) -- The domain from which to unjoin the computer. Can be `None`
  - **workgroup** (*str*) -- The workgroup to join the computer to. Default is `WORKGROUP`
- New in version 2015.5.7,2015.8.2.
- **disable** (*bool*) -- True to disable the computer account in Active Directory. Default is `False`
  - **restart** (*bool*) -- True will restart the computer after successful unjoin. Default is `False`

New in version 2015.5.7,2015.8.2.

#### Returns

Returns a dictionary if successful, otherwise `False`

#### Return type

`dict`

CLI Example:

```
salt 'minion-id' system.unjoin_domain restart=True

salt 'minion-id' system.unjoin_domain username='unjoinuser' \
    password='unjoinpassword' disable=True \
    restart=True
```

## 26.6.512 salt.modules.win\_task

Windows Task Scheduler Module .. versionadded:: 2016.3.0

A module for working with the Windows Task Scheduler. You can add and edit existing tasks. You can add and clear triggers and actions. You can list all tasks, folders, triggers, and actions.

`salt.modules.win_task.add_action` (*name=None*, *location='\\'*, *action\_type='Execute'*, *\*\*kwargs*)

Add an action to a task.

#### Parameters

- **name** (*str*) -- The name of the task to which to add the action.
- **location** (*str*) -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- **action\_type** (*str*) -- The type of action to add. There are three action types. Each one requires its own set of Keyword Arguments (*kwargs*). Valid values are:
  - Execute
  - Email
  - Message

Required arguments for each *action\_type*:

#### Execute

Execute a command or an executable

##### **cmd** (*str*):

(required) The command or executable to run.

##### **arguments** (*str*):

(optional) Arguments to be passed to the command or executable. To launch a

script the first command will need to be the interpreter for the script. For example, to run a vbscript you would pass `cscript.exe` in the `cmd` parameter and pass the script in the `arguments` parameter as follows:

```
• cmd='cscript.exe' arguments='c:\scripts\myscript.vbs'
```

Batch files do not need an interpreter and may be passed to the `cmd` parameter directly.

**start\_in (str):**

(optional) The current working directory for the command.

**Email**

Send and email. Requires `server`, `from`, and `to` or `cc`.

`from (str)`: The sender

`reply_to (str)`: Who to reply to

`to (str)`: The recipient

`cc (str)`: The CC recipient

`bcc (str)`: The BCC recipient

`subject (str)`: The subject of the email

`body (str)`: The Message Body of the email

`server (str)`: The server used to send the email

**attachments (list):**

A list of attachments. These will be the paths to the files to attach. ie: `attachments=["'C:\attachment1.txt', 'C:\attachment2.txt']"`

**Message**

Display a dialog box. The task must be set to "Run only when user is logged on" in order for the dialog box to display. Both parameters are required.

**title (str):**

The dialog box title.

**message (str):**

The dialog box message body

**Returns**

A dictionary containing the task configuration

**Return type**

`dict`

CLI Example:

```
salt 'minion-id' task.add_action <task_name> cmd='del /Q /S C:\\Temp'
```

```
salt.modules.win_task.add_trigger(name=None, location='\\', trigger_type=None,
    trigger_enabled=True, start_date=None, start_time=None,
    end_date=None, end_time=None, random_delay=None,
    repeat_interval=None, repeat_duration=None,
    repeat_stop_at_duration_end=False, execution_time_limit=None,
    delay=None, **kwargs)
```

Add a trigger to a Windows Scheduled task

**Note:** Arguments are parsed by the YAML loader and are subject to yaml's idiosyncrasies. Therefore, time values in some formats (%H:%M:%S and %H:%M) should to be quoted. See [YAML IDIOSYNCRASIES](#) for more

details.

---

#### Parameters

- **name** (*str*) -- The name of the task to which to add the trigger.
- **location** (*str*) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
- **trigger\_type** (*str*) -- The type of trigger to create. This is defined when the trigger is created and cannot be changed later. Options are as follows:
  - Event
  - Once
  - Daily
  - Weekly
  - Monthly
  - MonthlyDay
  - OnIdle
  - OnTaskCreation
  - OnBoot
  - OnLogon
  - OnSessionChange
- **trigger\_enabled** (*bool*) -- Boolean value that indicates whether the trigger is enabled.
- **start\_date** (*str*) -- The date when the trigger is activated. If no value is passed, the current date will be used. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d
- **start\_time** (*str*) -- The time when the trigger is activated. If no value is passed, midnight will be used. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M
- **end\_date** (*str*) -- The date when the trigger is deactivated. The trigger cannot start the task after it is deactivated. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d
- **end\_time** (*str*) -- The time when the trigger is deactivated. If this is not passed with `end_date` it will be set to midnight. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M
- **random\_delay** (*str*) -- The delay time that is randomly added to the start time of the trigger. Valid values are:
  - 30 seconds
  - 1 minute

- 30 minutes
- 1 hour
- 8 hours
- 1 day

---

**Note:** This parameter applies to the following trigger types

- Once
  - Daily
  - Weekly
  - Monthly
  - MonthlyDay
- 

- **repeat\_interval** (*str*) -- The amount of time between each restart of the task.

Valid values are:

- 5 minutes
- 10 minutes
- 15 minutes
- 30 minutes
- 1 hour

- **repeat\_duration** (*str*) -- How long the pattern is repeated. Valid values are:

- Indefinitely
- 15 minutes
- 30 minutes
- 1 hour
- 12 hours
- 1 day

- **repeat\_stop\_at\_duration\_end** (*bool*) -- Boolean value that indicates if a running instance of the task is stopped at the end of the repetition pattern duration.

- **execution\_time\_limit** (*str*) -- The maximum amount of time that the task launched by the trigger is allowed to run. Valid values are:

- 30 minutes
- 1 hour
- 2 hours
- 4 hours
- 8 hours
- 12 hours
- 1 day
- 3 days (default)

- **delay** (*str*) -- The time the trigger waits after its activation to start the task. Valid values are:

- 15 seconds
- 30 seconds
- 1 minute
- 30 minutes
- 1 hour
- 8 hours
- 1 day

---

**Note:** This parameter applies to the following trigger types:

- OnLogon
- OnBoot
- Event
- OnTaskCreation
- OnSessionChange

**kwargs**

There are optional keyword arguments determined by the type of trigger being defined. They are as follows:

*Event*

The trigger will be fired by an event.

**subscription (str):**

An event definition in xml format that fires the trigger. The easiest way to get this would be to create an event in Windows Task Scheduler and then copy the xml text.

*Once*

No special parameters required.

*Daily*

The task will run daily.

**days\_interval (int):**

The interval between days in the schedule. An interval of 1 produces a daily schedule. An interval of 2 produces an every-other day schedule. If no interval is specified, 1 is used. Valid entries are 1 - 999.

*Weekly*

The task will run weekly.

**weeks\_interval (int):**

The interval between weeks in the schedule. An interval of 1 produces a weekly schedule. An interval of 2 produces an every-other week schedule. If no interval is specified, 1 is used. Valid entries are 1 - 52.

**days\_of\_week (list):**

Sets the days of the week on which the task runs. Should be a list. ie: [ 'Monday', 'Wednesday', 'Friday' ]. Valid entries are the names of the days of the week.

*Monthly*

The task will run monthly.

**months\_of\_year (list):**

Sets the months of the year during which the task runs. Should be a list. ie: [ 'January', 'July' ]. Valid entries are the full names of all the months.

**days\_of\_month (list):**

Sets the days of the month during which the task runs. Should be a list. ie: [ 1, 15, 'Last' ]. Options are all days of the month 1 - 31 and the word 'Last' to indicate the last day of the month.

**last\_day\_of\_month (bool):**

Boolean value that indicates that the task runs on the last day of the month regardless of the actual date of that day.

---

**Note:** You can set the task to run on the last day of the month by either including the word 'Last' in the list of days, or setting the parameter 'last\_day\_of\_month' equal to True.

---

*MonthlyDay*

The task will run monthly on the specified day.

**months\_of\_year (list):**

Sets the months of the year during which the task runs. Should be a list. ie: [ 'January', 'July' ]. Valid entries are the full names of all the months.

**weeks\_of\_month (list):**

Sets the weeks of the month during which the task runs. Should be a list. ie: [ 'First', 'Third' ]. Valid options are:

- First
- Second
- Third
- Fourth

**last\_week\_of\_month (bool):**

Boolean value that indicates that the task runs on the last week of the month.

**days\_of\_week (list):**

Sets the days of the week during which the task runs. Should be a list. ie: ['Monday', 'Wednesday', 'Friday']. Valid entries are the names of the days of the week.

*OnIdle*

No special parameters required.

*OnTaskCreation*

No special parameters required.

*OnBoot*

No special parameters required.

*OnLogon*

No special parameters required.

*OnSessionChange*

The task will be triggered by a session change.

**session\_user\_name (str):**

Sets the user for the Terminal Server session. When a session state change is detected for this user, a task is started. To detect session status change for any user, do not pass this parameter.

**state\_change (str):**

Sets the kind of Terminal Server session change that would trigger a task launch.

Valid options are:

- ConsoleConnect: When you connect to a user session (switch users)
- ConsoleDisconnect: When you disconnect a user session (switch users)
- RemoteConnect: When a user connects via Remote Desktop
- RemoteDisconnect: When a user disconnects via Remote Desktop
- SessionLock: When the workstation is locked
- SessionUnlock: When the workstation is unlocked

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt 'minion-id' task.add_trigger <task_name> trigger_type=Once trigger_
→enabled=True start_date=2016/12/1 start_time='"12:01"'
```

**salt.modules.win\_task.clear\_triggers**(name, location='')

Remove all triggers from the task.

**Parameters**

- **name** (*str*) -- The name of the task from which to clear all triggers.
- **location** (*str*) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt 'minion-id' task.clear_trigger <task_name>
```

`salt.modules.win_task.create_folder` (*name*, *location*='\')

Create a folder in which to create tasks.

**Parameters**

- **name** (*str*) -- The name of the folder. This will be displayed in the task scheduler.
- **location** (*str*) -- A string value representing the location in which to create the folder. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt 'minion-id' task.create_folder <folder_name>
```

`salt.modules.win_task.create_task` (*name*, *location*='\', *user\_name*='System', *password*=None, *force*=False, *\*\*kwargs*)

Create a new task in the designated location. This function has many keyword arguments that are not listed here. For additional arguments see:

- `edit_task()`
- `add_action()`
- `add_trigger()`

**Parameters**

- **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.
- **location** (*str*) -- A string value representing the location in which to create the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
- **user\_name** (*str*) -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- **password** (*str*) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.
- **force** (*bool*) -- If the task exists, overwrite the existing task.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt 'minion-id' task.create_task <task_name> user_name=System force=True
→action_type=Execute cmd='del /Q /S C:\\Temp' trigger_type=Once start_
→date=2016-12-1 start_time="'01:00'"
```

`salt.modules.win_task.create_task_from_xml` (*name*, *location*='\', *xml\_text*=None, *xml\_path*=None, *user\_name*='System', *password*=None)

Create a task based on XML. Source can be a file or a string of XML.

**Parameters**

- **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.
- **location** (*str*) -- A string value representing the location in which to create the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

- **xml\_text** (*str*) -- A string of xml representing the task to be created. This will be overridden by `xml_path` if passed.
- **xml\_path** (*str*) -- The path to an XML file on the local system containing the xml that defines the task. This will override `xml_text`
- **user\_name** (*str*) -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- **password** (*str*) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

**Returns**

True if successful, otherwise False str: A string with the error message if there is an error

**Return type**

bool

**Raises**

- **ArgumentValueError** -- If arguments are invalid
- **CommandExecutionError** --

CLI Example:

```
salt '*' task.create_task_from_xml <task_name> xml_path=C:\task.xml
```

`salt.modules.win_task.delete_folder` (*name*, *location*='')

Delete a folder from the task scheduler.

**Parameters**

- **name** (*str*) -- The name of the folder to delete.
- **location** (*str*) -- A string value representing the location of the folder. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt 'minion-id' task.delete_folder <folder_name>
```

`salt.modules.win_task.delete_task` (*name*, *location*='')

Delete a task from the task scheduler.

**Parameters**

- **name** (*str*) -- The name of the task to delete.
- **location** (*str*) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt 'minion-id' task.delete_task <task_name>
```

```
salt.modules.win_task.edit_task(name=None, location='\\', user_name=None, password=None,
    description=None, enabled=None, hidden=None, run_if_idle=None,
    idle_duration=None, idle_wait_timeout=None,
    idle_stop_on_end=None, idle_restart=None, ac_only=None,
    stop_if_on_batteries=None, wake_to_run=None,
    run_if_network=None, network_id=None, network_name=None,
    allow_demand_start=None, start_when_available=None,
    restart_every=None, restart_count=3, execution_time_limit=None,
    force_stop=None, delete_after=None, multiple_instances=None,
    **kwargs)
```

Edit the parameters of a task. Triggers and Actions cannot be edited yet.

#### Parameters

- **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.
- **location** (*str*) -- A string value representing the location in which to create the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
- **user\_name** (*str*) -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- **password** (*str*) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

---

**Note:** The combination of `user_name` and `password` determine how the task runs. For example, if a username is passed without a password the task will only run when the user is logged in. If a password is passed as well the task will run whether the user is logged on or not. If you pass 'System' as the username the task will run as the system account (the password parameter is ignored).

---

- **description** (*str*) -- A string representing the text that will be displayed in the description field in the task scheduler.
- **enabled** (*bool*) -- A boolean value representing whether or not the task is enabled.
- **hidden** (*bool*) -- A boolean value representing whether or not the task is hidden.
- **run\_if\_idle** (*bool*) -- Boolean value that indicates that the Task Scheduler will run the task only if the computer is in an idle state.
- **idle\_duration** (*str*) -- A value that indicates the amount of time that the computer must be in an idle state before the task is run. Valid values are:
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
- **idle\_wait\_timeout** (*str*) -- A value that indicates the amount of time that the Task Scheduler will wait for an idle condition to occur. Valid values are:
  - Do not wait
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours
- **idle\_stop\_on\_end** (*bool*) -- Boolean value that indicates that the Task Scheduler will terminate the task if the idle condition ends before the task is completed.

- **idle\_restart** (*bool*) -- Boolean value that indicates whether the task is restarted when the computer cycles into an idle condition more than once.
- **ac\_only** (*bool*) -- Boolean value that indicates that the Task Scheduler will launch the task only while on AC power.
- **stop\_if\_on\_batteries** (*bool*) -- Boolean value that indicates that the task will be stopped if the computer begins to run on battery power.
- **wake\_to\_run** (*bool*) -- Boolean value that indicates that the Task Scheduler will wake the computer when it is time to run the task.
- **run\_if\_network** (*bool*) -- Boolean value that indicates that the Task Scheduler will run the task only when a network is available.
- **network\_id** (*guid*) -- GUID value that identifies a network profile.
- **network\_name** (*str*) -- Sets the name of a network profile. The name is used for display purposes.
- **allow\_demand\_start** (*bool*) -- Boolean value that indicates that the task can be started by using either the Run command or the Context menu.
- **start\_when\_available** (*bool*) -- Boolean value that indicates that the Task Scheduler can start the task at any time after its scheduled time has passed.
- **restart\_every** (*str*) -- A value that specifies the interval between task restart attempts. Valid values are:
  - False (to disable)
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours
- **restart\_count** (*int*) -- The number of times the Task Scheduler will attempt to restart the task. Valid values are integers 1 - 999.
- **execution\_time\_limit** (*bool*, *str*) -- The amount of time allowed to complete the task. Valid values are:
  - False (to disable)
  - 1 hour
  - 2 hours
  - 4 hours
  - 8 hours
  - 12 hours
  - 1 day
  - 3 days
- **force\_stop** (*bool*) -- Boolean value that indicates that the task may be terminated by using `TerminateProcess`.
- **delete\_after** (*bool*, *str*) -- The amount of time that the Task Scheduler will wait before deleting the task after it expires. Requires a trigger with an expiration date. Valid values are:
  - False (to disable)
  - Immediately
  - 30 days
  - 90 days
  - 180 days
  - 365 days
- **multiple\_instances** (*str*) -- Sets the policy that defines how the Task Scheduler deals with multiple instances of the task. Valid values are:
  - Parallel
  - Queue

- No New Instance
- Stop Existing

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' task.edit_task <task_name> description='This task is awesome'
```

`salt.modules.win_task.info`(*name*, *location*='')

Get the details about a task in the task scheduler.

**Parameters**

- **name** (*str*) -- The name of the task for which to return the status
- **location** (*str*) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**

A dictionary containing the task configuration

**Return type**

dict

CLI Example:

```
salt 'minion-id' task.info <task_name>
```

`salt.modules.win_task.list_actions`(*name*, *location*='')

List all actions that pertain to a task in the specified location.

**Parameters**

- **name** (*str*) -- The name of the task for which list actions.
- **location** (*str*) -- A string value representing the location of the task from which to list actions. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**

Returns a list of actions.

**Return type**

list

CLI Example:

```
# List all actions for a task in the default location
salt 'minion-id' task.list_actions <task_name>

# List all actions for the XblGameSaveTask in the Microsoft\XblGameSave
# location
salt 'minion-id' task.list_actions XblGameSaveTask Microsoft\XblGameSave
```

`salt.modules.win_task.list_folders`(*location*='')

List all folders located in a specific location in the task scheduler.

**Parameters**

**location** (*str*) -- A string value representing the folder from which you want to list tasks. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**

Returns a list of folders.

**Return type**

list

CLI Example:

```
# List all folders in the default location
salt 'minion-id' task.list_folders

# List all folders in the Microsoft directory
salt 'minion-id' task.list_folders Microsoft
```

`salt.modules.win_task.list_tasks(location='')`

List all tasks located in a specific location in the task scheduler.

**Parameters**

**location** (*str*) -- A string value representing the folder from which you want to list tasks. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**

Returns a list of tasks

**Return type**

list

CLI Example:

```
# List all tasks in the default location
salt 'minion-id' task.list_tasks

# List all tasks in the Microsoft\XblGameSave Directory
salt 'minion-id' task.list_tasks Microsoft\XblGameSave
```

`salt.modules.win_task.list_triggers(name, location='')`

List all triggers that pertain to a task in the specified location.

**Parameters**

- **name** (*str*) -- The name of the task for which list triggers.
- **location** (*str*) -- A string value representing the location of the task from which to list triggers. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**

Returns a list of triggers.

**Return type**

list

CLI Example:

```
# List all triggers for a task in the default location
salt 'minion-id' task.list_triggers <task_name>

# List all triggers for the XblGameSaveTask in the Microsoft\XblGameSave
# location
salt '*' task.list_triggers XblGameSaveTask Microsoft\XblGameSave
```

`salt.modules.win_task.run(name, location='')`

Run a scheduled task manually.

**Parameters**

- **name** (*str*) -- The name of the task to run.
- **location** (*str*) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt 'minion-id' task.run <task_name>
```

**salt.modules.win\_task.run\_wait**(*name*, *location*='')

Run a scheduled task and return when the task finishes

**Parameters**

- **name** (*str*) -- The name of the task to run.
- **location** (*str*) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt 'minion-id' task.run_wait <task_name>
```

**salt.modules.win\_task.status**(*name*, *location*='')

Determine the status of a task. Is it Running, Queued, Ready, etc.

**Parameters**

- **name** (*str*) -- The name of the task for which to return the status
- **location** (*str*) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**

The current status of the task. Will be one of the following:

- Unknown
- Disabled
- Queued
- Ready
- Running

**Return type**

str

CLI Example:

```
salt 'minion-id' task.list_status <task_name>
```

**salt.modules.win\_task.stop**(*name*, *location*='')

Stop a scheduled task.

**Parameters**

- **name** (*str*) -- The name of the task to stop.
- **location** (*str*) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt 'minion-id' task.list_stop <task_name>
```

## 26.6.513 salt.modules.win\_timezone

Module for managing timezone on Windows systems.

**class** salt.modules.win\_timezone.**TzMapper**(*unix\_to\_win*)

**add**(*k*, *v*)

**get\_unix**(*key*, *default=None*)

**get\_win**(*key*, *default=None*)

**list\_unix**()

**list\_win**()

**remove**(*k*)

salt.modules.win\_timezone.**get\_hwclock**()

Get current hardware clock setting (UTC or localtime)

---

**Note:** The hardware clock is always local time on Windows so this will always return "localtime"

---

CLI Example:

```
salt '*' timezone.get_hwclock
```

salt.modules.win\_timezone.**get\_offset**()

Get current numeric timezone offset from UTC (i.e. -0700)

**Returns**

Offset from UTC

**Return type**

str

CLI Example:

```
salt '*' timezone.get_offset
```

salt.modules.win\_timezone.**get\_zone**()

Get current timezone (i.e. America/Denver)

**Returns**

Timezone in unix format

**Return type**

str

**Raises**

**CommandExecutionError** -- If timezone could not be gathered

CLI Example:

```
salt '*' timezone.get_zone
```

salt.modules.win\_timezone.**get\_zonecode**()

Get current timezone (i.e. PST, MDT, etc)

**Returns**

An abbreviated timezone code

**Return type**

str

CLI Example:

```
salt '*' timezone.get_timezone
```

`salt.modules.win_timezone.list(unix_style=True)`

Return a list of Timezones that this module supports. These can be in either Unix or Windows format.

New in version 2018.3.3.

**Parameters**

**unix\_style** (*bool*) -- True returns Unix-style timezones. False returns Windows-style timezones. Default is True

**Returns**

A list of supported timezones

**Return type**

list

CLI Example:

```
# Unix-style timezones
salt '*' timezone.list

# Windows-style timezones
salt '*' timezone.list unix_style=False
```

`salt.modules.win_timezone.set_hwclock(clock)`

Sets the hardware clock to be either UTC or localtime

---

**Note:** The hardware clock is always local time on Windows so this will always return False

---

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

`salt.modules.win_timezone.set_zone(timezone)`

Sets the timezone using the tzutil.

**Parameters**

**timezone** (*str*) -- A valid timezone

**Returns**

True if successful, otherwise False

**Return type**

bool

**Raises**

**CommandExecutionError** -- If invalid timezone is passed

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

`salt.modules.win_timezone.zone_compare(timezone)`

Compares the given timezone with the machine timezone. Mostly useful for running state checks.

**Parameters**

**timezone** (*str*) -- The timezone to compare. This can be in Windows or Unix format. Can be any of the values returned by the `timezone.list` function

**Returns**

True if they match, otherwise False

**Return type**

bool

Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

**26.6.514 salt.modules.win\_useradd**

Module for managing Windows Users.

---

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *'user.info' is not available*), see [here](#).

---

**depends**

- pywintypes
- win32api
- win32con
- win32net
- win32netcon
- win32profile
- win32security
- win32ts
- wmi

---

**Note:** This currently only works with local user accounts, not domain accounts

---

`salt.modules.win_useradd.add`(*name*, *password=None*, *fullname=None*, *description=None*, *groups=None*, *home=None*, *homedrive=None*, *profile=None*, *logonscript=None*)

Add a user to the minion.

**Parameters**

- **name** (*str*) -- The username for the new account
- **password** (*str*, *optional*) -- User's password in plain text.
- **fullname** (*str*, *optional*) -- The user's full name.
- **description** (*str*, *optional*) -- A brief description of the user account.
- **groups** (*str*, *optional*) -- A list of groups to add the user to. (see `chgroups`)
- **home** (*str*, *optional*) -- The path to the user's home directory.
- **homedrive** (*str*, *optional*) -- The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **profile** (*str*, *optional*) -- An explicit path to a profile. Can be a UNC or a folder on the system. If left blank, windows uses its default profile directory.
- **logonscript** (*str*, *optional*) -- Path to a login script to run when the user logs on.

**Returns**

True if successful, otherwise False.

**Return type**

bool

CLI Example:

```
salt '*' user.add name password
```

`salt.modules.win_useradd.addgroup`(*name*, *group*)

Add user to a group

**Parameters**

- **name** (*str*) -- The username to add to the group
- **group** (*str*) -- The name of the group to which to add the user

**Returns**

True if successful, otherwise False.

**Return type**

bool

CLI Example:

```
salt '*' user.addgroup jsnuffy 'Power Users'
```

`salt.modules.win_useradd.chfullname`(*name*, *fullname*)

Change the full name of the user

**Parameters**

- **name** (*str*) -- The username for which to change the full name
- **fullname** (*str*) -- The new value for the full name

**Returns**

True if successful, otherwise False.

**Return type**

bool

CLI Example:

```
salt '*' user.chfullname user 'First Last'
```

`salt.modules.win_useradd.chgroups`(*name*, *groups*, *append=True*)

Change the groups this user belongs to, add `append=False` to make the user a member of only the specified groups

**Parameters**

- **name** (*str*) -- The username for which to change groups
- **groups** (*str*, *list*) -- A single group or a list of groups to assign to the user. For multiple groups this can be a comma delimited string or a list.
- **append** (*bool*, *optional*) -- True adds the passed groups to the user's current groups. False sets the user's groups to the passed groups only. Default is True.

**Returns**

True if successful, otherwise False.

**Return type**

bool

CLI Example:

```
salt '*' user.chgroups jsnuffy Administrators,Users True
```

`salt.modules.win_useradd.chhome`(*name*, *home*, *\*\*kwargs*)

Change the home directory of the user, pass True for `persist` to move files to the new home directory if the old home directory exist.

**Parameters**

- **name** (*str*) -- The name of the user whose home directory you wish to change
- **home** (*str*) -- The new location of the home directory

**Returns**

True if successful, otherwise False.

**Return type**

bool

CLI Example:

```
salt '*' user.chhome foo \\filesERVER\home\foo True
```

`salt.modules.win_useradd.chprofile`(*name*, *profile*)

Change the profile directory of the user

**Parameters**

- **name** (*str*) -- The name of the user whose profile you wish to change
- **profile** (*str*) -- The new location of the profile

**Returns**

True if successful, otherwise False.

**Return type**

bool

CLI Example:

```
salt '*' user.chprofile foo \\filesERVER\profiles\foo
```

`salt.modules.win_useradd.current`(*sam=False*)

Get the username that salt-minion is running under. If salt-minion is running as a service it should return the Local System account. If salt is running from a command prompt it should return the username that started the command prompt.

New in version 2015.5.6.

**Parameters**

**sam** (*bool*, *optional*) -- False returns just the username without any domain notation. True returns the domain with the username in the SAM format. Ie: domain\username

**Returns**

Returns username

**Return type**

str

CLI Example:

```
salt '*' user.current
```

`salt.modules.win_useradd.delete`(*name*, *purge=False*, *force=False*)

Remove a user from the minion

**Parameters**

- **name** (*str*) -- The name of the user to delete
- **purge** (*bool*, *optional*) -- Boolean value indicating that the user profile should also be removed when the user account is deleted. If set to True the profile will be removed. Default is False.
- **force** (*bool*, *optional*) -- Boolean value indicating that the user account should be deleted even if the user is logged in. True will log the user out and delete user.

**Returns**

True if successful, otherwise False.

**Return type**

bool

CLI Example:

```
salt '*' user.delete name
```

`salt.modules.win_useradd.getUserSid(username)`

Deprecated function. Please use `get_user_sid` instead

CLI Example:

```
salt '*' user.get_user_sid jsnuffy
```

`salt.modules.win_useradd.get_user_sid(username)`

Get the Security ID for the user

**Parameters**

**username** (*str*) -- The username for which to look up the SID

**Returns**

The user SID

**Return type**

*str*

CLI Example:

```
salt '*' user.get_user_sid jsnuffy
```

`salt.modules.win_useradd.getent(refresh=False)`

Return the list of all info for all users

**Parameters**

**refresh** (*bool*, *optional*) -- Refresh the cached user information. Useful when used from within a state function. Default is False.

**Returns**

A dictionary containing information about all users on the system

**Return type**

*dict*

CLI Example:

```
salt '*' user.getent
```

`salt.modules.win_useradd.info(name)`

Return user information

**Parameters**

**name** (*str*) -- Username for which to display information

**Returns**

A dictionary containing user information

- fullname
- username
- SID
- passwd (will always return None)
- comment (same as description, left here for backwards compatibility)
- description
- active
- logonscript
- profile
- home
- homedrive
- groups
- password\_changed
- successful\_logon\_attempts

- failed\_logon\_attempts
- last\_logon
- account\_disabled
- account\_locked
- expiration\_date
- password\_never\_expires
- disallow\_change\_password
- gid

**Return type**  
dict

CLI Example:

```
salt '*' user.info jsnuffly
```

`salt.modules.win_useradd.list_groups(name)`

Return a list of groups the named user belongs to

**Parameters**

**name** (*str*) -- The username for which to list groups

**Returns**

A list of groups to which the user belongs

**Return type**

list

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.win_useradd.list_users()`

Return a list of all users on Windows

**Returns**

A list of all users on the system

**Return type**

list

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.win_useradd.removegroup(name, group)`

Remove user from a group

**Parameters**

- **name** (*str*) -- The username to remove from the group
- **group** (*str*) -- The name of the group from which to remove the user

**Returns**

True if successful, otherwise False.

**Return type**

bool

CLI Example:

```
salt '*' user.removegroup jsnuffly 'Power Users'
```

`salt.modules.win_useradd.rename(name, new_name)`

Change the username for a named user

**Parameters**

- **name** (*str*) -- The username to change
- **new\_name** (*str*) -- The new name for the current user

**Returns**

True if successful, otherwise False.

**Return type**

bool

CLI Example:

```
salt '*' user.rename jsnuffy jshmoe
```

`salt.modules.win_useradd.setpassword`(*name*, *password*)

Set the user's password

**Parameters**

- **name** (*str*) -- The username for which to set the password
- **password** (*str*) -- The new password

**Returns**

True if successful, otherwise False.

**Return type**

bool

CLI Example:

```
salt '*' user.setpassword jsnuffy sup3rs3cr3t
```

`salt.modules.win_useradd.update`(*name*, *password=None*, *fullname=None*, *description=None*, *home=None*, *homedrive=None*, *logonscript=None*, *profile=None*, *expiration\_date=None*, *expired=None*, *account\_disabled=None*, *unlock\_account=None*, *password\_never\_expires=None*, *disallow\_change\_password=None*)

Updates settings for the Windows user. Name is the only required parameter. Settings will only be changed if the parameter is passed a value.

New in version 2015.8.0.

**Parameters**

- **name** (*str*) -- The username to update.
- **password** (*str*, *optional*) -- New user password in plain text.
- **fullname** (*str*, *optional*) -- The user's full name.
- **description** (*str*, *optional*) -- A brief description of the user account.
- **home** (*str*, *optional*) -- The path to the user's home directory.
- **homedrive** (*str*, *optional*) -- The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **logonscript** (*str*, *optional*) -- The path to the logon script.
- **profile** (*str*, *optional*) -- The path to the user's profile directory.
- **expiration\_date** (*date*, *optional*) -- The date and time when the account expires. Can be a valid date/time string. To set to never expire pass the string 'Never'.
- **expired** (*bool*, *optional*) -- Pass *True* to expire the account. The user will be prompted to change their password at the next logon. Pass *False* to mark the account as 'not expired'. You can't use this to negate the expiration if the expiration was caused by the account expiring. You'll have to change the *expiration\_date* as well.
- **account\_disabled** (*bool*, *optional*) -- True disables the account. False enables the account.
- **unlock\_account** (*bool*, *optional*) -- True unlocks a locked user account. False is ignored.
- **password\_never\_expires** (*bool*, *optional*) -- True sets the password to never expire. False allows the password to expire.
- **disallow\_change\_password** (*bool*, *optional*) -- True blocks the user from changing the password. False allows the user to change the password.

**Returns**

True if successful, otherwise False.

**Return type**

bool

CLI Example:

```
salt '*' user.update bob password=secret profile=C:\Users\Bob
home=\server\homeshare\bob homedrive=U:
```

**26.6.515 salt.modules.win\_wua**

Module for managing Windows Updates using the Windows Update Agent.

List updates on the system using the following functions:

- `win_wua.available`
- `win_wua.list`

This is an easy way to find additional information about updates available to the system, such as the GUID, KB number, or description.

Once you have the GUID or a KB number for the update you can get information about the update, download, install, or uninstall it using these functions:

- `win_wua.get`
- `win_wua.download`
- `win_wua.install`
- `win_wua.uninstall`

The `get` function expects a name in the form of a GUID, KB, or Title and should return information about a single update. The other functions accept either a single item or a list of items for downloading/installing/uninstalling a specific list of items.

The `win_wua.list` and `win_wua.get` functions are utility functions. In addition to returning information about updates they can also download and install updates by setting `download=True` or `install=True`. So, with `py:func:win_wua.list <salt.modules.win_wua.list_>` for example, you could run the function with the filters you want to see what is available. Then just add `install=True` to install everything on that list.

If you want to download, install, or uninstall specific updates, use `win_wua.download`, `win_wua.install`, or `win_wua.uninstall`. To update your system with the latest updates use `win_wua.list` and set `install=True`

You can also adjust the Windows Update settings using the `win_wua.set_wu_settings` function. This function is only supported on the following operating systems:

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

As of Windows 10 and Windows Server 2016, the ability to modify the Windows Update settings has been restricted. The settings can be modified in the Local Group Policy using the `lgpo` module.

New in version 2015.8.0.

**depends**

salt.utils.win\_update

salt.modules.win\_wua.**available** (*software=True, drivers=True, summary=False, skip\_installed=True, skip\_hidden=True, skip\_mandatory=False, skip\_reboot=False, categories=None, severities=None, online=True*)

New in version 2017.7.0.

List updates that match the passed criteria. This allows for more filter options than `list()`. Good for finding a specific GUID or KB.

**Parameters**

- **software** (*bool*) -- Include software updates in the results. Default is `True`
- **drivers** (*bool*) -- Include driver updates in the results. Default is `True`
- **summary** (*bool*) --
  - `True`: Return a summary of updates available for each category.
  - `False` (default): Return a detailed list of available updates.
- **skip\_installed** (*bool*) -- Skip updates that are already installed. Default is `True`
- **skip\_hidden** (*bool*) -- Skip updates that have been hidden. Default is `True`
- **skip\_mandatory** (*bool*) -- Skip mandatory updates. Default is `False`
- **skip\_reboot** (*bool*) -- Skip updates that require a reboot. Default is `False`
- **categories** (*list*) -- Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
- Definition Updates
- Drivers (make sure you set `drivers=True`)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender
- **severities** (*list*) -- Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:

- Critical
- Important
- **online** (*bool*) -- Tells the Windows Update Agent go online to update its local update database. `True` will go online. `False` will use the local update database as is. Default is `True`

New in version 3001.

**Returns**

Returns a dict containing either a summary or a list of updates:

```
Dict of Updates:
{'<GUID>': {
  'Title': <title>,
```

(continues on next page)

(continued from previous page)

```

'KB': <KB>,
'GUID': <the globally unique identifier for the update>,
'Description': <description>,
'Downloaded': <has the update been downloaded>,
'Installed': <has the update been installed>,
'Mandatory': <is the update mandatory>,
'UserInput': <is user input required>,
'EULAAccepted': <has the EULA been accepted>,
'Severity': <update severity>,
'NeedsReboot': <is the update installed and awaiting
↳reboot>,
'RebootBehavior': <will the update require a reboot>,
'Categories': [
    '<category 1>',
    '<category 2>',
    ... ]
}}

Summary of Updates:
{'Total': <total number of updates returned>,
 'Available': <updates that are not downloaded or installed>,
 'Downloaded': <updates that are downloaded but not
↳installed>,
 'Installed': <updates installed (usually 0 unless
↳installed=True)>,
 'Categories': {
    <category 1>: <total for that category>,
    <category 2>: <total for category 2>,
    ... }
}

```

**Return type**

dict

**CLI Examples:**

```

# Normal Usage (list all software updates)
salt '*' win_wua.available

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.available categories=["Critical Updates","Drivers"]

# List all Critical Security Updates
salt '*' win_wua.available categories=["Security Updates"] severities=[
↳"Critical"]

# List all updates with a severity of Critical
salt '*' win_wua.available severities=["Critical"]

# A summary of all available updates
salt '*' win_wua.available summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.available categories=["Feature Packs","Windows 8.1"]

```

(continues on next page)

(continued from previous page)

```
→ summary=True
```

`salt.modules.win_wua.download(names)`

New in version 2017.7.0.

Downloads updates that match the list of passed identifiers. It's easier to use this function by using `list_updates` and setting `download=True`.

#### Parameters

**names** (*str*, *list*) -- A single update or a list of updates to download. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

---

**Note:** An error will be raised if there are more results than there are items in the `names` parameter

---

#### Returns

A dictionary containing the details about the downloaded updates

#### Return type

`dict`

CLI Example:

```
# Normal Usage
salt '*' win_wua.download names=['12345678-abcd-1234-abcd-1234567890ab',
→ 'KB2131233']
```

`salt.modules.win_wua.get(name, download=False, install=False, online=True)`

New in version 2017.7.0.

Returns details for the named update

#### Parameters

- **name** (*str*) -- The name of the update you're searching for. This can be the GUID, a KB number, or any part of the name of the update. GUIDs and KBs are preferred. Run `list` to get the GUID for the update you're looking for.
- **download** (*bool*) -- Download the update returned by this function. Run this function first to see if the update exists, then set `download=True` to download the update.
- **install** (*bool*) -- Install the update returned by this function. Run this function first to see if the update exists, then set `install=True` to install the update.
- **online** (*bool*) -- Tells the Windows Update Agent go online to update its local update database. `True` will go online. `False` will use the local update database as is. Default is `True`

New in version 3001.

#### Returns

Returns a dict containing a list of updates that match the name if `download` and `install` are both set to `False`. Should usually be a single update, but can return multiple if a partial name is given.

If `download` or `install` is set to `true` it will return the results of the operation.

```
Dict of Updates:
{'<GUID>': {
  'Title': <title>,
  'KB': <KB>,
  'GUID': <the globally unique identifier for the update>,
```

(continues on next page)

(continued from previous page)

```

'Description': <description>,
'Downloaded': <has the update been downloaded>,
'Installed': <has the update been installed>,
'Mandatory': <is the update mandatory>,
'UserInput': <is user input required>,
'EULAAccepted': <has the EULA been accepted>,
'Severity': <update severity>,
'NeedsReboot': <is the update installed and awaiting
↳reboot>,
'RebootBehavior': <will the update require a reboot>,
'Categories': [
    '<category 1>',
    '<category 2>',
    ... ]
}}

```

**Return type**  
dict

CLI Examples:

```

# Recommended Usage using GUID without braces
# Use this to find the status of a specific update
salt '*' win_wua.get 12345678-abcd-1234-abcd-1234567890ab

# Use the following if you don't know the GUID:

# Using a KB number
# Not all updates have an associated KB
salt '*' win_wua.get KB3030298

# Using part or all of the name of the update
# Could possibly return multiple results
# Not all updates have an associated KB
salt '*' win_wua.get 'Microsoft Camera Codec Pack'

```

**salt.modules.win\_wua.get\_needs\_reboot()**

Determines if the system needs to be rebooted.

**Returns**

True if the system requires a reboot, otherwise False

**Return type**

bool

CLI Examples:

```
salt '*' win_wua.get_needs_reboot
```

**salt.modules.win\_wua.get\_wu\_settings()**

Get current Windows Update settings.

**Returns**

A dictionary of Windows Update settings:

**Featured Updates:**

Boolean value that indicates whether to display notifications for featured updates.

**Group Policy Required (Read-only):**

Boolean value that indicates whether Group Policy requires the Automatic Updates

service.

**Microsoft Update:**

Boolean value that indicates whether to turn on Microsoft Update for other Microsoft Products

**Needs Reboot:**

Boolean value that indicates whether the machine is in a reboot pending state.

**Non Admins Elevated:**

Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.

**Notification Level:**

Number 1 to 4 indicating the update level:

1. Never check for updates
2. Check for updates but let me choose whether to download and install them
3. Download updates but let me choose whether to install them
4. Install updates automatically

**Read Only (Read-only):**

Boolean value that indicates whether the Automatic Update settings are read-only.

**Recommended Updates:**

Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.

**Scheduled Day:**

Days of the week on which Automatic Updates installs or uninstalls updates.

**Scheduled Time:**

Time at which Automatic Updates installs or uninstalls updates.

**Return type**

dict

**CLI Examples:**

```
salt '*' win_wua.get_wu_settings
```

**salt.modules.win\_wua.install(names)**

New in version 2017.7.0.

Installs updates that match the list of identifiers. It may be easier to use the list\_updates function and set install=True.

**Parameters**

**names** (*str*, *list*) -- A single update or a list of updates to install. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

---

**Note:** An error will be raised if there are more results than there are items in the names parameter

---

**Returns**

A dictionary containing the details about the installed updates

**Return type**

dict

**CLI Examples:**

```
# Normal Usage
salt '*' win_wua.install KB12323211
```

**salt.modules.win\_wua.installed(summary=False, kbs\_only=False)**

New in version 3001.

Get a list of all updates that are currently installed on the system.

---

**Note:** This list may not necessarily match the Update History on the machine. This will only show the updates that apply to the current build of Windows. So, for example, the system may have shipped with Windows 10 Build 1607. That machine received updates to the 1607 build. Later the machine was upgraded to a newer feature release, 1803 for example. Then more updates were applied. This will only return the updates applied to the 1803 build and not those applied when the system was at the 1607 build.

---

#### Parameters

- **summary** (*bool*) -- Return a summary instead of a detailed list of updates. True will return a Summary, False will return a detailed list of installed updates. Default is False
- **kbs\_only** (*bool*) -- Only return a list of KBs installed on the system. If this parameter is passed, the `summary` parameter will be ignored. Default is False

#### Returns

Returns a dictionary of either a Summary or a detailed list of updates installed on the system when `kbs_only=False`

#### list:

Returns a list of KBs installed on the system when `kbs_only=True`

#### Return type

dict

#### CLI Examples:

```
# Get a detailed list of all applicable updates installed on the system
salt '*' win_wua.installed

# Get a summary of all applicable updates installed on the system
salt '*' win_wua.installed summary=True

# Get a simple list of KBs installed on the system
salt '*' win_wua.installed kbs_only=True
```

`salt.modules.win_wua.list` (*software=True, drivers=False, summary=False, skip\_installed=True, categories=None, severities=None, download=False, install=False, online=True*)

New in version 2017.7.0.

Returns a detailed list of available updates or a summary. If `download` or `install` is True the same list will be downloaded and/or installed.

#### Parameters

- **software** (*bool*) -- Include software updates in the results. Default is True
- **drivers** (*bool*) -- Include driver updates in the results. Default is False
- **summary** (*bool*) --
  - True: Return a summary of updates available for each category.
  - False (default): Return a detailed list of available updates.
- **skip\_installed** (*bool*) -- Skip installed updates in the results. Default is True
- **download** (*bool*) -- (Overrides reporting functionality) Download the list of updates returned by this function. Run this function first with `download=False` to see what will be downloaded, then set `download=True` to download the updates. Default is False
- **install** (*bool*) -- (Overrides reporting functionality) Install the list of updates returned by this function. Run this function first with `install=False` to see what will be installed, then set `install=True` to install the updates. Default is False

- **categories** (*list*) -- Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
  - Definition Updates
  - Drivers (make sure you set `drivers=True`)
  - Feature Packs
  - Security Updates
  - Update Rollups
  - Updates
  - Update Rollups
  - Windows 7
  - Windows 8.1
  - Windows 8.1 drivers
  - Windows 8.1 and later drivers
  - Windows Defender
- **severities** (*list*) -- Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:

- Critical
  - Important
- **online** (*bool*) -- Tells the Windows Update Agent go online to update its local update database. `True` will go online. `False` will use the local update database as is. Default is `True`

New in version 3001.

## Returns

Returns a dict containing either a summary or a list of updates:

```
Dict of Updates:
{'<GUID>': {
  'Title': <title>,
  'KB': <KB>,
  'GUID': <the globally unique identifier for the update>,
  'Description': <description>,
  'Downloaded': <has the update been downloaded>,
  'Installed': <has the update been installed>,
  'Mandatory': <is the update mandatory>,
  'UserInput': <is user input required>,
  'EULAAccepted': <has the EULA been accepted>,
  'Severity': <update severity>,
  'NeedsReboot': <is the update installed and awaiting
↳reboot>,
  'RebootBehavior': <will the update require a reboot>,
  'Categories': [
    '<category 1>',
    '<category 2>',
    ... ]
}}
```

```
Summary of Updates:
{'Total': <total number of updates returned>,
```

(continues on next page)

(continued from previous page)

```
'Available': <updates that are not downloaded or installed>,
'Downloaded': <updates that are downloaded but not
↳ installed>,
'Installed': <updates installed (usually 0 unless
↳ installed=True)>,
'Categories': {
  <category 1>: <total for that category>,
  <category 2>: <total for category 2>,
  ... }
}
```

**Return type**

dict

**CLI Examples:**

```
# Normal Usage (list all software updates)
salt '*' win_wua.list

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.list categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.list categories=['Security Updates'] severities=[
↳ 'Critical']

# List all updates with a severity of Critical
salt '*' win_wua.list severities=['Critical']

# A summary of all available updates
salt '*' win_wua.list summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.list categories=['Feature Packs','Windows 8.1']
↳ summary=True
```

`salt.modules.win_wua.set_wu_settings` (*level=None, recommended=None, featured=None, elevated=None, msupdate=None, day=None, time=None*)

Change Windows Update settings. If no parameters are passed, the current value will be returned.

**Supported:**

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

**Parameters**

- **level** (*int*) -- Number from 1 to 4 indicating the update level:
  1. Never check for updates
  2. Check for updates but let me choose whether to download and install them
  3. Download updates but let me choose whether to install them
  4. Install updates automatically
- **recommended** (*bool*) -- Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.
- **featured** (*bool*) -- Boolean value that indicates whether to display notifications

for featured updates.

- **elevated** (*bool*) -- Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.
- **msupdate** (*bool*) -- Boolean value that indicates whether to turn on Microsoft Update for other Microsoft products
- **day** (*str*) -- Days of the week on which Automatic Updates installs or uninstalls updates. Accepted values:
  - Everyday
  - Monday
  - Tuesday
  - Wednesday
  - Thursday
  - Friday
  - Saturday
- **time** (*str*) -- Time at which Automatic Updates installs or uninstalls updates. Must be in the `##:##` 24hr format, eg. 3:00 PM would be 15:00. Must be in 1 hour increments.

**Returns**

Returns a dictionary containing the results.

**Return type**

dict

CLI Examples:

```
salt '*' win_wua.set_wu_settings level=4 recommended=True featured=False
```

**salt.modules.win\_wua.uninstall**(*names*)

New in version 2017.7.0.

Uninstall updates.

**Parameters**

**names** (*str*, *list*) -- A single update or a list of updates to uninstall. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

**Returns**

A dictionary containing the details about the uninstalled updates

**Return type**

dict

CLI Examples:

```
# Normal Usage
salt '*' win_wua.uninstall KB3121212

# As a list
salt '*' win_wua.uninstall guid=['12345678-abcd-1234-abcd-1234567890ab',
→ 'KB1231231']
```

## 26.6.516 salt.modules.win\_wusa

Microsoft Update files management via wusa.exe

**maintainer**

Thomas Lemarchand

**platform**

Windows

**depends**

PowerShell

New in version 2018.3.4.

`salt.modules.win_wusa.install(path, restart=False)`

Install a KB from a .msu file.

**Parameters**

- **path** (*str*) -- The full path to the msu file to install
- **restart** (*bool*) -- True to force a restart if required by the installation. Adds the `/forcerestart` switch to the `wusa.exe` command. False will add the `/norestart` switch instead. Default is False

**Returns**

True if successful, otherwise False

**Return type**

bool

**Raises**

**CommandExecutionError** -- If the package is already installed or an error is encountered

CLI Example:

```
salt '*' wusa.install C:/temp/KB123456.msu
```

`salt.modules.win_wusa.is_installed(name)`

Check if a specific KB is installed.

**Parameters**

**name** (*str*) -- The name of the KB to check

**Returns**

True if installed, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' wusa.is_installed KB123456
```

`salt.modules.win_wusa.list_()`

Get a list of updates installed on the machine

**Returns**

A list of installed updates

**Return type**

list

CLI Example:

```
salt '*' wusa.list
```

`salt.modules.win_wusa.uninstall`(*path*, *restart=False*)

Uninstall a specific KB.

**Parameters**

- **path** (*str*) -- The full path to the msu file to uninstall. This can also be just the name of the KB to uninstall
- **restart** (*bool*) -- True to force a restart if required by the installation. Adds the `/forcerestart` switch to the `wusa.exe` command. False will add the `/norestart` switch instead. Default is False

**Returns**

True if successful, otherwise False

**Return type**

bool

**Raises**

**CommandExecutionError** -- If an error is encountered

CLI Example:

```
salt '*' wusa.uninstall KB123456

# or

salt '*' wusa.uninstall C:/temp/KB123456.msu
```

### 26.6.517 salt.modules.winrepo

Module to manage Windows software repo on a Standalone Minion

`file_client:` `local` must be set in the minion config file.

For documentation on Salt's Windows Repo feature, see [here](#).

`salt.modules.winrepo.genrepo`()

Generate `winrepo_cachefile` based on sls files in the `winrepo_dir`

CLI Example:

```
salt-call winrepo.genrepo
```

`salt.modules.winrepo.show_sls`(*name*, *saltenv='base'*)

New in version 2015.8.0.

Display the rendered software definition from a specific sls file in the local winrepo cache. This will parse all Jinja. Run `pkg.refresh_db` to pull the latest software definitions from the master.

---

**Note:** This function does not ask a master for an sls file to render. Instead it directly processes the file specified in *name*

---

**Parameters**

- **str** (*saltenv*) -- The name/path of the package you want to view. This can be the
- **local** (*full path to a file on the minion file system or a file on the*) --
- **cache.** (*minion*) --
- **str** -- The default environment is base

**Returns**

Returns a dictionary containing the rendered data structure

**Return type**  
dict

---

**Note:** To use a file from the minion cache start from the local winrepo root (C:\salt\var\cache\salt\minion\files\base\win\repo-ng). If you have .sls files organized in subdirectories you'll have to denote them with .. For example, if you have a test directory in the winrepo root with a gvim.sls file inside, would target that file like so: test.gvim. Directories can be targeted as well as long as they contain an init.sls inside. For example, if you have a node directory with an init.sls inside, target that like so: node.

---

CLI Example:

```
salt '*' winrepo.show_sls gvim
salt '*' winrepo.show_sls test.npp
salt '*' winrepo.show_sls C:\test\gvim.sls
```

salt.modules.winrepo.**update\_git\_repos**(*clean=False*)

Checkout git repos containing *Windows Software Package Definitions*.

---

**Important:** This function requires *Git for Windows* to be installed in order to work. When installing, make sure to select an installation option which permits the git executable to be run from the Command Prompt.

---

**clean**

[False] Clean repo cachedirs which are not configured under *winrepo\_remotes*.

---

**Note:** This option only applies if either *pygit2* or *GitPython* is installed into Salt's bundled Python.

---

**Warning:** This argument should not be set to True if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Example:

```
salt-call winrepo.update_git_repos
```

### 26.6.518 salt.modules.wordpress

This module is used to manage Wordpress installations

**depends**

wp binary from <http://wp-cli.org/>

**class** salt.modules.wordpress.**Plugin**(*name, status, update, versino*)

**name**

Alias for field number 0

**status**

Alias for field number 1

**update**

Alias for field number 2

**versino**

Alias for field number 3

**salt.modules.wordpress.activate**(*name, path, user*)

Activate a wordpress plugin

**name**

Wordpress plugin name

**path**

path to wordpress install location

**user**

user to run the command as

CLI Example:

```
salt '*' wordpress.activate HyperDB /var/www/html apache
```

**salt.modules.wordpress.deactivate**(*name, path, user*)

Deactivate a wordpress plugin

**name**

Wordpress plugin name

**path**

path to wordpress install location

**user**

user to run the command as

CLI Example:

```
salt '*' wordpress.deactivate HyperDB /var/www/html apache
```

**salt.modules.wordpress.install**(*path, user, admin\_user, admin\_password, admin\_email, title, url*)

Run the initial setup functions for a wordpress install

**path**

path to wordpress install location

**user**

user to run the command as

**admin\_user**

Username for the Administrative user for the wordpress install

**admin\_password**

Initial Password for the Administrative user for the wordpress install

**admin\_email**

Email for the Administrative user for the wordpress install

**title**

Title of the wordpress website for the wordpress install

**url**

Url for the wordpress install

CLI Example:

```
salt '*' wordpress.install /var/www/html apache dwallace password123
→ dwallace@example.com "Daniel's Awesome Blog" https://blog.
→ dwallace.com
```

`salt.modules.wordpress.is_installed`(*path*, *user=None*)

Check if wordpress is installed and setup

**path**

path to wordpress install location

**user**

user to run the command as

CLI Example:

```
salt '*' wordpress.is_installed /var/www/html apache
```

`salt.modules.wordpress.list_plugins`(*path*, *user*)

List plugins in an installed wordpress path

**path**

path to wordpress install location

**user**

user to run the command as

CLI Example:

```
salt '*' wordpress.list_plugins /var/www/html apache
```

`salt.modules.wordpress.show_plugin`(*name*, *path*, *user*)

Show a plugin in a wordpress install and check if it is installed

**name**

Wordpress plugin name

**path**

path to wordpress install location

**user**

user to run the command as

CLI Example:

```
salt '*' wordpress.show_plugin HyperDB /var/www/html apache
```

### 26.6.519 salt.modules.x509

Manage X509 certificates

New in version 2015.8.0.

**depends**

M2Crypto

Deprecated since version 3006.0.

**Warning:** This module has been deprecated and will be removed in Salt 3009 (Potassium). Please migrate to the replacement modules. For breaking changes between both versions, you can refer to the [x509\\_v2 execution module docs](#).

They will become the default x509 modules in Salt 3008 (Argon). You can explicitly switch to the new modules before that release by setting `features: {x509_v2: true}` in your minion configuration.

`salt.modules.x509.create_certificate`(*path=None*, *text=False*, *overwrite=True*, *ca\_server=None*, *\*\*kwargs*)

Create an X509 certificate.

**path:**

Path to write the certificate to.

**text:**

If `True`, return the PEM text without writing to a file. Default `False`.

**overwrite:**

If `True` (default), `create_certificate` will overwrite the entire PEM file. Set `False` to preserve existing private keys and dh params that may exist in the PEM file.

**kwargs:**

Any of the properties below can be included as additional keyword arguments.

**ca\_server:**

Request a remotely signed certificate from `ca_server`. For this to work, a `signing_policy` must be specified, and that same policy must be configured on the `ca_server`. See `signing_policy` for details. Also, the salt master must permit peers to call the `sign_remote_certificate` function.

Example:

```
/etc/salt/master.d/peer.conf
```

```
peer :
  .* :
    - x509.sign_remote_certificate
```

**subject properties:**

Any of the values below can be included to set subject properties. Any other subject properties supported by OpenSSL should also work.

**C:**

2 letter Country code

**CN:**

Certificate common name, typically the FQDN.

**Email:**

Email address

**GN:**

Given Name

**L:**

Locality

**O:**

Organization

**OU:**

Organization Unit

**SN:**

SurName

**ST:**

State or Province

**signing\_private\_key:**

A path or string of the private key in PEM format that will be used to sign this certificate. If neither `signing_cert`, `public_key`, or `csr` are included, it will be assumed that this is a self-signed certificate, and the public key matching `signing_private_key` will be used to create the certificate.

**signing\_private\_key\_passphrase:**

Passphrase used to decrypt the `signing_private_key`.

**signing\_cert:**

A certificate matching the private key that will be used to sign this certificate. This is used to populate the issuer values in the resulting certificate. Do not include this value for self-signed certificates.

**public\_key:**

The public key to be included in this certificate. This can be sourced from a public key, certificate, CSR or private key. If a private key is used, the matching public key from the private key will be generated before any processing is done. This means you can request a certificate from a remote CA using a

private key file as your `public_key` and only the public key will be sent across the network to the CA. If neither `public_key` or `csr` are specified, it will be assumed that this is a self-signed certificate, and the public key derived from `signing_private_key` will be used. Specify either `public_key` or `csr`, not both. Because you can input a CSR as a public key or as a CSR, it is important to understand the difference. If you import a CSR as a public key, only the public key will be added to the certificate, subject or extension information in the CSR will be lost.

**public\_key\_passphrase:**

If the public key is supplied as a private key, this is the passphrase used to decrypt it.

**csr:**

A file or PEM string containing a certificate signing request. This will be used to supply the subject, extensions and public key of a certificate. Any subject or extensions specified explicitly will overwrite any in the CSR.

**basicConstraints:**

X509v3 Basic Constraints extension.

**extensions:**

The following arguments set X509v3 Extension values. If the value starts with `critical`, the extension will be marked as critical.

Some special extensions are `subjectKeyIdentifier` and `authorityKeyIdentifier`.

`subjectKeyIdentifier` can be an explicit value or it can be the special string `hash`. `hash` will set the `subjectKeyIdentifier` equal to the SHA1 hash of the modulus of the public key in this certificate. Note that this is not the exact same hashing method used by OpenSSL when using the `hash` value.

`authorityKeyIdentifier` Use values acceptable to the openssl CLI tools. This will automatically populate `authorityKeyIdentifier` with the `subjectKeyIdentifier` of `signing_cert`. If this is a self-signed cert these values will be the same.

**basicConstraints:**

X509v3 Basic Constraints

**keyUsage:**

X509v3 Key Usage

**extendedKeyUsage:**

X509v3 Extended Key Usage

**subjectKeyIdentifier:**

X509v3 Subject Key Identifier

**issuerAltName:**

X509v3 Issuer Alternative Name

**subjectAltName:**

X509v3 Subject Alternative Name

**crlDistributionPoints:**

X509v3 CRL Distribution Points

**issuingDistributionPoint:**

X509v3 Issuing Distribution Point

**certificatePolicies:**

X509v3 Certificate Policies

**policyConstraints:**

X509v3 Policy Constraints

**inhibitAnyPolicy:**

X509v3 Inhibit Any Policy

**nameConstraints:**

X509v3 Name Constraints

**noCheck:**

X509v3 OCSP No Check

**nsComment:**

Netscape Comment

- nsCertType:**  
Netscape Certificate Type
- days\_valid:**  
The number of days this certificate should be valid. This sets the `notAfter` property of the certificate. Defaults to 365.
- version:**  
The version of the X509 certificate. Defaults to 3. This is automatically converted to the version value, so `version=3` sets the certificate version field to 0x2.
- serial\_number:**  
The serial number to assign to this certificate. If omitted a random serial number of size `serial_bits` is generated.
- serial\_bits:**  
The number of bits to use when randomly generating a serial number. Defaults to 64.
- algorithm:**  
The hashing algorithm to be used for signing this certificate. Defaults to sha256.
- copypath:**  
An additional path to copy the resulting certificate to. Can be used to maintain a copy of all certificates issued for revocation purposes.
- prepend\_cn:**  
If set to True, the CN and a dash will be prepended to the copypath's filename.
- Example:**  
`/etc/pki/issued_certs/www.example.com-DE:CA:FB:AD:00:00:00:00.crt`
- signing\_policy:**  
A signing policy that should be used to create this certificate. Signing policies should be defined in the minion configuration, or in a minion pillar. It should be a YAML formatted list of arguments which will override any arguments passed to this function. If the `minions` key is included in the signing policy, only minions matching that pattern (see `match.glob` and `match.compound`) will be permitted to remotely request certificates from that policy. In order to `match.compound` to work salt master must peers permit peers to call it.

Example:

`/etc/salt/master.d/peer.conf`

```
peer:
  .*:
    - match.compound
```

Example:

```
x509_signing_policies:
  www:
    - minions: 'www*'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/
```

The above signing policy can be invoked with `signing_policy=www`

**not\_before:**

Initial validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'.

New in version 3001.

**not\_after:**

Final validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'.

New in version 3001.

CLI Example:

```
salt '*' x509.create_certificate path=/etc/pki/myca.crt signing_private_
→key='/etc/pki/myca.key' csr='/etc/pki/myca.csr'}
```

```
salt.modules.x509.create_crl(path=None, text=False, signing_private_key=None,
                             signing_private_key_passphrase=None, signing_cert=None, revoked=None,
                             include_expired=False, days_valid=100, digest="")
```

Create a CRL

**Depends**

- PyOpenSSL Python module

**path:**

Path to write the CRL to.

**text:**

If True, return the PEM text without writing to a file. Default False.

**signing\_private\_key:**

A path or string of the private key in PEM format that will be used to sign the CRL. This is required.

**signing\_private\_key\_passphrase:**

Passphrase to decrypt the private key.

**signing\_cert:**

A certificate matching the private key that will be used to sign the CRL. This is required.

**revoked:**

A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A dict must contain either the key `serial_number` with the value of the serial number to revoke, or `certificate` with either the PEM encoded text of the certificate, or a path to the certificate to revoke.

The dict can optionally contain the `revocation_date` key. If this key is omitted the revocation date will be set to now. It should be a string in the format "%Y-%m-%d %H:%M:%S".

The dict can also optionally contain the `not_after` key. This is redundant if the `certificate` key is included. If the `Certificate` key is not included, this can be used for the logic behind the `include_expired` parameter. It should be a string in the format "%Y-%m-%d %H:%M:%S".

The dict can also optionally contain the `reason` key. This is the reason code for the revocation. Available choices are `unspecified`, `keyCompromise`, `CACompromise`, `affiliationChanged`, `superseded`, `cessationOfOperation` and `certificateHold`.

**include\_expired:**

Include expired certificates in the CRL. Default is False.

**days\_valid:**

The number of days that the CRL should be valid. This sets the Next Update field in the CRL.

**digest:**

The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14

CLI Example:

```
salt '*' x509.create_crl path=/etc/pki/mykey.key \
    signing_private_key=/etc/pki/ca.key \
```

(continues on next page)

(continued from previous page)

```

    signing_cert=/etc/pki/ca.crt \
    revoked="{ 'compromized-web-key': { 'certificate': '/etc/pki/certs/
    ↪www1.crt', 'revocation_date': '2015-03-01 00:00:00'} }"

```

`salt.modules.x509.create_csr` (*path=None, text=False, \*\*kwargs*)

Create a certificate signing request.

**path:**

Path to write the certificate to.

**text:**

If True, return the PEM text without writing to a file. Default False.

**algorithm:**

The hashing algorithm to be used for signing this request. Defaults to sha256.

**kwargs:**

The subject, extension and version arguments from `x509.create_certificate` can be used.

CLI Example:

```

salt '*' x509.create_csr path=/etc/pki/myca.csr public_key='/etc/pki/myca.
↪key' CN='My Cert'

```

`salt.modules.x509.create_private_key` (*path=None, text=False, bits=2048, passphrase=None, cipher='aes\_128\_cbc', verbose=True*)

Creates a private key in PEM format.

**path:**

The path to write the file to, either `path` or `text` are required.

**text:**

If True, return the PEM text without writing to a file. Default False.

**bits:**

Length of the private key in bits. Default 2048

**passphrase:**

Passphrase for encrypting the private key

**cipher:**

Cipher for encrypting the private key. Has no effect if passphrase is None.

**verbose:**

Provide visual feedback on stdout. Default True

New in version 2016.11.0.

CLI Example:

```

salt '*' x509.create_private_key path=/etc/pki/mykey.key

```

`salt.modules.x509.expired` (*certificate*)

Returns a dict containing limited details of a certificate and whether the certificate has expired.

New in version 2016.11.0.

**certificate:**

The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```

salt '*' x509.expired "/etc/pki/mycert.crt"

```

`salt.modules.x509.get_pem_entries` (*glob\_path*)

Returns a dict containing PEM entries in files matching a glob

**glob\_path:**

A path to certificates to be read and returned.

CLI Example:

```
salt '*' x509.get_pem_entries "/etc/pki/*.crt"
```

`salt.modules.x509.get_pem_entry`(*text*, *pem\_type=None*)

Returns a properly formatted PEM string from the input text fixing any whitespace or line-break issues

**text:**

Text containing the X509 PEM entry to be returned or path to a file containing the text.

**pem\_type:**

If specified, this function will only return a pem of a certain type, for example 'CERTIFICATE' or 'CERTIFICATE REQUEST'.

CLI Example:

```
salt '*' x509.get_pem_entry "-----BEGIN CERTIFICATE REQUEST-----MIICyzCCⓧ
→Ar8CAQI...-----END CERTIFICATE REQUEST"
```

`salt.modules.x509.get_private_key_size`(*private\_key*, *passphrase=None*)

Returns the bit length of a private key in PEM format.

**private\_key:**

A path or PEM encoded string containing a private key.

CLI Example:

```
salt '*' x509.get_private_key_size /etc/pki/mycert.key
```

`salt.modules.x509.get_public_key`(*key*, *passphrase=None*, *asObj=False*)

Returns a string containing the public key in PEM format.

**key:**

A path or PEM encoded string containing a CSR, Certificate or Private Key from which a public key can be retrieved.

CLI Example:

```
salt '*' x509.get_public_key /etc/pki/mycert.cer
```

`salt.modules.x509.get_signing_policy`(*signing\_policy\_name*)

Returns the details of a names signing policy, including the text of the public key that will be used to sign it. Does not return the private key.

CLI Example:

```
salt '*' x509.get_signing_policy www
```

`salt.modules.x509.read_certificate`(*certificate*)

Returns a dict containing details of a certificate. Input can be a PEM string or file path.

**certificate:**

The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.read_certificate /etc/pki/mycert.crt
```

`salt.modules.x509.read_certificates`(*glob\_path*)

Returns a dict containing details of all certificates matching a glob

**glob\_path:**

A path to certificates to be read and returned.

CLI Example:

```
salt '*' x509.read_certificates "/etc/pki/*.crt"
```

**salt.modules.x509.read\_crl(crl)**

Returns a dict containing details of a certificate revocation list. Input can be a PEM string or file path.

**Depends**

- OpenSSL command line tool

**crl:**

A path or PEM encoded string containing the CRL to read.

CLI Example:

```
salt '*' x509.read_crl /etc/pki/mycrl.crl
```

**salt.modules.x509.read\_csr(csr)**

Returns a dict containing details of a certificate request.

**Depends**

- OpenSSL command line tool

**csr:**

A path or PEM encoded string containing the CSR to read.

CLI Example:

```
salt '*' x509.read_csr /etc/pki/mycert.csr
```

**salt.modules.x509.sign\_remote\_certificate(argdic, \*\*kwargs)**

Request a certificate to be remotely signed according to a signing policy.

**argdic:**

A dict containing all the arguments to be passed into the create\_certificate function. This will become kwargs when passed to create\_certificate.

**kwargs:**

kwargs delivered from publish.publish

CLI Example:

```
salt '*' x509.sign_remote_certificate argdic="{ 'public_key': '/etc/pki/
->www.key', 'signing_policy': 'www'}" __pub_id='www1'
```

**salt.modules.x509.verify\_crl(crl, cert)**

Validate a CRL against a certificate. Parses openssl command line output, this is a workaround for M2Crypto's inability to get them from CSR objects.

**crl:**

The CRL to verify

**cert:**

The certificate to verify the CRL against

CLI Example:

```
salt '*' x509.verify_crl crl=/etc/pki/myca.crl cert=/etc/pki/myca.crt
```

**salt.modules.x509.verify\_private\_key(private\_key, public\_key, passphrase=None)**

Verify that 'private\_key' matches 'public\_key'

**private\_key:**

The private key to verify, can be a string or path to a private key in PEM format.

**public\_key:**

The public key to verify, can be a string or path to a PEM formatted certificate, CSR, or another private key.

**passphrase:**

Passphrase to decrypt the private key.

## CLI Example:

```
salt '*' x509.verify_private_key private_key=/etc/pki/myca.key \
    public_key=/etc/pki/myca.crt
```

`salt.modules.x509.verify_signature`(*certificate*, *signing\_pub\_key*=None, *signing\_pub\_key\_passphrase*=None)

Verify that certificate has been signed by `signing_pub_key`

**certificate:**

The certificate to verify. Can be a path or string containing a PEM formatted certificate.

**signing\_pub\_key:**

The public key to verify, can be a string or path to a PEM formatted certificate, CSR, or private key.

**signing\_pub\_key\_passphrase:**

Passphrase to the `signing_pub_key` if it is an encrypted private key.

## CLI Example:

```
salt '*' x509.verify_signature /etc/pki/mycert.pem \
    signing_pub_key=/etc/pki/myca.crt
```

`salt.modules.x509.will_expire`(*certificate*, *days*)

Returns a dict containing details of a certificate and whether the certificate will expire in the specified number of days. Input can be a PEM string or file path.

New in version 2016.11.0.

**certificate:**

The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

## CLI Example:

```
salt '*' x509.will_expire "/etc/pki/mycert.crt" days=30
```

`salt.modules.x509.write_pem`(*text*, *path*, *overwrite*=True, *pem\_type*=None)

Writes out a PEM string fixing any formatting or whitespace issues before writing.

**text:**

PEM string input to be written out.

**path:**

Path of the file to write the PEM out to.

**overwrite:**

If True (default), `write_pem` will overwrite the entire PEM file. Set False to preserve existing private keys and dh params that may exist in the PEM file.

**pem\_type:**

The PEM type to be saved, for example CERTIFICATE or PUBLIC KEY. Adding this will allow the function to take input that may contain multiple PEM types.

## CLI Example:

```
salt '*' x509.write_pem "-----BEGIN CERTIFICATE-----MIIGMzCCBbugA..."
    ↪path=/etc/pki/mycert.crt
```

## 26.6.520 salt.modules.x509\_v2

### Manage X.509 certificates

**depends**  
    cryptography

New in version 3006.0: This module represents a complete rewrite of the original x509 modules and is named x509\_v2 since it introduces breaking changes.
