```

`salt.cloud.clouds.ec2.get_availability_zone`(*vm\_*)

Return the availability zone to use

`salt.cloud.clouds.ec2.get_configured_provider`()

Return the first configured instance.

`salt.cloud.clouds.ec2.get_console_output`(*name=None*, *location=None*, *instance\_id=None*, *call=None*, *kwargs=None*)

Show the console output from the instance.

By default, returns decoded data, not the Base64-encoded data that is actually returned from the EC2 API.

`salt.cloud.clouds.ec2.get_dependencies`()

Warn if dependencies aren't met.

`salt.cloud.clouds.ec2.get_imageid`(*vm\_*)

Returns the ImageId to use

`salt.cloud.clouds.ec2.get_location`(*vm\_=None*)

Return the EC2 region to use, in this order:

- CLI parameter
- VM parameter
- Cloud profile setting

`salt.cloud.clouds.ec2.get_password_data`(*name=None*, *kwargs=None*, *instance\_id=None*, *call=None*)

Return password data for a Windows instance.

By default only the encrypted password data will be returned. However, if a `key_file` is passed in, then a decrypted password will also be returned.

Note that the `key_file` references the private key that was used to generate the keypair associated with this instance. This private key will `_not_` be transmitted to Amazon; it is only used internally inside of Salt Cloud to decrypt data `_after_` it has been received from Amazon.

CLI Examples:

```
salt-cloud -a get_password_data mymachine
salt-cloud -a get_password_data mymachine key_file=/root/ec2key.pem
```

Note: PKCS1\_v1\_5 was added in PyCrypto 2.5

**salt.cloud.clouds.ec2.get\_placementgroup**(*vm\_*)

Returns the PlacementGroup to use

**salt.cloud.clouds.ec2.get\_provider**(*vm\_=None*)

Extract the provider name from vm

**salt.cloud.clouds.ec2.get\_spot\_config**(*vm\_*)

Returns the spot instance configuration for the provided vm

**salt.cloud.clouds.ec2.get\_ssh\_gateway\_config**(*vm\_*)

Return the ssh\_gateway configuration.

**salt.cloud.clouds.ec2.get\_subnetid**(*vm\_*)

Returns the SubnetId to use

**salt.cloud.clouds.ec2.get\_tags**(*name=None, instance\_id=None, call=None, location=None, kwargs=None, resource\_id=None*)

Retrieve tags for a resource. Normally a VM name or instance\_id is passed in, but a resource\_id may be passed instead. If both are passed in, the instance\_id will be used.

CLI Examples:

```
salt-cloud -a get_tags mymachine
salt-cloud -a get_tags resource_id=vol-3267ab32
```

**salt.cloud.clouds.ec2.get\_tenancy**(*vm\_*)

Returns the Tenancy to use.

Can be "dedicated" or "default". Cannot be present for spot instances.

**salt.cloud.clouds.ec2.iam\_profile**(*vm\_*)

Return the IAM profile.

The IAM instance profile to associate with the instances. This is either the Amazon Resource Name (ARN) of the instance profile or the name of the role.

Type: String

Default: None

Required: No

Example: arn:aws:iam::111111111111:instance-profile/s3access

Example: s3access

**salt.cloud.clouds.ec2.import\_keypair**(*kwargs=None, call=None*)

Import an SSH public key.

New in version 2015.8.3.

**salt.cloud.clouds.ec2.keepvol\_on\_destroy**(*name, kwargs=None, call=None*)

Do not delete all/specified EBS volumes upon instance termination

CLI Example:

```
salt-cloud -a keepvol_on_destroy mymachine
```

`salt.cloud.clouds.ec2.keyname`(*vm\_*)

Return the keyname

`salt.cloud.clouds.ec2.list_availability_zones`(*vm\_=None*)

List all availability zones in the current region

`salt.cloud.clouds.ec2.list_nodes`(*call=None*)

Return a list of the VMs that are on the provider

`salt.cloud.clouds.ec2.list_nodes_full`(*location=None, call=None*)

Return a list of the VMs that are on the provider

`salt.cloud.clouds.ec2.list_nodes_min`(*location=None, call=None*)

Return a list of the VMs that are on the provider. Only a list of VM names, and their state, is returned. This is the minimum amount of information needed to check for existing VMs.

`salt.cloud.clouds.ec2.list_nodes_select`(*call=None*)

Return a list of the VMs that are on the provider, with select fields

`salt.cloud.clouds.ec2.optimize_providers`(*providers*)

Return an optimized list of providers.

We want to reduce the duplication of querying the same region.

If a provider is using the same credentials for the same region the same data will be returned for each provider, thus causing un-wanted duplicate data and API calls to EC2.

`salt.cloud.clouds.ec2.query`(*params=None, setname=None, requesturl=None, location=None, return\_url=False, return\_root=False*)

`salt.cloud.clouds.ec2.query_instance`(*vm\_=None, call=None*)

Query an instance upon creation from the EC2 API

`salt.cloud.clouds.ec2.queue_instances`(*instances*)

Queue a set of instances to be provisioned later. Expects a list.

Currently this only queries node data, and then places it in the cloud cache (if configured). If the salt-cloud-reactor is being used, these instances will be automatically provisioned using that.

For more information about the salt-cloud-reactor, see:

<https://github.com/saltstack-formulas/salt-cloud-reactor>

`salt.cloud.clouds.ec2.reboot`(*name, call=None*)

Reboot a node.

CLI Example:

```
salt-cloud -a reboot mymachine
```

`salt.cloud.clouds.ec2.register_image`(*kwargs=None, call=None*)

Create an ami from a snapshot

CLI Example:

```
salt-cloud -f register_image my-ec2-config ami_name=my_ami description=
→"my description"
    root_device_name=/dev/xvda snapshot_id=snap-xxxxxxxx
```

`salt.cloud.clouds.ec2.rename`(*name*, *kwargs*, *call=None*)

Properly rename a node. Pass in the new name as "new name".

CLI Example:

```
salt-cloud -a rename mymachine newname=yourmachine
```

`salt.cloud.clouds.ec2.request_instance`(*vm=None*, *call=None*)

Put together all of the information necessary to request an instance on EC2, and then fire off the request the instance.

Returns data about the instance

`salt.cloud.clouds.ec2.script`(*vm\_*)

Return the script deployment object

`salt.cloud.clouds.ec2.securitygroup`(*vm\_*)

Return the security group

`salt.cloud.clouds.ec2.securitygroupid`(*vm\_*)

Returns the SecurityGroupId

`salt.cloud.clouds.ec2.set_tags`(*name=None*, *tags=None*, *call=None*, *location=None*, *instance\_id=None*, *resource\_id=None*, *kwargs=None*)

Set tags for a resource. Normally a VM name or instance\_id is passed in, but a resource\_id may be passed instead. If both are passed in, the instance\_id will be used.

CLI Examples:

```
salt-cloud -a set_tags mymachine tag1=somestuff tag2='Other stuff'
salt-cloud -a set_tags resource_id=vol-3267ab32 tag=somestuff
```

`salt.cloud.clouds.ec2.show_delvol_on_destroy`(*name*, *kwargs=None*, *call=None*)

Do not delete all/specified EBS volumes upon instance termination

CLI Example:

```
salt-cloud -a show_delvol_on_destroy mymachine
```

`salt.cloud.clouds.ec2.show_detailed_monitoring`(*name=None*, *instance\_id=None*, *call=None*, *quiet=False*)

Show the details from EC2 regarding cloudwatch detailed monitoring.

`salt.cloud.clouds.ec2.show_image`(*kwargs*, *call=None*)

Show the details from EC2 concerning an AMI

`salt.cloud.clouds.ec2.show_instance`(*name=None*, *instance\_id=None*, *call=None*, *kwargs=None*)

Show the details from EC2 concerning an AMI.

Can be called as an action (which requires a name):

```
salt-cloud -a show_instance myinstance
```

...or as a function (which requires either a name or instance\_id):

```
salt-cloud -f show_instance my-ec2 name=myinstance
salt-cloud -f show_instance my-ec2 instance_id=i-d34db33f
```

`salt.cloud.clouds.ec2.show_keypair` (*kwargs=None, call=None*)

Show the details of an SSH keypair

`salt.cloud.clouds.ec2.show_pricing` (*kwargs=None, call=None*)

Show pricing for a particular profile. This is only an estimate, based on unofficial pricing sources.

CLI Examples:

```
salt-cloud -f show_pricing my-ec2-config profile=my-profile
```

If pricing sources have not been cached, they will be downloaded. Once they have been cached, they will not be updated automatically. To manually update all prices, use the following command:

```
salt-cloud -f update_pricing <provider>
```

New in version 2015.8.0.

`salt.cloud.clouds.ec2.show_term_protect` (*name=None, instance\_id=None, call=None, quiet=False*)

Show the details from EC2 concerning an instance's termination protection state

`salt.cloud.clouds.ec2.show_volume` (*kwargs=None, call=None*)

Wrapper around `describe_volumes`. Here just to keep functionality. Might be depreciated later.

`salt.cloud.clouds.ec2.sign` (*key, msg*)

`salt.cloud.clouds.ec2.ssh_interface` (*vm\_*)

Return the `ssh_interface` type to connect to. Either `'public_ips'` (default) or `'private_ips'`.

`salt.cloud.clouds.ec2.ssm_create_association` (*name=None, kwargs=None, instance\_id=None, call=None*)

Associates the specified SSM document with the specified instance

[http://docs.aws.amazon.com/ssm/latest/APIReference/API\\_CreateAssociation.html](http://docs.aws.amazon.com/ssm/latest/APIReference/API_CreateAssociation.html)

CLI Examples:

```
salt-cloud -a ssm_create_association ec2-instance-name ssm_document=ssm-
→document-name
```

`salt.cloud.clouds.ec2.ssm_describe_association` (*name=None, kwargs=None, instance\_id=None, call=None*)

Describes the associations for the specified SSM document or instance.

[http://docs.aws.amazon.com/ssm/latest/APIReference/API\\_DescribeAssociation.html](http://docs.aws.amazon.com/ssm/latest/APIReference/API_DescribeAssociation.html)

CLI Examples:

```
salt-cloud -a ssm_describe_association ec2-instance-name ssm_document=ssm-
→document-name
```

`salt.cloud.clouds.ec2.start` (*name, call=None*)

Start a node

`salt.cloud.clouds.ec2.stop` (*name, call=None*)

Stop a node

`salt.cloud.clouds.ec2.update_pricing` (*kwargs=None, call=None*)

Download most recent pricing information from AWS and convert to a local JSON file.

CLI Examples:

```
salt-cloud -f update_pricing my-ec2-config
salt-cloud -f update_pricing my-ec2-config type=linux
```

New in version 2015.8.0.

`salt.cloud.clouds.ec2.volume_create` (*\*\*kwargs*)

Wrapper around `create_volume`. Here just to ensure the compatibility with the cloud module.

`salt.cloud.clouds.ec2.volume_list` (*\*\*kwargs*)

Wrapper around `describe_volumes`. Here just to ensure the compatibility with the cloud module.

`salt.cloud.clouds.ec2.wait_for_instance` (*vm\_=None, data=None, ip\_address=None, display\_ssh\_output=True, call=None*)

Wait for an instance upon creation from the EC2 API, to become available

#### Google Compute Engine Module

The Google Compute Engine module. This module interfaces with Google Compute Engine (GCE). To authenticate to GCE, you will need to create a Service Account. To set up Service Account Authentication, follow the [Google Compute Engine Setup](#) instructions.

#### Example Provider Configuration

```
my-gce-config:
# The Google Cloud Platform Project ID
project: "my-project-id"
# The Service Account client ID
service_account_email_address: 1234567890@developer.gserviceaccount.com
# The location of the private key (PEM format)
service_account_private_key: /home/erjohnso/PRIVKEY.pem
driver: gce
# Specify whether to use public or private IP for deploy script.
# Valid options are:
#   private_ips - The salt-master is also hosted with GCE
#   public_ips - The salt-master is hosted outside of GCE
ssh_interface: public_ips
```

**maintainer**

Eric Johnson &lt;erjohnso@google.com&gt;

**maintainer**

Russell Tolle &lt;russ.tolle@gmail.com&gt;

**depends**

libcloud &gt;= 1.0.0

**salt.cloud.clouds.gce.attach\_disk**(*name=None, kwargs=None, call=None*)

Attach an existing disk to an existing instance.

CLI Example:

```
salt-cloud -a attach_disk myinstance disk_name=mydisk mode=READ_WRITE
```

**salt.cloud.clouds.gce.attach\_lb**(*kwargs=None, call=None*)

Add an existing node/member to an existing load-balancer configuration.

CLI Example:

```
salt-cloud -f attach_lb gce name=lb member=myinstance
```

**salt.cloud.clouds.gce.avail\_images**(*conn=None*)

Return a dict of all available VM images on the cloud provider with relevant data.

Note that for GCE, there are custom images within the project, but the generic images are in other projects. This returns a dict of images in the project plus images in well-known public projects that provide supported images, as listed on this page: <https://cloud.google.com/compute/docs/operating-systems/>

If image names overlap, the image in the current project is used.

**salt.cloud.clouds.gce.avail\_locations**(*conn=None, call=None*)

Return a dict of all available VM locations on the cloud provider with relevant data

**salt.cloud.clouds.gce.avail\_sizes**(*conn=None*)

Return a dict of available instances sizes (a.k.a machine types) and convert them to something more serializable.

**salt.cloud.clouds.gce.create**(*vm\_=None, call=None*)

Create a single GCE instance from a data dict.

**salt.cloud.clouds.gce.create\_address**(*kwargs=None, call=None*)

Create a static address in a region.

CLI Example:

```
salt-cloud -f create_address gce name=my-ip region=us-central1 address=IP
```

**salt.cloud.clouds.gce.create\_attach\_volumes**(*name, kwargs, call=None*)

New in version 2017.7.0.

Create and attach multiple volumes to a node. The 'volumes' and 'node' arguments are required, where 'node' is a libcloud node, and 'volumes' is a list of maps, where each map contains:

**size**

The size of the new disk in GB. Required.

**type**

The disk type, either pd-standard or pd-ssd. Optional, defaults to pd-standard.

**image**

An image to use for this new disk. Optional.

**snapshot**

A snapshot to use for this new disk. Optional.

**auto\_delete**

An option(bool) to keep or remove the disk upon instance deletion. Optional, defaults to False.

Volumes are attached in the order in which they are given, thus on a new node the first volume will be /dev/sdb, the second /dev/sdc, and so on.

**salt.cloud.clouds.gce.create\_disk**(*kwargs=None, call=None*)

Create a new persistent disk. Must specify *disk\_name* and *location*, and optionally can specify 'disk\_type' as pd-standard or pd-ssd, which defaults to pd-standard. Can also specify an *image* or *snapshot* but if neither of those are specified, a *size* (in GB) is required.

CLI Example:

```
salt-cloud -f create_disk gce disk_name=pd size=300 location=us-central1-b
```

**salt.cloud.clouds.gce.create\_fwrule**(*kwargs=None, call=None*)

Create a GCE firewall rule. The 'default' network is used if not specified.

CLI Example:

```
salt-cloud -f create_fwrule gce name=allow-http allow=tcp:80
```

**salt.cloud.clouds.gce.create\_hc**(*kwargs=None, call=None*)

Create an HTTP health check configuration.

CLI Example:

```
salt-cloud -f create_hc gce name=hc path=/healthy port=80
```

**salt.cloud.clouds.gce.create\_lb**(*kwargs=None, call=None*)

Create a load-balancer configuration.

CLI Example:

```
salt-cloud -f create_lb gce name=lb region=us-central1 ports=80
```

**salt.cloud.clouds.gce.create\_network**(*kwargs=None, call=None*)

Changed in version 2017.7.0.

Create a GCE network. Must specify name and cidr.

CLI Example:

```
salt-cloud -f create_network gce name=mynet cidr=10.10.10.0/24
→mode=legacy description=optional
salt-cloud -f create_network gce name=mynet description=optional
```

**salt.cloud.clouds.gce.create\_snapshot**(*kwargs=None, call=None*)

Create a new disk snapshot. Must specify *name* and *disk\_name*.

CLI Example:

```
salt-cloud -f create_snapshot gce name=snap1 disk_name=pd
```

`salt.cloud.clouds.gce.create_subnetwork` (*kwargs=None, call=None*)

New in version 2017.7.0.

Create a GCE Subnetwork. Must specify name, cidr, network, and region.

CLI Example:

```
salt-cloud -f create_subnetwork gce name=mysubnet network=mynet1
→region=us-west1 cidr=10.0.0.0/24 description=optional
```

`salt.cloud.clouds.gce.delete_address` (*kwargs=None, call=None*)

Permanently delete a static address.

CLI Example:

```
salt-cloud -f delete_address gce name=my-ip
```

`salt.cloud.clouds.gce.delete_disk` (*kwargs=None, call=None*)

Permanently delete a persistent disk.

CLI Example:

```
salt-cloud -f delete_disk gce disk_name=pd
```

`salt.cloud.clouds.gce.delete_fwrule` (*kwargs=None, call=None*)

Permanently delete a firewall rule.

CLI Example:

```
salt-cloud -f delete_fwrule gce name=allow-http
```

`salt.cloud.clouds.gce.delete_hc` (*kwargs=None, call=None*)

Permanently delete a health check.

CLI Example:

```
salt-cloud -f delete_hc gce name=hc
```

`salt.cloud.clouds.gce.delete_lb` (*kwargs=None, call=None*)

Permanently delete a load-balancer.

CLI Example:

```
salt-cloud -f delete_lb gce name=lb
```

`salt.cloud.clouds.gce.delete_network` (*kwargs=None, call=None*)

Permanently delete a network.

CLI Example:

```
salt-cloud -f delete_network gce name=mynet
```

`salt.cloud.clouds.gce.delete_snapshot` (*kwargs=None, call=None*)

Permanently delete a disk snapshot.

CLI Example:

```
salt-cloud -f delete_snapshot gce name=disk-snap-1
```

`salt.cloud.clouds.gce.delete_subnetwork` (*kwargs=None, call=None*)

New in version 2017.7.0.

Delete a GCE Subnetwork. Must specify name and region.

CLI Example:

```
salt-cloud -f delete_subnetwork gce name=mysubnet network=mynet1
→region=us-west1
```

`salt.cloud.clouds.gce.destroy` (*vm\_name, call=None*)

Call 'destroy' on the instance. Can be called with "-a destroy" or -d

CLI Example:

```
salt-cloud -a destroy myinstance1 myinstance2 ...
salt-cloud -d myinstance1 myinstance2 ...
```

`salt.cloud.clouds.gce.detach_disk` (*name=None, kwargs=None, call=None*)

Detach a disk from an instance.

CLI Example:

```
salt-cloud -a detach_disk myinstance disk_name=mydisk
```

`salt.cloud.clouds.gce.detach_lb` (*kwargs=None, call=None*)

Remove an existing node/member from an existing load-balancer configuration.

CLI Example:

```
salt-cloud -f detach_lb gce name=lb member=myinstance
```

`salt.cloud.clouds.gce.get_configured_provider` ()

Return the first configured instance.

`salt.cloud.clouds.gce.get_conn` ()

Return a conn object for the passed VM data

`salt.cloud.clouds.gce.get_dependencies` ()

Warn if dependencies aren't met.

`salt.cloud.clouds.gce.get_lb_conn` (*gce\_driver=None*)

Return a load-balancer conn object

`salt.cloud.clouds.gce.list_nodes` (*conn=None, call=None*)

Return a list of the VMs that are on the provider

`salt.cloud.clouds.gce.list_nodes_full` (*conn=None, call=None*)

Return a list of the VMs that are on the provider, with all fields

`salt.cloud.clouds.gce.list_nodes_select` (*conn=None, call=None*)

Return a list of the VMs that are on the provider, with select fields

`salt.cloud.clouds.gce.reboot`(*vm\_name*, *call=None*)

Call GCE 'reset' on the instance.

CLI Example:

```
salt-cloud -a reboot myinstance
```

`salt.cloud.clouds.gce.request_instance`(*vm\_*)

Request a single GCE instance from a data dict.

Changed in version 2017.7.0.

`salt.cloud.clouds.gce.script`(*vm\_*)

Return the script deployment object

`salt.cloud.clouds.gce.show_address`(*kwargs=None*, *call=None*)

Show the details of an existing static address.

CLI Example:

```
salt-cloud -f show_address gce name=mysnapshot region=us-central1
```

`salt.cloud.clouds.gce.show_disk`(*name=None*, *kwargs=None*, *call=None*)

Show the details of an existing disk.

CLI Example:

```
salt-cloud -a show_disk myinstance disk_name=mydisk
salt-cloud -f show_disk gce disk_name=mydisk
```

`salt.cloud.clouds.gce.show_fwrule`(*kwargs=None*, *call=None*)

Show the details of an existing firewall rule.

CLI Example:

```
salt-cloud -f show_fwrule gce name=allow-http
```

`salt.cloud.clouds.gce.show_hc`(*kwargs=None*, *call=None*)

Show the details of an existing health check.

CLI Example:

```
salt-cloud -f show_hc gce name=hc
```

`salt.cloud.clouds.gce.show_instance`(*vm\_name*, *call=None*)

Show the details of the existing instance.

`salt.cloud.clouds.gce.show_lb`(*kwargs=None*, *call=None*)

Show the details of an existing load-balancer.

CLI Example:

```
salt-cloud -f show_lb gce name=lb
```

`salt.cloud.clouds.gce.show_network`(*kwargs=None*, *call=None*)

Show the details of an existing network.

CLI Example:

```
salt-cloud -f show_network gce name=mynet
```

`salt.cloud.clouds.gce.show_pricing`(*kwargs=None, call=None*)

Show pricing for a particular profile. This is only an estimate, based on unofficial pricing sources.

New in version 2015.8.0.

CLI Examples:

```
salt-cloud -f show_pricing my-gce-config profile=my-profile
```

`salt.cloud.clouds.gce.show_snapshot`(*kwargs=None, call=None*)

Show the details of an existing snapshot.

CLI Example:

```
salt-cloud -f show_snapshot gce name=mynsnapshot
```

`salt.cloud.clouds.gce.show_subnetwork`(*kwargs=None, call=None*)

New in version 2017.7.0.

Show details of an existing GCE Subnetwork. Must specify name and region.

CLI Example:

```
salt-cloud -f show_subnetwork gce name=mysubnet region=us-west1
```

`salt.cloud.clouds.gce.start`(*vm\_name, call=None*)

Call GCE 'start' on the instance.

New in version 2017.7.0.

CLI Example:

```
salt-cloud -a start myinstance
```

`salt.cloud.clouds.gce.stop`(*vm\_name, call=None*)

Call GCE 'stop' on the instance.

New in version 2017.7.0.

CLI Example:

```
salt-cloud -a stop myinstance
```

`salt.cloud.clouds.gce.update_pricing`(*kwargs=None, call=None*)

Download most recent pricing information from GCE and save locally

CLI Examples:

```
salt-cloud -f update_pricing my-gce-config
```

New in version 2015.8.0.

## 26.4.8 salt.cloud.clouds.gogrid

### GoGrid Cloud Module

The GoGrid cloud module. This module interfaces with the gogrid public cloud service. To use Salt Cloud with GoGrid log into the GoGrid web interface and create an api key. Do this by clicking on "My Account" and then going to the API Keys tab.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/gogrid.conf`:

```
my-gogrid-config:
# The generated api key to use
apikey: asdff7896asdh789
# The apikey's shared secret
sharedsecret: saltybacon
driver: gogrid
```

---

**Note:** A Note about using Map files with GoGrid:

Due to limitations in the GoGrid API, instances cannot be provisioned in parallel with the GoGrid driver. Map files will work with GoGrid, but the `-P` argument should not be used on maps referencing GoGrid instances.

---

---

**Note:** A Note about using Map files with GoGrid:

Due to limitations in the GoGrid API, instances cannot be provisioned in parallel with the GoGrid driver. Map files will work with GoGrid, but the `-P` argument should not be used on maps referencing GoGrid instances.

---

`salt.cloud.clouds.gogrid.avail_images()`

Available images

`salt.cloud.clouds.gogrid.avail_locations()`

Available locations

`salt.cloud.clouds.gogrid.avail_sizes()`

Available sizes

`salt.cloud.clouds.gogrid.create(vm_)`

Create a single VM from a data dict

`salt.cloud.clouds.gogrid.destroy(name, call=None)`

Destroy a machine by name

CLI Example:

```
salt-cloud -d vm_name
```

`salt.cloud.clouds.gogrid.get_configured_provider()`

Return the first configured instance.

`salt.cloud.clouds.gogrid.list_common_lookups(kwargs=None, call=None)`

List common lookups for a particular type of item

New in version 2015.8.0.

`salt.cloud.clouds.gogrid.list_nodes` (*full=False, call=None*)

List of nodes, keeping only a brief listing

CLI Example:

```
salt-cloud -Q
```

`salt.cloud.clouds.gogrid.list_nodes_full` (*call=None*)

List nodes, with all available information

CLI Example:

```
salt-cloud -F
```

`salt.cloud.clouds.gogrid.list_nodes_select` (*call=None*)

Return a list of the VMs that are on the provider, with select fields

CLI Example:

```
salt-cloud -S
```

`salt.cloud.clouds.gogrid.list_passwords` (*kwargs=None, call=None*)

List all password on the account

New in version 2015.8.0.

`salt.cloud.clouds.gogrid.list_public_ips` (*kwargs=None, call=None*)

List all available public IPs.

CLI Example:

```
salt-cloud -f list_public_ips <provider>
```

To list unavailable (assigned) IPs, use:

CLI Example:

```
salt-cloud -f list_public_ips <provider> state=assigned
```

New in version 2015.8.0.

`salt.cloud.clouds.gogrid.reboot` (*name, call=None*)

Reboot a machine by name

CLI Example:

```
salt-cloud -a reboot vm_name
```

New in version 2015.8.0.

`salt.cloud.clouds.gogrid.show_instance` (*name, call=None*)

Start a machine by name

CLI Example:

```
salt-cloud -a show_instance vm_name
```

New in version 2015.8.0.

`salt.cloud.clouds.gogrid.start(name, call=None)`

Start a machine by name

CLI Example:

```
salt-cloud -a start vm_name
```

New in version 2015.8.0.

`salt.cloud.clouds.gogrid.stop(name, call=None)`

Stop a machine by name

CLI Example:

```
salt-cloud -a stop vm_name
```

New in version 2015.8.0.

## 26.4.9 salt.cloud.clouds.hetzner

### Hetzner Cloud Module

The Hetzner cloud module is used to control access to the hetzner cloud. <https://docs.hetzner.cloud/>

#### depends

hcloud >= 1.10

Use of this module requires the key parameter to be set.

#### my-hetzner-cloud-config:

**key:** <your api key>

**driver:** hetzner

`salt.cloud.clouds.hetzner.avail_images(call=None)`

Return a dictionary of available images

`salt.cloud.clouds.hetzner.avail_locations(call=None)`

Return a dictionary of available locations

`salt.cloud.clouds.hetzner.avail_sizes(call=None)`

Return a dictionary of available VM sizes

`salt.cloud.clouds.hetzner.create(vm_)`

Create a single VM from a data dict

`salt.cloud.clouds.hetzner.destroy(name, call=None)`

Destroy a node.

CLI Example:

```
salt-cloud --destroy mymachine
```

`salt.cloud.clouds.hetzner.get_configured_provider()`

Return the first configured instance.

`salt.cloud.clouds.hetzner.get_dependencies()`

Warn if dependencies aren't met.

`salt.cloud.clouds.hetzner.list_nodes` (*call=None*)

Return a dictionary of existing VMs in the current project, containing basic details of each VM

`salt.cloud.clouds.hetzner.list_nodes_full` (*call=None*)

Return a dictionary of existing VMs in the current project, containing full details per VM

`salt.cloud.clouds.hetzner.list_ssh_keys` (*call=None*)

Return a dictionary of available SSH keys configured in the current project

`salt.cloud.clouds.hetzner.reboot` (*name, call=None, wait=True*)

Reboot a node.

CLI Example:

```
salt-cloud -a reboot mymachine
```

`salt.cloud.clouds.hetzner.resize` (*name, kwargs, call=None*)

Resize a node.

CLI Example:

```
salt-cloud -a resize mymachine size=...
```

`salt.cloud.clouds.hetzner.show_instance` (*name, call=None*)

Return the details of a specific VM

`salt.cloud.clouds.hetzner.start` (*name, call=None, wait=True*)

Start a node.

CLI Example:

```
salt-cloud -a start mymachine
```

`salt.cloud.clouds.hetzner.stop` (*name, call=None, wait=True*)

Stop a node.

CLI Example:

```
salt-cloud -a stop mymachine
```

`salt.cloud.clouds.hetzner.wait_until` (*name, state, timeout=300*)

Wait until a specific state has been reached on a node

## 26.4.10 salt.cloud.clouds.joyent

### Joyent Cloud Module

The Joyent Cloud module is used to interact with the Joyent cloud system.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/joyent.conf`:

```
my-joyent-config:
  driver: joyent
  # The Joyent login user
```

(continues on next page)

(continued from previous page)

```

user: fred
# The Joyent user's password
password: saltybacon
# The location of the ssh private key that can log into the new VM
private_key: /root/mykey.pem
# The name of the private key
keyname: mykey

```

When creating your profiles for the joyent cloud, add the location attribute to the profile, this will automatically get picked up when performing tasks associated with that vm. An example profile might look like:

```

joyent_512:
provider: my-joyent-config
size: g4-highcpu-512M
image: centos-6
location: us-east-1

```

This driver can also be used with the Joyent SmartDataCenter project. More details can be found at:

Using SDC requires that an `api_host_suffix` is set. The default value for this is `.api.joyentcloud.com`. All characters, including the leading `.`, should be included:

```

api_host_suffix: .api.myhostname.com

```

```

depends
  PyCrypto

```

`salt.cloud.clouds.joyent.avail_images` (*call=None*)

Get list of available images

CLI Example:

```

salt-cloud --list-images

```

Can use a custom URL for images. Default is:

```

image_url: images.joyent.com/images

```

`salt.cloud.clouds.joyent.avail_locations` (*call=None*)

List all available locations

`salt.cloud.clouds.joyent.avail_sizes` (*call=None*)

get list of available packages

CLI Example:

```

salt-cloud --list-sizes

```

`salt.cloud.clouds.joyent.create` (*vm\_*)

Create a single VM from a data dict

CLI Example:

```

salt-cloud -p profile_name vm_name

```

`salt.cloud.clouds.joyent.create_node(**kwargs)`

convenience function to make the rest api call for node creation.

`salt.cloud.clouds.joyent.delete_key(kwargs=None, call=None)`

List the keys available

CLI Example:

```
salt-cloud -f delete_key joyent keyname=mykey
```

`salt.cloud.clouds.joyent.destroy(name, call=None)`

destroy a machine by name

#### Parameters

- **name** -- name given to the machine
- **call** -- call value in this case is 'action'

#### Returns

array of booleans , true if successfully stopped and true if successfully removed

CLI Example:

```
salt-cloud -d vm_name
```

`salt.cloud.clouds.joyent.get_configured_provider()`

Return the first configured instance.

`salt.cloud.clouds.joyent.get_image(vm_)`

Return the image object to use

`salt.cloud.clouds.joyent.get_location(vm_=None)`

Return the joyent data center to use, in this order:

- CLI parameter
- VM parameter
- Cloud profile setting

`salt.cloud.clouds.joyent.get_location_path(location='us-east-1',  
api_host_suffix='.api.joyentcloud.com')`

create url from location variable :param location: joyent data center location :return: url

`salt.cloud.clouds.joyent.get_node(name)`

gets the node from the full node list by name :param name: name of the vm :return: node object

`salt.cloud.clouds.joyent.get_size(vm_)`

Return the VM's size object

`salt.cloud.clouds.joyent.has_method(obj, method_name)`

Find if the provided object has a specific method

`salt.cloud.clouds.joyent.import_key(kwargs=None, call=None)`

List the keys available

CLI Example:

```
salt-cloud -f import_key joyent keyname=mykey keyfile=/tmp/mykey.pub
```

`salt.cloud.clouds.joyent.joyent_node_state(id_)`

Convert joyent returned state to state common to other data center return values for consistency

**Parameters**

**id** -- joyent state value

**Returns**

state value

`salt.cloud.clouds.joyent.key_list(items=None)`

convert list to dictionary using the key as the identifier :param items: array to iterate over :return: dictionary

`salt.cloud.clouds.joyent.list_keys(kwargs=None, call=None)`

List the keys available

`salt.cloud.clouds.joyent.list_nodes(full=False, call=None)`

list of nodes, keeping only a brief listing

CLI Example:

```
salt-cloud -Q
```

`salt.cloud.clouds.joyent.list_nodes_full(call=None)`

list of nodes, maintaining all content provided from joyent listings

CLI Example:

```
salt-cloud -F
```

`salt.cloud.clouds.joyent.list_nodes_select(call=None)`

Return a list of the VMs that are on the provider, with select fields

`salt.cloud.clouds.joyent.query(action=None, command=None, args=None, method='GET', location=None, data=None)`

Make a web call to Joyent

`salt.cloud.clouds.joyent.query_instance(vm_=None, call=None)`

Query an instance upon creation from the Joyent API

`salt.cloud.clouds.joyent.reboot(name, call=None)`

reboot a machine by name :param name: name given to the machine :param call: call value in this case is 'action' :return: true if successful

CLI Example:

```
salt-cloud -a reboot vm_name
```

`salt.cloud.clouds.joyent.reformat_node(item=None, full=False)`

Reformat the returned data from joyent, determine public/private IPs and strip out fields if necessary to provide either full or brief content.

**Parameters**

- **item** -- node dictionary
- **full** -- full or brief output

**Returns**

dict

**salt.cloud.clouds.joyent.show\_instance**(*name*, *call=None*)

get details about a machine :param name: name given to the machine :param call: call value in this case is 'action' :return: machine information

CLI Example:

```
salt-cloud -a show_instance vm_name
```

**salt.cloud.clouds.joyent.show\_key**(*kwargs=None*, *call=None*)

List the keys available

**salt.cloud.clouds.joyent.ssh\_interface**(*vm\_*)

Return the ssh\_interface type to connect to. Either 'public\_ips' (default) or 'private\_ips'.

**salt.cloud.clouds.joyent.start**(*name*, *call=None*)

start a machine by name :param name: name given to the machine :param call: call value in this case is 'action' :return: true if successful

CLI Example:

```
salt-cloud -a start vm_name
```

**salt.cloud.clouds.joyent.stop**(*name*, *call=None*)

stop a machine by name :param name: name given to the machine :param call: call value in this case is 'action' :return: true if successful

CLI Example:

```
salt-cloud -a stop vm_name
```

**salt.cloud.clouds.joyent.take\_action**(*name=None*, *call=None*, *command=None*, *data=None*, *method='GET'*, *location='us-east-1'*)

take action call used by start,stop, reboot :param name: name given to the machine :param call: call value in this case is 'action' :command: api path :data: any data to be passed to the api, must be in json format :method: GET,POST,or DELETE :location: data center to execute the command on :return: true if successful

## 26.4.11 salt.cloud.clouds.libvirt

### Libvirt Cloud Module

Example provider:

```
# A provider maps to a libvirt instance
my-libvirt-config:
  driver: libvirt
  # url: "qemu+ssh://user@remotekvm/system?socket=/var/run/libvirt/libvirt-
  ↪sock"
  url: qemu:///system
```

Example profile:

```

base-itest:
# points back at provider configuration e.g. the libvirt daemon to talk to
provider: my-libvirt-config
base_domain: base-image
# ip_source = [ ip-learning | qemu-agent ]
ip_source: ip-learning
# clone_strategy = [ quick | full ]
clone_strategy: quick
ssh_username: vagrant
# has_ssh_agent: True
password: vagrant
# if /tmp is mounted noexec do workaround
deploy_command: sh /tmp/.saltcloud/deploy.sh
# -F makes the bootstrap script overwrite existing config
# which make reprovisioning a box work
script_args: -F
grains:
  sushi: more tasty
# point at the another master at another port
minion:
  master: 192.168.16.1
  master_port: 5506

```

Tested on: - Fedora 26 (libvirt 3.2.1, qemu 2.9.1) - Fedora 25 (libvirt 1.3.3.2, qemu 2.6.1) - Fedora 23 (libvirt 1.2.18, qemu 2.4.1) - Centos 7 (libvirt 1.2.17, qemu 1.5.3)

`salt.cloud.clouds.libvirt.create(vm_)`

Provision a single machine

`salt.cloud.clouds.libvirt.create_volume_with_backing_store_xml(volume)`

`salt.cloud.clouds.libvirt.create_volume_xml(volume)`

`salt.cloud.clouds.libvirt.destroy(name, call=None)`

This function irreversibly destroys a virtual machine on the cloud provider. Before doing so, it should fire an event on the Salt event bus.

The tag for this event is `salt/cloud/<vm name>/destroying`. Once the virtual machine has been destroyed, another event is fired. The tag for that event is `salt/cloud/<vm name>/destroyed`.

**Dependencies:**

`list_nodes`

@param name: @type name: str @param call: @type call: @return: True if all went well, otherwise an error message @rtype: bool|str

`salt.cloud.clouds.libvirt.destroy_domain(conn, domain)`

`salt.cloud.clouds.libvirt.do_cleanup(cleanup)`

Clean up clone domain leftovers as much as possible.

Extra robust clean up in order to deal with some small changes in libvirt behavior over time. Passed in volumes and domains are deleted, any errors are ignored. Used when cloning/provisioning a domain fails.

**Parameters**

**cleanup** -- list containing dictionaries with two keys: 'what' and 'item'. If 'what' is domain the 'item' is a libvirt domain object. If 'what' is volume then the item is a libvirt volume object.

**Returns**

none

New in version 2017.7.3.

`salt.cloud.clouds.libvirt.find_pool_and_volume(conn, path)`

`salt.cloud.clouds.libvirt.generate_new_name(orig_name)`

`salt.cloud.clouds.libvirt.get_configured_provider()`

Return the first configured instance.

`salt.cloud.clouds.libvirt.get_domain_ip(domain, idx, ip_source, skip_loopback=True)`

`salt.cloud.clouds.libvirt.get_domain_ips(domain, ip_source)`

`salt.cloud.clouds.libvirt.get_domain_volumes(conn, domain)`

`salt.cloud.clouds.libvirt.libvirt_error_handler(ctx, error)`

Redirect stderr prints from libvirt to salt logging.

`salt.cloud.clouds.libvirt.list_nodes(call=None)`

Return a list of the VMs

id (str) image (str) size (str) state (str) private\_ips (list) public\_ips (list)

`salt.cloud.clouds.libvirt.list_nodes_full(call=None)`

Because this module is not specific to any cloud providers, there will be no nodes to list.

`salt.cloud.clouds.libvirt.list_nodes_select(call=None)`

Return a list of the VMs that are on the provider, with select fields

`salt.cloud.clouds.libvirt.to_ip_addr_type(addr_type)`

## 26.4.12 salt.cloud.clouds.linode

### The Linode Cloud Module

The Linode cloud module is used to interact with the Linode Cloud.

#### Provider

The following provider parameters are supported:

- **apikey:** (required) The key to use to authenticate with the Linode API.
- **password:** (required) The default password to set on new VMs. Must be 8 characters with at least one lowercase, uppercase, and numeric.
- **poll\_interval:** (optional) The rate of time in milliseconds to poll the Linode API for changes. Defaults to 500.
- **ratelimit\_sleep:** (optional) The time in seconds to wait before retrying after a ratelimit has been enforced. Defaults to 0.

---

**Note:** APIv3 usage has been removed in favor of APIv4. To move to APIv4 now, See the full migration guide here <https://docs.saltproject.io/en/latest/topics/cloud/linode.html#migrating-to-apiv4>.

---

Set up the provider configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/linode.conf`:

```
my-linode-provider:
  driver: linode
  apikey: f4ZsmwtB1c7f85Jdu43RgXVDFLNjuJaeIYV8QMftTqKScEB2vSosFSr...
  password: F00barbazverylongp@ssword
```

## Profile

The following profile parameters are supported:

- **size:** (required) The size of the VM. This should be a Linode instance type ID (i.e. `g6-standard-2`). Run `salt-cloud -f avail_sizes my-linode-provider` for options.
- **location:** (required) The location of the VM. This should be a Linode region (e.g. `us-east`). Run `salt-cloud -f avail_locations my-linode-provider` for options.
- **image:** (required) The image to deploy the boot disk from. This should be an image ID (e.g. `linode/ubuntu22.04`); official images start with `linode/`. Run `salt-cloud -f avail_images my-linode-provider` for more options.
- **password:** (\*required) The default password for the VM. Must be provided at the profile or provider level.
- **assign\_private\_ip:** (optional) Whether or not to assign a private IP to the VM. Defaults to `False`.
- **backups\_enabled:** (optional) Whether or not to enable the backup for this VM. Backup can be configured in your Linode account Defaults to `False`.
- **ssh\_interface:** (optional) The interface with which to connect over SSH. Valid options are `private_ips` or `public_ips`. Defaults to `public_ips`.
- **ssh\_pubkey:** (optional) The public key to authorize for SSH with the VM.
- **swap:** (optional) The amount of disk space to allocate for the swap partition. Defaults to 256.
- **clonefrom:** (optional) The name of the Linode to clone from.

Set up a profile configuration in `/etc/salt/cloud.profiles.d/`:

```
my-linode-profile:
  # a minimal configuration
  provider: my-linode-provider
  size: g6-standard-1
  image: linode/ubuntu22.04
  location: us-east

my-linode-profile-advanced:
  # an advanced configuration
  provider: my-linode-provider
  size: g6-standard-3
  image: linode/ubuntu22.04
  location: eu-west
  password: bogus123X
  assign_private_ip: true
  ssh_interface: private_ips
  ssh_pubkey: ssh-rsa AAAAB3NzaC1yc2EAAAADAQAB...
  swap_size: 512
```

## Migrating to APIv4

You will need to generate a new token for your account. See <https://www.linode.com/docs/products/tools/api/get-started/#create-an-api-token>

There are a few changes to note: - There has been a general move from label references to ID references. The profile configuration parameters `location`, `size`, and `image` have moved from being label based references to IDs. See the profile section for more information. In addition to these inputs being changed, `avail_sizes`, `avail_locations`, and `avail_images` now output options sorted by ID instead of label. - The `disk_size` profile configuration parameter has been deprecated and will not be taken into account when creating new VMs while targeting APIv4.

`salt.cloud.clouds.linode.avail_images` (*call=None*)

Return available Linode images.

CLI Example:

```
salt-cloud --list-images my-linode-config
salt-cloud -f avail_images my-linode-config
```

`salt.cloud.clouds.linode.avail_locations` (*call=None*)

Return available Linode datacenter locations.

CLI Example:

```
salt-cloud --list-locations my-linode-config
salt-cloud -f avail_locations my-linode-config
```

`salt.cloud.clouds.linode.avail_sizes` (*call=None*)

Return available Linode sizes.

CLI Example:

```
salt-cloud --list-sizes my-linode-config
salt-cloud -f avail_sizes my-linode-config
```

`salt.cloud.clouds.linode.boot` (*name=None, kwargs=None, call=None*)

Boot a Linode.

**name**

The name of the Linode to boot. Can be used instead of `linode_id`.

**linode\_id**

The ID of the Linode to boot. If provided, will be used as an alternative to `name` and reduces the number of API calls to Linode by one. Will be preferred over `name`.

**config\_id**

The ID of the Config to boot. Required.

**check\_running**

Defaults to True. If set to False, overrides the call to check if the VM is running before calling the `linode.boot` API call. Change `check_running` to True is useful during the boot call in the `create` function, since the new VM will not be running yet.

Can be called as an action (which requires a name):

```
salt-cloud -a boot my-instance config_id=10
```

...or as a function (which requires either a name or linode\_id):

```
salt-cloud -f boot my-linode-config name=my-instance config_id=10
salt-cloud -f boot my-linode-config linode_id=1225876 config_id=10
```

`salt.cloud.clouds.linode.clone` (*kwargs=None, call=None*)

Clone a Linode.

**linode\_id**

The ID of the Linode to clone. Required.

**location**

The location of the new Linode. Required.

**size**

The size of the new Linode (must be greater than or equal to the clone source). Required.

CLI Example:

```
salt-cloud -f clone my-linode-config linode_id=1234567 location=us-
→central size=g6-standard-1
```

`salt.cloud.clouds.linode.create` (*vm\_*)

Create a single Linode VM.

`salt.cloud.clouds.linode.create_config` (*kwargs=None, call=None*)

Creates a Linode Configuration Profile.

**name**

The name of the VM to create the config for.

**linode\_id**

The ID of the Linode to create the configuration for.

**root\_disk\_id**

The Root Disk ID to be used for this config.

**swap\_disk\_id**

The Swap Disk ID to be used for this config.

**data\_disk\_id**

The Data Disk ID to be used for this config.

New in version 2016.3.0.

**kernel\_id**

The ID of the kernel to use for this configuration profile.

`salt.cloud.clouds.linode.destroy` (*name, call=None*)

Destroys a Linode by name.

**name**

The name of VM to be destroyed.

CLI Example:

```
salt-cloud -d vm_name
```

`salt.cloud.clouds.linode.get_config_id(kwarg=None, call=None)`

Returns a `config_id` for a given `linode`.

New in version 2015.8.0.

**name**

The name of the Linode for which to get the `config_id`. Can be used instead of `linode_id`.

**linode\_id**

The ID of the Linode for which to get the `config_id`. Can be used instead of `name`.

CLI Example:

```
salt-cloud -f get_config_id my-linode-config name=my-linode
salt-cloud -f get_config_id my-linode-config linode_id=1234567
```

`salt.cloud.clouds.linode.get_configured_provider()`

Return the first configured instance.

`salt.cloud.clouds.linode.get_linode(kwarg=None, call=None)`

Returns data for a single named Linode.

**name**

The name of the Linode for which to get data. Can be used instead `linode_id`. Note this will induce an additional API call compared to using `linode_id`.

**linode\_id**

The ID of the Linode for which to get data. Can be used instead of `name`.

CLI Example:

```
salt-cloud -f get_linode my-linode-config name=my-instance
salt-cloud -f get_linode my-linode-config linode_id=1234567
```

`salt.cloud.clouds.linode.list_nodes(call=None)`

Returns a list of `linodes`, keeping only a brief listing.

CLI Example:

```
salt-cloud -Q
salt-cloud --query
salt-cloud -f list_nodes my-linode-config
```

---

**Note:** The `image` label only displays information about the VM's distribution vendor, such as "Debian" or "RHEL" and does not display the actual image name. This is due to a limitation of the Linode API.

---

`salt.cloud.clouds.linode.list_nodes_full(call=None)`

List `linodes`, with all available information.

CLI Example:

```
salt-cloud -F
salt-cloud --full-query
salt-cloud -f list_nodes_full my-linode-config
```

---

**Note:** The `image` label only displays information about the VM's distribution vendor, such as "Debian" or "RHEL" and does not display the actual image name. This is due to a limitation of the Linode API.

---

`salt.cloud.clouds.linode.list_nodes_min` (*call=None*)

Return a list of the VMs that are on the provider. Only a list of VM names and their state is returned. This is the minimum amount of information needed to check for existing VMs.

New in version 2015.8.0.

CLI Example:

```
salt-cloud -f list_nodes_min my-linode-config
salt-cloud --function list_nodes_min my-linode-config
```

`salt.cloud.clouds.linode.list_nodes_select` (*call=None*)

Return a list of the VMs that are on the provider, with select fields.

`salt.cloud.clouds.linode.reboot` (*name, call=None*)

Reboot a linode.

New in version 2015.8.0.

**name**

The name of the VM to reboot.

CLI Example:

```
salt-cloud -a reboot vm_name
```

`salt.cloud.clouds.linode.set_backup_schedule` (*name=None, kwargs=None, call=None*)

Set the backup schedule for a Linode.

**name**

The name (label) of the Linode. Can be used instead of `linode_id`.

**linode\_id**

The ID of the Linode instance to set the backup schedule for. If provided, will be used as an alternative to `name` and reduces the number of API calls to Linode by one. Will be preferred over `name`.

**auto\_enable**

If `True`, automatically enable the backup feature for the Linode if it wasn't already enabled. Optional parameter, default to `False`.

**day**

Possible values: Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday

The day of the week that your Linode's weekly Backup is taken. If not set manually, a day will be chosen for you. Backups are taken every day, but backups taken on this day are preferred when selecting backups to retain for a longer period.

If not set manually, then when backups are initially enabled, this may come back as `Scheduling` until the day is automatically selected.

**window**

Possible values: W0, W2, W4, W6, W8, W10, W12, W14, W16, W18, W20, W22

The window in which your backups will be taken, in UTC. A backups window is a two-hour span of time in which the backup may occur.

For example, W10 indicates that your backups should be taken between 10:00 and 12:00. If you do not choose a backup window, one will be selected for you automatically.

If not set manually, when backups are initially enabled this may come back as Scheduling until the window is automatically selected.

Can be called as an action (which requires a name):

```
salt-cloud -a set_backup_schedule my-linode-instance day=Monday
↳window=W20 auto_enable=True
```

...or as a function (which requires either a name or linode\_id):

```
salt-cloud -f set_backup_schedule my-linode-provider name=my-linode-
↳instance day=Monday window=W20 auto_enable=True
salt-cloud -f set_backup_schedule my-linode-provider linode_id=1225876
↳day=Monday window=W20 auto_enable=True
```

**salt.cloud.clouds.linode.show\_instance**(*name*, *call=None*)

Displays details about a particular Linode VM. Either a name or a linode\_id must be provided.

New in version 2015.8.0.

**name**

The name of the VM for which to display details.

CLI Example:

```
salt-cloud -a show_instance vm_name
```

---

**Note:** The image label only displays information about the VM's distribution vendor, such as "Debian" or "RHEL" and does not display the actual image name. This is due to a limitation of the Linode API.

---

**salt.cloud.clouds.linode.show\_pricing**(*kwargs=None*, *call=None*)

Show pricing for a particular profile. This is only an estimate, based on unofficial pricing sources.

New in version 2015.8.0.

CLI Example:

```
salt-cloud -f show_pricing my-linode-config profile=my-linode-profile
```

**salt.cloud.clouds.linode.start**(*name*, *call=None*)

Start a VM in Linode.

**name**

The name of the VM to start.

CLI Example:

```
salt-cloud -a stop vm_name
```

**salt.cloud.clouds.linode.stop**(*name*, *call=None*)

Stop a VM in Linode.

**name**

The name of the VM to stop.

CLI Example:

```
salt-cloud -a stop vm_name
```

### 26.4.13 salt.cloud.clouds.lxc

#### Install Salt on an LXC Container

New in version 2014.7.0.

Please read [core config documentation](#).

`salt.cloud.clouds.lxc.avail_images()`

`salt.cloud.clouds.lxc.create(vm_, call=None)`

Create an lxc Container. This function is idempotent and will try to either provision or finish the provision of an lxc container.

NOTE: Most of the initialization code has been moved and merged with the lxc runner and lxc.init functions

`salt.cloud.clouds.lxc.destroy(vm_, call=None)`

Destroy a lxc container

`salt.cloud.clouds.lxc.get_configured_provider(vm_=None)`

Return the contextual provider of None if no configured one can be found.

`salt.cloud.clouds.lxc.get_provider(name)`

`salt.cloud.clouds.lxc.list_nodes(conn=None, call=None)`

`salt.cloud.clouds.lxc.list_nodes_full(conn=None, call=None)`

`salt.cloud.clouds.lxc.list_nodes_select(call=None)`

Return a list of the VMs that are on the provider, with select fields

`salt.cloud.clouds.lxc.show_instance(name, call=None)`

Show the details from the provider concerning an instance

### 26.4.14 salt.cloud.clouds.oneandone

#### 1&1 Cloud Server Module

The 1&1 SaltStack cloud module allows a 1&1 server to be automatically deployed and bootstrapped with Salt. It also has functions to create block storages and ssh keys.

##### depends

1and1 >= 1.2.0

The module requires the 1&1 `api_token` to be provided. The server should also be assigned a public LAN, a private LAN, or both along with SSH key pairs.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/oneandone.conf`:

```

my-oneandone-config:
  driver: oneandone
  # The 1&1 api token
  api_token: <your-token>
  # SSH private key filename
  ssh_private_key: /path/to/private_key
  # SSH public key filename
  ssh_public_key: /path/to/public_key

```

```

my-oneandone-profile:
  provider: my-oneandone-config
  # Either provide fixed_instance_size_id or vcore, cores_per_processor, ram,
  ↪and hdds.
  # Size of the ID desired for the server
  fixed_instance_size: S
  # Total amount of processors
  vcore: 2
  # Number of cores per processor
  cores_per_processor: 2
  # RAM memory size in GB
  ram: 4
  # Hard disks
  hdds:
  -
    is_main: true
    size: 20
  -
    is_main: false
    size: 20
  # ID of the appliance image that will be installed on server
  appliance_id: <ID>
  # ID of the datacenter where the server will be created
  datacenter_id: <ID>
  # Description of the server
  description: My server description
  # Password of the server. Password must contain more than 8 characters
  # using uppercase letters, numbers and other special symbols.
  password: P4$w0rD
  # Power on server after creation - default True
  power_on: true
  # Firewall policy ID. If it is not provided, the server will assign
  # the best firewall policy, creating a new one if necessary.
  # If the parameter is sent with a 0 value, the server will be created with
  ↪all ports blocked.
  firewall_policy_id: <ID>
  # IP address ID
  ip_id: <ID>
  # Load balancer ID
  load_balancer_id: <ID>
  # Monitoring policy ID
  monitoring_policy_id: <ID>

```

Set `deploy` to `False` if Salt should not be installed on the node.

```
my-oneandone-profile:  
deploy: False
```

Create an SSH key

```
sudo salt-cloud -f create_ssh_key my-oneandone-config name='SaltTest'␣  
↳description='SaltTestDescription'
```

Create a block storage

```
sudo salt-cloud -f create_block_storage my-oneandone-config name='SaltTest2'  
description='SaltTestDescription' size=50 datacenter_id=  
↳'5091F6D8CBFEF9C26ACE957C652D5D49'
```

`salt.cloud.clouds.oneandone.avail_images` (*conn=None, call=None*)

Return a list of the server appliances that are on the provider

`salt.cloud.clouds.oneandone.avail_locations` (*conn=None, call=None*)

List available locations/datacenters for 1&1

`salt.cloud.clouds.oneandone.avail_sizes` (*call=None*)

Return a dict of all available VM sizes on the cloud provider with relevant data.

`salt.cloud.clouds.oneandone.create` (*vm\_*)

Create a single VM from a data dict

`salt.cloud.clouds.oneandone.create_block_storage` (*kwargs=None, call=None*)

Create a block storage

`salt.cloud.clouds.oneandone.create_ssh_key` (*kwargs=None, call=None*)

Create an ssh key

`salt.cloud.clouds.oneandone.destroy` (*name, call=None*)

destroy a server by name

#### Parameters

- **name** -- name given to the server
- **call** -- call value in this case is 'action'

#### Returns

array of booleans , true if successfully stopped and true if successfully removed

CLI Example:

```
salt-cloud -d vm_name
```

`salt.cloud.clouds.oneandone.get_configured_provider` ()

Return the first configured instance.

`salt.cloud.clouds.oneandone.get_conn` ()

Return a conn object for the passed VM data

`salt.cloud.clouds.oneandone.get_dependencies` ()

Warn if dependencies are not met.

`salt.cloud.clouds.oneandone.get_image(vm_)`

Return the image object to use

`salt.cloud.clouds.oneandone.get_key_filename(vm_)`

Check SSH private key file and return absolute path if exists.

`salt.cloud.clouds.oneandone.get_node(conn, name)`

Return a node for the named VM

`salt.cloud.clouds.oneandone.get_size(vm_)`

Return the VM's size object

`salt.cloud.clouds.oneandone.get_wait_timeout(vm_)`

Return the wait\_for\_timeout for resource provisioning.

`salt.cloud.clouds.oneandone.list_nodes(conn=None, call=None)`

Return a list of VMs that are on the provider

`salt.cloud.clouds.oneandone.list_nodes_full(conn=None, call=None)`

Return a list of the VMs that are on the provider, with all fields

`salt.cloud.clouds.oneandone.list_nodes_select(conn=None, call=None)`

Return a list of the VMs that are on the provider, with select fields

`salt.cloud.clouds.oneandone.load_public_key(vm_)`

Load the public key file if exists.

`salt.cloud.clouds.oneandone.reboot(name, call=None)`

reboot a server by name :param name: name given to the machine :param call: call value in this case is 'action'  
:return: true if successful

CLI Example:

```
salt-cloud -a reboot vm_name
```

`salt.cloud.clouds.oneandone.script(vm_)`

Return the script deployment object

`salt.cloud.clouds.oneandone.show_instance(name, call=None)`

Show the details from the provider concerning an instance

`salt.cloud.clouds.oneandone.start(name, call=None)`

start a server by name :param name: name given to the machine :param call: call value in this case is 'action'  
:return: true if successful

CLI Example:

```
salt-cloud -a start vm_name
```

`salt.cloud.clouds.oneandone.stop(name, call=None)`

stop a server by name :param name: name given to the machine :param call: call value in this case is 'action'  
:return: true if successful

CLI Example:

```
salt-cloud -a stop vm_name
```

## 26.4.15 salt.cloud.clouds.opennebula

### OpenNebula Cloud Module

The OpenNebula cloud module is used to control access to an OpenNebula cloud.

New in version 2014.7.0.

**depends**  
lxml

**depends**  
OpenNebula installation running version 4.14 or later.

Use of this module requires the `xml_rpc`, `user`, and `password` parameters to be set.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/opennebula.conf`:

```
my-opennebula-config:
xml_rpc: http://localhost:2633/RPC2
user: oneadmin
password: JHGhgsayu32jsa
driver: opennebula
```

This driver supports accessing new VM instances via DNS entry instead of IP address. To enable this feature, in the provider or profile file add `fqdn_base` with a value matching the base of your fully-qualified domain name. Example:

```
my-opennebula-config:
[... ]
fqdn_base: <my.basedomain.com>
[... ]
```

The driver will prepend the hostname to the `fqdn_base` and do a DNS lookup to find the IP of the new VM.

```
salt-cloud -f image_allocate opennebula datastore_name=default \
  data='NAME="My New Image" DESCRIPTION="Description of the image." \
  PATH=/home/one_user/images/image_name.img'
salt-cloud -f secgroup_allocate opennebula \
  data="Name = test RULE = [PROTOCOL = TCP, RULE_TYPE = inbound, \
  RANGE = 1000:2000]"
```

`salt.cloud.clouds.opennebula.avail_images` (*call=None*)

Return available OpenNebula images.

CLI Example:

```
salt-cloud --list-images opennebula
salt-cloud --function avail_images opennebula
salt-cloud -f avail_images opennebula
```

`salt.cloud.clouds.opennebula.avail_locations` (*call=None*)

Return available OpenNebula locations.

CLI Example:

```
salt-cloud --list-locations opennebula
salt-cloud --function avail_locations opennebula
salt-cloud -f avail_locations opennebula
```

`salt.cloud.clouds.opennebula.avail_sizes` (*call=None*)

Because sizes are built into templates with OpenNebula, there will be no sizes to return here.

`salt.cloud.clouds.opennebula.create` (*vm\_*)

Create a single VM from a data dict.

**vm\_**

The dictionary use to create a VM.

Optional `vm_ dict` options for overwriting template:

**region\_id**

Optional - OpenNebula Zone ID

**memory**

Optional - In MB

**cpu**

Optional - Percent of host CPU to allocate

**vcpu**

Optional - Amount of vCPUs to allocate

CLI Example:

```
salt-cloud -p my-opennebula-profile vm_name
salt-cloud -p my-opennebula-profile vm_name memory=16384 cpu=2.5
↪vcpu=16
```

`salt.cloud.clouds.opennebula.destroy` (*name, call=None*)

Destroy a node. Will check termination protection and warn if enabled.

**name**

The name of the vm to be destroyed.

CLI Example:

```
salt-cloud --destroy vm_name
salt-cloud -d vm_name
salt-cloud --action destroy vm_name
salt-cloud -a destroy vm_name
```

`salt.cloud.clouds.opennebula.get_cluster_id` (*kwargs=None, call=None*)

Returns a cluster's ID from the given cluster name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_cluster_id opennebula name=my-cluster-name
```

`salt.cloud.clouds.opennebula.get_configured_provider` ()

Return the first configured instance.

`salt.cloud.clouds.opennebula.get_datastore_id(kwarg=None, call=None)`

Returns a data store's ID from the given data store name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_datastore_id opennebula name=my-datastore-name
```

`salt.cloud.clouds.opennebula.get_dependencies()`

Warn if dependencies aren't met.

`salt.cloud.clouds.opennebula.get_host_id(kwarg=None, call=None)`

Returns a host's ID from the given host name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_host_id opennebula name=my-host-name
```

`salt.cloud.clouds.opennebula.get_image(vm_)`

Return the image object to use.

**vm\_**

The VM dictionary for which to obtain an image.

`salt.cloud.clouds.opennebula.get_image_id(kwarg=None, call=None)`

Returns an image's ID from the given image name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_image_id opennebula name=my-image-name
```

`salt.cloud.clouds.opennebula.get_location(vm_)`

Return the VM's location.

**vm\_**

The VM dictionary for which to obtain a location.

`salt.cloud.clouds.opennebula.get_one_version(kwarg=None, call=None)`

Returns the OpenNebula version.

New in version 2016.3.5.

CLI Example:

```
salt-cloud -f get_one_version one_provider_name
```

`salt.cloud.clouds.opennebula.get_secgroup_id(kwarg=None, call=None)`

Returns a security group's ID from the given security group name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_secgroup_id opennebula name=my-secgroup-name
```

`salt.cloud.clouds.opennebula.get_template(vm_)`

Return the template id for a VM.

New in version 2016.11.0.

**vm\_**

The VM dictionary for which to obtain a template.

`salt.cloud.clouds.opennebula.get_template_id(kwarg=None, call=None)`

Returns a template's ID from the given template name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_template_id opennebula name=my-template-name
```

`salt.cloud.clouds.opennebula.get_template_image(kwarg=None, call=None)`

Returns a template's image from the given template name.

New in version 2018.3.0.

```
salt-cloud -f get_template_image opennebula name=my-template-name
```

`salt.cloud.clouds.opennebula.get_vm_id(kwarg=None, call=None)`

Returns a virtual machine's ID from the given virtual machine's name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_vm_id opennebula name=my-vm
```

`salt.cloud.clouds.opennebula.get_vn_id(kwarg=None, call=None)`

Returns a virtual network's ID from the given virtual network's name.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f get_vn_id opennebula name=my-vn-name
```

`salt.cloud.clouds.opennebula.image_allocate(call=None, kwarg=None)`

Allocates a new image in OpenNebula.

New in version 2016.3.0.

**path**

The path to a file containing the template of the image to allocate. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.

**data**

The data containing the template of the image to allocate. Syntax can be the usual attribute=value or XML. Can be used instead of path.

**datastore\_id**

The ID of the data-store to be used for the new image. Can be used instead of datastore\_name.

**datastore\_name**

The name of the data-store to be used for the new image. Can be used instead of datastore\_id.

CLI Example:

```
salt-cloud -f image_allocate opennebula path=/path/to/image_file.txt
→datastore_id=1
salt-cloud -f image_allocate opennebula datastore_name=default \
  data='NAME="Ubuntu 14.04" PATH="/home/one_user/images/ubuntu_desktop.
→img" \
  DESCRIPTION="Ubuntu 14.04 for development."'
```

`salt.cloud.clouds.opennebula.image_clone` (*call=None, kwargs=None*)

Clones an existing image.

New in version 2016.3.0.

**name**

The name of the new image.

**image\_id**

The ID of the image to be cloned. Can be used instead of `image_name`.

**image\_name**

The name of the image to be cloned. Can be used instead of `image_id`.

CLI Example:

```
salt-cloud -f image_clone opennebula name=my-new-image image_id=10
salt-cloud -f image_clone opennebula name=my-new-image image_name=my-
→image-to-clone
```

`salt.cloud.clouds.opennebula.image_delete` (*call=None, kwargs=None*)

Deletes the given image from OpenNebula. Either a name or an `image_id` must be supplied.

New in version 2016.3.0.

**name**

The name of the image to delete. Can be used instead of `image_id`.

**image\_id**

The ID of the image to delete. Can be used instead of `name`.

CLI Example:

```
salt-cloud -f image_delete opennebula name=my-image
salt-cloud --function image_delete opennebula image_id=100
```

`salt.cloud.clouds.opennebula.image_info` (*call=None, kwargs=None*)

Retrieves information for a given image. Either a name or an `image_id` must be supplied.

New in version 2016.3.0.

**name**

The name of the image for which to gather information. Can be used instead of `image_id`.

**image\_id**

The ID of the image for which to gather information. Can be used instead of `name`.

CLI Example:

```
salt-cloud -f image_info opennebula name=my-image
salt-cloud --function image_info opennebula image_id=5
```

`salt.cloud.clouds.opennebula.image_persistent` (*call=None, kwargs=None*)

Sets the Image as persistent or not persistent.

New in version 2016.3.0.

**name**

The name of the image to set. Can be used instead of `image_id`.

**image\_id**

The ID of the image to set. Can be used instead of `name`.

**persist**

A boolean value to set the image as persistent or not. Set to true for persistent, false for non-persistent.

CLI Example:

```
salt-cloud -f image_persistent opennebula name=my-image persist=True
salt-cloud --function image_persistent opennebula image_id=5 persist=False
```

`salt.cloud.clouds.opennebula.image_snapshot_delete` (*call=None, kwargs=None*)

Deletes a snapshot from the image.

New in version 2016.3.0.

**image\_id**

The ID of the image from which to delete the snapshot. Can be used instead of `image_name`.

**image\_name**

The name of the image from which to delete the snapshot. Can be used instead of `image_id`.

**snapshot\_id**

The ID of the snapshot to delete.

CLI Example:

```
salt-cloud -f image_snapshot_delete vm_id=106 snapshot_id=45
salt-cloud -f image_snapshot_delete vm_name=my-vm snapshot_id=111
```

`salt.cloud.clouds.opennebula.image_snapshot_flatten` (*call=None, kwargs=None*)

Flattens the snapshot of an image and discards others.

New in version 2016.3.0.

**image\_id**

The ID of the image. Can be used instead of `image_name`.

**image\_name**

The name of the image. Can be used instead of `image_id`.

**snapshot\_id**

The ID of the snapshot to flatten.

CLI Example:

```
salt-cloud -f image_snapshot_flatten vm_id=106 snapshot_id=45
salt-cloud -f image_snapshot_flatten vm_name=my-vm snapshot_id=45
```

`salt.cloud.clouds.opennebula.image_snapshot_revert` (*call=None, kwargs=None*)

Reverts an image state to a previous snapshot.

New in version 2016.3.0.

**image\_id**

The ID of the image to revert. Can be used instead of `image_name`.

**image\_name**

The name of the image to revert. Can be used instead of `image_id`.

**snapshot\_id**

The ID of the snapshot to which the image will be reverted.

CLI Example:

```
salt-cloud -f image_snapshot_revert vm_id=106 snapshot_id=45
salt-cloud -f image_snapshot_revert vm_name=my-vm snapshot_id=120
```

`salt.cloud.clouds.opennebula.image_update` (*call=None, kwargs=None*)

Replaces the image template contents.

New in version 2016.3.0.

**image\_id**

The ID of the image to update. Can be used instead of `image_name`.

**image\_name**

The name of the image to update. Can be used instead of `image_id`.

**path**

The path to a file containing the template of the image. Syntax within the file can be the usual `attribute=value` or XML. Can be used instead of `data`.

**data**

Contains the template of the image. Syntax can be the usual `attribute=value` or XML. Can be used instead of `path`.

**update\_type**

There are two ways to update an image: `replace` the whole template or `merge` the new template with the existing one.

CLI Example:

```
salt-cloud -f image_update opennebula image_id=0 file=/path/to/image_
↳update_file.txt update_type=replace
salt-cloud -f image_update opennebula image_name="Ubuntu 14.04" update_
↳type=merge \
  data='NAME="Ubuntu Dev" PATH="/home/one_user/images/ubuntu_desktop.img
↳" \
  DESCRIPTION = "Ubuntu 14.04 for development."'
```

`salt.cloud.clouds.opennebula.list_clusters` (*call=None*)

Returns a list of clusters in OpenNebula.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f list_clusters opennebula
```

`salt.cloud.clouds.opennebula.list_datastores` (*call=None*)

Returns a list of data stores on OpenNebula.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f list_datastores opennebula
```

`salt.cloud.clouds.opennebula.list_hosts` (*call=None*)

Returns a list of hosts on OpenNebula.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f list_hosts opennebula
```

`salt.cloud.clouds.opennebula.list_nodes` (*call=None*)

Return a list of VMs on OpenNebula.

CLI Example:

```
salt-cloud -Q
salt-cloud --query
salt-cloud --function list_nodes opennebula
salt-cloud -f list_nodes opennebula
```

`salt.cloud.clouds.opennebula.list_nodes_full` (*call=None*)

Return a list of the VMs on OpenNebula.

CLI Example:

```
salt-cloud -F
salt-cloud --full-query
salt-cloud --function list_nodes_full opennebula
salt-cloud -f list_nodes_full opennebula
```

`salt.cloud.clouds.opennebula.list_nodes_select` (*call=None*)

Return a list of the VMs that are on the provider, with select fields.

`salt.cloud.clouds.opennebula.list_security_groups` (*call=None*)

Lists all security groups available to the user and the user's groups.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f list_security_groups opennebula
```

`salt.cloud.clouds.opennebula.list_templates` (*call=None*)

Lists all templates available to the user and the user's groups.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f list_templates opennebula
```

`salt.cloud.clouds.opennebula.list_vns` (*call=None*)

Lists all virtual networks available to the user and the user's groups.

New in version 2016.3.0.

CLI Example:

```
salt-cloud -f list_vns opennebula
```

`salt.cloud.clouds.opennebula.reboot` (*name*, *call=None*)

Reboot a VM.

New in version 2016.3.0.

**name**

The name of the VM to reboot.

CLI Example:

```
salt-cloud -a reboot my-vm
```

`salt.cloud.clouds.opennebula.secgroup_allocate` (*call=None*, *kwargs=None*)

Allocates a new security group in OpenNebula.

New in version 2016.3.0.

**path**

The path to a file containing the template of the security group. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

**data**

The template data of the security group. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

CLI Example:

```
salt-cloud -f secgroup_allocate opennebula path=/path/to/secgroup_file.txt
salt-cloud -f secgroup_allocate opennebula \
  data="NAME = test RULE = [PROTOCOL = TCP, RULE_TYPE = inbound, \
  RANGE = 1000:2000]"
```

`salt.cloud.clouds.opennebula.secgroup_clone` (*call=None*, *kwargs=None*)

Clones an existing security group.

New in version 2016.3.0.

**name**

The name of the new template.

**secgroup\_id**

The ID of the security group to be cloned. Can be used instead of `secgroup_name`.

**secgroup\_name**

The name of the security group to be cloned. Can be used instead of `secgroup_id`.

CLI Example:

```
salt-cloud -f secgroup_clone opennebula name=my-cloned-secgroup secgroup_
  →id=0
salt-cloud -f secgroup_clone opennebula name=my-cloned-secgroup secgroup_
  →name=my-secgroup
```

`salt.cloud.clouds.opennebula.secgroup_delete` (*call=None*, *kwargs=None*)

Deletes the given security group from OpenNebula. Either a name or a `secgroup_id` must be supplied.

New in version 2016.3.0.

**name**

The name of the security group to delete. Can be used instead of `secgroup_id`.

**secgroup\_id**

The ID of the security group to delete. Can be used instead of `name`.

CLI Example:

```
salt-cloud -f secgroup_delete opennebula name=my-secgroup
salt-cloud --function secgroup_delete opennebula secgroup_id=100
```

`salt.cloud.clouds.opennebula.secgroup_info` (*call=None, kwargs=None*)

Retrieves information for the given security group. Either a name or a `secgroup_id` must be supplied.

New in version 2016.3.0.

**name**

The name of the security group for which to gather information. Can be used instead of `secgroup_id`.

**secgroup\_id**

The ID of the security group for which to gather information. Can be used instead of `name`.

CLI Example:

```
salt-cloud -f secgroup_info opennebula name=my-secgroup
salt-cloud --function secgroup_info opennebula secgroup_id=5
```

`salt.cloud.clouds.opennebula.secgroup_update` (*call=None, kwargs=None*)

Replaces the security group template contents.

New in version 2016.3.0.

**secgroup\_id**

The ID of the security group to update. Can be used instead of `secgroup_name`.

**secgroup\_name**

The name of the security group to update. Can be used instead of `secgroup_id`.

**path**

The path to a file containing the template of the security group. Syntax within the file can be the usual `attribute=value` or XML. Can be used instead of `data`.

**data**

The template data of the security group. Syntax can be the usual `attribute=value` or XML. Can be used instead of `path`.

**update\_type**

There are two ways to update a security group: replace the whole template or merge the new template with the existing one.

CLI Example:

```
salt-cloud --function secgroup_update opennebula secgroup_id=100 \
  path=/path/to/secgroup_update_file.txt \
  update_type=replace
salt-cloud -f secgroup_update opennebula secgroup_name=my-secgroup update_
↪type=merge \
  data="Name = test RULE = [PROTOCOL = TCP, RULE_TYPE = inbound, RANGE
↪= 1000:2000]"
```

`salt.cloud.clouds.opennebula.show_instance`(*name*, *call=None*)

Show the details from OpenNebula concerning a named VM.

**name**

The name of the VM for which to display details.

**call**

Type of call to use with this function such as `function`.

CLI Example:

```
salt-cloud --action show_instance vm_name
salt-cloud -a show_instance vm_name
```

`salt.cloud.clouds.opennebula.start`(*name*, *call=None*)

Start a VM.

New in version 2016.3.0.

**name**

The name of the VM to start.

CLI Example:

```
salt-cloud -a start my-vm
```

`salt.cloud.clouds.opennebula.stop`(*name*, *call=None*)

Stop a VM.

New in version 2016.3.0.

**name**

The name of the VM to stop.

CLI Example:

```
salt-cloud -a stop my-vm
```

`salt.cloud.clouds.opennebula.template_allocate`(*call=None*, *kwargs=None*)

Allocates a new template in OpenNebula.

New in version 2016.3.0.

**path**

The path to a file containing the elements of the template to be allocated. Syntax within the file can be the usual `attribute=value` or XML. Can be used instead of `data`.

**data**

Contains the elements of the template to be allocated. Syntax can be the usual `attribute=value` or XML. Can be used instead of `path`.

CLI Example:

```
salt-cloud -f template_allocate opennebula path=/path/to/template_file.txt
salt-cloud -f template_allocate opennebula \
  data='CPU="1.0" DISK=[IMAGE="Ubuntu-14.04"] GRAPHICS=[LISTEN="0.0.0.0
→",TYPE="vnc"] \
  MEMORY="1024" NETWORK="yes" NIC=[NETWORK="192net",NETWORK_UNAME=
→"oneadmin"] \
```

(continues on next page)

(continued from previous page)

```
OS=[ARCH="x86_64"] SUNSTONE_CAPACITY_SELECT="YES" SUNSTONE_NETWORK_
→SELECT="YES" \
VCPU="1"
```

`salt.cloud.clouds.opennebula.template_clone` (*call=None, kwargs=None*)

Clones an existing virtual machine template.

New in version 2016.3.0.

**name**

The name of the new template.

**template\_id**

The ID of the template to be cloned. Can be used instead of `template_name`.

**template\_name**

The name of the template to be cloned. Can be used instead of `template_id`.

**clone\_images**

Optional, defaults to False. Indicates if the images attached to the template should be cloned as well.

CLI Example:

```
salt-cloud -f template_clone opennebula name=my-new-template template_id=0
salt-cloud -f template_clone opennebula name=my-new-template template_
→name=my-template
```

`salt.cloud.clouds.opennebula.template_delete` (*call=None, kwargs=None*)

Deletes the given template from OpenNebula. Either a name or a `template_id` must be supplied.

New in version 2016.3.0.

**name**

The name of the template to delete. Can be used instead of `template_id`.

**template\_id**

The ID of the template to delete. Can be used instead of `name`.

CLI Example:

```
salt-cloud -f template_delete opennebula name=my-template
salt-cloud --function template_delete opennebula template_id=5
```

`salt.cloud.clouds.opennebula.template_instantiate` (*call=None, kwargs=None*)

Instantiates a new virtual machine from a template.

New in version 2016.3.0.

---

**Note:** `template_instantiate` creates a VM on OpenNebula from a template, but it does not install Salt on the new VM. Use the `create` function for that functionality: `salt-cloud -p opennebula-profile vm-name`.

---

**vm\_name**

Name for the new VM instance.

**template\_id**

The ID of the template from which the VM will be created. Can be used instead of `template_name`.

**template\_name**

The name of the template from which the VM will be created. Can be used instead of `template_id`.

CLI Example:

```
salt-cloud -f template_instantiate opennebula vm_name=my-new-vm template_
→id=0
```

`salt.cloud.clouds.opennebula.template_update` (*call=None, kwargs=None*)

Replaces the template contents.

New in version 2016.3.0.

**template\_id**

The ID of the template to update. Can be used instead of `template_name`.

**template\_name**

The name of the template to update. Can be used instead of `template_id`.

**path**

The path to a file containing the elements of the template to be updated. Syntax within the file can be the usual `attribute=value` or XML. Can be used instead of `data`.

**data**

Contains the elements of the template to be updated. Syntax can be the usual `attribute=value` or XML. Can be used instead of `path`.

**update\_type**

There are two ways to update a template: `replace` the whole template or `merge` the new template with the existing one.

CLI Example:

```
salt-cloud --function template_update opennebula template_id=1 update_
→type=replace \
    path=/path/to/template_update_file.txt
salt-cloud -f template_update opennebula template_name=my-template update_
→type=merge \
    data='CPU="1.0" DISK=[IMAGE="Ubuntu-14.04"] GRAPHICS=[LISTEN="0.0.0.0
→",TYPE="vnc"] \
    MEMORY="1024" NETWORK="yes" NIC=[NETWORK="192net",NETWORK_UNAME=
→"oneadmin"] \
    OS=[ARCH="x86_64"] SUNSTONE_CAPACITY_SELECT="YES" SUNSTONE_NETWORK_
→SELECT="YES" \
    VCPU="1"'
```

`salt.cloud.clouds.opennebula.vm_action` (*name, kwargs=None, call=None*)

Submits an action to be performed on a given virtual machine.

New in version 2016.3.0.

**name**

The name of the VM to action.

**action**

The action to be performed on the VM. Available options include:

- `boot`

- delete
- delete-recreate
- hold
- poweroff
- poweroff-hard
- reboot
- reboot-hard
- release
- resched
- resume
- shutdown
- shutdown-hard
- stop
- suspend
- undeploy
- undeploy-hard
- unresched

CLI Example:

```
salt-cloud -a vm_action my-vm action='release'
```

`salt.cloud.clouds.opennebula.vm_allocate` (*call=None, kwargs=None*)

Allocates a new virtual machine in OpenNebula.

New in version 2016.3.0.

**path**

The path to a file defining the template of the VM to allocate. Syntax within the file can be the usual `attribute=value` or XML. Can be used instead of `data`.

**data**

Contains the template definitions of the VM to allocate. Syntax can be the usual `attribute=value` or XML. Can be used instead of `path`.

**hold**

If this parameter is set to `True`, the VM will be created in the HOLD state. If not set, the VM is created in the PENDING state. Default is `False`.

CLI Example:

```
salt-cloud -f vm_allocate path=/path/to/vm_template.txt
salt-cloud --function vm_allocate path=/path/to/vm_template.txt hold=True
```

`salt.cloud.clouds.opennebula.vm_attach` (*name, kwargs=None, call=None*)

Attaches a new disk to the given virtual machine.

New in version 2016.3.0.

**name**

The name of the VM for which to attach the new disk.

**path**

The path to a file containing a single disk vector attribute. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

**data**

Contains the data needed to attach a single disk vector attribute. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

CLI Example:

```
salt-cloud -a vm_attach my-vm path=/path/to/disk_file.txt
salt-cloud -a vm_attach my-vm data="DISK=[DISK_ID=1]"
```

`salt.cloud.clouds.opennebula.vm_attach_nic` (*name*, *kwargs=None*, *call=None*)

Attaches a new network interface to the given virtual machine.

New in version 2016.3.0.

**name**

The name of the VM for which to attach the new network interface.

**path**

The path to a file containing a single NIC vector attribute. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

**data**

Contains the single NIC vector attribute to attach to the VM. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

CLI Example:

```
salt-cloud -a vm_attach_nic my-vm path=/path/to/nic_file.txt
salt-cloud -a vm_attach_nic my-vm data="NIC=[NETWORK_ID=1]"
```

`salt.cloud.clouds.opennebula.vm_deploy` (*name*, *kwargs=None*, *call=None*)

Initiates the instance of the given VM on the target host.

New in version 2016.3.0.

**name**

The name of the VM to deploy.

**host\_id**

The ID of the target host where the VM will be deployed. Can be used instead of `host_name`.

**host\_name**

The name of the target host where the VM will be deployed. Can be used instead of `host_id`.

**capacity\_maintained**

True to enforce the Host capacity is not over-committed. This parameter is only acknowledged for users in the `oneadmin` group. Host capacity will be always enforced for regular users.

**datastore\_id**

The ID of the target system data-store where the VM will be deployed. Optional and can be used instead of `datastore_name`. If neither `datastore_id` nor `datastore_name` are set, OpenNebula will choose the data-store.

**datastore\_name**

The name of the target system data-store where the VM will be deployed. Optional, and can be used instead of `datastore_id`. If neither `datastore_id` nor `datastore_name` are set, OpenNebula will choose the data-store.

CLI Example:

```
salt-cloud -a vm_deploy my-vm host_id=0
salt-cloud -a vm_deploy my-vm host_id=1 capacity_maintained=False
salt-cloud -a vm_deploy my-vm host_name=host01 datastore_id=1
salt-cloud -a vm_deploy my-vm host_name=host01 datastore_name=default
```

`salt.cloud.clouds.opennebula.vm_detach`(*name*, *kwargs=None*, *call=None*)

Detaches a disk from a virtual machine.

New in version 2016.3.0.

**name**

The name of the VM from which to detach the disk.

**disk\_id**

The ID of the disk to detach.

CLI Example:

```
salt-cloud -a vm_detach my-vm disk_id=1
```

`salt.cloud.clouds.opennebula.vm_detach_nic`(*name*, *kwargs=None*, *call=None*)

Detaches a disk from a virtual machine.

New in version 2016.3.0.

**name**

The name of the VM from which to detach the network interface.

**nic\_id**

The ID of the nic to detach.

CLI Example:

```
salt-cloud -a vm_detach_nic my-vm nic_id=1
```

`salt.cloud.clouds.opennebula.vm_disk_save`(*name*, *kwargs=None*, *call=None*)

Sets the disk to be saved in the given image.

New in version 2016.3.0.

**name**

The name of the VM containing the disk to save.

**disk\_id**

The ID of the disk to save.

**image\_name**

The name of the new image where the disk will be saved.

**image\_type**

The type for the new image. If not set, then the default ONED Configuration will be used. Other valid types include: OS, CDROM, DATABLOCK, KERNEL, RAMDISK, and CONTEXT.

**snapshot\_id**

The ID of the snapshot to export. If not set, the current image state will be used.

CLI Example:

```
salt-cloud -a vm_disk_save my-vm disk_id=1 image_name=my-new-image
salt-cloud -a vm_disk_save my-vm disk_id=1 image_name=my-new-image image_
→type=CONTEXT snapshot_id=10
```

`salt.cloud.clouds.opennebula.vm_disk_snapshot_create` (*name*, *kwargs=None*, *call=None*)

Takes a new snapshot of the disk image.

New in version 2016.3.0.

**name**

The name of the VM of which to take the snapshot.

**disk\_id**

The ID of the disk to save.

**description**

The description for the snapshot.

CLI Example:

```
salt-cloud -a vm_disk_snapshot_create my-vm disk_id=0 description="My
→Snapshot Description"
```

`salt.cloud.clouds.opennebula.vm_disk_snapshot_delete` (*name*, *kwargs=None*, *call=None*)

Deletes a disk snapshot based on the given VM and the `disk_id`.

New in version 2016.3.0.

**name**

The name of the VM containing the snapshot to delete.

**disk\_id**

The ID of the disk to save.

**snapshot\_id**

The ID of the snapshot to be deleted.

CLI Example:

```
salt-cloud -a vm_disk_snapshot_delete my-vm disk_id=0 snapshot_id=6
```

`salt.cloud.clouds.opennebula.vm_disk_snapshot_revert` (*name*, *kwargs=None*, *call=None*)

Reverts a disk state to a previously taken snapshot.

New in version 2016.3.0.

**name**

The name of the VM containing the snapshot.

**disk\_id**

The ID of the disk to revert its state.

**snapshot\_id**

The ID of the snapshot to which the snapshot should be reverted.

CLI Example:

```
salt-cloud -a vm_disk_snapshot_revert my-vm disk_id=0 snapshot_id=6
```

`salt.cloud.clouds.opennebula.vm_info`(*name*, *call=None*)

Retrieves information for a given virtual machine. A VM name must be supplied.

New in version 2016.3.0.

**name**

The name of the VM for which to gather information.

CLI Example:

```
salt-cloud -a vm_info my-vm
```

`salt.cloud.clouds.opennebula.vm_migrate`(*name*, *kwargs=None*, *call=None*)

Migrates the specified virtual machine to the specified target host.

New in version 2016.3.0.

**name**

The name of the VM to migrate.

**host\_id**

The ID of the host to which the VM will be migrated. Can be used instead of `host_name`.

**host\_name**

The name of the host to which the VM will be migrated. Can be used instead of `host_id`.

**live\_migration**

If set to `True`, a live-migration will be performed. Default is `False`.

**capacity\_maintained**

`True` to enforce the Host capacity is not over-committed. This parameter is only acknowledged for users in the `oneadmin` group. Host capacity will be always enforced for regular users.

**datastore\_id**

The target system data-store ID where the VM will be migrated. Can be used instead of `datastore_name`.

**datastore\_name**

The name of the data-store target system where the VM will be migrated. Can be used instead of `datastore_id`.

CLI Example:

```
salt-cloud -a vm_migrate my-vm host_id=0 datastore_id=1
salt-cloud -a vm_migrate my-vm host_id=0 datastore_id=1 live_
→migration=True
salt-cloud -a vm_migrate my-vm host_name=host01 datastore_name=default
```

`salt.cloud.clouds.opennebula.vm_monitoring`(*name*, *call=None*)

Returns the monitoring records for a given virtual machine. A VM name must be supplied.

The monitoring information returned is a list of VM elements. Each VM element contains the complete dictionary of the VM with the updated information returned by the poll action.

New in version 2016.3.0.

**name**

The name of the VM for which to gather monitoring records.

CLI Example:

```
salt-cloud -a vm_monitoring my-vm
```

`salt.cloud.clouds.opennebula.vm_resize` (*name*, *kwargs=None*, *call=None*)

Changes the capacity of the virtual machine.

New in version 2016.3.0.

**name**

The name of the VM to resize.

**path**

The path to a file containing new capacity elements CPU, VCPU, MEMORY. If one of them is not present, or its value is 0, the VM will not be re-sized. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

**data**

Contains the new capacity elements CPU, VCPU, and MEMORY. If one of them is not present, or its value is 0, the VM will not be re-sized. Can be used instead of `path`.

**capacity\_maintained**

True to enforce the Host capacity is not over-committed. This parameter is only acknowledged for users in the `oneadmin` group. Host capacity will be always enforced for regular users.

CLI Example:

```
salt-cloud -a vm_resize my-vm path=/path/to/capacity_template.txt
salt-cloud -a vm_resize my-vm path=/path/to/capacity_template.txt
→capacity_maintained=False
salt-cloud -a vm_resize my-vm data="CPU=1 VCPU=1 MEMORY=1024"
```

`salt.cloud.clouds.opennebula.vm_snapshot_create` (*vm\_name*, *kwargs=None*, *call=None*)

Creates a new virtual machine snapshot from the provided VM.

New in version 2016.3.0.

**vm\_name**

The name of the VM from which to create the snapshot.

**snapshot\_name**

The name of the snapshot to be created.

CLI Example:

```
salt-cloud -a vm_snapshot_create my-vm snapshot_name=my-new-snapshot
```

`salt.cloud.clouds.opennebula.vm_snapshot_delete` (*vm\_name*, *kwargs=None*, *call=None*)

Deletes a virtual machine snapshot from the provided VM.

New in version 2016.3.0.

**vm\_name**

The name of the VM from which to delete the snapshot.

**snapshot\_id**

The ID of the snapshot to be deleted.

CLI Example:

```
salt-cloud -a vm_snapshot_delete my-vm snapshot_id=8
```

`salt.cloud.clouds.opennebula.vm_snapshot_revert` (*vm\_name*, *kwargs=None*, *call=None*)

Reverts a virtual machine to a snapshot

New in version 2016.3.0.

**vm\_name**

The name of the VM to revert.

**snapshot\_id**

The snapshot ID.

CLI Example:

```
salt-cloud -a vm_snapshot_revert my-vm snapshot_id=42
```

`salt.cloud.clouds.opennebula.vm_update` (*name*, *kwargs=None*, *call=None*)

Replaces the user template contents.

New in version 2016.3.0.

**name**

The name of the VM to update.

**path**

The path to a file containing new user template contents. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

**data**

Contains the new user template contents. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

**update\_type**

There are two ways to update a VM: replace the whole template or merge the new template with the existing one.

CLI Example:

```
salt-cloud -a vm_update my-vm path=/path/to/user_template_file.txt update_
→type='replace'
```

`salt.cloud.clouds.opennebula.vn_add_ar` (*call=None*, *kwargs=None*)

Adds address ranges to a given virtual network.

New in version 2016.3.0.

**vn\_id**

The ID of the virtual network to add the address range. Can be used instead of `vn_name`.

**vn\_name**

The name of the virtual network to add the address range. Can be used instead of `vn_id`.

**path**

The path to a file containing the template of the address range to add. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

**data**

Contains the template of the address range to add. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

CLI Example:

```
salt-cloud -f vn_add_ar opennebula vn_id=3 path=/path/to/address_range.txt
salt-cloud -f vn_add_ar opennebula vn_name=my-vn \
  data="AR=[TYPE=IP4, IP=192.168.0.5, SIZE=10]"
```

`salt.cloud.clouds.opennebula.vn_allocate` (*call=None, kwargs=None*)

Allocates a new virtual network in OpenNebula.

New in version 2016.3.0.

**path**

The path to a file containing the template of the virtual network to allocate. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

**data**

Contains the template of the virtual network to allocate. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

**cluster\_id**

The ID of the cluster for which to add the new virtual network. Can be used instead of `cluster_name`. If neither `cluster_id` nor `cluster_name` are provided, the virtual network won't be added to any cluster.

**cluster\_name**

The name of the cluster for which to add the new virtual network. Can be used instead of `cluster_id`. If neither `cluster_name` nor `cluster_id` are provided, the virtual network won't be added to any cluster.

CLI Example:

```
salt-cloud -f vn_allocate opennebula path=/path/to/vn_file.txt
```

`salt.cloud.clouds.opennebula.vn_delete` (*call=None, kwargs=None*)

Deletes the given virtual network from OpenNebula. Either a name or a `vn_id` must be supplied.

New in version 2016.3.0.

**name**

The name of the virtual network to delete. Can be used instead of `vn_id`.

**vn\_id**

The ID of the virtual network to delete. Can be used instead of `name`.

CLI Example:

```
salt-cloud -f vn_delete opennebula name=my-virtual-network
salt-cloud --function vn_delete opennebula vn_id=3
```

`salt.cloud.clouds.opennebula.vn_free_ar` (*call=None, kwargs=None*)

Frees a reserved address range from a virtual network.

New in version 2016.3.0.

**vn\_id**

The ID of the virtual network from which to free an address range. Can be used instead of `vn_name`.

**vn\_name**

The name of the virtual network from which to free an address range. Can be used instead of `vn_id`.

**ar\_id**

The ID of the address range to free.

CLI Example:

```
salt-cloud -f vn_free_ar opennebula vn_id=3 ar_id=1
salt-cloud -f vn_free_ar opennebula vn_name=my-vn ar_id=1
```

`salt.cloud.clouds.opennebula.vn_hold` (*call=None, kwargs=None*)

Holds a virtual network lease as used.

New in version 2016.3.0.

**vn\_id**

The ID of the virtual network from which to hold the lease. Can be used instead of `vn_name`.

**vn\_name**

The name of the virtual network from which to hold the lease. Can be used instead of `vn_id`.

**path**

The path to a file defining the template of the lease to hold. Syntax within the file can be the usual `attribute=value` or XML. Can be used instead of `data`.

**data**

Contains the template of the lease to hold. Syntax can be the usual `attribute=value` or XML. Can be used instead of `path`.

CLI Example:

```
salt-cloud -f vn_hold opennebula vn_id=3 path=/path/to/vn_hold_file.txt
salt-cloud -f vn_hold opennebula vn_name=my-vn data="LEASES=[IP=192.168.0.
↪5]"
```

`salt.cloud.clouds.opennebula.vn_info` (*call=None, kwargs=None*)

Retrieves information for the virtual network.

New in version 2016.3.0.

**name**

The name of the virtual network for which to gather information. Can be used instead of `vn_id`.

**vn\_id**

The ID of the virtual network for which to gather information. Can be used instead of `name`.

CLI Example:

```
salt-cloud -f vn_info opennebula vn_id=3
salt-cloud --function vn_info opennebula name=public
```

`salt.cloud.clouds.opennebula.vn_release` (*call=None, kwargs=None*)

Releases a virtual network lease that was previously on hold.

New in version 2016.3.0.

**vn\_id**

The ID of the virtual network from which to release the lease. Can be used instead of `vn_name`.

**vn\_name**

The name of the virtual network from which to release the lease. Can be used instead of `vn_id`.

**path**

The path to a file defining the template of the lease to release. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

**data**

Contains the template defining the lease to release. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

CLI Example:

```
salt-cloud -f vn_release opennebula vn_id=3 path=/path/to/vn_release_file.
↳txt
salt-cloud -f vn_release opennebula vn_name=my-vn data="LEASES=[IP=192.
↳168.0.5]"
```

`salt.cloud.clouds.opennebula.vn_reserve` (*call=None, kwargs=None*)

Reserve network addresses.

New in version 2016.3.0.

**vn\_id**

The ID of the virtual network from which to reserve addresses. Can be used instead of `vn_name`.

**vn\_name**

The name of the virtual network from which to reserve addresses. Can be used instead of `vn_id`.

**path**

The path to a file defining the template of the address reservation. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

**data**

Contains the template defining the address reservation. Syntax can be the usual attribute=value or XML. Data provided must be wrapped in double quotes. Can be used instead of `path`.

CLI Example:

```
salt-cloud -f vn_reserve opennebula vn_id=3 path=/path/to/vn_reserve_file.
↳txt
salt-cloud -f vn_reserve opennebula vn_name=my-vn data="SIZE=10 AR_ID=8
↳NETWORK_ID=1"
```

## 26.4.16 salt.cloud.clouds.openstack

### Openstack Cloud Driver

**depends**

shade>=1.19.0

OpenStack is an open source project that is in use by a number a cloud providers, each of which have their own ways of using it.

This OpenStack driver uses a the shade python module which is managed by the OpenStack Infra team. This module is written to handle all the different versions of different OpenStack tools for salt, so most commands are just passed over to the module to handle everything.

## Provider

There are two ways to configure providers for this driver. The first one is to just let shade handle everything, and configure using `os-client-config` and setting up `/etc/openstack/clouds.yml`.

```
clouds:
  democloud:
    region_name: RegionOne
    auth:
      username: 'demo'
      password: secret
      project_name: 'demo'
      auth_url: 'http://openstack/identity'
```

And then this can be referenced in the salt provider based on the *democloud* name.

```
myopenstack:
  driver: openstack
  cloud: democloud
  region_name: RegionOne
```

This allows for just using one configuration for salt-cloud and for any other openstack tools which are all using `/etc/openstack/clouds.yml`

The other method allows for specifying everything in the provider config, instead of using the extra configuration file. This will allow for passing salt-cloud configs only through pillars for minions without having to write a `clouds.yml` file on each minion.abs

```
myopenstack:
  driver: openstack
  region_name: RegionOne
  auth:
    username: 'demo'
    password: secret
    project_name: 'demo'
    user_domain_name: default,
    project_domain_name: default,
    auth_url: 'http://openstack/identity'
```

Or if you need to use a profile to setup some extra stuff, it can be passed as a *profile* to use any of the `vendor` config options.

```
myrackspace:
  driver: openstack
  profile: rackspace
  auth:
    username: rackusername
    api_key: myapikey
  region_name: ORD
  auth_type: rackspace_apikey
```

And this will pull in the profile for rackspace and setup all the correct options for the `auth_url` and different api versions for services.

## Profile

Most of the options for building servers are just passed on to the `create_server` function from shade.

The salt specific ones are:

- `ssh_key_file`: The path to the ssh key that should be used to login to the machine to bootstrap it
- `ssh_key_name`: The name of the keypair in openstack
- `userdata_template`: The renderer to use if the userdata is a file that is templated. Default: False
- `ssh_interface`: The interface to use to login for bootstrapping: `public_ips`, `private_ips`, `floating_ips`, `fixed_ips`
- `ignore_cidr`: Specify a CIDR range of unreachable private addresses for salt to ignore when connecting

```
centos:
provider: myopenstack
image: CentOS 7
size: ds1G
ssh_key_name: mykey
ssh_key_file: /root/.ssh/id_rsa
```

This is the minimum setup required.

If metadata is set to make sure that the host has finished setting up the `wait_for_metadata` can be set.

```
centos:
provider: myopenstack
image: CentOS 7
size: ds1G
ssh_key_name: mykey
ssh_key_file: /root/.ssh/id_rsa
meta:
  build_config: rack_user_only
wait_for_metadata:
  rax_service_level_automation: Complete
  rackconnect_automation_status: DEPLOYED
```

If your OpenStack instances only have private IP addresses and a CIDR range of private addresses are not reachable from the salt-master, you may set your preference to have Salt ignore it:

```
my-openstack-config:
  ignore_cidr: 192.168.0.0/16
```

Anything else from the `create_server` docs can be passed through here.

- `image`: Image dict, name or ID to boot with. `image` is required unless `boot_volume` is given.
- `flavor`: Flavor dict, name or ID to boot onto.
- `auto_ip`: Whether to take actions to find a routable IP for the server. (defaults to True)
- `ips`: List of IPs to attach to the server (defaults to None)
- `ip_pool`: Name of the network or floating IP pool to get an address from. (defaults to None)
- `root_volume`: Name or ID of a volume to boot from (defaults to None - deprecated, use `boot_volume`)
- `boot_volume`: Name or ID of a volume to boot from (defaults to None)

- **terminate\_volume**: If booting from a volume, whether it should be deleted when the server is destroyed. (defaults to False)
- **volumes**: (optional) A list of volumes to attach to the server
- **meta**: (optional) A dict of arbitrary key/value metadata to store for this server. Both keys and values must be <=255 characters.
- **files**: (optional, deprecated) A dict of files to overwrite on the server upon boot. Keys are file names (i.e. /etc/passwd) and values are the file contents (either as a string or as a file-like object). A maximum of five entries is allowed, and each file must be 10k or less.
- **reservation\_id**: a UUID for the set of servers being requested.
- **min\_count**: (optional extension) The minimum number of servers to launch.
- **max\_count**: (optional extension) The maximum number of servers to launch.
- **security\_groups**: A list of security group names
- **userdata**: user data to pass to be exposed by the metadata server this can be a file type object as well or a string.
- **key\_name**: (optional extension) name of previously created keypair to inject into the instance.
- **availability\_zone**: Name of the availability zone for instance placement.
- **block\_device\_mapping**: (optional) A list of dictionaries representing legacy block device mappings for this server. See [documentation](#) for details.
- **block\_device\_mapping\_v2**: (optional) A list of dictionaries representing block device mappings for this server. See [v2 documentation](#) for details.
- **nics**: (optional extension) an ordered list of nics to be added to this server, with information about connected networks, fixed IPs, port etc.
- **scheduler\_hints**: (optional extension) arbitrary key-value pairs specified by the client to help boot an instance
- **config\_drive**: (optional extension) value for config drive either boolean, or volume-id
- **disk\_config**: (optional extension) control how the disk is partitioned when the server is created. possible values are 'AUTO' or 'MANUAL'.
- **admin\_pass**: (optional extension) add a user supplied admin password.
- **timeout**: (optional) Seconds to wait, defaults to 60. See the `wait` parameter.
- **reuse\_ips**: (optional) Whether to attempt to reuse pre-existing floating ips should a floating IP be needed (defaults to True)
- **network**: (optional) Network dict or name or ID to attach the server to. Mutually exclusive with the nics parameter. Can also be be a list of network names or IDs or network dicts.
- **boot\_from\_volume**: Whether to boot from volume. 'boot\_volume' implies True, but boot\_from\_volume=True with no boot\_volume is valid and will create a volume from the image and use that.
- **volume\_size**: When booting an image from volume, how big should the created volume be? Defaults to 50.
- **nat\_destination**: Which network should a created floating IP be attached to, if it's not possible to infer from the cloud's configuration. (Optional, defaults to None)
- **group**: ServerGroup dict, name or id to boot the server in. If a group is provided in both scheduler\_hints and in the group param, the group param will win. (Optional, defaults to None)

---

**Note:** If there is anything added, that is not in this list, it can be added to an *extras* dictionary for the profile, and that will be to the `create_server` function.

---

`salt.cloud.clouds.openstack.avail_images` (*conn=None, call=None*)

List available images for OpenStack

CLI Example

```
salt-cloud -f avail_images myopenstack
salt-cloud --list-images myopenstack
```

`salt.cloud.clouds.openstack.avail_sizes` (*conn=None, call=None*)

List available sizes for OpenStack

CLI Example

```
salt-cloud -f avail_sizes myopenstack
salt-cloud --list-sizes myopenstack
```

`salt.cloud.clouds.openstack.call` (*conn=None, call=None, kwargs=None*)

Call function from shade.

func

function to call from shade.openstackcloud library

CLI Example

```
salt-cloud -f call myopenstack func=list_images
t sujksalt-cloud -f call myopenstack func=create_network name=mysubnet
```

`salt.cloud.clouds.openstack.create` (*vm\_*)

Create a single VM from a data dict

`salt.cloud.clouds.openstack.destroy` (*name, conn=None, call=None*)

Delete a single VM

`salt.cloud.clouds.openstack.get_configured_provider` ()

Return the first configured instance.

`salt.cloud.clouds.openstack.get_conn` ()

Return a conn object for the passed VM data

`salt.cloud.clouds.openstack.get_dependencies` ()

Warn if dependencies aren't met.

`salt.cloud.clouds.openstack.ignore_cidr` (*vm\_, ip*)

Return True if we are to ignore the specified IP.

`salt.cloud.clouds.openstack.list_networks` (*conn=None, call=None*)

List networks for OpenStack

CLI Example

```
salt-cloud -f list_networks myopenstack
```

`salt.cloud.clouds.openstack.list_nodes` (*conn=None, call=None*)

Return a list of VMs

CLI Example

```
salt-cloud -f list_nodes myopenstack
```

`salt.cloud.clouds.openstack.list_nodes_full` (*conn=None, call=None*)

Return a list of VMs with all the information about them

CLI Example

```
salt-cloud -f list_nodes_full myopenstack
```

`salt.cloud.clouds.openstack.list_nodes_min` (*conn=None, call=None*)

Return a list of VMs with minimal information

CLI Example

```
salt-cloud -f list_nodes_min myopenstack
```

`salt.cloud.clouds.openstack.list_nodes_select` (*conn=None, call=None*)

Return a list of VMs with the fields from *query.selection*

CLI Example

```
salt-cloud -f list_nodes_full myopenstack
```

`salt.cloud.clouds.openstack.list_subnets` (*conn=None, call=None, kwargs=None*)

List subnets in a virtual network

**network**

network to list subnets of

```
salt-cloud -f list_subnets myopenstack network=salt-net
```

`salt.cloud.clouds.openstack.preferred_ip` (*vm\_, ips*)

Return either an 'ipv4' (default) or 'ipv6' address depending on 'protocol' option. The list of 'ipv4' IPs is filtered by `ignore_cidr()` to remove any unreachable private addresses.

`salt.cloud.clouds.openstack.request_instance` (*vm\_, conn=None, call=None*)

Request an instance to be built

`salt.cloud.clouds.openstack.show_instance` (*name, conn=None, call=None*)

Get VM on this OpenStack account

**name**

name of the instance

CLI Example

```
salt-cloud -a show_instance myserver
```

`salt.cloud.clouds.openstack.ssh_interface` (*vm\_*)

Return the `ssh_interface` type to connect to. Either 'public\_ips' (default) or 'private\_ips'.

## 26.4.17 salt.cloud.clouds.packet

### Packet Cloud Module Using Packet's Python API Client

The Packet cloud module is used to control access to the Packet VPS system.

Use of this module only requires the `token` parameter.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/packet.conf`:

The Packet profile requires `size`, `image`, `location`, `project_id`

Optional profile parameters:

- `storage_size` - min value is 10, defines Gigabytes of storage that will be attached to device.
- `storage_tier` - `storage_1` - Standard Plan, `storage_2` - Performance Plan
- `snapshot_count` - int
- `snapshot_frequency` - string - possible values:
  - 1min
  - 15min
  - 1hour
  - 1day
  - 1week
  - 1month
  - 1year

This driver requires Packet's client library: <https://pypi.python.org/pypi/packet-python>

```

packet-provider:
  minion:
    master: 192.168.50.10
  driver: packet
  token: ewr23rdf35wC8oNjJrhmHa87rjSXzJyi
  private_key: /root/.ssh/id_rsa

packet-profile:
  provider: packet-provider
  size: baremetal_0
  image: ubuntu_16_04_image
  location: ewr1
  project_id: a64d000b-d47c-4d26-9870-46aac43010a6
  storage_size: 10
  storage_tier: storage_1
  storage_snapshot_count: 1
  storage_snapshot_frequency: 15min

```

`salt.cloud.clouds.packet.avail_images` (*call=None*)

Return available Packet os images.

CLI Example:

```
salt-cloud --list-images packet-provider
salt-cloud -f avail_images packet-provider
```

`salt.cloud.clouds.packet.avail_locations` (*call=None*)

Return available Packet datacenter locations.

CLI Example:

```
salt-cloud --list-locations packet-provider
salt-cloud -f avail_locations packet-provider
```

`salt.cloud.clouds.packet.avail_projects` (*call=None*)

Return available Packet projects.

CLI Example:

```
salt-cloud -f avail_projects packet-provider
```

`salt.cloud.clouds.packet.avail_sizes` (*call=None*)

Return available Packet sizes.

CLI Example:

```
salt-cloud --list-sizes packet-provider
salt-cloud -f avail_sizes packet-provider
```

`salt.cloud.clouds.packet.create` (*vm\_*)

Create a single Packet VM.

`salt.cloud.clouds.packet.destroy` (*name, call=None*)

Destroys a Packet device by name.

**name**

The hostname of VM to be destroyed.

CLI Example:

```
salt-cloud -d name
```

`salt.cloud.clouds.packet.get_configured_provider` ()

Return the first configured instance.

`salt.cloud.clouds.packet.get_devices_by_token` ()

`salt.cloud.clouds.packet.get_image` (*conn, vm\_*)

Return the image object to use

`salt.cloud.clouds.packet.get_size` (*conn, vm\_*)

Return the VM's size object

`salt.cloud.clouds.packet.is_profile_configured` (*vm\_*)

`salt.cloud.clouds.packet.list_nodes` (*call=None*)

Returns a list of devices, keeping only a brief listing.

CLI Example:

```
salt-cloud -Q
salt-cloud --query
salt-cloud -f list_nodes packet-provider
```

`salt.cloud.clouds.packet.list_nodes_full` (*call=None*)

List devices, with all available information.

CLI Example:

```
salt-cloud -F
salt-cloud --full-query
salt-cloud -f list_nodes_full packet-provider
```

`salt.cloud.clouds.packet.list_nodes_min` (*call=None*)

Return a list of the VMs that are on the provider. Only a list of VM names and their state is returned. This is the minimum amount of information needed to check for existing VMs.

New in version 2015.8.0.

CLI Example:

```
salt-cloud -f list_nodes_min packet-provider
salt-cloud --function list_nodes_min packet-provider
```

`salt.cloud.clouds.packet.list_nodes_select` (*call=None*)

Return a list of the VMs that are on the provider, with select fields.

`salt.cloud.clouds.packet.script` (*vm\_*)

Return the script deployment object

`salt.cloud.clouds.packet.show_instance` (*name, call=None*)

Show the details from the provider concerning an instance

## 26.4.18 salt.cloud.clouds.parallels

### Parallels Cloud Module

The Parallels cloud module is used to control access to cloud providers using the Parallels VPS system.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/parallels.conf`:

```
my-parallels-config:
# Parallels account information
user: myuser
password: mypassword
url: https://api.cloud.xmission.com:4465/paci/v1.0/
driver: parallels
```

`salt.cloud.clouds.parallels.avail_images` (*call=None*)

Return a list of the images that are on the provider

`salt.cloud.clouds.parallels.create` (*vm\_*)

Create a single VM from a data dict

`salt.cloud.clouds.parallels.create_node`(*vm\_*)

Build and submit the XML to create a node

`salt.cloud.clouds.parallels.destroy`(*name*, *call=None*)

Destroy a node.

CLI Example:

```
salt-cloud --destroy mymachine
```

`salt.cloud.clouds.parallels.get_configured_provider`()

Return the first configured instance.

`salt.cloud.clouds.parallels.get_image`(*vm\_*)

Return the image object to use

`salt.cloud.clouds.parallels.list_nodes`(*call=None*)

Return a list of the VMs that are on the provider

`salt.cloud.clouds.parallels.list_nodes_full`(*call=None*)

Return a list of the VMs that are on the provider

`salt.cloud.clouds.parallels.list_nodes_select`(*call=None*)

Return a list of the VMs that are on the provider, with select fields

`salt.cloud.clouds.parallels.query`(*action=None*, *command=None*, *args=None*, *method='GET'*,  
*data=None*)

Make a web call to a Parallels provider

`salt.cloud.clouds.parallels.script`(*vm\_*)

Return the script deployment object

`salt.cloud.clouds.parallels.show_image`(*kwargs*, *call=None*)

Show the details from Parallels concerning an image

`salt.cloud.clouds.parallels.show_instance`(*name*, *call=None*)

Show the details from Parallels concerning an instance

`salt.cloud.clouds.parallels.start`(*name*, *call=None*)

Start a node.

CLI Example:

```
salt-cloud -a start mymachine
```

`salt.cloud.clouds.parallels.stop`(*name*, *call=None*)

Stop a node.

CLI Example:

```
salt-cloud -a stop mymachine
```

`salt.cloud.clouds.parallels.wait_until`(*name*, *state*, *timeout=300*)

Wait until a specific state has been reached on a node

## 26.4.19 salt.cloud.clouds.profitbricks

### ProfitBricks Cloud Module

The ProfitBricks SaltStack cloud module allows a ProfitBricks server to be automatically deployed and bootstrapped with Salt.

```
depends
    profitbrick >= 3.1.0
```

The module requires ProfitBricks credentials to be supplied along with an existing virtual datacenter UUID where the server resources will reside. The server should also be assigned a public LAN, a private LAN, or both along with SSH key pairs. ...

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/profitbricks.conf`:

```
my-profitbricks-config:
driver: profitbricks
# The ProfitBricks login username
username: user@example.com
# The ProfitBricks login password
password: secretpassword
# The ProfitBricks virtual datacenter UUID
datacenter_id: <UUID>
# SSH private key filename
ssh_private_key: /path/to/private.key
# SSH public key filename
ssh_public_key: /path/to/public.key
```

```
my-profitbricks-profile:
provider: my-profitbricks-config
# Name of a predefined server size.
size: Micro Instance
# Assign CPU family to server.
cpu_family: INTEL_XEON
# Number of CPU cores to allocate to node (overrides server size).
cores: 4
# Amount of RAM in multiples of 256 MB (overrides server size).
ram: 4096
# The server availability zone.
availability_zone: ZONE_1
# Name or UUID of the HDD image to use.
image: <UUID>
# Image alias could be provided instead of image.
# Example 'ubuntu:latest'
#image_alias: <IMAGE_ALIAS>
# Size of the node disk in GB (overrides server size).
disk_size: 40
# Type of disk (HDD or SSD).
disk_type: SSD
# Storage availability zone to use.
disk_availability_zone: ZONE_2
# Assign the server to the specified public LAN.
```

(continues on next page)

(continued from previous page)

```

public_lan: <ID>
# Assign firewall rules to the network interface.
public_firewall_rules:
  SSH:
    protocol: TCP
    port_range_start: 22
    port_range_end: 22
# Assign the server to the specified private LAN.
private_lan: <ID>
# Enable NAT on the private NIC.
nat: true
# Assign additional volumes to the server.
volumes:
  data-volume:
    disk_size: 500
    disk_availability_zone: ZONE_3
  log-volume:
    disk_size: 50
    disk_type: SSD

```

To use a private IP for connecting and bootstrapping node:

```

my-profitbricks-profile:
  ssh_interface: private_lan

```

Set `deploy` to `False` if Salt should not be installed on the node.

```

my-profitbricks-profile:
  deploy: False

```

`salt.cloud.clouds.profitbricks.avail_images` (*call=None*)

Return a list of the images that are on the provider

`salt.cloud.clouds.profitbricks.avail_locations` (*call=None*)

Return a dict of all available VM locations on the cloud provider with relevant data

`salt.cloud.clouds.profitbricks.avail_sizes` (*call=None*)

Return a dict of all available VM sizes on the cloud provider with relevant data. Latest version can be found at:

`salt.cloud.clouds.profitbricks.create` (*vm\_*)

Create a single VM from a data dict

`salt.cloud.clouds.profitbricks.create_datacenter` (*call=None, kwargs=None*)

Creates a virtual datacenter based on supplied parameters.

CLI Example:

```

salt-cloud -f create_datacenter profitbricks name=mydatacenter
location=us/las description="my description"

```

`salt.cloud.clouds.profitbricks.create_loadbalancer` (*call=None, kwargs=None*)

Creates a loadbalancer within the datacenter from the provider config.

CLI Example:

```
salt-cloud -f create_loadbalancer profitbricks name=mylb
```

`salt.cloud.clouds.profitbricks.destroy`(*name*, *call=None*)

destroy a machine by name

**Parameters**

- **name** -- name given to the machine
- **call** -- call value in this case is 'action'

**Returns**

array of booleans , true if successfully stopped and true if successfully removed

CLI Example:

```
salt-cloud -d vm_name
```

`salt.cloud.clouds.profitbricks.get_configured_provider`()

Return the first configured instance.

`salt.cloud.clouds.profitbricks.get_conn`()

Return a conn object for the passed VM data

`salt.cloud.clouds.profitbricks.get_datacenter`(*conn*)

Return the datacenter from the config provider datacenter ID

`salt.cloud.clouds.profitbricks.get_datacenter_id`()

Return datacenter ID from provider configuration

`salt.cloud.clouds.profitbricks.get_dependencies`()

Warn if dependencies are not met.

`salt.cloud.clouds.profitbricks.get_disk_type`(*vm\_*)

Return the type of disk to use. Either 'HDD' (default) or 'SSD'.

`salt.cloud.clouds.profitbricks.get_image`(*vm\_*)

Return the image object to use

`salt.cloud.clouds.profitbricks.get_key_filename`(*vm\_*)

Check SSH private key file and return absolute path if exists.

`salt.cloud.clouds.profitbricks.get_node`(*conn*, *name*)

Return a node for the named VM

`salt.cloud.clouds.profitbricks.get_public_keys`(*vm\_*)

Retrieve list of SSH public keys.

`salt.cloud.clouds.profitbricks.get_size`(*vm\_*)

Return the VM's size object

`salt.cloud.clouds.profitbricks.get_wait_timeout`(*vm\_*)

Return the wait\_for\_timeout for resource provisioning.

`salt.cloud.clouds.profitbricks.list_datacenters`(*conn=None*, *call=None*)

List all the data centers

CLI Example:

```
salt-cloud -f list_datacenters my-profitbricks-config
```

`salt.cloud.clouds.profitbricks.list_images` (*call=None, kwargs=None*)

List all the images with alias by location

CLI Example:

```
salt-cloud -f list_images my-profitbricks-config location=us/las
```

`salt.cloud.clouds.profitbricks.list_loadbalancers` (*call=None*)

Return a list of the loadbalancers that are on the provider

`salt.cloud.clouds.profitbricks.list_nodes` (*conn=None, call=None*)

Return a list of VMs that are on the provider

`salt.cloud.clouds.profitbricks.list_nodes_full` (*conn=None, call=None*)

Return a list of the VMs that are on the provider, with all fields

`salt.cloud.clouds.profitbricks.reboot` (*name, call=None*)

reboot a machine by name :param name: name given to the machine :param call: call value in this case is 'action' :return: true if successful

CLI Example:

```
salt-cloud -a reboot vm_name
```

`salt.cloud.clouds.profitbricks.reserve_ipblock` (*call=None, kwargs=None*)

Reserve the IP Block

`salt.cloud.clouds.profitbricks.set_public_lan` (*lan\_id*)

Enables public Internet access for the specified public\_lan. If no public LAN is available, then a new public LAN is created.

`salt.cloud.clouds.profitbricks.show_instance` (*name, call=None*)

Show the details from the provider concerning an instance

`salt.cloud.clouds.profitbricks.signal_event` (*vm\_, event, description*)

`salt.cloud.clouds.profitbricks.ssh_interface` (*vm\_*)

Return the ssh\_interface type to connect to. Either 'public\_ips' (default) or 'private\_ips'.

`salt.cloud.clouds.profitbricks.start` (*name, call=None*)

start a machine by name :param name: name given to the machine :param call: call value in this case is 'action' :return: true if successful

CLI Example:

```
salt-cloud -a start vm_name
```

`salt.cloud.clouds.profitbricks.stop` (*name, call=None*)

stop a machine by name :param name: name given to the machine :param call: call value in this case is 'action' :return: true if successful

CLI Example:

```
salt-cloud -a stop vm_name
```

`salt.cloud.clouds.profitbricks.version_compatible(version)`

Checks profitbricks version

## 26.4.20 salt.cloud.clouds.proxmox

**Warning:** This module will be removed from Salt in version 3009 in favor of the [proxmox Salt Extension](#).

### Proxmox Cloud Module

New in version 2014.7.0.

The Proxmox cloud module is used to control access to cloud providers using the Proxmox system (KVM / OpenVZ / LXC).

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/proxmox.conf`:

#### my-proxmox-config:

```
# Proxmox account information
user: myuser@pam or myuser@pve
password: mypassword
url: hypervisor.domain.tld
port: 8006
driver: proxmox
verify_ssl: True
```

**Warning:** This cloud provider will be removed from Salt in version 3009.0 in favor of the [salttext.proxmox Salt Extension](#)

#### maintainer

Frank Klaassen <[frank@cloutright.nl](mailto:frank@cloutright.nl)>

#### depends

requests >= 2.2.1

#### depends

IPy >= 0.81

`salt.cloud.clouds.proxmox.avail_images(call=None, location='local')`

Return a list of the images that are on the provider

CLI Example:

```
salt-cloud --list-images my-proxmox-config
```

`salt.cloud.clouds.proxmox.avail_locations(call=None)`

Return a list of the hypervisors (nodes) which this Proxmox PVE machine manages

CLI Example:

```
salt-cloud --list-locations my-proxmox-config
```

`salt.cloud.clouds.proxmox.create`(*vm\_*)

Create a single VM from a data dict

CLI Example:

```
salt-cloud -p proxmox-ubuntu vmhostname
```

`salt.cloud.clouds.proxmox.create_node`(*vm\_*, *newid*)

Build and submit the requestdata to create a new node

`salt.cloud.clouds.proxmox.destroy`(*name*, *call=None*)

Destroy a node.

CLI Example:

```
salt-cloud --destroy mymachine
```

`salt.cloud.clouds.proxmox.get_configured_provider`()

Return the first configured instance.

`salt.cloud.clouds.proxmox.get_dependencies`()

Warn if dependencies aren't met.

`salt.cloud.clouds.proxmox.get_resources_nodes`(*call=None*, *resFilter=None*)

Retrieve all hypervisors (nodes) available on this environment

CLI Example:

```
salt-cloud -f get_resources_nodes my-proxmox-config
```

`salt.cloud.clouds.proxmox.get_resources_vms`(*call=None*, *resFilter=None*, *includeConfig=True*)

Retrieve all VMs available on this environment

CLI Example:

```
salt-cloud -f get_resources_vms my-proxmox-config
```

`salt.cloud.clouds.proxmox.get_vm_status`(*vmid=None*, *name=None*)

Get the status for a VM, either via the ID or the hostname

`salt.cloud.clouds.proxmox.get_vmconfig`(*vmid*, *node=None*, *node\_type='openvz'*)

Get VM configuration

`salt.cloud.clouds.proxmox.ignore_cidr`(*vm\_*, *ip*)

Return True if we are to ignore the specified IP.

`salt.cloud.clouds.proxmox.list_nodes`(*call=None*)

Return a list of the VMs that are managed by the provider

CLI Example:

```
salt-cloud -Q my-proxmox-config
```

`salt.cloud.clouds.proxmox.list_nodes_full`(*call=None*)

Return a list of the VMs that are on the provider

CLI Example:

```
salt-cloud -F my-proxmox-config
```

`salt.cloud.clouds.proxmox.list_nodes_select`(*call=None*)

Return a list of the VMs that are on the provider, with select fields

CLI Example:

```
salt-cloud -S my-proxmox-config
```

`salt.cloud.clouds.proxmox.preferred_ip`(*vm\_*, *ips*)

Return either an 'ipv4' (default) or 'ipv6' address depending on 'protocol' option. The list of 'ipv4' IPs is filtered by `ignore_cidr()` to remove any unreachable private addresses.

`salt.cloud.clouds.proxmox.query`(*conn\_type*, *option*, *post\_data=None*)

Execute the HTTP request to the API

`salt.cloud.clouds.proxmox.script`(*vm\_*)

Return the script deployment object

`salt.cloud.clouds.proxmox.set_vm_status`(*status*, *name=None*, *vmid=None*)

Convenience function for setting VM status

`salt.cloud.clouds.proxmox.show_instance`(*name*, *call=None*)

Show the details from Proxmox concerning an instance

`salt.cloud.clouds.proxmox.shutdown`(*name=None*, *vmid=None*, *call=None*)

Shutdown a node via ACPI.

CLI Example:

```
salt-cloud -a shutdown mymachine
```

`salt.cloud.clouds.proxmox.start`(*name*, *vmid=None*, *call=None*)

Start a node.

CLI Example:

```
salt-cloud -a start mymachine
```

`salt.cloud.clouds.proxmox.stop`(*name*, *vmid=None*, *call=None*)

Stop a node ("pulling the plug").

CLI Example:

```
salt-cloud -a stop mymachine
```

`salt.cloud.clouds.proxmox.wait_for_created`(*upid*, *timeout=300*)

Wait until a the vm has been created successfully

`salt.cloud.clouds.proxmox.wait_for_state`(*vmid*, *state*, *timeout=300*)

Wait until a specific state has been reached on a node

## 26.4.21 salt.cloud.clouds.pyrax

### Pyrax Cloud Module

PLEASE NOTE: This module is currently in early development, and considered to be experimental and unstable. It is not recommended for production use. Unless you are actively developing code in this module, you should use the OpenStack module instead.

`salt.cloud.clouds.pyrax.get_configured_provider()`

Return the first configured instance.

`salt.cloud.clouds.pyrax.get_conn(conn_type)`

Return a conn object for the passed VM data

`salt.cloud.clouds.pyrax.get_dependencies()`

Warn if dependencies aren't met.

`salt.cloud.clouds.pyrax.queues_create(call, kwargs)`

`salt.cloud.clouds.pyrax.queues_delete(call, kwargs)`

`salt.cloud.clouds.pyrax.queues_exists(call, kwargs)`

`salt.cloud.clouds.pyrax.queues_show(call, kwargs)`

## 26.4.22 salt.cloud.clouds.qingcloud

### QingCloud Cloud Module

New in version 2015.8.0.

The QingCloud cloud module is used to control access to the QingCloud. <http://www.qingcloud.com/>

Use of this module requires the `access_key_id`, `secret_access_key`, `zone` and `key_filename` parameter to be set.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/qingcloud.conf`:

```
my-qingcloud:
  driver: qingcloud
  access_key_id: AKIDMRTGYONNLTFFRBQJ
  secret_access_key: cLYwH21U5U0mcov4aNv2V2XocaHCG3JZGcxEczFu
  zone: pek2
  key_filename: /path/to/your.pem
```

`depends`

`requests`

`salt.cloud.clouds.qingcloud.avail_images(kwargs=None, call=None)`

Return a list of the images that are on the provider.

CLI Examples:

```
salt-cloud --list-images my-qingcloud
salt-cloud -f avail_images my-qingcloud zone=gd1
```

`salt.cloud.clouds.qingcloud.avail_locations` (*call=None*)

Return a dict of all available locations on the provider with relevant data.

CLI Examples:

```
salt-cloud --list-locations my-qingcloud
```

`salt.cloud.clouds.qingcloud.avail_sizes` (*kwargs=None, call=None*)

Return a list of the instance sizes that are on the provider.

CLI Examples:

```
salt-cloud --list-sizes my-qingcloud
salt-cloud -f avail_sizes my-qingcloud zone=pek2
```

`salt.cloud.clouds.qingcloud.create` (*vm\_*)

Create a single instance from a data dict.

CLI Examples:

```
salt-cloud -p qingcloud-ubuntu-c1m1 hostname1
salt-cloud -m /path/to/mymap.sls -P
```

`salt.cloud.clouds.qingcloud.destroy` (*instance\_id, call=None*)

Destroy an instance.

CLI Example:

```
salt-cloud -a destroy i-2f733r5n
salt-cloud -d i-2f733r5n
```

`salt.cloud.clouds.qingcloud.get_configured_provider` ()

Return the first configured instance.

`salt.cloud.clouds.qingcloud.get_dependencies` ()

Warn if dependencies aren't met.

`salt.cloud.clouds.qingcloud.list_nodes` (*call=None*)

Return a list of the instances that are on the provider.

CLI Examples:

```
salt-cloud -Q my-qingcloud
```

`salt.cloud.clouds.qingcloud.list_nodes_full` (*call=None*)

Return a list of the instances that are on the provider.

CLI Examples:

```
salt-cloud -F my-qingcloud
```

`salt.cloud.clouds.qingcloud.list_nodes_min` (*call=None*)

Return a list of the instances that are on the provider. Only a list of instances names, and their state, is returned.

CLI Examples:

```
salt-cloud -f list_nodes_min my-qingcloud
```

`salt.cloud.clouds.qingcloud.list_nodes_select` (*call=None*)  
Return a list of the instances that are on the provider, with selected fields.

CLI Examples:

```
salt-cloud -S my-qingcloud
```

`salt.cloud.clouds.qingcloud.query` (*params=None*)  
Make a web call to QingCloud IaaS API.

`salt.cloud.clouds.qingcloud.reboot` (*instance\_id, call=None*)  
Reboot an instance.

CLI Examples:

```
salt-cloud -a reboot i-2f733r5n
```

`salt.cloud.clouds.qingcloud.script` (*vm\_*)  
Return the script deployment object.

`salt.cloud.clouds.qingcloud.show_image` (*kwargs, call=None*)  
Show the details from QingCloud concerning an image.

CLI Examples:

```
salt-cloud -f show_image my-qingcloud image=trustysrvx64c
salt-cloud -f show_image my-qingcloud image=trustysrvx64c,coreos4
salt-cloud -f show_image my-qingcloud image=trustysrvx64c zone=ap1
```

`salt.cloud.clouds.qingcloud.show_instance` (*instance\_id, call=None, kwargs=None*)  
Show the details from QingCloud concerning an instance.

CLI Examples:

```
salt-cloud -a show_instance i-2f733r5n
```

`salt.cloud.clouds.qingcloud.start` (*instance\_id, call=None*)  
Start an instance.

CLI Examples:

```
salt-cloud -a start i-2f733r5n
```

`salt.cloud.clouds.qingcloud.stop` (*instance\_id, force=False, call=None*)  
Stop an instance.

CLI Examples:

```
salt-cloud -a stop i-2f733r5n
salt-cloud -a stop i-2f733r5n force=True
```

## 26.4.23 salt.cloud.clouds.saltify

### Saltify Module

The Saltify module is designed to install Salt on a remote machine, virtual or bare metal, using SSH. This module is useful for provisioning machines which are already installed, but not Salted.

Changed in version 2018.3.0: The `wake_on_lan` capability, and actions `destroy`, `reboot`, and `query` functions were added.

Use of this module requires some configuration in cloud profile and provider files as described in the [Getting Started with Saltify](#) documentation.

`salt.cloud.clouds.saltify.avail_images` (*call=None*)

This function returns a list of images available for this cloud provider.

```
salt-cloud --list-images saltify
```

returns a list of available profiles.

New in version 2018.3.0.

`salt.cloud.clouds.saltify.avail_locations` (*call=None*)

This function returns a list of locations available.

```
salt-cloud --list-locations my-cloud-provider
```

[ saltify will always return an empty dictionary ]

`salt.cloud.clouds.saltify.avail_sizes` (*call=None*)

This function returns a list of sizes available for this cloud provider.

```
salt-cloud --list-sizes saltify
```

[ saltify always returns an empty dictionary ]

`salt.cloud.clouds.saltify.create` (*vm\_*)

if configuration parameter `deploy` is `True`,

Provision a single machine, adding its keys to the salt master

else,

Test ssh connections to the machine

Configuration parameters:

- `deploy`: (see above)
- `provider`: name of entry in `salt/cloud.providers.d/??? file`
- `ssh_host`: IP address or DNS name of the new machine
- `ssh_username`: name used to log in to the new machine
- `ssh_password`: password to log in (unless `key_filename` is used)
- `key_filename`: (optional) SSH private key for passwordless login
- `ssh_port`: (default=22) TCP port for SSH connection
- `wake_on_lan_mac`: (optional) hardware (MAC) address for wake on lan

- `wol_sender_node`: (optional) salt minion to send wake on lan command
- `wol_boot_wait`: (default=30) seconds to delay while client boots
- `force_minion_config`: (optional) replace the minion configuration files on the new machine

See also *Miscellaneous Salt Cloud Options* and *Getting Started with Saltify*

CLI Example:

```
salt-cloud -p mymachine my_new_id
```

`salt.cloud.clouds.saltify.destroy`(*name*, *call=None*)

Destroy a node.

New in version 2018.3.0.

Disconnect a minion from the master, and remove its keys.

Optionally, (if `remove_config_on_destroy` is `True`),  
disables salt-minion from running on the minion, and erases the Salt configuration files from it.

Optionally, (if `shutdown_on_destroy` is `True`),  
orders the minion to halt.

CLI Example:

```
salt-cloud --destroy mymachine
```

`salt.cloud.clouds.saltify.get_configured_provider`()

Return the first configured instance.

`salt.cloud.clouds.saltify.list_nodes`(*call=None*)

List the nodes which have salt-cloud:driver:saltify grains.

```
salt-cloud -Q
```

returns a list of dictionaries of defined standard fields.

New in version 2018.3.0.

`salt.cloud.clouds.saltify.list_nodes_full`(*call=None*)

Lists complete information for all nodes.

```
salt-cloud -F
```

returns a list of dictionaries.

for 'saltify' minions, returns dict of grains (enhanced).

New in version 2018.3.0.

`salt.cloud.clouds.saltify.list_nodes_select`(*call=None*)

Return a list of the minions that have salt-cloud grains, with select fields.

`salt.cloud.clouds.saltify.reboot`(*name*, *call=None*)

Reboot a saltify minion.

New in version 2018.3.0.

**name**

The name of the VM to reboot.

CLI Example:

```
salt-cloud -a reboot vm_name
```

`salt.cloud.clouds.saltify.show_instance` (*name*, *call=None*)

List the a single node, return dict of grains.

## 26.4.24 salt.cloud.clouds.scaleway

### Scaleway Cloud Module

New in version 2015.8.0.

The Scaleway cloud module is used to interact with your Scaleway BareMetal Servers.

Use of this module only requires the `api_key` parameter to be set. Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/scaleway.conf`:

#### scaleway-config:

```
# Scaleway organization and token
access_key: 0e604a2c-aea6-4081-acb2-e1d1258ef95c
token: be8fd96b-04eb-4d39-b6ba-a9edbcf17f12
driver: scaleway
```

`salt.cloud.clouds.scaleway.avail_images` (*call=None*)

Return a list of the images that are on the provider.

`salt.cloud.clouds.scaleway.create` (*server\_*)

Create a single BareMetal server from a data dict.

`salt.cloud.clouds.scaleway.create_node` (*args*)

Create a node.

`salt.cloud.clouds.scaleway.destroy` (*name*, *call=None*)

Destroy a node. Will check termination protection and warn if enabled.

CLI Example:

```
salt-cloud --destroy mymachine
```

`salt.cloud.clouds.scaleway.get_configured_provider` ()

Return the first configured instance.

`salt.cloud.clouds.scaleway.get_image` (*server\_*)

Return the image object to use.

`salt.cloud.clouds.scaleway.list_nodes` (*call=None*)

Return a list of the BareMetal servers that are on the provider.

`salt.cloud.clouds.scaleway.list_nodes_full` (*call=None*)

Return a list of the BareMetal servers that are on the provider.

`salt.cloud.clouds.scaleway.list_nodes_select` (*call=None*)

Return a list of the BareMetal servers that are on the provider, with select fields.

`salt.cloud.clouds.scaleway.query` (*method='servers', server\_id=None, command=None, args=None, http\_method='GET', root='api\_root'*)

Make a call to the Scaleway API.

`salt.cloud.clouds.scaleway.script` (*server\_*)

Return the script deployment object.

`salt.cloud.clouds.scaleway.show_instance` (*name, call=None*)

Show the details from a Scaleway BareMetal server.

## 26.4.25 salt.cloud.clouds.softlayer

### SoftLayer Cloud Module

The SoftLayer cloud module is used to control access to the SoftLayer VPS system.

Use of this module only requires the `apikey` parameter. Set up the cloud configuration at:

`/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/softlayer.conf`:

```
my-softlayer-config:
# SoftLayer account api key
user: MYLOGIN
apikey: JVkbSJDGHSDKUKSDJfhsdklfjgsjdkflhjl s d f f f h g d g j k e n r t u i n v
driver: softlayer
```

The SoftLayer Python Library needs to be installed in order to use the SoftLayer salt.cloud modules. See: <https://pypi.python.org/pypi/SoftLayer>

**depends**  
softlayer

`salt.cloud.clouds.softlayer.avail_images` (*call=None*)

Return a dict of all available VM images on the cloud provider.

`salt.cloud.clouds.softlayer.avail_locations` (*call=None*)

List all available locations

`salt.cloud.clouds.softlayer.avail_sizes` (*call=None*)

Return a dict of all available VM sizes on the cloud provider with relevant data. This data is provided in three dicts.

`salt.cloud.clouds.softlayer.create` (*vm\_*)

Create a single VM from a data dict

`salt.cloud.clouds.softlayer.destroy` (*name, call=None*)

Destroy a node.

CLI Example:

```
salt-cloud --destroy mymachine
```

`salt.cloud.clouds.softlayer.get_configured_provider` ()

Return the first configured instance.

`salt.cloud.clouds.softlayer.get_conn(service='SoftLayer_Virtual_Guest')`

Return a conn object for the passed VM data

`salt.cloud.clouds.softlayer.get_dependencies()`

Warn if dependencies aren't met.

`salt.cloud.clouds.softlayer.get_location(vm_=None)`

Return the location to use, in this order:

- CLI parameter
- VM parameter
- Cloud profile setting

`salt.cloud.clouds.softlayer.list_custom_images(call=None)`

Return a dict of all custom VM images on the cloud provider.

`salt.cloud.clouds.softlayer.list_nodes(call=None)`

Return a list of the VMs that are on the provider

`salt.cloud.clouds.softlayer.list_nodes_full(mask='mask[id]', call=None)`

Return a list of the VMs that are on the provider

`salt.cloud.clouds.softlayer.list_nodes_select(call=None)`

Return a list of the VMs that are on the provider, with select fields

`salt.cloud.clouds.softlayer.list_vlans(call=None)`

List all VLANs associated with the account

`salt.cloud.clouds.softlayer.script(vm_)`

Return the script deployment object

`salt.cloud.clouds.softlayer.show_instance(name, call=None)`

Show the details from SoftLayer concerning a guest

### 26.4.26 salt.cloud.clouds.softlayer\_hw

#### SoftLayer HW Cloud Module

The SoftLayer HW cloud module is used to control access to the SoftLayer hardware cloud system

Use of this module only requires the `apikey` parameter. Set up the cloud configuration at:

`/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/softlayer.conf`:

```
my-softlayer-config:
# SoftLayer account api key
user: MYLOGIN
apikey: JVkbSJDGHSKUKSDJfhsdklfjgsjdkflhjlstdffhgdgjenrtuinv
driver: softlayer_hw
```

The SoftLayer Python Library needs to be installed in order to use the SoftLayer salt.cloud modules. See: <https://pypi.python.org/pypi/SoftLayer>

```
depends
  softlayer
```

`salt.cloud.clouds.softlayer_hw.avail_images` (*call=None*)

Return a dict of all available VM images on the cloud provider.

`salt.cloud.clouds.softlayer_hw.avail_locations` (*call=None*)

List all available locations

`salt.cloud.clouds.softlayer_hw.avail_sizes` (*call=None*)

Return a dict of all available VM sizes on the cloud provider with relevant data. This data is provided in three dicts.

`salt.cloud.clouds.softlayer_hw.create` (*vm\_*)

Create a single VM from a data dict

`salt.cloud.clouds.softlayer_hw.destroy` (*name, call=None*)

Destroy a node.

CLI Example:

```
salt-cloud --destroy mymachine
```

`salt.cloud.clouds.softlayer_hw.get_configured_provider` ()

Return the first configured instance.

`salt.cloud.clouds.softlayer_hw.get_conn` (*service='SoftLayer\_Hardware'*)

Return a conn object for the passed VM data

`salt.cloud.clouds.softlayer_hw.get_dependencies` ()

Warn if dependencies aren't met.

`salt.cloud.clouds.softlayer_hw.get_location` (*vm\_=None*)

Return the location to use, in this order:

- CLI parameter
- VM parameter
- Cloud profile setting

`salt.cloud.clouds.softlayer_hw.list_nodes` (*call=None*)

Return a list of the VMs that are on the provider

`salt.cloud.clouds.softlayer_hw.list_nodes_full` (*mask='mask[id, hostname, primaryIpAddress, primaryBackendIpAddress, processorPhysicalCoreAmount, memoryCount]', call=None*)

Return a list of the VMs that are on the provider

`salt.cloud.clouds.softlayer_hw.list_nodes_select` (*call=None*)

Return a list of the VMs that are on the provider, with select fields

`salt.cloud.clouds.softlayer_hw.list_vlans` (*call=None*)

List all VLANs associated with the account

`salt.cloud.clouds.softlayer_hw.script` (*vm\_*)

Return the script deployment object

`salt.cloud.clouds.softlayer_hw.show_all_categories` (*call=None*)

Return a dict of all available categories on the cloud provider.

New in version 2016.3.0.

`salt.cloud.clouds.softlayer_hw.show_all_prices` (*call=None, kwargs=None*)

Return a dict of all prices on the cloud provider.

`salt.cloud.clouds.softlayer_hw.show_instance` (*name, call=None*)

Show the details from SoftLayer concerning a guest

`salt.cloud.clouds.softlayer_hw.show_pricing` (*kwargs=None, call=None*)

Show pricing for a particular profile. This is only an estimate, based on unofficial pricing sources.

CLI Examples:

```
salt-cloud -f show_pricing my-softlayerhw-config profile=my-profile
```

If pricing sources have not been cached, they will be downloaded. Once they have been cached, they will not be updated automatically. To manually update all prices, use the following command:

```
salt-cloud -f update_pricing <provider>
```

New in version 2015.8.0.

## 26.4.27 salt.cloud.clouds.tencentcloud

### Tencent Cloud Cloud Module

New in version 3000.

The Tencent Cloud Cloud Module is used to control access to the Tencent Cloud instance. <https://intl.cloud.tencent.com/>

To use this module, set up the cloud configuration at

`/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/*.conf`:

```
my-tencentcloud-config:
driver: tencentcloud
# Tencent Cloud Secret Id
id: AKIDA64pOio9BMemkApzevX0HS169S4b750A
# Tencent Cloud Secret Key
key: 8r2xmPn0C5FDvRALmcJimiTZKVRsk260
# Tencent Cloud Region
location: ap-guangzhou
```

**depends**

tencentcloud-sdk-python

`salt.cloud.clouds.tencentcloud.avail_images` (*call=None*)

Return Tencent Cloud available image

CLI Example:

```
salt-cloud --list-images my-tencentcloud-config
salt-cloud -f avail_images my-tencentcloud-config
```

`salt.cloud.clouds.tencentcloud.avail_locations` (*call=None*)

Return Tencent Cloud available region

CLI Example:

```
salt-cloud --list-locations my-tencentcloud-config
salt-cloud -f avail_locations my-tencentcloud-config
```

`salt.cloud.clouds.tencentcloud.avail_sizes` (*call=None*)

Return Tencent Cloud available instance type

CLI Example:

```
salt-cloud --list-sizes my-tencentcloud-config
salt-cloud -f avail_sizes my-tencentcloud-config
```

`salt.cloud.clouds.tencentcloud.create` (*vm\_*)

Create a single Tencent Cloud instance from a data dict.

Tencent Cloud profiles require a provider, availability\_zone, image and size. Set up profile at /etc/salt/cloud.profiles or /etc/salt/cloud.profiles.d/\*.conf:

```
tencentcloud-guangzhou-s1sm1:
  provider: my-tencentcloud-config
  availability_zone: ap-guangzhou-3
  image: img-31tjrtph
  size: S1.SMALL1
  allocate_public_ip: True
  internet_max_bandwidth_out: 1
  password: '153e41ec96140152'
  securitygroups:
    - sg-5e90804b
```

CLI Examples:

```
salt-cloud -p tencentcloud-guangzhou-s1 myinstance
```

`salt.cloud.clouds.tencentcloud.destroy` (*name, call=None*)

Destroy a Tencent Cloud instance

CLI Example:

```
salt-cloud -a destroy myinstance
salt-cloud -d myinstance
```

`salt.cloud.clouds.tencentcloud.get_configured_provider` ()

Return the first configured instance.

`salt.cloud.clouds.tencentcloud.get_dependencies` ()

Warn if dependencies aren't met.

`salt.cloud.clouds.tencentcloud.get_provider_client` (*name=None*)

Return a new provider client

`salt.cloud.clouds.tencentcloud.list_availability_zones` (*call=None*)

Return all Tencent Cloud availability zones in current region

CLI Example:

```
salt-cloud -f list_availability_zones my-tencentcloud-config
```

`salt.cloud.clouds.tencentcloud.list_custom_images` (*call=None*)

Return all Tencent Cloud images in current region

CLI Example:

```
salt-cloud -f list_custom_images my-tencentcloud-config
```

`salt.cloud.clouds.tencentcloud.list_nodes` (*call=None*)

Return a list of instances that are on the provider

CLI Examples:

```
salt-cloud -Q
```

`salt.cloud.clouds.tencentcloud.list_nodes_full` (*call=None*)

Return a list of instances that are on the provider, with full details

CLI Examples:

```
salt-cloud -F
```

`salt.cloud.clouds.tencentcloud.list_nodes_min` (*call=None*)

Return a list of instances that are on the provider, Only names, and their state, is returned.

CLI Examples:

```
salt-cloud -f list_nodes_min my-tencentcloud-config
```

`salt.cloud.clouds.tencentcloud.list_nodes_select` (*call=None*)

Return a list of instances that are on the provider, with select fields

CLI Examples:

```
salt-cloud -S
```

`salt.cloud.clouds.tencentcloud.list_securitygroups` (*call=None*)

Return all Tencent Cloud security groups in current region

CLI Example:

```
salt-cloud -f list_securitygroups my-tencentcloud-config
```

`salt.cloud.clouds.tencentcloud.reboot` (*name, call=None*)

Reboot a Tencent Cloud instance

CLI Examples:

```
salt-cloud -a reboot myinstance
```

`salt.cloud.clouds.tencentcloud.script` (*vm\_*)

Return the script deployment object

`salt.cloud.clouds.tencentcloud.show_disk(name, call=None)`

Show the disk details of Tencent Cloud instance

CLI Examples:

```
salt-cloud -a show_disk myinstance
```

`salt.cloud.clouds.tencentcloud.show_image(kwargs, call=None)`

Show the details of Tencent Cloud image

CLI Examples:

```
salt-cloud -f show_image tencentcloud image=img-31tjrtph
```

`salt.cloud.clouds.tencentcloud.show_instance(name, call=None)`

Show the details of Tencent Cloud instance

CLI Examples:

```
salt-cloud -a show_instance myinstance
```

`salt.cloud.clouds.tencentcloud.start(name, call=None)`

Start a Tencent Cloud instance Notice: the instance state must be stopped

CLI Examples:

```
salt-cloud -a start myinstance
```

`salt.cloud.clouds.tencentcloud.stop(name, force=False, call=None)`

Stop a Tencent Cloud running instance Note: use `force=True` to make force stop

CLI Examples:

```
salt-cloud -a stop myinstance
salt-cloud -a stop myinstance force=True
```

## 26.4.28 salt.cloud.clouds.vagrant

### Vagrant Cloud Driver

The Vagrant cloud is designed to "vagrant up" a virtual machine as a Salt minion.

Use of this module requires some configuration in cloud profile and provider files as described in the [Getting Started with Vagrant](#) documentation.

New in version 2018.3.0.

`salt.cloud.clouds.vagrant.avail_images(call=None)`

This function returns a list of images available for this cloud provider. vagrant will return a list of profiles.

```
salt-cloud --list-images my-cloud-provider
```

`salt.cloud.clouds.vagrant.avail_locations(call=None)`

This function returns a list of locations available.

CLI Example:

```
salt-cloud --list-locations my-cloud-provider
# \[ vagrant will always returns an empty dictionary \]
```

`salt.cloud.clouds.vagrant.avail_sizes` (*call=None*)

This function returns a list of sizes available for this cloud provider.

CLI Example:

```
salt-cloud --list-sizes my-cloud-provider
# \[ vagrant always returns an empty dictionary \]
```

`salt.cloud.clouds.vagrant.create` (*vm\_*)

Provision a single machine

CLI Example:

```
salt-cloud -p my_profile new_node_1
```

`salt.cloud.clouds.vagrant.destroy` (*name, call=None*)

Destroy a node.

CLI Example:

```
salt-cloud --destroy mymachine
```

`salt.cloud.clouds.vagrant.get_configured_provider` ()

Return the first configured instance.

`salt.cloud.clouds.vagrant.list_nodes` (*call=None*)

List the nodes which have salt-cloud:driver:vagrant grains.

CLI Example:

```
salt-cloud -Q
```

`salt.cloud.clouds.vagrant.list_nodes_full` (*call=None*)

List the nodes, ask all 'vagrant' minions, return dict of grains (enhanced).

CLI Example:

```
salt-call -F
```

`salt.cloud.clouds.vagrant.list_nodes_select` (*call=None*)

Return a list of the minions that have salt-cloud grains, with select fields.

`salt.cloud.clouds.vagrant.reboot` (*name, call=None*)

Reboot a vagrant minion.

**name**

The name of the VM to reboot.

CLI Example:

```
salt-cloud -a reboot vm_name
```

`salt.cloud.clouds.vagrant.show_instance` (*name*, *call=None*)

List the a single node, return dict of grains.

## 26.4.29 salt.cloud.clouds.virtualbox

A salt cloud provider that lets you use virtualbox on your machine and act as a cloud.

### depends

vboxapi

For now this will only clone existing VMs. It's best to create a template from which we will clone.

Followed <https://docs.saltproject.io/en/latest/topics/cloud/cloud.html#non-libcloud-based-modules> to create this.

Dicts provided by salt:

### \_\_opts\_\_

[contains the options used to run Salt Cloud,] as well as a set of configuration and environment variables

`salt.cloud.clouds.virtualbox.create` (*vm\_info*)

Creates a virtual machine from the given VM information

This is what is used to request a virtual machine to be created by the cloud provider, wait for it to become available, and then (optionally) log in and install Salt on it.

Events fired:

This function fires the event `salt/cloud/vm_name/creating`, with the payload containing the names of the VM, profile, and provider.

@param vm\_info

```
{
  name: <str>
  profile: <dict>
  driver: <provider>:<profile>
  clonefrom: <vm_name>
  clonemode: <mode> (default: state, choices: state, child, all)
}
```

@type vm\_info dict @return dict of resulting vm. !!!Passwords can and should be included!!!

`salt.cloud.clouds.virtualbox.destroy` (*name*, *call=None*)

This function irreversibly destroys a virtual machine on the cloud provider. Before doing so, it should fire an event on the Salt event bus.

The tag for this event is `salt/cloud/<vm name>/destroying`. Once the virtual machine has been destroyed, another event is fired. The tag for that event is `salt/cloud/<vm name>/destroyed`.

### Dependencies:

list\_nodes

@param name: @type name: str @param call: @type call: @return: True if all went well, otherwise an error message @rtype: bool|str

`salt.cloud.clouds.virtualbox.get_configured_provider` ()

Return the first configured instance.

`salt.cloud.clouds.virtualbox.list_nodes` (*kwargs=None, call=None*)

This function returns a list of nodes available on this cloud provider, using the following fields:

id (str) image (str) size (str) state (str) private\_ips (list) public\_ips (list)

No other fields should be returned in this function, and all of these fields should be returned, even if empty. The `private_ips` and `public_ips` fields should always be of a list type, even if empty, and the other fields should always be of a str type. This function is normally called with the `-Q` option:

```
salt-cloud -Q
```

@param kwargs: @type kwargs: @param call: @type call: @return: @rtype:

`salt.cloud.clouds.virtualbox.list_nodes_full` (*kwargs=None, call=None*)

All information available about all nodes should be returned in this function. The fields in the `list_nodes()` function should also be returned, even if they would not normally be provided by the cloud provider.

This is because some functions both within Salt and 3rd party will break if an expected field is not present. This function is normally called with the `-F` option:

```
salt-cloud -F
```

@param kwargs: @type kwargs: @param call: @type call: @return: @rtype:

`salt.cloud.clouds.virtualbox.list_nodes_select` (*call=None*)

Return a list of the VMs that are on the provider, with select fields

`salt.cloud.clouds.virtualbox.map_clonemode` (*vm\_info*)

Convert the virtualbox config file values for `clone_mode` into the integers the API requires

`salt.cloud.clouds.virtualbox.show_image` (*kwargs, call=None*)

Show the details of an image

`salt.cloud.clouds.virtualbox.start` (*name, call=None*)

Start a machine. @param name: Machine to start @type name: str @param call: Must be "action" @type call: str

`salt.cloud.clouds.virtualbox.stop` (*name, call=None*)

Stop a running machine. @param name: Machine to stop @type name: str @param call: Must be "action" @type call: str

### 26.4.30 salt.cloud.clouds.vmware

#### VMware Cloud Module

New in version 2015.5.4.

The VMware cloud module allows you to manage VMware ESX, ESXi, and vCenter.

See [Getting started with VMware](#) to get started.

**codeauthor**

Nitin Madhok <nmadhok@g.clemson.edu>

## Dependencies

- pyVmomi Python Module

## pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

---

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

---

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original VMware cloud driver was developed against.

---

**Note:** Ensure python pyVmomi module is installed by running following one-liner check. The output should be 0.

```
python -c "import pyVmomi" ; echo $?
```

## Configuration

To use this module, set up the vCenter or ESX/ESXi URL, username and password in the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/vmware.conf`:

```
my-vmware-config:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
  url: '10.20.30.40'

vcenter01:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
  url: 'vcenter01.domain.com'
  protocol: 'https'
  port: 443

vcenter02:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
```

(continues on next page)

(continued from previous page)

```
url: 'vcenter02.domain.com'
protocol: 'http'
port: 80
```

```
esx01:
  driver: vmware
  user: 'admin'
  password: 'verybadpass'
  url: 'esx01.domain.com'
```

**Note:** Optionally, `protocol` and `port` can be specified if the vCenter server is not using the defaults. Default is `protocol: https` and `port: 443`.

**Note:** Changed in version 2015.8.0.

The `provider` parameter in cloud provider configuration was renamed to `driver`. This change was made to avoid confusion with the `provider` parameter that is used in cloud profile configuration. Cloud provider configuration now uses `driver` to refer to the salt-cloud driver that provides the underlying functionality to connect to a cloud provider, while cloud profile configuration continues to use `provider` to refer to the cloud provider configuration that you define.

To test the connection for `my-vmware-config` specified in the cloud configuration, run `test_vcenter_connection()`

`salt.cloud.clouds.vmware.add_host` (*kwargs=None, call=None*)

Add a host system to the specified cluster or datacenter in this VMware environment

**Note:** To use this function, you need to specify `esxi_host_user` and `esxi_host_password` under your provider configuration set up at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/vmware.conf`:

```
vcenter01:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
  url: 'vcenter01.domain.com'

  # Required when adding a host system
  esxi_host_user: 'root'
  esxi_host_password: 'myhostpassword'
  # Optional fields that can be specified when adding a host system
  esxi_host_ssl_thumbprint:
    → '12:A3:45:B6:CD:7E:F8:90:A1:BC:23:45:D6:78:9E:FA:01:2B:34:CD'
```

The SSL thumbprint of the host system can be optionally specified by setting `esxi_host_ssl_thumbprint` under your provider configuration. To get the SSL thumbprint of the host system, execute the following command from a remote server:

```
echo -n | openssl s_client -connect <YOUR-HOSTSYSTEM-DNS/IP>:443 2>/dev/
→ null | openssl x509 -noout -fingerprint -sha1
```

CLI Example:

```
salt-cloud -f add_host my-vmware-config host="myHostSystemName" cluster=
→"myClusterName"
salt-cloud -f add_host my-vmware-config host="myHostSystemName"
→datacenter="myDatacenterName"
```

`salt.cloud.clouds.vmware.avail_images` (*call=None*)

Return a list of all the templates present in this VMware environment with basic details

CLI Example:

```
salt-cloud --list-images my-vmware-config
```

`salt.cloud.clouds.vmware.avail_locations` (*call=None*)

Return a list of all the available locations/datacenters in this VMware environment

CLI Example:

```
salt-cloud --list-locations my-vmware-config
```

`salt.cloud.clouds.vmware.avail_sizes` (*call=None*)

Return a list of all the available sizes in this VMware environment.

CLI Example:

```
salt-cloud --list-sizes my-vmware-config
```

---

**Note:** Since sizes are built into templates, this function will return an empty dictionary.

---

`salt.cloud.clouds.vmware.build_clonespec` (*config\_spec, object\_ref, reloc\_spec, template*)

Returns the clone spec

`salt.cloud.clouds.vmware.connect_host` (*kwargs=None, call=None*)

Connect the specified host system in this VMware environment

CLI Example:

```
salt-cloud -f connect_host my-vmware-config host="myHostSystemName"
```

`salt.cloud.clouds.vmware.convert_to_template` (*name, kwargs=None, call=None*)

Convert the specified virtual machine to template.

CLI Example:

```
salt-cloud -a convert_to_template vmname
```

`salt.cloud.clouds.vmware.create` (*vm\_*)

To create a single VM in the VMware environment.

Sample profile and arguments that can be specified in it can be found [here](#).

CLI Example:

```
salt-cloud -p vmware-centos6.5 vmname
```

`salt.cloud.clouds.vmware.create_cluster` (*kwargs=None, call=None*)

Create a new cluster under the specified datacenter in this VMware environment

CLI Example:

```
salt-cloud -f create_cluster my-vmware-config name="myNewCluster"
→datacenter="datacenterName"
```

`salt.cloud.clouds.vmware.create_datacenter` (*kwargs=None, call=None*)

Create a new data center in this VMware environment

CLI Example:

```
salt-cloud -f create_datacenter my-vmware-config name="MyNewDatacenter"
```

`salt.cloud.clouds.vmware.create_datastore_cluster` (*kwargs=None, call=None*)

Create a new datastore cluster for the specified datacenter in this VMware environment

CLI Example:

```
salt-cloud -f create_datastore_cluster my-vmware-config name=
→"datastoreClusterName" datacenter="datacenterName"
```

`salt.cloud.clouds.vmware.create_folder` (*kwargs=None, call=None*)

Create the specified folder path in this VMware environment

---

**Note:** To create a Host and Cluster Folder under a Datacenter, specify `path="/yourDatacenterName/host/yourFolderName"`

To create a Network Folder under a Datacenter, specify `path="/yourDatacenterName/network/yourFolderName"`

To create a Storage Folder under a Datacenter, specify `path="/yourDatacenterName/datastore/yourFolderName"`

To create a VM and Template Folder under a Datacenter, specify `path="/yourDatacenterName/vm/yourFolderName"`

---

CLI Example:

```
salt-cloud -f create_folder my-vmware-config path="/Local/a/b/c"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/vm/
→MyVMFolder"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/host/
→MyHostFolder"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/network/
→MyNetworkFolder"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/storage/
→MyStorageFolder"
```

`salt.cloud.clouds.vmware.create_snapshot` (*name, kwargs=None, call=None*)

Create a snapshot of the specified virtual machine in this VMware environment

---

**Note:** If the VM is powered on, the internal state of the VM (memory dump) is included in the snapshot by default which will also set the power state of the snapshot to "powered on". You can set `memdump=False` to override this. This field is ignored if the virtual machine is powered off or if the VM does not support snapshots with memory dumps. Default is `memdump=True`

---

**Note:** If the VM is powered on when the snapshot is taken, VMware Tools can be used to quiesce the file system in the virtual machine by setting `quiesce=True`. This field is ignored if the virtual machine is powered off; if VMware Tools are not available or if `memdump=True`. Default is `quiesce=False`

---

CLI Example:

```
salt-cloud -a create_snapshot vmname snapshot_name="mySnapshot"
salt-cloud -a create_snapshot vmname snapshot_name="mySnapshot"
→ [description="My snapshot"] [memdump=False] [quiesce=True]
```

`salt.cloud.clouds.vmware.destroy` (*name, call=None*)

To destroy a VM from the VMware environment

CLI Example:

```
salt-cloud -d vmname
salt-cloud --destroy vmname
salt-cloud -a destroy vmname
```

`salt.cloud.clouds.vmware.disconnect_host` (*kwargs=None, call=None*)

Disconnect the specified host system in this VMware environment

CLI Example:

```
salt-cloud -f disconnect_host my-vmware-config host="myHostSystemName"
```

`salt.cloud.clouds.vmware.enter_maintenance_mode` (*kwargs=None, call=None*)

To put the specified host system in maintenance mode in this VMware environment

CLI Example:

```
salt-cloud -f enter_maintenance_mode my-vmware-config host=
→ "myHostSystemName"
```

`salt.cloud.clouds.vmware.exit_maintenance_mode` (*kwargs=None, call=None*)

To take the specified host system out of maintenance mode in this VMware environment

CLI Example:

```
salt-cloud -f exit_maintenance_mode my-vmware-config host=
→ "myHostSystemName"
```

`salt.cloud.clouds.vmware.get_clonespec_for_valid_snapshot` (*config\_spec, object\_ref, reloc\_spec, template, vm\_*)

return clonespec only if values are valid

`salt.cloud.clouds.vmware.get_configured_provider` ()

Return the first configured instance.

`salt.cloud.clouds.vmware.get_dependencies()`

Warn if dependencies aren't met.

`salt.cloud.clouds.vmware.get_vcenter_version(kwarg=None, call=None)`

Show the vCenter Server version with build number.

CLI Example:

```
salt-cloud -f get_vcenter_version my-vmware-config
```

`salt.cloud.clouds.vmware.handle_snapshot(config_spec, object_ref, reloc_spec, template, vm_)`

Returns a clone spec for cloning from snapshots :rtype vim.vm.CloneSpec

`salt.cloud.clouds.vmware.list_clusters(kwarg=None, call=None)`

List all the clusters for this VMware environment

CLI Example:

```
salt-cloud -f list_clusters my-vmware-config
```

`salt.cloud.clouds.vmware.list_clusters_by_datacenter(kwarg=None, call=None)`

List clusters for each datacenter; or clusters for a specified datacenter in this VMware environment

To list clusters for each datacenter:

CLI Example:

```
salt-cloud -f list_clusters_by_datacenter my-vmware-config
```

To list clusters for a specified datacenter:

CLI Example:

```
salt-cloud -f list_clusters_by_datacenter my-vmware-config datacenter=
↳ "datacenterName"
```

`salt.cloud.clouds.vmware.list_datacenters(kwarg=None, call=None)`

List all the data centers for this VMware environment

CLI Example:

```
salt-cloud -f list_datacenters my-vmware-config
```

`salt.cloud.clouds.vmware.list_datastore_clusters(kwarg=None, call=None)`

List all the datastore clusters for this VMware environment

CLI Example:

```
salt-cloud -f list_datastore_clusters my-vmware-config
```

`salt.cloud.clouds.vmware.list_datastores(kwarg=None, call=None)`

List all the datastores for this VMware environment

CLI Example:

```
salt-cloud -f list_datastores my-vmware-config
```

`salt.cloud.clouds.vmware.list_dvs` (*kwargs=None, call=None*)

List all the distributed virtual switches for this VMware environment

CLI Example:

```
salt-cloud -f list_dvs my-vmware-config
```

`salt.cloud.clouds.vmware.list_folders` (*kwargs=None, call=None*)

List all the folders for this VMware environment

CLI Example:

```
salt-cloud -f list_folders my-vmware-config
```

`salt.cloud.clouds.vmware.list_hbas` (*kwargs=None, call=None*)

List all HBAs for each host system; or all HBAs for a specified host system; or HBAs of specified type for each host system; or HBAs of specified type for a specified host system in this VMware environment

---

**Note:** You can specify type as either `parallel`, `iscsi`, `block` or `fibre`.

---

To list all HBAs for each host system:

CLI Example:

```
salt-cloud -f list_hbas my-vmware-config
```

To list all HBAs for a specified host system:

CLI Example:

```
salt-cloud -f list_hbas my-vmware-config host="hostSystemName"
```

To list HBAs of specified type for each host system:

CLI Example:

```
salt-cloud -f list_hbas my-vmware-config type="HBAType"
```

To list HBAs of specified type for a specified host system:

CLI Example:

```
salt-cloud -f list_hbas my-vmware-config host="hostSystemName" type=
→ "HBAType"
```

`salt.cloud.clouds.vmware.list_hosts` (*kwargs=None, call=None*)

List all the hosts for this VMware environment

CLI Example:

```
salt-cloud -f list_hosts my-vmware-config
```

`salt.cloud.clouds.vmware.list_hosts_by_cluster` (*kwargs=None, call=None*)

List hosts for each cluster; or hosts for a specified cluster in this VMware environment

To list hosts for each cluster:

CLI Example:

```
salt-cloud -f list_hosts_by_cluster my-vmware-config
```

To list hosts for a specified cluster:

CLI Example:

```
salt-cloud -f list_hosts_by_cluster my-vmware-config cluster="clusterName"
```

`salt.cloud.clouds.vmware.list_hosts_by_datacenter` (*kwargs=None, call=None*)

List hosts for each datacenter; or hosts for a specified datacenter in this VMware environment

To list hosts for each datacenter:

CLI Example:

```
salt-cloud -f list_hosts_by_datacenter my-vmware-config
```

To list hosts for a specified datacenter:

CLI Example:

```
salt-cloud -f list_hosts_by_datacenter my-vmware-config datacenter=
→"datacenterName"
```

`salt.cloud.clouds.vmware.list_networks` (*kwargs=None, call=None*)

List all the standard networks for this VMware environment

CLI Example:

```
salt-cloud -f list_networks my-vmware-config
```

`salt.cloud.clouds.vmware.list_nodes` (*kwargs=None, call=None*)

Return a list of all VMs and templates that are on the specified provider, with basic fields

CLI Example:

```
salt-cloud -f list_nodes my-vmware-config
```

To return a list of all VMs and templates present on ALL configured providers, with basic fields:

CLI Example:

```
salt-cloud -Q
```

`salt.cloud.clouds.vmware.list_nodes_full` (*kwargs=None, call=None*)

Return a list of all VMs and templates that are on the specified provider, with full details

CLI Example:

```
salt-cloud -f list_nodes_full my-vmware-config
```

To return a list of all VMs and templates present on ALL configured providers, with full details:

CLI Example:

```
salt-cloud -F
```

`salt.cloud.clouds.vmware.list_nodes_min` (*kwargs=None, call=None*)

Return a list of all VMs and templates that are on the specified provider, with no details

CLI Example:

```
salt-cloud -f list_nodes_min my-vmware-config
```

`salt.cloud.clouds.vmware.list_nodes_select` (*call=None*)

Return a list of all VMs and templates that are on the specified provider, with fields specified under `query.selection` in `/etc/salt/cloud`

CLI Example:

```
salt-cloud -f list_nodes_select my-vmware-config
```

To return a list of all VMs and templates present on ALL configured providers, with fields specified under `query.selection` in `/etc/salt/cloud`:

CLI Example:

```
salt-cloud -S
```

`salt.cloud.clouds.vmware.list_portgroups` (*kwargs=None, call=None*)

List all the distributed virtual portgroups for this VMware environment

CLI Example:

```
salt-cloud -f list_portgroups my-vmware-config
```

`salt.cloud.clouds.vmware.list_resourcepools` (*kwargs=None, call=None*)

List all the resource pools for this VMware environment

CLI Example:

```
salt-cloud -f list_resourcepools my-vmware-config
```

`salt.cloud.clouds.vmware.list_snapshots` (*kwargs=None, call=None*)

List snapshots either for all VMs and templates or for a specific VM/template in this VMware environment

To list snapshots for all VMs and templates:

CLI Example:

```
salt-cloud -f list_snapshots my-vmware-config
```

To list snapshots for a specific VM/template:

CLI Example:

```
salt-cloud -f list_snapshots my-vmware-config name="vmname"
```

`salt.cloud.clouds.vmware.list_templates` (*kwargs=None, call=None*)

List all the templates present in this VMware environment

CLI Example:

```
salt-cloud -f list_templates my-vmware-config
```

`salt.cloud.clouds.vmware.list_vapps` (*kwargs=None, call=None*)

List all the vApps for this VMware environment

CLI Example:

```
salt-cloud -f list_vapps my-vmware-config
```

`salt.cloud.clouds.vmware.reboot_host` (*kwargs=None, call=None*)

Reboot the specified host system in this VMware environment

---

**Note:** If the host system is not in maintenance mode, it will not be rebooted. If you want to reboot the host system regardless of whether it is in maintenance mode, set `force=True`. Default is `force=False`.

---

CLI Example:

```
salt-cloud -f reboot_host my-vmware-config host="myHostSystemName"
→ [force=True]
```

`salt.cloud.clouds.vmware.remove_all_snapshots` (*name, kwargs=None, call=None*)

Remove all the snapshots present for the specified virtual machine.

---

**Note:** All the snapshots higher up in the hierarchy of the current snapshot tree are consolidated and their virtual disks are merged. To override this behavior and only remove all snapshots, set `merge_snapshots=False`. Default is `merge_snapshots=True`

---

CLI Example:

```
salt-cloud -a remove_all_snapshots vmname [merge_snapshots=False]
```

`salt.cloud.clouds.vmware.remove_host` (*kwargs=None, call=None*)

Remove the specified host system from this VMware environment

CLI Example:

```
salt-cloud -f remove_host my-vmware-config host="myHostSystemName"
```

`salt.cloud.clouds.vmware.remove_snapshot` (*name, kwargs=None, call=None*)

Remove a snapshot of the specified virtual machine in this VMware environment

CLI Example:

```
salt-cloud -a remove_snapshot vmname snapshot_name="mySnapshot"
salt-cloud -a remove_snapshot vmname snapshot_name="mySnapshot" [remove_
→ children="True"]
```

`salt.cloud.clouds.vmware.rescan_hba` (*kwargs=None, call=None*)

To rescan a specified HBA or all the HBAs on the Host System

CLI Example:

```
salt-cloud -f rescan_hba my-vmware-config host="hostSystemName"
salt-cloud -f rescan_hba my-vmware-config hba="hbaDeviceName" host=
→ "hostSystemName"
```

`salt.cloud.clouds.vmware.reset` (*name*, *soft=False*, *call=None*)

To reset a VM using its name

---

**Note:** If `soft=True` then issues a command to the guest operating system asking it to perform a reboot. Otherwise hypervisor will terminate VM and start it again. Default is `soft=False`

For `soft=True` `vmtools` should be installed on guest system.

---

CLI Example:

```
salt-cloud -a reset vmname
salt-cloud -a reset vmname soft=True
```

`salt.cloud.clouds.vmware.revert_to_snapshot` (*name*, *kwargs=None*, *call=None*)

Revert virtual machine to its current snapshot. If no snapshot exists, the state of the virtual machine remains unchanged

---

**Note:** The virtual machine will be powered on if the power state of the snapshot when it was created was set to "Powered On". Set `power_off=True` so that the virtual machine stays powered off regardless of the power state of the snapshot when it was created. Default is `power_off=False`.

If the power state of the snapshot when it was created was "Powered On" and if `power_off=True`, the VM will be put in suspended state after it has been reverted to the snapshot.

---

CLI Example:

```
salt-cloud -a revert_to_snapshot vmame [power_off=True]
salt-cloud -a revert_to_snapshot vmame snapshot_name="selectedSnapshot"
→ [power_off=True]
```

`salt.cloud.clouds.vmware.script` (*vm\_*)

Return the script deployment object

`salt.cloud.clouds.vmware.show_instance` (*name*, *call=None*)

List all available details of the specified VM

CLI Example:

```
salt-cloud -a show_instance vmname
```

`salt.cloud.clouds.vmware.shutdown_host` (*kwargs=None*, *call=None*)

Shut down the specified host system in this VMware environment

---

**Note:** If the host system is not in maintenance mode, it will not be shut down. If you want to shut down the host system regardless of whether it is in maintenance mode, set `force=True`. Default is `force=False`.

---

CLI Example:

```
salt-cloud -f shutdown_host my-vmware-config host="myHostSystemName"
→ [force=True]
```

`salt.cloud.clouds.vmware.start`(*name*, *call=None*)

To start/power on a VM using its name

CLI Example:

```
salt-cloud -a start vmname
```

`salt.cloud.clouds.vmware.stop`(*name*, *soft=False*, *call=None*)

To stop/power off a VM using its name

---

**Note:** If `soft=True` then issues a command to the guest operating system asking it to perform a clean shutdown of all services. Default is `soft=False`

For `soft=True` `vmtools` should be installed on guest system.

---

CLI Example:

```
salt-cloud -a stop vmname
salt-cloud -a stop vmname soft=True
```

`salt.cloud.clouds.vmware.suspend`(*name*, *call=None*)

To suspend a VM using its name

CLI Example:

```
salt-cloud -a suspend vmname
```

`salt.cloud.clouds.vmware.terminate`(*name*, *call=None*)

To do an immediate power off of a VM using its name. A SIGKILL is issued to the `vmx` process of the VM

CLI Example:

```
salt-cloud -a terminate vmname
```

`salt.cloud.clouds.vmware.test_vcenter_connection`(*kwargs=None*, *call=None*)

Test if the connection can be made to the vCenter server using the specified credentials inside `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/vmware.conf`

CLI Example:

```
salt-cloud -f test_vcenter_connection my-vmware-config
```

`salt.cloud.clouds.vmware.upgrade_tools`(*name*, *reboot=False*, *call=None*)

To upgrade VMware Tools on a specified virtual machine.

---

**Note:** If the virtual machine is running Windows OS, use `reboot=True` to reboot the virtual machine after VMware tools upgrade. Default is `reboot=False`

---

CLI Example:

```
salt-cloud -a upgrade_tools vmname
salt-cloud -a upgrade_tools vmname reboot=True
```

`salt.cloud.clouds.vmware.upgrade_tools_all` (*call=None*)

To upgrade VMware Tools on all virtual machines present in the specified provider

---

**Note:** If the virtual machine is running Windows OS, this function will attempt to suppress the automatic reboot caused by a VMware Tools upgrade.

---

CLI Example:

```
salt-cloud -f upgrade_tools_all my-vmware-config
```

### 26.4.31 salt.cloud.clouds.vultrpy

#### Vultr Cloud Module using python-vultr bindings

New in version 2016.3.0.

The Vultr cloud module is used to control access to the Vultr VPS system.

Use of this module only requires the `api_key` parameter.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/vultr.conf`:

```
my-vultr-config:  
# Vultr account api key  
api_key: <supersecretapi_key>  
driver: vultr
```

Set up the cloud profile at `/etc/salt/cloud.profiles` or `/etc/salt/cloud.profiles.d/vultr.conf`:

```
nyc-4gb-4cpu-ubuntu-14-04:  
location: 1  
provider: my-vultr-config  
image: 160  
size: 95  
enable_private_network: True
```

This driver also supports Vultr's *startup script* feature. You can list startup scripts in your account with

```
salt-cloud -f list_scripts <name of vultr provider>
```

That list will include the IDs of the scripts in your account. Thus, if you have a script called 'setup-networking' with an ID of 493234 you can specify that startup script in a profile like so:

```
nyc-2gb-1cpu-ubuntu-17-04:  
location: 1  
provider: my-vultr-config  
image: 223  
size: 13  
startup_script_id: 493234
```

Similarly you can also specify a firewall group ID using the option `firewall_group_id`. You can list firewall groups with

```
salt-cloud -f list_firewall_groups <name of vultr provider>
```

To specify SSH keys to be preinstalled on the server, use the `ssh_key_names` setting

```
nyc-2gb-1cpu-ubuntu-17-04:
location: 1
provider: my-vultr-config
image: 223
size: 13
ssh_key_names: dev1,dev2,salt-master
```

You can list SSH keys available on your account using

```
salt-cloud -f list_keypairs <name of vultr provider>
```

```
salt.cloud.clouds.vultrpy.avail_firewall_groups(conn=None)
    return available firewall groups

salt.cloud.clouds.vultrpy.avail_images(conn=None)
    Return available images

salt.cloud.clouds.vultrpy.avail_keys(conn=None)
    return available SSH keys

salt.cloud.clouds.vultrpy.avail_locations(conn=None)
    return available datacenter locations

salt.cloud.clouds.vultrpy.avail_scripts(conn=None)
    return available startup scripts

salt.cloud.clouds.vultrpy.avail_sizes(conn=None)
    Return available sizes ("plans" in VultrSpeak)

salt.cloud.clouds.vultrpy.create(vm_)
    Create a single VM from a data dict

salt.cloud.clouds.vultrpy.destroy(name)
    Remove a node from Vultr

salt.cloud.clouds.vultrpy.get_configured_provider()
    Return the first configured instance

salt.cloud.clouds.vultrpy.list_firewall_groups(conn=None, call=None)
    return list of firewall groups

salt.cloud.clouds.vultrpy.list_keypairs(conn=None, call=None)
    return list of SSH keys

salt.cloud.clouds.vultrpy.list_nodes(**kwargs)
    Return basic data on nodes

salt.cloud.clouds.vultrpy.list_nodes_full(**kwargs)
    Return all data on nodes

salt.cloud.clouds.vultrpy.list_nodes_select(conn=None, call=None)
    Return a list of the VMs that are on the provider, with select fields
```

`salt.cloud.clouds.vultrpy.list_scripts` (*conn=None, call=None*)

return list of Startup Scripts

`salt.cloud.clouds.vultrpy.show_instance` (*name, call=None*)

Show the details from the provider concerning an instance

`salt.cloud.clouds.vultrpy.show_keypair` (*kwargs=None, call=None*)

return list of SSH keys

`salt.cloud.clouds.vultrpy.start` (*\*args, \*\*kwargs*)

Execute a "start" action on a VM

`salt.cloud.clouds.vultrpy.stop` (*\*args, \*\*kwargs*)

Execute a "stop" action on a VM

## 26.4.32 salt.cloud.clouds.xen

### XenServer Cloud Driver

The XenServer driver is designed to work with a Citrix XenServer.

Requires XenServer SDK (can be downloaded from <https://www.citrix.com/downloads/xenserver/product-software/>)

Place a copy of the XenAPI.py in the Python site-packages folder.

**depends**

XenAPI

Example provider configuration:

```
# /etc/salt/cloud.providers.d/myxen.conf
myxen:
  driver: xen
  url: http://10.0.0.120
  user: root
  password: p@ssw0rd
```

Example profile configuration:

```
# /etc/salt/cloud.profiles.d/myxen.conf
suse:
  provider: myxen
  user: root
  password: p@ssw0rd
  image: opensuseleap42_2-template
  storage_repo: 'Local storage'
  resource_pool: default_pool
  clone: True
  minion:
    master: 10.0.0.18
sles:
  provider: myxen
  user: root
  clone: False
```

(continues on next page)

(continued from previous page)

```

image: sles12sp2-template
deploy: False
w2k12:
  provider: myxen
  image: w2k12svr-template
  clone: True
  userdata_file: /srv/salt/win/files/windows-firewall.ps1
  win_installer: /srv/salt/win/files/Salt-Minion-2016.11.3-AMD64-
  ↳ Setup.exe
  win_username: Administrator
  win_password: p@ssw0rd
  use_winrm: False
  ipv4_cidr: 10.0.0.215/24
  ipv4_gw: 10.0.0.1

```

`salt.cloud.clouds.xen.avail_images` (*call=None*)

Get a list of images from Xen

If called with the `--list-images` then it returns images with all details.

```
salt-cloud --list-images myxen
```

`salt.cloud.clouds.xen.avail_locations` (*session=None, call=None*)

Return available Xen locations (not implemented)

```
salt-cloud --list-locations myxen
```

`salt.cloud.clouds.xen.avail_sizes` (*session=None, call=None*)

Return a list of Xen template definitions

```
salt-cloud --list-sizes myxen
```

`salt.cloud.clouds.xen.create` (*vm\_*)

Create a VM in Xen

The configuration for this function is read from the profile settings.

```
salt-cloud -p some_profile xenvm01
```

`salt.cloud.clouds.xen.destroy` (*name=None, call=None*)

Destroy Xen VM or template instance

```
salt-cloud -d xenvm01
```

`salt.cloud.clouds.xen.destroy_template` (*name=None, call=None, kwargs=None*)

Destroy Xen VM or template instance

```
salt-cloud -f destroy_template myxen name=testvm2
```

`salt.cloud.clouds.xen.destroy_vm_vdis` (*name=None, session=None, call=None*)

Get virtual block devices on VM

```
salt-cloud -a destroy_vm_vdis xenvm01
```

`salt.cloud.clouds.xen.get_configured_provider()`

Return the first configured instance.

`salt.cloud.clouds.xen.get_pv_args(name, session=None, call=None)`

Get PV arguments for a VM

```
salt-cloud -a get_pv_args xenvm01
```

`salt.cloud.clouds.xen.get_vm_ip(name=None, session=None, call=None)`

Get the IP address of the VM

```
salt-cloud -a get_vm_ip xenvm01
```

---

**Note:** Requires xen guest tools to be installed in VM

---

`salt.cloud.clouds.xen.host_list(call=None)`

Get a list of Xen Servers

```
salt-cloud -f host_list myxen
```

`salt.cloud.clouds.xen.list_nodes()`

List virtual machines

```
salt-cloud -Q
```

`salt.cloud.clouds.xen.list_nodes_full(session=None)`

List full virtual machines

```
salt-cloud -F
```

`salt.cloud.clouds.xen.list_nodes_select(call=None)`

Perform a select query on Xen VM instances

```
salt-cloud -S
```

`salt.cloud.clouds.xen.pause(name, call=None, session=None)`

Pause a vm

```
salt-cloud -a pause xenvm01
```

`salt.cloud.clouds.xen.pif_list(call=None)`

Get a list of Resource Pools

```
salt-cloud -f pool_list myxen
```

`salt.cloud.clouds.xen.pool_list(call=None)`

Get a list of Resource Pools

```
salt-cloud -f pool_list myxen
```

`salt.cloud.clouds.xen.reboot`(*name*, *call=None*, *session=None*)

Reboot a vm

```
salt-cloud -a reboot xenvm01
```

`salt.cloud.clouds.xen.resume`(*name*, *call=None*, *session=None*)

Resume a vm from disk

```
salt-cloud -a resume xenvm01
```

`salt.cloud.clouds.xen.set_pv_args`(*name*, *kwargs=None*, *session=None*, *call=None*)

Set PV arguments for a VM

```
salt-cloud -a set_pv_args xenvm01 pv_args="utf-8 graphical"
```

`salt.cloud.clouds.xen.set_vm_ip`(*name=None*, *ipv4\_cidr=None*, *ipv4\_gw=None*, *session=None*, *call=None*)

Set the IP address on a virtual interface (vif)

`salt.cloud.clouds.xen.show_instance`(*name*, *session=None*, *call=None*)

Show information about a specific VM or template

```
salt-cloud -a show_instance xenvm01
```

---

**Note:** memory is `memory_dynamic_max`

---

`salt.cloud.clouds.xen.shutdown`(*name*, *call=None*, *session=None*)

Shutdown a vm

```
salt-cloud -a shutdown xenvm01
```

`salt.cloud.clouds.xen.sr_list`(*call=None*)

Get a list of storage repositories

```
salt-cloud -f sr_list myxen
```

`salt.cloud.clouds.xen.start`(*name*, *call=None*, *session=None*)

Start a vm

```
salt-cloud -a start xenvm01
```

`salt.cloud.clouds.xen.stop`(*name*, *call=None*, *session=None*)

Stop a vm

```
salt-cloud -a stop xenvm01
```

`salt.cloud.clouds.xen.suspend`(*name*, *call=None*, *session=None*)

Suspend a vm to disk

```
salt-cloud -a suspend xenvm01
```

`salt.cloud.clouds.xen.template_list` (*call=None*)

Return available Xen template information.

This returns the details of each template to show number cores, memory sizes, etc..

```
salt-cloud -f template_list myxen
```

`salt.cloud.clouds.xen.unpause` (*name, call=None, session=None*)

UnPause a vm

```
salt-cloud -a unpause xenvm01
```

`salt.cloud.clouds.xen.vbd_list` (*name=None, call=None*)

Get a list of VBDs on a VM

**requires:** the name of the vm with the vbd definition

```
salt-cloud -a vbd_list xenvm01
```

`salt.cloud.clouds.xen.vdi_list` (*call=None, kwargs=None*)

Return available Xen VDI images

If this function is called with the `-f` or `--function` then it can return a list with minimal detail using the `terse=True` keyword argument.

```
salt-cloud -f vdi_list myxen terse=True
```

`salt.cloud.clouds.xen.vif_list` (*name, call=None, kwargs=None*)

Get a list of virtual network interfaces on a VM

**requires:** the name of the vm with the vbd definition

```
salt-cloud -a vif_list xenvm01
```

## 26.5 engine modules

<code>docker_events</code>	
<code>fluent</code>	An engine that reads messages from the salt event bus and pushes them onto a fluent endpoint.
<code>http_logstash</code>	HTTP Logstash engine
<code>ircbot</code>	IRC Bot engine
<code>junos_syslog</code>	Junos Syslog Engine
<code>libvirt_events</code>	An engine that listens for libvirt events and resends them to the salt event bus.
<code>logentries</code>	An engine that sends events to the Logentries logging service.
<code>logstash_engine</code>	An engine that reads messages from the salt event bus and pushes them onto a logstash endpoint.
<code>napalm_syslog</code>	NAPALM syslog engine
<code>reactor</code>	Setup Reactor
<code>redis_sentinel</code>	An engine that reads messages from the redis sentinel pubsub and sends reactor events based on the channels they are subscribed to.
<code>script</code>	Send events based on a script's stdout
<code>slack</code>	An engine that reads messages from Slack and can act on them
<code>slack_bolt_engine</code>	An engine that reads messages from Slack and can act on them
<code>sqs_events</code>	An engine that continuously reads messages from SQS and fires them as events.
<code>stalekey</code>	An engine that uses presence detection to keep track of which minions have been recently connected and remove their keys if they have not been connected for a certain period of time.
<code>test</code>	A simple test engine, not intended for real use but as an example
<code>thorium</code>	Manage the Thorium complex event reaction system
<code>webhook</code>	Send events from webhook api

### 26.5.1 salt.engines.docker\_events

**Warning:** This module will be removed from Salt in version 3009 in favor of the [docker Salt Extension](#).

Send events from Docker events :Depends: Docker API >= 1.22

```
salt.engines.docker_events.start(docker_url='unix://var/run/docker.sock', timeout=60,
                                tag='salt/engines/docker_events', filters=None)
```

Scan for Docker events and fire events

Example Config

```
engines:
- docker_events:
  docker_url: unix:///var/run/docker.sock
  filters:
  event:
  - start
  - stop
  - die
  - oom
```

The config above sets up engines to listen for events from the Docker daemon and publish them to the Salt event bus.

For filter reference, see <https://docs.docker.com/engine/reference/commandline/events/>

### 26.5.2 salt.engines.fluent

An engine that reads messages from the salt event bus and pushes them onto a fluent endpoint.

New in version 3000.

#### Configuration

All arguments are optional

Example configuration of default settings

```
engines:
- fluent:
  host: localhost
  port: 24224
  app: engine
```

Example fluentd configuration

```
<source>
  @type forward
  port 24224
</source>

<match saltstack.**>
  @type file
  path /var/log/td-agent/saltstack
</match>
```

#### depends

fluent-logger

`salt.engines.fluent.start` (*host*='localhost', *port*=24224, *app*='engine')

Listen to salt events and forward them to fluent

#### Parameters

- **host** (*str*) -- Host running fluentd agent. Default is localhost
- **port** (*int*) -- Port of fluentd agent. Default is 24224

- **app** (*str*) -- Text sent as fluentd tag. Default is "engine". This text is appended to "salt-stack." to form a fluentd tag, ex: "saltstack.engine"

### 26.5.3 salt.engines.http\_logstash

#### HTTP Logstash engine

An engine that reads messages from the salt event bus and pushes them onto a logstash endpoint via HTTP requests. Changed in version 2018.3.0.

---

**Note:** By default, this engine take everything from the Salt bus and exports into Logstash. For a better selection of the events that you want to publish, you can use the `tags` and `funs` options.

---

#### configuration

Example configuration

```
engines:
- http_logstash:
  url: http://blabla.com/salt-stuff
  tags:
  - salt/job/*/new
  - salt/job/*/ret/*
  funs:
  - probes.results
  - bgp.config
```

`salt.engines.http_logstash.start` (*url*, *funs=None*, *tags=None*)

Listen to salt events and forward them to logstash.

#### url

The Logstash endpoint.

#### funs: **None**

A list of functions to be compared against, looking into the `fun` field from the event data. This option helps to select the events generated by one or more functions. If an event does not have the `fun` field in the data section, it will be published. For a better selection, consider using the `tags` option. By default, this option accepts any event to be submitted to Logstash.

#### tags: **None**

A list of pattern to compare the event tag against. By default, this option accepts any event to be submitted to Logstash.

### 26.5.4 salt.engines.ircbot

IRC Bot engine

New in version 2017.7.0.

Example Configuration

```
engines:
- ircbot:
```

(continues on next page)

(continued from previous page)

```

nick: <nick>
username: <username>
password: <password>
host: irc.oftc.net
port: 7000
channels:
  - salt-test
  - '##something'
use_ssl: True
use_sasl: True
disable_query: True
allow_hosts:
  - salt/engineer/. *
allow_nicks:
  - gtmanfred

```

Available commands on irc are:

**ping**

return pong

**echo <stuff>**

return <stuff> targeted at the user who sent the commands

**event <tag> [<extra>, <data>]**

fire event on the master or minion event stream with the tag `salt/engines/ircbot/<tag>` and a data object with a list of everything else sent in the message

Example of usage

```

08:33:57 @gtmanfred > !ping
08:33:57  gtmanbot > gtmanfred: pong
08:34:02 @gtmanfred > !echo ping
08:34:02  gtmanbot > ping
08:34:17 @gtmanfred > !event test/tag/ircbot irc is useful
08:34:17  gtmanbot > gtmanfred: TaDa!

```

```

[DEBUG ] Sending event: tag = salt/engines/ircbot/test/tag/ircbot; data = {
→ '_stamp': '2016-11-28T14:34:16.633623', 'data': ['irc', 'is', 'useful']}

```

**class** salt.engines.ircbot.**Event**(*source, code, line*)

**code**

Alias for field number 1

**line**

Alias for field number 2

**source**

Alias for field number 0

**class** salt.engines.ircbot.**IRCClient**(*nick, host, port=6667, username=None, password=None, channels=None, use\_ssl=False, use\_sasl=False, char='!', allow\_hosts=False, allow\_nicks=False, disable\_query=True*)

**join\_channel**(*channel*)

**on\_closed**()

**on\_connect**()

**read\_messages**()

**send\_message**(*line*)

**class** salt.engines.ircbot.**PrivEvent**(*source, nick, user, host, code, channel, command, line*)

**channel**

Alias for field number 5

**code**

Alias for field number 4

**command**

Alias for field number 6

**host**

Alias for field number 3

**line**

Alias for field number 7

**nick**

Alias for field number 1

**source**

Alias for field number 0

**user**

Alias for field number 2

salt.engines.ircbot.**start**(*nick, host, port=6667, username=None, password=None, channels=None, use\_ssl=False, use\_sasl=False, char='!', allow\_hosts=False, allow\_nicks=False, disable\_query=True*)

IRC Bot for interacting with salt.

**nick**

Nickname of the connected Bot.

**host**

irc server (example - irc.oftc.net).

**port**

irc port. Default: 6667

**password**

password for authenticating. If not provided, user will not authenticate on the irc server.

**channels**

channels to join.

**use\_ssl**

connect to server using ssl. Default: False

**use\_sasl**

authenticate using sasl, instead of messaging NickServ. Default: False

---

**Note:** This will allow the bot user to be fully authenticated before joining any channels

---

**char**

command character to look for. Default: !

**allow\_hosts**

hostmasks allowed to use commands on the bot. Default: False True to allow all False to allow none List of regexes to allow matching

**allow\_nicks**

Nicks that are allowed to use commands on the bot. Default: False True to allow all False to allow none List of regexes to allow matching

**disable\_query**

Disable commands from being sent through private queries. Require they be sent to a channel, so that all communication can be controlled by access to the channel. Default: True

**Warning:** Unauthenticated Access to event stream

This engine sends events calls to the event stream without authenticating them in salt. Authentication will need to be configured and enforced on the irc server or enforced in the irc channel. The engine only accepts commands from channels, so non authenticated users could be banned or quieted in the channel.

/mode +q \$~a # quiet all users who are not authenticated /mode +r # do not allow unauthenticated users into the channel

It would also be possible to add a password to the irc channel, or only allow invited users to join.

## 26.5.5 salt.engines.junos\_syslog

### Junos Syslog Engine

New in version 2017.7.0.

**depends**

pyparsing, twisted

An engine that listens to syslog message from Junos devices, extract event information and generate message on SaltStack bus.

The event topic sent to salt is dynamically generated according to the topic title specified by the user. The incoming event data (from the junos device) consists of the following fields:

1. hostname
2. hostip
3. daemon
4. event
5. severity
6. priority

7. timestamp
8. message
9. pid
10. raw (the raw event data forwarded from the device)

The topic title can consist of any of the combination of above fields, but the topic has to start with 'jnpr/syslog'. So, we can have different combinations:

- jnpr/syslog/hostip/daemon/event
- jnpr/syslog/daemon/severity

The corresponding dynamic topic sent on salt event bus would look something like:

- jnpr/syslog/1.1.1.1/mgd/UI\_COMMIT\_COMPLETED
- jnpr/syslog/sshhd/7

The default topic title is 'jnpr/syslog/hostname/event'.

The user can choose the type of data they wants of the event bus. Like, if one wants only events pertaining to a particular daemon, they can specify that in the configuration file:

```
daemon: mgd
```

One can even have a list of daemons like:

```
daemon:
- mgd
- sshd
```

Example configuration (to be written in master config file)

```
engines:
- junos_syslog:
  port: 9999
  topic: jnpr/syslog/hostip/daemon/event
  daemon:
    - mgd
    - sshd
```

For junos\_syslog engine to receive events, syslog must be set on the junos device. This can be done via following configuration:

```
set system syslog host <ip-of-the-salt-device> port 516 any any
```

Below is a sample syslog event which is received from the junos device:

```
'<30>May 29 05:18:12 bng-ui-vm-9 mspd[1492]: No chassis configuration found'
```

The source for parsing the syslog messages is taken from: <https://gist.github.com/leandrosilva/3651640#file-xlog-py>

```
class salt.engines.junos_syslog.DatagramProtocol
```

```
salt.engines.junos_syslog.start(port=516, **kwargs)
```

## 26.5.6 salt.engines.libvirt\_events

An engine that listens for libvirt events and resends them to the salt event bus.

The minimal configuration is the following and will listen to all events on the local hypervisor and send them with a tag starting with salt/engines/libvirt\_events:

```
engines:
- libvirt_events
```

Note that the automatically-picked libvirt connection will depend on the value of `uri_default` in `/etc/libvirt/libvirt.conf`. To force using another connection like the local LXC libvirt driver, set the `uri` property as in the following example configuration.

```
engines:
- libvirt_events:
  uri: lxc:///
  tag_prefix: libvirt
  filters:
    - domain/lifecycle
    - domain/reboot
    - pool
```

Filters is a list of event types to relay to the event bus. Items in this list can be either one of the main types (domain, network, pool, nodedev, secret), all or a more precise filter. These can be done with values like `<main_type>/<subtype>`. The possible values are in the `CALLBACK_DEFS` constant. If the filters list contains all, all events will be relayed.

Be aware that the list of events increases with libvirt versions, for example network events have been added in libvirt 1.2.1 and storage events in 2.0.0.

### Running the engine on non-root

Running this engine as non-root requires a special attention, which is surely the case for the master running as user *salt*. The engine is likely to fail to connect to libvirt with an error like this one:

```
[ERROR ] authentication unavailable: no polkit agent available to authenticate action
'org.libvirt.unix.monitor'
```

To fix this, the user running the engine, for example the salt-master, needs to have the rights to connect to libvirt in the machine polkit config. A polkit rule like the following one will allow *salt* user to connect to libvirt:

```
polkit.addRule(function(action, subject) {
  if (action.id.indexOf("org.libvirt") == 0 &&
      subject.user == "salt") {
    return polkit.Result.YES;
  }
});
```

#### depends

libvirt 1.0.0+ python binding

New in version 2019.2.0.

`salt.engines.libvirt_events.start(uri=None, tag_prefix='salt/engines/libvirt_events', filters=None)`

Listen to libvirt events and forward them to salt.

**Parameters**

- **uri** -- libvirt URI to listen on. Defaults to None to pick the first available local hypervisor
- **tag\_prefix** -- the beginning of the salt event tag to use. Defaults to 'salt/engines/libvirt\_events'
- **filters** -- the list of event of listen on. Defaults to 'all'

**26.5.7 salt.engines.logentries**

An engine that sends events to the Logentries logging service.

**maintainer**

Jimmy Tang ([jimmy\\_tang@rapid7.com](mailto:jimmy_tang@rapid7.com))

**maturity**

New

**depends**

ssl, certifi

**platform**

all

New in version 2016.3.0.

To enable this engine the master and/or minion will need the following python libraries

ssl certifi

If you are running a new enough version of python then the ssl library will be present already.

You will also need the following values configured in the minion or master config.

**configuration**

Example configuration

```
engines:
- logentries:
    endpoint: data.logentries.com
    port: 10000
    token: 057af3e2-1c05-47c5-882a-5cd644655dbf
```

The 'token' can be obtained from the Logentries service.

To test this engine

```
salt '*' test.ping cmd.run uptime
```

```
class salt.engines.logentries.PlainTextSocketAppender(verbose=True,
LE_API='data.logentries.com',
LE_PORT=80, LE_TLS_PORT=443)
```

```
close_connection()
```

```
open_connection()
```

```
put(data)
```

**reopen\_connection()**

`salt.engines.logentries.SocketAppender`

alias of `TLSSocketAppender`

**class** `salt.engines.logentries.TLSSocketAppender` (*verbose=True, LE\_API='data.logentries.com', LE\_PORT=80, LE\_TLS\_PORT=443*)

**open\_connection()**

`salt.engines.logentries.event_bus_context`(*opts*)

`salt.engines.logentries.start`(*endpoint='data.logentries.com', port=10000, token=None, tag='salt/engines/logentries'*)

Listen to salt events and forward them to Logentries

### 26.5.8 salt.engines.logstash\_engine

An engine that reads messages from the salt event bus and pushes them onto a logstash endpoint.

New in version 2015.8.0.

#### configuration

Example configuration

```
engines:  
- logstash:  
  host: log.my_network.com  
  port: 5959  
  proto: tcp
```

#### depends

logstash

`salt.engines.logstash_engine.event_bus_context`(*opts*)

`salt.engines.logstash_engine.start`(*host, port=5959, tag='salt/engine/logstash', proto='udp'*)

Listen to salt events and forward them to logstash

### 26.5.9 salt.engines.napalm\_syslog

#### NAPALM syslog engine

New in version 2017.7.0.

An engine that takes syslog messages structured in [OpenConfig](#) or IETF format and fires Salt events.

As there can be many messages pushed into the event bus, the user is able to filter based on the object structure.

## Requirements

- `napalm-logs`

This engine transfers objects from the `napalm-logs` library into the event bus. The top dictionary has the following keys:

- `ip`
- `host`
- `timestamp`
- `os`: the network OS identified
- `model_name`: the OpenConfig or IETF model name
- `error`: the error name (consult the documentation)
- `message_details`: details extracted from the syslog message
- `open_config`: the OpenConfig model

The `napalm-logs` transfers the messages via widely used transport mechanisms such as: ZeroMQ (default), Kafka, etc.

The user can select the right transport using the `transport` option in the configuration.

### configuration

Example configuration

```
engines:
  - napalm_syslog:
      transport: zmq
      address: 1.2.3.4
      port: 49018
```

### configuration

Configuration example, excluding messages from IOS-XR devices:

```
engines:
  - napalm_syslog:
      transport: kafka
      address: 1.2.3.4
      port: 49018
      os_blacklist:
        - iosxr
```

Event example:

```
{
  "_stamp": "2017-05-26T10:03:18.653045",
  "error": "BGP_PREFIX_THRESH_EXCEEDED",
  "host": "vmx01",
  "ip": "192.168.140.252",
  "message_details": {
    "date": "May 25",
    "host": "vmx01",
    "message": "192.168.140.254 (External AS 65001): Configured maximum"
  }
}
```

(continues on next page)

(continued from previous page)

}

```

To consume the events and eventually react and deploy a configuration changes on the device(s) firing the event, one is able to identify the minion ID, using one of the following alternatives, but not limited to:

- *Host grains* to match the event tag
- *Host DNS grain* to match the IP address in the event data
- *Hostname grains* to match the event tag

- *Define static grains*
- *Write a grains module*
- *Targeting minions using pillar data* - The user can configure certain information in the Pillar data and then use it to identify minions

Master configuration example, to match the event and react:

```
reactor:
- 'napalm/syslog/*/BGP_PREFIX_THRESH_EXCEEDED/*':
  - salt://increase_prefix_limit_on_thresh_exceeded.sls
```

Which matches the events having the error code BGP\_PREFIX\_THRESH\_EXCEEDED from any network operating system, from any host and reacts, executing the `increase_prefix_limit_on_thresh_exceeded.sls` reactor, found under one of the `file_roots` paths.

Reactor example:

```
increase_prefix_limit_on_thresh_exceeded:
local.net.load_template:
- tgt: "hostname:{{ data['host'] }}"
- tgt_type: grain
- kwarg:
  template_name: salt://increase_prefix_limit.jinja
  openconfig_structure: {{ data['open_config'] }}
```

The reactor in the example increases the BGP prefix limit when triggered by an event as above. The minion is matched using the `host` field from the data (which is the body of the event), compared to the `hostname grain` field. When the event occurs, the reactor will execute the `net.load_template` function, sending as arguments the template `salt://increase_prefix_limit.jinja` defined by the user in their environment and the complete OpenConfig object under the variable name `openconfig_structure`. Inside the Jinja template, the user can process the object from `openconfig_structure` and define the business logic as required.

```
salt.engines.napalm_syslog.start(transport='zmq', address='0.0.0.0', port=49017, auth_address='0.0.0.0',
                                auth_port=49018, disable_security=False, certificate=None,
                                os_whitelist=None, os_blacklist=None, error_whitelist=None,
                                error_blacklist=None, host_whitelist=None, host_blacklist=None)
```

Listen to `napalm-logs` and publish events into the Salt event bus.

**transport: zmq**

Choose the desired transport.

---

**Note:** Currently `zmq` is the only valid option.

---

**address: 0.0.0.0**

The address of the publisher, as configured on `napalm-logs`.

**port: 49017**

The port of the publisher, as configured on `napalm-logs`.

**auth\_address: 0.0.0.0**

The address used for authentication when security is not disabled.

**auth\_port: 49018**

Port used for authentication.

**disable\_security: False**

Trust unencrypted messages. Strongly discouraged in production.

**certificate: None**

Absolute path to the SSL certificate.

**os\_whitelist: None**

List of operating systems allowed. By default everything is allowed.

**os\_blacklist: None**

List of operating system to be ignored. Nothing ignored by default.

**error\_whitelist: None**

List of errors allowed.

**error\_blacklist: None**

List of errors ignored.

**host\_whitelist: None**

List of hosts or IPs to be allowed.

**host\_blacklist: None**

List of hosts of IPs to be ignored.

### 26.5.10 salt.engines.reactor

Setup Reactor

Example Config in Master or Minion config

```
engines:  
  - reactor:  
      refresh_interval: 60  
      worker_threads: 10  
      worker_hwm: 10000  
  
reactor:  
  - 'salt/cloud/*/destroyed':  
  - /srv/reactor/destroy/*.sls
```

`salt.engines.reactor.start` (*refresh\_interval=None, worker\_threads=None, worker\_hwm=None*)

### 26.5.11 salt.engines.redis\_sentinel

An engine that reads messages from the redis sentinel pubsub and sends reactor events based on the channels they are subscribed to.

New in version 2016.3.0.

**configuration**

Example configuration

```
engines:  
  - redis_sentinel:  
      hosts:  
        matching: 'board*'  
        port: 26379
```

(continues on next page)

(continued from previous page)

```

interface: eth2
channels:
- '+switch-master'
- '+odown'
- '-odown'

```

**depends**  
redis

**class** salt.engines.redis\_sentinel.**Listener** (*host=None, port=None, channels=None, tag=None*)

**run**()

**work**(*item*)

salt.engines.redis\_sentinel.**start**(*hosts, channels, tag=None*)

### 26.5.12 salt.engines.script

Send events based on a script's stdout

Example Config

```

engines:
- script:
  cmd: /some/script.py -a 1 -b 2
  output: json
  interval: 5
  onchange: false

```

Script engine configs:

**cmd**

Script or command to execute

**output**

Any available saltstack deserializer

**interval**

How often in seconds to execute the command

**onchange**

New in version 3006.0.

Only fire an event if the tag-specific output changes. Defaults to False.

salt.engines.script.**start**(*cmd, output='json', interval=1, onchange=False*)

Parse stdout of a command and generate an event

The script engine will scrap stdout of the given script and generate an event based on the presence of the 'tag' key and its value.

If there is a data obj available, that will also be fired along with the tag.

### Example

Given the following json output from a script:

```
{ "tag" : "lots/of/tacos",  
  "data" : { "toppings" : "cilantro" }  
}
```

This will fire the event 'lots/of/tacos' on the event bus with the data obj as is.

#### Parameters

- **cmd** -- The command to execute
- **output** -- How to deserialize stdout of the script
- **interval** -- How often to execute the script
- **onchange** -- Only fire an event if the tag-specific output changes

### 26.5.13 salt.engines.slack

An engine that reads messages from Slack and can act on them

New in version 2016.3.0.

#### depends

`slackclient` Python module

---

**Important:** This engine requires a bot user. To create a bot user, first go to the **Custom Integrations** page in your Slack Workspace. Copy and paste the following URL, and replace `myworkspace` with the proper value for your workspace:

`https://myworkspace.slack.com/apps/manage/custom-integrations`

Next, click on the **Bots** integration and request installation. Once approved by an admin, you will be able to proceed with adding the bot user. Once the bot user has been added, you can configure it by adding an avatar, setting the display name, etc. You will also at this time have access to your API token, which will be needed to configure this engine.

Finally, add this bot user to a channel by switching to the channel and using `/invite @mybotuser`. Keep in mind that this engine will process messages from each channel in which the bot is a member, so it is recommended to narrowly define the commands which can be executed, and the Slack users which are allowed to run commands.

---

This engine has two boolean configuration parameters that toggle specific features (both default to `False`):

1. **control** - If set to `True`, then any message which starts with the trigger string (which defaults to `!` and can be overridden by setting the `trigger` option in the engine configuration) will be interpreted as a Salt CLI command and the engine will attempt to run it. The permissions defined in the various `groups` will determine if the Slack user is allowed to run the command. The `targets` and `default_target` options can be used to set targets for a given command, but the engine can also read the following two keyword arguments:
  - **target** - The target expression to use for the command
  - **tgt\_type** - The match type, can be one of `glob`, `list`, `pcre`, `grain`, `grain_pcre`, `pillar`, `nodegroup`, `range`, `ipcidr`, or `compound`. The default value is `glob`.

Here are a few examples:

```
!test.ping target=*
!state.apply foo target=os:CentOS tgt_type=grain
!pkg.version mypkg target=role:database tgt_type=pillar
```

2. `fire_all` - If set to `True`, all messages which are not prefixed with the trigger string will be fired as events onto Salt's `ref:event bus <event-system>`. The tag for these events will be prefixed with the string specified by the tag config option (default: `salt/engines/slack`).

The `groups_pillar_name` config option can be used to pull group configuration from the specified pillar key.

**Note:** In order to use `groups_pillar_name`, the engine must be running as a minion running on the master, so that the Caller client can be used to retrieve that minion's pillar data, because the master process does not have pillar data.

## Configuration Examples

Changed in version 2017.7.0: Access control group support added

This example uses a single group called `default`. In addition, other groups are being loaded from pillar data. The group names do not have any significance, it is the users and commands defined within them that are used to determine whether the Slack user has permission to run the desired command.

```
engines:
  - slack:
      token: 'xoxb-xxxxxxxxxx-xxxxxxxxxxxxxxxxxxxxxxxxxxxxx'
      control: True
      fire_all: False
      groups_pillar_name: 'slack_engine:groups_pillar'
      groups:
        default:
          users:
            - '*'
          commands:
            - test.ping
            - cmd.run
            - list_jobs
            - list_commands
          aliases:
            list_jobs:
              cmd: jobs.list_jobs
            list_commands:
              cmd: 'pillar.get salt:engines:slack:valid_commands'
      →target=saltmaster tgt_type=list'
      default_target:
        target: saltmaster
        tgt_type: glob
      targets:
        test.ping:
          target: '*'
          tgt_type: glob
        cmd.run:
```

(continues on next page)

(continued from previous page)

```
target: saltmaster
tgt_type: list
```

This example shows multiple groups applying to different users, with all users having access to run test.ping. Keep in mind that when using \*, the value must be quoted, or else PyYAML will fail to load the configuration.

```
engines:
- slack:
  groups_pillar: slack_engine_pillar
  token: 'xoxb-xxxxxxxxx-xxxxxxxxxxxxxxxxxxxxxxxxxxxxx'
  control: True
  fire_all: True
  tag: salt/engines/slack
  groups_pillar_name: 'slack_engine:groups_pillar'
  groups:
    default:
      users:
        - '*'
      commands:
        - test.ping
      aliases:
        list_jobs:
          cmd: jobs.list_jobs
        list_commands:
          cmd: 'pillar.get salt:engines:slack:valid_commands'
      →target=saltmaster tgt_type=list'
    gods:
      users:
        - garethgreenaway
      commands:
        - '*'
```

**class** salt.engines.slack.SlackClient(*token*)

**can\_user\_run**(*user, command, groups*)

Break out the permissions into the following:

Check whether a user is in any group, including whether a group has the '\*' membership

#### Parameters

- **user** (*str*) -- The username being checked against
- **command** (*str*) -- The command that is being invoked (e.g. test.ping)
- **groups** (*dict*) -- the dictionary with groups permissions structure.

#### Return type

*tuple*

#### Returns

On a successful permitting match, returns 2-element tuple that contains the name of the group that successfully matched, and a dictionary containing the configuration of the group so it can be referenced.

On failure it returns an empty tuple

**commandline\_to\_list** (*cmdline\_str, trigger\_string*)

cmdline\_str is the string of the command line trigger\_string is the trigger string, to be removed

**control\_message\_target** (*slack\_user\_name, text, loaded\_groups, trigger\_string*)

Returns a tuple of (target, cmdline,) for the response

Raises IndexError if a user can't be looked up from all\_slack\_users

Returns (False, False) if the user doesn't have permission

These are returned together because the commandline and the targeting interact with the group config (specifically aliases and targeting configuration) so taking care of them together works out.

The cmdline that is returned is the actual list that should be processed by salt, and not the alias.

**fire** (*tag, msg*)

This replaces a function in main called 'fire'

It fires an event into the salt bus.

**format\_return\_text** (*data, function, \*\*kwargs*)

Print out YAML using the block mode

**generate\_triggered\_messages** (*token, trigger\_string, groups, groups\_pillar\_name*)

slack\_token = string trigger\_string = string input\_valid\_users = set input\_valid\_commands = set

When the trigger\_string prefixes the message text, yields a dictionary of:

```
{
  'message_data': m_data,
  'cmdline': cmdline_list, # this is a list
  'channel': channel,
  'user': m_data['user'],
  'slack_client': sc
}
```

else yields {'message\_data': m\_data} and the caller can handle that

When encountering an error (e.g. invalid message), yields {}, the caller can proceed to the next message

When the websocket being read from has given up all its messages, yields {'done': True} to indicate that the caller has read all of the relevant data for now, and should continue its own processing and check back for more data later.

This relies on the caller sleeping between checks, otherwise this could flood

**get\_config\_groups** (*groups\_conf, groups\_pillar\_name*)

get info from groups in config, and from the named pillar

todo: add specification for the minion to use to recover pillar

**get\_jobs\_from\_runner** (*outstanding\_jids*)

Given a list of job\_ids, return a dictionary of those job\_ids that have completed and their results.

Query the salt event bus via the jobs runner. jobs.list\_job will show a job in progress, jobs.lookup\_jid will return a job that has completed.

returns a dictionary of job id: result

**get\_slack\_channels** (*token*)

Get all channel names from Slack

**get\_slack\_users** (*token*)

Get all users from Slack

**get\_target** (*permitted\_group, cmdline, alias\_cmdline*)

When we are permitted to run a command on a target, look to see what the default targeting is for that group, and for that specific command (if provided).

It's possible for None or False to be the result of either, which means that it's expected that the caller provide a specific target.

If no configured target is provided, the command line will be parsed for target=foo and tgt\_type=bar

Test for this:

```
h = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
     'default_target': {'target': '*', 'tgt_type': 'glob'},
     'targets': {'pillar.get': {'target': 'you_momma', 'tgt_type':
     ↪ 'list'}},
     'users': {'dmangot', 'jmickle', 'pcn'}}
f = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
     'default_target': {}, 'targets': {}, 'users': {'dmangot', 'jmickle
     ↪ ', 'pcn'}}

g = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
     'default_target': {'target': '*', 'tgt_type': 'glob'},
     'targets': {}, 'users': {'dmangot', 'jmickle', 'pcn'}}
```

Run each of them through `get_configured_target(('foo', f), 'pillar.get')` and confirm a valid target

**message\_text** (*m\_data*)

Raises ValueError if a value doesn't work out, and TypeError if this isn't a message type

**parse\_args\_and\_kwargs** (*cmdline*)

cmdline: list

returns tuple of: args (list), kwargs (dict)

**run\_command\_async** (*msg*)

## Parameters

- **message\_generator** (*generator of dict*) -- Generates messages from slack that should be run
- **fire\_all** (*bool*) -- Whether to also fire messages to the event bus
- **tag** (*str*) -- The tag to send to use to send to the event bus
- **interval** (*int*) -- time to wait between ending a loop and beginning the next

**run\_commands\_from\_slack\_async** (*message\_generator, fire\_all, tag, control, interval=1*)

Pull any pending messages from the message\_generator, sending each one to either the event bus, the command\_async or both, depending on the values of fire\_all and command

`salt.engines.slack.start` (*token, control=False, trigger='!', groups=None, groups\_pillar\_name=None, fire\_all=False, tag='salt/engines/slack'*)

Listen to slack events and forward them to salt, new version

## 26.5.14 salt.engines.slack\_bolt\_engine

An engine that reads messages from Slack and can act on them

New in version 3006.0.

### depends

`slack_bolt` Python module

---

**Important:** This engine requires a Slack app and a Slack Bot user. To create a bot user, first go to the **Custom Integrations** page in your Slack Workspace. Copy and paste the following URL, and log in with account credentials with administrative privileges:

<https://api.slack.com/apps/new>

Next, click on the `From scratch` option from the `Create an app` popup. Give your new app a unique name, eg. `SaltSlackEngine`, select the workspace where your app will be running, and click `Create App`.

Next, click on `Socket Mode` and then click on the toggle button for `Enable Socket Mode`. In the dialog give your `Socket Mode Token` a unique name and then copy and save the app level token. This will be used as the `app_token` parameter in the Slack engine configuration.

Next, click on `Event Subscriptions` and ensure that `Enable Events` is in the on position. Then add the following bot events, `message.channel` and `message.im` to the `Subscribe to bot events` list.

Next, click on `OAuth & Permissions` and then under `Bot Token Scope`, click on `Add an OAuth Scope`. Ensure the following scopes are included:

- `channels:history`
- `channels:read`
- `chat:write`
- `commands`
- `files:read`
- `files:write`
- `im:history`
- `mpim:history`
- `usergroups:read`
- `users:read`

Once all the scopes have been added, click the `Install to Workspace` button under `OAuth Tokens for Your Workspace`, then click `Allow`. Copy and save the `Bot User OAuth Token`, this will be used as the `bot_token` parameter in the Slack engine configuration.

Finally, add this bot user to a channel by switching to the channel and using `/invite @mybotuser`. Keep in mind that this engine will process messages from each channel in which the bot is a member, so it is recommended to narrowly define the commands which can be executed, and the Slack users which are allowed to run commands.

---

This engine has two boolean configuration parameters that toggle specific features (both default to `False`):

1. `control` - If set to `True`, then any message which starts with the trigger string (which defaults to `!` and can be overridden by setting the `trigger` option in the engine configuration) will be interpreted as a Salt CLI command and the engine will attempt to run it. The permissions defined in the various `groups` will determine if the Slack user is allowed to run the command. The `targets` and `default_target` options can be used to set targets for a given command, but the engine can also read the following two keyword arguments:

- `target` - The target expression to use for the command
- `tgt_type` - The match type, can be one of `glob`, `list`, `pcre`, `grain`, `grain_pcre`, `pillar`, `nodegroup`, `range`, `ipcidr`, or `compound`. The default value is `glob`.

Here are a few examples:

```
!test.ping target=*
!state.apply foo target=os:CentOS tgt_type=grain
!pkg.version mypkg target=role:database tgt_type=pillar
```

2. `fire_all` - If set to `True`, all messages which are not prefixed with the trigger string will be fired as events onto Salt's `ref:event bus <event-system>`. The tag for these events will be prefixed with the string specified by the tag config option (default: `salt/engines/slack`).

The `groups_pillar_name` config option can be used to pull group configuration from the specified pillar key.

---

**Note:** In order to use `groups_pillar_name`, the engine must be running as a minion running on the master, so that the `Caller` client can be used to retrieve that minion's pillar data, because the master process does not have pillar data.

---

## Configuration Examples

Changed in version 2017.7.0: Access control group support added

Changed in version 3006.0: Updated to use `slack_bolt` Python library.

This example uses a single group called `default`. In addition, other groups are being loaded from pillar data. The users and commands defined within these groups are used to determine whether the Slack user has permission to run the desired command.

```
engines:
  - slack_bolt:
      app_token: "xapp-x-xxxxxxxxxxxx-xxxxxxxxxxxx-
→xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx"
      bot_token: 'xob-xxxxxxxx-xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx'
      control: True
      fire_all: False
      groups_pillar_name: 'slack_engine:groups_pillar'
      groups:
        default:
          users:
            - '*'
          commands:
            - test.ping
            - cmd.run
            - list_jobs
            - list_commands
          aliases:
            list_jobs:
              cmd: jobs.list_jobs
            list_commands:
              cmd: 'pillar.get salt:engines:slack:valid_commands'
→target=saltmaster tgt_type=list'
```

(continues on next page)

(continued from previous page)

```

default_target:
  target: saltmaster
  tgt_type: glob
targets:
  test.ping:
    target: '*'
    tgt_type: glob
  cmd.run:
    target: saltmaster
    tgt_type: list

```

This example shows multiple groups applying to different users, with all users having access to run test.ping. Keep in mind that when using \*, the value must be quoted, or else PyYAML will fail to load the configuration.

```

```

**class** salt.engines.slack\_bolt\_engine.**SlackClient**(*app\_token*, *bot\_token*, *trigger\_string*)

**can\_user\_run**(*user*, *command*, *groups*)

Check whether a user is in any group, including whether a group has the '\*' membership

Parameters

- **user** (*str*) -- The username being checked against
- **command** (*str*) -- The command that is being invoked (e.g. test.ping)
- **groups** (*dict*) -- the dictionary with groups permissions structure.

**Return type**

tuple

**Returns**

On a successful permitting match, returns 2-element tuple that contains the name of the group that successfully matched, and a dictionary containing the configuration of the group so it can be referenced.

On failure it returns an empty tuple

**commandline\_to\_list**(*cmdline\_str, trigger\_string*)

*cmdline\_str* is the string of the command line *trigger\_string* is the trigger string, to be removed

**control\_message\_target**(*slack\_user\_name, text, loaded\_groups, trigger\_string*)

Returns a tuple of (target, cmdline,) for the response

Raises IndexError if a user can't be looked up from `all_slack_users`

Returns (False, False) if the user doesn't have permission

These are returned together because the commandline and the targeting interact with the group config (specifically aliases and targeting configuration) so taking care of them together works out.

The cmdline that is returned is the actual list that should be processed by salt, and not the alias.

**fire**(*tag, msg*)

This replaces a function in main called 'fire'

It fires an event into the salt bus.

**Parameters**

- **tag** (*str*) -- The tag to use when sending events to the Salt event bus.
- **msg** (*dict*) -- The msg dictionary to send to the Salt event bus.

**format\_return\_text**(*data, function, \*\*kwargs*)

Print out YAML using the block mode

**Parameters**

- **token** -- The return data that needs to be formatted.
- **token** -- The function that was used to generate the return data.

**generate\_triggered\_messages**(*token, trigger\_string, groups, groups\_pillar\_name*)

`slack_token = string` `trigger_string = string` `input_valid_users = set` `input_valid_commands = set`

When the `trigger_string` prefixes the message text, yields a dictionary of:

```
{
  'message_data': m_data,
  'cmdline': cmdline_list, # this is a list
  'channel': channel,
  'user': m_data['user'],
  'slack_client': sc
}
```

else yields `{'message_data': m_data}` and the caller can handle that

When encountering an error (e.g. invalid message), yields `{}`, the caller can proceed to the next message

When the websocket being read from has given up all its messages, yields `{'done': True}` to indicate that the caller has read all of the relevant data for now, and should continue its own processing and check back for more data later.

This relies on the caller sleeping between checks, otherwise this could flood

**get\_config\_groups** (*groups\_conf*, *groups\_pillar\_name*)  
get info from groups in config, and from the named pillar

**Parameters**

- **group\_conf** (*dict*) -- The dictionary containing the groups, group members, and the commands those group members have access to.
- **groups\_pillar\_name** (*str*) -- can be used to pull group configuration from the specified pillar key.

**get\_jobs\_from\_runner** (*outstanding\_jids*)

Given a list of *job\_ids*, return a dictionary of those *job\_ids* that have completed and their results.

Query the salt event bus via the jobs runner. `jobs.list_job` will show a job in progress, `jobs.lookup_jid` will return a job that has completed.

**Parameters**

- **outstanding\_jids** (*list*) -- The list of job ids to check for completion.

returns a dictionary of job id: result

**get\_slack\_channels** (*token*)

Get all channel names from Slack

**Parameters**

- **token** (*str*) -- The Slack token being used to allow Salt to interact with Slack.

**get\_slack\_users** (*token*)

Get all users from Slack

**Parameters**

- **token** -- The Slack token being used to allow Salt to interact with Slack.

**get\_target** (*permitted\_group*, *cmdline*, *alias\_cmdline*)

When we are permitted to run a command on a target, look to see what the default targeting is for that group, and for that specific command (if provided).

It's possible for `None` or `False` to be the result of either, which means that it's expected that the caller provide a specific target.

If no configured target is provided, the command line will be parsed for `target=foo` and `tgt_type=bar`

Test for this:

```
h = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
     'default_target': {'target': '*', 'tgt_type': 'glob'},
     'targets': {'pillar.get': {'target': 'you_momma', 'tgt_type':
     ↪ 'list'}}},
     'users': {'dmangot', 'jmickle', 'pcn'}}
f = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
     'default_target': {}, 'targets': {}, 'users': {'dmangot', 'jmickle
     ↪ ', 'pcn'}}

g = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
```

(continues on next page)

(continued from previous page)

```
'default_target': {'target': '*', 'tgt_type': 'glob'},
'targets': {}, 'users': {'dmangot', 'jmickle', 'pcn'}}
```

Run each of them through `get_configured_target(('foo', f), 'pillar.get')` and confirm a valid target

#### Parameters

- **permitted\_group** (*tuple*) -- A tuple containing the group name and group configuration to check for permission.
- **cmdline** (*list*) -- The command sent from Slack formatted as a list.
- **alias\_cmdline** (*str*) -- An alias to a cmdline.

#### **message\_text** (*m\_data*)

Raises `ValueError` if a value doesn't work out, and `TypeError` if this isn't a message type

#### Parameters

**m\_data** (*dict*) -- The message sent from Slack

#### **message\_trigger** (*message*)

#### **parse\_args\_and\_kwargs** (*cmdline*)

#### Parameters

**cmdline** (*list*) -- The command sent from Slack formatted as a list.

returns tuple of: args (list), kwargs (dict)

#### **run\_command\_async** (*msg*)

#### Parameters

**msg** (*dict*) -- The message dictionary that contains the command and all information.

#### **run\_commands\_from\_slack\_async** (*message\_generator, fire\_all, tag, control, interval=1*)

Pull any pending messages from the `message_generator`, sending each one to either the event bus, the `command_async` or both, depending on the values of `fire_all` and `command`

#### Parameters

- **message\_generator** (*generator of dict*) -- Generates messages from slack that should be run
- **fire\_all** (*bool*) -- Whether to also fire messages to the event bus
- **control** (*bool*) -- If set to True, whether Slack is allowed to control Salt.
- **tag** (*str*) -- The tag to send to use to send to the event bus
- **interval** (*int*) -- time to wait between ending a loop and beginning the next

```
salt.engines.slack_bolt_engine.start(app_token, bot_token, control=False, trigger='!', groups=None,
                                   groups_pillar_name=None, fire_all=False,
                                   tag='salt/engines/slack')
```

Listen to slack events and forward them to salt, new version

#### Parameters

- **app\_token** (*str*) -- The Slack application token used by Salt to communicate with Slack.
- **bot\_token** (*str*) -- The Slack bot token used by Salt to communicate with Slack.

- **control** (*bool*) -- Determines whether or not commands sent from Slack with the trigger string will control Salt, defaults to False.
- **trigger** (*str*) -- The string that should preface all messages in Slack that should be treated as commands to send to Salt.
- **group** (*str*) -- The string that should preface all messages in Slack that should be treated as commands to send to Salt.
- **group\_pillars** -- A pillar key that can be used to pull group configuration.
- **fire\_all** (*bool*) -- If set to True, all messages which are not prefixed with the trigger string will fired as events onto Salt's ref:*event bus <event-system>*. The tag for these events will be prefixed with the string specified by the `tag` config option (default: `salt/engines/slack`).
- **tag** (*str*) -- The tag to prefix all events sent to the Salt event bus.

### 26.5.15 salt.engines.sqs\_events

An engine that continuously reads messages from SQS and fires them as events.

Note that long polling is utilized to avoid excessive CPU usage.

New in version 2015.8.0.

```
depends
  boto
```

#### Configuration

This engine can be run on the master or on a minion.

Example Config:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
sqs.message_format: json
```

Explicit sqs credentials are accepted but this engine can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

If IAM roles are not (or for boto version < 2.5.1) used you need to specify them either in a pillar or in the config file of the master or minion, as appropriate:

To deserialize the message from json:

```
sqs.message_format: json
```

It's also possible to specify key, keyid and region via a profile:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
sqs.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile:

```
myprofile:  
  keyid: GKTADJGHEIQSXMKKRBJ08H  
  key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkggh  
  region: us-east-1
```

Additionally you can define cross account sqs:

```
engines:  
  - sqs_events:  
    queue: prod  
    owner_acct_id: 111111111111
```

```
salt.engines.sqs_events.start(queue, profile=None, tag='salt/engine/sqs', owner_acct_id=None)
```

Listen to sqs and fire message on event bus

### 26.5.16 salt.engines.stalekey

An engine that uses presence detection to keep track of which minions have been recently connected and remove their keys if they have not been connected for a certain period of time.

Requires that the `minion_data_cache` option be enabled.

New in version 2017.7.0.

#### configuration

Example configuration:

```
engines:  
  - stalekey:  
    interval: 3600  
    expire: 86400
```

```
salt.engines.stalekey.start(interval=3600, expire=604800)
```

Start the engine

### 26.5.17 salt.engines.test

A simple test engine, not intended for real use but as an example

```
salt.engines.test.event_bus_context(opts)
```

```
salt.engines.test.start()
```

Listen to events and write them to a log file

### 26.5.18 salt.engines.thorium

Manage the Thorium complex event reaction system

`salt.engines.thorium.start` (*grains=False, grain\_keys=None, pillar=False, pillar\_keys=None*)

Execute the Thorium runtime

### 26.5.19 salt.engines.webhook

Send events from webhook api

`salt.engines.webhook.start` (*address=None, port=5000, ssl\_cert=None, ssl\_key=None*)

Api to listen for webhooks to send to the reactor.

Implement the webhook behavior in an engine. [rest\\_cherryipy Webhook docs](#)

Unlike the `rest_cherryipy Webhook`, this is only an unauthenticated webhook endpoint. If an authenticated webhook endpoint is needed, use the `salt-api` webhook which runs on the master and authenticates through `eauth`.

**Warning:** Unauthenticated endpoint

This engine sends webhook calls to the event stream. If the engine is running on a minion with `file_client: local` the event is sent to the minion event stream. Otherwise it is sent to the master event stream.

Example Config

```
engines:
  - webhook: {}
```

```
engines:
  - webhook:
      port: 8000
      address: 10.128.1.145
      ssl_cert: /etc/pki/tls/certs/localhost.crt
      ssl_key: /etc/pki/tls/certs/localhost.key
```

## 26.6 execution modules

---

Virtual modules

### 26.6.1 salt.modules.group

group is a virtual module that is fulfilled by one of the following modules:

Execution Module	Used for
<i>groupadd</i>	Linux, NetBSD, and OpenBSD systems using <code>groupadd(8)</code> , <code>groupdel(8)</code> , and <code>groupmod(8)</code>
<i>pw_group</i>	FreeBSD-based OSes using <code>pw(8)</code>
<i>solaris_group</i>	Solaris-based OSes using <code>groupadd(1M)</code> , <code>groupdel(1M)</code> , and <code>groupmod(1M)</code>
<i>win_groupadd</i>	Windows

### 26.6.2 salt.modules.kernelpkg

kernelpkg is a virtual module that is fulfilled by one of the following modules:

Execution Module	Used for
<i>kernelpkg_linux_apt</i>	Debian/Ubuntu-based distros which use <code>apt-get</code> for package management
<i>kernelpkg_linux_yum</i>	RedHat-based distros and derivatives using <code>yum</code> or <code>dnf</code>

### 26.6.3 salt.modules.pkg

pkg is a virtual module that is fulfilled by one of the following modules:

Execution Module	Used for
<i>aixpkg</i>	AIX OS using <code>installp</code> and <code>rpm</code>
<i>aptpkg</i>	Debian/Ubuntu-based distros which use <code>apt-get(8)</code> for package management
<i>mac_brew_pkg</i>	Mac OS software management using <a href="#">Homebrew</a>
<i>ebuildpkg</i>	Gentoo-based systems (utilizes the <code>portage</code> python module as well as <code>emerge(1)</code> )
<i>frebsd_pkg</i>	FreeBSD-based OSes using <code>pkg_add(1)</code>
<i>openbsd_pkg</i>	OpenBSD-based OSes using <code>pkg_add(1)</code>
<i>pacmanpkg</i>	Arch Linux-based distros using <code>pacman(8)</code>
<i>pkgin</i>	NetBSD-based OSes using <code>pkgin(1)</code>
<i>pkgng</i>	FreeBSD-based OSes using <code>pkg(8)</code>
<i>pkgutil</i>	Solaris-based OSes using <a href="#">OpenCSW's pkgutil(1)</a>
<i>solaris_pkg</i>	Solaris-based OSes using <code>pkgadd(1M)</code>
<i>solaris_ips_pkg</i>	Solaris-based OSes using <code>IPS pkg(1)</code>
<i>win_pkg</i>	Salt's <a href="#">Windows Package Manager</a>
<i>yumpkg</i>	RedHat-based distros and derivatives using <code>yum(8)</code> or <code>dnf(8)</code>
<i>zypperpkg</i>	SUSE-based distros using <code>zypper(8)</code>

## 26.6.4 salt.modules.service

`service` is a virtual module that is fulfilled by one of the following modules:

Execution Module	Used for
<i>debian_serv</i>	Debian Wheezy and earlier
<i>freebsd_serv</i>	FreeBSD-based OSes using <code>service(8)</code>
<i>gentoo_serv</i>	Gentoo Linux using <code>sysvinit</code> and <code>rc-update(8)</code>
<i>mac_service</i>	Mac OS hosts using <code>launchctl(1)</code>
<i>netbsd_servi</i>	NetBSD-based OSes
<i>openbsd_serv</i>	OpenBSD-based OSes
<i>rh_service</i>	RedHat-based distros and derivatives using <code>service(8)</code> and <code>chkconfig(8)</code> . Supports both pure <code>sysvinit</code> and mixed <code>sysvinit/upstart</code> systems.
<i>service</i>	Fallback which simply wraps <code>sysvinit</code> scripts
<i>smf_service</i>	Solaris-based OSes which use SMF
<i>systemd_ser</i>	Linux distros which use <code>systemd</code>
<i>upstart_ser</i>	Ubuntu-based distros using <code>upstart</code>
<i>win_service</i>	Windows

## 26.6.5 salt.modules.shadow

`shadow` is a virtual module that is fulfilled by one of the following modules:

Execution Module	Used for
<i>aix_shadow</i>	AIX
<i>linux_shadow</i>	Linux
<i>bsd_shadow</i>	FreeBSD, OpenBSD, NetBSD
<i>solaris_shadow</i>	Solaris-based OSes
<i>win_shadow</i>	Windows

## 26.6.6 salt.modules.sysctl

`sysctl` is a virtual module that is fulfilled by one of the following modules:

Execution Module	Used for
<i>freebsd_sysctl</i>	FreeBSD
<i>linux_sysctl</i>	Linux
<i>mac_sysctl</i>	macOS
<i>netbsd_sysctl</i>	NetBSD
<i>openbsd_sysctl</i>	OpenBSD

## 26.6.7 salt.modules.user

`user` is a virtual module that is fulfilled by one of the following modules:

Execution Module	Used for
<code>useradd</code>	Linux, NetBSD, and OpenBSD systems using <code>useradd(8)</code> , <code>userdel(8)</code> , and <code>usermod(8)</code>
<code>pw_user</code>	FreeBSD-based OSes using <code>pw(8)</code>
<code>solaris_user</code>	Solaris-based OSes using <code>useradd(1M)</code> , <code>userdel(1M)</code> , and <code>usermod(1M)</code>
<code>mac_user</code>	MacOS
<code>win_useradd</code>	Windows

<code>acme</code>	ACME / Let's Encrypt module
<code>aix_group</code>	Manage groups on Solaris
<code>aix_shadow</code>	Manage account locks on AIX systems
<code>aixpkg</code>	Package support for AIX
<code>aliases</code>	Manage the information in the aliases file
<code>alternatives</code>	Support for Alternatives system
<code>ansiblegate</code>	Ansible Support
<code>apache</code>	Support for Apache
<code>apcups</code>	Module for apcupsd
<code>apf</code>	Support for Advanced Policy Firewall (APF) maintainer Mostafa Hussein < <a href="mailto:mostafa.hussein91@gmail.com">mostafa.hussein91@gmail.com</a> >
	maturity
	new
	depends
	python-iptables
	platform
	Linux
<code>apkpkg</code>	Support for apk
<code>aptly</code>	Aptly Debian repository manager.
<code>aptpkg</code>	Support for APT (Advanced Packaging Tool)
<code>archive</code>	A module to wrap (non-Windows) archive calls
<code>arista_pyeapi</code>	Arista pyeapi
<code>artifactory</code>	Module for fetching artifacts from Artifactory
<code>at</code>	Wrapper module for at(1)
<code>at_solaris</code>	Wrapper for at(1) on Solaris-like systems
<code>augeas_cfg</code>	Manages configuration files via augeas
<code>aws_sqs</code>	Support for the Amazon Simple Queue Service.
<code>bamboohr</code>	Support for BambooHR
<code>baredoc</code>	Baredoc walks the installed module and state directories and generates dictionaries and lists of the function names and their arguments.
<code>bcache</code>	Module for managing BCache sets
<code>beacons</code>	Module for managing the Salt beacons on a minion
<code>bigip</code>	An execution module which can manipulate an f5 bigip via iControl REST
<code>bluez_bluetooth</code>	Support for Bluetooth (using BlueZ in Linux).

Table 3 – continued from previous page

<i>boto3_elasticache</i>	Execution module for Amazon Elasticache using boto3
<i>boto3_elasticsearch</i>	Connection module for Amazon Elasticsearch Service
<i>boto3_route53</i>	Execution module for Amazon Route53 written against Boto 3
<i>boto3_sns</i>	Connection module for Amazon SNS
<i>boto_apigateway</i>	Connection module for Amazon APIGateway
<i>boto_asg</i>	Connection module for Amazon Autoscale Groups
<i>boto_cfn</i>	Connection module for Amazon Cloud Formation
<i>boto_cloudfront</i>	Connection module for Amazon CloudFront
<i>boto_cloudtrail</i>	Connection module for Amazon CloudTrail
<i>boto_cloudwatch</i>	Connection module for Amazon CloudWatch
<i>boto_cloudwatch_event</i>	Connection module for Amazon CloudWatch Events
<i>boto_cognitoidentity</i>	Connection module for Amazon CognitoIdentity
<i>boto_datapipeline</i>	Connection module for Amazon Data Pipeline
<i>boto_dynamodb</i>	Connection module for Amazon DynamoDB
<i>boto_ec2</i>	Connection module for Amazon EC2
<i>boto_efs</i>	Connection module for Amazon EFS
<i>boto_elasticache</i>	Connection module for Amazon Elasticache
<i>boto_elasticsearch_domain</i>	Connection module for Amazon Elasticsearch Service
<i>boto_elb</i>	Connection module for Amazon ELB
<i>boto_elbv2</i>	Connection module for Amazon ALB
<i>boto_iam</i>	Connection module for Amazon IAM
<i>boto_iot</i>	Connection module for Amazon IoT
<i>boto_kinesis</i>	Connection module for Amazon Kinesis
<i>boto_kms</i>	Connection module for Amazon KMS
<i>boto_lambda</i>	Connection module for Amazon Lambda
<i>boto_rds</i>	Connection module for Amazon RDS
<i>boto_route53</i>	Connection module for Amazon Route53
<i>boto_s3</i>	Connection module for Amazon S3 using boto3
<i>boto_s3_bucket</i>	Connection module for Amazon S3 Buckets
<i>boto_secgroup</i>	Connection module for Amazon Security Groups
<i>boto_sns</i>	Connection module for Amazon SNS
<i>boto_sqs</i>	Connection module for Amazon SQS
<i>boto_ssm</i>	Connection module for Amazon SSM
<i>boto_vpc</i>	Connection module for Amazon VPC
<i>bower</i>	Manage and query Bower packages
<i>bridge</i>	Module for gathering and managing bridging information
<i>bsd_shadow</i>	Manage the password database on BSD systems
<i>btrfs</i>	Module for managing BTRFS file systems.
<i>cabal</i>	Manage and query Cabal packages
<i>capirca_acl</i>	Capirca ACL
<i>cassandra_cql</i>	Cassandra Database Module
<i>celery</i>	Support for scheduling celery tasks.
<i>ceph</i>	Module to provide ceph control with salt.
<i>chassis</i>	Glue execution module to link to the <i>fx2 proxymodule</i> .
<i>chef</i>	Execute chef in server or solo mode
<i>chocolatey</i>	A module that wraps calls to the Chocolatey package manager ( <a href="http://chocolatey.org">http://chocolatey.org</a> )
<i>chronos</i>	Module providing a simple management interface to a chronos cluster.

continues on next page

Table 3 – continued from previous page

<i>chroot</i>	Module for chroot :maintainer: Alberto Planas <aplanas@suse.com> :maturity: new :depends: None :platform: Linux
<i>cimc</i>	Module to provide Cisco UCS compatibility to Salt
<i>ciscoconfparse_mod</i>	Execution module for <a href="#">ciscoconfparse</a>
<i>cisconso</i>	Execution module for Cisco Network Services Orchestrator Proxy minions
<i>cloud</i>	Salt-specific interface for calling Salt Cloud directly
<i>cmdmod</i>	A module for shelling out.
<i>composer</i>	Use composer to install PHP dependencies for a directory
<i>config</i>	Return config information
<i>consul</i>	Interact with Consul
<i>container_resource</i>	Common resources for LXC and systemd-nspawn containers
<i>cp</i>	Minion side functions for salt-cp
<i>cpan</i>	Manage Perl modules using CPAN
<i>cron</i>	Work with cron
<i>cryptdev</i>	Salt module to manage Unix cryptsetup jobs and the crypttab file
<i>csf</i>	Support for Config Server Firewall (CSF) maintainer Mostafa Hussein <mostafa.hussein91@gmail.com> maturity new platform Linux
<i>cyg</i>	Manage cygwin packages.
<i>daemontools</i>	daemontools service module.
<i>data</i>	Manage a local persistent data structure that can hold any arbitrary data specific to the minion
<i>datadog_api</i>	An execution module that interacts with the Datadog API
<i>ddns</i>	Support for RFC 2136 dynamic DNS updates.
<i>deb_apache</i>	
<i>deb_postgres</i>	Module to provide Postgres compatibility to salt for debian family specific tools.
<i>debconfmod</i>	Support for Debconf
<i>debian_ip</i>	The networking module for Debian-based distros
<i>debian_service</i>	Service support for Debian systems (uses update-rc.d and /sbin/service)
<i>debuild_pkgbuild</i>	Debian Package builder system
<i>defaults</i>	Module to work with salt formula defaults files
<i>devinfo</i>	Module for devinfo :maintainer: Alberto Planas <aplanas@suse.com> :maturity: new :depends: None :platform: Linux
<i>devmap</i>	Device-Mapper module
<i>dig</i>	Compendium of generic DNS utilities.
<i>disk</i>	Module for managing disks and blockdevices
<i>djangomod</i>	Manage Django sites
<i>dnsmasq</i>	Module for managing dnsmasq

continues on next page

Table 3 – continued from previous page

<i>dnsutil</i>	Compendium of generic DNS utilities.
<i>dockercompose</i>	
<i>dockermod</i>	
<i>dpkg_lowpkg</i>	Support for DEB packages
<i>drac</i>	Manage Dell DRAC
<i>dracr</i>	Manage Dell DRAC.
<i>drbd</i>	DRBD administration module
<i>dummyproxy_pkg</i>	Package support for the dummy proxy used by the test suite
<i>dummyproxy_service</i>	Provide the service module for the dummy proxy used in integration tests
<i>ebuildpkg</i>	Support for Portage
<i>eix</i>	Support for Eix
<i>elasticsearch</i>	Elasticsearch - A distributed RESTful search and analytics server
<i>environ</i>	Support for getting and setting the environment variables of the current salt process.
<i>eselect</i>	Support for eselect, Gentoo's configuration and management tool.
<i>esxcluster</i>	Module used to access the esxcluster proxy connection methods
<i>esxdatacenter</i>	Module used to access the esxdatacenter proxy connection methods
<i>esxi</i>	Glues the VMware vSphere Execution Module to the VMware ESXi Proxy Minions to the <i>esxi proxymodule</i> .
<i>esxvm</i>	Module used to access the esx proxy connection methods
<i>etcd_mod</i>	Execution module to work with etcd
<i>ethtool</i>	Module for running ethtool command
<i>event</i>	Use the <i>Salt Event System</i> to fire events from the master to the minion and vice-versa.
<i>extfs</i>	Module for managing ext2/3/4 file systems
<i>file</i>	Manage information about regular files, directories, and special files on the minion, set/read user, group, mode, and data
<i>firewalld</i>	Support for firewalld.
<i>freebsd_sysctl</i>	Module for viewing and modifying sysctl parameters
<i>freebsd_update</i>	Support for freebsd-update utility on FreeBSD.
<i>freebsdjail</i>	The jail module for FreeBSD
<i>freebsdkernelmod</i>	Module to manage FreeBSD kernel modules
<i>freebsdpkg</i>	Remote package support using <code>pkg_add(1)</code>
<i>freebsdports</i>	Install software from the FreeBSD <code>ports(7)</code> system
<i>freebsdservice</i>	The service module for FreeBSD
<i>freezer</i>	Module for freezer :maintainer: Alberto Planas <aplanas@suse.com> :maturity: new :depends: None :platform: Linux
<i>gcp_addon</i>	A route is a rule that specifies how certain packets should be handled by the virtual network.
<i>gem</i>	Manage ruby gems.

continues on next page

Table 3 – continued from previous page

<i>genesis</i>	Module for managing container and VM images
<i>gentoo_service</i>	Top level package command wrapper, used to translate the os detected by grains to the correct service manager
<i>gentoolkitmod</i>	Support for Gentoolkit
<i>git</i>	Support for the Git SCM
<i>github</i>	Module for interacting with the GitHub v3 API.
<i>glanceng</i>	Glance module for interacting with OpenStack Glance
<i>glassfish</i>	Module for working with the Glassfish/Payara 4.x management API .
<i>glusterfs</i>	Manage a glusterfs pool
<i>gnomedesktop</i>	GNOME implementations
<i>google_chat</i>	Module for sending messages to google chat.
<i>gpg</i>	Manage GPG keychains, add keys, create keys, retrieve keys from key servers.
<i>grafana4</i>	Module for working with the Grafana v4 API
<i>grains</i>	Return/control aspects of the grains data
<i>groupadd</i>	Manage groups on Linux, OpenBSD and NetBSD
<i>grub_legacy</i>	Support for GRUB Legacy
<i>guestfs</i>	Interact with virtual machine images via libguestfs
<i>hadoop</i>	Support for hadoop
<i>haproxyconn</i>	Support for haproxy
<i>hashutil</i>	A collection of hashing and encoding functions
<i>heat</i>	Module for handling OpenStack Heat calls
<i>helm</i>	Interface with Helm
<i>hg</i>	Support for the Mercurial SCM
<i>highstate_doc</i>	This module renders highstate configuration into a more human readable format.
<i>hosts</i>	Manage the information in the hosts file
<i>http</i>	Module for making various web calls.
<i>icinga2</i>	Module to provide icinga2 compatibility to salt.
<i>idem</i>	Idem Support
<i>ifttt</i>	Support for IFTTT
<i>ilo</i>	Manage HP ILO
<i>incron</i>	Work with incron
<i>influxdb08mod</i>	InfluxDB - A distributed time series database
<i>influxdbmod</i>	InfluxDB - A distributed time series database
<i>infoblox</i>	This module have been tested on infoblox API v1.2.1, other versions of the API are likly workable.
<i>ini_manage</i>	Edit ini files
<i>inspectlib</i>	
<i>inspectlib.collector</i>	
<i>inspectlib.dbhandle</i>	
<i>inspectlib.entities</i>	
<i>inspectlib.exceptions</i>	

continues on next page

Table 3 – continued from previous page

<i>inspectlib.fsd</i>	<b>codeauthor</b> Bo Maryniuk <bo@suse.de>
<i>inspectlib.kiwiproc</i>	
<i>inspectlib.query</i>	
<i>inspector</i>	Module for full system inspection.
<i>introspect</i>	Functions to perform introspection on a minion, and return data in a format usable by Salt States
<i>iosconfig</i>	Cisco IOS configuration manipulation helpers
<i>ipmi</i>	Support IPMI commands over LAN.
<i>ipset</i>	Support for ipset
<i>iptables</i>	Support for iptables
<i>iwtools</i>	Support for Wireless Tools for Linux
<i>jboss7</i>	Module for managing JBoss AS 7 through the CLI interface.
<i>jboss7_cli</i>	Module for low-level interaction with JbossAS7 through CLI.
<i>jenkinsmod</i>	Module for controlling Jenkins
<i>jinja</i>	Module for checking jinja maps and verifying the result of loading JSON/YAML files
<i>jira_mod</i>	JIRA Execution module
<i>junos</i>	Module to interact with Junos devices.
<i>k8s</i>	
<i>kapacitor</i>	Kapacitor execution module.
<i>kerberos</i>	Manage Kerberos KDC
<i>kernelpkg_linux_apt</i>	Manage Linux kernel packages on APT-based systems
<i>kernelpkg_linux_yum</i>	Manage Linux kernel packages on YUM-based systems
<i>key</i>	Functions to view the minion's public key information
<i>keyboard</i>	Module for managing keyboards on supported POSIX-like systems using systemd, or such as Redhat, Debian and Gentoo.
<i>keystone</i>	Module for handling openstack keystone calls.
<i>keystoneng</i>	Keystone module for interacting with OpenStack Keystone
<i>keystore</i>	Module to interact with keystores
<i>kmod</i>	Module to manage Linux kernel modules
<i>kubeadm</i>	
<i>kubernetesmod</i>	
<i>launchctl_service</i>	Module for the management of MacOS systems that use launchd/launchctl
<i>layman</i>	Support for Layman
<i>ldap3</i>	Query and modify an LDAP database (alternative interface)
<i>ldapmod</i>	Salt interface to LDAP commands
<i>libcloud_compute</i>	Apache Libcloud Compute Management
<i>libcloud_dns</i>	Apache Libcloud DNS Management

continues on next page

Table 3 – continued from previous page

<i>libcloud_loadbalancer</i>	Apache Libcloud Load Balancer Management
<i>libcloud_storage</i>	Apache Libcloud Storage Management
<i>linux_acl</i>	Support for Linux File Access Control Lists
<i>linux_ip</i>	The networking module for Non-RH/Deb Linux distros
<i>linux_lvm</i>	Support for Linux LVM2
<i>linux_service</i>	If Salt's OS detection does not identify a different virtual service module, the minion will fall back to using this basic module, which simply wraps sysvinit scripts.
<i>linux_shadow</i>	Manage the shadow file on Linux systems
<i>linux_sysctl</i>	Module for viewing and modifying sysctl parameters
<i>localemod</i>	Module for managing locales on POSIX-like systems.
<i>locate</i>	Module for using the locate utilities
<i>logadm</i>	Module for managing Solaris logadm based log rotations.
<i>logmod</i>	On-demand logging
<i>logrotate</i>	Module for managing logrotate.
<i>lvs</i>	Support for LVS (Linux Virtual Server)
<i>lxc</i>	Control Linux Containers via Salt
<i>lxd</i>	Module for managing the LXD daemon and its containers.
<i>mac_assistive</i>	This module allows you to manage assistive access on macOS minions with 10.9+
<i>mac_brew_pkg</i>	Homebrew for macOS
<i>mac_desktop</i>	macOS implementations of various commands in the "desktop" interface
<i>mac_group</i>	Manage groups on Mac OS 10.7+
<i>mac_keychain</i>	Install certificates into the keychain on Mac OS
<i>mac_pkgutil</i>	Installer support for macOS.
<i>mac_portspkg</i>	Support for MacPorts under macOS.
<i>mac_power</i>	Module for editing power settings on macOS
<i>mac_service</i>	The service module for macOS
<i>mac_shadow</i>	Manage macOS local directory passwords and policies
<i>mac_softwareupdate</i>	Support for the softwareupdate command on MacOS.
<i>mac_sysctl</i>	Module for viewing and modifying sysctl parameters
<i>mac_system</i>	System module for sleeping, restarting, and shutting down the system on Mac OS X
<i>mac_timezone</i>	Module for editing date/time settings on macOS
<i>mac_user</i>	Manage users on Mac OS 10.7+
<i>mac_xattr</i>	This module allows you to manage extended attributes on files or directories
<i>macdefaults</i>	Set defaults on Mac OS
<i>macpackage</i>	Install pkg, dmg and .app applications on macOS minions.
<i>makeconf</i>	Support for modifying make.conf under Gentoo
<i>mandrill</i>	Mandrill
<i>marathon</i>	Module providing a simple management interface to a marathon cluster.
<i>match</i>	The match module allows for match routines to be run and determine target specs
<i>mattermost</i>	Module for sending messages to Mattermost
<i>mdadm_raid</i>	Salt module to manage RAID arrays with mdadm
<i>mdata</i>	Module for managing metadata in SmartOS Zones

continues on next page

Table 3 – continued from previous page

<i>memcached</i>	Module for Management of Memcached Keys
<i>mine</i>	The function cache system allows for data to be stored on the master so it can be easily read by other minions
<i>minion</i>	Module to provide information about minions
<i>mod_random</i>	Provides access to randomness generators.
<i>modjk</i>	Control Modjk via the Apache Tomcat "Status" worker ( <a href="http://tomcat.apache.org/connectors-doc/reference/status.html">http://tomcat.apache.org/connectors-doc/reference/status.html</a> )
<i>mongodb</i>	Module to provide MongoDB functionality to Salt
<i>monit</i>	Monit service module.
<i>moosefs</i>	Module for gathering and managing information about MooseFS
<i>mount</i>	Salt module to manage Unix mounts and the fstab file
<i>mssql</i>	Module to provide MS SQL Server compatibility to salt.
<i>msteams</i>	Module for sending messages to MS Teams
<i>munin</i>	Run munin plugins/checks from salt and format the output as data.
<i>mysql</i>	Module to provide MySQL compatibility to salt.
<i>nacl</i>	This module helps include encrypted passwords in pillars, grains and salt state files.
<i>nagios</i>	Run nagios plugins/checks from salt and get the return as data.
<i>nagios_rpc</i>	Check Host & Service status from Nagios via JSON RPC.
<i>namecheap_domains</i>	Namecheap Domain Management
<i>namecheap_domains_dns</i>	Namecheap DNS Management
<i>namecheap_domains_ns</i>	Namecheap Nameserver Management
<i>namecheap_ssl</i>	Namecheap SSL Certificate Management
<i>namecheap_users</i>	Namecheap User Management
<i>napalm_bgp</i>	NAPALM BGP
<i>napalm_formula</i>	NAPALM Formula helpers
<i>napalm_mod</i>	NAPALM helpers
<i>napalm_netacl</i>	NAPALM ACL
<i>napalm_network</i>	NAPALM Network
<i>napalm_ntp</i>	NAPALM NTP
<i>napalm_probes</i>	NAPALM Probes
<i>napalm_route</i>	NAPALM Route
<i>napalm_snmp</i>	NAPALM SNMP
<i>napalm_users</i>	NAPALM Users
<i>napalm_yang_mod</i>	NAPALM YANG
<i>netaddress</i>	Module for getting information about network addresses.
<i>netbox</i>	NetBox
<i>netbsd_sysctl</i>	Module for viewing and modifying sysctl parameters
<i>netbsdservice</i>	The service module for NetBSD
<i>netmiko_mod</i>	Netmiko Execution Module
<i>netscaler</i>	Module to provide Citrix Netscaler compatibility to Salt (compatible with netscaler 9.2+)
<i>network</i>	Module for gathering and managing network information
<i>neutron</i>	Module for handling OpenStack Neutron calls
<i>neutronng</i>	Neutron module for interacting with OpenStack Neutron

continues on next page

Table 3 – continued from previous page

<i>nexus</i>	Module for fetching artifacts from Nexus 3.x
<i>nfs3</i>	Module for managing NFS version 3.
<i>nftables</i>	Support for nftables
<i>nginx</i>	Support for nginx
<i>nilrt_ip</i>	The networking module for NI Linux Real-Time distro
<i>nix</i>	Work with Nix packages
<i>nova</i>	Module for handling OpenStack Nova calls
<i>npm</i>	Manage and query NPM packages.
<i>nspawn</i>	Manage nspawn containers
<i>nxos</i>	Execution module for Cisco NX OS Switches.
<i>nxos_api</i>	Execution module to manage Cisco Nexus Switches (NX-OS) over the NX-API
<i>nxos_upgrade</i>	Execution module to upgrade Cisco NX-OS Switches.
<i>omapi</i>	This module interacts with an ISC DHCP Server via OMAPI.
<i>openbsd_sysctl</i>	Module for viewing and modifying OpenBSD sysctl parameters
<i>openbsdpkg</i>	Package support for OpenBSD
<i>openbsdrctl_service</i>	The rctl service module for OpenBSD
<i>openbsdservice</i>	The service module for OpenBSD
<i>openscap</i>	Module for OpenSCAP Management
<i>openstack_config</i>	Modify, retrieve, or delete values from OpenStack configuration files.
<i>openstack_mng</i>	Module for OpenStack Management
<i>openvswitch</i>	Support for Open vSwitch - module with basic Open vSwitch commands.
<i>opkg</i>	Support for Opkg
<i>opsgenie</i>	Module for sending data to OpsGenie
<i>oracle</i>	Oracle DataBase connection module
<i>osquery</i>	Support for OSQuery - <a href="https://osquery.io">https://osquery.io</a> .
<i>out</i>	Output Module
<i>pacmanpkg</i>	A module to wrap pacman calls, since Arch is the best ( <a href="https://wiki.archlinux.org/index.php/Arch_is_the_best">https://wiki.archlinux.org/index.php/Arch_is_the_best</a> )
<i>pagerduty</i>	Module for Firing Events via PagerDuty
<i>pagerduty_util</i>	Module for manageing PagerDuty resource
<i>pam</i>	Support for pam
<i>panos</i>	Module to provide Palo Alto compatibility to Salt
<i>parallels</i>	Manage Parallels Desktop VMs with <code>prlctl</code> and <code>prlsrvctl</code> .
<i>parted_partition</i>	Module for managing partitions on POSIX-like systems.
<i>pcs</i>	Configure a Pacemaker/Corosync cluster with PCS
<i>pdbedit</i>	Manage accounts in Samba's passdb using pdbedit
<i>pecl</i>	Manage PHP pecl extensions.
<i>peeringdb</i>	PeeringDB Module
<i>pf</i>	Control the OpenBSD packet filter (PF).
<i>philips_hue</i>	Philips HUE lamps module for proxy.
<i>pillar</i>	Extract the pillar data for this minion
<i>pip</i>	Install Python packages with pip to either the system or a virtualenv
<i>pkg_resource</i>	Resources needed by pkg providers

continues on next page

Table 3 – continued from previous page

<i>pkgin</i>	Package support for pkgin based systems, inspired from freebsd/pkg module
<i>pkgng</i>	Support for pkgng, the new package manager for FreeBSD
<i>pkgutil</i>	Pkgutil support for Solaris
<i>portage_config</i>	Configure portage(5)
<i>postfix</i>	Support for Postfix
<i>postgres</i>	Module to provide Postgres compatibility to salt.
<i>poudriere</i>	Support for poudriere
<i>powerpath</i>	powerpath support.
<i>proxy</i>	This module allows you to manage proxy settings
<i>ps</i>	A salt interface to psutil, a system and process library.
<i>publish</i>	Publish a command from a minion to a target
<i>puppet</i>	Execute puppet routines
<i>purefa</i>	Management of Pure Storage FlashArray
<i>purefb</i>	Management of Pure Storage FlashBlade
<i>pushbullet</i>	Module for sending messages to Pushbullet ( <a href="https://www.pushbullet.com">https://www.pushbullet.com</a> )
<i>pushover_notify</i>	
<i>pw_group</i>	Manage groups on FreeBSD
<i>pw_user</i>	Manage users with the pw command
<i>pyenv</i>	Manage python installations with pyenv.
<i>qemu_img</i>	Qemu-img Command Wrapper
<i>qemu_nbd</i>	Qemu Command Wrapper
<i>quota</i>	Module for managing quotas on POSIX-like systems.
<i>rabbitmq</i>	Module to provide RabbitMQ compatibility to Salt.
<i>rallydev</i>	Support for RallyDev
<i>random_org</i>	Module for retrieving random information from Random.org
<i>rbac_solaris</i>	Module for Solaris' Role-Based Access Control
<i>rbenv</i>	Manage ruby installations with rbenv.
<i>rdp</i>	Manage RDP Service on Windows servers
<i>rebootmgr</i>	Module for rebootmgr :maintainer: Alberto Planas < <a href="mailto:aplanas@suse.com">aplanas@suse.com</a> > :maturity: new :depends: None :platform: Linux
<i>redismod</i>	Module to provide redis functionality to Salt
<i>reg</i>	Manage the Windows registry
<i>rest_pkg</i>	Package support for the REST example
<i>rest_sample_utils</i>	Utility functions for the rest_sample
<i>rest_service</i>	Provide the service module for the proxy-minion REST sample
<i>restartcheck</i>	checkrestart functionality for Debian and Red Hat Based systems
<i>restconf</i>	Execution module for RESTCONF Proxy minions
<i>ret</i>	Module to integrate with the returner system and retrieve data sent to a salt returner
<i>rh_ip</i>	The networking module for RHEL/Fedora based distros
<i>rh_service</i>	Service support for RHEL-based systems, including support for both upstart and sysvinit
<i>riak</i>	Riak Salt Module
<i>rpm_lowpkg</i>	Support for rpm

continues on next page

Table 3 – continued from previous page

<i>rpmbuild_pkgbuild</i>	RPM Package builder system
<i>rsync</i>	Wrapper for rsync
<i>runit</i>	runit service module ( <a href="http://smarden.org/runit">http://smarden.org/runit</a> )
<i>rvm</i>	Manage ruby installations and gemsets with RVM, the Ruby Version Manager.
<i>s3</i>	Connection module for Amazon S3
<i>s6</i>	s6 service module
<i>salt_proxy</i>	Salt proxy module
<i>salt_version</i>	Access Salt's elemental release code-names.
<i>saltcheck</i>	A module for testing the logic of states and highstates on salt minions
<i>saltcloudmod</i>	Control a salt cloud system
<i>saltutil</i>	The Saltutil module is used to manage the state of the salt minion itself.
<i>schedule</i>	Module for managing the Salt schedule on a minion
<i>scp_mod</i>	SCP Module
<i>scsi</i>	SCSI administration module
<i>sdb</i>	Module for Manipulating Data via the Salt DB API
<i>seed</i>	Virtual machine image management tools
<i>selinux</i>	Execute calls on selinux
<i>sensehat</i>	Module for controlling the LED matrix or reading environment data on the SenseHat of a Raspberry Pi.
<i>sensors</i>	Read lm-sensors
<i>serverdensity_device</i>	Wrapper around Server Density API
<i>servicenow</i>	Module for execution of ServiceNow CI (configuration items)
<i>slack_notify</i>	Module for sending messages to Slack
<i>slackware_service</i>	The service module for Slackware
<i>slsutil</i>	Utility functions for use with or in SLS files
<i>smartos_imgadm</i>	Module for running imgadm command on SmartOS
<i>smartos_nictagadm</i>	Module for running nictagadm command on SmartOS :maintainer: Jorge Schrauwen < <a href="mailto:sjorge@blackdot.be">sjorge@blackdot.be</a> > :maturity: new :depends: nictagadm binary, dladm binary :platform: smartos
<i>smartos_virt</i>	virt compatibility module for managing VMs on SmartOS
<i>smartos_vmadm</i>	Module for running vmadm command on SmartOS
<i>smbios</i>	Interface to SMBIOS/DMI
<i>smf_service</i>	Service support for Solaris 10 and 11, should work with other systems that use SMF also.
<i>smtp</i>	Module for Sending Messages via SMTP
<i>snapper</i>	Module to manage filesystem snapshots with snapper
<i>solaris_fmadm</i>	Module for running fmadm and fmdump on Solaris
<i>solaris_group</i>	Manage groups on Solaris
<i>solaris_shadow</i>	Manage the password database on Solaris systems
<i>solaris_system</i>	Support for reboot, shutdown, etc
<i>solaris_user</i>	Manage users with the useradd command
<i>solarisipspkg</i>	IPS pkg support for Solaris
<i>solarispkg</i>	Package support for Solaris
<i>solr</i>	Apache Solr Salt Module
<i>solrcloud</i>	Module for solrcloud configuration
<i>splunk</i>	Module for interop with the Splunk API

continues on next page

Table 3 – continued from previous page

<code>splunk_search</code>	Module for interop with the Splunk API
<code>sqlite3</code>	Support for SQLite3
<code>ssh</code>	Manage client ssh components
<code>ssh_pkg</code>	Service support for the REST example
<code>ssh_service</code>	Provide the service module for the proxy-minion SSH sample .
<code>state</code>	Control the state system on the minion.
<code>status</code>	Module for returning various status data about a minion.
<code>statuspage</code>	StatusPage
<code>supervisord</code>	Provide the service module for system supervisord or supervisord in a virtualenv
<code>suse_apache</code>	
<code>suse_ip</code>	The networking module for SUSE based distros
<code>svn</code>	Subversion SCM
<code>swarm</code>	Docker Swarm Module using Docker's Python SDK
<code>swift</code>	Module for handling OpenStack Swift calls Author: Anthony Stanton < <a href="mailto:anthony.stanton@gmail.com">anthony.stanton@gmail.com</a> >
<code>sysbench</code>	The 'sysbench' module is used to analyze the performance of the minions, right from the master! It measures various system parameters such as CPU, Memory, File I/O, Threads and Mutex.
<code>sysfs</code>	Module for interfacing with SysFS
<code>syslog_ng</code>	Module for getting information about syslog-ng
<code>sysmod</code>	The sys module provides information about the available functions on the minion
<code>sysrc</code>	sysrc module for FreeBSD
<code>system</code>	Support for reboot, shutdown, etc on POSIX-like systems.
<code>system_profiler</code>	System Profiler Module
<code>systemd_service</code>	Provides the service module for systemd
<code>telegram</code>	Module for sending messages via Telegram.
<code>telemetry</code>	Connection module for Telemetry
<code>temp</code>	Simple module for creating temporary directories and files
<code>test</code>	Module for running arbitrary tests
<code>test_virtual</code>	Module for testing that a <code>__virtual__</code> function returning False will not be available via the Salt Loader.
<code>testinframod</code>	This module exposes the functionality of the TestInfra library for use with SaltStack in order to verify the state of your minions.
<code>textfsm_mod</code>	TextFSM
<code>timezone</code>	Module for managing timezone on POSIX-like systems.
<code>tls</code>	A salt module for SSL/TLS.
<code>tomcat</code>	Support for Tomcat
<code>trafficserver</code>	Apache Traffic Server execution module.
<code>transactional_update</code>	Transactional update
<code>travis-ci</code>	Commands for working with travisci.
<code>tuned</code>	Interface to Red Hat tuned-adm module
<code>twilio_notify</code>	Module for notifications via Twilio
<code>udev</code>	Manage and query udev info

continues on next page

Table 3 – continued from previous page

<i>upstart_service</i>	Module for the management of upstart systems.
<i>uptime</i>	Wrapper around uptime API
<i>useradd</i>	Manage users with the useradd command
<i>uwsgi</i>	uWSGI stats server <a href="https://uwsgi-docs.readthedocs.io/en/latest/StatsServer.html">https://uwsgi-docs.readthedocs.io/en/latest/StatsServer.html</a>
<i>vagrant</i>	Work with virtual machines managed by Vagrant.
<i>varnish</i>	Support for Varnish
<i>vault</i>	
<i>vbox_guest</i>	VirtualBox Guest Additions installer
<i>vboxmanage</i>	Support for VirtualBox using the VBoxManage command
<i>vcenter</i>	Module used to access the vcenter proxy connection methods
<i>victorops</i>	Support for VictorOps
<i>virt</i>	Work with virtual machines managed by libvirt
<i>virtualenv_mod</i>	Create virtualenv environments.
<i>vmctl</i>	Manage vms running on the OpenBSD VMM hypervisor using vmctl(8).
<i>vsphere</i>	Manage VMware vCenter servers and ESXi hosts.
<i>webutil</i>	Support for htpasswd command.
<i>win_appx</i>	Manage provisioned apps
<i>win_auditpol</i>	A salt module for modifying the audit policies on the machine
<i>win_autoruns</i>	Module for listing programs that automatically run on startup (very alpha...not tested on anything but my Win 7x64)
<i>win_certutil</i>	This module allows you to install certificates into the windows certificate manager.
<i>win_dacl</i>	Manage DACLs on Windows
<i>win_disk</i>	Module for gathering disk information on Windows
<i>win_dism</i>	Install features/packages for Windows using DISM, which is useful for minions not running server versions of Windows.
<i>win_dns_client</i>	Module for configuring DNS Client on Windows systems
<i>win_dsc</i>	Module for working with Windows PowerShell DSC (Desired State Configuration)
<i>win_event</i>	A module for working with the Windows Event log system.
<i>win_file</i>	Manage information about files on the minion, set/read user, group data, modify the ACL of files/directories
<i>win_firewall</i>	Module for configuring Windows Firewall using netsh
<i>win_groupadd</i>	Manage groups on Windows
<i>win_iis</i>	Microsoft IIS site management via WebAdministration powershell module
<i>win_ip</i>	The networking module for Windows based systems
<i>win_lgpo</i>	Manage Local Policy on Windows
<i>win_lgpo_reg</i>	LGPO - Registry.pol
<i>win_license</i>	This module allows you to manage windows licensing via slmgr.vbs

continues on next page

Table 3 – continued from previous page

<i>win_network</i>	Module for gathering and managing network information
<i>win_ntp</i>	Management of NTP servers on Windows
<i>win_path</i>	Manage the Windows System PATH
<i>win_pkg</i>	A module to manage software on Windows
<i>win_pki</i>	Microsoft certificate management via the PKI Client PowerShell module.
<i>win_powercfg</i>	This module allows you to control the power settings of a windows minion via powercfg.
<i>win_psget</i>	Module for managing PowerShell through PowerShell-Get (PSGet)
<i>win_servermanager</i>	Manage Windows features via the ServerManager powershell module.
<i>win_service</i>	Windows Service module.
<i>win_shadow</i>	Manage the shadow file
<i>win_shortcut</i>	Execution module for creating shortcuts on Windows.
<i>win_smtp_server</i>	Module for managing IIS SMTP server configuration on Windows servers.
<i>win_snmp</i>	Module for managing SNMP service settings on Windows servers.
<i>win_status</i>	Module for returning various status data about a minion.
<i>win_system</i>	Module for managing Windows systems and getting Windows system information.
<i>win_task</i>	Windows Task Scheduler Module .
<i>win_timezone</i>	Module for managing timezone on Windows systems.
<i>win_useradd</i>	Module for managing Windows Users.
<i>win_wua</i>	Module for managing Windows Updates using the Windows Update Agent.
<i>win_wusa</i>	Microsoft Update files management via wusa.exe
<i>winrepo</i>	Module to manage Windows software repo on a Standalone Minion
<i>wordpress</i>	This module is used to manage Wordpress installations
<i>x509</i>	Manage X509 certificates
<i>x509_v2</i>	Manage X.509 certificates
<i>xapi_virt</i>	This module (mostly) uses the XenAPI to manage Xen virtual machines.
<i>xbpspkg</i>	Package support for XBPS package manager (used by VoidLinux)
<i>xfs</i>	Module for managing XFS file systems.
<i>xml</i>	XML file manager
<i>xmpp</i>	Module for Sending Messages via XMPP (a.k.a.
<i>yaml</i>	Yaml helper module for troubleshooting yaml
<i>yumpkg</i>	Support for YUM/DNF
<i>zabbix</i>	
<i>zcbuildout</i>	Management of zc.buildout
<i>zenoss</i>	Module for working with the Zenoss API
<i>zfs</i>	Module for running ZFS command
<i>zk_concurrency</i>	Concurrency controls in zookeeper
<i>znc</i>	znc - An advanced IRC bouncer
<i>zoneadm</i>	Module for Solaris 10's zoneadm

continues on next page

Table 3 – continued from previous page

<code>zonecfg</code>	Module for Solaris 10's zonecfg
<code>zookeeper</code>	Zookeeper Module maintainer SaltStack maturity new platform all depends kazoo
<code>zpool</code>	Module for running ZFS zpool command
<code>zypperpkg</code>	Package support for openSUSE via the zypper package manager

## 26.6.8 salt.modules.acme

### ACME / Let's Encrypt module

New in version 2016.3.0.

This module currently looks for certbot script in the \$PATH as - certbot, - lestsencrypt, - certbot-auto, - letsencrypt-auto eventually falls back to /opt/letsencrypt/letsencrypt-auto

**Note:** Installation & configuration of the Let's Encrypt client can for example be done using <https://github.com/saltstack-formulas/letsencrypt-formula>

**Warning:** Be sure to set at least `accept-tos = True` in `cli.ini`!

Most parameters will fall back to `cli.ini` defaults if `None` is given.

### DNS plugins

This module currently supports the CloudFlare certbot DNS plugin. The DNS plugin credentials file needs to be passed in using the `dns_plugin_credentials` argument.

Make sure the appropriate certbot plugin for the wanted DNS provider is installed before using this module.

`salt.modules.acme.cert` (*name, aliases=None, email=None, webroot=None, test\_cert=False, renew=None, keysize=None, server=None, owner='root', group='root', mode='0640', certname=None, preferred\_challenges=None, tls\_sni\_01\_port=None, tls\_sni\_01\_address=None, http\_01\_port=None, http\_01\_address=None, dns\_plugin=None, dns\_plugin\_credentials=None, manual\_auth\_hook=None, manual\_cleanup\_hook=None*)

Obtain/renew a certificate from an ACME CA, probably Let's Encrypt.

#### Parameters

- **name** -- Common Name of the certificate (DNS name of certificate)
- **aliases** -- subjectAltNames (Additional DNS names on certificate)

- **email** -- e-mail address for interaction with ACME provider
- **webroot** -- True or a full path to use to use webroot. Otherwise use standalone mode
- **test\_cert** -- Request a certificate from the Happy Hacker Fake CA (mutually exclusive with 'server')
- **renew** -- True/'force' to force a renewal, or a window of renewal before expiry in days
- **keysize** -- RSA key bits
- **server** -- API endpoint to talk to
- **owner** -- owner of the private key file
- **group** -- group of the private key file
- **mode** -- mode of the private key file
- **certname** -- Name of the certificate to save
- **preferred\_challenges** -- A sorted, comma delimited list of the preferred challenge to use during authorization with the most preferred challenge listed first.
- **tls\_sni\_01\_port** -- Port used during tls-sni-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 443.
- **tls\_sni\_01\_address** -- The address the server listens to during tls-sni-01 challenge.
- **http\_01\_port** -- Port used in the http-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 80.
- **https\_01\_address** -- The address the server listens to during http-01 challenge.
- **dns\_plugin** -- Name of a DNS plugin to use (currently only 'cloudflare' or 'digitalocean')
- **dns\_plugin\_credentials** -- Path to the credentials file if required by the specified DNS plugin
- **dns\_plugin\_propagate\_seconds** -- Number of seconds to wait for DNS propagations before asking ACME servers to verify the DNS record. (default 10)
- **manual\_auth\_hook** -- Path to the manual authentication hook script.
- **manual\_cleanup\_hook** -- Path to the manual cleanup or post-authentication hook script.

**Return type**

dict

**Returns**

Dictionary with 'result' True/False/None, 'comment' and certificate's expiry date ('not\_after')

CLI Example:

```
salt 'gitlab.example.com' acme.cert dev.example.com "[gitlab.example.com]
→" test_cert=True          renew=14 webroot=/opt/gitlab/embedded/service/
→gitlab-rails/public
```

**salt.modules.acme.certs()**

Return a list of active certificates

CLI Example:

```
salt 'vhost.example.com' acme.certs
```

`salt.modules.acme.expires(name)`

The expiry date of a certificate in ISO format

**Parameters**

**name** (*str*) -- Name of certificate

**Return type**

*str*

**Returns**

Expiry date in ISO format.

CLI Example:

```
salt 'gitlab.example.com' acme.expires dev.example.com
```

`salt.modules.acme.has(name)`

Test if a certificate is in the Let's Encrypt Live directory

**Parameters**

**name** (*str*) -- Name of certificate

**Return type**

*bool*

Code example:

```
if __salt__['acme.has']('dev.example.com'):
    log.info('That is one nice certificate you have there!')
```

`salt.modules.acme.info(name)`

Return information about a certificate

**Parameters**

**name** (*str*) -- Name of certificate

**Return type**

*dict*

**Returns**

Dictionary with information about the certificate. If neither the `tls` nor the `x509` module can be used to determine the certificate information, the information will be retrieved as one big text block under the key `text` using the `openssl` cli.

CLI Example:

```
salt 'gitlab.example.com' acme.info dev.example.com
```

`salt.modules.acme.needs_renewal(name, window=None)`

Check if a certificate needs renewal

**Parameters**

- **name** (*str*) -- Name of certificate
- **window** (*bool/str/int*) -- Window in days to renew earlier or True/force to just return True

**Return type**

*bool*

**Returns**

Whether or not the certificate needs to be renewed.

Code example:

```
if __salt__['acme.needs_renewal']('dev.example.com'):
    __salt__['acme.cert']('dev.example.com', **kwargs)
else:
    log.info('Your certificate is still good')
```

`salt.modules.acme.renew_by(name, window=None)`

Date in ISO format when a certificate should first be renewed

**Parameters**

- **name** (*str*) -- Name of certificate
- **window** (*int*) -- number of days before expiry when renewal should take place

**Return type**

*str*

**Returns**

Date of certificate renewal in ISO format.

## 26.6.9 salt.modules.aix\_group

Manage groups on Solaris

---

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info' is not available`), see [here](#).

---

`salt.modules.aix_group.add(name, gid=None, system=False, root=None, **kwargs)`

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.aix_group.adduser(name, username, root=None)`

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

`salt.modules.aix_group.chgid(name, gid)`

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.aix_group.delete(name)`

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.aix_group.deluser(name, username, root=None)`

Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

`salt.modules.aix_group.getent(refresh=False)`

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.aix_group.info(name)`

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.aix_group.members(name, members_list, root=None)`

Replaces members of the group with a provided list.

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo'.

foo:x:1234:user1,user2,user3,...

### 26.6.10 salt.modules.aix\_shadow

Manage account locks on AIX systems

New in version 2018.3.0.

**depends**

none

`salt.modules.aix_shadow.locked(user)`

Query for all accounts which are flagged as locked.

CLI Example:

```
salt <minion_id> shadow.locked ALL
```

`salt.modules.aix_shadow.login_failures`(*user*)

Query for all accounts which have 3 or more login failures.

CLI Example:

```
salt <minion_id> shadow.login_failures ALL
```

`salt.modules.aix_shadow.unlock`(*user*)

Unlock user for locked account

CLI Example:

```
salt <minion_id> shadow.unlock user
```

### 26.6.11 salt.modules.aixpkg

Package support for AIX

---

**Important:** If you feel that Salt should be using this module to manage filesets or rpm packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see [here](#).

---

`salt.modules.aixpkg.available_version`(*\*names, \*\*kwargs*)

This function is an alias of `latest_version`.

Return the latest available version of the named fileset/rpm package available for upgrade or installation. If more than one fileset/rpm package name is specified, a dict of name/version pairs is returned.

If the latest version of a given fileset/rpm package is already installed, an empty string will be returned for that package.

Changed in version 3005.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

**Note: currently only functional for rpm packages due to filesets do not have a specific location to check**

Requires yum or dnf available in order to query a repository

This function will always return an empty string for unfound fileset/rpm package.

`salt.modules.aixpkg.install`(*name=None, refresh=False, pkgs=None, version=None, test=False, \*\*kwargs*)

Install the named fileset(s)/rpm package(s).

Changed in version 3005:

**preference to install rpm packages are to use in the following order:**

`/opt/freeware/bin/dnf /opt/freeware/bin/yum /usr/bin/yum /usr/bin/rpm`

**name**

The name of the fileset or rpm package to be installed.

**refresh**

Whether or not to update the yum database before executing.

**pkgs**

A list of filesets and/or rpm packages to install. Must be passed as a python list. The name parameter will be ignored if this option is passed.

**version**

Install a specific version of a fileset/rpm package. (Unused at present).

**test**

Verify that command functions correctly.

Returns a dict containing the new fileset(s)/rpm package(s) names and versions:

```
{<package>: {'old': '<old-version>',
             'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install /stage/middleware/AIX/bash-4.2-3.aix6.1.ppc.rpm
salt '*' pkg.install /stage/middleware/AIX/bash-4.2-3.aix6.1.ppc.rpm
↳ refresh=True
salt '*' pkg.install /stage/middleware/AIX/VIOS2211_update/tpc_4.1.1.85.
↳ bff
salt '*' pkg.install /cecc/repos/aix72/TL3/BASE/installp/ppc/bos.rte.
↳ printers_7.2.2.0.bff
salt '*' pkg.install /stage/middleware/AIX/Xlc/usr/sys/inst.images/xlc.rte
salt '*' pkg.install /stage/middleware/AIX/Firefox/ppc-AIX53/Firefox.base
salt '*' pkg.install /cecc/repos/aix72/TL3/BASE/installp/ppc/bos.net
salt '*' pkg.install pkgs=['"foo", "bar"']
salt '*' pkg.install libxml2
```

`salt.modules.aixpkg.latest_version(*names, **kwargs)`

Return the latest available version of the named fileset/rpm package available for upgrade or installation. If more than one fileset/rpm package name is specified, a dict of name/version pairs is returned.

If the latest version of a given fileset/rpm package is already installed, an empty string will be returned for that package.

Changed in version 3005.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

**Note:** currently only functional for rpm packages due to filesets do not have a specific location to check  
Requires yum or dnf available in order to query a repository

This function will always return an empty string for unfound fileset/rpm package.

`salt.modules.aixpkg.list_pkgs(versions_as_list=False, **kwargs)`

List the filesets/rpm packages currently installed as a dict:

```
{<package_name>: '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.aixpkg.remove`(*name=None, pkgs=None, \*\*kwargs*)

Remove specified fileset(s)/rpm package(s).

**name**

The name of the fileset or rpm package to be deleted.

Changed in version 3005:

**preference to install rpm packages are to use in the following order:**

/opt/freeware/bin/dnf /opt/freeware/bin/yum /usr/bin/yum /usr/bin/rpm

**pkgs**

A list of filesets and/or rpm packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <fileset/rpm package name>
salt '*' pkg.remove tcsh
salt '*' pkg.remove xlc.rte
salt '*' pkg.remove Firefox.base.adt
salt '*' pkg.remove pkgs=['"foo"', "bar"]'
```

`salt.modules.aixpkg.upgrade_available`(*name, \*\*kwargs*)

Check whether or not an upgrade is available for a given package

Changed in version 3005.

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

**Note: currently only functional for rpm packages due to filesets do not have a specific location to check**

Requires yum or dnf available in order to query a repository

`salt.modules.aixpkg.version`(\**names, \*\*kwargs*)

Return the current installed version of the named fileset/rpm package If more than one fileset/rpm package name is specified a dict of name/version pairs is returned.

Changed in version 3005.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

### 26.6.12 salt.modules.aliases

Manage the information in the aliases file

`salt.modules.aliases.get_target(alias)`

Return the target associated with an alias

CLI Example:

```
salt '*' aliases.get_target alias
```

`salt.modules.aliases.has_target(alias, target)`

Return true if the alias/target is set

CLI Example:

```
salt '*' aliases.has_target alias target
```

`salt.modules.aliases.list_aliases()`

Return the aliases found in the aliases file in this format:

```
{'alias': 'target'}
```

CLI Example:

```
salt '*' aliases.list_aliases
```

`salt.modules.aliases.rm_alias(alias)`

Remove an entry from the aliases file

CLI Example:

```
salt '*' aliases.rm_alias alias
```

`salt.modules.aliases.set_target(alias, target)`

Set the entry in the aliases file for the given alias, this will overwrite any previous entry for the given alias or create a new one if it does not exist.

CLI Example:

```
salt '*' aliases.set_target alias target
```

### 26.6.13 salt.modules.alternatives

Support for Alternatives system

**codeauthor**

Radek Rada <radek.rada@gmail.com>

`salt.modules.alternatives.auto(name)`

Trigger alternatives to set the path for <name> as specified by priority.

CLI Example:

```
salt '*' alternatives.auto name
```

`salt.modules.alternatives.check_exists(name, path)`

Check if the given path is an alternative for a name.

New in version 2015.8.4.

CLI Example:

```
salt '*' alternatives.check_exists name path
```

`salt.modules.alternatives.check_installed(name, path)`

Check if the current highest-priority match for a given alternatives link is set to the desired path

CLI Example:

```
salt '*' alternatives.check_installed name path
```

`salt.modules.alternatives.display(name)`

Display alternatives settings for defined command name

CLI Example:

```
salt '*' alternatives.display editor
```

`salt.modules.alternatives.install(name, link, path, priority)`

Install symbolic links determining default commands

CLI Example:

```
salt '*' alternatives.install editor /usr/bin/editor /usr/bin/emacs23 50
```

`salt.modules.alternatives.remove(name, path)`

Remove symbolic links determining the default commands.

CLI Example:

```
salt '*' alternatives.remove name path
```

`salt.modules.alternatives.set_(name, path)`

Manually set the alternative <path> for <name>.

CLI Example:

```
salt '*' alternatives.set name path
```

`salt.modules.alternatives.show_current(name)`

Display the current highest-priority alternative for a given alternatives link

CLI Example:

```
salt '*' alternatives.show_current editor
```

`salt.modules.alternatives.show_link(name)`

Display master link for the alternative

New in version 2015.8.13,2016.3.4,2016.11.0.

CLI Example:

```
salt '*' alternatives.show_link editor
```

## 26.6.14 salt.modules.ansiblegate

### Ansible Support

This module can have an optional minion-level configuration in `/etc/salt/minion.d/` as follows:

```
ansible_timeout: 1200
```

The timeout is how many seconds Salt should wait for any Ansible module to respond.

`salt.modules.ansiblegate.call(module, *args, **kwargs)`

Call an Ansible module by invoking it.

#### Parameters

- **module** -- the name of the module.
- **args** -- Arguments to pass to the module
- **kwargs** -- keywords to pass to the module

CLI Example:

```
salt * ansible.call ping data=foobar
```

`salt.modules.ansiblegate.discover_playbooks(path=None, locations=None, playbook_extension=None, hosts_filename=None, syntax_check=False)`

New in version 3005.

Discover Ansible playbooks stored under the given path or from multiple paths (locations)

This will search for files matching with the playbook file extension under the given root path and will also look for files inside the first level of directories in this path.

The return of this function would be a dict like this:

```
{
  "/home/foobar/": {
    "my_ansible_playbook.yml": {
      "fullpath": "/home/foobar/playbooks/my_ansible_playbook.yml",
      "custom_inventory": "/home/foobar/playbooks/hosts"
    },
    "another_playbook.yml": {
      "fullpath": "/home/foobar/playbooks/another_playbook.yml",
      "custom_inventory": "/home/foobar/playbooks/hosts"
    },
    "lamp_simple/site.yml": {
      "fullpath": "/home/foobar/playbooks/lamp_simple/site.yml",
      "custom_inventory": "/home/foobar/playbooks/lamp_simple/hosts"
    },
    "lamp_proxy/site.yml": {
      "fullpath": "/home/foobar/playbooks/lamp_proxy/site.yml",
      "custom_inventory": "/home/foobar/playbooks/lamp_proxy/hosts"
    }
  }
}
```

(continues on next page)

(continued from previous page)

```

    }
  },
  "/srv/playbooks/": {
    "example_playbook/example.yml": {
      "fullpath": "/srv/playbooks/example_playbook/example.yml",
      "custom_inventory": "/srv/playbooks/example_playbook/hosts"
    }
  }
}

```

**Parameters**

- **path** -- Path to discover playbooks from.
- **locations** -- List of paths to discover playbooks from.
- **playbook\_extension** -- File extension of playbooks file to search for. Default: "yml"
- **hosts\_filename** -- Filename of custom playbook inventory to search for. Default: "hosts"
- **syntax\_check** -- Skip playbooks that do not pass "ansible-playbook --syntax-check" validation. Default: False

**Returns**

The discovered playbooks under the given paths

CLI Example:

```

salt 'ansiblehost' ansible.discover_playbooks path=/srv/playbooks/
salt 'ansiblehost' ansible.discover_playbooks locations='["/srv/playbooks/
→", "/srv/foobar"]'

```

`salt.modules.ansiblegate.help`(*module=None, \*args*)

Display help on Ansible standard module.

**Parameters**

**module** -- The module to get the help

CLI Example:

```

salt * ansible.help ping

```

`salt.modules.ansiblegate.list_`(*pattern=None*)

Lists available modules.

CLI Example:

```

salt * ansible.list
salt * ansible.list '*win*' # To get all modules matching 'win' on it's
→name

```

`salt.modules.ansiblegate.playbooks`(*playbook, rundir=None, check=False, diff=False, extra\_vars=None, flush\_cache=False, forks=5, inventory=None, limit=None, list\_hosts=False, list\_tags=False, list\_tasks=False, module\_path=None, skip\_tags=None, start\_at\_task=None, syntax\_check=False, tags=None, playbook\_kwargs=None*)

## Run Ansible Playbooks

### Parameters

- **playbook** -- Which playbook to run.
- **rundir** -- Directory to run *ansible-playbook* in. (Default: None)
- **check** -- don't make any changes; instead, try to predict some of the changes that may occur (Default: False)
- **diff** -- when changing (small) files and templates, show the differences in those files; works great with --check (default: False)
- **extra\_vars** -- set additional variables as key=value or YAML/JSON, if filename prepend with @, (default: None)
- **flush\_cache** -- clear the fact cache for every host in inventory (default: False)
- **forks** -- specify number of parallel processes to use (Default: 5)
- **inventory** -- specify inventory host path or comma separated host list. (Default: None) (Ansible's default is /etc/ansible/hosts)
- **limit** -- further limit selected hosts to an additional pattern (Default: None)
- **list\_hosts** -- outputs a list of matching hosts; does not execute anything else (Default: False)
- **list\_tags** -- list all available tags (Default: False)
- **list\_tasks** -- list all tasks that would be executed (Default: False)
- **module\_path** -- prepend colon-separated path(s) to module library. (Default: None)
- **skip\_tags** -- only run plays and tasks whose tags do not match these values (Default: False)
- **start\_at\_task** -- start the playbook at the task matching this name (Default: None)
- **tags** -- only run plays and tasks tagged with these values (Default: None)

### Param

    syntax\_check: perform a syntax check on the playbook, but do not execute it (Default: False)

### Returns

    Playbook return

CLI Example:

```
salt 'ansiblehost' ansible.playbooks playbook=/srv/playbooks/play.yml
```

`salt.modules.ansiblegate.targets` (*inventory*='/etc/ansible/hosts', *yaml*=False, *export*=False)

New in version 3005.

Return the inventory from an Ansible *inventory\_file*

### Parameters

- **inventory** -- The inventory file to read the inventory from. Default: "/etc/ansible/hosts"
- **yaml** -- Return the inventory as yaml output. Default: False
- **export** -- Return inventory as export format. Default: False

CLI Example:

```
salt 'ansiblehost' ansible.targets
salt 'ansiblehost' ansible.targets inventory=my_custom_inventory
```

## 26.6.15 salt.modules.apache

Support for Apache

**Note:** The functions in here are generic functions designed to work with all implementations of Apache. Debian-specific functions have been moved into `deb_apache.py`, but will still load under the `apache` namespace when a Debian-based system is detected.

`salt.modules.apache.config`(*name, config, edit=True*)

Create VirtualHost configuration files

**name**

File for the virtual host

**config**

VirtualHost configurations

**Note:** This function is not meant to be used from the command line. Config is meant to be an ordered dict of all of the apache configs.

CLI Example:

```
salt '*' apache.config /etc/httpd/conf.d/ports.conf config="{['Listen':
→ '22']}"
```

`salt.modules.apache.directives`()

Return list of directives together with expected arguments and places where the directive is valid (`apachectl -L`)

CLI Example:

```
salt '*' apache.directives
```

`salt.modules.apache.fullversion`()

Return server version (`apachectl -V`)

CLI Example:

```
salt '*' apache.fullversion
```

`salt.modules.apache.modules`()

Return list of static and shared modules (`apachectl -M`)

CLI Example:

```
salt '*' apache.modules
```

`salt.modules.apache.server_status` (*profile='default'*)

Get Information from the Apache server-status handler

---

**Note:** The server-status handler is disabled by default. In order for this function to work it needs to be enabled. See [http://httpd.apache.org/docs/2.2/mod/mod\\_status.html](http://httpd.apache.org/docs/2.2/mod/mod_status.html)

---

The following configuration needs to exist in pillar/grains. Each entry nested in `apache.server-status` is a profile of a vhost/server. This would give support for multiple apache servers/vhosts.

```
apache.server-status:
  default:
    url: http://localhost/server-status
    user: someuser
    pass: password
    realm: 'authentication realm for digest passwords'
    timeout: 5
```

CLI Examples:

```
salt '*' apache.server_status
salt '*' apache.server_status other-profile
```

`salt.modules.apache.servermods` ()

Return list of modules compiled into the server (`apachectl -l`)

CLI Example:

```
salt '*' apache.servermods
```

`salt.modules.apache.signal` (*signal=None*)

Signals httpd to start, restart, or stop.

CLI Example:

```
salt '*' apache.signal restart
```

`salt.modules.apache.useradd` (*pwfile, user, password, opts=""*)

Add HTTP user using the `htpasswd` command. If the `htpasswd` file does not exist, it will be created. Valid options that can be passed are:

```
n Don't update file; display results on stdout.
m Force MD5 hashing of the password (default).
d Force CRYPT(3) hashing of the password.
p Do not hash the password (plaintext).
s Force SHA1 hashing of the password.
```

CLI Examples:

```
salt '*' apache.useradd /etc/httpd/htpasswd larry badpassword
salt '*' apache.useradd /etc/httpd/htpasswd larry badpass opts=ns
```

`salt.modules.apache.userdel` (*pwfile, user*)

Delete HTTP user from the specified `htpasswd` file.

CLI Example:

```
salt '*' apache.userdel /etc/httpd/htpasswd larry
```

`salt.modules.apache.version()`

Return server version (`apachectl -v`)

CLI Example:

```
salt '*' apache.version
```

`salt.modules.apache.vhosts()`

Show the settings as parsed from the config file (currently only shows the virtualhost settings) (`apachectl -S`). Because each additional virtual host adds to the execution time, this command may require a long timeout be specified by using `-t 10`.

CLI Example:

```
salt -t 10 '*' apache.vhosts
```

## 26.6.16 salt.modules.apcups

Module for `apcupsd`

`salt.modules.apcups.status()`

Return `apcaccess` output

CLI Example:

```
salt '*' apcups.status
```

`salt.modules.apcups.status_battery()`

Return true if running on battery power

CLI Example:

```
salt '*' apcups.status_battery
```

`salt.modules.apcups.status_charge()`

Return battery charge

CLI Example:

```
salt '*' apcups.status_charge
```

`salt.modules.apcups.status_load()`

Return load

CLI Example:

```
salt '*' apcups.status_load
```

## 26.6.17 salt.modules.apf

### Support for Advanced Policy Firewall (APF)

**maintainer**

Mostafa Hussein <mostafa.hussein91@gmail.com>

**maturity**

new

**depends**

python-iptables

**platform**

Linux

`salt.modules.apf.allow(ip, port=None)`

Add host (IP/FQDN) to allow\_hosts.rules and immediately load new rule into firewall

CLI Example:

```
salt '*' apf.allow 127.0.0.1
```

`salt.modules.apf.deny(ip)`

Add host (IP/FQDN) to deny\_hosts.rules and immediately load new rule into firewall

CLI Example:

```
salt '*' apf.deny 1.2.3.4
```

`salt.modules.apf.disable()`

Stop (flush) all firewall rules

CLI Example:

```
salt '*' apf.disable
```

`salt.modules.apf.enable()`

Load all firewall rules

CLI Example:

```
salt '*' apf.enable
```

`salt.modules.apf.refresh()`

Refresh & resolve dns names in trust rules

CLI Example:

```
salt '*' apf.refresh
```

`salt.modules.apf.reload()`

Stop (flush) & reload firewall rules

CLI Example:

```
salt '*' apf.reload
```

`salt.modules.apf.remove(ip)`

Remove host from [glob]\*\_hosts.rules and immediately remove rule from firewall

CLI Example:

```
salt '*' apf.remove 1.2.3.4
```

`salt.modules.apf.running()`

Check apf status

CLI Example:

```
salt '*' apf.running
```

## 26.6.18 salt.modules.apkpkg

Support for apk

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

New in version 2017.7.0.

`salt.modules.apkpkg.file_dict(*packages, **kwargs)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.apkpkg.file_list(*packages, **kwargs)`

List the files that belong to a package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.apkpkg.install(name=None, refresh=False, pkgs=None, sources=None, **kwargs)`

Install the passed package, add `refresh=True` to update the apk database.

**name**

The name of the package to be installed. Note that this parameter is ignored if either `"pkgs"` or `"sources"` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `"sources"` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh**

Whether or not to refresh the package database before installing.

Multiple Package Installation Options:

**pkgs**

A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['foo', 'bar']
```

**sources**

A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.deb"}, {"bar":  
↪ "salt://bar.deb"}]
```

**install\_recommends**

Whether to install the packages marked as recommended. Default is True.

Returns a dict containing the new package names and versions:

```
{ '<package>': {'old': '<old-version>',  
               'new': '<new-version>'}}
```

`salt.modules.apkpkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>  
salt '*' pkg.latest_version <package name>  
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.apkpkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed in a dict:

```
{ '<package_name>': '<version>' }
```

CLI Example:

```
salt '*' pkg.list_pkgs  
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.apkpkg.list_upgrades(refresh=True, **kwargs)`

List all available package upgrades.

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.apkpkg.owner` (\*paths, \*\*kwargs)

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version` <`salt.modules.apk.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owns /usr/bin/apachectl
salt '*' pkg.owns /usr/bin/apachectl /usr/bin/basename
```

`salt.modules.apkpkg.purge` (name=None, pkgs=None, \*\*kwargs)

Alias to `remove`

`salt.modules.apkpkg.refresh_db` (\*\*kwargs)

Updates the package list

- True: Database updated successfully
- False: Problem updating database

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.apkpkg.remove` (name=None, pkgs=None, purge=False, \*\*kwargs)

Remove packages using `apk del`.

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.apkpkg.upgrade` (name=None, pkgs=None, refresh=True, \*\*kwargs)

Upgrades all packages via `apk upgrade` or a specific package if name or pkgs is specified. Name is ignored if pkgs is specified

Returns a dict containing the changes.

```
{<package>: {'old': '<old-version>',
             'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.apkpkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 26.6.19 salt.modules.aptly

Aptly Debian repository manager.

New in version 2018.3.0.

`salt.modules.aptly.cleanup_db(config_path='/etc/aptly.conf', dry_run=False)`

Remove data regarding unreferenced packages and delete files in the package pool that are no longer being used by packages.

**Parameters**

**dry\_run** (*bool*) -- Report potential changes without making any changes.

**Returns**

A dictionary of the package keys and files that were removed.

**Return type**

dict

CLI Example:

```
salt '*' aptly.cleanup_db
```

`salt.modules.aptly.delete_repo(name, config_path='/etc/aptly.conf', force=False)`

Remove the repository.

**Parameters**

- **name** (*str*) -- The name of the repository.
- **config\_path** (*str*) -- The path to the configuration file for the aptly instance.
- **force** (*bool*) -- Whether to remove the repository even if it is used as the source of an existing snapshot.

**Returns**

A boolean representing whether all changes succeeded.

**Return type**

bool

CLI Example:

```
salt '*' aptly.delete_repo name="test-repo"
```

`salt.modules.apty.get_config(config_path='/etc/apty.conf')`

Get the configuration data.

**Parameters**

**config\_path** (*str*) -- The path to the configuration file for the aptly instance.

**Returns**

A dictionary containing the configuration data.

**Return type**

dict

CLI Example:

```
salt '*' aptly.get_config
```

`salt.modules.apty.get_repo(name, config_path='/etc/apty.conf, with_packages=False)`

Get the details of the repository.

**Parameters**

- **name** (*str*) -- The name of the repository.
- **config\_path** (*str*) -- The path to the configuration file for the aptly instance.
- **with\_packages** (*bool*) -- Return a list of packages in the repo.

**Returns**

A dictionary containing information about the repository.

**Return type**

dict

CLI Example:

```
salt '*' aptly.get_repo name="test-repo"
```

`salt.modules.apty.list_mirrors(config_path='/etc/apty.conf')`

Get a list of all the mirrors.

**Parameters**

**config\_path** (*str*) -- The path to the configuration file for the aptly instance.

**Returns**

A list of the mirror names.

**Return type**

list

CLI Example:

```
salt '*' aptly.list_mirrors
```

`salt.modules.apty.list_published(config_path='/etc/apty.conf')`

Get a list of all the published repositories.

**Parameters**

**config\_path** (*str*) -- The path to the configuration file for the aptly instance.

**Returns**

A list of the published repository names.

**Return type**

list

CLI Example:

```
salt '*' aptly.list_published
```

`salt.modules.aptly.list_repos` (*config\_path*='/etc/aptly.conf', *with\_packages*=False)

List all of the repos.

**Parameters**

- **config\_path** (*str*) -- The path to the configuration file for the aptly instance.
- **with\_packages** (*bool*) -- Return a list of packages in the repo.

**Returns**

A dictionary of the repositories.

**Return type**

dict

CLI Example:

```
salt '*' aptly.list_repos
```

`salt.modules.aptly.list_snapshots` (*config\_path*='/etc/aptly.conf', *sort\_by\_time*=False)

Get a list of all the snapshots.

**Parameters**

- **config\_path** (*str*) -- The path to the configuration file for the aptly instance.
- **sort\_by\_time** (*bool*) -- Whether to sort by creation time instead of by name.

**Returns**

A list of the snapshot names.

**Return type**

list

CLI Example:

```
salt '*' aptly.list_snapshots
```

`salt.modules.aptly.new_repo` (*name*, *config\_path*='/etc/aptly.conf', *comment*=None, *component*=None, *distribution*=None, *uploaders\_file*=None, *from\_snapshot*=None, *saltenv*='base')

Create the new repository.

**Parameters**

- **name** (*str*) -- The name of the repository.
- **config\_path** (*str*) -- The path to the configuration file for the aptly instance.
- **comment** (*str*) -- The description of the repository.
- **component** (*str*) -- The default component to use when publishing.
- **distribution** (*str*) -- The default distribution to use when publishing.
- **uploaders\_file** (*str*) -- The repository upload restrictions config.

- **from\_snapshot** (*str*) -- The snapshot to initialize the repository contents from.
- **saltenv** (*str*) -- The environment the file resides in.

**Returns**

A boolean representing whether all changes succeeded.

**Return type**

bool

CLI Example:

```
salt '*' aptly.new_repo name="test-repo" comment="Test main repo"
→component="main" distribution="trusty"
```

`salt.modules.aptly.set_repo` (*name*, *config\_path*='/etc/aptly.conf', *comment*=None, *component*=None, *distribution*=None, *uploaders\_file*=None, *saltenv*='base')

Configure the repository settings.

**Parameters**

- **name** (*str*) -- The name of the repository.
- **config\_path** (*str*) -- The path to the configuration file for the aptly instance.
- **comment** (*str*) -- The description of the repository.
- **component** (*str*) -- The default component to use when publishing.
- **distribution** (*str*) -- The default distribution to use when publishing.
- **uploaders\_file** (*str*) -- The repository upload restrictions config.
- **from\_snapshot** (*str*) -- The snapshot to initialize the repository contents from.
- **saltenv** (*str*) -- The environment the file resides in.

**Returns**

A boolean representing whether all changes succeeded.

**Return type**

bool

CLI Example:

```
salt '*' aptly.set_repo name="test-repo" comment="Test universe repo"
→component="universe" distribution="xenial"
```

## 26.6.20 salt.modules.aptpkg

Support for APT (Advanced Packaging Tool)

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

For repository management, the `python-apt` package must be installed.

---

**class** salt.modules.aptpkg.**SourceEntry** (*line*, *file*=None)

**repo\_line()**

Return the repo line for the sources file

**str()**

**class** salt.modules.aptpkg.SourcesList

**add**(*type, uri, dist, orig\_comps, architectures, signedby*)

**add\_file**(*file*)

Add the lines of a file to self.list

**remove**(*source*)

remove a source from the list of sources

**save**()

write all of the sources from the list of sources to the file.

salt.modules.aptpkg.**add\_repo\_key**(*path=None, text=None, keyserver=None, keyid=None, saltenv='base', aptkey=True, keydir=None, keyfile=None*)

New in version 2017.7.0.

Add a repo key using `apt-key add`.

#### Parameters

- **path** (*str*) -- The path of the key file to import.
- **text** (*str*) -- The key data to import, in string form.
- **keyserver** (*str*) -- The server to download the repo key specified by the keyid.
- **keyid** (*str*) -- The key id of the repo key to add.
- **saltenv** (*str*) -- The environment the key file resides in.
- **aptkey** (*bool*) -- Use the binary apt-key.
- **keydir** (*str*) -- The directory path to save keys. The default directory is `/etc/apt/keyrings/` which is the recommended path for adding third party keys. This argument is only used when `aptkey` is `False`.
- **keyfile** (*str*) -- The name of the key to add. This is only required when `aptkey` is `False` and you are using a keyserver. This argument is only used when `aptkey` is `False`.

#### Returns

A boolean representing whether the repo key was added.

#### Return type

`bool`

**Warning:** The `apt-key` binary is deprecated and will last be available in Debian 11 and Ubuntu 22.04. It is recommended to use `aptkey=False` when using this module.

CLI Examples:

```

salt '*' pkg.add_repo_key 'salt://apt/sources/test.key'
salt '*' pkg.add_repo_key text="'$KEY1'"

```

(continues on next page)

(continued from previous page)

```
salt '*' pkg.add_repo_key keyserver='keyserver.example' keyid='0000AAAA'
```

`salt.modules.aptpkg.autoremove` (*list\_only=False*, *purge=False*)

New in version 2015.5.0.

Remove packages not required by another package using `apt-get autoremove`.

**list\_only**

[False] Only retrieve the list of packages to be auto-removed, do not actually perform the auto-removal.

**purge**

[False] Also remove package config data when autoremoving packages.

New in version 2015.8.0.

CLI Example:

```
salt '*' pkg.autoremove
salt '*' pkg.autoremove list_only=True
salt '*' pkg.autoremove purge=True
```

`salt.modules.aptpkg.available_version` (*\*names*, *\*\*kwargs*)

This function is an alias of `latest_version`.

Changed in version 3007.0.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the `fromrepo` keyword argument.

**cache\_valid\_time**

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=unstable
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.aptpkg.del_repo` (*repo*, *\*\*kwargs*)

Delete a repo from the `sources.list` / `sources.list.d`

If the `.list` file is in the `sources.list.d` directory and the file that the repo exists in does not contain any other repo configuration, the file itself will be deleted.

The repo passed in must be a fully formed repository definition string.

CLI Examples:

```
salt '*' pkg.del_repo "myrepo definition"
```

`salt.modules.aptpkg.del_repo_key` (*name=None, aptkey=True, keydir=None, \*\*kwargs*)

New in version 2015.8.0.

Remove a repo key using `apt-key del`

**name**

Repo from which to remove the key. Unnecessary if `keyid` is passed.

**keyid**

The KeyID of the GPG key to remove

**keyid\_ppa**

[False] If set to `True`, the repo's GPG key ID will be looked up from `ppa.launchpad.net` and removed.

---

**Note:** Setting this option to `True` requires that the `name` param also be passed.

---

**aptkey**

Use the binary `apt-key`.

**keydir**

The directory path to save keys. The default directory is `/etc/apt/keyrings/` which is the recommended path for adding third party keys.

**Warning:** The `apt-key` binary is deprecated and will last be available in Debian 11 and Ubuntu 22.04. It is recommended to use `aptkey=False` when using this module.

CLI Examples:

```
salt '*' pkg.del_repo_key keyid=0123ABCD
salt '*' pkg.del_repo_key name='ppa:foo/bar' keyid_ppa=True
```

`salt.modules.aptpkg.file_dict` (*\*packages, \*\*kwargs*)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_dict httpd
salt '*' pkg.file_dict httpd postfix
salt '*' pkg.file_dict
```

`salt.modules.aptpkg.file_list` (*\*packages, \*\*kwargs*)

List the files that belong to a package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.aptpkg.get_repo` (*repo, \*\*kwargs*)

Display a repo from the `sources.list / sources.list.d`

The repo passed in needs to be a complete repo entry.

CLI Examples:

```
salt '*' pkg.get_repo "myrepo definition"
```

`salt.modules.aptpkg.get_repo_keys` (*aptkey=True, keydir=None*)

New in version 2017.7.0.

List known repo key details. :param bool aptkey: Use the binary apt-key. :param str keydir: The directory path to save keys. The default directory is `/etc/apt/keyrings/` which is the recommended path for adding third party keys. This argument is only used when aptkey is False.

**Returns**

A dictionary containing the repo keys.

**Return type**

dict

CLI Examples:

```
salt '*' pkg.get_repo_keys
```

`salt.modules.aptpkg.get_selections` (*pattern=None, state=None*)

View package state from the dpkg database.

Returns a dict of dicts containing the state, and package names:

```
{ '<host>':
  { '<state>': ['pkg1',
              ...
              ]
  },
  ...
}
```

CLI Example:

```
salt '*' pkg.get_selections
salt '*' pkg.get_selections 'python-*'
salt '*' pkg.get_selections state=hold
salt '*' pkg.get_selections 'openssh*' state=hold
```

`salt.modules.aptpkg.hold` (*name=None, pkgs=None, sources=None, \*\*kwargs*)

New in version 2014.7.0.

Set package in 'hold' state, meaning it will not be upgraded.

**name**

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

**pkgs**

A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

`salt.modules.aptpkg.info_installed(*names, **kwargs)`

Return the information of the named package(s) installed on the system.

New in version 2015.8.1.

#### names

The names of the packages for which to return information.

#### failhard

Whether to throw an exception if none of the packages are installed. Defaults to True.

New in version 2016.11.3.

CLI Example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> failhard=false
```

`salt.modules.aptpkg.install(name=None, refresh=False, fromrepo=None, skip_verify=False, debconf=None, pkgs=None, sources=None, reinstall=False, downloadonly=False, ignore_epoch=False, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any `apt-get/dpkg` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package, add `refresh=True` to update the `dpkg` database.

#### name

The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (`:i386`, etc.) to the end of the package name.

CLI Example:

```
salt '*' pkg.install <package name>
```

#### refresh

Whether or not to refresh the package database before installing.

#### cache\_valid\_time

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

#### fromrepo

Specify a package repository to install from (e.g., `apt-get -t unstable install somepackage`)

**skip\_verify**

Skip the GPG verification check (e.g., `--allow-unauthenticated`, or `--force-bad-verify` for install from package file).

**debconf**

Provide the path to a debconf answers file, processed before installation.

**version**

Install a specific version of the package, e.g. `1.2.3~0ubuntu0`. Ignored if `"pkgs"` or `"sources"` is passed.

Changed in version 2018.3.0: version can now contain comparison operators (e.g. `>1.2.3`, `<=2.0`, etc.)

**reinstall**

[False] Specifying `reinstall=True` will use `apt-get install --reinstall` rather than simply `apt-get install` for requested packages that are already installed.

If a version is specified with the requested package, then `apt-get install --reinstall` will only be used if the installed version matches the requested version.

New in version 2015.8.0.

**ignore\_epoch**

[False] Only used when the version of a package is specified using a comparison operator (e.g. `>4.1`). If set to `True`, then the epoch will be ignored when comparing the currently-installed version to the desired version.

New in version 2018.3.0.

**Multiple Package Installation Options:****pkgs**

A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['foo', 'bar']
salt '*' pkg.install pkgs=['foo', {'bar': '1.2.3-0ubuntu0'}]
```

**sources**

A list of DEB packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (`:i386`, etc.) to the end of the package name.

Changed in version 2014.7.0.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.deb"}, {"bar":
→ "salt://bar.deb"}]
```

**force\_yes**

Passes `--force-yes` to the `apt-get` command. Don't use this unless you know what you're doing.

New in version 0.17.4.

**install\_recommends**

Whether to install the packages marked as recommended. Default is `True`.

New in version 2015.5.0.

**only\_upgrade**

Only upgrade the packages, if they are already installed. Default is False.

New in version 2015.5.0.

**force\_conf\_new**

Always install the new version of any configuration files.

New in version 2015.8.0.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.aptpkg.latest_version(*names, **kwargs)`

Changed in version 3007.0.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the `fromrepo` keyword argument.

`cache_valid_time`

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within `<value>` seconds

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=unstable
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.aptpkg.list_downloaded(root=None, **kwargs)`

New in version 3000.

List prefetched packages downloaded by apt in the local disk.

**root**

operate on a different root directory.

CLI Example:

```
salt '*' pkg.list_downloaded
```

`salt.modules.aptpkg.list_pkgs(versions_as_list=False, removed=False, purge_desired=False, **kwargs)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

**removed**

If `True`, then only packages which have been removed (but not purged) will be returned.

**purge\_desired**

If `True`, then only packages which have been marked to be purged, but can't be purged due to their status as dependencies for other installed packages, will be returned. Note that these packages will appear in installed

Changed in version 2014.1.1: Packages in this state now correctly show up in the output of this function.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.aptpkg.list_repo_pkgs(*args, **kwargs)`

New in version 2017.7.0.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. For example:

```
{
  'bash': ['4.3-14ubuntu1.1',
           '4.3-14ubuntu1'],
  'nginx': ['1.10.0-0ubuntu0.16.04.4',
            '1.9.15-0ubuntu1']
}
```

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
```

`salt.modules.aptpkg.list_repos(**kwargs)`

Lists all repos in the sources.list (and sources.lists.d) files

CLI Example:

```
salt '*' pkg.list_repos
salt '*' pkg.list_repos disabled=True
```

`salt.modules.aptpkg.list_upgrades(refresh=True, dist_upgrade=True, **kwargs)`

List all available package upgrades.

#### refresh

Whether to refresh the package database before listing upgrades. Default: True.

#### cache\_valid\_time

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

#### dist\_upgrade

Whether to list the upgrades using dist-upgrade vs upgrade. Default is to use dist-upgrade.

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.aptpkg.mod_repo(repo, saltenv='base', aptkey=True, **kwargs)`

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the definition is well formed. For Ubuntu the `ppa:<project>/repo` format is acceptable. `ppa:` format can only be used to create a new repository.

The following options are available to modify a repo definition:

**architectures**

A comma-separated list of supported architectures, e.g. `amd64` If this option is not set, all architectures (configured in the system) will be used.

**comps**

A comma separated list of components for the repo, e.g. `main`

**file**

A file name to be used

**keyserver**

Keyserver to get gpg key from

**keyid**

Key ID or a list of key IDs to load with the `keyserver` argument

**key\_url**

URL to a GPG key to add to the APT GPG keyring

**key\_text**

GPG key in string form to add to the APT GPG keyring

New in version 2018.3.0.

**consolidate**

[False] If `True`, will attempt to de-duplicate and consolidate sources

**comments**

Sometimes you want to supply additional information, but not as enabled configuration. All comments provided here will be joined into a single string and appended to the repo configuration with a comment marker (`#`) before it.

New in version 2015.8.9.

**refresh**

[True] Enable or disable (True or False) refreshing of the apt package database. The previous `refresh_db` argument was deprecated in favor of `refresh``. The `refresh_db` argument will still continue to work to ensure backwards compatibility, but please change to using the preferred `refresh`.

---

**Note:** Due to the way keys are stored for APT, there is a known issue where the key won't be updated unless another change is made at the same time. Keys should be properly added on initial configuration.

---

CLI Examples:

```
salt '*' pkg.mod_repo 'myrepo definition' uri=http://new/uri
salt '*' pkg.mod_repo 'myrepo definition' comps=main,universe
```

`salt.modules.aptpkg.normalize_name(name)`

Strips the architecture from the specified package name, if necessary.

CLI Example:

```
salt '*' pkg.normalize_name zsh:amd64
```

`salt.modules.aptpkg.owner(*paths, **kwargs)`

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```

`salt.modules.aptpkg.parse_arch(name)`

Parse name and architecture from the specified package name.

CLI Example:

```
salt '*' pkg.parse_arch zsh:amd64
```

`salt.modules.aptpkg.purge(name=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `apt-get/dpkg` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages via `apt-get purge` along with all configuration files.

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.aptpkg.refresh_db(cache_valid_time=0, failhard=False, **kwargs)`

Updates the APT database to latest packages based upon repositories

Returns a dict, with the keys being package databases and the values being the result of the update attempt. Values can be one of the following:

- True: Database updated successfully

- False: Problem updating database
- None: Database already up-to-date

cache\_valid\_time

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

failhard

If False, return results of Err lines as False for the package database that encountered the error.

If True, raise an error with a list of the package databases that encountered errors.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.aptpkg.remove` (*name=None, pkgs=None, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any `apt-get/dpkg` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of False (no quotes).

Remove packages using `apt-get remove`.

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.aptpkg.services_need_restart` (*\*\*kwargs*)

New in version 3003.

List services that use files which have been changed by the package manager. It might be needed to restart them.

Requires checkrestart from the debian-goodies package.

CLI Examples:

```
salt '*' pkg.services_need_restart
```

`salt.modules.aptpkg.set_selections` (*path=None, selection=None, clear=False, saltenv='base'*)

Change package state in the dpkg database.

The state can be any one of, documented in `dpkg(1)`:

- install
- hold
- deinstall
- purge

This command is commonly used to mark specific packages to be held from being upgraded, that is, to be kept at a certain version. When a state is changed to anything but being held, then it is typically followed by `apt-get -u dselect-upgrade`.

Note: Be careful with the `clear` argument, since it will start with setting all packages to deinstall state.

Returns a dict of dicts containing the package names, and the new and old versions:

```
{ '<host>':
  { '<package>': { 'new': '<new-state>',
                  'old': '<old-state>' }
  },
  ...
}
```

CLI Example:

```
salt '*' pkg.set_selections selection='{"install": ["netcat"]}'
salt '*' pkg.set_selections selection='{"hold": ["openssh-server",
↪"openssh-client"]}'
salt '*' pkg.set_selections salt://path/to/file
salt '*' pkg.set_selections salt://path/to/file clear=True
```

`salt.modules.aptpkg.show` (*\*names, \*\*kwargs*)

New in version 2019.2.0.

Runs an `apt-cache show` on the passed package names, and returns the results in a nested dictionary. The top level of the return data will be the package name, with each package name mapping to a dictionary of version numbers to any additional information returned by `apt-cache show`.

#### filter

An optional comma-separated list (or quoted Python list) of case-insensitive keys on which to filter. This allows one to restrict the information returned for each package to a smaller selection of pertinent items.

#### refresh

[False] If True, the apt cache will be refreshed first. By default, no refresh is performed.

CLI Examples:

```
salt myminion pkg.show gawk
salt myminion pkg.show 'nginx-*'
salt myminion pkg.show 'nginx-*' filter=description,provides
```

`salt.modules.aptpkg.unhold` (*name=None, pkgs=None, sources=None, \*\*kwargs*)

New in version 2014.7.0.

Set package current in 'hold' state to install state, meaning it will be upgraded.

**name**

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

**pkgs**

A list of packages to unhold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs=['foo', 'bar']
```

`salt.modules.aptpkg.upgrade` (*refresh=True, dist\_upgrade=False, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any `apt-get/dpkg` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Upgrades all packages via `apt-get upgrade` or `apt-get dist-upgrade` if `dist_upgrade` is `True`.

Returns a dictionary containing the changes:

```
{ '<package>': {'old': '<old-version>',  
               'new': '<new-version>'}}
```

**dist\_upgrade**

Whether to perform the upgrade using `dist-upgrade` vs `upgrade`. Default is to use `upgrade`.

New in version 2014.7.0.

**refresh**

[True] If `True`, the apt cache will be refreshed first. By default, this is `True` and a refresh is performed.

**cache\_valid\_time**

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

**download\_only (or downloadonly)**

Only download the packages, don't unpack or install them. Use `downloadonly` to be in line with `yum` and `zypper` module.

New in version 2018.3.0.

**force\_conf\_new**

Always install the new version of any configuration files.

New in version 2015.8.0.

**allow\_downgrades**

Allow apt to downgrade packages without a prompt.

New in version 3005.

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.aptpkg.upgrade_available`(*name*, *\*\*kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.aptpkg.version`(*\*names*, *\*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.aptpkg.version_cmp`(*pkg1*, *pkg2*, *ignore\_epoch=False*, *\*\*kwargs*)

Do a cmp-style comparison on two packages. Return -1 if `pkg1 < pkg2`, 0 if `pkg1 == pkg2`, and 1 if `pkg1 > pkg2`. Return None if there was a problem making the comparison.

**ignore\_epoch**

[False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0ubuntu1' '0.2.4.1-0ubuntu1'
```

## 26.6.21 salt.modules.archive

A module to wrap (non-Windows) archive calls

New in version 2014.1.0.

`salt.modules.archive.cmd_unzip`(*zip\_file*, *dest*, *excludes=None*, *options=None*, *template=None*, *runas=None*, *trim\_output=False*, *password=None*)

New in version 2015.5.0: In versions 2014.7.x and earlier, this function was known as `archive.unzip`.

Uses the `unzip` command to unpack zip files. This command is part of the [Info-ZIP](#) suite of tools, and is typically packaged as simply `unzip`.

**zip\_file**

Path of zip file to be unpacked

**dest**

The destination directory into which the file should be unpacked

**excludes**

[None] Comma-separated list of files not to unpack. Can also be passed in a Python list.

**template**

[None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.cmd_unzip template=jinja /tmp/zipfile.zip '/tmp/{
↳{grains.id}}' excludes=file_1,file_2
```

**options**

Optional when using zip archives, ignored when using other archives files. This is mostly used to overwrite existing files with `o`. This options are only used when `unzip` binary is used.

New in version 2016.3.1.

**runas**

[None] Unpack the zip file as the specified user. Defaults to the user under which the minion is running.

New in version 2015.5.0.

**trim\_output**

[False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

**password**

Password to use with password protected zip files

---

**Note:** This is not considered secure. It is recommended to instead use `archive.unzip` for password-protected ZIP files. If a password is used here, then the `unzip` command run to extract the ZIP file will not show up in the minion log like most shell commands Salt runs do. However, the password will still be present in the events logged to the minion log at the `debug` log level. If the minion is logging at `debug` (or more verbose), then be advised that the password will appear in the log.

---

New in version 2016.11.0.

CLI Example:

```
salt '*' archive.cmd_unzip /tmp/zipfile.zip /home/strongbad/ⓧ
↳excludes=file_1,file_2
```

`salt.modules.archive.cmd_zip`(*zip\_file*, *sources*, *template=None*, *cwd=None*, *runas=None*)

New in version 2015.5.0: In versions 2014.7.x and earlier, this function was known as `archive.zip`.

Uses the `zip` command to create zip files. This command is part of the `Info-ZIP` suite of tools, and is typically packaged as simply `zip`.

**zip\_file**

Path of zip file to be created

**sources**

Comma-separated list of sources to include in the zip file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

**template**

[None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.cmd_zip template=jinja /tmp/zipfile.zip /tmp/
↳sourcefile1,/tmp/{grains.id}.txt
```

**cwd**

[None] Use this argument along with relative paths in `sources` to create zip files which do not contain the leading directories. If not specified, the zip file will be created as if the `cwd` was `/`, and creating a

zip file of `/foo/bar/baz.txt` will contain the parent directories `foo` and `bar`. To create a zip file containing just `baz.txt`, the following command would be used:

```
salt '*' archive.cmd_zip /tmp/baz.zip baz.txt cwd=/foo/bar
```

New in version 2014.7.1.

#### runas

[None] Create the zip file as the specified user. Defaults to the user under which the minion is running.

New in version 2015.5.0.

CLI Example:

```
salt '*' archive.cmd_zip /tmp/zipfile.zip /tmp/sourcefile1,/tmp/
→sourcefile2
# Globbing for sources (2017.7.0 and later)
salt '*' archive.cmd_zip /tmp/zipfile.zip '/tmp/sourcefile*'
```

`salt.modules.archive.gunzip` (*gzipfile*, *template=None*, *runas=None*, *options=None*)

Uses the `gunzip` command to unpack gzip files

#### template

[None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.gunzip template=jinja /tmp/{{grains.id}}.txt.gz
```

#### runas

[None] The user with which to run the `gzip` command line

#### options

[None] Pass any additional arguments to `gzip`

New in version 2016.3.4.

CLI Example:

```
# Create /tmp/sourcefile.txt
salt '*' archive.gunzip /tmp/sourcefile.txt.gz
salt '*' archive.gunzip /tmp/sourcefile.txt options='--verbose'
```

`salt.modules.archive.gzip` (*sourcefile*, *template=None*, *runas=None*, *options=None*)

Uses the `gzip` command to create gzip files

#### template

[None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.gzip template=jinja /tmp/{{grains.id}}.txt
```

#### runas

[None] The user with which to run the `gzip` command line

#### options

[None] Pass any additional arguments to `gzip`

New in version 2016.3.4.

CLI Example:

```
# Create /tmp/sourcefile.txt.gz
salt '*' archive.gzip /tmp/sourcefile.txt
salt '*' archive.gzip /tmp/sourcefile.txt options='-9 --verbose'
```

`salt.modules.archive.is_encrypted`(*name*, *clean*=False, *saltenv*='base', *source\_hash*=None, *use\_etag*=False)

New in version 2016.11.0.

Changed in version 3005.

Returns True if the zip archive is password-protected, False if not. If the specified file is not a ZIP archive, an error will be raised.

#### name

The path / URL of the archive to check.

#### clean

[False] Set this value to True to delete the path referred to by name once the contents have been listed. This option should be used with care.

---

**Note:** If there is an error listing the archive's contents, the cached file will not be removed, to allow for troubleshooting.

---

#### saltenv

[base] Specifies the fileserver environment from which to retrieve archive. This is only applicable when archive is a file from the salt:// fileserver.

#### source\_hash

If name is an http(s)/ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

#### use\_etag

If True, remote http/https file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the source\_hash parameter.

New in version 3005.

CLI Examples:

```
salt '*' archive.is_encrypted /path/to/myfile.zip
salt '*' archive.is_encrypted salt://foo.zip
salt '*' archive.is_encrypted salt://foo.zip saltenv=dev
salt '*' archive.is_encrypted https://domain.tld/myfile.zip clean=True
salt '*' archive.is_encrypted https://domain.tld/myfile.zip source_
→hash=f1d2d2f924e986ac86fdf7b36c94bcdf32beec15
salt '*' archive.is_encrypted ftp://10.1.2.3/foo.zip
```

`salt.modules.archive.list_`(*name*, *archive\_format*=None, *options*=None, *strip\_components*=None, *clean*=False, *verbose*=False, *saltenv*='base', *source\_hash*=None, *use\_etag*=False)

New in version 2016.11.0.

Changed in version 2016.11.2,3005: The `rarfile` Python module is now supported for listing the contents of rar archives. This is necessary on minions with older releases of the rar CLI tool, which do not support listing

the contents in a parsable format.

List the files and directories in an tar, zip, or rar archive.

---

**Note:** This function will only provide results for XZ-compressed archives if the `xz` CLI command is available, as Python does not at this time natively support XZ compression in its `tarfile` module. Keep in mind however that most Linux distros ship with `xz` already installed.

To check if a given minion has `xz`, the following Salt command can be run:

```
salt minion_id cmd.which xz
```

If `None` is returned, then `xz` is not present and must be installed. It is widely available and should be packaged as either `xz` or `xz-utils`.

---

#### name

Path/URL of archive

#### archive\_format

Specify the format of the archive (`tar`, `zip`, or `rar`). If this argument is omitted, the archive format will be guessed based on the value of the `name` parameter.

#### options

**For tar archives only.** This function will, by default, try to use the `tarfile` module from the Python standard library to get a list of files/directories. If this method fails, then it will fall back to using the shell to decompress the archive to stdout and pipe the results to `tar -tf -` to produce a list of filenames. XZ-compressed archives are already supported automatically, but in the event that the tar archive uses a different sort of compression not supported natively by `tarfile`, this option can be used to specify a command that will decompress the archive to stdout. For example:

```
salt minion_id archive.list /path/to/foo.tar.gz options='gzip --
↳decompress --stdout'
```

---

**Note:** It is not necessary to manually specify options for gzip'ed archives, as gzip compression is natively supported by `tarfile`.

---

#### strip\_components

This argument specifies a number of top-level directories to strip from the results. This is similar to the paths that would be extracted if `--strip-components` (or `--strip`) were used when extracting tar archives.

New in version 2016.11.2.

#### clean

[False] Set this value to `True` to delete the path referred to by `name` once the contents have been listed. This option should be used with care.

---

**Note:** If there is an error listing the archive's contents, the cached file will not be removed, to allow for troubleshooting.

---

#### verbose

[False] If `False`, this function will return a list of files/dirs in the archive. If `True`, it will return a

dictionary categorizing the paths into separate keys containing the directory names, file names, and also directories/files present in the top level of the archive.

Changed in version 2016.11.2: This option now includes symlinks in their own list. Before, they were included with files.

**saltenv**

[base] Specifies the fileserver environment from which to retrieve `archive`. This is only applicable when `archive` is a file from the `salt://` fileserver.

**source\_hash**

If `name` is an `http(s)/ftp` URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

**use\_etag**

If `True`, remote `http/https` file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the `source_hash` parameter.

New in version 3005.

## CLI Examples:

```
salt '*' archive.list /path/to/myfile.tar.gz
salt '*' archive.list /path/to/myfile.tar.gz strip_components=1
salt '*' archive.list salt://foo.tar.gz
salt '*' archive.list https://domain.tld/myfile.zip
salt '*' archive.list https://domain.tld/myfile.zip source_
→hash=f1d2d2f924e986ac86fdf7b36c94bcdf32beec15
salt '*' archive.list ftp://10.1.2.3/foo.rar
```

`salt.modules.archive.rar` (*rarfile*, *sources*, *template=None*, *cwd=None*, *runas=None*)

Uses `rar` for Linux to create rar files

**rarfile**

Path of rar file to be created

**sources**

Comma-separated list of sources to include in the rar file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

**cwd**

[None] Run the rar command from the specified directory. Use this argument along with relative file paths to create rar files which do not contain the leading directories. If not specified, this will default to the home directory of the user under which the salt minion process is running.

New in version 2014.7.1.

**template**

[None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.rar template=jinja /tmp/rarfile.rar '/tmp/
→sourcefile1,/tmp/{{grains.id}}.txt'
```

## CLI Example:

```
salt '*' archive.rar /tmp/rarfile.rar /tmp/sourcefile1,/tmp/sourcefile2
# Globbing for sources (2017.7.0 and later)
salt '*' archive.rar /tmp/rarfile.rar '/tmp/sourcefile*'
```

`salt.modules.archive.tar` (*options*, *tarfile*, *sources=None*, *dest=None*, *cwd=None*, *template=None*, *runas=None*)

**Note:** This function has changed for version 0.17.0. In prior versions, the `cwd` and `template` arguments must be specified, with the source directories/files coming as a space-separated list at the end of the command. Beginning with 0.17.0, `sources` must be a comma-separated list, and the `cwd` and `template` arguments are optional.

Uses the tar command to pack, unpack, etc. tar files

#### options

Options to pass to the tar command

Changed in version 2015.8.0: The mandatory `-` prefixing has been removed. An options string beginning with a `--long-option`, would have uncharacteristically needed its first `-` removed under the former scheme.

Also, tar will parse its options differently if short options are used with or without a preceding `-`, so it is better to not confuse the user into thinking they're using the `non--` format, when really they are using the `with--` format.

#### tarfile

The filename of the tar archive to pack/unpack

#### sources

Comma delimited list of files to **pack** into the tarfile. Can also be passed as a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

#### dest

The destination directory into which to **unpack** the tarfile

#### cwd

[None] The directory in which the tar command should be executed. If not specified, will default to the home directory of the user under which the salt minion process is running.

#### template

[None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.tar cjvf /tmp/salt.tar.bz2 {{grains.saltpath}}
↳ template=jinja
```

CLI Examples:

```
# Create a tarfile
salt '*' archive.tar cjvf /tmp/tarfile.tar.bz2 /tmp/file_1,/tmp/file_2
# Create a tarfile using globbing (2017.7.0 and later)
salt '*' archive.tar cjvf /tmp/tarfile.tar.bz2 '/tmp/file_*'
# Unpack a tarfile
salt '*' archive.tar xf foo.tar dest=/target/directory
```

`salt.modules.archive.unrar` (*rarfile*, *dest*, *excludes=None*, *template=None*, *runas=None*, *trim\_output=False*)

Uses rar for Linux to unpack rar files

**rarfile**

Name of rar file to be unpacked

**dest**

The destination directory into which to **unpack** the rar file

**template**

[None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.unrar template=jinja /tmp/rarfile.rar /tmp/{{grains.
↳id}}/ excludes=file_1,file_2
```

**trim\_output**

[False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

CLI Example:

```
salt '*' archive.unrar /tmp/rarfile.rar /home/strongbad/ excludes=file_1,
↳file_2
```

`salt.modules.archive.unzip` (*zip\_file*, *dest*, *excludes=None*, *options=None*, *template=None*, *runas=None*, *trim\_output=False*, *password=None*, *extract\_perms=True*)

Uses the `zipfile` Python module to unpack zip files

Changed in version 2015.5.0: This function was rewritten to use Python's native zip file support. The old functionality has been preserved in the new function `archive.cmd_unzip`. For versions 2014.7.x and earlier, see the `archive.cmd_zip` documentation.

**zip\_file**

Path of zip file to be unpacked

**dest**

The destination directory into which the file should be unpacked

**excludes**

[None] Comma-separated list of files not to unpack. Can also be passed in a Python list.

**options**

This options are only used when `unzip` binary is used. In this function is ignored.

New in version 2016.3.1.

**template**

[None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.unzip template=jinja /tmp/zipfile.zip /tmp/{{grains.
↳id}}/ excludes=file_1,file_2
```

**runas**

[None] Unpack the zip file as the specified user. Defaults to the user under which the minion is running.

**trim\_output**

[False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

CLI Example:

```
salt '*' archive.unzip /tmp/zipfile.zip /home/strongbad/ excludes=file_1,
→file_2
```

**password**

Password to use with password protected zip files

---

**Note:** The password will be present in the events logged to the minion log file at the debug log level. If the minion is logging at debug (or more verbose), then be advised that the password will appear in the log.

---

New in version 2016.3.0.

**extract\_perms**

[True] The Python `zipfile` module does not extract file/directory attributes by default. When this argument is set to True, Salt will attempt to apply the file permission attributes to the extracted files/folders.

On Windows, only the read-only flag will be extracted as set within the zip file, other attributes (i.e. user/group permissions) are ignored.

Set this argument to False to disable this behavior.

New in version 2016.11.0.

CLI Example:

```
salt '*' archive.unzip /tmp/zipfile.zip /home/strongbad/ password=
→'BadPassword'
```

`salt.modules.archive.zip_(zip_file, sources, template=None, cwd=None, runas=None, zip64=False)`

Uses the `zipfile` Python module to create zip files

Changed in version 2015.5.0: This function was rewritten to use Python's native zip file support. The old functionality has been preserved in the new function `archive.cmd_zip`. For versions 2014.7.x and earlier, see the `archive.cmd_zip` documentation.

**zip\_file**

Path of zip file to be created

**sources**

Comma-separated list of sources to include in the zip file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

**template**

[None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.zip template=jinja /tmp/zipfile.zip /tmp/sourcefile1,
→/tmp/{{grains.id}}.txt
```

**cwd**

[None] Use this argument along with relative paths in `SOURCES` to create zip files which do not contain the leading directories. If not specified, the zip file will be created as if the `cwd` was `/`, and creating a zip file of `/foo/bar/baz.txt` will contain the parent directories `foo` and `bar`. To create a zip file containing just `baz.txt`, the following command would be used:

```
salt '*' archive.zip /tmp/baz.zip baz.txt cwd=/foo/bar
```

**runas**

[None] Create the zip file as the specified user. Defaults to the user under which the minion is running.

**zip64**

[False] Used to enable ZIP64 support, necessary to create archives larger than 4 GByte in size. If true, will create ZIP file with the ZIP64 extension when the zipfile is larger than 2 GB. ZIP64 extension is disabled by default in the Python native zip support because the default zip and unzip commands on Unix (the InfoZIP utilities) don't support these extensions.

CLI Example:

```
salt '*' archive.zip /tmp/zipfile.zip /tmp/sourcefile1,/tmp/sourcefile2
# Globbing for sources (2017.7.0 and later)
salt '*' archive.zip /tmp/zipfile.zip '/tmp/sourcefile*'
```

## 26.6.22 salt.modules.arista\_pyeapi

### Arista pyeapi

New in version 2019.2.0.

Execution module to interface the connection with Arista switches, connecting to the remote network device using the `pyeapi` library. It is flexible enough to execute the commands both when running under an Arista Proxy Minion, as well as running under a Regular Minion by specifying the connection arguments, i.e., `device_type`, `host`, `username`, `password` etc.

**codeauthor**

Mircea Ulinic <ping@mirceaulinic.net>

**maturity**

new

**depends**

pyeapi

**platform**

unix

---

**Note:** To understand how to correctly enable the eAPI on your switch, please check <https://eos.arista.com/arista-eapi-101/>.

---

### Dependencies

The `pyeapi` Execution module requires the Python Client for eAPI (`pyeapi`) to be installed: `pip install pyeapi`.

## Usage

This module can equally be used via the `pyeapi` Proxy module or directly from an arbitrary (Proxy) Minion that is running on a machine having access to the network device API, and the `pyeapi` library is installed.

When running outside of the `pyeapi Proxy` (i.e., from another Proxy Minion type, or regular Minion), the `pyeapi` connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the `pyeapi` key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the `pyeapi` Proxy Module:

**transport: https**

Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

**host: localhost**

The IP address or DNS host name of the connection device.

**username: admin**

The username to pass to the device to authenticate the eAPI connection.

**password**

The password to pass to the device to authenticate the eAPI connection.

**port**

The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**enablepwd**

The enable mode password if required by the destination node.

Example (when not running in a `pyeapi` Proxy Minion):

```
pyeapi:
  username: test
  password: test
```

In case the `username` and `password` are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a `pyeapi` Proxy, e.g.:

```
salt '*' pyeapi.run_commands 'show version' 'show interfaces'
salt '*' pyeapi.config 'ntp server 1.2.3.4'
```

---

**Note:** Remember that the above applies only when not running in a `pyeapi` Proxy Minion. If you want to use the `pyeapi Proxy`, please follow the documentation notes for a proper setup.

---

`salt.modules.arista_pyeapi.call`(*method*, \*args, \*\*kwargs)

Invoke an arbitrary `pyeapi` method.

**method**

The name of the `pyeapi` method to invoke.

**args**

A list of arguments to send to the method invoked.

**kwargs**

Key-value dictionary to send to the method invoked.

**transport: https**

Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**host: localhost**

The IP address or DNS host name of the connection device.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**username: admin**

The username to pass to the device to authenticate the eAPI connection.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**password**

The password to pass to the device to authenticate the eAPI connection.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**port**

The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**enablepwd**

The enable mode password if required by the destination node.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

CLI Example:

```
salt '*' pyeapi.call run_commands "['show version']"
```

`salt.modules.arista_pyeapi.config`(*commands=None, config\_file=None, template\_engine='jinja', context=None, defaults=None, saltenv='base', \*\*kwargs*)

Configures the node with the specified commands.

This method is used to send configuration commands to the node. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

Returns the diff after the configuration commands are loaded.

**config\_file**

The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

#### commands

The commands to send to the node in config mode. If the `commands` argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

---

**Note:** This argument is ignored when `config_file` is specified.

---

#### template\_engine: **jinja**

The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

#### context

Variables to add to the template context.

#### defaults

Default values of the `context` dict.

#### transport: **https**

Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

#### host: **localhost**

The IP address or DNS host name of the connection device.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

#### username: **admin**

The username to pass to the device to authenticate the eAPI connection.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

#### password

The password to pass to the device to authenticate the eAPI connection.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

#### port

The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**enablepwd**

The enable mode password if required by the destination node.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

CLI Example:

```
salt '*' pyeapi.config commands="['ntp server 1.2.3.4', 'ntp server 5.6.7.8']"
salt '*' pyeapi.config config_file=salt://config.txt
salt '*' pyeapi.config config_file=https://bit.ly/2LGLcDy context="{
  'servers': ['1.2.3.4']}"
```

`salt.modules.arista_pyeapi.get_config`(*config='running-config', params=None, as\_string=False, \*\*kwargs*)

Retrieves the config from the device.

This method will retrieve the config from the node as either a string or a list object. The config to retrieve can be specified as either the startup-config or the running-config.

**config: running-config**

Specifies to return either the nodes startup-config or running-config. The default value is the running-config.

**params**

A string of keywords to append to the command for retrieving the config.

**as\_string: False**

Flag that determines the response. If `True`, then the configuration is returned as a raw string. If `False`, then the configuration is returned as a list. The default value is `False`.

**transport: https**

Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**host: localhost**

The IP address or DNS host name of the connection device.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**username: admin**

The username to pass to the device to authenticate the eAPI connection.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**password**

The password to pass to the device to authenticate the eAPI connection.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**port**

The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**enablepwd**

The enable mode password if required by the destination node.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

CLI Example:

```
salt '*' pyeapi.get_config
salt '*' pyeapi.get_config params='section snmp-server'
salt '*' pyeapi.get_config config='startup-config'
```

`salt.modules.arista_pyeapi.get_connection(**kwargs)`

Return the connection object to the pyeapi Node.

**Warning:** This function returns an unserializable object, hence it is not meant to be used on the CLI. This should mainly be used when invoked from other modules for the low level connection with the network device.

**kwargs**

Key-value dictionary with the authentication details.

USAGE Example:

```
conn = __salt__['pyeapi.get_connection'](host='router1.example.com',
                                         username='example',
                                         password='example')
show_ver = conn.run_commands(['show version', 'show interfaces'])
```

`salt.modules.arista_pyeapi.run_commands(*commands, **kwargs)`

Sends the commands over the transport to the device.

This function sends the commands to the device using the nodes transport. This is a lower layer function that shouldn't normally need to be used, preferring instead to use `config()` or `enable()`.

**transport: https**

Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**host: localhost**

The IP address or DNS host name of the connection device.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**username: admin**

The username to pass to the device to authenticate the eAPI connection.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**password**

The password to pass to the device to authenticate the eAPI connection.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**port**

The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**enablepwd**

The enable mode password if required by the destination node.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

CLI Example:

```
salt '*' pyeapi.run_commands 'show version'
salt '*' pyeapi.run_commands 'show version' encoding=text
salt '*' pyeapi.run_commands 'show version' encoding=text host=cr1.thn.
→lon username=example password=weak
```

Output example:

```
veos1:
  |_
  -----
  architecture:
    i386
  bootupTimestamp:
    1527541728.53
  hardwareRevision:

version:
    4.18.1F

```

`salt.modules.arista_pyeapi.section(regex, config='running-config', **kwargs)`

Return a section of the config.

**regex**

A valid regular expression used to select sections of configuration to return.

**config: running-config**

The configuration to return. Valid values for config are `running-config` or `startup-config`. The default value is `running-config`.

**transport: https**

Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**host: localhost**

The IP address or DNS host name of the connection device.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**username: admin**

The username to pass to the device to authenticate the eAPI connection.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**password**

The password to pass to the device to authenticate the eAPI connection.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**port**

The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

**enablepwd**

The enable mode password if required by the destination node.

---

**Note:** This argument does not need to be specified when running in a *pyeapi* Proxy Minion.

---

CLI Example:

```
salt '*'
```

### 26.6.23 salt.modules.artifactory

Module for fetching artifacts from Artifactory

**exception** salt.modules.artifactory.**ArtifactoryError**(*value*)

salt.modules.artifactory.**get\_latest\_release**(*artifactory\_url*, *repository*, *group\_id*, *artifact\_id*, *packaging*, *target\_dir*='/tmp', *target\_file*=None, *classifier*=None, *username*=None, *password*=None, *use\_literal\_group\_id*=False)

Gets the latest release of the artifact

**artifactory\_url**

URL of artifactory instance

**repository**

Release repository in artifactory to retrieve artifact from, for example: libs-releases

**group\_id**

Group Id of the artifact

**artifact\_id**

Artifact Id of the artifact

**packaging**

Packaging type (jar,war,ear,etc)

**target\_dir**

Target directory to download artifact to (default: /tmp)

**target\_file**

Target file to download artifact to (by default it is target\_dir/artifact\_id-version.packaging)

**classifier**

Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

**username**

Artifactory username. Optional parameter.

**password**

Artifactory password. Optional parameter.

salt.modules.artifactory.**get\_latest\_snapshot**(*artifactory\_url*, *repository*, *group\_id*, *artifact\_id*, *packaging*, *target\_dir*='/tmp', *target\_file*=None, *classifier*=None, *username*=None, *password*=None, *use\_literal\_group\_id*=False)

Gets latest snapshot of the given artifact

**artifactory\_url**

URL of artifactory instance

**repository**

Snapshot repository in artifactory to retrieve artifact from, for example: libs-snapshots

**group\_id**

Group Id of the artifact

**artifact\_id**

Artifact Id of the artifact

**packaging**

Packaging type (jar,war,ear,etc)

**target\_dir**

Target directory to download artifact to (default: /tmp)

**target\_file**

Target file to download artifact to (by default it is target\_dir/artifact\_id-snapshot\_version.packaging)

**classifier**

Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

**username**

Artifactory username. Optional parameter.

**password**

Artifactory password. Optional parameter.

`salt.modules.artifactory.get_release` (*artifactory\_url, repository, group\_id, artifact\_id, packaging, version, target\_dir='/tmp', target\_file=None, classifier=None, username=None, password=None, use\_literal\_group\_id=False*)

Gets the specified release of the artifact

**artifactory\_url**

URL of artifactory instance

**repository**

Release repository in artifactory to retrieve artifact from, for example: libs-releases

**group\_id**

Group Id of the artifact

**artifact\_id**

Artifact Id of the artifact

**packaging**

Packaging type (jar,war,ear,etc)

**version**

Version of the artifact

**target\_dir**

Target directory to download artifact to (default: /tmp)

**target\_file**

Target file to download artifact to (by default it is target\_dir/artifact\_id-version.packaging)

**classifier**

Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

**username**

Artifactory username. Optional parameter.

**password**

Artifactory password. Optional parameter.

`salt.modules.artifactory.get_snapshot` (*artifactory\_url*, *repository*, *group\_id*, *artifact\_id*, *packaging*, *version*, *snapshot\_version=None*, *target\_dir='/tmp'*, *target\_file=None*, *classifier=None*, *username=None*, *password=None*, *use\_literal\_group\_id=False*)

Gets snapshot of the desired version of the artifact

**artifactory\_url**

URL of artifactory instance

**repository**

Snapshot repository in artifactory to retrieve artifact from, for example: libs-snapshots

**group\_id**

Group Id of the artifact

**artifact\_id**

Artifact Id of the artifact

**packaging**

Packaging type (jar,war,ear,etc)

**version**

Version of the artifact

**target\_dir**

Target directory to download artifact to (default: /tmp)

**target\_file**

Target file to download artifact to (by default it is `target_dir/artifact_id-snapshot_version.packaging`)

**classifier**

Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

**username**

Artifactory username. Optional parameter.

**password**

Artifactory password. Optional parameter.

`salt.modules.artifactory.set_basic_auth` (*url*, *username*, *password*)

Sets the username and password for a specific url. Helper method.

CLI Example:

### 26.6.24 salt.modules.at

Wrapper module for at(1)

Also, a 'tag' feature has been added to more easily tag jobs.

**platform**

linux,openbsd,freebsd

Changed in version 2017.7.0.

`salt.modules.at.at(*args, **kwargs)`

Add a job to the queue.

The 'timespec' follows the format documented in the at(1) manpage.

CLI Example:

```
salt '*' at.at <timespec> <cmd> [tag=<tag>] [runas=<user>]
salt '*' at.at 12:05am '/sbin/reboot' tag=reboot
salt '*' at.at '3:05am +3 days' 'bin/myscript' tag=nightly runas=jim
salt '*' at.at '"22:02"' 'bin/myscript' tag=nightly runas=jim
```

`salt.modules.at.atc(jobid)`

Print the at(1) script that will run for the passed job id. This is mostly for debugging so the output will just be text.

CLI Example:

```
salt '*' at.atc <jobid>
```

`salt.modules.at.atq(tag=None)`

List all queued and running jobs or only those with an optional 'tag'.

CLI Example:

```
salt '*' at.atq
salt '*' at.atq [tag]
salt '*' at.atq [job number]
```

`salt.modules.at.atrm(*args)`

Remove jobs from the queue.

CLI Example:

```
salt '*' at.atrm <jobid> <jobid> .. <jobid>
salt '*' at.atrm all
salt '*' at.atrm all [tag]
```

`salt.modules.at.jobcheck(**kwargs)`

Check the job from queue. The kwargs dict include 'hour minute day month year tag runas' Other parameters will be ignored.

CLI Example:

```
salt '*' at.jobcheck runas=jam day=13
salt '*' at.jobcheck day=13 month=12 year=13 tag=rose
```

## 26.6.25 salt.modules.at\_solaris

Wrapper for at(1) on Solaris-like systems

---

**Note:** we try to mirror the generic at module where possible

---

**maintainer**

jorge schrauwen <sjorge@blackdot.be>

**maturity**

new

**platform**

solaris,illumos,smartso

New in version 2017.7.0.

**salt.modules.at\_solaris.at**(\*args, \*\*kwargs)

Add a job to the queue.

The 'timespec' follows the format documented in the at(1) manpage.

CLI Example:

```
salt '*' at.at <timespec> <cmd> [tag=<tag>] [runas=<user>]
salt '*' at.at 12:05am '/sbin/reboot' tag=reboot
salt '*' at.at '3:05am +3 days' 'bin/myscript' tag=nightly runas=jim
```

**salt.modules.at\_solaris.atc**(jobid)

Print the at(1) script that will run for the passed job id. This is mostly for debugging so the output will just be text.

CLI Example:

```
salt '*' at.atc <jobid>
```

**salt.modules.at\_solaris.atq**(tag=None)

List all queued and running jobs or only those with an optional 'tag'.

CLI Example:

```
salt '*' at.atq
salt '*' at.atq [tag]
salt '*' at.atq [job number]
```

**salt.modules.at\_solaris.atrm**(\*args)

Remove jobs from the queue.

CLI Example:

```
salt '*' at.atrm <jobid> <jobid> .. <jobid>
salt '*' at.atrm all
salt '*' at.atrm all [tag]
```

**salt.modules.at\_solaris.jobcheck**(\*\*kwargs)

Check the job from queue. The kwargs dict include 'hour minute day month year tag runas' Other parameters will be ignored.

CLI Example:

```
salt '*' at.jobcheck runas=jam day=13
salt '*' at.jobcheck day=13 month=12 year=13 tag=rose
```

## 26.6.26 salt.modules.augeas\_cfg

Manages configuration files via augeas

This module requires the `augeas` Python module.

**Warning:** Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with python-augeas, causing the augeas module to fail to import. If the minion has the augeas module installed, but the functions in this execution module fail to run due to being unavailable, first restart the salt-minion service. If the problem persists past that, the following command can be run from the master to determine what is causing the import to fail:

```
salt minion-id cmd.run 'python -c "from augeas import Augeas"'
```

For affected Debian/Ubuntu hosts, installing `libpython2.7` has been known to resolve the issue.

`salt.modules.augeas_cfg.execute` (*context=None, lens=None, commands=(), load\_path=None*)

Execute Augeas commands

New in version 2014.7.0.

CLI Example:

```
salt '*' augeas.execute /files/etc/redis/redis.conf \
  commands='["set bind 0.0.0.0", "set maxmemory 1G"]'
```

**context**

The Augeas context

**lens**

The Augeas lens to use

**commands**

The Augeas commands to execute

New in version 2016.3.0.

**load\_path**

A colon-separated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in `AUGEAS_LENS_LIB`.

`salt.modules.augeas_cfg.get` (*path, value="", load\_path=None*)

Get a value for a specific augeas path

CLI Example:

```
salt '*' augeas.get /files/etc/hosts/1/ ipaddr
```

**path**

The path to get the value of

**value**

The optional value to get

New in version 2016.3.0.

**load\_path**

A colon-separated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in `AUGEAS_LENS_LIB`.

`salt.modules.augeas_cfg.ls`(*path*, *load\_path=None*)

List the direct children of a node

CLI Example:

```
salt '*' augeas.ls /files/etc/passwd
```

**path**

The path to list

New in version 2016.3.0.

**load\_path**

A colon-separated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in `AUGEAS_LENS_LIB`.

`salt.modules.augeas_cfg.match`(*path*, *value=""*, *load\_path=None*)

Get matches for path expression

CLI Example:

```
salt '*' augeas.match /files/etc/services/service-name ssh
```

**path**

The path to match

**value**

The value to match on

New in version 2016.3.0.

**load\_path**

A colon-separated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in `AUGEAS_LENS_LIB`.

`salt.modules.augeas_cfg.remove`(*path*, *load\_path=None*)

Get matches for path expression

CLI Example:

```
salt '*' augeas.remove \  
/files/etc/sysctl.conf/net.ipv4.conf.all.log_martians
```

**path**

The path to remove

New in version 2016.3.0.

**load\_path**

A colon-separated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS\_LENS\_LIB.

`salt.modules.augeas_cfg.setvalue(*args)`

Set a value for a specific augeas path

CLI Example:

```
salt '*' augeas.setvalue /files/etc/hosts/1/canonical localhost
```

This will set the first entry in /etc/hosts to localhost

CLI Example:

```
salt '*' augeas.setvalue /files/etc/hosts/01/ipaddr 192.168.1.1 \
/files/etc/hosts/01/canonical test
```

Adds a new host to /etc/hosts the ip address 192.168.1.1 and hostname test

CLI Example:

```
salt '*' augeas.setvalue prefix=/files/etc/sudoers/ \
"spec[user = '%wheel']/user" "%wheel" \
"spec[user = '%wheel']/host_group/host" 'ALL' \
"spec[user = '%wheel']/host_group/command[1]" 'ALL' \
"spec[user = '%wheel']/host_group/command[1]/tag" 'PASSWD' \
"spec[user = '%wheel']/host_group/command[2]" '/usr/bin/apt-get' \
→ \
"spec[user = '%wheel']/host_group/command[2]/tag" NOPASSWD
```

Ensures that the following line is present in /etc/sudoers:

```
%wheel ALL = PASSWD : ALL , NOPASSWD : /usr/bin/apt-get , /usr/bin/
→ aptitude
```

`salt.modules.augeas_cfg.tree(path, load_path=None)`

Returns recursively the complete tree of a node

CLI Example:

```
salt '*' augeas.tree /files/etc/
```

**path**

The base of the recursive listing

New in version 2016.3.0.

**load\_path**

A colon-separated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS\_LENS\_LIB.

### 26.6.27 salt.modules.aws\_sqs

Support for the Amazon Simple Queue Service.

`salt.modules.aws_sqs.create_queue` (*name*, *region*, *opts=None*, *user=None*)

Creates a queue with the correct name.

**name**

Name of the SQS queue to create

**region**

Region to create the SQS queue in

**opts**

[None] Any additional options to add to the command line

**user**

[None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' aws_sqs.create_queue <sqs queue> <region>
```

`salt.modules.aws_sqs.delete_message` (*queue*, *region*, *receipthandle*, *opts=None*, *user=None*)

Delete one or more messages from a queue in a region

**queue**

The name of the queue to delete messages from

**region**

Region where SQS queues exists

**receipthandle**

The ReceiptHandle of the message to delete. The ReceiptHandle is obtained in the return from `receive_message`

**opts**

[None] Any additional options to add to the command line

**user**

[None] Run as a user other than what the minion runs as

CLI Example:

```
salt '*' aws_sqs.delete_message <sqs queue> <region> receipthandle='<sqs  
→ReceiptHandle>'
```

New in version 2014.7.0.

`salt.modules.aws_sqs.delete_queue` (*name*, *region*, *opts=None*, *user=None*)

Deletes a queue in the region.

**name**

Name of the SQS queue to deletes

**region**

Name of the region to delete the queue from

**opts**

[None] Any additional options to add to the command line

**user**

[None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' aws_sqs.delete_queue <sqs queue> <region>
```

`salt.modules.aws_sqs.list_queues` (*region*, *opts=None*, *user=None*)

List the queues in the selected region.

**region**

Region to list SQS queues for

**opts**

[None] Any additional options to add to the command line

**user**

[None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' aws_sqs.list_queues <region>
```

`salt.modules.aws_sqs.queue_exists` (*name*, *region*, *opts=None*, *user=None*)

Returns True or False on whether the queue exists in the region

**name**

Name of the SQS queue to search for

**region**

Name of the region to search for the queue in

**opts**

[None] Any additional options to add to the command line

**user**

[None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' aws_sqs.queue_exists <sqs queue> <region>
```

`salt.modules.aws_sqs.receive_message` (*queue*, *region*, *num=1*, *opts=None*, *user=None*)

Receive one or more messages from a queue in a region

**queue**

The name of the queue to receive messages from

**region**

Region where SQS queues exists

**num**

[1] The max number of messages to receive

**opts**

[None] Any additional options to add to the command line

**user**

[None] Run as a user other than what the minion runs as

CLI Example:

```
salt '*' aws_sqs.receive_message <sqs queue> <region>
salt '*' aws_sqs.receive_message <sqs queue> <region> num=10
```

New in version 2014.7.0.

## 26.6.28 salt.modules.bamboohr

Support for BambooHR

New in version 2015.8.0.

Requires a subdomain and an apikey in /etc/salt/minion:

```
bamboohr:
  apikey: 012345678901234567890
  subdomain: mycompany
```

`salt.modules.bamboohr.list_employees` (*order\_by='id'*)

Show all employees for this company.

CLI Example:

```
salt myminion bamboohr.list_employees
```

By default, the return data will be keyed by ID. However, it can be ordered by any other field. Keep in mind that if the field that is chosen contains duplicate values (i.e., location is used, for a company which only has one location), then each duplicate value will be overwritten by the previous. Therefore, it is advisable to only sort by fields that are guaranteed to be unique.

CLI Examples:

```
salt myminion bamboohr.list_employees order_by=id
salt myminion bamboohr.list_employees order_by=displayName
salt myminion bamboohr.list_employees order_by=workEmail
```

`salt.modules.bamboohr.list_meta_fields`()

Show all meta data fields for this company.

CLI Example:

```
salt myminion bamboohr.list_meta_fields
```

`salt.modules.bamboohr.list_users` (*order\_by='id'*)

Show all users for this company.

CLI Example:

```
salt myminion bamboohr.list_users
```

By default, the return data will be keyed by ID. However, it can be ordered by any other field. Keep in mind that if the field that is chosen contains duplicate values (i.e., location is used, for a company which only has one location), then each duplicate value will be overwritten by the previous. Therefore, it is advisable to only sort by fields that are guaranteed to be unique.

CLI Examples:

```
salt myminion bamboohr.list_users order_by=id
salt myminion bamboohr.list_users order_by=email
```

`salt.modules.bamboohr.show_employee`(*emp\_id*, *fields=None*)

Show all employees for this company.

CLI Example:

```
salt myminion bamboohr.show_employee 1138
```

By default, the fields normally returned from `bamboohr.list_employees` are returned. These fields are:

- canUploadPhoto
- department
- displayName
- firstName
- id
- jobTitle
- lastName
- location
- mobilePhone
- nickname
- photoUploaded
- photoUrl
- workEmail
- workPhone
- workPhoneExtension

If needed, a different set of fields may be specified, separated by commas:

CLI Example:

```
salt myminion bamboohr.show_employee 1138 displayName,dateOfBirth
```

A list of available fields can be found at <http://www.bamboohr.com/api/documentation/employees.php>

`salt.modules.bamboohr.update_employee`(*emp\_id*, *key=None*, *value=None*, *items=None*)

Update one or more items for this employee. Specifying an empty value will clear it for that employee.

CLI Examples:

```
salt myminion bamboohr.update_employee 1138 nickname Curly
salt myminion bamboohr.update_employee 1138 nickname ''
salt myminion bamboohr.update_employee 1138 items={'nickname': "Curly"}
salt myminion bamboohr.update_employee 1138 items={'nickname': ""}
```

## 26.6.29 salt.modules.baredoc

Baredoc walks the installed module and state directories and generates dictionaries and lists of the function names and their arguments.

New in version 3001.

`salt.modules.baredoc.list_modules` (*name=False, names\_only=False*)

Walk the Salt install tree for execution modules and return a dictionary or a list of their functions as well as their arguments.

### Parameters

- **name** -- specify a specific module to list. If not specified, all modules will be listed.
- **names\_only** -- Return only a list of the callable functions instead of a dictionary with arguments

CLI Example:

```

salt myminion baredoc.list_modules

myminion:
  -----
  [...]
  at:
  - atq:
    tag: null
  - atrm:
    args: args
  - at:
    args: args
    kwargs: kwargs
  - atc:
    jobid: null
  - jobcheck:
    kwargs: kwargs
  [...]

```

`salt.modules.baredoc.list_states` (*name=False, names\_only=False*)

Walk the Salt install tree for state modules and return a dictionary or a list of their functions as well as their arguments.

### Parameters

- **name** -- specify a specific module to list. If not specified, all modules will be listed.
- **names\_only** -- Return only a list of the callable functions instead of a dictionary with arguments

CLI Example:

(example truncated for brevity)

```

salt myminion baredoc.list_states

myminion:
  -----

```

(continues on next page)

(continued from previous page)

```
[...]
at:
- present:
  name: null
  timespec: null
  tag: null
  user: null
  job: null
  unique_tag: false
- absent:
  name: null
  jobid: null
  kwargs: kwargs
- watch:
  name: null
  timespec: null
  tag: null
  user: null
  job: null
  unique_tag: false
- mod_watch:
  name: null
  kwargs: kwargs
[...]
```

`salt.modules.baredoc.module_docs(*names)`

Return the docstrings for all modules. Optionally, specify a module or a function to narrow the selection.

**Parameters**

**name** -- specify a specific module to list.

CLI Example:

```
salt myminion baredoc.module_docs
```

`salt.modules.baredoc.state_docs(*names)`

Return the docstrings for all state modules. Optionally, specify a state module or a function to narrow the selection.

**Parameters**

**name** -- specify a specific module to list.

CLI Example:

```
salt myminion baredoc.state_docs at
```

## 26.6.30 salt.modules.bcache

Module for managing BCache sets

BCache is a block-level caching mechanism similar to ZFS L2ARC/ZIL, dm-cache and fscache. It works by formatting one block device as a cache set, then adding backend devices (which need to be formatted as such) to the set and activating them.

It's available in Linux mainline kernel since 3.10

<https://www.kernel.org/doc/Documentation/bcache.txt>

This module needs the bcache userspace tools to function.

New in version 2016.3.0.

`salt.modules.bcache.attach_` (*dev=None*)

Attach a backing devices to a cache set If no dev is given, all backing devices will be attached.

CLI Example:

```
salt '*' bcache.attach sdc
salt '*' bcache.attach /dev/bcache1
```

### Returns

bool or None if nuttin' happened

`salt.modules.bcache.back_make` (*dev, cache\_mode='writeback', force=False, attach=True, bucket\_size=None*)

Create a backing device for attachment to a set. Because the block size must be the same, a cache set already needs to exist.

CLI Example:

```
salt '*' bcache.back_make sdc cache_mode=writeback attach=True
```

### Parameters

- **cache\_mode** -- writethrough, writeback, writearound or none.
- **force** -- Overwrite existing bcache
- **attach** -- Immediately attach the backing device to the set
- **bucket\_size** -- Size of a bucket (see kernel doc)

`salt.modules.bcache.cache_make` (*dev, reserved=None, force=False, block\_size=None, bucket\_size=None, attach=True*)

Create BCache cache on a block device. If blkdiscard is available the entire device will be properly cleared in advance.

CLI Example:

```
salt '*' bcache.cache_make sdb reserved=10% block_size=4096
```

### Parameters

- **reserved** -- if dev is a full device, create a partition table with this size empty.

---

**Note:** this increases the amount of reserved space available to SSD garbage collectors, potentially (vastly) increasing performance

---

- **block\_size** -- Block size of the cache; defaults to devices' logical block size
- **force** -- Overwrite existing BCache sets
- **attach** -- Attach all existing backend devices immediately

`salt.modules.bcache.config_` (*dev=None, \*\*kwargs*)

Show or update config of a bcache device.

If no device is given, operate on the cache set itself.

CLI Example:

```
salt '*' bcache.config
salt '*' bcache.config bcache1
salt '*' bcache.config errors=panic journal_delay_ms=150
salt '*' bcache.config bcache1 cache_mode=writeback writeback_percent=15
```

#### Returns

config or True/False

`salt.modules.bcache.detach` (*dev=None*)

Detach a backing device(s) from a cache set If no dev is given, all backing devices will be attached.

Detaching a backing device will flush its write cache. This should leave the underlying device in a consistent state, but might take a while.

CLI Example:

```
salt '*' bcache.detach sdc
salt '*' bcache.detach bcache1
```

`salt.modules.bcache.device` (*dev, stats=False, config=False, internals=False, superblock=False*)

Check the state of a single bcache device

CLI Example:

```
salt '*' bcache.device bcache0
salt '*' bcache.device /dev/sdc stats=True
```

#### Parameters

- **stats** -- include statistics
- **settings** -- include all settings
- **internals** -- include all internals
- **superblock** -- include superblock info

`salt.modules.bcache.start()`

Trigger a start of the full bcache system through udev.

CLI Example:

```
salt '*' bcache.start
```

`salt.modules.bcache.status(stats=False, config=False, internals=False, superblock=False, alldevs=False)`

Show the full status of the BCache system and optionally all its involved devices

CLI Example:

```
salt '*' bcache.status
salt '*' bcache.status stats=True
salt '*' bcache.status internals=True alldevs=True
```

#### Parameters

- **stats** -- include statistics
- **config** -- include settings
- **internals** -- include internals
- **superblock** -- include superblock

`salt.modules.bcache.stop(dev=None)`

Stop a bcache device. If no device is given, all backing devices will be detached from the cache, which will subsequently be stopped.

**Warning:** 'Stop' on an individual backing device means hard-stop; no attempt at flushing will be done and the bcache device will seemingly 'disappear' from the device lists

CLI Example:

```
salt '*' bcache.stop
```

`salt.modules.bcache.super_(dev)`

Read out BCache SuperBlock

CLI Example:

```
salt '*' bcache.device bcache0
salt '*' bcache.device /dev/sdc
```

`salt.modules.bcache.uuid(dev=None)`

Return the bcache UUID of a block device. If no device is given, the Cache UUID is returned.

CLI Example:

```
salt '*' bcache.uuid
salt '*' bcache.uuid /dev/sda
salt '*' bcache.uuid bcache0
```

### 26.6.31 salt.modules.beacons

Module for managing the Salt beacons on a minion

New in version 2015.8.0.

`salt.modules.beacons.add(name, beacon_data, **kwargs)`

Add a beacon on the minion

#### Parameters

- **name** -- Name of the beacon to configure
- **beacon\_data** -- Dictionary or list containing configuration for beacon.

#### Returns

Boolean and status message on success or failure of add.

CLI Example:

```
salt '*' beacons.add ps "[{'processes': {'salt-master': 'stopped',
→ 'apache2': 'stopped'}}]"
```

`salt.modules.beacons.delete(name, **kwargs)`

Delete a beacon item

#### Parameters

**name** -- Name of the beacon to delete

#### Returns

Boolean and status message on success or failure of delete.

CLI Example:

```
salt '*' beacons.delete ps
salt '*' beacons.delete load
```

`salt.modules.beacons.disable(**kwargs)`

Disable all beacons jobs on the minion

#### Returns

Boolean and status message on success or failure of disable.

CLI Example:

```
salt '*' beacons.disable
```

`salt.modules.beacons.disable_beacon(name, **kwargs)`

Disable a beacon on the minion

#### Name

Name of the beacon to disable.

#### Returns

Boolean and status message on success or failure of disable.

CLI Example:

```
salt '*' beacons.disable_beacon ps
```

`salt.modules.beacons.enable(**kwargs)`

Enable all beacons on the minion

**Returns**

Boolean and status message on success or failure of enable.

**Return type**

bool

CLI Example:

```
salt '*' beacons.enable
```

`salt.modules.beacons.enable_beacon(name, **kwargs)`

Enable beacon on the minion

**Name**

Name of the beacon to enable.

**Returns**

Boolean and status message on success or failure of enable.

CLI Example:

```
salt '*' beacons.enable_beacon ps
```

`salt.modules.beacons.list_(return_yaml=True, include_pillar=True, include_opts=True, **kwargs)`

List the beacons currently configured on the minion

**Parameters**

- **return\_yaml** -- Whether to return YAML formatted output, default True
- **include\_pillar** -- Whether to include beacons that are configured in pillar, default is True.
- **include\_opts** -- Whether to include beacons that are configured in opts, default is True.

**Returns**

List of currently configured Beacons.

CLI Example:

```
salt '*' beacons.list
```

`salt.modules.beacons.list_available(return_yaml=True, **kwargs)`

List the beacons currently available on the minion

**Parameters**

**return\_yaml** -- Whether to return YAML formatted output, default True

**Returns**

List of currently configured Beacons.

CLI Example:

```
salt '*' beacons.list_available
```

`salt.modules.beacons.modify`(*name*, *beacon\_data*, *\*\*kwargs*)

Modify an existing beacon

**Parameters**

- **name** -- Name of the beacon to configure
- **beacon\_data** -- Dictionary or list containing updated configuration for beacon.

**Returns**

Boolean and status message on success or failure of modify.

CLI Example:

```
salt '*' beacons.modify ps "[{'salt-master': 'stopped'}, {'apache2':
→ 'stopped'}]"
```

`salt.modules.beacons.reset`(*\*\*kwargs*)

Reset beacon configuration on the minion

CLI Example:

```
salt '*' beacons.reset
```

`salt.modules.beacons.save`(*\*\*kwargs*)

Save all configured beacons to the minion config

**Returns**

Boolean and status message on success or failure of save.

CLI Example:

```
salt '*' beacons.save
```

### 26.6.32 salt.modules.bigip

An execution module which can manipulate an f5 bigip via iControl REST

**maturity**

develop

**platform**

f5\_bigip\_11.6

`salt.modules.bigip.add_pool_member`(*hostname*, *username*, *password*, *name*, *member*)

A function to connect to a bigip device and add a new member to an existing pool.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the pool to modify

**member**

The name of the member to add i.e. 10.1.1.2:80

CLI Example:

```
salt '*' bigip.add_pool_members bigip admin admin my-pool 10.2.2.1:80
```

`salt.modules.bigip.commit_transaction`(*hostname, username, password, label*)

A function to connect to a bigip device and commit an existing transaction.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**label**

the label of this transaction stored within the grain: `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.commit_transaction bigip admin admin my_transaction
```

`salt.modules.bigip.create_monitor`(*hostname, username, password, monitor\_type, name, \*\*kwargs*)

A function to connect to a bigip device and create a monitor.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**monitor\_type**

The type of monitor to create

**name**

The name of the monitor to create

**kwargs**

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

CLI Example:

```
salt '*' bigip.create_monitor bigip admin admin http my-http-monitor
↪ timeout=10 interval=5
```

`salt.modules.bigip.create_node`(*hostname, username, password, name, address, trans\_label=None*)

A function to connect to a bigip device and create a node.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the node

**address**

The address of the node

**trans\_label**

The label of the transaction stored within the grain: `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.create_node bigip admin admin 10.1.1.2
```

```
salt.modules.bigip.create_pool(hostname, username, password, name, members=None,
allow_nat=None, allow_snat=None, description=None,
gateway_failsafe_device=None, ignore_persisted_weight=None,
ip_tos_to_client=None, ip_tos_to_server=None,
link_qos_to_client=None, link_qos_to_server=None,
load_balancing_mode=None, min_active_members=None,
min_up_members=None, min_up_members_action=None,
min_up_members_checking=None, monitor=None, profiles=None,
queue_depth_limit=None, queue_on_connection_limit=None,
queue_time_limit=None, reselect_tries=None,
service_down_action=None, slow_ramp_time=None)
```

A function to connect to a bigip device and create a pool.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the pool to create.

**members**

List of comma delimited pool members to add to the pool. i.e. `10.1.1.1:80,10.1.1.2:80,10.1.1.3:80`

**allow\_nat**

[yes | no]

**allow\_snat**

[yes | no]

**description**

[string]

**gateway\_failsafe\_device**

[string]

**ignore\_persisted\_weight**

[enabled | disabled]

**ip\_tos\_to\_client**

[pass-through | [integer]]

**ip\_tos\_to\_server**  
[pass-through | [integer]]

**link\_qos\_to\_client**  
[pass-through | [integer]]

**link\_qos\_to\_server**  
[pass-through | [integer]]

**load\_balancing\_mode**  
[dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node | least-connections-members | least-connections-node | least-sessions | observed-member | observed-node | predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member | weighted-least-connections-node]

**min\_active\_members**  
[integer]

**min\_up\_members**  
[integer]

**min\_up\_members\_action**  
[failover | reboot | restart-all]

**min\_up\_members\_checking**  
[enabled | disabled]

**monitor**  
[name]

**profiles**  
[none | profile\_name]

**queue\_depth\_limit**  
[integer]

**queue\_on\_connection\_limit**  
[enabled | disabled]

**queue\_time\_limit**  
[integer]

**reselect\_tries**  
[integer]

**service\_down\_action**  
[drop | none | reselect | reset]

**slow\_ramp\_time**  
[integer]

CLI Example:

```
salt '*' bigip.create_pool bigip admin admin my-pool 10.1.1.1:80,10.1.1.1.
→2:80,10.1.1.1.3:80 monitor=http
```

`salt.modules.bigip.create_profile`(*hostname*, *username*, *password*, *profile\_type*, *name*, *\*\*kwargs*)

A function to connect to a bigip device and create a profile.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**profile\_type**

The type of profile to create

**name**

The name of the profile to create

**kwargs**

[ arg=val ] ... [arg=key1:val1,key2:val2] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

**Creating Complex Args**

Profiles can get pretty complicated in terms of the amount of possible config options. Use the following shorthand to create complex arguments such as lists, dictionaries, and lists of dictionaries. An option is also provided to pass raw json as well.

**lists [i,i,i]:**

param='item1,item2,item3'

**Dictionary [k:v,k:v,k,v]:**

param='key-1:val-1,key-2:val2,key-3:va-3'

**List of Dictionaries [k:v,k:v|k:v,k:v|k:v,k:v]:**

param='key-1:val-1,key-2:val-2|key-1:val-1,key-2:val-2|key-1:val-1,key-2:val-2'

**JSON: 'j{ ... }j':**

cert-key-chain='j{ "default": { "cert": "default.crt", "chain": "default.crt", "key": "default.key" } }j'

**Escaping Delimiters:**

Use \, or \: or \| to escape characters which shouldn't be treated as delimiters i.e.  
ciphers='DEFAULT\:!SSLv3'

CLI Example:

```
salt '*' bigip.create_profile bigip admin admin http my-http-profile
→defaultsFrom='/Common/http'
salt '*' bigip.create_profile bigip admin admin http my-http-profile
→defaultsFrom='/Common/http' \
  enforcement=maxHeaderCount:3200,maxRequests:10
```

`salt.modules.bigip.create_virtual` (*hostname, username, password, name, destination, pool=None, address\_status=None, auto\_lasthop=None, bwc\_policy=None, cmp\_enabled=None, connection\_limit=None, dhcp\_relay=None, description=None, fallback\_persistence=None, flow\_eviction\_policy=None, gtm\_score=None, ip\_forward=None, ip\_protocol=None, internal=None, twelve\_forward=None, last\_hop\_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate\_class=None, rate\_limit=None, rate\_limit\_mode=None, rate\_limit\_dst=None, rate\_limit\_src=None, rules=None, related\_rules=None, reject=None, source=None, source\_address\_translation=None, source\_port=None, state=None, traffic\_classes=None, translate\_address=None, translate\_port=None, vlans=None*)

A function to connect to a bigip device and create a virtual server.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the virtual to create

**destination**

[ [virtual\_address\_name:port] | [ipv4:port] | [ipv6:port] ]

**pool**

  traffic_classes=my-class,other-class \
  vlans=enabled:external,internal
```

`salt.modules.bigip.delete_monitor` (*hostname, username, password, monitor\_type, name*)

A function to connect to a bigip device and delete an existing monitor.

**hostname**  
 The host/address of the bigip device

**username**  
 The iControl REST username

**password**  
 The iControl REST password

**monitor\_type**  
 The type of monitor to delete

**name**  
 The name of the monitor to delete

CLI Example:

```
salt '*' bigip.delete_monitor bigip admin admin http my-http-monitor
```

`salt.modules.bigip.delete_node` (*hostname, username, password, name, trans\_label=None*)

A function to connect to a bigip device and delete a specific node.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the node which will be deleted.

**trans\_label**

The label of the transaction stored within the grain: `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.delete_node bigip admin admin my-node
```

`salt.modules.bigip.delete_pool` (*hostname, username, password, name*)

A function to connect to a bigip device and delete a specific pool.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the pool which will be deleted

CLI Example

```
salt '*' bigip.delete_node bigip admin admin my-pool
```

`salt.modules.bigip.delete_pool_member` (*hostname, username, password, name, member*)

A function to connect to a bigip device and delete a specific pool.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the pool to modify

**member**

The name of the pool member to delete

CLI Example:

```
salt '*' bigip.delete_pool_member bigip admin admin my-pool 10.2.2.2:80
```

`salt.modules.bigip.delete_profile`(*hostname*, *username*, *password*, *profile\_type*, *name*)

A function to connect to a bigip device and delete an existing profile.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**profile\_type**

The type of profile to delete

**name**

The name of the profile to delete

CLI Example:

```
salt '*' bigip.delete_profile bigip admin admin http my-http-profile
```

`salt.modules.bigip.delete_transaction`(*hostname*, *username*, *password*, *label*)

A function to connect to a bigip device and delete an existing transaction.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**label**

The label of this transaction stored within the grain: `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.delete_transaction bigip admin admin my_transaction
```

`salt.modules.bigip.delete_virtual`(*hostname*, *username*, *password*, *name*)

A function to connect to a bigip device and delete a specific virtual.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the virtual to delete

CLI Example:

```
salt '*' bigip.delete_virtual bigip admin admin my-virtual
```

`salt.modules.bigip.list_monitor` (*hostname, username, password, monitor\_type, name=None*)

A function to connect to a bigip device and list an existing monitor. If no name is provided than all monitors of the specified type will be listed.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**monitor\_type**

The type of monitor(s) to list

**name**

The name of the monitor to list

CLI Example:

```
salt '*' bigip.list_monitor bigip admin admin http my-http-monitor
```

`salt.modules.bigip.list_node` (*hostname, username, password, name=None, trans\_label=None*)

A function to connect to a bigip device and list all nodes or a specific node.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the node to list. If no name is specified than all nodes will be listed.

**trans\_label**

The label of the transaction stored within the grain: `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.list_node bigip admin admin my-node
```

`salt.modules.bigip.list_pool` (*hostname, username, password, name=None*)

A function to connect to a bigip device and list all pools or a specific pool.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the pool to list. If no name is specified then all pools will be listed.

CLI Example:

```
salt '*' bigip.list_pool bigip admin admin my-pool
```

`salt.modules.bigip.list_profile`(*hostname, username, password, profile\_type, name=None*)

A function to connect to a bigip device and list an existing profile. If no name is provided than all profiles of the specified type will be listed.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**profile\_type**

The type of profile(s) to list

**name**

The name of the profile to list

CLI Example:

```
salt '*' bigip.list_profile bigip admin admin http my-http-profile
```

`salt.modules.bigip.list_transaction`(*hostname, username, password, label*)

A function to connect to a bigip device and list an existing transaction.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**label**

the label of this transaction stored within the grain: `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.list_transaction bigip admin admin my_transaction
```

`salt.modules.bigip.list_virtual`(*hostname, username, password, name=None*)

A function to connect to a bigip device and list all virtuals or a specific virtual.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the virtual to list. If no name is specified than all virtuals will be listed.

CLI Example:

```
salt '*' bigip.list_virtual bigip admin admin my-virtual
```

`salt.modules.bigip.modify_monitor` (*hostname, username, password, monitor\_type, name, \*\*kwargs*)

A function to connect to a bigip device and modify an existing monitor.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**monitor\_type**

The type of monitor to modify

**name**

The name of the monitor to modify

**kwargs**

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

CLI Example:

```
salt '*' bigip.modify_monitor bigip admin admin http my-http-monitor
→ timeout=16 interval=6
```

`salt.modules.bigip.modify_node` (*hostname, username, password, name, connection\_limit=None, description=None, dynamic\_ratio=None, logging=None, monitor=None, rate\_limit=None, ratio=None, session=None, state=None, trans\_label=None*)

A function to connect to a bigip device and modify an existing node.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the node to modify

**connection\_limit**

[integer]

**description**

[string]

**dynamic\_ratio**

[integer]

**logging**

[enabled | disabled]

**monitor**

[[name] | none | default]

**rate\_limit**  
[integer]

**ratio**  
[integer]

**session**  
[user-enabled | user-disabled]

**state**  
[user-down | user-up ]

**trans\_label**  
The label of the transaction stored within the grain: `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.modify_node bigip admin admin 10.1.1.2 ratio=20  
↳ logging=enabled
```

`salt.modules.bigip.modify_pool`(*hostname, username, password, name, allow\_nat=None, allow\_snat=None, description=None, gateway\_failsafe\_device=None, ignore\_persisted\_weight=None, ip\_tos\_to\_client=None, ip\_tos\_to\_server=None, link\_qos\_to\_client=None, link\_qos\_to\_server=None, load\_balancing\_mode=None, min\_active\_members=None, min\_up\_members=None, min\_up\_members\_action=None, min\_up\_members\_checking=None, monitor=None, profiles=None, queue\_depth\_limit=None, queue\_on\_connection\_limit=None, queue\_time\_limit=None, reselect\_tries=None, service\_down\_action=None, slow\_ramp\_time=None*)

A function to connect to a bigip device and modify an existing pool.

**hostname**  
The host/address of the bigip device

**username**  
The iControl REST username

**password**  
The iControl REST password

**name**  
The name of the pool to modify.

**allow\_nat**  
[yes | no]

**allow\_snat**  
[yes | no]

**description**  
[string]

**gateway\_failsafe\_device**  
[string]

**ignore\_persisted\_weight**  
[yes | no]

**ip\_tos\_to\_client**  
[pass-through | [integer]]

**ip\_tos\_to\_server**  
[pass-through | [integer]]

**link\_qos\_to\_client**  
[pass-through | [integer]]

**link\_qos\_to\_server**  
[pass-through | [integer]]

**load\_balancing\_mode**  
[dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node | least-connections-members | least-connections-node | least-sessions | observed-member | observed-node | predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member | weighted-least-connections-node]

**min\_active\_members**  
[integer]

**min\_up\_members**  
[integer]

**min\_up\_members\_action**  
[failover | reboot | restart-all]

**min\_up\_members\_checking**  
[enabled | disabled]

**queue\_time\_limit**  
[integer]

**reselect\_tries**  
[integer]

**service\_down\_action**  
[drop | none | reselect | reset]

**slow\_ramp\_time**  
[integer]

CLI Example:

```
salt '*' bigip.modify_pool bigip admin admin my-pool 10.1.1.1:80,10.1.1.
→2:80,10.1.1.3:80 min_active_members=1
```

`salt.modules.bigip.modify_pool_member` (*hostname, username, password, name, member, connection\_limit=None, description=None, dynamic\_ratio=None, inherit\_profile=None, logging=None, monitor=None, priority\_group=None, profiles=None, rate\_limit=None, ratio=None, session=None, state=None*)

A function to connect to a bigip device and modify an existing member of a pool.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the pool to modify

**member**

The name of the member to modify i.e. 10.1.1.2:80

**connection\_limit**

[integer]

**description**

[string]

**dynamic\_ratio**

[integer]

**inherit\_profile**

[enabled | disabled]

**logging**

[enabled | disabled]

**monitor**

[name]

**priority\_group**

[integer]

**profiles**

[none | profile\_name]

**rate\_limit**

[integer]

**ratio**

[integer]

**session**

[user-enabled | user-disabled]

**state**

[ user-up | user-down ]

CLI Example:

```
salt '*' bigip.modify_pool_member bigip admin admin my-pool 10.2.2.1:80
→state=use-down session=user-disabled
```

`salt.modules.bigip.modify_profile`(*hostname, username, password, profile\_type, name, \*\*kwargs*)

A function to connect to a bigip device and create a profile.

A function to connect to a bigip device and create a profile.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**profile\_type**

The type of profile to create

**name**

The name of the profile to create

**kwargs**

[ `arg=val` ] ... [ `arg=key1:val1,key2:val2` ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

Creating Complex Args

Profiles can get pretty complicated in terms of the amount of possible config options. Use the following shorthand to create complex arguments such as lists, dictionaries, and lists of dictionaries. An option is also provided to pass raw json as well.

**lists [i,i,i]:**

`param='item1,item2,item3'`

**Dictionary [k:v,k:v,k,v]:**

`param='key-1:val-1,key-2:val2,key-3:va-3'`

**List of Dictionaries [k:v,k:v|k:v,k:v|k:v,k:v]:**

`param='key-1:val-1,key-2:val-2|key-1:val-1, key-2:val-2|key-1:val-1,key-2:val-2'`

**JSON: 'j{ ... }j':**

`cert-key-chain='j{ "default": { "cert": "default.crt", "chain": "default.crt", "key": "default.key" } }j'`

**Escaping Delimiters:**

Use `\,` or `\:` or `\|` to escape characters which shouldn't be treated as delimiters i.e. `ciphers='DEFAULT\:!SSLv3'`

CLI Example:

```
salt '*' bigip.modify_profile bigip admin admin http my-http-profile
↳ defaultsFrom='/Common/http'

salt '*' bigip.modify_profile bigip admin admin http my-http-profile
↳ defaultsFrom='/Common/http' \
  enforcement=maxHeaderCount:3200,maxRequests:10

salt '*' bigip.modify_profile bigip admin admin client-ssl my-client-ssl-
↳1 retainCertificate=false \
```

(continues on next page)

(continued from previous page)

```

ciphers='DEFAULT\:!SSLv3'
cert_key_chain='j{ "default": { "cert": "default.crt", "chain":
→"default.crt", "key": "default.key" } }j'

```

```

salt.modules.bigip.modify_virtual(hostname, username, password, name, destination=None,
pool=None, address_status=None, auto_lasthop=None,
bwc_policy=None, cmp_enabled=None, connection_limit=None,

**translate\_address**  
[enabled | disabled]

**translate\_port**  
[enabled | disabled]

**vlan**  
[none | default | [enabled|disabled]:vlan1,vlan2,vlan3 ... ]

CLI Example:

```
salt '*' bigip.modify_virtual bigip admin admin my-virtual source_address_
→translation=none
salt '*' bigip.modify_virtual bigip admin admin my-virtual rules=my-rule,
→my-other-rule
```

**salt.modules.bigip.replace\_pool\_members** (*hostname, username, password, name, members*)

A function to connect to a bigip device and replace members of an existing pool with new members.

**hostname**  
The host/address of the bigip device

**username**  
The iControl REST username

**password**  
The iControl REST password

**name**  
The name of the pool to modify

**members**  
List of comma delimited pool members to replace existing members with. i.e.  
10.1.1.1:80,10.1.1.2:80,10.1.1.3:80

CLI Example:

```
salt '*' bigip.replace_pool_members bigip admin admin my-pool 10.2.2.1:80,
→10.2.2.2:80,10.2.2.3:80
```

`salt.modules.bigip.start_transaction(hostname, username, password, label)`

A function to connect to a bigip device and start a new transaction.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**label**

The name / alias for this transaction. The actual transaction id will be stored within a grain called `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.start_transaction bigip admin admin my_transaction
```

### 26.6.33 salt.modules.bluez\_bluetooth

Support for Bluetooth (using BlueZ in Linux).

The following packages are required packages for this module:

```
bluez >= 5.7 bluez-libs >= 5.7 bluez-utils >= 5.7 pybluez >= 0.18
```

`salt.modules.bluez_bluetooth.address_()`

Get the many addresses of the Bluetooth adapter

CLI Example:

```
salt '*' bluetooth.address
```

`salt.modules.bluez_bluetooth.block(bdaddr)`

Block a specific bluetooth device by BD Address

CLI Example:

```
salt '*' bluetooth.block DE:AD:BE:EF:CA:FE
```

`salt.modules.bluez_bluetooth.discoverable(dev)`

Enable this bluetooth device to be discoverable.

CLI Example:

```
salt '*' bluetooth.discoverable hci0
```

`salt.modules.bluez_bluetooth.noscan(dev)`

Turn off scanning modes on this device.

CLI Example:

```
salt '*' bluetooth.noscan hci0
```

`salt.modules.bluez_bluetooth.pair`(*address, key*)

Pair the bluetooth adapter with a device

CLI Example:

```
salt '*' bluetooth.pair DE:AD:BE:EF:CA:FE 1234
```

Where DE:AD:BE:EF:CA:FE is the address of the device to pair with, and 1234 is the passphrase.

TODO: This function is currently broken, as the bluez-simple-agent program no longer ships with BlueZ >= 5.0. It needs to be refactored.

`salt.modules.bluez_bluetooth.power`(*dev, mode*)

Power a bluetooth device on or off

CLI Examples:

```
salt '*' bluetooth.power hci0 on
salt '*' bluetooth.power hci0 off
```

`salt.modules.bluez_bluetooth.scan`()

Scan for bluetooth devices in the area

CLI Example:

```
salt '*' bluetooth.scan
```

`salt.modules.bluez_bluetooth.start`()

Start the bluetooth service.

CLI Example:

```
salt '*' bluetooth.start
```

`salt.modules.bluez_bluetooth.stop`()

Stop the bluetooth service.

CLI Example:

```
salt '*' bluetooth.stop
```

`salt.modules.bluez_bluetooth.unblock`(*bdaddr*)

Unblock a specific bluetooth device by BD Address

CLI Example:

```
salt '*' bluetooth.unblock DE:AD:BE:EF:CA:FE
```

`salt.modules.bluez_bluetooth.unpair`(*address*)

Unpair the bluetooth adapter from a device

CLI Example:

```
salt '*' bluetooth.unpair DE:AD:BE:EF:CA:FE
```

Where DE:AD:BE:EF:CA:FE is the address of the device to unpair.

TODO: This function is currently broken, as the bluez-simple-agent program no longer ships with BlueZ >= 5.0. It needs to be refactored.

```
salt.modules.bluez_bluetooth.version()
```

Return Bluez version from bluetoothd -v

CLI Example:

```
salt '*' bluetoothd.version
```

## 26.6.34 salt.modules.boto3\_elasticache

### Execution module for Amazon Elasticache using boto3

New in version 2017.7.0.

#### configuration

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
→amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
elasticache.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
  region: us-east-1
```

#### depends

boto3

```
salt.modules.boto3_elasticache.add_tags_to_resource(name, region=None, key=None,
keyid=None, profile=None, **args)
```

Add tags to an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those at hand though, feel free to utilize this function...

Example:

```
salt myminion boto3_elasticache.add_tags_to_resource name
→ '=arn:aws:elasticache:us-west-2:0123456789:snapshot:mySnapshot'
→ Tags="['Key': 'TeamOwner', 'Value': 'infrastructure']"
```

`salt.modules.boto3_elasticache.authorize_cache_security_group_ingress` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *\*\*args*)

Authorize network ingress from an ec2 security group to a cache security group.

Example:

```
salt myminion boto3_elasticache.authorize_cache_security_group_ingress
→ mycachesecgrp
→ EC2SecurityGroupName=someEC2sg
→ EC2SecurityGroupOwnerId=SOMEOWNERID
```

`salt.modules.boto3_elasticache.cache_cluster_exists` (*name*, *conn=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if a cache cluster exists.

Example:

```
salt myminion boto3_elasticache.cache_cluster_exists myelasticache
```

`salt.modules.boto3_elasticache.cache_security_group_exists` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an ElastiCache security group exists.

Example:

```
salt myminion boto3_elasticache.cache_security_group_exists
→ mysecuritygroup
```

`salt.modules.boto3_elasticache.cache_subnet_group_exists` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an ElastiCache subnet group exists.

Example:

```
salt myminion boto3_elasticache.cache_subnet_group_exists my-subnet-group
```

`salt.modules.boto3_elasticache.copy_snapshot` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *\*\*args*)

Make a copy of an existing snapshot.

Example:

```
salt myminion boto3_elasticache.copy_snapshot name=mySnapshot
→
→ TargetSnapshotName=copyOfMySnapshot
```

`salt.modules.boto3_elasticache.create_cache_cluster` (*name*, *wait=600*, *security\_groups=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *\*\*args*)

Create a cache cluster.

Example:

```
salt myminion boto3_elasticache.create_cache_cluster name=myCacheCluster
→
→ Engine=redis
→ CacheNodeType=cache.t2.micro
→ NumCacheNodes=1
→ SecurityGroupIds=' [sg-11223344] '
→
→ CacheSubnetGroupName=myCacheSubnetGroup
```

`salt.modules.boto3_elasticache.create_cache_parameter_group` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *\*\*args*)

Create a cache parameter group.

Example:

```
salt myminion boto3_elasticache.create_cache_parameter_group
→ name=myParamGroup CacheParameterGroupFamily=redis2.8
→ Description="My Parameter Group"
```

`salt.modules.boto3_elasticache.create_cache_security_group` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *\*\*args*)

Create a cache security group.

Example:

```
salt myminion boto3_elasticache.create_cache_security_group mycachsecgrp
→ Description='My Cache Security Group'
```

`salt.modules.boto3_elasticache.create_cache_subnet_group` (*name*, *subnets=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *\*\*args*)

Create an ElastiCache subnet group

Example:

```
salt myminion boto3_elasticache.create_cache_subnet_group name=my-subnet-
→ group
→ CacheSubnetGroupDescription="description"
→ subnets=' [myVPCSubnet1,myVPCSubnet2] '
```

`salt.modules.boto3_elasticache.create_replication_group` (*name*, *wait=600*, *security\_groups=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *\*\*args*)

Create a replication group. Params are extensive and variable - see [http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create\\_replication\\_group](http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create_replication_group) for in-depth usage documentation.

Example:

```
salt myminion boto3_elasticache.create_replication_group
↳                                     name=myelasticache
↳                                     ReplicationGroupDescription=description
```

```
salt.modules.boto3_elasticache.delete_cache_cluster(name, wait=600, region=None,
                                                    key=None, keyid=None, profile=None,
                                                    **args)
```

Delete a cache cluster.

Example:

```
salt myminion boto3_elasticache.delete myelasticache
```

```
salt.modules.boto3_elasticache.delete_cache_parameter_group(name, region=None,
                                                            key=None, keyid=None,
                                                            profile=None, **args)
```

Delete a cache parameter group.

Example:

```
salt myminion boto3_elasticache.delete_cache_parameter_group myParamGroup
```

```
salt.modules.boto3_elasticache.delete_cache_security_group(name, region=None,
                                                           key=None, keyid=None,
                                                           profile=None, **args)
```

Delete a cache security group.

Example:

```
salt myminion boto3_elasticache.delete_cache_security_group
↳ myelasticachesg
```

```
salt.modules.boto3_elasticache.delete_cache_subnet_group(name, region=None, key=None,
                                                         keyid=None, profile=None,
                                                         **args)
```

Delete an ElastiCache subnet group.

Example:

```
salt myminion boto3_elasticache.delete_subnet_group
↳ region=us-east-1
```

```
salt.modules.boto3_elasticache.delete_replication_group(name, wait=600, region=None,
                                                         key=None, keyid=None,
                                                         profile=None, **args)
```

Delete an ElastiCache replication group, optionally taking a snapshot first.

Example:

```
salt myminion boto3_elasticache.delete_replication_group my-replication-
→group
```

`salt.modules.boto3_elasticache.describe_cache_clusters` (*name=None, conn=None, region=None, key=None, keyid=None, profile=None, \*\*args*)

Return details about all (or just one) Elasticache cache clusters.

Example:

```
salt myminion boto3_elasticache.describe_cache_clusters
salt myminion boto3_elasticache.describe_cache_clusters myelasticache
```

`salt.modules.boto3_elasticache.describe_cache_parameter_groups` (*name=None, conn=None, region=None, key=None, keyid=None, profile=None*)

Return details about all (or just one) Elasticache cache clusters.

Example:

```
salt myminion boto3_elasticache.describe_cache_parameter_groups
salt myminion boto3_elasticache.describe_cache_parameter_groups
→myParameterGroup
```

`salt.modules.boto3_elasticache.describe_cache_security_groups` (*name=None, conn=None, region=None, key=None, keyid=None, profile=None*)

Return details about all (or just one) Elasticache cache clusters.

Example:

```
salt myminion boto3_elasticache.describe_cache_security_groups
salt myminion boto3_elasticache.describe_cache_security_groups
→mycachesegrp
```

`salt.modules.boto3_elasticache.describe_cache_subnet_groups` (*name=None, conn=None, region=None, key=None, keyid=None, profile=None*)

Return details about all (or just one) Elasticache replication groups.

Example:

```
salt myminion boto3_elasticache.describe_cache_subnet_groups region=us-
→east-1
```

`salt.modules.boto3_elasticache.describe_replication_groups` (*name=None, conn=None, region=None, key=None, keyid=None, profile=None*)

Return details about all (or just one) Elasticache replication groups.

Example:

```
salt myminion boto3_elasticache.describe_replication_groups
salt myminion boto3_elasticache.describe_replication_groups myelasticache
```

```
salt.modules.boto3_elasticache.list_cache_subnet_groups(region=None, key=None,
                                                         keyid=None, profile=None)
```

Return a list of all cache subnet group names

Example:

```
salt myminion boto3_elasticache.list_cache_subnet_groups region=us-east-1
```

```
salt.modules.boto3_elasticache.list_tags_for_resource(name, region=None, key=None,
                                                         keyid=None, profile=None, **args)
```

List tags on an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those handy, feel free to utilize this however...

Example:

```
salt myminion boto3_elasticache.list_tags_for_resource ✘
→ name='arn:aws:elasticache:us-west-2:0123456789:snapshot:mySnapshot'
```

```
salt.modules.boto3_elasticache.modify_cache_cluster(name, wait=600, security_groups=None,
                                                         region=None, key=None, keyid=None,
                                                         profile=None, **args)
```

Update a cache cluster in place.

**Notes:** {ApplyImmediately: False} is pretty dangd silly in the context of salt.

You can pass it, but for fairly obvious reasons the results over multiple runs will be undefined and probably contrary to your desired state. Reducing the number of nodes requires an EXPLICIT CacheNodeIdsToRemove be passed, which until a reasonable heuristic for programmatically deciding which nodes to remove has been established, MUST be decided and populated intentionally before a state call, and removed again before the next. In practice this is not particularly useful and should probably be avoided.

Example:

```
salt myminion boto3_elasticache.create_cache_cluster name=myCacheCluster ✘
→ ✘
→ NotificationTopicStatus=inactive
```

```
salt.modules.boto3_elasticache.modify_cache_subnet_group(name, subnets=None,
                                                            region=None, key=None,
                                                            keyid=None, profile=None,
                                                            **args)
```

Modify an ElastiCache subnet group

Example:

```
salt myminion boto3_elasticache.modify_cache_subnet_group
→                                     name=my-subnet-group
→                                     subnets=' [myVPCSubnet3] '
```

```
salt.modules.boto3_elasticache.modify_replication_group(name, wait=600,
                                                         security_groups=None,
                                                         region=None, key=None,
                                                         keyid=None, profile=None,
                                                         **args)
```

Modify a replication group.

Example:

```
salt myminion boto3_elasticache.modify_replication_group
→                                     name=myelasticache
→                                     ReplicationGroupDescription=newDescription
```

```
salt.modules.boto3_elasticache.remove_tags_from_resource(name, region=None, key=None,
                                                         keyid=None, profile=None,
                                                         **args)
```

Remove tags from an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those at hand though, feel free to utilize this function...

Example:

```
salt myminion boto3_elasticache.remove_tags_from_resource
→ name='arn:aws:elasticache:us-west-2:0123456789:snapshot:mySnapshot'
→ TagKeys="['TeamOwner']"
```

```
salt.modules.boto3_elasticache.replication_group_exists(name, region=None, key=None,
                                                         keyid=None, profile=None)
```

Check to see if a replication group exists.

Example:

```
salt myminion boto3_elasticache.replication_group_exists myelasticache
```

```
salt.modules.boto3_elasticache.revoke_cache_security_group_ingress(name,
                                                                      region=None,
                                                                      key=None,
                                                                      keyid=None,
                                                                      profile=None,
                                                                      **args)
```

Revoke network ingress from an ec2 security group to a cache security group.

Example:

```
salt myminion boto3_elasticache.revoke_cache_security_group_ingress
→ mycachesegrp
```

(continues on next page)

(continued from previous page)

```

↪ EC2SecurityGroupName=someEC2sg
↪ EC2SecurityGroupOwnerId=SOMEOWNERID

```

### 26.6.35 salt.modules.boto3\_elasticsearch

Connection module for Amazon Elasticsearch Service

New in version 3001.

#### configuration

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```

http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
↪ amazon-ec2.html

```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```

es.keyid: GKTADJGHEIQSXMKKRBJ08H
es.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs

```

A region may also be specified in the configuration:

```

es.region: us-east-1

```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1

```

#### All methods return a dict with:

'result' key containing a boolean indicating success or failure, 'error' key containing the error message returned by boto on error, 'response' key containing the data of the response returned by boto on success.

#### codeauthor

Herbert Buurman <herbert.buurman@ogd.nl>

#### depends

boto3

**salt.modules.boto3\_elasticsearch.add\_tags** (*domain\_name=None, arn=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Attaches tags to an existing Elasticsearch domain. Tags are a set of case-sensitive key value pairs. An Elasticsearch domain may have up to 10 tags.

#### Parameters

- **domain\_name** (*str*) -- The name of the Elasticsearch domain you want to add tags to.

- **arn** (*str*) -- The ARN of the Elasticsearch domain you want to add tags to. Specifying this overrides `domain_name`.
- **tags** (*dict*) -- The dict of tags to add to the Elasticsearch domain.

**Return type**

dict

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

CLI Example:

```
salt myminion boto3_elasticsearch.add_tags domain_name=mydomain tags='{
→ "foo": "bar", "baz": "qux"}'
```

`salt.modules.boto3_elasticsearch.cancel_elasticsearch_service_software_update` (*domain\_name*, *re-gion=None*, *keyid=None*, *key=None*, *pro-file=None*)

Cancels a scheduled service software update for an Amazon ES domain. You can only perform this operation before the `AutomatedUpdateDate` and when the `UpdateStatus` is in the `PENDING_UPDATE` state.

**Parameters**

**domain\_name** (*str*) -- The name of the domain that you want to stop the latest service software update on.

**Return type**

dict

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the current service software options. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

`salt.modules.boto3_elasticsearch.check_upgrade_eligibility` (*domain\_name*, *elasticsearch\_version*, *region=None*, *keyid=None*, *key=None*, *profile=None*)

Helper function to determine in one call if an Elasticsearch domain can be upgraded to the specified Elasticsearch version.

This assumes that the Elasticsearch domain is at rest at the moment this function is called. I.e. The domain is not in the process of :

- being created.
- being updated.
- another upgrade running, or a check thereof.
- being deleted.

Behind the scenes, this does 3 things:

- Check if `elasticsearch_version` is among the compatible elasticsearch versions.
- Perform a check if the Elasticsearch domain is eligible for the upgrade.
- Check the result of the check and return the result as a boolean.

#### Parameters

- **name** (*str*) -- The Elasticsearch domain name to check.
- **elasticsearch\_version** (*str*) -- The Elasticsearch version to upgrade to.

#### Return type

`dict`

#### Returns

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with boolean result of the check. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

CLI Example:

```
salt myminion boto3_elasticsearch.check_upgrade_eligibility mydomain '6.7'
```

```
salt.modules.boto3_elasticsearch.create_elasticsearch_domain(domain_name, elasticsearch_version=None, elasticsearch_cluster_config=None, ebs_options=None, access_policies=None, snapshot_options=None, vpc_options=None, cognito_options=None, encryption_at_rest_options=None, node_to_node_encryption_options=None, advanced_options=None, log_publishing_options=None, blocking=False, region=None, key=None, keyid=None, profile=None)
```

Given a valid config, create a domain.

#### Parameters

- **domain\_name** (*str*) -- The name of the Elasticsearch domain that you are creating. Domain names are unique across the domains owned by an account within an AWS region. Domain names must start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).
- **elasticsearch\_version** (*str*) -- String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".
- **elasticsearch\_cluster\_config** (*dict*) -- Dictionary specifying the configuration options for an Elasticsearch domain. Keys (case sensitive) in here are:
  - InstanceType (*str*): The instance type for an Elasticsearch cluster.

- InstanceCount (int): The instance type for an Elasticsearch cluster.
- DedicatedMasterEnabled (bool): Indicate whether a dedicated master node is enabled.
- ZoneAwarenessEnabled (bool): Indicate whether zone awareness is enabled. If this is not enabled, the Elasticsearch domain will only be in one availability zone.
- ZoneAwarenessConfig (dict): Specifies the zone awareness configuration for a domain when zone awareness is enabled. Keys (case sensitive) in here are:
  - \* AvailabilityZoneCount (int): An integer value to indicate the number of availability zones for a domain when zone awareness is enabled. This should be equal to number of subnets if VPC endpoints is enabled. Allowed values: 2, 3
- DedicatedMasterType (str): The instance type for a dedicated master node.
- DedicatedMasterCount (int): Total number of dedicated master nodes, active and on standby, for the cluster.
- **efs\_options** (*dict*) -- Dict specifying the options to enable or disable and specifying the type and size of EFS storage volumes. Keys (case sensitive) in here are:
  - EFSEnabled (bool): Specifies whether EFS-based storage is enabled.
  - VolumeType (str): Specifies the volume type for EFS-based storage.
  - VolumeSize (int): Integer to specify the size of an EFS volume.
  - Iops (int): Specifies the IOPD for a Provisioned IOPS EFS volume (SSD).
- **access\_policies** (*str or dict*) -- Dict or JSON string with the IAM access policy.
- **snapshot\_options** (*dict*) -- Dict specifying the snapshot options. Keys (case sensitive) in here are:
  - AutomatedSnapshotStartHour (int): Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.
- **vpc\_options** (*dict*) -- Dict with the options to specify the subnets and security groups for the VPC endpoint. Keys (case sensitive) in here are:
  - SubnetIds (list): The list of subnets for the VPC endpoint.
  - SecurityGroupIds (list): The list of security groups for the VPC endpoint.
- **cognito\_options** (*dict*) -- Dict with options to specify the cognito user and identity pools for Kibana authentication. Keys (case sensitive) in here are:
  - Enabled (bool): Specifies the option to enable Cognito for Kibana authentication.
  - UserPoolId (str): Specifies the Cognito user pool ID for Kibana authentication.
  - IdentityPoolId (str): Specifies the Cognito identity pool ID for Kibana authentication.
  - RoleArn (str): Specifies the role ARN that provides Elasticsearch permissions for accessing Cognito resources.
- **encryption\_at\_rest\_options** (*dict*) -- Dict specifying the encryption at rest options. Keys (case sensitive) in here are:
  - Enabled (bool): Specifies the option to enable Encryption At Rest.
  - KmsKeyId (str): Specifies the KMS Key ID for Encryption At Rest options.
- **node\_to\_node\_encryption\_options** (*dict*) -- Dict specifying the node to node encryption options. Keys (case sensitive) in here are:

- Enabled (bool): Specify True to enable node-to-node encryption.
- **advanced\_options** (*dict*) -- Dict with option to allow references to indices in an HTTP request body. Must be False when configuring access to individual sub-resources. By default, the value is True. See <http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createupdatedomains.html#es-createdomain-configure-advanced-options> for more information.
- **log\_publishing\_options** (*dict*) -- Dict with options for various type of logs. The keys denote the type of log file and can be one of the following:
  - INDEX\_SLOW\_LOGS
  - SEARCH\_SLOW\_LOGS
  - ES\_APPLICATION\_LOGS
 The value assigned to each key is a dict with the following case sensitive keys:
  - CloudWatchLogsLogGroupArn (str): The ARN of the Cloudwatch log group to which the log needs to be published.
  - Enabled (bool): Specifies whether given log publishing option is enabled or not.
- **blocking** (*bool*) -- Whether or not to wait (block) until the Elasticsearch domain has been created.

Note: Not all instance types allow enabling encryption at rest. See <https://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/aes-supported-instance-types.html>

#### Return type

dict

#### Returns

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the domain status configuration. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

CLI Example:

```
salt myminion boto3_elasticsearch.create_elasticsearch_domain mydomain \
elasticsearch_cluster_config='{ \
  "InstanceType": "t2.micro.elasticsearch", \
  "InstanceCount": 1, \
  "DedicatedMasterEnabled": False, \
  "ZoneAwarenessEnabled": False}' \
ebs_options='{ \
  "EBSEnabled": True, \
  "VolumeType": "gp2", \
  "VolumeSize": 10, \
  "Iops": 0}' \
access_policies='{ \
  "Version": "2012-10-17", \
  "Statement": [ \
    {"Effect": "Allow", \
      "Principal": {"AWS": "*"}, \
      "Action": "es:*", \
      "Resource": "arn:aws:es:us-east-1:111111111111:domain/mydomain/*", \
```

(continues on next page)

(continued from previous page)

```
"Condition": {"IpAddress": {"aws:SourceIp": ["127.0.0.1"]}}}]' \
snapshot_options='{"AutomatedSnapshotStartHour": 0}' \
advanced_options='{"rest.action.multi.allow_explicit_index": "true"}'
```

```
salt.modules.boto3_elasticsearch.delete_elasticsearch_domain(domain_name,
                                                            blocking=False,
                                                            region=None, key=None,
                                                            keyid=None,
                                                            profile=None)
```

Permanently deletes the specified Elasticsearch domain and all of its data. Once a domain is deleted, it cannot be recovered.

#### Parameters

- **domain\_name** (*str*) -- The name of the domain to delete.
- **blocking** (*bool*) -- Whether or not to wait (block) until the Elasticsearch domain has been deleted.

#### Return type

dict

#### Returns

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

```
salt.modules.boto3_elasticsearch.delete_elasticsearch_service_role(region=None,
                                                                    keyid=None,
                                                                    key=None,
                                                                    profile=None)
```

Deletes the service-linked role that Elasticsearch Service uses to manage and maintain VPC domains. Role deletion will fail if any existing VPC domains use the role. You must delete any such Elasticsearch domains before deleting the role.

#### Return type

dict

#### Returns

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

```
salt.modules.boto3_elasticsearch.describe_elasticsearch_domain(domain_name,
                                                                region=None,
                                                                keyid=None,
                                                                key=None,
                                                                profile=None)
```

Given a domain name gets its status description.

#### Parameters

- **domain\_name** (*str*) -- The name of the domain to get the status of.

#### Return type

dict

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the domain status information. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

```
salt.modules.boto3_elasticsearch.describe_elasticsearch_domain_config(domain_name,  
                                                                    re-  
                                                                    gion=None,  
                                                                    keyid=None,  
                                                                    key=None,  
                                                                    pro-  
                                                                    file=None)
```

Provides cluster configuration information about the specified Elasticsearch domain, such as the state, creation date, update version, and update date for cluster options.

**Parameters**

**domain\_name** (*str*) -- The name of the domain to describe.

**Return type**

dict

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the current configuration information. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

```
salt.modules.boto3_elasticsearch.describe_elasticsearch_domains(domain_names,  
                                                                region=None,  
                                                                keyid=None,  
                                                                key=None,  
                                                                profile=None)
```

Returns domain configuration information about the specified Elasticsearch domains, including the domain ID, domain endpoint, and domain ARN.

**Parameters**

**domain\_names** (*list*) -- List of domain names to get information for.

**Return type**

dict

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the list of domain status information. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

CLI Example:

```
salt myminion boto3_elasticsearch.describe_elasticsearch_domains '['  
↪ "domain_a", "domain_b"]'
```

`salt.modules.boto3_elasticsearch.describe_elasticsearch_instance_type_limits` (*instance\_type*, *elasticsearch\_version*, *domain\_name=None*, *region=None*, *keyid=None*, *key=None*, *profile=None*)

Describe Elasticsearch Limits for a given InstanceType and ElasticsearchVersion. When modifying existing Domain, specify the `` DomainName `` to know what Limits are supported for modifying.

#### Parameters

- **instance\_type** (*str*) -- The instance type for an Elasticsearch cluster for which Elasticsearch Limits are needed.
- **elasticsearch\_version** (*str*) -- Version of Elasticsearch for which Limits are needed.
- **domain\_name** (*str*) -- Represents the name of the Domain that we are trying to modify. This should be present only if we are querying for Elasticsearch Limits for existing domain.

#### Return type

`dict`

#### Returns

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the limits information. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

CLI Example:

```
salt myminion boto3_elasticsearch.describe_elasticsearch_instance_type_
→limits \
  instance_type=r3.8xlarge.elasticsearch \
  elasticsearch_version='6.2'
```

`salt.modules.boto3_elasticsearch.describe_reserved_elasticsearch_instance_offerings` (*reserved\_*, *re-*, *gion=None*, *keyid=None*, *key=None*, *profile=None*)

Lists available reserved Elasticsearch instance offerings.

#### Parameters

**reserved\_elasticsearch\_instance\_offering\_id** (*str*) -- The offering identifier filter value. Use this parameter to show only the available offering that matches the specified reservation identifier.

**Return type**

dict

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the list of offerings information. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

```
salt.modules.boto3_elasticsearch.describe_reserved_elasticsearch_instances(reserved_elasticsearch_  
re-  
gion=None,  
keyid=None,  
key=None,  
pro-  
file=None)
```

Returns information about reserved Elasticsearch instances for this account.

**Parameters**

**reserved\_elasticsearch\_instance\_id** (*str*) -- The reserved instance identifier filter value. Use this parameter to show only the reservation that matches the specified reserved Elasticsearch instance ID.

**Return type**

dict

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with a list of information on reserved instances. Upon failure, also contains a key 'error' with the error message as value.

**Note**

Version 1.9.174 of boto3 has a bug in that reserved\_elasticsearch\_instance\_id is considered a required argument, even though the documentation says otherwise.

New in version 3001.

```
salt.modules.boto3_elasticsearch.exists(domain_name, region=None, key=None, keyid=None,  
profile=None)
```

Given a domain name, check to see if the given domain exists.

**Parameters**

**domain\_name** (*str*) -- The name of the domain to check.

**Return type**

dict

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

```
salt.modules.boto3_elasticsearch.get_compatible_elasticsearch_versions(domain_name=None,  
re-  
gion=None,  
keyid=None,  
key=None,  
pro-  
file=None)
```

Returns a list of upgrade compatible Elastisearch versions. You can optionally pass a `domain_name` to get all upgrade compatible Elasticsearch versions for that specific domain.

**Parameters**

**domain\_name** (*str*) -- The name of an Elasticsearch domain.

**Return type**

`dict`

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with a list of compatible versions. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

```
salt.modules.boto3_elasticsearch.get_upgrade_history(domain_name, region=None,
                                                    keyid=None, key=None,
                                                    profile=None)
```

Retrieves the complete history of the last 10 upgrades that were performed on the domain.

**Parameters**

**domain\_name** (*str*) -- The name of an Elasticsearch domain. Domain names are unique across the domains owned by an account within an AWS region. Domain names start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).

**Return type**

`dict`

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with a list of upgrade histories. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

```
salt.modules.boto3_elasticsearch.get_upgrade_status(domain_name, region=None,
                                                    keyid=None, key=None, profile=None)
```

Retrieves the latest status of the last upgrade or upgrade eligibility check that was performed on the domain.

**Parameters**

**domain\_name** (*str*) -- The name of an Elasticsearch domain. Domain names are unique across the domains owned by an account within an AWS region. Domain names start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).

**Return type**

`dict`

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with upgrade status information. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

```
salt.modules.boto3_elasticsearch.list_domain_names(region=None, keyid=None, key=None,
                                                    profile=None)
```

Returns the name of all Elasticsearch domains owned by the current user's account.

**Return type**

dict

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with a list of domain names. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

```
salt.modules.boto3_elasticsearch.list_elasticsearch_instance_types(elasticsearch_version,  
do-  
main_name=None,  
region=None,  
keyid=None,  
key=None,  
profile=None)
```

List all Elasticsearch instance types that are supported for given ElasticsearchVersion.

**Parameters**

- **elasticsearch\_version** (*str*) -- Version of Elasticsearch for which list of supported elasticsearch instance types are needed.
- **domain\_name** (*str*) -- DomainName represents the name of the Domain that we are trying to modify. This should be present only if we are querying for list of available Elasticsearch instance types when modifying existing domain.

**Return type**

dict

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with a list of Elasticsearch instance types. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

```
salt.modules.boto3_elasticsearch.list_elasticsearch_versions(region=None,  
keyid=None, key=None,  
profile=None)
```

List all supported Elasticsearch versions.

**Return type**

dict

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with a list of Elasticsearch versions. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

```
salt.modules.boto3_elasticsearch.list_tags(domain_name=None, arn=None, region=None,  
key=None, keyid=None, profile=None)
```

Returns all tags for the given Elasticsearch domain.

**Return type**

dict

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with a dict of tags. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

`salt.modules.boto3_elasticsearch.purchase_reserved_elasticsearch_instance_offering` (*reserved\_elasticsearch\_instance\_offering\_name, instance\_count, region=None, keyid=None, key=None, profile=None*)

Allows you to purchase reserved Elasticsearch instances.

**Parameters**

- **reserved\_elasticsearch\_instance\_offering\_id** (*str*) -- The ID of the reserved Elasticsearch instance offering to purchase.
- **reservation\_name** (*str*) -- A customer-specified identifier to track this reservation.
- **instance\_count** (*int*) -- The number of Elasticsearch instances to reserve.

**Return type**

dict

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with purchase information. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

`salt.modules.boto3_elasticsearch.remove_tags` (*tag\_keys, domain\_name=None, arn=None, region=None, key=None, keyid=None, profile=None*)

Removes the specified set of tags from the specified Elasticsearch domain.

**Parameters**

- **tag\_keys** (*list*) -- List with tag keys you want to remove from the Elasticsearch domain.
- **domain\_name** (*str*) -- The name of the Elasticsearch domain you want to remove tags from.
- **arn** (*str*) -- The ARN of the Elasticsearch domain you want to remove tags from. Specifying this overrides `domain_name`.

**Return type**

dict

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

CLI Example:

```
salt myminion boto3_elasticsearch.remove_tags '['foo', 'bar']' domain_
↳name=my_domain
```

```
salt.modules.boto3_elasticsearch.start_elasticsearch_service_software_update(domain_name,
                                                                              re-
                                                                              gion=None,
                                                                              keyid=None,
                                                                              key=None,
                                                                              pro-
                                                                              file=None)
```

Schedules a service software update for an Amazon ES domain.

**Parameters**

**domain\_name** (*str*) -- The name of the domain that you want to update to the latest service software.

**Return type**

dict

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with service software information. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

```
salt.modules.boto3_elasticsearch.update_elasticsearch_domain_config(domain_name,
                                                                      elastic-
                                                                      search_cluster_config=None,
                                                                      ebs_options=None,
                                                                      vpc_options=None,
                                                                      ac-
                                                                      cess_policies=None,
                                                                      snap-
                                                                      shot_options=None,
                                                                      cog-
                                                                      nito_options=None,
                                                                      ad-
                                                                      vanced_options=None,
                                                                      log_publishing_options=None,
                                                                      blocking=False,
                                                                      region=None,
                                                                      key=None,
                                                                      keyid=None,
                                                                      profile=None)
```

Modifies the cluster configuration of the specified Elasticsearch domain, for example setting the instance type and the number of instances.

**Parameters**

- **domain\_name** (*str*) -- The name of the Elasticsearch domain that you are creating. Domain names are unique across the domains owned by an account within an AWS region. Domain names must start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).
- **elasticsearch\_cluster\_config** (*dict*) -- Dictionary specifying the configuration options for an Elasticsearch domain. Keys (case sensitive) in here are:
  - InstanceType (*str*): The instance type for an Elasticsearch cluster.
  - InstanceCount (*int*): The instance type for an Elasticsearch cluster.
  - DedicatedMasterEnabled (*bool*): Indicate whether a dedicated master node is enabled.
  - ZoneAwarenessEnabled (*bool*): Indicate whether zone awareness is enabled.
  - ZoneAwarenessConfig (*dict*): Specifies the zone awareness configuration for a domain when zone awareness is enabled. Keys (case sensitive) in here are:
    - \* AvailabilityZoneCount (*int*): An integer value to indicate the number of availability zones for a domain when zone awareness is enabled. This should be equal to number of subnets if VPC endpoints is enabled.
  - DedicatedMasterType (*str*): The instance type for a dedicated master node.
  - DedicatedMasterCount (*int*): Total number of dedicated master nodes, active and on standby, for the cluster.
- **ebs\_options** (*dict*) -- Dict specifying the options to enable or disable and specifying the type and size of EBS storage volumes. Keys (case sensitive) in here are:
  - EBSEnabled (*bool*): Specifies whether EBS-based storage is enabled.
  - VolumeType (*str*): Specifies the volume type for EBS-based storage.
  - VolumeSize (*int*): Integer to specify the size of an EBS volume.
  - Iops (*int*): Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).
- **snapshot\_options** (*dict*) -- Dict specifying the snapshot options. Keys (case sensitive) in here are:
  - AutomatedSnapshotStartHour (*int*): Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.
- **vpc\_options** (*dict*) -- Dict with the options to specify the subnets and security groups for the VPC endpoint. Keys (case sensitive) in here are:
  - SubnetIds (*list*): The list of subnets for the VPC endpoint.
  - SecurityGroupIds (*list*): The list of security groups for the VPC endpoint.
- **cognito\_options** (*dict*) -- Dict with options to specify the cognito user and identity pools for Kibana authentication. Keys (case sensitive) in here are:
  - Enabled (*bool*): Specifies the option to enable Cognito for Kibana authentication.
  - UserPoolId (*str*): Specifies the Cognito user pool ID for Kibana authentication.
  - IdentityPoolId (*str*): Specifies the Cognito identity pool ID for Kibana authentication.
  - RoleArn (*str*): Specifies the role ARN that provides Elasticsearch permissions for accessing Cognito resources.

- **advanced\_options** (*dict*) -- Dict with option to allow references to indices in an HTTP request body. Must be *False* when configuring access to individual sub-resources. By default, the value is *True*. See <http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createupdatedomains.html#es-createdomain-configure-advanced-options> for more information.
- **access\_policies** (*str/dict*) -- Dict or JSON string with the IAM access policy.
- **log\_publishing\_options** (*dict*) -- Dict with options for various type of logs. The keys denote the type of log file and can be one of the following:  
 INDEX\_SLOW\_LOGS, SEARCH\_SLOW\_LOGS, ES\_APPLICATION\_LOGS.  
 The value assigned to each key is a dict with the following case sensitive keys:
  - CloudWatchLogsLogGroupArn (*str*): The ARN of the Cloudwatch log group to which the log needs to be published.
  - Enabled (*bool*): Specifies whether given log publishing option is enabled or not.
- **blocking** (*bool*) -- Whether or not to wait (block) until the Elasticsearch domain has been updated.

**Return type**

dict

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the domain configuration. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

CLI Example:

```
salt myminion boto3_elasticsearch.update_elasticsearch_domain_config
→mydomain \
  elasticsearch_cluster_config='{\
    "InstanceType": "t2.micro.elasticsearch", \
    "InstanceCount": 1, \
    "DedicatedMasterEnabled": false, \
    "ZoneAwarenessEnabled": false}' \
  ebs_options='{\
    "EBSEnabled": true, \
    "VolumeType": "gp2", \
    "VolumeSize": 10, \
    "Iops": 0}' \
  access_policies='{ "Version": "2012-10-17", "Statement": [\
    { "Effect": "Allow", "Principal": {"AWS": "*"}, "Action": "es:*", \
    "Resource": "arn:aws:es:us-east-1:111111111111:domain/mydomain/*", \
    "Condition": {"IpAddress": {"aws:SourceIp": ["127.0.0.1"]}}}]}' \
  snapshot_options='{ "AutomatedSnapshotStartHour": 0}' \
  advanced_options='{ "rest.action.multi.allow_explicit_index": "true"}
```

```
salt.modules.boto3_elasticsearch.upgrade_elasticsearch_domain(domain_name,
                                                            target_version, per-
                                                            form_check_only=None,
                                                            blocking=False,
                                                            region=None,
                                                            keyid=None, key=None,
                                                            profile=None)
```

Allows you to either upgrade your domain or perform an Upgrade eligibility check to a compatible Elasticsearch version.

#### Parameters

- **domain\_name** (*str*) -- The name of an Elasticsearch domain. Domain names are unique across the domains owned by an account within an AWS region. Domain names start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).
- **target\_version** (*str*) -- The version of Elasticsearch that you intend to upgrade the domain to.
- **perform\_check\_only** (*bool*) -- This flag, when set to True, indicates that an Upgrade Eligibility Check needs to be performed. This will not actually perform the Upgrade.
- **blocking** (*bool*) -- Whether or not to wait (block) until the Elasticsearch domain has been upgraded.

#### Return type

dict

#### Returns

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the domain configuration. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

CLI Example:

```
salt myminion boto3_elasticsearch.upgrade_elasticsearch_domain mydomain \
target_version='6.7' \
perform_check_only=True
```

```
salt.modules.boto3_elasticsearch.wait_for_upgrade(domain_name, region=None, keyid=None,
                                                  key=None, profile=None)
```

Block until an upgrade-in-progress for domain name is finished.

#### Parameters

- **name** (*str*) -- The name of the domain to wait for.

#### Rtype dict

#### Returns

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

### 26.6.36 salt.modules.boto3\_route53

Execution module for Amazon Route53 written against Boto 3

New in version 2017.7.0.

#### configuration

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
→amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

A region may also be specified in the configuration:

```
route53.region: us-east-1
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
region: us-east-1
```

Note that Route53 essentially ignores all (valid) settings for 'region', since there is only one End-point (in us-east-1 if you care) and any (valid) region setting will just send you there. It is entirely safe to set it to None as well.

#### depends

boto3

```
salt.modules.boto3_route53.associate_vpc_with_hosted_zone (HostedZoneId=None,
Name=None, VPCId=None,
VPCName=None,
VPCRegion=None,
Comment=None, region=None,
key=None, keyid=None,
profile=None)
```

Associates an Amazon VPC with a private hosted zone.

To perform the association, the VPC and the private hosted zone must already exist. You can't convert a public hosted zone into a private hosted zone. If you want to associate a VPC from one AWS account with a zone from another, the AWS account owning the hosted zone must first submit a CreateVPCAssociationAuthorization (using create\_vpc\_association\_authorization() or by other means, such as the AWS console). With that done, the account owning the VPC can then call associate\_vpc\_with\_hosted\_zone() to create the association.

Note that if both sides happen to be within the same account, associate\_vpc\_with\_hosted\_zone() is enough on its own, and there is no need for the CreateVPCAssociationAuthorization step.

Also note that looking up hosted zones by name (e.g. using the Name parameter) only works within a single account - if you're associating a VPC to a zone in a different account, as outlined above, you unfortunately

MUST use the HostedZoneId parameter exclusively.

#### HostedZoneId

The unique Zone Identifier for the Hosted Zone.

#### Name

The domain name associated with the Hosted Zone(s).

#### VPCId

When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.

#### VPCName

When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.

#### VPCRegion

When working with a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you'll need to provide an explicit value for VPCRegion.

#### Comment

Any comments you want to include about the change being made.

CLI Example:

```
salt myminion boto3_route53.associate_vpc_with_hosted_zone
→ Name=example.org. VPCName=myVPC VPCRegion=us-
→east-1 Comment="Whoo-hoo! I added another VPC."
```

```
salt.modules.boto3_route53.change_resource_record_sets (HostedZoneId=None, Name=None,
PrivateZone=None,
ChangeBatch=None, region=None,
key=None, keyid=None,
profile=None)
```

See the [AWS Route53 API docs](#) as well as the [Boto3 documentation](#) for all the details...

The syntax for a ChangeBatch parameter is as follows, but note that the permutations of allowed parameters and combinations thereof are quite varied, so perusal of the above linked docs is highly recommended for any non-trivial configurations.

```
{
  "Comment": "string",
  "Changes": [
    {
      "Action": "CREATE"|"DELETE"|"UPSERT",
      "ResourceRecordSet": {
        "Name": "string",
        "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"NAPTR"|"PTR" |
→"SRV"|"SPF"|"AAAA",
        "SetIdentifier": "string",
        "Weight": 123,
        "Region": "us-east-1"|"us-east-2"|"us-west-1"|"us-west-2" |
→"ca-central-1"|"eu-west-1"|"eu-west-2"|"eu-central-1"|"ap-southeast-1" |
→"ap-southeast-2"|"ap-northeast-1"|"ap-northeast-2"|"sa-east-1"|"cn-
→north-1"|"ap-south-1",
        "GeoLocation": {
```

(continues on next page)

(continued from previous page)

```

        "ContinentCode": "string",
        "CountryCode": "string",
        "SubdivisionCode": "string"
    },
    "Failover": "PRIMARY|"SECONDARY",
    "TTL": 123,
    "ResourceRecords": [
        {
            "Value": "string"
        },
    ],
    "AliasTarget": {
        "HostedZoneId": "string",
        "DNSName": "string",
        "EvaluateTargetHealth": True|False
    },
    "HealthCheckId": "string",
    "TrafficPolicyInstanceId": "string"
    },
}
]
}

```

CLI Example:

```

foo='{
    "Name": "my-cname.example.org.",
    "TTL": 600,
    "Type": "CNAME",
    "ResourceRecords": [
        {
            "Value": "my-host.example.org"
        }
    ]
}'
foo=`echo $foo` # Remove newlines
salt myminion boto3_route53.change_resource_record_sets
↪ DomainName=example.org. keyid=A1234567890ABCDEF123
↪ key=xblahblahblah ChangeBatch="{ 'Changes': [ { 'Action':
↪ 'UPSERT', 'ResourceRecordSet': $foo } ] }"

```

`salt.modules.boto3_route53.create_hosted_zone` (*Name*, *VPCId=None*, *VPCName=None*, *VPCRegion=None*, *CallerReference=None*, *Comment=""*, *PrivateZone=False*, *DelegationSetId=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a new Route53 Hosted Zone. Returns a Python data structure with information about the newly created Hosted Zone.

**Name**

The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request.

**VPCId**

When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName. Ignored if passed for a non-private zone.

**VPCName**

When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId. Ignored if passed for a non-private zone.

**VPCRegion**

When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you'll need to provide an explicit value for this option. Ignored if passed for a non-private zone.

**CallerReference**

A unique string that identifies the request and that allows create\_hosted\_zone() calls to be retried without the risk of executing the operation twice. This is a required parameter when creating new Hosted Zones. Maximum length of 128.

**Comment**

Any comments you want to include about the hosted zone.

**PrivateZone**

Boolean - Set to True if creating a private hosted zone.

**DelegationSetId**

If you want to associate a reusable delegation set with this hosted zone, the ID that Amazon Route 53 assigned to the reusable delegation set when you created it. Note that XXX TODO create\_delegation\_set() is not yet implemented, so you'd need to manually create any delegation sets before utilizing this.

**region**

Region endpoint to connect to.

**key**

AWS key to bind with.

**keyid**

AWS keyid to bind with.

**profile**

Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.create_hosted_zone example.org.
```

**salt.modules.boto3\_route53.delete\_hosted\_zone** (*Id, region=None, key=None, keyid=None, profile=None*)

Delete a Route53 hosted zone.

CLI Example:

```
salt myminion boto3_route53.delete_hosted_zone Z1234567890
```

**salt.modules.boto3\_route53.delete\_hosted\_zone\_by\_domain** (*Name, PrivateZone=None, region=None, key=None, keyid=None, profile=None*)

Delete a Route53 hosted zone by domain name, and PrivateZone status if provided.

CLI Example:

```
salt myminion boto3_route53.delete_hosted_zone_by_domain example.org.
```

```
salt.modules.boto3_route53.disassociate_vpc_from_hosted_zone(HostedZoneId=None,
                                                             Name=None,
                                                             VPCId=None,
                                                             VPCName=None,
                                                             VPCRegion=None,
                                                             Comment=None,
                                                             region=None, key=None,
                                                             keyid=None,
                                                             profile=None)
```

Disassociates an Amazon VPC from a private hosted zone.

You can't disassociate the last VPC from a private hosted zone. You also can't convert a private hosted zone into a public hosted zone.

Note that looking up hosted zones by name (e.g. using the Name parameter) only works XXX FACTCHECK within a single AWS account - if you're disassociating a VPC in one account from a hosted zone in a different account you unfortunately MUST use the HostedZoneId parameter exclusively. XXX FIXME DOCU

#### HostedZoneId

The unique Zone Identifier for the Hosted Zone.

#### Name

The domain name associated with the Hosted Zone(s).

#### VPCId

When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.

#### VPCName

When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.

#### VPCRegion

When working with a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you'll need to provide an explicit value for VPCRegion.

#### Comment

Any comments you want to include about the change being made.

CLI Example:

```
salt myminion boto3_route53.disassociate_vpc_from_hosted_zone
→ Name=example.org. VPCName=myVPC
→ VPCRegion=us-east-1 Comment="Whoops! Don't wanna talk to this-here"
→ zone no more."
```

```
salt.modules.boto3_route53.find_hosted_zone(Id=None, Name=None, PrivateZone=None,
                                              region=None, key=None, keyid=None,
                                              profile=None)
```

Find a hosted zone with the given characteristics.

#### Id

The unique Zone Identifier for the Hosted Zone. Exclusive with Name.

#### Name

The domain name associated with the Hosted Zone. Exclusive with Id. Note this has the potential to

match more than one hosted zone (e.g. a public and a private if both exist) which will raise an error unless PrivateZone has also been passed in order split the different.

**PrivateZone**

Boolean - Set to True if searching for a private hosted zone.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.find_hosted_zone Name=salt.org.
→ profile='{ "region": "us-east-1", "keyid": "A12345678AB", "key":
→ "xblahblahblah" }'
```

**salt.modules.boto3\_route53.get\_hosted\_zone** (*Id, region=None, key=None, keyid=None, profile=None*)

Return detailed info about the given zone.

**Id**

The unique Zone Identifier for the Hosted Zone.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.get_hosted_zone Z1234567690
→ profile='{ "region": "us-east-1", "keyid": "A12345678AB", "key":
→ "xblahblahblah" }'
```

**salt.modules.boto3\_route53.get\_hosted\_zones\_by\_domain** (*Name, region=None, key=None, keyid=None, profile=None*)

Find any zones with the given domain name and return detailed info about them. Note that this can return multiple Route53 zones, since a domain name can be used in both public and private zones.

**Name**

The domain name associated with the Hosted Zone(s).

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.get_hosted_zones_by_domain salt.org.
↪     profile='{"region": "us-east-1", "keyid": "A12345678AB", "key":
↪ "xblahblahblah"}'
```

```
salt.modules.boto3_route53.get_resource_records(HostedZoneId=None, Name=None,
                                                StartRecordName=None,
                                                StartRecordType=None, PrivateZone=None,
                                                region=None, key=None, keyid=None,
                                                profile=None)
```

Get all resource records from a given zone matching the provided StartRecordName (if given) or all records in the zone (if not), optionally filtered by a specific StartRecordType. This will return any and all RRs matching, regardless of their special AWS flavors (weighted, geolocation, alias, etc.) so your code should be prepared for potentially large numbers of records back from this function - for example, if you've created a complex geolocation mapping with lots of entries all over the world providing the same server name to many different regional clients.

If you want EXACTLY ONE record to operate on, you'll need to implement any logic required to pick the specific RR you care about from those returned.

Note that if you pass in Name without providing a value for PrivateZone (either True or False), CommandExecutionError can be raised in the case of both public and private zones matching the domain. XXX FIXME DOCU

CLI Example:

```
salt myminion boto3_route53.get_records test.example.org example.org A
```

```
salt.modules.boto3_route53.list_hosted_zones(DelegationSetId=None, region=None, key=None,
                                              keyid=None, profile=None)
```

Return detailed info about all zones in the bound account.

**DelegationSetId**

If you're using reusable delegation sets and you want to list all of the hosted zones that are associated with a reusable delegation set, specify the ID of that delegation set.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.describe_hosted_zones profile=
→ '{"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}
→ '
```

**salt.modules.boto3\_route53.update\_hosted\_zone\_comment** (*Id=None, Name=None, Comment=None, PrivateZone=None, region=None, key=None, keyid=None, profile=None*)

Update the comment on an existing Route 53 hosted zone.

**Id**

The unique Zone Identifier for the Hosted Zone.

**Name**

The domain name associated with the Hosted Zone(s).

**Comment**

Any comments you want to include about the hosted zone.

**PrivateZone**

Boolean - Set to True if changing a private hosted zone.

CLI Example:

```
salt myminion boto3_route53.update_hosted_zone_comment Name=example.org.
→ Comment="This is an example comment for an example zone"
```

## 26.6.37 salt.modules.boto3\_sns

Connection module for Amazon SNS

**configuration**

This module accepts explicit sns credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
→ amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

A region may also be specified in the configuration:

```
sns.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
```

(continues on next page)

(continued from previous page)

```

key: askdjghsdfjkghWupUjasdfklkfklgjsdfjajkghs
region: us-east-1

```

**depends**

boto3

**salt.modules.boto3\_sns.create\_topic** (*Name, region=None, key=None, keyid=None, profile=None*)  
Create an SNS topic.

CLI Example:

```
salt myminion boto3_sns.create_topic mytopic region=us-east-1
```

**salt.modules.boto3\_sns.delete\_topic** (*TopicArn, region=None, key=None, keyid=None, profile=None*)  
Delete an SNS topic.

CLI Example:

```
salt myminion boto3_sns.delete_topic mytopic region=us-east-1
```

**salt.modules.boto3\_sns.describe\_topic** (*name, region=None, key=None, keyid=None, profile=None*)  
Returns details about a specific SNS topic, specified by name or ARN.

CLI Example:

```
salt my_favorite_client boto3_sns.describe_topic a_sns_topic_of_my_choice
```

**salt.modules.boto3\_sns.get\_subscription\_attributes** (*SubscriptionArn, region=None, key=None, keyid=None, profile=None*)

Returns all of the properties of a subscription.

CLI Example:

```
salt myminion boto3_sns.get_subscription_attributes somesubscription
→ region=us-west-1
```

**salt.modules.boto3\_sns.get\_topic\_attributes** (*TopicArn, region=None, key=None, keyid=None, profile=None*)

Returns all of the properties of a topic. Topic properties returned might differ based on the authorization of the user.

CLI Example:

```
salt myminion boto3_sns.get_topic_attributes someTopic region=us-west-1
```

**salt.modules.boto3\_sns.list\_subscriptions** (*region=None, key=None, keyid=None, profile=None*)  
Returns a list of the requester's topics

CLI Example:

```
salt myminion boto3_sns.list_subscriptions region=us-east-1
```

**salt.modules.boto3\_sns.list\_subscriptions\_by\_topic** (*TopicArn, region=None, key=None, keyid=None, profile=None*)

Returns a list of the subscriptions to a specific topic

CLI Example:

```
salt myminion boto3_sns.list_subscriptions_by_topic mytopic region=us-
→east-1
```

`salt.modules.boto3_sns.list_topics` (*region=None, key=None, keyid=None, profile=None*)

Returns a list of the requester's topics

CLI Example:

```
salt myminion boto3_sns.list_topics
```

`salt.modules.boto3_sns.set_subscription_attributes` (*SubscriptionArn, AttributeName, AttributeValue, region=None, key=None, keyid=None, profile=None*)

Set an attribute of a subscription to a new value.

CLI Example:

```
salt myminion boto3_sns.set_subscription_attributes someSubscription
→RawMessageDelivery jsonStringValue
```

`salt.modules.boto3_sns.set_topic_attributes` (*TopicArn, AttributeName, AttributeValue, region=None, key=None, keyid=None, profile=None*)

Set an attribute of a topic to a new value.

CLI Example:

```
salt myminion boto3_sns.set_topic_attributes someTopic DisplayName
→myDisplayNameValue
```

`salt.modules.boto3_sns.subscribe` (*TopicArn, Protocol, Endpoint, region=None, key=None, keyid=None, profile=None*)

Subscribe to a Topic.

CLI Example:

```
salt myminion boto3_sns.subscribe mytopic https https://www.example.com/
→sns-endpoint
```

`salt.modules.boto3_sns.topic_exists` (*name, region=None, key=None, keyid=None, profile=None*)

Check to see if an SNS topic exists.

CLI Example:

```
salt myminion boto3_sns.topic_exists mytopic region=us-east-1
```

`salt.modules.boto3_sns.unsubscribe` (*SubscriptionArn, region=None, key=None, keyid=None, profile=None*)

Unsubscribe a specific SubscriptionArn of a topic.

CLI Example:

```
salt myminion boto3_sns.unsubscribe my_subscription_arn region=us-east-1
```

## 26.6.38 salt.modules.boto\_apigateway

Connection module for Amazon APIGateway

New in version 2016.11.0.

### depends

- boto >= 2.8.0
- boto3 >= 1.2.1
- botocore >= 1.4.49

### configuration

This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
↪amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
apigateway.keyid: GKTADJGHEIQSXMKKRBJ08H
apigateway.key: askdjghsdfjkghWupUjasdfklkdflkjgjsdfjajkghs
```

A region may also be specified in the configuration:

```
apigateway.region: us-west-2
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkjgjsdfjajkghs
  region: us-west-2
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., describe\_apigateway) return:

```
apigateway:
- {...}
- {...}
```

or

**error:****message:** error message

`salt.modules.boto_apigateway.activate_api_deployment` (*restApiId, stageName, deploymentId, region=None, key=None, keyid=None, profile=None*)

Activates previously deployed deployment for a given stage

CLI Example:

```
salt myminion boto_apigateway.activate_api_deployent restApiId stagename
↳ deploymentId
```

`salt.modules.boto_apigateway.api_exists` (*name, description=None, region=None, key=None, keyid=None, profile=None*)

Check to see if the given Rest API Name and optionally description exists.

CLI Example:

```
salt myminion boto_apigateway.exists myapi_name
```

`salt.modules.boto_apigateway.api_model_exists` (*restApiId, modelName, region=None, key=None, keyid=None, profile=None*)

Check to see if the given modelName exists in the given restApiId

CLI Example:

```
salt myminion boto_apigateway.api_model_exists restApiId modelName
```

`salt.modules.boto_apigateway.associate_api_key_stagekeys` (*apiKey, stagekeyslist, region=None, key=None, keyid=None, profile=None*)

associate the given stagekeyslist to the given apiKey.

CLI Example:

```
salt myminion boto_apigateway.associate_stagekeys_api_key \
  api_key '["restapi id/stage name", ...]'
```

`salt.modules.boto_apigateway.attach_usage_plan_to_apis` (*plan\_id, apis, region=None, key=None, keyid=None, profile=None*)

Attaches given usage plan to each of the apis provided in a list of apiId and stage values

New in version 2017.7.0.

**apis**

a list of dictionaries, where each dictionary contains the following:

**apiId**

a string, which is the id of the created API in AWS ApiGateway

**stage**

a string, which is the stage that the created API is deployed to.

CLI Example:

```
salt myminion boto_apigateway.attach_usage_plan_to_apis plan_id='usage'
↳plan id' apis='[{"apiId": "some id 1", "stage": "some stage 1"}]'
```

`salt.modules.boto_apigateway.create_api` (*name, description, cloneFrom=None, region=None, key=None, keyid=None, profile=None*)

Create a new REST API Service with the given name

Returns {created: True} if the rest api was created and returns {created: False} if the rest api was not created.

CLI Example:

```
salt myminion boto_apigateway.create_api myapi_name api_description
```

`salt.modules.boto_apigateway.create_api_deployment` (*restApiId, stageName, stageDescription="", description="", cacheClusterEnabled=False, cacheClusterSize='0.5', variables=None, region=None, key=None, keyid=None, profile=None*)

Creates a new API deployment.

CLI Example:

```
salt myminion boto_apigateway.create_api_deployent restApiId stagename'
↳stageDescription='' \
description='' cacheClusterEnabled=True|False cacheClusterSize=0.5'
↳variables='{ "name": "value" }'
```

`salt.modules.boto_apigateway.create_api_integration` (*restApiId, resourcePath, httpMethod, integrationType, integrationHttpMethod, uri, credentials, requestParameters=None, requestTemplates=None, region=None, key=None, keyid=None, profile=None*)

Creates an integration for a given method in a given API. If integrationType is MOCK, uri and credential parameters will be ignored.

uri is in the form of (substitute APIGATEWAY\_REGION and LAMBDA\_FUNC\_ARN)  
 "arn:aws:apigateway:APIGATEWAY\_REGION:lambda:path/2015-03-31/functions/LAMBDA\_FUNC\_ARN/invocations"  
 credentials is in the form of an iam role name or role arn.

CLI Example:

```
salt myminion boto_apigateway.create_api_integration restApiId'
↳resourcePath httpMethod \
integrationType integrationHttpMethod uri'
↳credentials ['{}' ['{}']]
```

`salt.modules.boto_apigateway.create_api_integration_response` (*restApiId, resourcePath, httpMethod, statusCode, selectionPattern, responseParameters=None, responseTemplates=None, region=None, key=None, keyid=None, profile=None*)

Creates an integration response for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.create_api_integration_response restApiId
↳resourcePath httpMethod \
    statusCode selectionPattern ['{}' ['{}']]
```

```
salt.modules.boto_apigateway.create_api_key(name, description, enabled=True, stageKeys=None,
region=None, key=None, keyid=None,
profile=None)
```

Create an API key given name and description.

An optional enabled argument can be provided. If provided, the valid values are True|False. This argument defaults to True.

An optional stageKeys argument can be provided in the form of list of dictionary with 'restApiId' and 'stageName' as keys.

CLI Example:

```
salt myminion boto_apigateway.create_api_key name description
salt myminion boto_apigateway.create_api_key name description
↳enabled=False
salt myminion boto_apigateway.create_api_key name description \
    stageKeys=[{"restApiId": "id", "stageName": "stagename"}]
```

```
salt.modules.boto_apigateway.create_api_method(restApiId, resourcePath, httpMethod,
authorizationType, apiKeyRequired=False,
requestParameters=None, requestModels=None,
region=None, key=None, keyid=None,
profile=None)
```

Creates API method for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.create_api_method restApiId resourcePath,
↳httpMethod, authorizationType, \
    apiKeyRequired=False, requestParameters={'name', 'value'},
↳requestModels={'content-type', 'value'}
```

```
salt.modules.boto_apigateway.create_api_method_response(restApiId, resourcePath,
httpMethod, statusCode,
responseParameters=None,
responseModels=None,
region=None, key=None,
keyid=None, profile=None)
```

Create API method response for a method on a given resource in the given API

CLI Example:

```
salt myminion boto_apigateway.create_api_method_response restApiId
↳resourcePath httpMethod \
```

(continues on next page)

(continued from previous page)

```

statusCode responseParameters='{"name", "True|False"}'
↳responseModels='{"content-type", "model"}'

```

```

salt.modules.boto_apigateway.create_api_model(restApiId, modelName, modelDescription,
                                             schema, contentType='application/json',
                                             region=None, key=None, keyid=None,
                                             profile=None)

```

Create a new model in a given API with a given schema, currently only contentType supported is 'application/json'

CLI Example:

```

salt myminion boto_apigateway.create_api_model restApiId modelName
↳modelDescription '<schema>' 'content-type'

```

```

salt.modules.boto_apigateway.create_api_resources(restApiId, path, region=None, key=None,
                                                  keyid=None, profile=None)

```

Given rest api id, and an absolute resource path, create all the resources and return all resources in the resourcepath, returns False on failure.

CLI Example:

```

salt myminion boto_apigateway.create_api_resources myapi_id resource_path

```

```

salt.modules.boto_apigateway.create_api_stage(restApiId, stageName, deploymentId,
                                              description="", cacheClusterEnabled=False,
                                              cacheClusterSize='0.5', variables=None,
                                              region=None, key=None, keyid=None,
                                              profile=None)

```

Creates a new API stage for a given restApiId and deploymentId.

CLI Example:

```

salt myminion boto_apigateway.create_api_stage restApiId stagename
↳deploymentId \
  description='' cacheClusterEnabled=True|False cacheClusterSize='0.5'
↳variables='{"name": "value"}'

```

```

salt.modules.boto_apigateway.create_usage_plan(name, description=None, throttle=None,
                                              quota=None, region=None, key=None,
                                              keyid=None, profile=None)

```

Creates a new usage plan with throttling and quotas optionally applied

New in version 2017.7.0.

**name**

Name of the usage plan

**throttle**

A dictionary consisting of the following keys:

**rateLimit**

requests per second at steady rate, float

**burstLimit**

maximum number of requests per second, integer

**quota**

A dictionary consisting of the following keys:

**limit**

number of allowed requests per specified quota period [required if quota parameter is present]

**offset**

number of requests to be subtracted from limit at the beginning of the period [optional]

**period**

quota period, must be one of DAY, WEEK, or MONTH. [required if quota parameter is present]

CLI Example:

```
salt myminion boto_apigateway.create_usage_plan name='usage plan name'
↳throttle='{"rateLimit": 10.0, "burstLimit": 10}'
```

**salt.modules.boto\_apigateway.delete\_api** (*name, description=None, region=None, key=None, keyid=None, profile=None*)

Delete all REST API Service with the given name and an optional API description

Returns {deleted: True, count: deleted\_count} if apis were deleted, and returns {deleted: False} if error or not found.

CLI Example:

```
salt myminion boto_apigateway.delete_api myapi_name

salt myminion boto_apigateway.delete_api myapi_name description='api
↳description'
```

**salt.modules.boto\_apigateway.delete\_api\_deployment** (*restApiId, deploymentId, region=None, key=None, keyid=None, profile=None*)

Deletes API deployment for a given restApiId and deploymentID

CLI Example:

```
salt myminion boto_apigateway.delete_api_deployent restApiId deploymentId
```

**salt.modules.boto\_apigateway.delete\_api\_integration** (*restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None*)

Deletes an integration for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_integration restApiId
↳resourcePath httpMethod
```

**salt.modules.boto\_apigateway.delete\_api\_integration\_response** (*restApiId, resourcePath, httpMethod, statusCode, region=None, key=None, keyid=None, profile=None*)

Deletes an integration response for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_integration_response restApiId
↳resourcePath httpMethod statusCode
```

`salt.modules.boto_apigateway.delete_api_key` (*apiKey*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a given apiKey

CLI Example:

```
salt myminion boto_apigateway.delete_api_key apikeystring
```

`salt.modules.boto_apigateway.delete_api_method` (*restApiId*, *resourcePath*, *httpMethod*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete API method for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_method restApiId resourcePath
↳httpMethod
```

`salt.modules.boto_apigateway.delete_api_method_response` (*restApiId*, *resourcePath*, *httpMethod*, *statusCode*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete API method response for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_method_response restApiId
↳resourcePath httpMethod statusCode
```

`salt.modules.boto_apigateway.delete_api_model` (*restApiId*, *modelName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a model identified by name in a given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_model restApiId modelName
```

`salt.modules.boto_apigateway.delete_api_resources` (*restApiId*, *path*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given restApiId and an absolute resource path, delete the resources starting from the absolute resource path. If resourcepath is the root resource '/', the function will return False. Returns False on failure.

CLI Example:

```
salt myminion boto_apigateway.delete_api_resources myapi_id, resource_path
```

`salt.modules.boto_apigateway.delete_api_stage` (*restApiId*, *stageName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes stage identified by stageName from API identified by restApiId

CLI Example:

```
salt myminion boto_apigateway.delete_api_stage restApiId stageName
```

```
salt.modules.boto_apigateway.delete_usage_plan(plan_id, region=None, key=None, keyid=None,
                                                profile=None)
```

Deletes usage plan identified by `plan_id`

New in version 2017.7.0.

CLI Example:

```
salt myminion boto_apigateway.delete_usage_plan plan_id='usage plan id'
```

```
salt.modules.boto_apigateway.describe_api_deployment(restApiId, deploymentId, region=None,
                                                       key=None, keyid=None,
                                                       profile=None)
```

Get API deployment for a given `restApiId` and `deploymentId`.

CLI Example:

```
salt myminion boto_apigateway.describe_api_deployent restApiId
↳ deploymentId
```

```
salt.modules.boto_apigateway.describe_api_deployments(restApiId, region=None, key=None,
                                                         keyid=None, profile=None)
```

Gets information about the defined API Deployments. Return list of api deployments.

CLI Example:

```
salt myminion boto_apigateway.describe_api_deployments restApiId
```

```
salt.modules.boto_apigateway.describe_api_integration(restApiId, resourcePath, httpMethod,
                                                         region=None, key=None,
                                                         keyid=None, profile=None)
```

Get an integration for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_integration restApiId
↳ resourcePath httpMethod
```

```
salt.modules.boto_apigateway.describe_api_integration_response(restApiId,
                                                                resourcePath,
                                                                httpMethod,
                                                                statusCode,
                                                                region=None,
                                                                key=None,
                                                                keyid=None,
                                                                profile=None)
```

Get an integration response for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_integration_response restApiId
↳ resourcePath httpMethod statusCode
```

`salt.modules.boto_apigateway.describe_api_key` (*apiKey, region=None, key=None, keyid=None, profile=None*)

Gets info about the given api key

CLI Example:

```
salt myminion boto_apigateway.describe_api_key apigw_api_key
```

`salt.modules.boto_apigateway.describe_api_keys` (*region=None, key=None, keyid=None, profile=None*)

Gets information about the defined API Keys. Return list of apiKeys.

CLI Example:

```
salt myminion boto_apigateway.describe_api_keys
```

`salt.modules.boto_apigateway.describe_api_method` (*restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None*)

Get API method for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_method restApiId resourcePath  
→ httpMethod
```

`salt.modules.boto_apigateway.describe_api_method_response` (*restApiId, resourcePath, httpMethod, statusCode, region=None, key=None, keyid=None, profile=None*)

Get API method response for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_method_response restApiId  
→ resourcePath httpMethod statusCode
```

`salt.modules.boto_apigateway.describe_api_model` (*restApiId, modelName, flatten=True, region=None, key=None, keyid=None, profile=None*)

Get a model by name for a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_model restApiId modelName  
→ [True]
```

`salt.modules.boto_apigateway.describe_api_models` (*restApiId, region=None, key=None, keyid=None, profile=None*)

Get all models for a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_models restApiId
```

```
salt.modules.boto_apigateway.describe_api_resource(restApiId, path, region=None, key=None,
                                                    keyid=None, profile=None)
```

Given rest api id, and an absolute resource path, returns the resource id for the given path.

CLI Example:

```
salt myminion boto_apigateway.describe_api_resource myapi_id resource_path
```

```
salt.modules.boto_apigateway.describe_api_resource_method(restApiId, resourcePath,
                                                           httpMethod, region=None,
                                                           key=None, keyid=None,
                                                           profile=None)
```

Given rest api id, resource path, and http method (must be one of DELETE, GET, HEAD, OPTIONS, PATCH, POST, PUT), return the method for the api/resource path if defined. Return False if method is not defined.

CLI Example:

```
salt myminion boto_apigateway.describe_api_resource_method myapi_id
→resource_path httpmethod
```

```
salt.modules.boto_apigateway.describe_api_resources(restApiId, region=None, key=None,
                                                       keyid=None, profile=None)
```

Given rest api id, return all resources for this api.

CLI Example:

```
salt myminion boto_apigateway.describe_api_resources myapi_id
```

```
salt.modules.boto_apigateway.describe_api_stage(restApiId, stageName, region=None,
                                                    key=None, keyid=None, profile=None)
```

Get API stage for a given apiID and stage name

CLI Example:

```
salt myminion boto_apigateway.describe_api_stage restApiId stageName
```

```
salt.modules.boto_apigateway.describe_api_stages(restApiId, deploymentId, region=None,
                                                    key=None, keyid=None, profile=None)
```

Get all API stages for a given apiID and deploymentID

CLI Example:

```
salt myminion boto_apigateway.describe_api_stages restApiId deploymentId
```

```
salt.modules.boto_apigateway.describe_apis(name=None, description=None, region=None,
                                              key=None, keyid=None, profile=None)
```

Returns all rest apis in the defined region. If optional parameter name is included, returns all rest apis matching the name in the defined region.

CLI Example:

```
salt myminion boto_apigateway.describe_apis
salt myminion boto_apigateway.describe_apis name='api name'
```

(continues on next page)

(continued from previous page)

```
salt myminion boto_apigateway.describe_apis name='api name' description=
↳ 'desc str'
```

`salt.modules.boto_apigateway.describe_usage_plans` (*name=None, plan\_id=None, region=None, key=None, keyid=None, profile=None*)

Returns a list of existing usage plans, optionally filtered to match a given plan name

New in version 2017.7.0.

CLI Example:

```
salt myminion boto_apigateway.describe_usage_plans
salt myminion boto_apigateway.describe_usage_plans name='usage plan name'
salt myminion boto_apigateway.describe_usage_plans plan_id='usage plan id'
```

`salt.modules.boto_apigateway.detach_usage_plan_from_apis` (*plan\_id, apis, region=None, key=None, keyid=None, profile=None*)

Detaches given usage plan from each of the apis provided in a list of apiId and stage value

New in version 2017.7.0.

**apis**

a list of dictionaries, where each dictionary contains the following:

**apiId**

a string, which is the id of the created API in AWS ApiGateway

**stage**

a string, which is the stage that the created API is deployed to.

CLI Example:

```
salt myminion boto_apigateway.detach_usage_plan_to_apis plan_id='usage
↳ plan id' apis='[{"apiId": "some id 1", "stage": "some stage 1"}]'
```

`salt.modules.boto_apigateway.disable_api_key` (*apiKey, region=None, key=None, keyid=None, profile=None*)

disable the given apiKey.

CLI Example:

```
salt myminion boto_apigateway.enable_api_key api_key
```

`salt.modules.boto_apigateway.disassociate_api_key_stagekeys` (*apiKey, stagekeyslist, region=None, key=None, keyid=None, profile=None*)

disassociate the given stagekeyslist to the given apiKey.

CLI Example:

```
salt myminion boto_apigateway.disassociate_stagekeys_api_key \
  api_key '["restapi id/stage name", ...]'
```

`salt.modules.boto_apigateway.enable_api_key` (*apiKey, region=None, key=None, keyid=None, profile=None*)

enable the given apiKey.

CLI Example:

```
salt myminion boto_apigateway.enable_api_key api_key
```

`salt.modules.boto_apigateway.flush_api_stage_cache` (*restApiId*, *stageName*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

Flushes cache for the stage identified by stageName from API identified by restApiId

CLI Example:

```
salt myminion boto_apigateway.flush_api_stage_cache restApiId stageName
```

`salt.modules.boto_apigateway.override_api_stage_variables` (*restApiId*, *stageName*,  
*variables*, *region=None*,  
*key=None*, *keyid=None*,  
*profile=None*)

Overwrite the stage variables for the given restApiId and stage name with the given variables, variables must be in the form of a dictionary. Overwrite will always remove all the existing stage variables associated with the given restApiId and stage name, follow by the adding of all the variables specified in the variables dictionary

CLI Example:

```
salt myminion boto_apigateway.override_api_stage_variables restApiId
→stageName variables='{"name": "value"}'
```

`salt.modules.boto_apigateway.update_api_key_description` (*apiKey*, *description*, *region=None*,  
*key=None*, *keyid=None*,  
*profile=None*)

update the given apiKey with the given description.

CLI Example:

```
salt myminion boto_apigateway.update_api_key_description api_key
→description
```

`salt.modules.boto_apigateway.update_api_model_schema` (*restApiId*, *modelName*, *schema*,  
*region=None*, *key=None*, *keyid=None*,  
*profile=None*)

update the schema (in python dictionary format) for the given model in the given restApiId

CLI Example:

```
salt myminion boto_apigateway.update_api_model_schema restApiId modelName
→schema
```

`salt.modules.boto_apigateway.update_usage_plan` (*plan\_id*, *throttle=None*, *quota=None*,  
*region=None*, *key=None*, *keyid=None*,  
*profile=None*)

Updates an existing usage plan with throttling and quotas

New in version 2017.7.0.

**plan\_id**

Id of the created usage plan

**throttle**

A dictionary consisting of the following keys:

**rateLimit**

requests per second at steady rate, float

**burstLimit**

maximum number of requests per second, integer

**quota**

A dictionary consisting of the following keys:

**limit**

number of allowed requests per specified quota period [required if quota parameter is present]

**offset**

number of requests to be subtracted from limit at the beginning of the period [optional]

**period**

quota period, must be one of DAY, WEEK, or MONTH. [required if quota parameter is present]

CLI Example:

```
salt myminion boto_apigateway.update_usage_plan plan_id='usage plan id'
↳ throttle='{"rateLimit": 10.0, "burstLimit": 10}'
```

### 26.6.39 salt.modules.boto\_asg

Connection module for Amazon Autoscale Groups

New in version 2014.7.0.

**configuration**

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
↳ amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkgsh
```

A region may also be specified in the configuration:

```
asg.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkgsh
  region: us-east-1
```

**depends**  
boto

**depends**  
boto3

`salt.modules.boto_asg.create` (*name, launch\_config\_name, availability\_zones, min\_size, max\_size, desired\_capacity=None, load\_balancers=None, default\_cooldown=None, health\_check\_type=None, health\_check\_period=None, placement\_group=None, vpc\_zone\_identifier=None, tags=None, termination\_policies=None, suspended\_processes=None, scaling\_policies=None, scheduled\_actions=None, region=None, notification\_arn=None, notification\_types=None, key=None, keyid=None, profile=None*)

Create an autoscale group.

CLI Example:

```
salt myminion boto_asg.create myasg mylc ["us-east-1a", "us-east-1e"] 1
→10 load_balancers=["myelb", "myelb2"] tags=[{"key": "Name", value=
→"myasg", "propagate_at_launch": True}]'
```

`salt.modules.boto_asg.create_launch_configuration` (*name, image\_id, key\_name=None, vpc\_id=None, vpc\_name=None, security\_groups=None, user\_data=None, instance\_type='m1.small', kernel\_id=None, ramdisk\_id=None, block\_device\_mappings=None, instance\_monitoring=False, spot\_price=None, instance\_profile\_name=None, ebs\_optimized=False, associate\_public\_ip\_address=None, volume\_type=None, delete\_on\_termination=True, iops=None, use\_block\_device\_types=False, region=None, key=None, keyid=None, profile=None*)

Create a launch configuration.

CLI Example:

```
salt myminion boto_asg.create_launch_configuration mylc image_id=ami-
→0b9c9f62 key_name='mykey' security_groups=["mygroup"] instance_type=
→'c3.2xlarge'
```

`salt.modules.boto_asg.delete` (*name, force=False, region=None, key=None, keyid=None, profile=None*)

Delete an autoscale group.

CLI Example:

```
salt myminion boto_asg.delete myasg region=us-east-1
```

`salt.modules.boto_asg.delete_launch_configuration` (*name, region=None, key=None, keyid=None, profile=None*)

Delete a launch configuration.

CLI Example:

```
salt myminion boto_asg.delete_launch_configuration mylc
```

`salt.modules.boto_asg.describe_launch_configuration`(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Dump details of a given launch configuration.

CLI Example:

```
salt myminion boto_asg.describe_launch_configuration mylc
```

`salt.modules.boto_asg.enter_standby`(*name*, *instance\_ids*, *should\_decrement\_desired\_capacity=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Switch desired instances to StandBy mode

New in version 2016.11.0.

CLI Example:

```
salt-call boto_asg.enter_standby my_autoscale_group_name '["i-xxxxxx"]'
```

`salt.modules.boto_asg.exists`(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an autoscale group exists.

CLI Example:

```
salt myminion boto_asg.exists myasg region=us-east-1
```

`salt.modules.boto_asg.exit_standby`(*name*, *instance\_ids*, *should\_decrement\_desired\_capacity=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Exit desired instances from StandBy mode

New in version 2016.11.0.

CLI Example:

```
salt-call boto_asg.exit_standby my_autoscale_group_name '["i-xxxxxx"]'
```

`salt.modules.boto_asg.get_all_groups`(*region=None*, *key=None*, *keyid=None*, *profile=None*)

Return all AutoScale Groups visible in the account (as a list of `boto.ec2.autoscale.group.AutoScalingGroup`).

New in version 2016.11.0.

CLI Example:

```
salt-call boto_asg.get_all_groups region=us-east-1 --output yaml
```

`salt.modules.boto_asg.get_all_launch_configurations`(*region=None*, *key=None*, *keyid=None*, *profile=None*)

Fetch and return all Launch Configuration with details.

CLI Example:

```
salt myminion boto_asg.get_all_launch_configurations
```

`salt.modules.boto_asg.get_cloud_init_mime(cloud_init)`

Get a mime multipart encoded string from a cloud-init dict. Currently supports boothooks, scripts and cloud-config.

CLI Example:

```
salt myminion boto.get_cloud_init_mime <cloud init>
```

`salt.modules.boto_asg.get_config(name, region=None, key=None, keyid=None, profile=None)`

Get the configuration for an autoscale group.

CLI Example:

```
salt myminion boto_asg.get_config myasg region=us-east-1
```

`salt.modules.boto_asg.get_instances(name, lifecycle_state='InService', health_status='Healthy',  
attribute='private_ip_address', attributes=None, region=None,  
key=None, keyid=None, profile=None)`

return attribute of all instances in the named autoscale group.

CLI Example:

```
salt-call boto_asg.get_instances my_autoscale_group_name
```

`salt.modules.boto_asg.get_scaling_policy_arn(as_group, scaling_policy_name, region=None,  
key=None, keyid=None, profile=None)`

Return the arn for a scaling policy in a specific autoscale group or None if not found. Mainly used as a helper method for `boto_cloudwatch_alarm`, for linking alarms to scaling policies.

CLI Example:

```
salt '*' boto_asg.get_scaling_policy_arn mygroup mypolicy
```

`salt.modules.boto_asg.launch_configuration_exists(name, region=None, key=None,  
keyid=None, profile=None)`

Check for a launch configuration's existence.

CLI Example:

```
salt myminion boto_asg.launch_configuration_exists mylc
```

`salt.modules.boto_asg.list_groups(region=None, key=None, keyid=None, profile=None)`

Return all AutoScale Groups visible in the account (as a list of names).

New in version 2016.11.0.

CLI Example:

```
salt-call boto_asg.list_groups region=us-east-1
```

`salt.modules.boto_asg.list_launch_configurations(region=None, key=None, keyid=None,  
profile=None)`

List all Launch Configurations.

CLI Example:

```
salt myminion boto_asg.list_launch_configurations
```

`salt.modules.boto_asg.update`(*name, launch\_config\_name, availability\_zones, min\_size, max\_size, desired\_capacity=None, load\_balancers=None, default\_cooldown=None, health\_check\_type=None, health\_check\_period=None, placement\_group=None, vpc\_zone\_identifier=None, tags=None, termination\_policies=None, suspended\_processes=None, scaling\_policies=None, scheduled\_actions=None, notification\_arn=None, notification\_types=None, region=None, key=None, keyid=None, profile=None*)

Update an autoscale group.

CLI Example:

```
salt myminion boto_asg.update myasg mylc '["us-east-1a", "us-east-1e"]' 1x
→10 load_balancers='["myelb", "myelb2"]' tags='[{"key": "Name", value=
→"myasg", "propagate_at_launch": True}]'
```

## 26.6.40 salt.modules.boto\_cfn

Connection module for Amazon Cloud Formation

New in version 2015.5.0.

### configuration

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
→amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cfn.keyid: GKTADJGHEIQSXMKKRBJ08H
cfn.key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cfn.region: us-east-1
```

### depends

boto

`salt.modules.boto_cfn.create`(*name, template\_body=None, template\_url=None, parameters=None, notification\_arns=None, disable\_rollback=None, timeout\_in\_minutes=None, capabilities=None, tags=None, on\_failure=None, stack\_policy\_body=None, stack\_policy\_url=None, region=None, key=None, keyid=None, profile=None*)

Create a CFN stack.

CLI Example:

```
salt myminion boto_cfn.create mystack template_url='https://s3.amazonaws.
→com/bucket/template.cft' region=us-east-1
```

`salt.modules.boto_cfn.delete`(*name, region=None, key=None, keyid=None, profile=None*)

Delete a CFN stack.

CLI Example:

```
salt myminion boto_cfn.delete mystack region=us-east-1
```

`salt.modules.boto_cfn.describe`(*name, region=None, key=None, keyid=None, profile=None*)

Describe a stack.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_cfn.describe mystack region=us-east-1
```

`salt.modules.boto_cfn.exists`(*name, region=None, key=None, keyid=None, profile=None*)

Check to see if a stack exists.

CLI Example:

```
salt myminion boto_cfn.exists mystack region=us-east-1
```

`salt.modules.boto_cfn.get_template`(*name, region=None, key=None, keyid=None, profile=None*)

Check to see if attributes are set on a CFN stack.

CLI Example:

```
salt myminion boto_cfn.get_template mystack
```

`salt.modules.boto_cfn.update_stack`(*name, template\_body=None, template\_url=None, parameters=None, notification\_arns=None, disable\_rollback=False, timeout\_in\_minutes=None, capabilities=None, tags=None, use\_previous\_template=None, stack\_policy\_during\_update\_body=None, stack\_policy\_during\_update\_url=None, stack\_policy\_body=None, stack\_policy\_url=None, region=None, key=None, keyid=None, profile=None*)

Update a CFN stack.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_cfn.update_stack mystack template_url='https://s3.
↳amazonaws.com/bucket/template.cft' region=us-east-1
```

`salt.modules.boto_cfn.validate_template`(*template\_body=None, template\_url=None, region=None, key=None, keyid=None, profile=None*)

Validate cloudformation template

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_cfn.validate_template mystack-template
```

## 26.6.41 salt.modules.boto\_cloudfront

Connection module for Amazon CloudFront

New in version 2018.3.0.

### depends

boto3

### configuration

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles or it can read them from the `~/.aws/credentials` file or from these environment variables: `AWS_ACCESS_KEY_ID`, `AWS_SECRET_ACCESS_KEY`. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

```
http://boto3.readthedocs.io/en/latest/guide/configuration.html#guide-configuration
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudfront.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudfront.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cloudfront.region: us-east-1
```

If a region is not specified, the default is `us-east-1`.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

`salt.modules.boto_cloudfront.create_distribution` (*name, config, tags=None, region=None, key=None, keyid=None, profile=None*)

Create a CloudFront distribution with the given name, config, and (optionally) tags.

### name

Name for the CloudFront distribution

### config

Configuration for the distribution

### tags

Tags to associate with the distribution

### region

Region to connect to

### key

Secret key to use

**keyid**

Access key to use

**profile**

A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.

CLI Example:

```
salt myminion boto_cloudfront.create_distribution name=mydistribution
→profile=awsprofile config='{"Comment":"partial configuration
→","Enabled":true}'
```

**salt.modules.boto\_cloudfront.export\_distributions** (*region=None, key=None, keyid=None, profile=None*)

Get details of all CloudFront distributions. Produces results that can be used to create an SLS file.

CLI Example:

```
salt-call boto_cloudfront.export_distributions --out=txt | sed
→"s/local: //" > cloudfront_distributions.sls
```

**salt.modules.boto\_cloudfront.get\_distribution** (*name, region=None, key=None, keyid=None, profile=None*)

Get information about a CloudFront distribution (configuration, tags) with a given name.

**name**

Name of the CloudFront distribution

**region**

Region to connect to

**key**

Secret key to use

**keyid**

Access key to use

**profile**

A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.

CLI Example:

```
salt myminion boto_cloudfront.get_distribution name=mydistribution
→profile=awsprofile
```

**salt.modules.boto\_cloudfront.update\_distribution** (*name, config, tags=None, region=None, key=None, keyid=None, profile=None*)

Update the config (and optionally tags) for the CloudFront distribution with the given name.

**name**

Name of the CloudFront distribution

**config**

Configuration for the distribution

**tags**

Tags to associate with the distribution

**region**

Region to connect to

**key**

Secret key to use

**keyid**

Access key to use

**profile**

A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.

CLI Example:

```
salt myminion boto_cloudfront.update_distribution name=mydistribution
  ↳profile=awsprofile                               config='{"Comment":"partial configuration
  ↳","Enabled":true}'
```

## 26.6.42 salt.modules.boto\_cloudtrail

Connection module for Amazon CloudTrail

New in version 2016.3.0.

**depends**

- boto
- boto3

The dependencies listed above can be installed via package or pip.

**configuration**

This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
  ↳amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudtrail.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudtrail.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cloudtrail.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

`salt.modules.boto_cloudtrail.add_tags` (*Name, region=None, key=None, keyid=None, profile=None, \*\*kwargs*)

Add tags to a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.

CLI Example:

```
salt myminion boto_cloudtrail.add_tags my_trail tag_a=tag_value tag_b=tag_
→value
```

`salt.modules.boto_cloudtrail.create` (*Name, S3BucketName, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=None, IsMultiRegionTrail=None, EnableLogFileValidation=None, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, region=None, key=None, keyid=None, profile=None*)

Given a valid config, create a trail.

Returns {created: true} if the trail was created and returns {created: False} if the trail was not created.

CLI Example:

```
salt myminion boto_cloudtrail.create my_trail my_bucket
```

`salt.modules.boto_cloudtrail.delete` (*Name, region=None, key=None, keyid=None, profile=None*)

Given a trail name, delete it.

Returns {deleted: true} if the trail was deleted and returns {deleted: false} if the trail was not deleted.

CLI Example:

```
salt myminion boto_cloudtrail.delete mytrail
```

`salt.modules.boto_cloudtrail.describe` (*Name, region=None, key=None, keyid=None, profile=None*)

Given a trail name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_cloudtrail.describe mytrail
```

`salt.modules.boto_cloudtrail.exists` (*Name, region=None, key=None, keyid=None, profile=None*)

Given a trail name, check to see if the given trail exists.

Returns True if the given trail exists and returns False if the given trail does not exist.

CLI Example:

```
salt myminion boto_cloudtrail.exists mytrail
```

`salt.modules.boto_cloudtrail.list` (*region=None, key=None, keyid=None, profile=None*)

List all trails

Returns list of trails

CLI Example:

**policies:**

- {...}
- {...}

`salt.modules.boto_cloudtrail.list_tags` (*Name, region=None, key=None, keyid=None, profile=None*)

List tags of a trail

**Returns**

- {...}
- {...}

**Return type**

tags

CLI Example:

```
salt myminion boto_cloudtrail.list_tags my_trail
```

`salt.modules.boto_cloudtrail.remove_tags` (*Name, region=None, key=None, keyid=None, profile=None, \*\*kwargs*)

Remove tags from a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.

CLI Example:

```
salt myminion boto_cloudtrail.remove_tags my_trail tag_a=tag_value tag_
→b=tag_value
```

`salt.modules.boto_cloudtrail.start_logging` (*Name, region=None, key=None, keyid=None, profile=None*)

Start logging for a trail

Returns {started: true} if the trail was started and returns {started: False} if the trail was not started.

CLI Example:

```
salt myminion boto_cloudtrail.start_logging my_trail
```

`salt.modules.boto_cloudtrail.status` (*Name, region=None, key=None, keyid=None, profile=None*)

Given a trail name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_cloudtrail.describe mytrail
```

`salt.modules.boto_cloudtrail.stop_logging` (*Name, region=None, key=None, keyid=None, profile=None*)

Stop logging for a trail

Returns {stopped: true} if the trail was stopped and returns {stopped: False} if the trail was not stopped.

CLI Example:

```
salt myminion boto_cloudtrail.stop_logging my_trail
```

`salt.modules.boto_cloudtrail.update` (*Name, S3BucketName, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=None, IsMultiRegionTrail=None, EnableLogFileValidation=None, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update a trail.

Returns {created: true} if the trail was created and returns {created: False} if the trail was not created.

CLI Example:

```
salt myminion boto_cloudtrail.update my_trail my_bucket
```

### 26.6.43 salt.modules.boto\_cloudwatch

Connection module for Amazon CloudWatch

New in version 2014.7.0.

#### configuration

This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
↪amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch.key: askdjghsdfjkghWupUjasdfklkdflkjdfjajkghs
```

A region may also be specified in the configuration:

```
cloudwatch.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkdflkjdfjajkghs
region: us-east-1
```

#### depends

boto

`salt.modules.boto_cloudwatch.convert_to_arn` (*arns, region=None, key=None, keyid=None, profile=None*)

Convert a list of strings into actual arns. Converts convenience names such as 'scaling\_policy:...'

CLI Example:

```
salt '*' convert_to_arn 'scaling_policy:'
```

```
salt.modules.boto_cloudwatch.create_or_update_alarm(connection=None, name=None,
                                                    metric=None, namespace=None,
                                                    statistic=None, comparison=None,
                                                    threshold=None, period=None,
                                                    evaluation_periods=None, unit=None,
                                                    description="", dimensions=None,
                                                    alarm_actions=None,
                                                    insufficient_data_actions=None,
                                                    ok_actions=None, region=None,
                                                    key=None, keyid=None, profile=None)
```

Create or update a cloudwatch alarm.

Params are the same as:

<https://boto.readthedocs.io/en/latest/ref/cloudwatch.html#boto.ec2.cloudwatch.alarm.MetricAlarm>.

Dimensions must be a dict. If the value of Dimensions is a string, it will be json decoded to produce a dict. `alarm_actions`, `insufficient_data_actions`, and `ok_actions` must be lists of string. If the passed-in value is a string, it will be split on “,” to produce a list. The strings themselves for `alarm_actions`, `insufficient_data_actions`, and `ok_actions` must be Amazon resource names (ARN's); however, this method also supports an arn lookup notation, as follows:

```
arn:aws:.... ARN as per http://docs.aws.amazon.com/general/latest/gr/aws-arns-and-
namespaces.html scaling_policy:<as_name>:<scaling_policy_name> The named autoscale
group scaling policy, for the named group (e.g. scaling_policy:my-asg:ScaleDown)
```

This is convenient for setting up autoscaling as follows. First specify a `boto_asg.present` state for an ASG with `scaling_policies`, and then set up `boto_cloudwatch_alarm.present` states which have `alarm_actions` that reference the `scaling_policy`.

CLI Example:

```
salt myminion boto_cloudwatch.create_alarm name=myalarm ... region=us-
→east-1
```

```
salt.modules.boto_cloudwatch.delete_alarm(name, region=None, key=None, keyid=None,
                                           profile=None)
```

Delete a cloudwatch alarm

CLI example to delete a queue:

```
salt myminion boto_cloudwatch.delete_alarm myalarm region=us-east-1
```

```
salt.modules.boto_cloudwatch.get_alarm(name, region=None, key=None, keyid=None, profile=None)
Get alarm details. Also can be used to check to see if an alarm exists.
```

CLI Example:

```
salt myminion boto_cloudwatch.get_alarm myalarm region=us-east-1
```

```
salt.modules.boto_cloudwatch.get_all_alarms(region=None, prefix=None, key=None, keyid=None,
                                              profile=None)
```

Get all alarm details. Produces results that can be used to create an sls file.

If prefix parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

1. **Make a "backup" of all existing alarms**  
`$ salt-call boto_cloudwatch.get_all_alarms --out=txt | sed "s/local: //" > legacy_alarms.sls`
2. **Get all alarms with new prefixed names**  
`$ salt-call boto_cloudwatch.get_all_alarms "prefix="**MANAGED BY SALT**" --out=txt | sed "s/local: //" > managed_alarms.sls`
3. **Insert the managed alarms into cloudwatch**  
`$ salt-call state.template managed_alarms.sls`
4. Manually verify that the new alarms look right
5. Delete the original alarms `$ sed s/present/absent/ legacy_alarms.sls > remove_legacy_alarms.sls $ salt-call state.template remove_legacy_alarms.sls`
6. Get all alarms again, verify no changes `$ salt-call boto_cloudwatch.get_all_alarms --out=txt | sed "s/local: //" > final_alarms.sls $ diff final_alarms.sls managed_alarms.sls`

CLI Example:

```
salt myminion boto_cloudwatch.get_all_alarms region=us-east-1 --out=txt
```

## 26.6.44 salt.modules.boto\_cloudwatch\_event

Connection module for Amazon CloudWatch Events

New in version 2016.11.0.

### configuration

This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch_event.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch_event.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cloudwatch_event.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

**depends**  
boto3

`salt.modules.boto_cloudwatch_event.create_or_update` (*Name, ScheduleExpression=None, EventPattern=None, Description=None, RoleArn=None, State=None, region=None, key=None, keyid=None, profile=None*)

Given a valid config, create an event rule.

Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.

CLI Example:

```
salt myminion boto_cloudwatch_event.create_or_update my_rule
```

`salt.modules.boto_cloudwatch_event.delete` (*Name, region=None, key=None, keyid=None, profile=None*)

Given a rule name, delete it.

Returns {deleted: true} if the rule was deleted and returns {deleted: false} if the rule was not deleted.

CLI Example:

```
salt myminion boto_cloudwatch_event.delete myrule
```

`salt.modules.boto_cloudwatch_event.describe` (*Name, region=None, key=None, keyid=None, profile=None*)

Given a rule name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_cloudwatch_event.describe myrule
```

`salt.modules.boto_cloudwatch_event.exists` (*Name, region=None, key=None, keyid=None, profile=None*)

Given a rule name, check to see if the given rule exists.

Returns True if the given rule exists and returns False if the given rule does not exist.

CLI Example:

```
salt myminion boto_cloudwatch_event.exists myevent region=us-east-1
```

`salt.modules.boto_cloudwatch_event.list_rules` (*region=None, key=None, keyid=None, profile=None*)

List, with details, all Cloudwatch Event rules visible in the current scope.

CLI Example:

```
salt myminion boto_cloudwatch_event.list_rules region=us-east-1
```

`salt.modules.boto_cloudwatch_event.list_targets` (*Rule, region=None, key=None, keyid=None, profile=None*)

Given a rule name list the targets of that rule.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_cloudwatch_event.list_targets myrule
```

`salt.modules.boto_cloudwatch_event.put_targets` (*Rule, Targets, region=None, key=None, keyid=None, profile=None*)

Add the given targets to the given rule

Returns a dictionary describing any failures.

CLI Example:

```
salt myminion boto_cloudwatch_event.put_targets myrule [{'Id': 'target1',
↳ 'Arn': 'arn:***'}]
```

`salt.modules.boto_cloudwatch_event.remove_targets` (*Rule, Ids, region=None, key=None, keyid=None, profile=None*)

Given a rule name remove the named targets from the target list

Returns a dictionary describing any failures.

CLI Example:

```
salt myminion boto_cloudwatch_event.remove_targets myrule ['Target1']
```

## 26.6.45 salt.modules.boto\_cognitoidentity

Connection module for Amazon CognitoIdentity

New in version 2016.11.0.

### configuration

This module accepts explicit CognitoIdentity credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
↳ amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cognitoidentity.keyid: GKTADJGHEIQSXMKKRBJ08H
cognitoidentity.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkgsh
```

A region may also be specified in the configuration:

```
cognitoidentity.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkgsh
  region: us-east-1
```

Changed in version 2015.8.0: All methods now return a dictionary. Create, delete, set, and update methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., *describe\_identity\_pools*) return:

```
identity_pools:
- {...}
- {...}
```

or

```
error:
  message: error message
```

**depends**  
boto3

`salt.modules.boto_cognitoidentity.create_identity_pool` (*IdentityPoolName*, *AllowUnauthenticatedIdentities=False*, *SupportedLoginProviders=None*, *DeveloperProviderName=None*, *OpenIdConnectProviderARNs=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Creates a new identity pool. All parameters except for *IdentityPoolName* is optional. *SupportedLoginProviders* should be a dictionary mapping provider names to provider app IDs. *OpenIdConnectProviderARNs* should be a list of OpenID Connect provider ARNs.

Returns the created identity pool if successful

CLI Example:

```
salt myminion boto_cognitoidentity.create_identity_pool my_id_pool_name ❌
  ↪ DeveloperProviderName=custom_developer_
  ↪ provider
```

`salt.modules.boto_cognitoidentity.delete_identity_pools` (*IdentityPoolName*, *IdentityPoolId=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given an identity pool name, (optionally if an identity pool id is given, the given name will be ignored)

Deletes all identity pools matching the given name, or the specific identity pool with the given identity pool id.

CLI Example:

```
salt myminion boto_cognitoidentity.delete_identity_pools my_id_pool_name
salt myminion boto_cognitoidentity.delete_identity_pools ''
→IdentityPoolId=my_id_pool_id
```

`salt.modules.boto_cognitoidentity.describe_identity_pools` (*IdentityPoolName*,  
*IdentityPoolId=None*,  
*region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Given an identity pool name, (optionally if an identity pool id is given, the given name will be ignored)

Returns a list of matched identity pool name's pool properties

CLI Example:

```
salt myminion boto_cognitoidentity.describe_identity_pools my_id_pool_name
salt myminion boto_cognitoidentity.describe_identity_pools ''
→IdentityPoolId=my_id_pool_id
```

`salt.modules.boto_cognitoidentity.get_identity_pool_roles` (*IdentityPoolName*,  
*IdentityPoolId=None*,  
*region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Given an identity pool name, (optionally if an identity pool id if given, the given name will be ignored)

Returns a list of matched identity pool name's associated roles

CLI Example:

```
salt myminion boto_cognitoidentity.get_identity_pool_roles my_id_pool_name
salt myminion boto_cognitoidentity.get_identity_pool_roles ''
→IdentityPoolId=my_id_pool_id
```

`salt.modules.boto_cognitoidentity.set_identity_pool_roles` (*IdentityPoolId*,  
*AuthenticatedRole=None*,  
*UnauthenticatedRole=None*,  
*region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Given an identity pool id, set the given `AuthenticatedRole` and `UnauthenticatedRole` (the Role can be an iam arn, or a role name) If `AuthenticatedRole` or `UnauthenticatedRole` is not given, the authenticated and/or the unauthenticated role associated previously with the pool will be cleared.

Returns set True if successful, set False if unsuccessful with the associated errors.

CLI Example:

```
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_
→roles # this clears the roles
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id
→
→AuthenticatedRole=my_auth_role UnauthenticatedRole=my_unauth_
→role # this set both roles
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id
→
→AuthenticatedRole=my_auth_role # this will set the auth
→role and clear the unauth role
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id
→
→UnauthenticatedRole=my_unauth_role # this will set the
→unauth role and clear the auth role
```

`salt.modules.boto_cognitoidentity.update_identity_pool` (*IdentityPoolId*,  
*IdentityPoolName=None*, *AllowUnauthenticatedIdentities=False*,  
*SupportedLoginProviders=None*, *DeveloperProviderName=None*,  
*OpenIdConnectProviderARNs=None*, *region=None*,  
*key=None*, *keyid=None*,  
*profile=None*)

Updates the given IdentityPoolId's properties. All parameters except for IdentityPoolId, is optional. SupportedLoginProviders should be a dictionary mapping provider names to provider app IDs. OpenIdConnectProviderARNs should be a list of OpenID Connect provider ARNs.

To clear SupportedLoginProviders pass '{}'

To clear OpenIdConnectProviderARNs pass '[]'

boto3 api prevents DeveloperProviderName to be updated after it has been set for the first time.

Returns the updated identity pool if successful

CLI Example:

```
salt myminion boto_cognitoidentity.update_identity_pool my_id_pool_id my_
→id_pool_name DeveloperProviderName=custom_
→developer_provider
```

## 26.6.46 salt.modules.boto\_datapipeline

Connection module for Amazon Data Pipeline

New in version 2016.3.0.

**depends**  
 boto3

`salt.modules.boto_datapipeline.activate_pipeline` (*pipeline\_id*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Start processing pipeline tasks. This function is idempotent.

CLI Example:

```
salt myminion boto_datapipeline.activate_pipeline my_pipeline_id
```

`salt.modules.boto_datapipeline.create_pipeline` (*name*, *unique\_id*, *description=""*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

Create a new, empty pipeline. This function is idempotent.

CLI Example:

```
salt myminion boto_datapipeline.create_pipeline my_name my_unique_id
```

`salt.modules.boto_datapipeline.delete_pipeline` (*pipeline\_id*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Delete a pipeline, its pipeline definition, and its run history. This function is idempotent.

CLI Example:

```
salt myminion boto_datapipeline.delete_pipeline my_pipeline_id
```

`salt.modules.boto_datapipeline.describe_pipelines` (*pipeline\_ids*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Retrieve metadata about one or more pipelines.

CLI Example:

```
salt myminion boto_datapipeline.describe_pipelines ['my_pipeline_id']
```

`salt.modules.boto_datapipeline.get_pipeline_definition` (*pipeline\_id*, *version='latest'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get the definition of the specified pipeline.

CLI Example:

```
salt myminion boto_datapipeline.get_pipeline_definition my_pipeline_id
```

`salt.modules.boto_datapipeline.list_pipelines` (*region=None*, *key=None*, *keyid=None*, *profile=None*)

Get a list of pipeline ids and names for all pipelines.

CLI Example:

```
salt myminion boto_datapipeline.list_pipelines profile=myprofile
```

`salt.modules.boto_datapipeline.pipeline_id_from_name` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get the pipeline id, if it exists, for the given name.

CLI Example:

```
salt myminion boto_datapipeline.pipeline_id_from_name my_pipeline_name
```

`salt.modules.boto_datapipeline.put_pipeline_definition` (*pipeline\_id*, *pipeline\_objects*, *parameter\_objects=None*, *parameter\_values=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Add tasks, schedules, and preconditions to the specified pipeline. This function is idempotent and will replace an existing definition.

CLI Example:

```
salt myminion boto_datapipeline.put_pipeline_definition my_pipeline_id my_
→pipeline_objects
```

## 26.6.47 salt.modules.boto\_dynamodb

Connection module for Amazon DynamoDB

New in version 2015.5.0.

### configuration

This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
→amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjakghs
```

A region may also be specified in the configuration:

```
region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjakghs
  region: us-east-1
```

### depends

boto

`salt.modules.boto_dynamodb.create_global_secondary_index` (*table\_name, global\_index, region=None, key=None, keyid=None, profile=None*)

Creates a single global secondary index on a DynamoDB table.

CLI Example:

```
salt myminion boto_dynamodb.create_global_secondary_index table_name /
index_name
```

`salt.modules.boto_dynamodb.create_table` (*table\_name, region=None, key=None, keyid=None, profile=None, read\_capacity\_units=None, write\_capacity\_units=None, hash\_key=None, hash\_key\_data\_type=None, range\_key=None, range\_key\_data\_type=None, local\_indexes=None, global\_indexes=None*)

Creates a DynamoDB table.

CLI Example:

```
salt myminion boto_dynamodb.create_table table_name /
region=us-east-1 /
hash_key=id /
hash_key_data_type=N /
range_key=created_at /
range_key_data_type=N /
read_capacity_units=1 /
write_capacity_units=1
```

`salt.modules.boto_dynamodb.delete`(*table\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a DynamoDB table.

CLI Example:

```
salt myminion boto_dynamodb.delete table_name region=us-east-1
```

`salt.modules.boto_dynamodb.describe`(*table\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Describe a DynamoDB table.

CLI Example:

```
salt myminion boto_dynamodb.describe table_name region=us-east-1
```

`salt.modules.boto_dynamodb.exists`(*table\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if a table exists.

CLI Example:

```
salt myminion boto_dynamodb.exists table_name region=us-east-1
```

`salt.modules.boto_dynamodb.extract_index`(*index\_data*, *global\_index=False*)

Instantiates and returns an AllIndex object given a valid index configuration

CLI Example:

```
salt myminion boto_dynamodb.extract_index index
```

`salt.modules.boto_dynamodb.list_tags_of_resource`(*resource\_arn*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Returns a dictionary of all tags currently attached to a given resource.

CLI Example:

```
salt myminion boto_dynamodb.list_tags_of_resource resource_
→arn=arn:aws:dynamodb:us-east-1:012345678901:table/my-table
```

New in version 3006.0.

`salt.modules.boto_dynamodb.tag_resource`(*resource\_arn*, *tags*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Sets given tags (provided as list or dict) on the given resource.

CLI Example:

```
salt myminion boto_dynamodb.tag_resource resource_
→arn=arn:aws:dynamodb:us-east-1:012345678901:table/my-table
→ tags='{Name: my-table, Owner: Ops}'
```

New in version 3006.0.

`salt.modules.boto_dynamodb.untag_resource` (*resource\_arn, tag\_keys, region=None, key=None, keyid=None, profile=None*)

Removes given tags (provided as list) from the given resource.

CLI Example:

```
salt myminion boto_dynamodb.untag_resource resource_
→arn=arn:aws:dynamodb:us-east-1:012345678901:table/my-table
→ tag_keys='[Name, Owner]'
```

New in version 3006.0.

`salt.modules.boto_dynamodb.update` (*table\_name, throughput=None, global\_indexes=None, region=None, key=None, keyid=None, profile=None*)

Update a DynamoDB table.

CLI Example:

```
salt myminion boto_dynamodb.update table_name region=us-east-1
```

`salt.modules.boto_dynamodb.update_global_secondary_index` (*table\_name, global\_indexes, region=None, key=None, keyid=None, profile=None*)

Updates the throughput of the given global secondary indexes.

CLI Example:

```
salt myminion boto_dynamodb.update_global_secondary_index table_name /
indexes
```

## 26.6.48 salt.modules.boto\_ec2

Connection module for Amazon EC2

New in version 2015.8.0.

### configuration

This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available [here](#).

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
ec2.keyid: GKTADJGHEIQSXMKKRBJ08H
ec2.key: askdjghsdfjkghWupUjasdfklkdflkjdfjajkgghs
```

A region may also be specified in the configuration:

```
ec2.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid, and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKB08H
  key: askdjghsd fjkghWupUj asdf lkd fkl gj sdfj ajkghs
  region: us-east-1
```

**depends**  
boto

`salt.modules.boto_ec2.allocate_eip_address` (*domain=None, region=None, key=None, keyid=None, profile=None*)

Allocate a new Elastic IP address and associate it with your account.

**domain**

(string) Optional param - if set to exactly 'vpc', the address will be allocated to the VPC. The default simply maps the EIP to your account container.

**returns**

(dict) dict of 'interesting' information about the newly allocated EIP, with probably the most interesting keys being 'public\_ip'; and 'allocation\_id' iff 'domain=vpc' was passed.

CLI Example:

```
salt-call boto_ec2.allocate_eip_address domain=vpc
```

New in version 2016.3.0.

`salt.modules.boto_ec2.assign_private_ip_addresses` (*network\_interface\_name=None, network\_interface\_id=None, private\_ip\_addresses=None, secondary\_private\_ip\_address\_count=None, allow\_reassignment=False, region=None, key=None, keyid=None, profile=None*)

Assigns one or more secondary private IP addresses to a network interface.

**network\_interface\_id**

(string) - ID of the network interface to associate the IP with (exclusive with 'network\_interface\_name')

**network\_interface\_name**

(string) - Name of the network interface to associate the IP with (exclusive with 'network\_interface\_id')

**private\_ip\_addresses**

(list) - Assigns the specified IP addresses as secondary IP addresses to the network interface (exclusive with 'secondary\_private\_ip\_address\_count')

**secondary\_private\_ip\_address\_count**

(int) - The number of secondary IP addresses to assign to the network interface. (exclusive with 'private\_ip\_addresses')

**allow\_reassociation**

(bool) - Allow a currently associated EIP to be re-associated with the new instance or interface.

**returns**

(bool) - True on success, False on failure.

CLI Example:

```

salt myminion boto_ec2.assign_private_ip_addresses network_interface_
→name=my_eni private_ip_addresses=private_ip
salt myminion boto_ec2.assign_private_ip_addresses network_interface_
→name=my_eni secondary_private_ip_address_count=2

```

New in version 2017.7.0.

```

salt.modules.boto_ec2.associate_eip_address(instance_id=None, instance_name=None,
public_ip=None, allocation_id=None,
network_interface_id=None,
network_interface_name=None,
private_ip_address=None,
allow_reassociation=False, region=None, key=None,
keyid=None, profile=None)

```

Associate an Elastic IP address with a currently running instance or a network interface. This requires exactly one of either 'public\_ip' or 'allocation\_id', depending on whether you're associating a VPC address or a plain EC2 address.

**instance\_id**

(string) - ID of the instance to associate with (exclusive with 'instance\_name')

**instance\_name**

(string) - Name tag of the instance to associate with (exclusive with 'instance\_id')

**public\_ip**

(string) - Public IP address, for standard EC2 based allocations.

**allocation\_id**

(string) - Allocation ID for a VPC-based EIP.

**network\_interface\_id**

(string) - ID of the network interface to associate the EIP with

**network\_interface\_name**

(string) - Name of the network interface to associate the EIP with

**private\_ip\_address**

(string) - The primary or secondary private IP address to associate with the Elastic IP address.

**allow\_reassociation**

(bool) - Allow a currently associated EIP to be re-associated with the new instance or interface.

**returns**

(bool) - True on success, False on failure.

CLI Example:

```

salt myminion boto_ec2.associate_eip_address instance_name=bubba.ho.tep
→allocation_id=eipalloc-ef382c8a

```

New in version 2016.3.0.

```

salt.modules.boto_ec2.attach_network_interface(device_index, name=None,
network_interface_id=None,
instance_name=None, instance_id=None,
region=None, key=None, keyid=None,
profile=None)

```

Attach an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.attach_network_interface my_eni instance_name=salt-
↳master device_index=0
```

`salt.modules.boto_ec2.attach_volume` (*volume\_id, instance\_id, device, region=None, key=None, keyid=None, profile=None*)

Attach an EBS volume to an EC2 instance. ..

**volume\_id**

(string) – The ID of the EBS volume to be attached.

**instance\_id**

(string) – The ID of the EC2 instance to attach the volume to.

**device**

(string) – The device on the instance through which the volume is exposed (e.g. /dev/sdh)

**returns**

(bool) - True on success, False on failure.

CLI Example:

```
salt-call boto_ec2.attach_volume vol-12345678 i-87654321 /dev/sdh
```

`salt.modules.boto_ec2.create_image` (*ami\_name, instance\_id=None, instance\_name=None, tags=None, region=None, key=None, keyid=None, profile=None, description=None, no\_reboot=False, dry\_run=False, filters=None*)

Given instance properties that define exactly one instance, create AMI and return AMI-id.

CLI Examples:

```
salt myminion boto_ec2.create_image ami_name instance_name=myinstance
salt myminion boto_ec2.create_image another_ami_name tags={'"mytag":
↳"value"}' description='this is my ami'
```

`salt.modules.boto_ec2.create_key` (*key\_name, save\_path, region=None, key=None, keyid=None, profile=None*)

Creates a key and saves it to a given path. Returns the private key.

CLI Example:

```
salt myminion boto_ec2.create_key mykey /root/
```

`salt.modules.boto_ec2.create_network_interface` (*name, subnet\_id=None, subnet\_name=None, private\_ip\_address=None, description=None, groups=None, region=None, key=None, keyid=None, profile=None*)

Create an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.create_network_interface my_eni subnet-12345
↳description=my_eni groups=['my_group']
```

`salt.modules.boto_ec2.create_tags` (*resource\_ids*, *tags*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create new metadata tags for the specified resource ids.

New in version 2016.11.0.

**resource\_ids**

(string) or (list) – List of resource IDs. A plain string will be converted to a list of one element.

**tags**

(dict) – Dictionary of name/value pairs. To create only a tag name, pass " as the value.

**returns**

(bool) - True on success, False on failure.

CLI Example:

```
salt-call boto_ec2.create_tags vol-12345678 '{"Name": "myVolume01"}'
```

`salt.modules.boto_ec2.create_volume` (*zone\_name*, *size=None*, *snapshot\_id=None*, *volume\_type=None*, *iops=None*, *encrypted=False*, *kms\_key\_id=None*, *wait\_for\_creation=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an EBS volume to an availability zone.

**zone\_name**

(string) – The Availability zone name of the EBS volume to be created.

**size**

(int) – **The size of the new volume, in GiB. If you're creating the volume from a snapshot and don't specify a volume size, the default is the snapshot size.**

**snapshot\_id**

(string) – The snapshot ID from which the new volume will be created.

**volume\_type**

(string) - **The type of the volume. Valid volume types for AWS can be found here:**  
<http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html>

**iops**

(int) - The provisioned IOPS you want to associate with this volume.

**encrypted**

(bool) - Specifies whether the volume should be encrypted.

**kms\_key\_id**

(string) - **If encrypted is True, this KMS Key ID may be specified to encrypt volume with this key e.g.:** `arn:aws:kms:us-east-1:012345678910:key/abcd1234-a123-456a-a12b-a123b4cd56ef`

**wait\_for\_creation**

(bool) - Whether or not to wait for volume creation to complete.

**returns**

(string) - created volume id on success, error message on failure.

CLI Example:

```
salt-call boto_ec2.create_volume us-east-1a size=10
salt-call boto_ec2.create_volume us-east-1a snapshot_id=snap-0123abcd
```

`salt.modules.boto_ec2.delete_key` (*key\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a key. Always returns True

CLI Example:

```
salt myminion boto_ec2.delete_key mykey
```

`salt.modules.boto_ec2.delete_network_interface` (*name=None*, *network\_interface\_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.create_network_interface my_eni subnet-12345
→description=my_eni groups=['my_group']
```

`salt.modules.boto_ec2.delete_tags` (*resource\_ids*, *tags*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete metadata tags for the specified resource ids.

New in version 2016.11.0.

**resource\_ids**

(string) or (list) – List of resource IDs. A plain string will be converted to a list of one element.

**tags**

(dict) or (list) – Either a dictionary containing name/value pairs or a list containing just tag names.

If you pass in a dictionary, the values must match the actual tag values or the tag will not be deleted.

If you pass in a value of None for the tag value, all tags with that name will be deleted.

**returns**

(bool) - True on success, False on failure.

CLI Example:

```
salt-call boto_ec2.delete_tags vol-12345678 '{"Name": "myVolume01"}'
salt-call boto_ec2.delete_tags vol-12345678 '["Name","MountPoint"]'
```

`salt.modules.boto_ec2.delete_volume` (*volume\_id*, *instance\_id=None*, *device=None*, *force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Detach an EBS volume from an EC2 instance.

New in version 2016.11.0.

**volume\_id**

(string) – The ID of the EBS volume to be deleted.

**force**

(bool) – Forces deletion even if the device has not yet been detached from its instance.

**returns**

(bool) - True on success, False on failure.

CLI Example:

```
salt-call boto_ec2.delete_volume vol-12345678
```

`salt.modules.boto_ec2.detach_network_interface` (*name=None, network\_interface\_id=None, attachment\_id=None, force=False, region=None, key=None, keyid=None, profile=None*)

Detach an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.detach_network_interface my_eni
```

`salt.modules.boto_ec2.detach_volume` (*volume\_id, instance\_id=None, device=None, force=False, wait\_for\_detachment=False, region=None, key=None, keyid=None, profile=None*)

Detach an EBS volume from an EC2 instance.

New in version 2016.11.0.

**volume\_id**

(string) – The ID of the EBS volume to be detached.

**instance\_id**

(string) – The ID of the EC2 instance from which it will be detached.

**device**

(string) – The device on the instance through which the volume is exposed (e.g. /dev/sdh)

**force**

(bool) – Forces detachment if the previous detachment attempt did not occur cleanly.

This option can lead to data loss or a corrupted file system. Use this option only as a last resort to detach a volume from a failed instance. The instance will not have an opportunity to flush file system caches nor file system meta data. If you use this option, you must perform file system check and repair procedures.

**wait\_for\_detachment**

(bool) - Whether or not to wait for volume detachment to complete.

**returns**

(bool) - True on success, False on failure.

CLI Example:

```
salt-call boto_ec2.detach_volume vol-12345678 i-87654321
```

`salt.modules.boto_ec2.disassociate_eip_address` (*public\_ip=None, association\_id=None, region=None, key=None, keyid=None, profile=None*)

Disassociate an Elastic IP address from a currently running instance. This requires exactly one of either 'association\_id' or 'public\_ip', depending on whether you're dealing with a VPC or EC2 Classic address.

**public\_ip**

(string) – Public IP address, for EC2 Classic allocations.

**association\_id**

(string) – Association ID for a VPC-bound EIP.

**returns**

(bool) - True on success, False on failure.

CLI Example:

```
salt myminion boto_ec2.disassociate_eip_address association_id=eipassoc-
→e3ba2d16
```

New in version 2016.3.0.

**salt.modules.boto\_ec2.exists**(*instance\_id=None, name=None, tags=None, region=None, key=None, keyid=None, profile=None, in\_states=None, filters=None*)

Given an instance id, check to see if the given instance id exists.

Returns True if the given instance with the given id, name, or tags exists; otherwise, False is returned.

CLI Example:

```
salt myminion boto_ec2.exists myinstance
```

**salt.modules.boto\_ec2.find\_images**(*ami\_name=None, executable\_by=None, owners=None, image\_ids=None, tags=None, region=None, key=None, keyid=None, profile=None, return\_objs=False*)

Given image properties, find and return matching AMI ids

CLI Examples:

```
salt myminion boto_ec2.find_images tags='{"mytag": "value"}'
```

**salt.modules.boto\_ec2.find\_instances**(*instance\_id=None, name=None, tags=None, region=None, key=None, keyid=None, profile=None, return\_objs=False, in\_states=None, filters=None*)

Given instance properties, find and return matching instance ids

CLI Examples:

```
salt myminion boto_ec2.find_instances # Lists all instances
salt myminion boto_ec2.find_instances name=myinstance
salt myminion boto_ec2.find_instances tags='{"mytag": "value"}'
salt myminion boto_ec2.find_instances filters='{"vpc-id": "vpc-12345678"}'
```

**salt.modules.boto\_ec2.get\_all\_eip\_addresses**(*addresses=None, allocation\_ids=None, region=None, key=None, keyid=None, profile=None*)

Get public addresses of some, or all EIPs associated with the current account.

**addresses**

(list) - Optional list of addresses. If provided, only the addresses associated with those in the list will be returned.

**allocation\_ids**

(list) - Optional list of allocation IDs. If provided, only the addresses associated with the given allocation IDs will be returned.

**returns**

(list) - A list of the requested EIP addresses

CLI Example:

```
salt-call boto_ec2.get_all_eip_addresses
```

New in version 2016.3.0.

`salt.modules.boto_ec2.get_all_tags` (*filters=None, region=None, key=None, keyid=None, profile=None*)

Describe all tags matching the filter criteria, or all tags in the account otherwise.

New in version 2018.3.0.

#### filters

(dict) - Additional constraints on which volumes to return. Note that valid filters vary extensively depending on the resource type. When in doubt, search first without a filter and then use the returned data to help fine-tune your search. You can generally garner the resource type from its ID (e.g. `vol-XXXXXX` is a volume, `i-XXXXXX` is an instance, etc).

CLI Example:

```
salt-call boto_ec2.get_all_tags '{"tag:Name": myInstanceNameTag, resource-
→type: instance}'
```

`salt.modules.boto_ec2.get_all_volumes` (*volume\_ids=None, filters=None, return\_objs=False, region=None, key=None, keyid=None, profile=None*)

Get a list of all EBS volumes, optionally filtered by provided 'filters' param

New in version 2016.11.0.

#### volume\_ids

(list) - Optional list of `volume_ids`. If provided, only the volumes associated with those in the list will be returned.

#### filters

(dict) - Additional constraints on which volumes to return. Valid filters are:

- `attachment.attach-time` - The time stamp when the attachment initiated.
- `attachment.delete-on-termination` - Whether the volume is deleted on instance termination.
- `attachment.device` - The device name that is exposed to the instance (for example, `/dev/sda1`).
- `attachment.instance-id` - The ID of the instance the volume is attached to.
- `attachment.status` - The attachment state (`attaching` | `attached` | `detaching` | `detached`).
- `availability-zone` - The Availability Zone in which the volume was created.
- `create-time` - The time stamp when the volume was created.
- `encrypted` - The encryption status of the volume.
- `size` - The size of the volume, in GiB.
- `snapshot-id` - The snapshot from which the volume was created.
- `status` - The status of the volume (`creating` | `available` | `in-use` | `deleting` | `deleted` | `error`).
- `tag:key=value` - The key/value combination of a tag assigned to the resource.
- `volume-id` - The volume ID.
- `volume-type` - The Amazon EBS volume type. This can be `gp2` for General Purpose SSD, `io1` for Provisioned IOPS SSD, `st1` for Throughput Optimized HDD, `sc1` for Cold HDD, or `standard` for Magnetic volumes.

**return\_objs**

(bool) - Changes the return type from list of volume IDs to list of boto.ec2.volume.Volume objects

**returns**

(list) - A list of the requested values: Either the volume IDs or, if return\_objs is True, boto.ec2.volume.Volume objects.

CLI Example:

```
salt-call boto_ec2.get_all_volumes filters='{"tag:Name": "myVolume01"}'
```

`salt.modules.boto_ec2.get_attribute`(*attribute*, *instance\_name=None*, *instance\_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *filters=None*)

Get an EC2 instance attribute.

CLI Example:

```
salt myminion boto_ec2.get_attribute sourceDestCheck instance_name=my_
↳ instance
```

**Available attributes:**

- instanceType
- kernel
- ramdisk
- userData
- disableApiTermination
- instanceInitiatedShutdownBehavior
- rootDeviceName
- blockDeviceMapping
- productCodes
- sourceDestCheck
- groupSet
- ebsOptimized
- sriovNetSupport

`salt.modules.boto_ec2.get_eip_address_info`(*addresses=None*, *allocation\_ids=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get 'interesting' info about some, or all EIPs associated with the current account.

**addresses**

(list) - Optional list of addresses. If provided, only the addresses associated with those in the list will be returned.

**allocation\_ids**

(list) - Optional list of allocation IDs. If provided, only the addresses associated with the given allocation IDs will be returned.

**returns**

(list of dicts) - A list of dicts, each containing the info for one of the requested EIPs.

CLI Example:

```
salt-call boto_ec2.get_eip_address_info addresses=52.4.2.15
```

New in version 2016.3.0.

`salt.modules.boto_ec2.get_id`(*name=None, tags=None, region=None, key=None, keyid=None, profile=None, in\_states=None, filters=None*)

Given instance properties, return the instance id if it exists.

CLI Example:

```
salt myminion boto_ec2.get_id myinstance
```

`salt.modules.boto_ec2.get_key`(*key\_name, region=None, key=None, keyid=None, profile=None*)

Check to see if a key exists. Returns fingerprint and name if it does and False if it doesn't

CLI Example:

```
salt myminion boto_ec2.get_key mykey
```

`salt.modules.boto_ec2.get_keys`(*keynames=None, filters=None, region=None, key=None, keyid=None, profile=None*)

Gets all keys or filters them by name and returns a list. *keynames* (list):: A list of the names of keypairs to retrieve. If not provided, all key pairs will be returned. *filters* (dict):: Optional filters that can be used to limit the results returned. Filters are provided in the form of a dictionary consisting of filter names as the key and filter values as the value. The set of allowable filter names/values is dependent on the request being performed. Check the EC2 API guide for details.

CLI Example:

```
salt myminion boto_ec2.get_keys
```

`salt.modules.boto_ec2.get_network_interface`(*name=None, network\_interface\_id=None, region=None, key=None, keyid=None, profile=None*)

Get an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.get_network_interface name=my_eni
```

`salt.modules.boto_ec2.get_network_interface_id`(*name, region=None, key=None, keyid=None, profile=None*)

Get an Elastic Network Interface id from its name tag.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.get_network_interface_id name=my_eni
```

`salt.modules.boto_ec2.get_tags` (*instance\_id=None, keyid=None, key=None, profile=None, region=None*)

Given an `instance_id`, return a list of tags associated with that instance.

**returns**

(list) - list of tags as key/value pairs

CLI Example:

```
salt myminion boto_ec2.get_tags instance_id
```

`salt.modules.boto_ec2.get_unassociated_eip_address` (*domain='standard', region=None, key=None, keyid=None, profile=None*)

Return the first unassociated EIP

**domain**

Indicates whether the address is an EC2 address or a VPC address (standard|vpc).

CLI Example:

```
salt-call boto_ec2.get_unassociated_eip_address
```

New in version 2016.3.0.

`salt.modules.boto_ec2.get_zones` (*region=None, key=None, keyid=None, profile=None*)

Get a list of AZs for the configured region.

CLI Example:

```
salt myminion boto_ec2.get_zones
```

`salt.modules.boto_ec2.import_key` (*key\_name, public\_key\_material, region=None, key=None, keyid=None, profile=None*)

Imports the public key from an RSA key pair that you created with a third-party tool. Supported formats: - OpenSSH public key format (e.g., the format in `~/.ssh/authorized_keys`) - Base64 encoded DER format - SSH public key file format as specified in RFC4716 - DSA keys are not supported. Make sure your key generator is set up to create RSA keys. Supported lengths: 1024, 2048, and 4096.

CLI Example:

```
salt myminion boto_ec2.import mykey publickey
```

`salt.modules.boto_ec2.modify_network_interface_attribute` (*name=None, network\_interface\_id=None, attr=None, value=None, region=None, key=None, keyid=None, profile=None*)

Modify an attribute of an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.modify_network_interface_attribute my_eni
↪attr=description value='example description'
```

`salt.modules.boto_ec2.release_eip_address` (*public\_ip=None, allocation\_id=None, region=None, key=None, keyid=None, profile=None*)

Free an Elastic IP address. Pass either a public IP address to release an EC2 Classic EIP, or an AllocationId to release a VPC EIP.

**public\_ip**

(string) - The public IP address - for EC2 elastic IPs.

**allocation\_id**

(string) - The Allocation ID - for VPC elastic IPs.

**returns**

(bool) - True on success, False on failure

CLI Example:

```
salt myminion boto_ec2.release_eip_address allocation_id=eipalloc-ef382c8a
```

New in version 2016.3.0.

```
salt.modules.boto_ec2.run(image_id, name=None, tags=None, key_name=None, security_groups=None,
    user_data=None, instance_type='m1.small', placement=None, kernel_id=None,
    ramdisk_id=None, monitoring_enabled=None, vpc_id=None, vpc_name=None,
    subnet_id=None, subnet_name=None, private_ip_address=None,
    block_device_map=None, disable_api_termination=None,
    instance_initiated_shutdown_behavior=None, placement_group=None,
    client_token=None, security_group_ids=None, security_group_names=None,
    additional_info=None, tenancy=None, instance_profile_arn=None,
    instance_profile_name=None, ebs_optimized=None,
    network_interface_id=None, network_interface_name=None, region=None,
    key=None, keyid=None, profile=None, network_interfaces=None)
```

Create and start an EC2 instance.

Returns True if the instance was created; otherwise False.

CLI Example:

```
salt myminion boto_ec2.run ami-b80c2b87 name=myinstance
```

**image\_id**

(string) - The ID of the image to run.

**name**

(string) - The name of the instance.

**tags**

(dict of key: value pairs) - tags to apply to the instance.

**key\_name**

(string) - The name of the key pair with which to launch instances.

**security\_groups**

(list of strings) - The names of the EC2 classic security groups with which to associate instances

**user\_data**

(string) - The Base64-encoded MIME user data to be made available to the instance(s) in this reservation.

**instance\_type**

(string) - The type of instance to run. Note that some image types (e.g. hvm) only run on some instance types.

**placement**

(string) – The Availability Zone to launch the instance into.

**kernel\_id**

(string) – The ID of the kernel with which to launch the instances.

**ramdisk\_id**

(string) – The ID of the RAM disk with which to launch the instances.

**monitoring\_enabled**

(bool) – Enable detailed CloudWatch monitoring on the instance.

**vpc\_id**

(string) – ID of a VPC to bind the instance to. Exclusive with vpc\_name.

**vpc\_name**

(string) – Name of a VPC to bind the instance to. Exclusive with vpc\_id.

**subnet\_id**

(string) – The subnet ID within which to launch the instances for VPC.

**subnet\_name**

(string) – The name of a subnet within which to launch the instances for VPC.

**private\_ip\_address**

(string) – If you're using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g. 10.0.0.25).

**block\_device\_map**

(boto.ec2.blockdevicemapping.BlockDeviceMapping) – A BlockDeviceMapping data structure describing the EBS volumes associated with the Image. (string) – A string representation of a BlockDeviceMapping structure (dict) – A dict describing a BlockDeviceMapping structure

YAML example:

```
device-maps:
  /dev/sdb:
    ephemeral_name: ephemeral0
  /dev/sdc:
    ephemeral_name: ephemeral1
  /dev/sdd:
    ephemeral_name: ephemeral2
  /dev/sde:
    ephemeral_name: ephemeral3
  /dev/sdf:
    size: 20
    volume_type: gp2
```

**disable\_api\_termination**

(bool) – If True, the instances will be locked and will not be able to be terminated via the API.

**instance\_initiated\_shutdown\_behavior**

(string) – Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are: stop, terminate

**placement\_group**

(string) – If specified, this is the name of the placement group in which the instance(s) will be launched.

**client\_token**

(string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.

**security\_group\_ids**

(list of strings) – The ID(s) of the VPC security groups with which to associate instances.

**security\_group\_names**

(list of strings) – The name(s) of the VPC security groups with which to associate instances.

**additional\_info**

(string) – Specifies additional information to make available to the instance(s).

**tenancy**

(string) – The tenancy of the instance you want to launch. An instance with a tenancy of ‘dedicated’ runs on single-tenant hardware and can only be launched into a VPC. Valid values are: “default” or “dedicated”.  
NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.

**instance\_profile\_arn**

(string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.

**instance\_profile\_name**

(string) – The name of the IAM Instance Profile (IIP) to associate with the instances.

**ebs\_optimized**

(bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn’t available with all instance types.

**network\_interfaces**

(`boto.ec2.networkinterface.NetworkInterfaceCollection`) – A `NetworkInterfaceCollection` data structure containing the ENI specifications for the instance.

**network\_interface\_id**

(string) - ID of the network interface to attach to the instance

**network\_interface\_name**

(string) - Name of the network interface to attach to the instance

```
salt.modules.boto_ec2.set_attribute(attribute, attribute_value, instance_name=None,  
instance_id=None, region=None, key=None, keyid=None,  
profile=None, filters=None)
```

Set an EC2 instance attribute. Returns whether the operation succeeded or not.

CLI Example:

```
salt myminion boto_ec2.set_attribute sourceDestCheck False instance_  
→name=my_instance
```

**Available attributes:**

- instanceType
- kernel
- ramdisk
- userData
- disableApiTermination
- instanceInitiatedShutdownBehavior
- rootDeviceName

- blockDeviceMapping
- productCodes
- sourceDestCheck
- groupSet
- ebsOptimized
- sriovNetSupport

`salt.modules.boto_ec2.set_volumes_tags` (*tag\_maps*, *authoritative=False*, *dry\_run=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

New in version 2016.11.0.

#### `tag_maps` (list)

List of dicts of filters and tags, where 'filters' is a dict suitable for passing to the 'filters' argument of `get_all_volumes()` above, and 'tags' is a dict of tags to be set on volumes (via `create_tags/delete_tags`) as matched by the given filters. The filter syntax is extended to permit passing either a list of `volume_ids` or an `instance_name` (with `instance_name` being the Name tag of the instance to which the desired volumes are mapped). Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently with one call to this function. If filtering by instance Name, You may additionally limit the instances matched by passing in a list of desired instance states. The default set of states is ('pending', 'rebooting', 'running', 'stopping', 'stopped').

YAML example fragment:

```
- filters:
  attachment.instance_id: i-abcdef12
  tags:
    Name: dev-int-abcdef12.aws-foo.com
- filters:
  attachment.device: /dev/sdf
  tags:
    ManagedSnapshots: true
    BillingGroup: bubba.hotep@aws-foo.com
  in_states:
  - stopped
  - terminated
- filters:
  instance_name: prd-foo-01.aws-foo.com
  tags:
    Name: prd-foo-01.aws-foo.com
    BillingGroup: infra-team@aws-foo.com
- filters:
  volume_ids: [ vol-12345689, vol-abcdef12 ]
  tags:
    BillingGroup: infra-team@aws-foo.com
```

#### `authoritative` (bool)

If true, any existing tags on the matched volumes, and not explicitly requested here, will be removed.

#### `dry_run` (bool)

If true, don't change anything, just return a dictionary describing any changes which would have been applied.

**returns (dict)**

A dict describing status and any changes.

```
salt.modules.boto_ec2.terminate(instance_id=None, name=None, region=None, key=None, keyid=None,
                                profile=None, filters=None)
```

Terminate the instance described by instance\_id or name.

CLI Example:

```
salt myminion boto_ec2.terminate name=myinstance
salt myminion boto_ec2.terminate instance_id=i-a46b9f
```

```
salt.modules.boto_ec2.unassign_private_ip_addresses(network_interface_name=None,
                                                    network_interface_id=None,
                                                    private_ip_addresses=None,
                                                    region=None, key=None, keyid=None,
                                                    profile=None)
```

Unassigns one or more secondary private IP addresses from a network interface

**network\_interface\_id**

(string) - ID of the network interface to associate the IP with (exclusive with 'network\_interface\_name')

**network\_interface\_name**

(string) - Name of the network interface to associate the IP with (exclusive with 'network\_interface\_id')

**private\_ip\_addresses**

(list) - Assigns the specified IP addresses as secondary IP addresses to the network interface.

**returns**

(bool) - True on success, False on failure.

CLI Example:

```
salt myminion boto_ec2.unassign_private_ip_addresses network_interface_
→name=my_eni private_ip_addresses=private_ip
```

New in version 2017.7.0.

## 26.6.49 salt.modules.boto\_efs

Connection module for Amazon EFS

New in version 2017.7.0.

**configuration**

This module accepts explicit EFS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles or it can read them from the `~/.aws/credentials` file or from these environment variables: `AWS_ACCESS_KEY_ID`, `AWS_SECRET_ACCESS_KEY`. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

```
http://docs.aws.amazon.com/efs/latest/ug/
access-control-managing-permissions.html

http://boto3.readthedocs.io/en/latest/guide/
configuration.html#guide-configuration
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file

```
efs.keyid: GKTADJGHEIQSXMKKRBJ08H
efs.key: askd+ghsdfjkghWupU/asdf\kdfklgjsdfjajkgghs
```

A region may also be specified in the configuration

```
efs.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid, and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askd+ghsdfjkghWupU/asdf\kdfklgjsdfjajkgghs
region: us-east-1
```

### depends

boto3

```
salt.modules.boto_efs.create_file_system(name, performance_mode='generalPurpose',
                                          keyid=None, key=None, profile=None, region=None,
                                          creation_token=None, **kwargs)
```

Creates a new, empty file system.

### name

(string) - The name for the new file system

### performance\_mode

(string) - The PerformanceMode of the file system. Can be either generalPurpose or maxIO

### creation\_token

(string) - A unique name to be used as reference when creating an EFS. This will ensure idempotency. Set to name if not specified otherwise

### returns

(dict) - A dict of the data for the elastic file system

CLI Example:

```
salt 'my-minion' boto_efs.create_file_system efs-name generalPurpose
```

```
salt.modules.boto_efs.create_mount_target(filesystemid, subnetid, ipaddress=None,
                                          securitygroups=None, keyid=None, key=None,
                                          profile=None, region=None, **kwargs)
```

Creates a mount target for a file system. You can then mount the file system on EC2 instances via the mount target.

You can create one mount target in each Availability Zone in your VPC. All EC2 instances in a VPC within a given Availability Zone share a single mount target for a given file system.

If you have multiple subnets in an Availability Zone, you create a mount target in one of the subnets. EC2 instances do not need to be in the same subnet as the mount target in order to access their file system.

### filesystemid

(string) - ID of the file system for which to create the mount target.

**subnetid**

(string) - ID of the subnet to add the mount target in.

**ipaddress**

(string) - Valid IPv4 address within the address range of the specified subnet.

**securitygroups**

(list[string]) - Up to five VPC security group IDs, of the form sg-xxxxxxx. These must be for the same VPC as subnet specified.

**returns**

(dict) - A dict of the response data

CLI Example:

```
salt 'my-minion' boto_efs.create_mount_target filesystemid subnetid
```

`salt.modules.boto_efs.create_tags` (*filesystemid, tags, keyid=None, key=None, profile=None, region=None, \*\*kwargs*)

Creates or overwrites tags associated with a file system. Each tag is a key-value pair. If a tag key specified in the request already exists on the file system, this operation overwrites its value with the value provided in the request.

**filesystemid**

(string) - ID of the file system for whose tags will be modified.

**tags**

(dict) - The tags to add to the file system

CLI Example:

```
salt 'my-minion' boto_efs.create_tags
```

`salt.modules.boto_efs.delete_file_system` (*filesystemid, keyid=None, key=None, profile=None, region=None, \*\*kwargs*)

Deletes a file system, permanently severing access to its contents. Upon return, the file system no longer exists and you can't access any contents of the deleted file system. You can't delete a file system that is in use. That is, if the file system has any mount targets, you must first delete them.

**filesystemid**

(string) - ID of the file system to delete.

CLI Example:

```
salt 'my-minion' boto_efs.delete_file_system filesystemid
```

`salt.modules.boto_efs.delete_mount_target` (*mounttargetid, keyid=None, key=None, profile=None, region=None, \*\*kwargs*)

Deletes the specified mount target.

This operation forcibly breaks any mounts of the file system via the mount target that is being deleted, which might disrupt instances or applications using those mounts. To avoid applications getting cut off abruptly, you might consider unmounting any mounts of the mount target, if feasible. The operation also deletes the associated network interface. Uncommitted writes may be lost, but breaking a mount target using this operation does not corrupt the file system itself. The file system you created remains. You can mount an EC2 instance in your VPC via another mount target.

**mounttargetid**

(string) - ID of the mount target to delete

CLI Example:

```
salt 'my-minion' boto_efs.delete_mount_target mounttargetid
```

**delete\_tags**(*filesystemid, tags, keyid=None, key=None, profile=None, region=None, \*\*kwargs*)

Deletes the specified tags from a file system.

**filesystemid**

(string) - ID of the file system for whose tags will be removed.

**tags**

(list[string]) - The tag keys to delete to the file system

CLI Example:

```
salt 'my-minion' boto_efs.delete_tags
```

**get\_file\_systems**(*filesystemid=None, keyid=None, key=None, profile=None, region=None, creation\_token=None, \*\*kwargs*)

Get all EFS properties or a specific instance property if filesystemid is specified

**filesystemid**

(string) - ID of the file system to retrieve properties

**creation\_token**(string) - A unique token that identifies an EFS. If filesystem created via `create_file_system` this would either be explicitly passed in or set to name. You can limit your search with this.**returns**

(list[dict]) - list of all elastic file system properties

CLI Example:

```
salt 'my-minion' boto_efs.get_file_systems efs-id
```

**get\_mount\_targets**(*filesystemid=None, mounttargetid=None, keyid=None, key=None, profile=None, region=None, \*\*kwargs*)

Get all the EFS mount point properties for a specific filesystemid or the properties for a specific mounttargetid. One or the other must be specified

**filesystemid**(string) - ID of the file system whose mount targets to list  
Must be specified if mounttargetid is not**mounttargetid**(string) - ID of the mount target to have its properties returned  
Must be specified if filesystemid is not**returns**

(list[dict]) - list of all mount point properties

CLI Example:

```
salt 'my-minion' boto_efs.get_mount_targets
```

`salt.modules.boto_efs.get_tags` (*filesystemid*, *keyid=None*, *key=None*, *profile=None*, *region=None*, *\*\*kwargs*)

Return the tags associated with an EFS instance.

**filesystemid**

(string) - ID of the file system whose tags to list

**returns**

(list) - list of tags as key/value pairs

CLI Example:

```
salt 'my-minion' boto_efs.get_tags efs-id
```

`salt.modules.boto_efs.set_security_groups` (*mounttargetid*, *securitygroup*, *keyid=None*, *key=None*, *profile=None*, *region=None*, *\*\*kwargs*)

Modifies the set of security groups in effect for a mount target

**mounttargetid**

(string) - ID of the mount target whose security groups will be modified

**securitygroups**

(list[string]) - list of no more than 5 VPC security group IDs.

CLI Example:

```
salt 'my-minion' boto_efs.set_security_groups my-mount-target-id my-sec-
→group
```

## 26.6.50 salt.modules.boto\_elasticache

Connection module for Amazon Elasticache

New in version 2014.7.0.

**configuration**

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
→amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
elasticache.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjakghs
  region: us-east-1

```

depends  
boto

```

salt.modules.boto_elasticache.authorize_cache_security_group_ingress(name,
                                                                    ec2_security_group_name,
                                                                    ec2_security_group_owner_id,
                                                                    region=None,
                                                                    key=None,
                                                                    keyid=None,
                                                                    pro-
                                                                    file=None)

```

Authorize network ingress from an ec2 security group to a cache security group.

CLI Example:

```

salt myminion boto_elasticache.authorize_cache_security_group_ingress
→myelasticachesg myec2sg 879879

```

```

salt.modules.boto_elasticache.create(name, num_cache_nodes=None, engine=None,
                                       cache_node_type=None, replication_group_id=None,
                                       engine_version=None, cache_parameter_group_name=None,
                                       cache_subnet_group_name=None,
                                       cache_security_group_names=None,
                                       security_group_ids=None, snapshot_arns=None,
                                       preferred_availability_zone=None,
                                       preferred_maintenance_window=None, port=None,
                                       notification_topic_arn=None,
                                       auto_minor_version_upgrade=None, wait=None, region=None,
                                       key=None, keyid=None, profile=None)

```

Create a cache cluster.

CLI Example:

```

salt myminion boto_elasticache.create myelasticache 1 redis cache.t1.micro
cache_security_group_names='["myelasticachesg"]'

```

```

salt.modules.boto_elasticache.create_cache_security_group(name, description,
                                                            region=None, key=None,
                                                            keyid=None, profile=None)

```

Create a cache security group.

CLI Example:

```

salt myminion boto_elasticache.create_cache_security_group
→myelasticachesg 'My Cache Security Group'

```

```

salt.modules.boto_elasticache.create_replication_group(name, primary_cluster_id,
                                                         replication_group_description,
                                                         wait=None, region=None,
                                                         key=None, keyid=None,
                                                         profile=None)

```

Create replication group.

CLI Example:

```
salt myminion boto_elasticache.create_replication_group myelasticache
↳ myprimarycluster description
```

```
salt.modules.boto_elasticache.create_subnet_group(name, description, subnet_ids=None,
                                                    subnet_names=None, tags=None,
                                                    region=None, key=None, keyid=None,
                                                    profile=None)
```

Create an ElastiCache subnet group

CLI example to create an ElastiCache subnet group:

```
salt myminion boto_elasticache.create_subnet_group my-subnet-group
↳ "group description" subnet_ids='[subnet-12345678, subnet-87654321]
↳ ' region=us-east-1
```

```
salt.modules.boto_elasticache.delete(name, wait=False, region=None, key=None, keyid=None,
                                      profile=None)
```

Delete a cache cluster.

CLI Example:

```
salt myminion boto_elasticache.delete myelasticache
```

```
salt.modules.boto_elasticache.delete_cache_security_group(name, region=None,
                                                           key=None, keyid=None,
                                                           profile=None)
```

Delete a cache security group.

CLI Example:

```
salt myminion boto_elasticache.delete_cache_security_group
↳ myelasticachesg 'My Cache Security Group'
```

```
salt.modules.boto_elasticache.delete_replication_group(name, region=None, key=None,
                                                         keyid=None, profile=None)
```

Delete an ElastiCache replication group.

CLI Example:

```
salt myminion boto_elasticache.delete_replication_group my-replication-
↳ group region=us-east-1
```

```
salt.modules.boto_elasticache.delete_subnet_group(name, region=None, key=None,
                                                    keyid=None, profile=None)
```

Delete an ElastiCache subnet group.

CLI Example:

```
salt myminion boto_elasticache.delete_subnet_group my-subnet-group
↳ region=us-east-1
```

`salt.modules.boto_elasticache.describe_replication_group` (*name*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*,  
*parameter=None*)

Get replication group information.

CLI Example:

```
salt myminion boto_elasticache.describe_replication_group mygroup
```

`salt.modules.boto_elasticache.exists` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if a cache cluster exists.

CLI Example:

```
salt myminion boto_elasticache.exists myelasticache
```

`salt.modules.boto_elasticache.get_all_cache_subnet_groups` (*name=None*, *region=None*,  
*key=None*, *keyid=None*,  
*profile=None*)

Return a list of all cache subnet groups with details

CLI Example:

```
salt myminion boto_elasticache.get_all_subnet_groups region=us-east-1
```

`salt.modules.boto_elasticache.get_cache_subnet_group` (*name*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Get information about a cache subnet group.

CLI Example:

```
salt myminion boto_elasticache.get_cache_subnet_group mycache_subnet_group
```

`salt.modules.boto_elasticache.get_config` (*name*, *region=None*, *key=None*, *keyid=None*,  
*profile=None*)

Get the configuration for a cache cluster.

CLI Example:

```
salt myminion boto_elasticache.get_config myelasticache
```

`salt.modules.boto_elasticache.get_group_host` (*name*, *region=None*, *key=None*, *keyid=None*,  
*profile=None*)

Get hostname from replication cache group

CLI Example:

```
salt myminion boto_elasticache.get_group_host myelasticachegroup
```

`salt.modules.boto_elasticache.get_node_host` (*name*, *region=None*, *key=None*, *keyid=None*,  
*profile=None*)

Get hostname from cache node

CLI Example:

```
salt myminion boto_elasticache.get_node_host myelasticache
```

`salt.modules.boto_elasticache.group_exists` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if a replication group exists.

CLI Example:

```
salt myminion boto_elasticache.group_exists myelasticache
```

`salt.modules.boto_elasticache.list_cache_subnet_groups` (*name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return a list of all cache subnet group names

CLI Example:

```
salt myminion boto_elasticache.list_subnet_groups region=us-east-1
```

`salt.modules.boto_elasticache.revoke_cache_security_group_ingress` (*name*, *ec2\_security\_group\_name*, *ec2\_security\_group\_owner\_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Revoke network ingress from an ec2 security group to a cache security group.

CLI Example:

```
salt myminion boto_elasticache.revoke_cache_security_group_ingress
→myelasticachesg myec2sg 879879
```

`salt.modules.boto_elasticache.subnet_group_exists` (*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an ElastiCache subnet group exists.

CLI Example:

```
salt myminion boto_elasticache.subnet_group_exists my-param-group
→ region=us-east-1
```

## 26.6.51 salt.modules.boto\_elasticsearch\_domain

Connection module for Amazon Elasticsearch Service

New in version 2016.11.0.

### configuration

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
→amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
lambda.keyid: GKTADJGHEIQSXMKKRBJ08H
lambda.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
lambda.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

Create and delete methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., *describe\_function*) return:

```
domain:
  - {...}
  - {...}
```

or

```
error:
  message: error message
```

**depends**

boto3

`salt.modules.boto_elasticsearch_domain.add_tags` (*DomainName=None, ARN=None, region=None, key=None, keyid=None, profile=None, \*\*kwargs*)

Add tags to a domain

Returns {tagged: true} if the domain was tagged and returns {tagged: False} if the domain was not tagged.

CLI Example:

```
salt myminion boto_elasticsearch_domain.add_tags mydomain tag_a=tag_value
→tag_b=tag_value
```

`salt.modules.boto_elasticsearch_domain.create` (*DomainName, ElasticsearchClusterConfig=None, EBSOptions=None, AccessPolicies=None, SnapshotOptions=None, AdvancedOptions=None, region=None, key=None, keyid=None, profile=None, ElasticsearchVersion=None*)

Given a valid config, create a domain.

Returns {created: true} if the domain was created and returns {created: False} if the domain was not created.

CLI Example:

```
salt myminion boto_elasticsearch_domain.create mydomain \
  {'InstanceType': 't2.micro.elasticsearch', 'InstanceCount': 1, \
  'DedicatedMasterEnabled': false, 'ZoneAwarenessEnabled': false} \
  {'EBSEnabled': true, 'VolumeType': 'gp2', 'VolumeSize': 10, \
  'Iops': 0} \
  {"Version": "2012-10-17", "Statement": [{"Effect": "Allow",
→ "Principal": {"AWS": "*"}, "Action": "es:*", \
  "Resource": "arn:aws:es:us-east-1:111111111111:domain/mydomain/*"},
→ \
  "Condition": {"IpAddress": {"aws:SourceIp": ["127.0.0.1"]}}}] \
  {"AutomatedSnapshotStartHour": 0} \
  {"rest.action.multi.allow_explicit_index": "true"}
```

`salt.modules.boto_elasticsearch_domain.delete` (*DomainName, region=None, key=None, keyid=None, profile=None*)

Given a domain name, delete it.

Returns {deleted: true} if the domain was deleted and returns {deleted: false} if the domain was not deleted.

CLI Example:

```
salt myminion boto_elasticsearch_domain.delete mydomain
```

`salt.modules.boto_elasticsearch_domain.describe` (*DomainName, region=None, key=None, keyid=None, profile=None*)

Given a domain name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_elasticsearch_domain.describe mydomain
```

`salt.modules.boto_elasticsearch_domain.exists` (*DomainName, region=None, key=None, keyid=None, profile=None*)

Given a domain name, check to see if the given domain exists.

Returns True if the given domain exists and returns False if the given function does not exist.

CLI Example:

```
salt myminion boto_elasticsearch_domain.exists mydomain
```

`salt.modules.boto_elasticsearch_domain.list_tags` (*DomainName=None, ARN=None, region=None, key=None, keyid=None, profile=None*)

List tags of a trail

**Returns**

- {...}
- {...}

**Return type**

tags

CLI Example:

```
salt myminion boto_cloudtrail.list_tags my_trail
```

`salt.modules.boto_elasticsearch_domain.remove_tags` (*TagKeys, DomainName=None, ARN=None, region=None, key=None, keyid=None, profile=None*)

Remove tags from a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.

CLI Example:

```
salt myminion boto_cloudtrail.remove_tags my_trail tag_a=tag_value tag_
→b=tag_value
```

`salt.modules.boto_elasticsearch_domain.status` (*DomainName, region=None, key=None, keyid=None, profile=None*)

Given a domain name describe its status.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_elasticsearch_domain.status mydomain
```

`salt.modules.boto_elasticsearch_domain.update` (*DomainName, ElasticsearchClusterConfig=None, EBOptions=None, AccessPolicies=None, SnapshotOptions=None, AdvancedOptions=None, region=None, key=None, keyid=None, profile=None*)

Update the named domain to the configuration.

Returns {updated: true} if the domain was updated and returns {updated: False} if the domain was not updated.

CLI Example:

```
salt myminion boto_elasticsearch_domain.update mydomain \
  {'InstanceType': 't2.micro.elasticsearch', 'InstanceCount': 1, \
  'DedicatedMasterEnabled': false, 'ZoneAwarenessEnabled': false} \
  {'EBSEnabled': true, 'VolumeType': 'gp2', 'VolumeSize': 10, \
  'Iops': 0} \
  {"Version": "2012-10-17", "Statement": [{"Effect": "Allow",
→"Principal": {"AWS": "*"}, "Action": "es:*", \
  "Resource": "arn:aws:es:us-east-1:111111111111:domain/mydomain/*"},
→\
```

(continues on next page)

(continued from previous page)

```
"Condition": {"IpAddress": {"aws:SourceIp": ["127.0.0.1"]}}}] \
{"AutomatedSnapshotStartHour": 0} \
{"rest.action.multi.allow_explicit_index": "true"}
```

## 26.6.52 salt.modules.boto\_elb

Connection module for Amazon ELB

New in version 2014.7.0.

### configuration

This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
↪amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdfklkfgjsdfjajkghs
```

A region may also be specified in the configuration:

```
elb.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfgjsdfjajkghs
region: us-east-1
```

### depends

boto >= 2.33.0

**salt.modules.boto\_elb.apply\_security\_groups** (*name, security\_groups, region=None, key=None, keyid=None, profile=None*)

Apply security groups to ELB.

CLI Example:

```
salt myminion boto_elb.apply_security_groups myelb '["mysecgroup1"]'
```

**salt.modules.boto\_elb.attach\_subnets** (*name, subnets, region=None, key=None, keyid=None, profile=None*)

Attach ELB to subnets.

CLI Example:

```
salt myminion boto_elb.attach_subnets myelb '["mysubnet"]'
```

`salt.modules.boto_elb.create`(*name*, *availability\_zones*, *listeners*, *subnets=None*, *security\_groups=None*, *scheme='internet-facing'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an ELB

CLI example to create an ELB:

```
salt myminion boto_elb.create myelb '["us-east-1a", "us-east-1e"]' '{"elb_
↳port": 443, "elb_protocol": "HTTPS", ...}' region=us-east-1
```

`salt.modules.boto_elb.create_listeners`(*name*, *listeners*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create listeners on an ELB.

CLI Example:

```
salt myminion boto_elb.create_listeners myelb '["HTTPS", "HTTP", 443, 80,
↳ "arn:aws:iam::11 1111:server-certificate/mycert"]'
```

`salt.modules.boto_elb.create_policy`(*name*, *policy\_name*, *policy\_type*, *policy*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an ELB policy.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_elb.create_policy myelb mypolicy
↳LBCookieStickinessPolicyType '{"CookieExpirationPeriod": 3600}'
```

`salt.modules.boto_elb.delete`(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an ELB.

CLI example to delete an ELB:

```
salt myminion boto_elb.delete myelb region=us-east-1
```

`salt.modules.boto_elb.delete_listeners`(*name*, *ports*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete listeners on an ELB.

CLI Example:

```
salt myminion boto_elb.delete_listeners myelb '[80,443]'
```

`salt.modules.boto_elb.delete_policy`(*name*, *policy\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an ELB policy.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_elb.delete_policy myelb mypolicy
```

`salt.modules.boto_elb.delete_tags` (*name, tags, region=None, key=None, keyid=None, profile=None*)

Add the tags on an ELB

**name**

name of the ELB

**tags**

list of tags to remove

CLI Example:

```
salt myminion boto_elb.delete_tags my-elb-name ['TagToRemove1',
→ 'TagToRemove2']
```

`salt.modules.boto_elb.deregister_instances` (*name, instances, region=None, key=None, keyid=None, profile=None*)

Deregister instances with an ELB. Instances is either a string instance id or a list of string instance id's.

Returns:

- True: instance(s) deregistered successfully
- False: instance(s) failed to be deregistered
- None: instance(s) not valid or not registered, no action taken

CLI Example:

```
salt myminion boto_elb.deregister_instances myelb instance_id
salt myminion boto_elb.deregister_instances myelb "[instance_id, instance_
→ id]"
```

`salt.modules.boto_elb.detach_subnets` (*name, subnets, region=None, key=None, keyid=None, profile=None*)

Detach ELB from subnets.

CLI Example:

```
salt myminion boto_elb.detach_subnets myelb '["mysubnet"]'
```

`salt.modules.boto_elb.disable_availability_zones` (*name, availability\_zones, region=None, key=None, keyid=None, profile=None*)

Disable availability zones for ELB.

CLI Example:

```
salt myminion boto_elb.disable_availability_zones myelb '["us-east-1a"]'
```

`salt.modules.boto_elb.enable_availability_zones` (*name, availability\_zones, region=None, key=None, keyid=None, profile=None*)

Enable availability zones for ELB.

CLI Example:

```
salt myminion boto_elb.enable_availability_zones myelb '["us-east-1a"]'
```

`salt.modules.boto_elb.exists` (*name, region=None, key=None, keyid=None, profile=None*)

Check to see if an ELB exists.

CLI Example:

```
salt myminion boto_elb.exists myelb region=us-east-1
```

`salt.modules.boto_elb.get_all_elbs` (*region=None, key=None, keyid=None, profile=None*)

Return all load balancers associated with an account

CLI Example:

```
salt myminion boto_elb.get_all_elbs region=us-east-1
```

`salt.modules.boto_elb.get_attributes` (*name, region=None, key=None, keyid=None, profile=None*)

Check to see if attributes are set on an ELB.

CLI Example:

```
salt myminion boto_elb.get_attributes myelb
```

`salt.modules.boto_elb.get_elb_config` (*name, region=None, key=None, keyid=None, profile=None*)

Get an ELB configuration.

CLI Example:

```
salt myminion boto_elb.exists myelb region=us-east-1
```

`salt.modules.boto_elb.get_health_check` (*name, region=None, key=None, keyid=None, profile=None*)

Get the health check configured for this ELB.

CLI Example:

```
salt myminion boto_elb.get_health_check myelb
```

`salt.modules.boto_elb.get_instance_health` (*name, region=None, key=None, keyid=None, profile=None, instances=None*)

Get a list of instances and their health state

CLI Example:

```
salt myminion boto_elb.get_instance_health myelb
salt myminion boto_elb.get_instance_health myelb region=us-east-1
→instances="[instance_id,instance_id]"
```

`salt.modules.boto_elb.list_elbs` (*region=None, key=None, keyid=None, profile=None*)

Return names of all load balancers associated with an account

CLI Example:

```
salt myminion boto_elb.list_elbs region=us-east-1
```

`salt.modules.boto_elb.listener_dict_to_tuple` (*listener*)

Convert an ELB listener dict into a listener tuple used by certain parts of the AWS ELB API.

CLI Example:

```
salt myminion boto_elb.listener_dict_to_tuple '{"elb_port":80,"instance_
→port":80,"elb_protocol":"HTTP"}'
```

`salt.modules.boto_elb.register_instances` (*name, instances, region=None, key=None, keyid=None, profile=None*)

Register instances with an ELB. Instances is either a string instance id or a list of string instance id's.

Returns:

- True: instance(s) registered successfully
- False: instance(s) failed to be registered

CLI Example:

```
salt myminion boto_elb.register_instances myelb instance_id
salt myminion boto_elb.register_instances myelb "[instance_id,instance_id]
→"
```

`salt.modules.boto_elb.set_attributes` (*name, attributes, region=None, key=None, keyid=None, profile=None*)

Set attributes on an ELB.

**name (string)**

Name of the ELB instance to set attributes for

**attributes**

A dict of attributes to set.

Valid attributes are:

**access\_log (dict)**

**enabled (bool)**

Enable storage of access logs.

**s3\_bucket\_name (string)**

The name of the S3 bucket to place logs.

**s3\_bucket\_prefix (string)**

Prefix for the log file name.

**emit\_interval (int)**

Interval for storing logs in S3 in minutes. Valid values are 5 and 60.

**connection\_draining (dict)**

**enabled (bool)**

Enable connection draining.

**timeout (int)**

Maximum allowed time in seconds for sending existing connections to an instance that is deregistering or unhealthy. Default is 300.

**cross\_zone\_load\_balancing (dict)**

**enabled (bool)**

Enable cross-zone load balancing.

CLI example to set attributes on an ELB:

```
salt myminion boto_elb.set_attributes myelb '{"access_log": {"enabled":
→"true", "s3_bucket_name": "mybucket", "s3_bucket_prefix": "mylogs/",
→"emit_interval": "5"}}' region=us-east-1
```

`salt.modules.boto_elb.set_backend_policy` (*name, port, policies=None, region=None, key=None, keyid=None, profile=None*)

Set the policies of an ELB backend server.

CLI Example:

```
salt myminion boto_elb.set_backend_policy myelb 443 "[policy1,policy2]"
```

`salt.modules.boto_elb.set_health_check` (*name, health\_check, region=None, key=None, keyid=None, profile=None*)

Set attributes on an ELB.

CLI example to set attributes on an ELB:

```
salt myminion boto_elb.set_health_check myelb '{"target": "HTTP:80/"}'
```

`salt.modules.boto_elb.set_instances` (*name, instances, test=False, region=None, key=None, keyid=None, profile=None*)

Set the instances assigned to an ELB to exactly the list given

CLI Example:

```
salt myminion boto_elb.set_instances myelb region=us-east-1 instances=
→ "[instance_id,instance_id]"
```

`salt.modules.boto_elb.set_listener_policy` (*name, port, policies=None, region=None, key=None, keyid=None, profile=None*)

Set the policies of an ELB listener.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_elb.set_listener_policy myelb 443 "[policy1,policy2]"
```

`salt.modules.boto_elb.set_tags` (*name, tags, region=None, key=None, keyid=None, profile=None*)

Add the tags on an ELB

New in version 2016.3.0.

**name**

name of the ELB

**tags**

dict of name/value pair tags

CLI Example:

```
salt myminion boto_elb.set_tags my-elb-name '{"Tag1': 'Value', 'Tag2':
→ 'Another Value}'"
```

## 26.6.53 salt.modules.boto\_elbv2

Connection module for Amazon ALB

New in version 2017.7.0.

### configuration

This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
↪amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
elbv2.keyid: GKTADJGHEIQSXMKKRBJ08H
elbv2.key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs
elbv2.region: us-west-2
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs
region: us-east-1
```

### depends

boto3

```
salt.modules.boto_elbv2.create_target_group(name, protocol, port, vpc_id, region=None,
                                             key=None, keyid=None, profile=None,
                                             health_check_protocol='HTTP',
                                             health_check_port='traffic-port',
                                             health_check_path='/',
                                             health_check_interval_seconds=30,
                                             health_check_timeout_seconds=5,
                                             healthy_threshold_count=5,
                                             unhealthy_threshold_count=2)
```

Create target group if not present.

### name

(string) - The name of the target group.

### protocol

(string) - The protocol to use for routing traffic to the targets

### port

(int) - The port on which the targets receive traffic. This port is used unless you specify a port override when registering the traffic.

### vpc\_id

(string) - The identifier of the virtual private cloud (VPC).

**health\_check\_protocol**

(string) - The protocol the load balancer uses when performing health check on targets. The default is the HTTP protocol.

**health\_check\_port**

(string) - The port the load balancer uses when performing health checks on targets. The default is 'traffic-port', which indicates the port on which each target receives traffic from the load balancer.

**health\_check\_path**

(string) - The ping path that is the destination on the targets for health checks. The default is /.

**health\_check\_interval\_seconds**

(integer) - The approximate amount of time, in seconds, between health checks of an individual target. The default is 30 seconds.

**health\_check\_timeout\_seconds**

(integer) - The amount of time, in seconds, during which no response from a target means a failed health check. The default is 5 seconds.

**healthy\_threshold\_count**

(integer) - The number of consecutive health checks successes required before considering an unhealthy target healthy. The default is 5.

**unhealthy\_threshold\_count**

(integer) - The number of consecutive health check failures required before considering a target unhealthy. The default is 2.

**returns**

(bool) - True on success, False on failure.

CLI Example:

```
salt myminion boto_elbv2.create_target_group learn1give1 protocol=HTTP
→port=54006 vpc_id=vpc-deadbeef
```

`salt.modules.boto_elbv2.delete_target_group` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete target group.

**name**

(string) - Target Group Name or Amazon Resource Name (ARN).

**returns**

(bool) - True on success, False on failure.

CLI Example:

```
salt myminion boto_elbv2.delete_target_group
→arn:aws:elasticloadbalancing:us-west-2:644138682826:targetgroup/
→learn1give1-api/414788a16b5cf163
```

`salt.modules.boto_elbv2.deregister_targets` (*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deregister targets to a target group of an ALB. *targets* is either a instance id string or a list of instance id's.

Returns:

- True: instance(s) deregistered successfully
- False: instance(s) failed to be deregistered

CLI Example:

```
salt myminion boto_elbv2.deregister_targets myelb instance_id
salt myminion boto_elbv2.deregister_targets myelb "[instance_id,instance_
→id]"
```

`salt.modules.boto_elbv2.describe_target_health`(*name*, *targets=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get the current health check status for targets in a target group.

CLI Example:

```
salt myminion boto_elbv2.describe_target_health
→arn:aws:elasticloadbalancing:us-west-2:644138682826:targetgroup/
→learn1give1-api/414788a16b5cf163 targets=["i-isdf23ifjf"]
```

`salt.modules.boto_elbv2.register_targets`(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Register targets to a target group of an ALB. *targets* is either a instance id string or a list of instance id's.

Returns:

- True: instance(s) registered successfully
- False: instance(s) failed to be registered

CLI Example:

```
salt myminion boto_elbv2.register_targets myelb instance_id
salt myminion boto_elbv2.register_targets myelb "[instance_id,instance_id]
→"
```

`salt.modules.boto_elbv2.target_group_exists`(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if a target group exists.

CLI Example:

```
salt myminion boto_elbv2.target_group_exists
→arn:aws:elasticloadbalancing:us-west-2:644138682826:targetgroup/
→learn1give1-api/414788a16b5cf163
```

## 26.6.54 salt.modules.boto\_iam

Connection module for Amazon IAM

New in version 2014.7.0.

### configuration

This module accepts explicit iam credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
→amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkgghs
iam.region: us-east-1
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkgghs
  region: us-east-1
```

**depends**  
boto

```
salt.modules.boto_iam.add_user_to_group(user_name, group_name, region=None, key=None,
                                         keyid=None, profile=None)
```

Add user to group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.add_user_to_group myuser mygroup
```

```
salt.modules.boto_iam.associate_profile_to_role(profile_name, role_name, region=None,
                                                key=None, keyid=None, profile=None)
```

Associate an instance profile with an IAM role.

CLI Example:

```
salt myminion boto_iam.associate_profile_to_role myirole myprofile
```

```
salt.modules.boto_iam.attach_group_policy(policy_name, group_name, region=None, key=None,
                                           keyid=None, profile=None)
```

Attach a managed policy to a group.

CLI Example:

```
salt myminion boto_iam.attach_group_policy mypolicy mygroup
```

```
salt.modules.boto_iam.attach_role_policy(policy_name, role_name, region=None, key=None,
                                          keyid=None, profile=None)
```

Attach a managed policy to a role.

CLI Example:

```
salt myminion boto_iam.attach_role_policy mypolicy myrole
```

```
salt.modules.boto_iam.attach_user_policy(policy_name, user_name, region=None, key=None,
                                           keyid=None, profile=None)
```

Attach a managed policy to a user.

CLI Example:

```
salt myminion boto_iam.attach_user_policy mypolicy myuser
```

`salt.modules.boto_iam.build_policy`(*region=None, key=None, keyid=None, profile=None*)

Build a default assume role policy.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.build_policy
```

`salt.modules.boto_iam.create_access_key`(*user\_name, region=None, key=None, keyid=None, profile=None*)

Create access key id for a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.create_access_key myuser
```

`salt.modules.boto_iam.create_group`(*group\_name, path=None, region=None, key=None, keyid=None, profile=None*)

Create a group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.create_group group
```

`salt.modules.boto_iam.create_instance_profile`(*name, region=None, key=None, keyid=None, profile=None*)

Create an instance profile.

CLI Example:

```
salt myminion boto_iam.create_instance_profile myprofile
```

`salt.modules.boto_iam.create_login_profile`(*user\_name, password, region=None, key=None, keyid=None, profile=None*)

Creates a login profile for the specified user, give the user the ability to access AWS services and the AWS Management Console.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.create_login_profile user_name password
```

`salt.modules.boto_iam.create_policy`(*policy\_name, policy\_document, path=None, description=None, region=None, key=None, keyid=None, profile=None*)

Create a policy.

CLI Example:

```
salt myminios boto_iam.create_policy mypolicy '{"Version": "2012-10-17",
→"Statement": [{ "Effect": "Allow", "Action": ["s3:Get*", "s3:List*"],
→"Resource": ["arn:aws:s3:::my-bucket/shared/*"]}]}'
```

`salt.modules.boto_iam.create_policy_version`(*policy\_name*, *policy\_document*,  
*set\_as\_default=None*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Create a policy version.

CLI Example:

```
salt myminios boto_iam.create_policy_version mypolicy '{"Version": "2012-
→10-17", "Statement": [{ "Effect": "Allow", "Action": ["s3:Get*",
→"s3:List*"], "Resource": ["arn:aws:s3:::my-bucket/shared/*"]}]}'
```

`salt.modules.boto_iam.create_role`(*name*, *policy\_document=None*, *path=None*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

Create an instance role.

CLI Example:

```
salt myminion boto_iam.create_role myrole
```

`salt.modules.boto_iam.create_role_policy`(*role\_name*, *policy\_name*, *policy*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

Create or modify a role policy.

CLI Example:

```
salt myminion boto_iam.create_role_policy myrole mypolicy '{"MyPolicy":
→"Statement": [{"Action": ["sqs:*"], "Effect": "Allow", "Resource": [
→"arn:aws:sqs:*:*:*"], "Sid": "MyPolicySqs1"}]}'
```

`salt.modules.boto_iam.create_saml_provider`(*name*, *saml\_metadata\_document*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

Create SAML provider

CLI Example:

```
salt myminion boto_iam.create_saml_provider my_saml_provider_name saml_
→metadata_document
```

`salt.modules.boto_iam.create_user`(*user\_name*, *path=None*, *region=None*, *key=None*, *keyid=None*,  
*profile=None*)

Create a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.create_user myuser
```

`salt.modules.boto_iam.deactivate_mfa_device`(*user\_name*, *serial*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Deactivates the specified MFA device and removes it from association with the user.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_iam.deactivate_mfa_device user_name serial_num
```

`salt.modules.boto_iam.delete_access_key`(*access\_key\_id*, *user\_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete access key id from a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.delete_access_key myuser
```

`salt.modules.boto_iam.delete_group`(*group\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a group policy.

CLI Example:

```
salt myminion boto_iam.delete_group mygroup
```

`salt.modules.boto_iam.delete_group_policy`(*group\_name*, *policy\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a group policy.

CLI Example:

```
salt myminion boto_iam.delete_group_policy mygroup mypolicy
```

`salt.modules.boto_iam.delete_instance_profile`(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an instance profile.

CLI Example:

```
salt myminion boto_iam.delete_instance_profile myprofile
```

`salt.modules.boto_iam.delete_login_profile`(*user\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a login profile for the specified user.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_iam.delete_login_profile user_name
```

`salt.modules.boto_iam.delete_policy`(*policy\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a policy.

CLI Example:

```
salt myminion boto_iam.delete_policy mypolicy
```

`salt.modules.boto_iam.delete_policy_version` (*policy\_name, version\_id, region=None, key=None, keyid=None, profile=None*)

Delete a policy version.

CLI Example:

```
salt myminion boto_iam.delete_policy_version mypolicy v1
```

`salt.modules.boto_iam.delete_role` (*name, region=None, key=None, keyid=None, profile=None*)

Delete an IAM role.

CLI Example:

```
salt myminion boto_iam.delete_role myrole
```

`salt.modules.boto_iam.delete_role_policy` (*role\_name, policy\_name, region=None, key=None, keyid=None, profile=None*)

Delete a role policy.

CLI Example:

```
salt myminion boto_iam.delete_role_policy myrole mypolicy
```

`salt.modules.boto_iam.delete_saml_provider` (*name, region=None, key=None, keyid=None, profile=None*)

Delete SAML provider

CLI Example:

```
salt myminion boto_iam.delete_saml_provider my_saml_provider_name
```

`salt.modules.boto_iam.delete_server_cert` (*cert\_name, region=None, key=None, keyid=None, profile=None*)

Deletes a certificate from Amazon.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.delete_server_cert mycert_name
```

`salt.modules.boto_iam.delete_user` (*user\_name, region=None, key=None, keyid=None, profile=None*)

Delete a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.delete_user myuser
```

`salt.modules.boto_iam.delete_user_policy` (*user\_name, policy\_name, region=None, key=None, keyid=None, profile=None*)

Delete a user policy.

CLI Example:

```
salt myminion boto_iam.delete_user_policy myuser mypolicy
```

`salt.modules.boto_iam.delete_virtual_mfa_device` (*serial, region=None, key=None, keyid=None, profile=None*)

Deletes the specified virtual MFA device.

CLI Example:

```
salt myminion boto_iam.delete_virtual_mfa_device serial_num
```

`salt.modules.boto_iam.describe_role` (*name, region=None, key=None, keyid=None, profile=None*)

Get information for a role.

CLI Example:

```
salt myminion boto_iam.describe_role myrole
```

`salt.modules.boto_iam.detach_group_policy` (*policy\_name, group\_name, region=None, key=None, keyid=None, profile=None*)

Detach a managed policy to a group.

CLI Example:

```
salt myminion boto_iam.detach_group_policy mypolicy mygroup
```

`salt.modules.boto_iam.detach_role_policy` (*policy\_name, role\_name, region=None, key=None, keyid=None, profile=None*)

Detach a managed policy to a role.

CLI Example:

```
salt myminion boto_iam.detach_role_policy mypolicy myrole
```

`salt.modules.boto_iam.detach_user_policy` (*policy\_name, user\_name, region=None, key=None, keyid=None, profile=None*)

Detach a managed policy to a user.

CLI Example:

```
salt myminion boto_iam.detach_user_policy mypolicy myuser
```

`salt.modules.boto_iam.disassociate_profile_from_role` (*profile\_name, role\_name, region=None, key=None, keyid=None, profile=None*)

Disassociate an instance profile from an IAM role.

CLI Example:

```
salt myminion boto_iam.disassociate_profile_from_role myrole myprofile
```

`salt.modules.boto_iam.export_roles` (*path\_prefix='/', region=None, key=None, keyid=None, profile=None*)

Get all IAM role details. Produces results that can be used to create an sls file.

CLI Example:

```
salt-call boto_iam.export_roles --out=txt | sed "s/local: //" > iam_roles.  
→sls
```

`salt.modules.boto_iam.export_users` (*path\_prefix='/', region=None, key=None, keyid=None, profile=None*)

Get all IAM user details. Produces results that can be used to create an sls file.

New in version 2016.3.0.

CLI Example:

```
salt-call boto_iam.export_users --out=txt | sed "s/local: //" > iam_users.
→sls
```

`salt.modules.boto_iam.get_account_id` (*region=None, key=None, keyid=None, profile=None*)

Get a the AWS account id associated with the used credentials.

CLI Example:

```
salt myminion boto_iam.get_account_id
```

`salt.modules.boto_iam.get_account_policy` (*region=None, key=None, keyid=None, profile=None*)

Get account policy for the AWS account.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_account_policy
```

`salt.modules.boto_iam.get_all_access_keys` (*user\_name, marker=None, max\_items=None, region=None, key=None, keyid=None, profile=None*)

Get all access keys from a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_all_access_keys myuser
```

`salt.modules.boto_iam.get_all_group_policies` (*group\_name, region=None, key=None, keyid=None, profile=None*)

Get a list of policy names from a group.

CLI Example:

```
salt myminion boto_iam.get_all_group_policies mygroup
```

`salt.modules.boto_iam.get_all_groups` (*path\_prefix='/', region=None, key=None, keyid=None, profile=None*)

Get and return all IAM group details, starting at the optional path.

New in version 2016.3.0.

CLI Example:

```
salt-call boto_iam.get_all_groups
```

`salt.modules.boto_iam.get_all_instance_profiles` (*path\_prefix='/', region=None, key=None, keyid=None, profile=None*)

Get and return all IAM instance profiles, starting at the optional path.

New in version 2016.11.0.

CLI Example:

```
salt-call boto_iam.get_all_instance_profiles
```

`salt.modules.boto_iam.get_all_mfa_devices`(*user\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get all MFA devices associated with an IAM user.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_iam.get_all_mfa_devices user_name
```

`salt.modules.boto_iam.get_all_roles`(*path\_prefix=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get and return all IAM role details, starting at the optional path.

New in version 2016.3.0.

CLI Example:

```
salt-call boto_iam.get_all_roles
```

`salt.modules.boto_iam.get_all_user_policies`(*user\_name*, *marker=None*, *max\_items=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get all user policies.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_all_user_policies myuser
```

`salt.modules.boto_iam.get_all_users`(*path\_prefix='/'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get and return all IAM user details, starting at the optional path.

New in version 2016.3.0.

CLI Example:

```
salt-call boto_iam.get_all_users
```

`salt.modules.boto_iam.get_group`(*group\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get group information.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_group mygroup
```

`salt.modules.boto_iam.get_group_members` (*group\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get group information.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_iam.get_group mygroup
```

`salt.modules.boto_iam.get_group_policy` (*group\_name*, *policy\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Retrieves the specified policy document for the specified group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_group_policy mygroup policyname
```

`salt.modules.boto_iam.get_policy` (*policy\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if policy exists.

CLI Example:

```
salt myminion boto_iam.instance_profile_exists myprofile
```

`salt.modules.boto_iam.get_policy_version` (*policy\_name*, *version\_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if policy exists.

CLI Example:

```
salt myminion boto_iam.instance_profile_exists myprofile
```

`salt.modules.boto_iam.get_role_policy` (*role\_name*, *policy\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get a role policy.

CLI Example:

```
salt myminion boto_iam.get_role_policy myrole mypolicy
```

`salt.modules.boto_iam.get_saml_provider` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get SAML provider document.

CLI Example:

```
salt myminion boto_iam.get_saml_provider arn
```

`salt.modules.boto_iam.get_saml_provider_arn` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get SAML provider

CLI Example:

```
salt myminion boto_iam.get_saml_provider_arn my_saml_provider_name
```

`salt.modules.boto_iam.get_server_certificate`(*cert\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Returns certificate information from Amazon

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_server_certificate mycert_name
```

`salt.modules.boto_iam.get_user`(*user\_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get user information.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_user myuser
```

`salt.modules.boto_iam.get_user_policy`(*user\_name*, *policy\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Retrieves the specified policy document for the specified user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_user_policy myuser mypolicyname
```

`salt.modules.boto_iam.instance_profile_exists`(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an instance profile exists.

CLI Example:

```
salt myminion boto_iam.instance_profile_exists myprofile
```

`salt.modules.boto_iam.list_attached_group_policies`(*group\_name*, *path\_prefix=None*, *entity\_filter=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List entities attached to the given group.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

`salt.modules.boto_iam.list_attached_role_policies`(*role\_name*, *path\_prefix=None*, *entity\_filter=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List entities attached to the given role.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

`salt.modules.boto_iam.list_attached_user_policies` (*user\_name*, *path\_prefix=None*,  
*entity\_filter=None*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

List entities attached to the given user.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

`salt.modules.boto_iam.list_entities_for_policy` (*policy\_name*, *path\_prefix=None*,  
*entity\_filter=None*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

List entities that a policy is attached to.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

`salt.modules.boto_iam.list_instance_profiles` (*path\_prefix='/'*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

List all IAM instance profiles, starting at the optional path.

New in version 2016.11.0.

CLI Example:

```
salt-call boto_iam.list_instance_profiles
```

`salt.modules.boto_iam.list_policies` (*region=None*, *key=None*, *keyid=None*, *profile=None*)

List policies.

CLI Example:

```
salt myminion boto_iam.list_policies
```

`salt.modules.boto_iam.list_policy_versions` (*policy\_name*, *region=None*, *key=None*, *keyid=None*,  
*profile=None*)

List versions of a policy.

CLI Example:

```
salt myminion boto_iam.list_policy_versions mypolicy
```

`salt.modules.boto_iam.list_role_policies` (*role\_name*, *region=None*, *key=None*, *keyid=None*,  
*profile=None*)

Get a list of policy names from a role.

CLI Example:

```
salt myminion boto_iam.list_role_policies myrole
```

`salt.modules.boto_iam.list_saml_providers` (*region=None*, *key=None*, *keyid=None*, *profile=None*)

List SAML providers.

CLI Example:

```
salt myminion boto_iam.list_saml_providers
```

`salt.modules.boto_iam.policy_exists` (*policy\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if policy exists.

CLI Example:

```
salt myminion boto_iam.instance_profile_exists myiprfile
```

`salt.modules.boto_iam.policy_version_exists` (*policy\_name*, *version\_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if policy exists.

CLI Example:

```
salt myminion boto_iam.instance_profile_exists myiprfile
```

`salt.modules.boto_iam.profile_associated` (*role\_name*, *profile\_name*, *region*, *key*, *keyid*, *profile*)

Check to see if an instance profile is associated with an IAM role.

CLI Example:

```
salt myminion boto_iam.profile_associated myrole myiprfile
```

`salt.modules.boto_iam.put_group_policy` (*group\_name*, *policy\_name*, *policy\_json*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Adds or updates the specified policy document for the specified group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.put_group_policy mygroup policyname policyrules
```

`salt.modules.boto_iam.put_user_policy` (*user\_name*, *policy\_name*, *policy\_json*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Adds or updates the specified policy document for the specified user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.put_user_policy myuser policyname policyrules
```

`salt.modules.boto_iam.remove_user_from_group` (*group\_name*, *user\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Remove user from group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.remove_user_from_group mygroup myuser
```

`salt.modules.boto_iam.role_exists` (*name, region=None, key=None, keyid=None, profile=None*)

Check to see if an IAM role exists.

CLI Example:

```
salt myminion boto_iam.role_exists myirole
```

`salt.modules.boto_iam.set_default_policy_version` (*policy\_name, version\_id, region=None, key=None, keyid=None, profile=None*)

Set the default version of a policy.

CLI Example:

```
salt myminion boto_iam.set_default_policy_version mypolicy v1
```

`salt.modules.boto_iam.update_account_password_policy` (*allow\_users\_to\_change\_password=None, hard\_expiry=None, max\_password\_age=None, minimum\_password\_length=None, password\_reuse\_prevention=None, require\_lowercase\_characters=None, require\_numbers=None, require\_symbols=None, require\_uppercase\_characters=None, region=None, key=None, keyid=None, profile=None*)

Update the password policy for the AWS account.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.update_account_password_policy True
```

`salt.modules.boto_iam.update_assume_role_policy` (*role\_name, policy\_document, region=None, key=None, keyid=None, profile=None*)

Update an assume role policy for a role.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.update_assume_role_policy myrole '{"Statement": "...
→"}'
```

`salt.modules.boto_iam.update_saml_provider` (*name, saml\_metadata\_document, region=None, key=None, keyid=None, profile=None*)

Update SAML provider.

CLI Example:

```
salt myminion boto_iam.update_saml_provider my_saml_provider_name saml_
→metadata_document
```

`salt.modules.boto_iam.upload_server_cert` (*cert\_name, cert\_body, private\_key, cert\_chain=None, path=None, region=None, key=None, keyid=None, profile=None*)

Upload a certificate to Amazon.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.upload_server_cert mycert_name crt priv_key
```

#### Parameters

- **cert\_name** -- The name for the server certificate. Do not include the path in this value.
- **cert\_body** -- The contents of the public key certificate in PEM-encoded format.
- **private\_key** -- The contents of the private key in PEM-encoded format.
- **cert\_chain** -- The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.
- **path** -- The path for the server certificate.
- **region** -- The name of the region to connect to.
- **key** -- The key to be used in order to connect
- **keyid** -- The keyid to be used in order to connect
- **profile** -- The profile that contains a dict of region, key, keyid

#### Returns

True / False

```
salt.modules.boto_iam.user_exists_in_group(user_name, group_name, region=None, key=None, keyid=None, profile=None)
```

Check if user exists in group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.user_exists_in_group myuser mygroup
```

## 26.6.55 salt.modules.boto\_iot

Connection module for Amazon IoT

New in version 2016.3.0.

#### depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

#### configuration

This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
iot.keyid: GKTADJGHEIQSXMKKRBJ08H
iot.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
iot.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
region: us-east-1
```

`salt.modules.boto_iot.attach_principal_policy` (*policyName*, *principal*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Attach the specified policy to the specified principal (certificate or other credential.)

Returns {attached: true} if the policy was attached {attached: False} if the policy was not attached.

CLI Example:

```
salt myminion boto_iot.attach_principal_policy mypolicy mycognitoID
```

`salt.modules.boto_iot.create_policy` (*policyName*, *policyDocument*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, create a policy.

Returns {created: true} if the policy was created and returns {created: False} if the policy was not created.

CLI Example:

```
salt myminion boto_iot.create_policy my_policy \
  '{"Version":"2015-12-12",\
  "Statement":[{"Effect":"Allow",\
    "Action":["iot:Publish"],\
    "Resource":["arn::::topic/foo/bar"]}]}'
```

`salt.modules.boto_iot.create_policy_version` (*policyName*, *policyDocument*, *setAsDefault=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, create a new version of a policy.

Returns {created: true} if the policy version was created and returns {created: False} if the policy version was not created.

CLI Example:

```
salt myminion boto_iot.create_policy_version my_policy \
    '{"Statement":[{"Effect":"Allow","Action":["iot:Publish"],"Resource":\
    →:["arn:::::topic/foo/bar"]}]}'
```

`salt.modules.boto_iot.create_thing_type` (*thingTypeName*, *thingTypeDescription*, *searchableAttributesList*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, create a thing type.

Returns {created: true} if the thing type was created and returns {created: False} if the thing type was not created.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_iot.create_thing_type mythingtype \
    thingtype_description_string '["searchable_attr_1", "searchable_
    →attr_2"]'
```

`salt.modules.boto_iot.create_topic_rule` (*ruleName*, *sql*, *actions*, *description*, *ruleDisabled=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, create a topic rule.

Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.

CLI Example:

```
salt myminion boto_iot.create_topic_rule my_rule "SELECT * FROM 'some/
    →thing'" \
    '[{"lambda":{"functionArn":"arn:::::something"}}, {"sns":{\
    →"targetArn":"arn:::::something","roleArn":"arn:::::something"}}]'
```

`salt.modules.boto_iot.delete_policy` (*policyName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a policy name, delete it.

Returns {deleted: true} if the policy was deleted and returns {deleted: false} if the policy was not deleted.

CLI Example:

```
salt myminion boto_iot.delete_policy mypolicy
```

`salt.modules.boto_iot.delete_policy_version` (*policyName*, *policyVersionId*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a policy name and version, delete it.

Returns {deleted: true} if the policy version was deleted and returns {deleted: false} if the policy version was not deleted.

CLI Example:

```
salt myminion boto_iot.delete_policy_version mypolicy version
```

`salt.modules.boto_iot.delete_thing_type` (*thingTypeName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a thing type name, delete it.

Returns {deleted: true} if the thing type was deleted and returns {deleted: false} if the thing type was not deleted.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_iot.delete_thing_type mythingtype
```

`salt.modules.boto_iot.delete_topic_rule` (*ruleName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a rule name, delete it.

Returns {deleted: true} if the rule was deleted and returns {deleted: false} if the rule was not deleted.

CLI Example:

```
salt myminion boto_iot.delete_rule myrule
```

`salt.modules.boto_iot.deprecate_thing_type` (*thingTypeName*, *undoDeprecate=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a thing type name, deprecate it when `undoDeprecate` is `False` and undepricate it when `undoDeprecate` is `True`.

Returns {deprecated: true} if the thing type was deprecated and returns {deprecated: false} if the thing type was not deprecated.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_iot.deprecate_thing_type mythingtype
```

`salt.modules.boto_iot.describe_policy` (*policyName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a policy name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_iot.describe_policy mypolicy
```

`salt.modules.boto_iot.describe_policy_version` (*policyName*, *policyVersionId*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a policy name and version describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_iot.describe_policy_version mypolicy version
```

`salt.modules.boto_iot.describe_thing_type` (*thingTypeName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a thing type name describe its properties.

Returns a dictionary of interesting properties.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_iot.describe_thing_type mythingtype
```

`salt.modules.boto_iot.describe_topic_rule`(*ruleName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a topic rule name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_iot.describe_topic_rule myrule
```

`salt.modules.boto_iot.detach_principal_policy`(*policyName*, *principal*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Detach the specified policy from the specified principal (certificate or other credential.)

Returns {detached: true} if the policy was detached {detached: False} if the policy was not detached.

CLI Example:

```
salt myminion boto_iot.detach_principal_policy mypolicy mycognitoID
```

`salt.modules.boto_iot.list_policies`(*region=None*, *key=None*, *keyid=None*, *profile=None*)

List all policies

Returns list of policies

CLI Example:

```
salt myminion boto_iot.list_policies
```

Example Return:

```
policies:  
- {...}  
- {...}
```

`salt.modules.boto_iot.list_policy_versions`(*policyName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List the versions available for the given policy.

CLI Example:

```
salt myminion boto_iot.list_policy_versions mypolicy
```

Example Return:

```
policyVersions:  
- {...}  
- {...}
```

`salt.modules.boto_iot.list_principal_policies`(*principal*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List the policies attached to the given principal.

CLI Example:

```
salt myminion boto_iot.list_principal_policies myprincipal
```

Example Return:

```
policies:
- {...}
- {...}
```

`salt.modules.boto_iot.list_topic_rules` (*topic=None, ruleDisabled=None, region=None, key=None, keyid=None, profile=None*)

List all rules (for a given topic, if specified)

Returns list of rules

CLI Example:

```
salt myminion boto_iot.list_topic_rules
```

Example Return:

```
rules:
- {...}
- {...}
```

`salt.modules.boto_iot.policy_exists` (*policyName, region=None, key=None, keyid=None, profile=None*)

Given a policy name, check to see if the given policy exists.

Returns True if the given policy exists and returns False if the given policy does not exist.

CLI Example:

```
salt myminion boto_iot.policy_exists mypolicy
```

`salt.modules.boto_iot.policy_version_exists` (*policyName, policyVersionId, region=None, key=None, keyid=None, profile=None*)

Given a policy name and version ID, check to see if the given policy version exists.

Returns True if the given policy version exists and returns False if the given policy version does not exist.

CLI Example:

```
salt myminion boto_iot.policy_version_exists mypolicy versionid
```

`salt.modules.boto_iot.replace_topic_rule` (*ruleName, sql, actions, description, ruleDisabled=False, region=None, key=None, keyid=None, profile=None*)

Given a valid config, replace a topic rule with the new values.

Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.

CLI Example:

```
salt myminion boto_iot.replace_topic_rule my_rule 'SELECT * FROM some.
→thing' \
  '[{"lambda":{"functionArn":"arn::::something"}}, {"sns":{"
  "targetArn":"arn::::something","roleArn":"arn::::something"}}]'
```

`salt.modules.boto_iot.set_default_policy_version` (*policyName, policyVersionId, region=None, key=None, keyid=None, profile=None*)

Sets the specified version of the specified policy as the policy's default (operative) version. This action affects all certificates that the policy is attached to.

Returns {changed: true} if the policy version was set {changed: False} if the policy version was not set.

CLI Example:

```
salt myminion boto_iot.set_default_policy_version mypolicy versionid
```

`salt.modules.boto_iot.thing_type_exists` (*thingTypeName, region=None, key=None, keyid=None, profile=None*)

Given a thing type name, check to see if the given thing type exists

Returns True if the given thing type exists and returns False if the given thing type does not exist.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_iot.thing_type_exists mythingtype
```

`salt.modules.boto_iot.topic_rule_exists` (*ruleName, region=None, key=None, keyid=None, profile=None*)

Given a rule name, check to see if the given rule exists.

Returns True if the given rule exists and returns False if the given rule does not exist.

CLI Example:

```
salt myminion boto_iot.topic_rule_exists myrule
```

## 26.6.56 salt.modules.boto\_kinesis

Connection module for Amazon Kinesis

New in version 2017.7.0.

### configuration

This module accepts explicit Kinesis credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
kinesis.keyid: GKTADJGHEIQSXMKKRBJ08H
kinesis.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
kinesis.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
  region: us-east-1
```

#### depends

boto3

```
salt.modules.boto_kinesis.create_stream(stream_name, num_shards, region=None, key=None,
                                          keyid=None, profile=None)
```

Create a stream with name `stream_name` and initial number of shards `num_shards`.

CLI Example:

```
salt myminion boto_kinesis.create_stream my_stream N region=us-east-1
```

```
salt.modules.boto_kinesis.decrease_stream_retention_period(stream_name,
                                                            retention_hours,
                                                            region=None, key=None,
                                                            keyid=None, profile=None)
```

Decrease stream retention period to `retention_hours`

CLI Example:

```
salt myminion boto_kinesis.decrease_stream_retention_period my_stream N
→ region=us-east-1
```

```
salt.modules.boto_kinesis.delete_stream(stream_name, region=None, key=None, keyid=None,
                                          profile=None)
```

Delete the stream with name `stream_name`. This cannot be undone! All data will be lost!!

CLI Example:

```
salt myminion boto_kinesis.delete_stream my_stream region=us-east-1
```

```
salt.modules.boto_kinesis.disable_enhanced_monitoring(stream_name, metrics, region=None,
                                                         key=None, keyid=None,
                                                         profile=None)
```

Disable enhanced monitoring for the specified shard-level metrics on stream `stream_name`

CLI Example:

```
salt myminion boto_kinesis.disable_enhanced_monitoring my_stream ["metrics
→", "to", "disable"] region=us-east-1
```

```
salt.modules.boto_kinesis.enable_enhanced_monitoring(stream_name, metrics, region=None,
                                                         key=None, keyid=None,
                                                         profile=None)
```

Enable enhanced monitoring for the specified shard-level metrics on stream `stream_name`

CLI Example:

```
salt myminion boto_kinesis.enable_enhanced_monitoring my_stream ["metrics
→", "to", "enable"] region=us-east-1
```

`salt.modules.boto_kinesis.exists`(*stream\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)  
Check if the stream exists. Returns False and the error if it does not.

CLI Example:

```
salt myminion boto_kinesis.exists my_stream region=us-east-1
```

`salt.modules.boto_kinesis.get_info_for_reshard`(*stream\_details*)

Collect some data: number of open shards, key range, etc. Modifies *stream\_details* to add a sorted list of OpenShards. Returns (*min\_hash\_key*, *max\_hash\_key*, *stream\_details*)

CLI Example:

```
salt myminion boto_kinesis.get_info_for_reshard existing_stream_details
```

`salt.modules.boto_kinesis.get_stream_when_active`(*stream\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get complete stream info from AWS, returning only when the stream is in the ACTIVE state. Continues to retry when stream is updating or creating. If the stream is deleted during retries, the loop will catch the error and break.

CLI Example:

```
salt myminion boto_kinesis.get_stream_when_active my_stream region=us-
→east-1
```

`salt.modules.boto_kinesis.increase_stream_retention_period`(*stream\_name*, *retention\_hours*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Increase stream retention period to *retention\_hours*

CLI Example:

```
salt myminion boto_kinesis.increase_stream_retention_period my_stream N
→region=us-east-1
```

`salt.modules.boto_kinesis.list_streams`(*region=None*, *key=None*, *keyid=None*, *profile=None*)

Return a list of all streams visible to the current account

CLI Example:

```
salt myminion boto_kinesis.list_streams
```

`salt.modules.boto_kinesis.long_int`(*hash\_key*)

The hash key is a 128-bit int, sent as a string. It's necessary to convert to int/long for comparison operations. This helper method handles python 2/3 incompatibility

CLI Example:

```
salt myminion boto_kinesis.long_int some_MD5_hash_as_string
```

**Returns**

long object if python 2.X, int object if python 3.X

`salt.modules.boto_kinesis.reshard` (*stream\_name, desired\_size, force=False, region=None, key=None, keyid=None, profile=None*)

Reshard a kinesis stream. Each call to this function will wait until the stream is ACTIVE, then make a single split or merge operation. This function decides where to split or merge with the assumption that the ultimate goal is a balanced partition space.

For safety, user must past in force=True; otherwise, the function will dry run.

CLI Example:

```
salt myminion boto_kinesis.reshard my_stream N True region=us-east-1
```

**Returns**

True if a split or merge was found/performed, False if nothing is needed

**26.6.57 salt.modules.boto\_kms**

Connection module for Amazon KMS

New in version 2015.8.0.

**configuration**

This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
kms.keyid: GKTADJGHEIQSXMKKRBJ08H
kms.key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkghs
```

A region may also be specified in the configuration:

```
kms.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

**myprofile:**

```
keyid: GKTADJGHEIQSXMKKRBJ08H key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkghs region: us-east-1
```

**depends**

boto

`salt.modules.boto_kms.create_alias` (*alias\_name, target\_key\_id, region=None, key=None, keyid=None, profile=None*)

Create a display name for a key.

CLI Example:

```
salt myminion boto_kms.create_alias 'alias/mykey' key_id
```

`salt.modules.boto_kms.create_grant` (*key\_id*, *grantee\_principal*, *retiring\_principal*=None, *operations*=None, *constraints*=None, *grant\_tokens*=None, *region*=None, *key*=None, *keyid*=None, *profile*=None)

Adds a grant to a key to specify who can access the key and under what conditions.

CLI Example:

```
salt myminion boto_kms.create_grant 'alias/mykey' 'arn:aws:iam::11111111:/
→role/myrole' operations=['"Encrypt","Decrypt"]'
```

`salt.modules.boto_kms.create_key` (*policy*=None, *description*=None, *key\_usage*=None, *region*=None, *key*=None, *keyid*=None, *profile*=None)

Creates a master key.

CLI Example:

```
salt myminion boto_kms.create_key '{"Statement":...}' "My master key"
```

`salt.modules.boto_kms.decrypt` (*ciphertext\_blob*, *encryption\_context*=None, *grant\_tokens*=None, *region*=None, *key*=None, *keyid*=None, *profile*=None)

Decrypt ciphertext.

CLI Example:

```
salt myminion boto_kms.decrypt encrypted_ciphertext
```

`salt.modules.boto_kms.describe_key` (*key\_id*, *region*=None, *key*=None, *keyid*=None, *profile*=None)

Get detailed information about a key.

CLI Example:

```
salt myminion boto_kms.describe_key 'alias/mykey'
```

`salt.modules.boto_kms.disable_key` (*key\_id*, *region*=None, *key*=None, *keyid*=None, *profile*=None)

Mark key as disabled.

CLI Example:

```
salt myminion boto_kms.disable_key 'alias/mykey'
```

`salt.modules.boto_kms.disable_key_rotation` (*key\_id*, *region*=None, *key*=None, *keyid*=None, *profile*=None)

Disable key rotation for specified key.

CLI Example:

```
salt myminion boto_kms.disable_key_rotation 'alias/mykey'
```

`salt.modules.boto_kms.enable_key` (*key\_id*, *region*=None, *key*=None, *keyid*=None, *profile*=None)

Mark key as enabled.

CLI Example:

```
salt myminion boto_kms.enable_key 'alias/mykey'
```

```
salt.modules.boto_kms.enable_key_rotation(key_id, region=None, key=None, keyid=None,
                                           profile=None)
```

Disable key rotation for specified key.

CLI Example:

```
salt myminion boto_kms.enable_key_rotation 'alias/mykey'
```

```
salt.modules.boto_kms.encrypt(key_id, plaintext, encryption_context=None, grant_tokens=None,
                                region=None, key=None, keyid=None, profile=None)
```

Encrypt plaintext into cipher text using specified key.

CLI Example:

```
salt myminion boto_kms.encrypt 'alias/mykey' 'myplaintext' '{"aws:username": "myuser"}'
```

```
salt.modules.boto_kms.generate_data_key(key_id, encryption_context=None,
                                           number_of_bytes=None, key_spec=None,
                                           grant_tokens=None, region=None, key=None, keyid=None,
                                           profile=None)
```

Generate a secure data key.

CLI Example:

```
salt myminion boto_kms.generate_data_key 'alias/mykey' number_of_
↳ bytes=1024 key_spec=AES_128
```

```
salt.modules.boto_kms.generate_data_key_without_plaintext(key_id,
                                                            encryption_context=None,
                                                            number_of_bytes=None,
                                                            key_spec=None,
                                                            grant_tokens=None,
                                                            region=None, key=None,
                                                            keyid=None, profile=None)
```

Generate a secure data key without a plaintext copy of the key.

CLI Example:

```
salt myminion boto_kms.generate_data_key_without_plaintext 'alias/mykey'
↳ number_of_bytes=1024 key_spec=AES_128
```

```
salt.modules.boto_kms.generate_random(number_of_bytes=None, region=None, key=None,
                                         keyid=None, profile=None)
```

Generate a random string.

CLI Example:

```
salt myminion boto_kms.generate_random number_of_bytes=1024
```

```
salt.modules.boto_kms.get_key_policy(key_id, policy_name, region=None, key=None, keyid=None,
                                       profile=None)
```

Get the policy for the specified key.

CLI Example:

```
salt myminion boto_kms.get_key_policy 'alias/mykey' mypolicy
```

`salt.modules.boto_kms.get_key_rotation_status`(*key\_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get status of whether or not key rotation is enabled for a key.

CLI Example:

```
salt myminion boto_kms.get_key_rotation_status 'alias/mykey'
```

`salt.modules.boto_kms.key_exists`(*key\_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check for the existence of a key.

CLI Example:

```
salt myminion boto_kms.key_exists 'alias/mykey'
```

`salt.modules.boto_kms.list_grants`(*key\_id*, *limit=None*, *marker=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List grants for the specified key.

CLI Example:

```
salt myminion boto_kms.list_grants 'alias/mykey'
```

`salt.modules.boto_kms.list_key_policies`(*key\_id*, *limit=None*, *marker=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List key\_policies for the specified key.

CLI Example:

```
salt myminion boto_kms.list_key_policies 'alias/mykey'
```

`salt.modules.boto_kms.put_key_policy`(*key\_id*, *policy\_name*, *policy*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Attach a key policy to the specified key.

CLI Example:

```
salt myminion boto_kms.put_key_policy 'alias/mykey' default '{"Statement":...}'
```

`salt.modules.boto_kms.re_encrypt`(*ciphertext\_blob*, *destination\_key\_id*, *source\_encryption\_context=None*, *destination\_encryption\_context=None*, *grant\_tokens=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Reencrypt encrypted data with a new master key.

CLI Example:

```
salt myminion boto_kms.re_encrypt 'encrypted_data' 'alias/mynewkey' default '{"Statement":...}'
```

`salt.modules.boto_kms.revoke_grant` (*key\_id, grant\_id, region=None, key=None, keyid=None, profile=None*)

Revoke a grant from a key.

CLI Example:

```
salt myminion boto_kms.revoke_grant 'alias/mykey' 8u89hf-j09j...
```

`salt.modules.boto_kms.update_key_description` (*key\_id, description, region=None, key=None, keyid=None, profile=None*)

Update a key's description.

CLI Example:

```
salt myminion boto_kms.update_key_description 'alias/mykey' 'My key'
```

## 26.6.58 salt.modules.boto\_lambda

Connection module for Amazon Lambda

New in version 2016.3.0.

### depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

### configuration

This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available [here](#).

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
lambda.keyid: GKTADJGHEIQSXMKKRBJ08H
lambda.key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

A region may also be specified in the configuration:

```
lambda.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
  region: us-east-1
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```
created: true
```

or

```

created: false
error:
  message: error message

```

Request methods (e.g., *describe\_function*) return:

```

function:
- { . . . }
- { . . . }

```

or

```

error:
  message: error message

```

`salt.modules.boto_lambda.add_permission` (*FunctionName, StatementId, Action, Principal, SourceArn=None, SourceAccount=None, Qualifier=None, region=None, key=None, keyid=None, profile=None*)

Add a permission to a lambda function.

Returns {added: true} if the permission was added and returns {added: False} if the permission was not added.

CLI Example:

```

salt myminion boto_lambda.add_permission my_function my_id "lambda:*" \
    s3.amazonaws.com aws:arn::::bucket-name \
    aws-account-id

```

`salt.modules.boto_lambda.alias_exists` (*FunctionName, Name, region=None, key=None, keyid=None, profile=None*)

Given a function name and alias name, check to see if the given alias exists.

Returns True if the given alias exists and returns False if the given alias does not exist.

CLI Example:

```

salt myminion boto_lambda.alias_exists myfunction myalias

```

`salt.modules.boto_lambda.create_alias` (*FunctionName, Name, FunctionVersion, Description="", region=None, key=None, keyid=None, profile=None*)

Given a valid config, create an alias to a function.

Returns {created: true} if the alias was created and returns {created: False} if the alias was not created.

CLI Example:

```

salt myminion boto_lambda.create_alias my_function my_alias $LATEST "An
↪alias"

```

`salt.modules.boto_lambda.create_event_source_mapping` (*EventSourceArn, FunctionName, StartingPosition, Enabled=True, BatchSize=100, region=None, key=None, keyid=None, profile=None*)

Identifies a stream as an event source for a Lambda function. It can be either an Amazon Kinesis stream or an Amazon DynamoDB stream. AWS Lambda invokes the specified function when records are posted to the stream.

Returns {created: true} if the event source mapping was created and returns {created: False} if the event source mapping was not created.

CLI Example:

```
salt myminion boto_lambda.create_event_source_mapping arn:::eventsources
→myfunction LATEST
```

```
salt.modules.boto_lambda.create_function(FunctionName, Runtime, Role, Handler, ZipFile=None,
                                         S3Bucket=None, S3Key=None, S3ObjectVersion=None,
                                         Description="", Timeout=3, MemorySize=128,
                                         Publish=False, WaitForRole=False, RoleRetries=5,
                                         region=None, key=None, keyid=None, profile=None,
                                         VpcConfig=None, Environment=None)
```

New in version 2017.7.0.

Given a valid config, create a function.

#### Environment

The parent object that contains your environment's configuration settings. This is a dictionary of the form:

```
{
  'Variables': {
    'VariableName': 'VariableValue'
  }
}
```

Returns {'created': True} if the function was created and {created: False} if the function was not created.

CLI Example:

```
salt myminion boto_lambda.create_function my_function python2.7 my_role my_
→file.my_function my_function.zip
salt myminion boto_lambda.create_function my_function python2.7 my_role my_
→file.my_function salt://files/my_function.zip
```

```
salt.modules.boto_lambda.delete_alias(FunctionName, Name, region=None, key=None, keyid=None,
                                       profile=None)
```

Given a function name and alias name, delete the alias.

Returns {deleted: true} if the alias was deleted and returns {deleted: false} if the alias was not deleted.

CLI Example:

```
salt myminion boto_lambda.delete_alias myfunction myalias
```

```
salt.modules.boto_lambda.delete_event_source_mapping(UUID=None, EventSourceArn=None,
                                                     FunctionName=None, region=None,
                                                     key=None, keyid=None,
                                                     profile=None)
```

Given an event source mapping ID or an event source ARN and FunctionName, delete the event source mapping

Returns {deleted: true} if the mapping was deleted and returns {deleted: false} if the mapping was not deleted.

CLI Example:

```
salt myminion boto_lambda.delete_event_source_mapping 260c423d-e8b5-4443-
↳8d6a-5e91b9ecd0fa
```

`salt.modules.boto_lambda.delete_function`(*FunctionName*, *Qualifier=None*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

Given a function name and optional version qualifier, delete it.

Returns {deleted: true} if the function was deleted and returns {deleted: false} if the function was not deleted.

CLI Example:

```
salt myminion boto_lambda.delete_function myfunction
```

`salt.modules.boto_lambda.describe_alias`(*FunctionName*, *Name*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Given a function name and alias name describe the properties of the alias.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_lambda.describe_alias myalias
```

`salt.modules.boto_lambda.describe_event_source_mapping`(*UUID=None*,  
*EventSourceArn=None*,  
*FunctionName=None*,  
*region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Given an event source mapping ID or an event source ARN and FunctionName, obtain the current settings of that mapping.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_lambda.describe_event_source_mapping uuid
```

`salt.modules.boto_lambda.describe_function`(*FunctionName*, *region=None*, *key=None*, *keyid=None*,  
*profile=None*)

Given a function name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_lambda.describe_function myfunction
```

`salt.modules.boto_lambda.event_source_mapping_exists`(*UUID=None*, *EventSourceArn=None*,  
*FunctionName=None*, *region=None*,  
*key=None*, *keyid=None*,  
*profile=None*)

Given an event source mapping ID or an event source ARN and FunctionName, check whether the mapping exists.

Returns True if the given alias exists and returns False if the given alias does not exist.

CLI Example:

```
salt myminion boto_lambda.alias_exists myfunction myalias
```

```
salt.modules.boto_lambda.function_exists(FunctionName, region=None, key=None, keyid=None,
                                         profile=None)
```

Given a function name, check to see if the given function name exists.

Returns True if the given function exists and returns False if the given function does not exist.

CLI Example:

```
salt myminion boto_lambda.function_exists myfunction
```

```
salt.modules.boto_lambda.get_event_source_mapping_ids(EventSourceArn, FunctionName,
                                                       region=None, key=None,
                                                       keyid=None, profile=None)
```

Given an event source and function name, return a list of mapping IDs

CLI Example:

```
salt myminion boto_lambda.get_event_source_mapping_ids arn:::: myfunction
```

```
salt.modules.boto_lambda.get_permissions(FunctionName, Qualifier=None, region=None,
                                         key=None, keyid=None, profile=None)
```

Get resource permissions for the given lambda function

Returns dictionary of permissions, by statement ID

CLI Example:

```
salt myminion boto_lambda.get_permissions my_function

permissions: {...}
```

```
salt.modules.boto_lambda.list_function_versions(FunctionName, region=None, key=None,
                                                keyid=None, profile=None)
```

List the versions available for the given function.

Returns list of function versions

CLI Example:

```
versions:
- {...}
- {...}
```

```
salt.modules.boto_lambda.list_functions(region=None, key=None, keyid=None, profile=None)
```

List all Lambda functions visible in the current scope.

CLI Example:

```
salt myminion boto_lambda.list_functions
```

`salt.modules.boto_lambda.remove_permission` (*FunctionName, StatementId, Qualifier=None, region=None, key=None, keyid=None, profile=None*)

Remove a permission from a lambda function.

Returns {removed: true} if the permission was removed and returns {removed: False} if the permission was not removed.

CLI Example:

```
salt myminion boto_lambda.remove_permission my_function my_id
```

`salt.modules.boto_lambda.update_alias` (*FunctionName, Name, FunctionVersion=None, Description=None, region=None, key=None, keyid=None, profile=None*)

Update the named alias to the configuration.

Returns {updated: true} if the alias was updated and returns {updated: False} if the alias was not updated.

CLI Example:

```
salt myminion boto_lambda.update_alias my_lambda my_alias $LATEST
```

`salt.modules.boto_lambda.update_event_source_mapping` (*UUID, FunctionName=None, Enabled=None, BatchSize=None, region=None, key=None, keyid=None, profile=None*)

Update the event source mapping identified by the UUID.

Returns {updated: true} if the alias was updated and returns {updated: False} if the alias was not updated.

CLI Example:

```
salt myminion boto_lambda.update_event_source_mapping uuid
↳FunctionName=new_function
```

`salt.modules.boto_lambda.update_function_code` (*FunctionName, ZipFile=None, S3Bucket=None, S3Key=None, S3ObjectVersion=None, Publish=False, region=None, key=None, keyid=None, profile=None*)

Upload the given code to the named lambda function.

Returns {updated: true} if the function was updated and returns {updated: False} if the function was not updated.

CLI Example:

```
salt myminion boto_lambda.update_function_code my_function
↳ZipFile=function.zip
```

`salt.modules.boto_lambda.update_function_config` (*FunctionName, Role=None, Handler=None, Description=None, Timeout=None, MemorySize=None, region=None, key=None, keyid=None, profile=None, VpcConfig=None, WaitForRole=False, RoleRetries=5, Environment=None*)

New in version 2017.7.0.

Update the named lambda function to the configuration.

#### Environment

The parent object that contains your environment's configuration settings. This is a dictionary of the form:

```
{
  'Variables': {
    'VariableName': 'VariableValue'
  }
}
```

Returns {'updated': True} if the function was updated, and {'updated': False} if the function was not updated.

CLI Example:

```
salt myminion boto_lambda.update_function_config my_function my_role my_
→file.my_function "my lambda function"
```

## 26.6.59 salt.modules.boto\_rds

Connection module for Amazon RDS

New in version 2015.8.0.

#### configuration

This module accepts explicit rds credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
→amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
rds.keyid: GKTADJGHEIQSXMKKRBJ08H
rds.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
rds.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
region: us-east-1
```

depends  
boto3

```
salt.modules.boto_rds.create(name, allocated_storage, db_instance_class, engine, master_username,
                             master_user_password, db_name=None, db_security_groups=None,
                             vpc_security_group_ids=None, vpc_security_groups=None,
                             availability_zone=None, db_subnet_group_name=None,
                             preferred_maintenance_window=None, db_parameter_group_name=None,
                             backup_retention_period=None, preferred_backup_window=None,
                             port=None, multi_az=None, engine_version=None,
                             auto_minor_version_upgrade=None, license_model=None, iops=None,
                             option_group_name=None, character_set_name=None,
                             publicly_accessible=None, wait_status=None, tags=None,
                             db_cluster_identifier=None, storage_type=None, tde_credential_arn=None,
                             tde_credential_password=None, storage_encrypted=None,
                             kms_key_id=None, domain=None, copy_tags_to_snapshot=None,
                             monitoring_interval=None, monitoring_role_arn=None,
                             domain_iam_role_name=None, region=None, promotion_tier=None,
                             key=None, keyid=None, profile=None)
```

Create an RDS Instance

CLI example to create an RDS Instance:

```
salt myminion boto_rds.create myrds 10 db.t2.micro MySQL sqlusr sqlpassw
```

```
salt.modules.boto_rds.create_option_group(name, engine_name, major_engine_version,
                                           option_group_description, tags=None, region=None,
                                           key=None, keyid=None, profile=None)
```

Create an RDS option group

CLI example to create an RDS option group:

```
salt myminion boto_rds.create_option_group my-opt-group mysql 5.6
→ "group description" ❌
```

```
salt.modules.boto_rds.create_parameter_group(name, db_parameter_group_family, description,
                                              tags=None, region=None, key=None, keyid=None,
                                              profile=None)
```

Create an RDS parameter group

CLI example to create an RDS parameter group:

```
salt myminion boto_rds.create_parameter_group my-param-group mysql5.6
→ "group description" ❌
```

```
salt.modules.boto_rds.create_read_replica(name, source_name, db_instance_class=None,
                                           availability_zone=None, port=None,
                                           auto_minor_version_upgrade=None, iops=None,
                                           option_group_name=None, publicly_accessible=None,
                                           tags=None, db_subnet_group_name=None,
                                           storage_type=None, copy_tags_to_snapshot=None,
                                           monitoring_interval=None,
                                           monitoring_role_arn=None, region=None, key=None,
                                           keyid=None, profile=None)
```

Create an RDS read replica

CLI example to create an RDS read replica:

```
salt myminion boto_rds.create_read_replica replicaname source_name
```

```
salt.modules.boto_rds.create_subnet_group(name, description, subnet_ids, tags=None,
                                           region=None, key=None, keyid=None, profile=None)
```

Create an RDS subnet group

CLI example to create an RDS subnet group:

```
salt myminion boto_rds.create_subnet_group my-subnet-group
→ "group description" '[subnet-12345678, subnet-87654321]'
→ region=us-east-1
```

```
salt.modules.boto_rds.delete(name, skip_final_snapshot=None, final_db_snapshot_identifier=None,
                              region=None, key=None, keyid=None, profile=None, tags=None,
                              wait_for_deletion=True, timeout=180)
```

Delete an RDS instance.

CLI Example:

```
salt myminion boto_rds.delete myrds skip_final_snapshot=True
→ region=us-east-1
```

```
salt.modules.boto_rds.delete_option_group(name, region=None, key=None, keyid=None,
                                           profile=None)
```

Delete an RDS option group.

CLI Example:

```
salt myminion boto_rds.delete_option_group my-opt-group
→ region=us-east-1
```

```
salt.modules.boto_rds.delete_parameter_group(name, region=None, key=None, keyid=None,
                                              profile=None)
```

Delete an RDS parameter group.

CLI Example:

```
salt myminion boto_rds.delete_parameter_group my-param-group
→ region=us-east-1
```

```
salt.modules.boto_rds.delete_subnet_group(name, region=None, key=None, keyid=None,
                                           profile=None)
```

Delete an RDS subnet group.

CLI Example:

```
salt myminion boto_rds.delete_subnet_group my-subnet-group
→ region=us-east-1
```

```
salt.modules.boto_rds.describe(name, tags=None, region=None, key=None, keyid=None, profile=None)
```

Return RDS instance details.

CLI Example:

```
salt myminion boto_rds.describe myrds
```

`salt.modules.boto_rds.describe_db_instances` (*name=None, filters=None, jmespath='DBInstances', region=None, key=None, keyid=None, profile=None*)

Return a detailed listing of some, or all, DB Instances visible in the current scope. Arbitrary subelements or subsections of the returned dataset can be selected by passing in a valid JMSEPath filter as well.

CLI Example:

```
salt myminion boto_rds.describe_db_instances jmespath='DBInstances[*].
↳DBInstanceIdentifier'
```

`salt.modules.boto_rds.describe_db_subnet_groups` (*name=None, filters=None, jmespath='DBSubnetGroups', region=None, key=None, keyid=None, profile=None*)

Return a detailed listing of some, or all, DB Subnet Groups visible in the current scope. Arbitrary subelements or subsections of the returned dataset can be selected by passing in a valid JMSEPath filter as well.

CLI Example:

```
salt myminion boto_rds.describe_db_subnet_groups
```

`salt.modules.boto_rds.describe_parameter_group` (*name, Filters=None, MaxRecords=None, Marker=None, region=None, key=None, keyid=None, profile=None*)

Returns a list of *DBParameterGroup* descriptions. CLI example to description of parameter group:

```
salt myminion boto_rds.describe_parameter_group parametergroupname
↳ region=us-east-1
```

`salt.modules.boto_rds.describe_parameters` (*name, Source=None, MaxRecords=None, Marker=None, region=None, key=None, keyid=None, profile=None*)

Returns a list of *DBParameterGroup* parameters. CLI example to description of parameters

```
salt myminion boto_rds.describe_parameters parametergroupname
↳ region=us-east-1
```

`salt.modules.boto_rds.exists` (*name, tags=None, region=None, key=None, keyid=None, profile=None*)

Check to see if an RDS exists.

CLI Example:

```
salt myminion boto_rds.exists myrds region=us-east-1
```

`salt.modules.boto_rds.get_endpoint` (*name, tags=None, region=None, key=None, keyid=None, profile=None*)

Return the endpoint of an RDS instance.

CLI Example:

```
salt myminion boto_rds.get_endpoint myrds
```

```

salt.modules.boto_rds.modify_db_instance(name, allocated_storage=None,
                                         allow_major_version_upgrade=None,
                                         apply_immediately=None,
                                         auto_minor_version_upgrade=None,
                                         backup_retention_period=None,
                                         ca_certificate_identifier=None,
                                         character_set_name=None,
                                         copy_tags_to_snapshot=None,
                                         db_cluster_identifier=None, db_instance_class=None,
                                         db_name=None, db_parameter_group_name=None,
                                         db_port_number=None, db_security_groups=None,
                                         db_subnet_group_name=None, domain=None,
                                         domain_iam_role_name=None, engine_version=None,
                                         iops=None, kms_key_id=None, license_model=None,
                                         master_user_password=None,
                                         monitoring_interval=None, monitoring_role_arn=None,
                                         multi_az=None, new_db_instance_identifier=None,
                                         option_group_name=None,
                                         preferred_backup_window=None,
                                         preferred_maintenance_window=None,
                                         promotion_tier=None, publicly_accessible=None,
                                         storage_encrypted=None, storage_type=None,
                                         tde_credential_arn=None,
                                         tde_credential_password=None,
                                         vpc_security_group_ids=None, region=None, key=None,
                                         keyid=None, profile=None)

```

Modify settings for a DB instance. CLI example to description of parameters

```

salt myminion boto_rds.modify_db_instance db_instance_identifier
→ region=us-east-1

```

```

salt.modules.boto_rds.option_group_exists(name, tags=None, region=None, key=None,
                                           keyid=None, profile=None)

```

Check to see if an RDS option group exists.

CLI Example:

```

salt myminion boto_rds.option_group_exists myoptiongr region=us-east-1

```

```

salt.modules.boto_rds.parameter_group_exists(name, tags=None, region=None, key=None,
                                              keyid=None, profile=None)

```

Check to see if an RDS parameter group exists.

CLI Example:

```

salt myminion boto_rds.parameter_group_exists myparametergroup
→ region=us-east-1

```

```

salt.modules.boto_rds.subnet_group_exists(name, tags=None, region=None, key=None,
                                           keyid=None, profile=None)

```

Check to see if an RDS subnet group exists.

CLI Example:

```
salt myminion boto_rds.subnet_group_exists my-param-group
→ region=us-east-1
```

`salt.modules.boto_rds.update_parameter_group` (*name, parameters, apply\_method='pending-reboot', tags=None, region=None, key=None, keyid=None, profile=None*)

Update an RDS parameter group.

CLI Example:

```
salt myminion boto_rds.update_parameter_group my-param-group
→ parameters='{"back_log":1, "binlog_cache_size":4096}'
→ region=us-east-1
```

### 26.6.60 salt.modules.boto\_route53

Connection module for Amazon Route53

New in version 2014.7.0.

#### configuration

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
→ amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdfklkdfklgsdfjajkghs
```

A region may also be specified in the configuration:

```
route53.region: us-east-1
```

If a region is not specified, the default is 'universal', which is what the boto\_route53 library expects, rather than None.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkdfklgsdfjajkghs
region: us-east-1
```

#### depends

boto

```
salt.modules.boto_route53.add_record(name, value, zone, record_type, identifier=None, ttl=None,
                                     region=None, key=None, keyid=None, profile=None,
                                     wait_for_sync=True, split_dns=False, private_zone=False,
                                     retry_on_rate_limit=None, rate_limit_retries=None,
                                     retry_on_errors=True, error_retries=5)
```

Add a record to a zone.

CLI Example:

```
salt myminion boto_route53.add_record test.example.org 1.1.1.1 example.
→org A
```

#### retry\_on\_errors

Continue to query if the zone exists after an error is raised. The previously used argument *retry\_on\_rate\_limit* was deprecated for this argument. Users can still use *retry\_on\_rate\_limit* to ensure backwards compatibility, but please migrate to using the favored *retry\_on\_errors* argument instead.

#### error\_retries

Number of times to attempt to query if the zone exists. The previously used argument *rate\_limit\_retries* was deprecated for this arguments. Users can still use *rate\_limit\_retries* to ensure backwards compatibility, but please migrate to using the favored *error\_retries* argument instead.

```
salt.modules.boto_route53.create_healthcheck(ip_addr=None, fqdn=None, region=None,
                                             key=None, keyid=None, profile=None, port=53,
                                             hc_type='TCP', resource_path="",
                                             string_match=None, request_interval=30,
                                             failure_threshold=3, retry_on_errors=True,
                                             error_retries=5)
```

Create a Route53 healthcheck

New in version 2018.3.0.

**ip\_addr**

IP address to check. *ip\_addr* or *fqdn* is required.

**fqdn**

Domain name of the endpoint to check. *ip\_addr* or *fqdn* is required

**port**

Port to check

**hc\_type**

Healthcheck type. HTTP | HTTPS | HTTP\_STR\_MATCH | HTTPS\_STR\_MATCH | TCP

**resource\_path**

Path to check

**string\_match**

If *hc\_type* is HTTP\_STR\_MATCH or HTTPS\_STR\_MATCH, the string to search for in the response body from the specified resource

**request\_interval**

The number of seconds between the time that Amazon Route 53 gets a response from your endpoint and the time that it sends the next health-check request.

**failure\_threshold**

The number of consecutive health checks that an endpoint must pass or fail for Amazon Route 53 to change the current status of the endpoint from unhealthy to healthy or vice versa.

**region**

Region endpoint to connect to

**key**

AWS key

**keyid**

AWS keyid

**profile**

AWS pillar profile

**CLI Example:**

```
salt myminion boto_route53.create_healthcheck 192.168.0.1
salt myminion boto_route53.create_healthcheck 192.168.0.1 port=443 hc_
  ↳ type=HTTPS
  ↳ resource_path=/ fqdn=blog.saltstack.furniture
```

**salt.modules.boto\_route53.create\_hosted\_zone** (*domain\_name*, *caller\_ref=*None, *comment=*",  
*private\_zone=*False, *vpc\_id=*None,  
*vpc\_name=*None, *vpc\_region=*None, *region=*None,  
*key=*None, *keyid=*None, *profile=*None)

Create a new Route53 Hosted Zone. Returns a Python data structure with information about the newly created Hosted Zone.

**domain\_name**

The name of the domain. This must be fully-qualified, terminating with a period. This is the name you have registered with your domain registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request.

**caller\_ref**

A unique string that identifies the request and that allows `create_hosted_zone()` calls to be retried without the risk of executing the operation twice. It can take several minutes for the change to replicate globally, and change from PENDING to INSYNC status. Thus it's best to provide some value for this where possible, since duplicate calls while the first is in PENDING status will be accepted and can lead to multiple copies of the zone being created. On the other hand, if a zone is created with a given `caller_ref`, then deleted, a second attempt to create a zone with the same `caller_ref` will fail until that `caller_ref` is flushed from the Route53 system, which can take upwards of 24 hours.

**comment**

Any comments you want to include about the hosted zone.

**private\_zone**

Set True if creating a private hosted zone.

**vpc\_id**

When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with `vpc_name`. Ignored when creating a non-private zone.

**vpc\_name**

When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with `vpc_id`. Ignored when creating a non-private zone.

**vpc\_region**

When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from `vpc_id` or `vpc_name`, where possible. If this fails, you'll need to provide an explicit value for this option. Ignored when creating a non-private zone.

**region**

Region endpoint to connect to.

**key**

AWS key to bind with.

**keyid**

AWS keyid to bind with.

**profile**

Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto_route53.create_hosted_zone example.org
```

`salt.modules.boto_route53.create_zone` (*zone, private=False, vpc\_id=None, vpc\_region=None, region=None, key=None, keyid=None, profile=None*)

Create a Route53 hosted zone.

New in version 2015.8.0.

**zone**

DNS zone to create

**private**

True/False if the zone will be a private zone

**vpc\_id**

VPC ID to associate the zone to (required if private is True)

**vpc\_region**

VPC Region (required if private is True)

**region**

region endpoint to connect to

**key**

AWS key

**keyid**

AWS keyid

**profile**

AWS pillar profile

CLI Example:

```
salt myminion boto_route53.create_zone example.org
```

`salt.modules.boto_route53.delete_record` (*name, zone, record\_type, identifier=None, all\_records=False, region=None, key=None, keyid=None, profile=None, wait\_for\_sync=True, split\_dns=False, private\_zone=False, retry\_on\_rate\_limit=None, rate\_limit\_retries=None, retry\_on\_errors=True, error\_retries=5*)

Modify a record in a zone.

CLI Example:

```
salt myminion boto_route53.delete_record test.example.org example.org A
```

#### **retry\_on\_errors**

Continue to query if the zone exists after an error is raised. The previously used argument *retry\_on\_rate\_limit* was deprecated for this argument. Users can still use *retry\_on\_rate\_limit* to ensure backwards compatibility, but please migrate to using the favored *retry\_on\_errors* argument instead.

#### **error\_retries**

Number of times to attempt to query if the zone exists. The previously used argument *rate\_limit\_retries* was deprecated for this arguments. Users can still use *rate\_limit\_retries* to ensure backwards compatibility, but please migrate to using the favored *error\_retries* argument instead.

`salt.modules.boto_route53.delete_zone` (*zone*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a Route53 hosted zone.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_route53.delete_zone example.org
```

`salt.modules.boto_route53.describe_hosted_zones` (*zone\_id=None*, *domain\_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return detailed info about one, or all, zones in the bound account. If neither *zone\_id* nor *domain\_name* is provided, return all zones. Note that the return format is slightly different between the 'all' and 'single' description types.

#### **zone\_id**

The unique identifier for the Hosted Zone

#### **domain\_name**

The FQDN of the Hosted Zone (including final period)

#### **region**

Region to connect to.

#### **key**

Secret key to be used.

#### **keyid**

Access key to be used.

#### **profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.describe_hosted_zones domain_name=foo.bar.com.
→ profile='{"region": "us-east-1", "keyid": "A12345678AB",
→ "key": "xblahblahblah"}'
```

```
salt.modules.boto_route53.get_record(name, zone, record_type, fetch_all=False, region=None,
                                     key=None, keyid=None, profile=None, split_dns=False,
                                     private_zone=False, identifier=None,
                                     retry_on_rate_limit=None, rate_limit_retries=None,
                                     retry_on_errors=True, error_retries=5)
```

Get a record from a zone.

CLI Example:

```
salt myminion boto_route53.get_record test.example.org example.org A
```

#### **retry\_on\_errors**

Continue to query if the zone exists after an error is raised. The previously used argument *retry\_on\_rate\_limit* was deprecated for this argument. Users can still use *retry\_on\_rate\_limit* to ensure backwards compatibility, but please migrate to using the favored *retry\_on\_errors* argument instead.

#### **error\_retries**

Number of times to attempt to query if the zone exists. The previously used argument *rate\_limit\_retries* was deprecated for this arguments. Users can still use *rate\_limit\_retries* to ensure backwards compatibility, but please migrate to using the favored *error\_retries* argument instead.

```
salt.modules.boto_route53.list_all_zones_by_id(region=None, key=None, keyid=None,
                                               profile=None)
```

List, by their IDs, all hosted zones in the bound account.

#### **region**

Region to connect to.

#### **key**

Secret key to be used.

#### **keyid**

Access key to be used.

#### **profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.list_all_zones_by_id
```

```
salt.modules.boto_route53.list_all_zones_by_name(region=None, key=None, keyid=None,
                                                  profile=None)
```

List, by their FQDNs, all hosted zones in the bound account.

#### **region**

Region to connect to.

#### **key**

Secret key to be used.

#### **keyid**

Access key to be used.

#### **profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.list_all_zones_by_name
```

`salt.modules.boto_route53.update_record`(*name, value, zone, record\_type, identifier=None, ttl=None, region=None, key=None, keyid=None, profile=None, wait\_for\_sync=True, split\_dns=False, private\_zone=False, retry\_on\_rate\_limit=None, rate\_limit\_retries=None, retry\_on\_errors=True, error\_retries=5*)

Modify a record in a zone.

CLI Example:

```
salt myminion boto_route53.modify_record test.example.org 1.1.1.1 example.  
→org A
```

#### **retry\_on\_errors**

Continue to query if the zone exists after an error is raised. The previously used argument `retry_on_rate_limit` was deprecated for this argument. Users can still use `retry_on_rate_limit` to ensure backwards compatibility, but please migrate to using the favored `retry_on_errors` argument instead.

#### **error\_retries**

Number of times to attempt to query if the zone exists. The previously used argument `rate_limit_retries` was deprecated for this arguments. Users can still use `rate_limit_retries` to ensure backwards compatibility, but please migrate to using the favored `error_retries` argument instead.

`salt.modules.boto_route53.zone_exists`(*zone, region=None, key=None, keyid=None, profile=None, retry\_on\_rate\_limit=None, rate\_limit\_retries=None, retry\_on\_errors=True, error\_retries=5*)

Check for the existence of a Route53 hosted zone.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_route53.zone_exists example.org
```

#### **retry\_on\_errors**

Continue to query if the zone exists after an error is raised. The previously used argument `retry_on_rate_limit` was deprecated for this argument. Users can still use `retry_on_rate_limit` to ensure backwards compatibility, but please migrate to using the favored `retry_on_errors` argument instead.

#### **error\_retries**

Number of times to attempt to query if the zone exists. The previously used argument `rate_limit_retries` was deprecated for this arguments. Users can still use `rate_limit_retries` to ensure backwards compatibility, but please migrate to using the favored `error_retries` argument instead.

## 26.6.61 salt.modules.boto\_s3

Connection module for Amazon S3 using boto3

New in version 2018.3.0.

### configuration

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles or it can read them from the `~/.aws/credentials` file or from these environment variables: `AWS_ACCESS_KEY_ID`, `AWS_SECRET_ACCESS_KEY`. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
http://boto3.readthedocs.io/en/latest/guide/configuration.html#guide-configuration
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
s3.region: us-east-1
```

If a region is not specified, the default is `us-east-1`.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
  region: us-east-1
```

### depends

boto3

`salt.modules.boto_s3.get_object_metadata` (*name*, *extra\_args=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get metadata about an S3 object. Returns None if the object does not exist.

You can pass AWS SSE-C related args and/or RequestPayer in *extra\_args*.

CLI Example:

```
salt myminion boto_s3.get_object_metadata \
    my_bucket/path/to/object \
    region=us-east-1 \
    key=key \
    keyid=keyid \
    profile=profile \
```

`salt.modules.boto_s3.upload_file` (*source, name, extra\_args=None, region=None, key=None, keyid=None, profile=None*)

Upload a local file as an S3 object.

CLI Example:

```
salt myminion boto_s3.upload_file \
    /path/to/local/file \
    my_bucket/path/to/object \
    region=us-east-1 \
    key=key \
    keyid=keyid \
    profile=profile \
```

### 26.6.62 salt.modules.boto\_s3\_bucket

Connection module for Amazon S3 Buckets

New in version 2016.3.0.

#### depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

#### configuration

This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

<http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkgghs
```

A region may also be specified in the configuration:

```
s3.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkgghs
  region: us-east-1
```

```
salt.modules.boto_s3_bucket.create(Bucket, ACL=None, LocationConstraint=None,
                                   GrantFullControl=None, GrantRead=None, GrantReadACP=None,
                                   GrantWrite=None, GrantWriteACP=None, region=None,
                                   key=None, keyid=None, profile=None)
```

Given a valid config, create an S3 Bucket.

Returns {created: true} if the bucket was created and returns {created: False} if the bucket was not created.

CLI Example:

```
salt myminion boto_s3_bucket.create my_bucket \
                                   GrantFullControl='emailaddress=example@example.com' \
                                   GrantRead='uri="http://acs.amazonaws.com/groups/global/
→AllUsers"' \
                                   GrantReadACP='emailaddress="exampl@example.com",id=
→"2345678909876432"' \
                                   LocationConstraint=us-west-1
```

```
salt.modules.boto_s3_bucket.delete(Bucket, MFA=None, RequestPayer=None, Force=False,
                                   region=None, key=None, keyid=None, profile=None)
```

Given a bucket name, delete it, optionally emptying it first.

Returns {deleted: true} if the bucket was deleted and returns {deleted: false} if the bucket was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete mybucket
```

```
salt.modules.boto_s3_bucket.delete_cors(Bucket, region=None, key=None, keyid=None,
                                         profile=None)
```

Delete the CORS configuration for the given bucket

Returns {deleted: true} if CORS was deleted and returns {deleted: False} if CORS was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_cors my_bucket
```

```
salt.modules.boto_s3_bucket.delete_lifecycle_configuration(Bucket, region=None,
                                                           key=None, keyid=None,
                                                           profile=None)
```

Delete the lifecycle configuration for the given bucket

Returns {deleted: true} if Lifecycle was deleted and returns {deleted: False} if Lifecycle was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_lifecycle_configuration my_bucket
```

```
salt.modules.boto_s3_bucket.delete_objects(Bucket, Delete, MFA=None, RequestPayer=None,
                                             region=None, key=None, keyid=None, profile=None)
```

Delete objects in a given S3 bucket.

Returns {deleted: true} if all objects were deleted and {deleted: false, failed: [key, ...]} otherwise

CLI Example:

```
salt myminion boto_s3_bucket.delete_objects mybucket '{Objects: [Key:
→myobject]}'
```

`salt.modules.boto_s3_bucket.delete_policy` (*Bucket, region=None, key=None, keyid=None, profile=None*)

Delete the policy from the given bucket

Returns {deleted: true} if policy was deleted and returns {deleted: False} if policy was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_policy my_bucket
```

`salt.modules.boto_s3_bucket.delete_replication` (*Bucket, region=None, key=None, keyid=None, profile=None*)

Delete the replication config from the given bucket

Returns {deleted: true} if replication configuration was deleted and returns {deleted: False} if replication configuration was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_replication my_bucket
```

`salt.modules.boto_s3_bucket.delete_tagging` (*Bucket, region=None, key=None, keyid=None, profile=None*)

Delete the tags from the given bucket

Returns {deleted: true} if tags were deleted and returns {deleted: False} if tags were not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_tagging my_bucket
```

`salt.modules.boto_s3_bucket.delete_website` (*Bucket, region=None, key=None, keyid=None, profile=None*)

Remove the website configuration from the given bucket

Returns {deleted: true} if website configuration was deleted and returns {deleted: False} if website configuration was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_website my_bucket
```

`salt.modules.boto_s3_bucket.describe` (*Bucket, region=None, key=None, keyid=None, profile=None*)

Given a bucket name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_s3_bucket.describe mybucket
```

`salt.modules.boto_s3_bucket.empty` (*Bucket, MFA=None, RequestPayer=None, region=None, key=None, keyid=None, profile=None*)

Delete all objects in a given S3 bucket.

Returns {deleted: true} if all objects were deleted and {deleted: false, failed: [key, ...]} otherwise

CLI Example:

```
salt myminion boto_s3_bucket.empty mybucket
```

`salt.modules.boto_s3_bucket.exists` (*Bucket, region=None, key=None, keyid=None, profile=None*)

Given a bucket name, check to see if the given bucket exists.

Returns True if the given bucket exists and returns False if the given bucket does not exist.

CLI Example:

```
salt myminion boto_s3_bucket.exists mybucket
```

`salt.modules.boto_s3_bucket.list` (*region=None, key=None, keyid=None, profile=None*)

List all buckets owned by the authenticated sender of the request.

Returns list of buckets

CLI Example:

```
Owner: {...}
Buckets:
- {...}
- {...}
```

`salt.modules.boto_s3_bucket.list_object_versions` (*Bucket, Delimiter=None, EncodingType=None, Prefix=None, region=None, key=None, keyid=None, profile=None*)

List objects in a given S3 bucket.

Returns a list of objects.

CLI Example:

```
salt myminion boto_s3_bucket.list_object_versions mybucket
```

`salt.modules.boto_s3_bucket.list_objects` (*Bucket, Delimiter=None, EncodingType=None, Prefix=None, FetchOwner=False, StartAfter=None, region=None, key=None, keyid=None, profile=None*)

List objects in a given S3 bucket.

Returns a list of objects.

CLI Example:

```
salt myminion boto_s3_bucket.list_objects mybucket
```

`salt.modules.boto_s3_bucket.put_acl` (*Bucket, ACL=None, AccessControlPolicy=None, GrantFullControl=None, GrantRead=None, GrantReadACP=None, GrantWrite=None, GrantWriteACP=None, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update the ACL for a bucket.

Returns {updated: true} if the ACL was updated and returns {updated: False} if the ACL was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_acl my_bucket 'public' \
    GrantFullControl='emailaddress=example@example.com' \
    GrantRead='uri="http://acs.amazonaws.com/groups/global/
↳AllUsers"' \
    GrantReadACP='emailaddress="exempl@example.com",id=
↳"2345678909876432"'
```

`salt.modules.boto_s3_bucket.put_cors`(*Bucket, CORSRules, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update the CORS rules for a bucket.

Returns {updated: true} if CORS was updated and returns {updated: False} if CORS was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_cors my_bucket '[{\
  "AllowedHeaders": [],\
  "AllowedMethods": ["GET"],\
  "AllowedOrigins": ["*"],\
  "ExposeHeaders": [],\
  "MaxAgeSeconds": 123,\
}]'
```

`salt.modules.boto_s3_bucket.put_lifecycle_configuration`(*Bucket, Rules, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update the Lifecycle rules for a bucket.

Returns {updated: true} if Lifecycle was updated and returns {updated: False} if Lifecycle was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_lifecycle_configuration my_bucket '[{\
  "Expiration": {...},\
  "ID": "idstring",\
  "Prefix": "prefixstring",\
  "Status": "enabled",\
  "Transitions": [{...}],\
  "NoncurrentVersionTransitions": [{...}],\
  "NoncurrentVersionExpiration": {...},\
}]'
```

`salt.modules.boto_s3_bucket.put_logging`(*Bucket, TargetBucket=None, TargetPrefix=None, TargetGrants=None, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update the logging parameters for a bucket.

Returns {updated: true} if parameters were updated and returns {updated: False} if parameters were not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_logging my_bucket log_bucket '[{...}]'
↳prefix
```

`salt.modules.boto_s3_bucket.put_notification_configuration`(*Bucket*,  
*TopicConfigurations=None*,  
*QueueConfigurations=None*,  
*LambdaFunctionConfigurations=None*, *region=None*,  
*key=None*, *keyid=None*,  
*profile=None*)

Given a valid config, update the notification parameters for a bucket.

Returns {updated: true} if parameters were updated and returns {updated: False} if parameters were not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_notification_configuration my_bucket
  [{...}] \
  [{...}] \
  [{...}]
```

`salt.modules.boto_s3_bucket.put_policy`(*Bucket*, *Policy*, *region=None*, *key=None*, *keyid=None*,  
*profile=None*)

Given a valid config, update the policy for a bucket.

Returns {updated: true} if policy was updated and returns {updated: False} if policy was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_policy my_bucket {...}
```

`salt.modules.boto_s3_bucket.put_replication`(*Bucket*, *Role*, *Rules*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Given a valid config, update the replication configuration for a bucket.

Returns {updated: true} if replication configuration was updated and returns {updated: False} if replication configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_replication my_bucket my_role [...]
```

`salt.modules.boto_s3_bucket.put_request_payment`(*Bucket*, *Payer*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Given a valid config, update the request payment configuration for a bucket.

Returns {updated: true} if request payment configuration was updated and returns {updated: False} if request payment configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_request_payment my_bucket Requester
```

`salt.modules.boto_s3_bucket.put_tagging`(*Bucket*, *region=None*, *key=None*, *keyid=None*,  
*profile=None*, *\*\*kwargs*)

Given a valid config, update the tags for a bucket.

Returns {updated: true} if tags were updated and returns {updated: False} if tags were not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_tagging my_bucket my_role [...]
```

`salt.modules.boto_s3_bucket.put_versioning` (*Bucket, Status, MFADelete=None, MFA=None, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update the versioning configuration for a bucket.

Returns {updated: true} if versioning configuration was updated and returns {updated: False} if versioning configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_versioning my_bucket Enabled
```

`salt.modules.boto_s3_bucket.put_website` (*Bucket, ErrorDocument=None, IndexDocument=None, RedirectAllRequestsTo=None, RoutingRules=None, region=None, key=None, keyid=None, profile=None*)

Given a valid config, update the website configuration for a bucket.

Returns {updated: true} if website configuration was updated and returns {updated: False} if website configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_website my_bucket IndexDocument='{"Suffix": "index.html"}'
```

### 26.6.63 salt.modules.boto\_secgroup

Connection module for Amazon Security Groups

New in version 2014.7.0.

#### configuration

This module accepts explicit ec2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
secgroup.keyid: GKTADJGHEIQSXMKKRBJ08H
secgroup.key: askdjghsdfjkgHwupUjasdfkldfklgjsdfjajkgHs
```

A region may also be specified in the configuration:

```
secgroup.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs
  region: us-east-1

```

**depends**

boto

```

salt.modules.boto_secgroup.authorize(name=None, source_group_name=None,
                                       source_group_owner_id=None, ip_protocol=None,
                                       from_port=None, to_port=None, cidr_ip=None,
                                       group_id=None, source_group_group_id=None, region=None,
                                       key=None, keyid=None, profile=None, vpc_id=None,
                                       vpc_name=None, egress=False)

```

Add a new rule to an existing security group.

CLI Example:

```

salt myminion boto_secgroup.authorize mysecgroup ip_protocol=tcp from_
→port=80 to_port=80 cidr_ip=['10.0.0.0/8', '192.168.0.0/24']

```

```

salt.modules.boto_secgroup.convert_to_group_ids(groups, vpc_id=None, vpc_name=None,
                                                  region=None, key=None, keyid=None,
                                                  profile=None)

```

Given a list of security groups and a vpc\_id, convert\_to\_group\_ids will convert all list items in the given list to security group ids.

CLI Example:

```

salt myminion boto_secgroup.convert_to_group_ids mysecgroup vpc-89yhh7h

```

```

salt.modules.boto_secgroup.create(name, description, vpc_id=None, vpc_name=None, region=None,
                                   key=None, keyid=None, profile=None)

```

Create a security group.

CLI Example:

```

salt myminion boto_secgroup.create mysecgroup 'My Security Group'

```

```

salt.modules.boto_secgroup.delete(name=None, group_id=None, region=None, key=None, keyid=None,
                                   profile=None, vpc_id=None, vpc_name=None)

```

Delete a security group.

CLI Example:

```

salt myminion boto_secgroup.delete mysecgroup

```

```

salt.modules.boto_secgroup.delete_tags(tags, name=None, group_id=None, vpc_name=None,
                                         vpc_id=None, region=None, key=None, keyid=None,
                                         profile=None)

```

Deletes tags from a security group.

New in version 2016.3.0.

**tags**

a list of tags to remove

**name**  
the name of the security group

**group\_id**  
the group id of the security group (in lieu of a name/vpc combo)

**vpc\_name**  
the name of the vpc to search the named group for

**vpc\_id**  
the id of the vpc, in lieu of the vpc\_name

**region**  
the amazon region

**key**  
amazon key

**keyid**  
amazon keyid

**profile**  
amazon profile

CLI Example:

```
salt myminion boto_secgroup.delete_tags ['TAG_TO_DELETE1','TAG_TO_DELETE2
→'] security_group_name vpc_id=vpc-13435 profile=my_aws_profile
```

`salt.modules.boto_secgroup.exists` (*name=None, region=None, key=None, keyid=None, profile=None, vpc\_id=None, vpc\_name=None, group\_id=None*)

Check to see if a security group exists.

CLI Example:

```
salt myminion boto_secgroup.exists mysecgroup
```

`salt.modules.boto_secgroup.get_all_security_groups` (*groupnames=None, group\_ids=None, filters=None, region=None, key=None, keyid=None, profile=None*)

Return a list of all Security Groups matching the given criteria and filters.

Note that the `groupnames` argument only functions correctly for EC2 Classic and default VPC Security Groups. To find groups by name in other VPCs you'll want to use the `group-name` filter instead.

The valid keys for the `filters` argument can be found in [AWS's API documentation](#).

CLI Example:

```
salt myminion boto_secgroup.get_all_security_groups filters='{group-name:
→mygroup}'
```

`salt.modules.boto_secgroup.get_config` (*name=None, group\_id=None, region=None, key=None, keyid=None, profile=None, vpc\_id=None, vpc\_name=None*)

Get the configuration for a security group.

CLI Example:

```
salt myminion boto_secgroup.get_config mysecgroup
```

```
salt.modules.boto_secgroup.get_group_id(name, vpc_id=None, vpc_name=None, region=None,
                                         key=None, keyid=None, profile=None)
```

Get a Group ID given a Group Name or Group Name and VPC ID

CLI Example:

```
salt myminion boto_secgroup.get_group_id mysecgroup
```

```
salt.modules.boto_secgroup.revoke(name=None, source_group_name=None,
                                   source_group_owner_id=None, ip_protocol=None, from_port=None,
                                   to_port=None, cidr_ip=None, group_id=None,
                                   source_group_group_id=None, region=None, key=None,
                                   keyid=None, profile=None, vpc_id=None, vpc_name=None,
                                   egress=False)
```

Remove a rule from an existing security group.

CLI Example:

```
salt myminion boto_secgroup.revoke mysecgroup ip_protocol=tcp from_
↳port=80 to_port=80 cidr_ip='10.0.0.0/8'
```

```
salt.modules.boto_secgroup.set_tags(tags, name=None, group_id=None, vpc_name=None,
                                     vpc_id=None, region=None, key=None, keyid=None,
                                     profile=None)
```

Sets tags on a security group.

New in version 2016.3.0.

**tags**

a dict of key:value pair of tags to set on the security group

**name**

the name of the security group

**group\_id**

the group id of the security group (in lieu of a name/vpc combo)

**vpc\_name**

the name of the vpc to search the named group for

**vpc\_id**

the id of the vpc, in lieu of the vpc\_name

**region**

the amazon region

**key**

amazon key

**keyid**

amazon keyid

**profile**

amazon profile

CLI Example:

```
salt myminion boto_secgroup.set_tags '{"TAG1': 'Value1', 'TAG2': 'Value2'}
↳" security_group_name vpc_id=vpc-13435 profile=my_aws_profile
```

## 26.6.64 salt.modules.boto\_sns

Connection module for Amazon SNS

### configuration

This module accepts explicit sns credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
→amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs
```

A region may also be specified in the configuration:

```
sns.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs
  region: us-east-1
```

### depends

boto

**salt.modules.boto\_sns.create** (*name, region=None, key=None, keyid=None, profile=None*)

Create an SNS topic.

CLI example to create a topic:

```
salt myminion boto_sns.create mytopic region=us-east-1
```

**salt.modules.boto\_sns.delete** (*name, region=None, key=None, keyid=None, profile=None*)

Delete an SNS topic.

CLI example to delete a topic:

```
salt myminion boto_sns.delete mytopic region=us-east-1
```

**salt.modules.boto\_sns.exists** (*name, region=None, key=None, keyid=None, profile=None*)

Check to see if an SNS topic exists.

CLI Example:

```
salt myminion boto_sns.exists mytopic region=us-east-1
```

**salt.modules.boto\_sns.get\_all\_subscriptions\_by\_topic** (*name, region=None, key=None, keyid=None, profile=None*)

Get list of all subscriptions to a specific topic.

CLI example to delete a topic:

```
salt myminion boto_sns.get_all_subscriptions_by_topic mytopic region=us-
→east-1
```

`salt.modules.boto_sns.get_all_topics` (*region=None, key=None, keyid=None, profile=None*)

Returns a list of the all topics..

CLI Example:

```
salt myminion boto_sns.get_all_topics
```

`salt.modules.boto_sns.get_arn` (*name, region=None, key=None, keyid=None, profile=None*)

Returns the full ARN for a given topic name.

CLI Example:

```
salt myminion boto_sns.get_arn mytopic
```

`salt.modules.boto_sns.subscribe` (*topic, protocol, endpoint, region=None, key=None, keyid=None, profile=None*)

Subscribe to a Topic.

CLI example to delete a topic:

```
salt myminion boto_sns.subscribe mytopic https https://www.example.com/
→sns-endpoint region=us-east-1
```

`salt.modules.boto_sns.unsubscribe` (*topic, subscription\_arn, region=None, key=None, keyid=None, profile=None*)

Unsubscribe a specific SubscriptionArn of a topic.

CLI Example:

```
salt myminion boto_sns.unsubscribe my_topic my_subscription_arn region=us-
→east-1
```

New in version 2016.11.0.

### 26.6.65 salt.modules.boto\_sqs

Connection module for Amazon SQS

New in version 2014.7.0.

#### configuration

This module accepts explicit sqs credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
→amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdfklkdflkjgjsdfjajkghs
```

A region may also be specified in the configuration:

```
sqs.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkjgjsdfjajkghs
  region: us-east-1
```

### depends

boto3

`salt.modules.boto_sqs.create` (*name*, *attributes=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an SQS queue.

CLI Example:

```
salt myminion boto_sqs.create myqueue region=us-east-1
```

`salt.modules.boto_sqs.delete` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an SQS queue.

CLI Example:

```
salt myminion boto_sqs.delete myqueue region=us-east-1
```

`salt.modules.boto_sqs.exists` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if a queue exists.

CLI Example:

```
salt myminion boto_sqs.exists myqueue region=us-east-1
```

`salt.modules.boto_sqs.get_attributes` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return attributes currently set on an SQS queue.

CLI Example:

```
salt myminion boto_sqs.get_attributes myqueue
```

`salt.modules.boto_sqs.list_` (*prefix=""*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return a list of the names of all visible queues.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_sqs.list region=us-east-1
```

`salt.modules.boto_sqs.set_attributes` (*name, attributes, region=None, key=None, keyid=None, profile=None*)

Set attributes on an SQS queue.

CLI Example:

```
salt myminion boto_sqs.set_attributes myqueue '{ReceiveMessageWaitTimeSeconds: 20}' region=us-east-1
```

## 26.6.66 salt.modules.boto\_ssm

Connection module for Amazon SSM

### configuration

This module uses IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

### depends

boto3

`salt.modules.boto_ssm.delete_parameter` (*Name, region=None, key=None, keyid=None, profile=None*)

Removes a parameter from the SSM parameter store

New in version 3000.

```
salt-call boto_ssm.delete_parameter test-param
```

`salt.modules.boto_ssm.get_parameter` (*name, withdecryption=False, resp\_json=False, region=None, key=None, keyid=None, profile=None*)

Retrieves a parameter from SSM Parameter Store

New in version 3000.

```
salt-call boto_ssm.get_parameter test-param withdescription=True
```

`salt.modules.boto_ssm.put_parameter` (*Name, Value, Description=None, Type='String', KeyId=None, Overwrite=False, AllowedPattern=None, region=None, key=None, keyid=None, profile=None*)

Sets a parameter in the SSM parameter store

New in version 3000.

```
salt-call boto_ssm.put_parameter test-param test_value Type=SecureString KeyId=alias/aws/ssm Description='test encrypted key'
```

## 26.6.67 salt.modules.boto\_vpc

Connection module for Amazon VPC

New in version 2014.7.0.

### depends

- boto >= 2.8.0
- boto3 >= 1.2.6

### configuration

This module accepts explicit VPC credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available [here](#).

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
vpc.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
region: us-east-1
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```
created: true
```

or

```
created: false
error:
message: error message
```

Request methods (e.g., *describe\_vpc*) return:

```
vpcs:
- {...}
- {...}
```

or

```
error:
message: error message
```

New in version 2016.11.0.

Functions to request, accept, delete and describe VPC peering connections. Named VPC peering connections can be requested using these modules. VPC owner accounts can accept VPC peering connections (named or otherwise).

Examples showing creation of VPC peering connection

```
# Create a named VPC peering connection
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-
↳be82e9da name=my_vpc_connection
# Without a name
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-
↳be82e9da
# Specify a region
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-
↳be82e9da region=us-west-2
```

Check to see if VPC peering connection is pending

```
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc
# Specify a region
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc region=us-
↳west-2
# specify an id
salt myminion boto_vpc.is_peering_connection_pending conn_id=pcx-8a8939e3
```

Accept VPC peering connection

```
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc region=us-
↳west-2
# specify an id
salt myminion boto_vpc.accept_vpc_peering_connection conn_id=pcx-8a8939e3
```

Deleting VPC peering connection via this module

```
# Delete a named VPC peering connection
salt myminion boto_vpc.delete_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.delete_vpc_peering_connection name=salt-vpc region=us-
↳west-2
# specify an id
salt myminion boto_vpc.delete_vpc_peering_connection conn_id=pcx-8a8939e3
```

```
salt.modules.boto_vpc.accept_vpc_peering_connection(conn_id="", name="", region=None,
                                                    key=None, keyid=None, profile=None,
                                                    dry_run=False)
```

Request a VPC peering connection between two VPCs.

New in version 2016.11.0.

#### Parameters

- **conn\_id** -- The ID to use. String type.
- **name** -- The name of this VPC peering connection. String type.
- **region** -- The AWS region to use. Type string.

- **key** -- The key to use for this connection. Type string.
- **keyid** -- The key id to use.
- **profile** -- The profile to use.
- **dry\_run** -- The dry\_run flag to set.

**Returns**  
dict

Warning: Please specify either the vpc\_peering\_connection\_id or name but not both. Specifying both will result in an error!

CLI Example:

```
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc
→region=us-west-2
# specify an id
salt myminion boto_vpc.accept_vpc_peering_connection conn_id=pcx-8a8939e3
```

`salt.modules.boto_vpc.associate_dhcp_options_to_vpc` (*dhcp\_options\_id*, *vpc\_id=None*,  
*vpc\_name=None*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

Given valid DHCP options id and a valid VPC id, associate the DHCP options record with the VPC.

Returns True if the DHCP options record were associated and returns False if the DHCP options record was not associated.

CLI Example:

```
salt myminion boto_vpc.associate_dhcp_options_to_vpc 'dhcp-a0bl34pp' 'vpc-
→6b1fe402'
```

`salt.modules.boto_vpc.associate_network_acl_to_subnet` (*network\_acl\_id=None*,  
*subnet\_id=None*,  
*network\_acl\_name=None*,  
*subnet\_name=None*, *region=None*,  
*key=None*, *keyid=None*,  
*profile=None*)

Given a network acl and subnet ids or names, associate a network acl to a subnet.

CLI Example:

```
salt myminion boto_vpc.associate_network_acl_to_subnet \
network_acl_id='acl-5fb85d36' subnet_id='subnet-6a1fe403'
```

```
salt myminion boto_vpc.associate_network_acl_to_subnet \
network_acl_id='myacl' subnet_id='mysubnet'
```

`salt.modules.boto_vpc.associate_route_table` (*route\_table\_id=None*, *subnet\_id=None*,  
*route\_table\_name=None*, *subnet\_name=None*,  
*region=None*, *key=None*, *keyid=None*,  
*profile=None*)

Given a route table and subnet name or id, associates the route table with the subnet.

CLI Example:

```
salt myminion boto_vpc.associate_route_table 'rtb-1f382e7d' 'subnet-
→6a1fe403'
```

```
salt myminion boto_vpc.associate_route_table route_table_name='myrtb' \
subnet_name='mysubnet'
```

`salt.modules.boto_vpc.check_vpc` (*vpc\_id=None, vpc\_name=None, region=None, key=None, keyid=None, profile=None*)

Check whether a VPC with the given name or id exists. Returns the vpc\_id or None. Raises SaltInvocationError if both vpc\_id and vpc\_name are None. Optionally raise a CommandExecutionError if the VPC does not exist.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_vpc.check_vpc vpc_name=myvpc profile=awsprofile
```

`salt.modules.boto_vpc.create` (*cidr\_block, instance\_tenancy=None, vpc\_name=None, enable\_dns\_support=None, enable\_dns\_hostnames=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given a valid CIDR block, create a VPC.

An optional instance\_tenancy argument can be provided. If provided, the valid values are 'default' or 'dedicated'

An optional vpc\_name argument can be provided.

Returns {created: true} if the VPC was created and returns {created: False} if the VPC was not created.

CLI Example:

```
salt myminion boto_vpc.create '10.0.0.0/24'
```

`salt.modules.boto_vpc.create_customer_gateway` (*vpn\_connection\_type, ip\_address, bgp\_asn, customer\_gateway\_name=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given a valid VPN connection type, a static IP address and a customer gateway's Border Gateway Protocol (BGP) Autonomous System Number, create a customer gateway.

Returns the customer gateway id if the customer gateway was created and returns False if the customer gateway was not created.

CLI Example:

```
salt myminion boto_vpc.create_customer_gateway 'ipsec.1', '12.1.2.3', ☒
→65534
```

`salt.modules.boto_vpc.create_dhcp_options` (*domain\_name=None, domain\_name\_servers=None, ntp\_servers=None, netbios\_name\_servers=None, netbios\_node\_type=None, dhcp\_options\_name=None, tags=None, vpc\_id=None, vpc\_name=None, region=None, key=None, keyid=None, profile=None*)

Given valid DHCP options, create a DHCP options record, optionally associating it with an existing VPC.

Returns True if the DHCP options record was created and returns False if the DHCP options record was not deleted.

Changed in version 2015.8.0: Added `vpc_name` and `vpc_id` arguments

CLI Example:

```
salt myminion boto_vpc.create_dhcp_options domain_name='example.com' \  
domain_name_servers='[1.2.3.4]' ntp_servers='[5.6.7.8]' \  
netbios_name_servers='[10.0.0.1]' netbios_node_type=1 \  
vpc_name='myvpc'
```

```
salt.modules.boto_vpc.create_internet_gateway(internet_gateway_name=None, vpc_id=None, vpc_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Create an Internet Gateway, optionally attaching it to an existing VPC.

Returns the internet gateway id if the internet gateway was created and returns False if the internet gateways was not created.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.create_internet_gateway \  
internet_gateway_name=myigw vpc_name=myvpc
```

```
salt.modules.boto_vpc.create_nat_gateway(subnet_id=None, subnet_name=None, allocation_id=None, region=None, key=None, keyid=None, profile=None)
```

Create a NAT Gateway within an existing subnet. If `allocation_id` is specified, the elastic IP address it references is associated with the gateway. Otherwise, a new `allocation_id` is created and used.

This function requires boto3 to be installed.

Returns the nat gateway id if the nat gateway was created and returns False if the nat gateway was not created.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_vpc.create_nat_gateway subnet_name=mysubnet
```

```
salt.modules.boto_vpc.create_network_acl(vpc_id=None, vpc_name=None, network_acl_name=None, subnet_id=None, subnet_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Given a `vpc_id`, creates a network acl.

Returns the network acl id if successful, otherwise returns False.

Changed in version 2015.8.0: Added `vpc_name`, `subnet_id`, and `subnet_name` arguments

CLI Example:

```
salt myminion boto_vpc.create_network_acl 'vpc-6b1fe402'
```

```
salt.modules.boto_vpc.create_network_acl_entry(network_acl_id=None, rule_number=None,
                                              protocol=None, rule_action=None,
                                              cidr_block=None, egress=None,
                                              network_acl_name=None, icmp_code=None,
                                              icmp_type=None, port_range_from=None,
                                              port_range_to=None, region=None, key=None,
                                              keyid=None, profile=None)
```

Creates a network acl entry.

CLI Example:

```
salt myminion boto_vpc.create_network_acl_entry 'acl-5fb85d36' '32767' \
    'all' 'deny' '0.0.0.0/0' egress=true
```

```
salt.modules.boto_vpc.create_route(route_table_id=None, destination_cidr_block=None,
                                   route_table_name=None, gateway_id=None,
                                   internet_gateway_name=None, instance_id=None,
                                   interface_id=None, vpc_peering_connection_id=None,
                                   vpc_peering_connection_name=None, region=None, key=None,
                                   keyid=None, profile=None, nat_gateway_id=None,
                                   nat_gateway_subnet_name=None,
                                   nat_gateway_subnet_id=None)
```

Creates a route.

If a nat gateway is specified, boto3 must be installed

CLI Example:

```
salt myminion boto_vpc.create_route 'rtb-1f382e7d' '10.0.0.0/16' gateway_
    id='vgw-a1b2c3'
```

```
salt.modules.boto_vpc.create_route_table(vpc_id=None, vpc_name=None,
                                           route_table_name=None, tags=None, region=None,
                                           key=None, keyid=None, profile=None)
```

Creates a route table.

Changed in version 2015.8.0: Added vpc\_name argument

CLI Examples:

```
salt myminion boto_vpc.create_route_table vpc_id='vpc-6b1fe402' \
    route_table_name='myroutetable'
salt myminion boto_vpc.create_route_table vpc_name='myvpc' \
    route_table_name='myroutetable'
```

```
salt.modules.boto_vpc.create_subnet(vpc_id=None, cidr_block=None, vpc_name=None,
                                     availability_zone=None, subnet_name=None, tags=None,
                                     region=None, key=None, keyid=None, profile=None,
                                     auto_assign_public_ipv4=False)
```

Given a valid VPC ID or Name and a CIDR block, create a subnet for the VPC.

An optional availability zone argument can be provided.

Returns True if the VPC subnet was created and returns False if the VPC subnet was not created.

Changed in version 2015.8.0: Added vpc\_name argument

CLI Examples:

```
salt myminion boto_vpc.create_subnet vpc_id='vpc-6b1fe402' \
    subnet_name='mysubnet' cidr_block='10.0.0.0/25'
salt myminion boto_vpc.create_subnet vpc_name='myvpc' \
    subnet_name='mysubnet', cidr_block='10.0.0.0/25'
```

`salt.modules.boto_vpc.customer_gateway_exists` (*customer\_gateway\_id=None, customer\_gateway\_name=None, region=None, key=None, keyid=None, profile=None*)

Given a customer gateway ID, check if the customer gateway ID exists.

Returns True if the customer gateway ID exists; Returns False otherwise.

CLI Example:

```
salt myminion boto_vpc.customer_gateway_exists cgw-b6a247df
salt myminion boto_vpc.customer_gateway_exists customer_gateway_name=mycgw
```

`salt.modules.boto_vpc.delete` (*vpc\_id=None, name=None, vpc\_name=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given a VPC ID or VPC name, delete the VPC.

Returns {deleted: true} if the VPC was deleted and returns {deleted: false} if the VPC was not deleted.

CLI Example:

```
salt myminion boto_vpc.delete vpc_id='vpc-6b1fe402'
salt myminion boto_vpc.delete name='myvpc'
```

`salt.modules.boto_vpc.delete_customer_gateway` (*customer\_gateway\_id=None, customer\_gateway\_name=None, region=None, key=None, keyid=None, profile=None*)

Given a customer gateway ID or name, delete the customer gateway.

Returns True if the customer gateway was deleted and returns False if the customer gateway was not deleted.

Changed in version 2015.8.0: Added `customer_gateway_name` argument

CLI Example:

```
salt myminion boto_vpc.delete_customer_gateway 'cgw-b6a247df'
```

`salt.modules.boto_vpc.delete_dhcp_options` (*dhcp\_options\_id=None, dhcp\_options\_name=None, region=None, key=None, keyid=None, profile=None*)

Delete dhcp options by id or name.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.delete_dhcp_options 'dopt-b6a247df'
```

`salt.modules.boto_vpc.delete_internet_gateway` (*internet\_gateway\_id=None, internet\_gateway\_name=None, detach=False, region=None, key=None, keyid=None, profile=None*)

Delete an internet gateway (by name or id).

Returns True if the internet gateway was deleted and otherwise False.

New in version 2015.8.0.

CLI Examples:

```
salt myminion boto_vpc.delete_internet_gateway internet_gateway_id=igw-
→1a2b3c
salt myminion boto_vpc.delete_internet_gateway internet_gateway_name=myigw
```

```
salt.modules.boto_vpc.delete_nat_gateway(nat_gateway_id, release_eips=False, region=None,
key=None, keyid=None, profile=None,
wait_for_delete=False, wait_for_delete_retries=5)
```

Delete a nat gateway (by id).

Returns True if the internet gateway was deleted and otherwise False.

This function requires boto3 to be installed.

New in version 2016.11.0.

**nat\_gateway\_id**

Id of the NAT Gateway

**release\_eips**

whether to release the elastic IPs associated with the given NAT Gateway Id

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_delete**

whether to wait for delete of the NAT gateway to be in failed or deleted state after issuing the delete call.

**wait\_for\_delete\_retries**

NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding.

CLI Examples:

```
salt myminion boto_vpc.delete_nat_gateway nat_gateway_id=igw-1a2b3c
```

```
salt.modules.boto_vpc.delete_network_acl(network_acl_id=None, network_acl_name=None,
disassociate=False, region=None, key=None,
keyid=None, profile=None)
```

Delete a network acl based on the network\_acl\_id or network\_acl\_name provided.

CLI Examples:

```
salt myminion boto_vpc.delete_network_acl network_acl_id='acl-5fb85d36' \
disassociate=false
```

```
salt myminion boto_vpc.delete_network_acl network_acl_name='myacl' \
    disassociate=true
```

`salt.modules.boto_vpc.delete_network_acl_entry` (*network\_acl\_id=None, rule\_number=None, egress=None, network\_acl\_name=None, region=None, key=None, keyid=None, profile=None*)

Deletes a network acl entry.

CLI Example:

```
salt myminion boto_vpc.delete_network_acl_entry 'acl-5fb85d36' '32767'
```

`salt.modules.boto_vpc.delete_route` (*route\_table\_id=None, destination\_cidr\_block=None, route\_table\_name=None, region=None, key=None, keyid=None, profile=None*)

Deletes a route.

CLI Example:

```
salt myminion boto_vpc.delete_route 'rtb-1f382e7d' '10.0.0.0/16'
```

`salt.modules.boto_vpc.delete_route_table` (*route\_table\_id=None, route\_table\_name=None, region=None, key=None, keyid=None, profile=None*)

Deletes a route table.

CLI Examples:

```
salt myminion boto_vpc.delete_route_table route_table_id='rtb-1f382e7d'
salt myminion boto_vpc.delete_route_table route_table_name='myroutetable'
```

`salt.modules.boto_vpc.delete_subnet` (*subnet\_id=None, subnet\_name=None, region=None, key=None, keyid=None, profile=None*)

Given a subnet ID or name, delete the subnet.

Returns True if the subnet was deleted and returns False if the subnet was not deleted.

Changed in version 2015.8.0: Added `subnet_name` argument

CLI Example:

```
salt myminion boto_vpc.delete_subnet 'subnet-6a1fe403'
```

`salt.modules.boto_vpc.delete_vpc_peering_connection` (*conn\_id=None, conn\_name=None, region=None, key=None, keyid=None, profile=None, dry\_run=False*)

Delete a VPC peering connection.

New in version 2016.11.0.

**conn\_id**

The connection ID to check. Exclusive with `conn_name`.

**conn\_name**

The connection name to check. Exclusive with `conn_id`.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**dry\_run**

If True, skip application and simply return projected status.

CLI Example:

```
# Create a named VPC peering connection
salt myminion boto_vpc.delete_vpc_peering_connection conn_name=salt-vpc
# Specify a region
salt myminion boto_vpc.delete_vpc_peering_connection conn_name=salt-vpc
→ region=us-west-2
# specify an id
salt myminion boto_vpc.delete_vpc_peering_connection conn_id=pcx-8a8939e3
```

**salt.modules.boto\_vpc.describe**(*vpc\_id=None, vpc\_name=None, region=None, key=None, keyid=None, profile=None*)

Describe a VPC's properties. If no VPC ID/Name is spcified then describe the default VPC.

Returns a dictionary of interesting properties.

Changed in version 2015.8.0: Added vpc\_name argument

CLI Example:

```
salt myminion boto_vpc.describe vpc_id=vpc-123456
salt myminion boto_vpc.describe vpc_name=myvpc
```

**salt.modules.boto\_vpc.describe\_nat\_gateways**(*nat\_gateway\_id=None, subnet\_id=None, subnet\_name=None, vpc\_id=None, vpc\_name=None, states=('pending', 'available'), region=None, key=None, keyid=None, profile=None*)

Return a description of nat gateways matching the selection criteria

This function requires boto3 to be installed.

CLI Example:

```
salt myminion boto_vpc.describe_nat_gateways nat_gateway_id='nat-
→03b02643b43216fe7'
salt myminion boto_vpc.describe_nat_gateways subnet_id='subnet-5b05942d'
```

**salt.modules.boto\_vpc.describe\_route\_tables**(*route\_table\_id=None, route\_table\_name=None, vpc\_id=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given route table properties, return details of all matching route tables.

This function requires boto3 to be installed.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_vpc.describe_route_tables vpc_id='vpc-a6a9efc3'
```

```
salt.modules.boto_vpc.describe_subnet(subnet_id=None, subnet_name=None, region=None,
                                         key=None, keyid=None, profile=None)
```

Given a subnet id or name, describe its properties.

Returns a dictionary of interesting properties.

New in version 2015.8.0.

CLI Examples:

```
salt myminion boto_vpc.describe_subnet subnet_id=subnet-123456
salt myminion boto_vpc.describe_subnet subnet_name=mysubnet
```

```
salt.modules.boto_vpc.describe_subnets(subnet_ids=None, subnet_names=None, vpc_id=None,
                                           cidr=None, region=None, key=None, keyid=None,
                                           profile=None)
```

Given a VPC ID or subnet CIDR, returns a list of associated subnets and their details. Return all subnets if VPC ID or CIDR are not provided. If a subnet id or CIDR is provided, only its associated subnet details will be returned.

New in version 2015.8.0.

CLI Examples:

```
salt myminion boto_vpc.describe_subnets
```

```
salt myminion boto_vpc.describe_subnets subnet_ids=['subnet-ba1987ab',
→ 'subnet-ba1987cd']
```

```
salt myminion boto_vpc.describe_subnets vpc_id=vpc-123456
```

```
salt myminion boto_vpc.describe_subnets cidr=10.0.0.0/21
```

```
salt.modules.boto_vpc.describe_vpc_peering_connection(name, region=None, key=None,
                                                         keyid=None, profile=None)
```

Returns any VPC peering connection id(s) for the given VPC peering connection name.

VPC peering connection ids are only returned for connections that are in the active, pending-acceptance or provisioning state.

New in version 2016.11.0.

#### Parameters

- **name** -- The string name for this VPC peering connection
- **region** -- The aws region to use
- **key** -- Your aws key
- **keyid** -- The key id associated with this aws account
- **profile** -- The profile to use

#### Returns

dict

CLI Example:

```
salt myminion boto_vpc.describe_vpc_peering_connection salt-vpc
# Specify a region
salt myminion boto_vpc.describe_vpc_peering_connection salt-vpc region=us-
→west-2
```

`salt.modules.boto_vpc.describe_vpcs` (*vpc\_id=None, name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Describe all VPCs, matching the filter criteria if provided.

Returns a list of dictionaries with interesting properties.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.describe_vpcs
```

`salt.modules.boto_vpc.dhcp_options_exists` (*dhcp\_options\_id=None, name=None, dhcp\_options\_name=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Check if a dhcp option exists.

Returns True if the dhcp option exists; Returns False otherwise.

CLI Example:

```
salt myminion boto_vpc.dhcp_options_exists dhcp_options_id='dhcp-a0bl34pp'
```

`salt.modules.boto_vpc.disassociate_network_acl` (*subnet\_id=None, vpc\_id=None, subnet\_name=None, vpc\_name=None, region=None, key=None, keyid=None, profile=None*)

Given a subnet ID, disassociates a network acl.

CLI Example:

```
salt myminion boto_vpc.disassociate_network_acl 'subnet-6a1fe403'
```

`salt.modules.boto_vpc.disassociate_route_table` (*association\_id, region=None, key=None, keyid=None, profile=None*)

Disassociates a route table.

**association\_id**

The Route Table Association ID to disassociate

CLI Example:

```
salt myminion boto_vpc.disassociate_route_table 'rtbassoc-d8ccddbba'
```

`salt.modules.boto_vpc.exists` (*vpc\_id=None, name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given a VPC ID, check to see if the given VPC ID exists.

Returns True if the given VPC ID exists and returns False if the given VPC ID does not exist.

CLI Example:

```
salt myminion boto_vpc.exists myvpc
```

`salt.modules.boto_vpc.get_dhcp_options` (*dhcp\_options\_name=None, dhcp\_options\_id=None, region=None, key=None, keyid=None, profile=None*)

Return a dict with the current values of the requested DHCP options set

CLI Example:

```
salt myminion boto_vpc.get_dhcp_options 'myfunnydhcptionsname'
```

New in version 2016.3.0.

`salt.modules.boto_vpc.get_id` (*name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Given VPC properties, return the VPC id if a match is found.

CLI Example:

```
salt myminion boto_vpc.get_id myvpc
```

`salt.modules.boto_vpc.get_resource_id` (*resource, name=None, resource\_id=None, region=None, key=None, keyid=None, profile=None*)

Get an AWS id for a VPC resource by type and name.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.get_resource_id internet_gateway myigw
```

`salt.modules.boto_vpc.get_subnet_association` (*subnets, region=None, key=None, keyid=None, profile=None*)

Given a subnet (aka: a vpc zone identifier) or list of subnets, returns vpc association.

Returns a VPC ID if the given subnets are associated with the same VPC ID. Returns False on an error or if the given subnets are associated with different VPC IDs.

CLI Examples:

```
salt myminion boto_vpc.get_subnet_association subnet-61b47516
```

```
salt myminion boto_vpc.get_subnet_association ['subnet-61b47516', 'subnet-↪2cb9785b']
```

`salt.modules.boto_vpc.is_peering_connection_pending` (*conn\_id=None, conn\_name=None, region=None, key=None, keyid=None, profile=None*)

Check if a VPC peering connection is in the pending state.

New in version 2016.11.0.

**conn\_id**

The connection ID to check. Exclusive with `conn_name`.

**conn\_name**

The connection name to check. Exclusive with `conn_id`.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_vpc.is_peering_connection_pending conn_name=salt-vpc
# Specify a region
salt myminion boto_vpc.is_peering_connection_pending conn_name=salt-vpc
→ region=us-west-2
# specify an id
salt myminion boto_vpc.is_peering_connection_pending conn_id=pcx-8a8939e3
```

```
salt.modules.boto_vpc.nat_gateway_exists(nat_gateway_id=None, subnet_id=None,
                                         subnet_name=None, vpc_id=None, vpc_name=None,
                                         states=('pending', 'available'), region=None, key=None,
                                         keyid=None, profile=None)
```

Checks if a nat gateway exists.

This function requires boto3 to be installed.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_vpc.nat_gateway_exists nat_gateway_id='nat-
→ 03b02643b43216fe7'
salt myminion boto_vpc.nat_gateway_exists subnet_id='subnet-5b05942d'
```

```
salt.modules.boto_vpc.network_acl_exists(network_acl_id=None, name=None,
                                         network_acl_name=None, tags=None, region=None,
                                         key=None, keyid=None, profile=None)
```

Checks if a network acl exists.

Returns True if the network acl exists or returns False if it doesn't exist.

CLI Example:

```
salt myminion boto_vpc.network_acl_exists network_acl_id='acl-5fb85d36'
```

```
salt.modules.boto_vpc.peering_connection_pending_from_vpc(conn_id=None,
                                                           conn_name=None,
                                                           vpc_id=None,
                                                           vpc_name=None,
                                                           region=None, key=None,
                                                           keyid=None, profile=None)
```

Check if a VPC peering connection is in the pending state, and requested from the given VPC.

New in version 2016.11.0.

**conn\_id**

The connection ID to check. Exclusive with conn\_name.

**conn\_name**

The connection name to check. Exclusive with conn\_id.

**vpc\_id**

Is this the ID of the requesting VPC for this peering connection. Exclusive with vpc\_name.

**vpc\_name**

Is this the Name of the requesting VPC for this peering connection. Exclusive with vpc\_id.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc
```

```
salt.modules.boto_vpc.replace_network_acl_entry(network_acl_id=None, rule_number=None,
protocol=None, rule_action=None,
cidr_block=None, egress=None,
network_acl_name=None, icmp_code=None,
icmp_type=None, port_range_from=None,
port_range_to=None, region=None,
key=None, keyid=None, profile=None)
```

Replaces a network acl entry.

CLI Example:

```
salt myminion boto_vpc.replace_network_acl_entry 'acl-5fb85d36' '32767' \
'all' 'deny' '0.0.0.0/0' egress=true
```

```
salt.modules.boto_vpc.replace_route(route_table_id=None, destination_cidr_block=None,
route_table_name=None, gateway_id=None, instance_id=None,
interface_id=None, region=None, key=None, keyid=None,
profile=None, vpc_peering_connection_id=None)
```

Replaces a route.

CLI Example:

```
salt myminion boto_vpc.replace_route 'rtb-1f382e7d' '10.0.0.0/16' gateway_
→id='vgw-a1b2c3'
```

```
salt.modules.boto_vpc.replace_route_table_association(association_id, route_table_id,
region=None, key=None,
keyid=None, profile=None)
```

Replaces a route table association.

CLI Example:

```
salt myminion boto_vpc.replace_route_table_association 'rtbassoc-d8ccddbba
→' 'rtb-1f382e7d'
```

```
salt.modules.boto_vpc.request_vpc_peering_connection(requester_vpc_id=None,
                                                    requester_vpc_name=None,
                                                    peer_vpc_id=None,
                                                    peer_vpc_name=None, name=None,
                                                    peer_owner_id=None,
                                                    peer_region=None, region=None,
                                                    key=None, keyid=None, profile=None,
                                                    dry_run=False)
```

Request a VPC peering connection between two VPCs.

New in version 2016.11.0.

**requester\_vpc\_id**

ID of the requesting VPC. Exclusive with requester\_vpc\_name.

**requester\_vpc\_name**

Name tag of the requesting VPC. Exclusive with requester\_vpc\_id.

**peer\_vpc\_id**

ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with peer\_vpc\_name.

**peer\_vpc\_name**

Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account and same region, else resolving it into a vpc ID will almost certainly fail. Exclusive with peer\_vpc\_id.

**name**

The name to use for this VPC peering connection.

**peer\_owner\_id**

ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.

**peer\_region**

Region of peer VPC. For inter-region vpc peering connections. Not required for intra-region peering connections.

New in version 3005.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**dry\_run**

If True, skip application and return status.

CLI Example:

```
# Create a named VPC peering connection
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-
→be82e9da name=my_vpc_connection
# Without a name
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-
→be82e9da
# Specify a region
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-
→be82e9da region=us-west-2
```

`salt.modules.boto_vpc.resource_exists` (*resource*, *name=None*, *resource\_id=None*, *tags=None*,  
*region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a resource type and name, return {exists: true} if it exists, {exists: false} if it does not exist, or {error: {message: error text}} on error.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.resource_exists internet_gateway myigw
```

`salt.modules.boto_vpc.route_exists` (*destination\_cidr\_block*, *route\_table\_name=None*,  
*route\_table\_id=None*, *gateway\_id=None*, *instance\_id=None*,  
*interface\_id=None*, *tags=None*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*, *vpc\_peering\_connection\_id=None*)

Checks if a route exists.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.route_exists destination_cidr_block='10.0.0.0/20'
→gateway_id='local' route_table_name='test'
```

`salt.modules.boto_vpc.route_table_exists` (*route\_table\_id=None*, *name=None*,  
*route\_table\_name=None*, *tags=None*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

Checks if a route table exists.

CLI Example:

```
salt myminion boto_vpc.route_table_exists route_table_id='rtb-1f382e7d'
```

`salt.modules.boto_vpc.subnet_exists` (*subnet\_id=None*, *name=None*, *subnet\_name=None*, *cidr=None*,  
*tags=None*, *zones=None*, *region=None*, *key=None*, *keyid=None*,  
*profile=None*)

Check if a subnet exists.

Returns True if the subnet exists, otherwise returns False.

Changed in version 2015.8.0: Added `subnet_name` argument  
Deprecated name argument

CLI Example:

```
salt myminion boto_vpc.subnet_exists subnet_id='subnet-6a1fe403'
```

## 26.6.68 salt.modules.bower

### Manage and query Bower packages

This module manages the installed packages using Bower. Note that npm, git and bower must be installed for this module to be available.

**salt.modules.bower.install** (*pkg, dir, pkgs=None, runas=None, env=None*)

Install a Bower package.

If no package is specified, the dependencies (from bower.json) of the package in the given directory will be installed.

**pkg**

A package name in any format accepted by Bower, including a version identifier

**dir**

The target directory in which to install the package

**pkgs**

A list of package names in the same format as the `pkg` parameter

**runas**

The user to run Bower with

**env**

Environment variables to set when invoking Bower. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:

```
salt '*' bower.install underscore /path/to/project
salt '*' bower.install jquery#2.0 /path/to/project
```

**salt.modules.bower.list\_** (*dir, runas=None, env=None*)

List installed Bower packages.

**dir**

The directory whose packages will be listed

**runas**

The user to run Bower with

**env**

Environment variables to set when invoking Bower. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:

```
salt '*' bower.list /path/to/project
```

**salt.modules.bower.prune** (*dir, runas=None, env=None*)

New in version 2017.7.0.

Remove extraneous local Bower packages, i.e. those not referenced in bower.json

**dir**

The directory whose packages will be pruned

**runas**

The user to run Bower with

**env**

Environment variables to set when invoking Bower. Uses the same env format as the `cmd.run` execution function.

CLI Example:

```
salt '*' bower.prune /path/to/project
```

`salt.modules.bower.uninstall`(*pkg*, *dir*, *runas=None*, *env=None*)

Uninstall a Bower package.

**pkg**

A package name in any format accepted by Bower

**dir**

The target directory from which to uninstall the package

**runas**

The user to run Bower with

**env**

Environment variables to set when invoking Bower. Uses the same env format as the `cmd.run` execution function.

CLI Example:

```
salt '*' bower.uninstall underscore /path/to/project
```

### 26.6.69 salt.modules.bridge

Module for gathering and managing bridging information

`salt.modules.bridge.add`(*br=None*)

Creates a bridge

CLI Example:

```
salt '*' bridge.add br0
```

`salt.modules.bridge.addif`(*br=None*, *iface=None*)

Adds an interface to a bridge

CLI Example:

```
salt '*' bridge.addif br0 eth0
```

`salt.modules.bridge.delete`(*br=None*)

Deletes a bridge

CLI Example:

```
salt '*' bridge.delete br0
```

`salt.modules.bridge.delif`(*br=None, iface=None*)

Removes an interface from a bridge

CLI Example:

```
salt '*' bridge.delif br0 eth0
```

`salt.modules.bridge.find_interfaces`(*\*args*)

Returns the bridge to which the interfaces are bond to

CLI Example:

```
salt '*' bridge.find_interfaces eth0 [eth1...]
```

`salt.modules.bridge.interfaces`(*br=None*)

Returns interfaces attached to a bridge

CLI Example:

```
salt '*' bridge.interfaces br0
```

`salt.modules.bridge.list_`()

Returns the machine's bridges list

CLI Example:

```
salt '*' bridge.list
```

`salt.modules.bridge.show`(*br=None*)

Returns bridges interfaces along with enslaved physical interfaces. If no interface is given, all bridges are shown, else only the specified bridge values are returned.

CLI Example:

```
salt '*' bridge.show
salt '*' bridge.show br0
```

`salt.modules.bridge.stp`(*br=None, state='disable', iface=None*)

Sets Spanning Tree Protocol state for a bridge

CLI Example:

```
salt '*' bridge.stp br0 enable
salt '*' bridge.stp br0 disable
```

For BSD-like operating systems, it is required to add the interface on which to enable the STP.

CLI Example:

```
salt '*' bridge.stp bridge0 enable fxp0
salt '*' bridge.stp bridge0 disable fxp0
```

## 26.6.70 salt.modules.bsd\_shadow

Manage the password database on BSD systems

---

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to *'shadow.info' is not available*), see [here](#).

---

`salt.modules.bsd_shadow.default_hash()`

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

`salt.modules.bsd_shadow.del_password(name)`

New in version 2015.8.2.

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

`salt.modules.bsd_shadow.gen_password(password, crypt_salt=None, algorithm='sha512')`

Generate hashed password

---

**Note:** When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

---

### password

Plaintext password to be hashed.

### crypt\_salt

Cryptographic salt. If not given, a random 8-character salt will be generated.

### algorithm

The following hash algorithms are supported:

- md5
- blowfish (not in mainline glibc, only available in distros that add it)
- sha256
- sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'  
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'  
→algorithm=sha256
```

`salt.modules.bsd_shadow.info(name)`

Return information for the specified user

CLI Example:

---

```
salt '*' shadow.info someuser
```

`salt.modules.bsd_shadow.set_change(name, change)`

Sets the time at which the password expires (in seconds since the UNIX epoch). See `man 8 usermod` on NetBSD and OpenBSD or `man 8 pw` on FreeBSD.

A value of 0 sets the password to never expire.

CLI Example:

```
salt '*' shadow.set_change username 1419980400
```

`salt.modules.bsd_shadow.set_expire(name, expire)`

Sets the time at which the account expires (in seconds since the UNIX epoch). See `man 8 usermod` on NetBSD and OpenBSD or `man 8 pw` on FreeBSD.

A value of 0 sets the account to never expire.

CLI Example:

```
salt '*' shadow.set_expire username 1419980400
```

`salt.modules.bsd_shadow.set_password(name, password)`

Set the password for a named user. The password must be a properly defined hash. A password hash can be generated with `gen_password()`.

It is important to make sure that a supported cipher is used.

CLI Example:

```
salt '*' shadow.set_password someuser '$1$UYCIxa628.9qXjpQCjM4a..'
```

### 26.6.71 salt.modules.btrfs

Module for managing BTRFS file systems.

`salt.modules.btrfs.add(mountpoint, *devices, **kwargs)`

Add a devices to a BTRFS filesystem.

General options:

- **nodiscard**: Do not perform whole device TRIM
- **force**: Force overwrite existing filesystem on the disk

CLI Example:

```
salt '*' btrfs.add /mountpoint /dev/sda1 /dev/sda2
```

`salt.modules.btrfs.convert(device, permanent=False, keepIf=False)`

Convert ext2/3/4 to BTRFS. Device should be mounted.

Filesystem can be converted temporarily so the further processing and rollback is possible, or permanently, where previous extended filesystem image gets deleted. Please note, permanent conversion takes a while as BTRFS filesystem needs to be properly rebalanced afterwards.

General options:

- **permanent**: Specify if the migration should be permanent (false by default)

- **keeplf**: Keep **lost+found** of the partition (removed by default, but still in the image, if not permanent migration)

CLI Example:

```
salt '*' btrfs.convert /dev/sda1
salt '*' btrfs.convert /dev/sda1 permanent=True
```

`salt.modules.btrfs.defragment`(*path*)

Defragment mounted BTRFS filesystem. In order to defragment a filesystem, device should be properly mounted and writable.

If passed a device name, then defragmented whole filesystem, mounted on in. If passed a mount point of the filesystem, then only this mount point is defragmented.

CLI Example:

```
salt '*' btrfs.defragment /dev/sda1
salt '*' btrfs.defragment /path/on/filesystem
```

`salt.modules.btrfs.delete`(*mountpoint*, *\*devices*, *\*\*kwargs*)

Remove devices from a BTRFS filesystem.

CLI Example:

```
salt '*' btrfs.delete /mountpoint /dev/sda1 /dev/sda2
```

`salt.modules.btrfs.devices`()

Get known BTRFS formatted devices on the system.

CLI Example:

```
salt '*' btrfs.devices
```

`salt.modules.btrfs.features`()

List currently available BTRFS features.

CLI Example:

```
salt '*' btrfs.mkfs_features
```

`salt.modules.btrfs.info`(*device*)

Get BTRFS filesystem information.

CLI Example:

```
salt '*' btrfs.info /dev/sda1
```

`salt.modules.btrfs.mkfs`(*\*devices*, *\*\*kwargs*)

Create a file system on the specified device. By default wipes out with force.

General options:

- **allocsize**: Specify the BTRFS offset from the start of the device.
- **bytecount**: Specify the size of the resultant filesystem.
- **nodesize**: Node size.
- **leafsize**: Specify the nodesize, the tree block size in which btrfs stores data.

- **noforce**: Prevent force overwrite when an existing filesystem is detected on the device.
- **sectorsize**: Specify the sectorsize, the minimum data block allocation unit.
- **nodiscard**: Do not perform whole device TRIM operation by default.
- **uuid**: Pass UUID or pass True to generate one.

Options:

- **dto**: (**raid0|raid1|raid5|raid6|raid10|single|dup**)  
Specify how the data must be spanned across the devices specified.
- **mto**: (**raid0|raid1|raid5|raid6|raid10|single|dup**)  
Specify how metadata must be spanned across the devices specified.
- **fts**: Features (call `salt <host> btrfs.features` for full list of available features)

See the `mkfs.btrfs(8)` manpage for a more complete description of corresponding options description.

CLI Example:

```
salt '*' btrfs.mkfs /dev/sda1
salt '*' btrfs.mkfs /dev/sda1 noforce=True
```

`salt.modules.btrfs.properties`(*obj*, *type=None*, *set=None*)

List properties for given btrfs object. The object can be path of BTRFS device, mount point, or any directories/files inside the BTRFS filesystem.

General options:

- **type**: Possible types are s[ubvol], f[ilesystem], i[node] and d[evice].
- **force**: Force overwrite existing filesystem on the disk
- **set**: <key=value,key1=value1...> Options for a filesystem properties.

CLI Example:

```
salt '*' btrfs.properties /mountpoint
salt '*' btrfs.properties /dev/sda1 type=subvol set='ro=false,label="My
↪Storage"'
```

`salt.modules.btrfs.resize`(*mountpoint*, *size*)

Resize filesystem.

General options:

- **mountpoint**: Specify the BTRFS mountpoint to resize.
- **size**: ([+/-]<newsize>[kKmMgGtTpPeE])max) Specify the new size of the target.

CLI Example:

```
salt '*' btrfs.resize /mountpoint size=+1g
salt '*' btrfs.resize /dev/sda1 size=max
```

`salt.modules.btrfs.subvolume_create`(*name*, *dest=None*, *qgroupids=None*)

Create subvolume *name* in *dest*.

Return True if the subvolume is created, False if the subvolume is already there.

**name**

Name of the new subvolume

**dest**

If not given, the subvolume will be created in the current directory, if given will be in /dest/name

**qgroupids**

Add the newly created subvolume to a qgroup. This parameter is a list

CLI Example:

```
salt '*' btrfs.subvolume_create var
salt '*' btrfs.subvolume_create var dest=/mnt
salt '*' btrfs.subvolume_create var qgroupids='[200]'
```

`salt.modules.btrfs.subvolume_delete` (*name=None, names=None, commit=None*)

Delete the subvolume(s) from the filesystem

The user can remove one single subvolume (name) or multiple of them at the same time (names). One of the two parameters needs to be specified.

Please, refer to the documentation to understand the implication on the transactions, and when the subvolume is really deleted.

Return True if the subvolume is deleted, False if the subvolume was already missing.

**name**

Name of the subvolume to remove

**names**

List of names of subvolumes to remove

**commit**

- 'after': Wait for transaction commit at the end
- 'each': Wait for transaction commit after each delete

CLI Example:

```
salt '*' btrfs.subvolume_delete /var/volumes/tmp
salt '*' btrfs.subvolume_delete /var/volumes/tmp commit=after
```

`salt.modules.btrfs.subvolume_exists` (*path*)

Check if a subvolume is present in the filesystem.

**path**

Mount point for the subvolume (full path)

CLI Example:

```
salt '*' btrfs.subvolume_exists /mnt/var
```

`salt.modules.btrfs.subvolume_find_new` (*name, last\_gen*)

List the recently modified files in a subvolume

**name**

Name of the subvolume

**last\_gen**

Last transid marker from where to compare

CLI Example:

```
salt '*' btrfs.subvolume_find_new /var/volumes/tmp 1024
```

`salt.modules.btrfs.subvolume_get_default`(*path*)

Get the default subvolume of the filesystem path

**path**

Mount point for the subvolume

CLI Example:

```
salt '*' btrfs.subvolume_get_default /var/volumes/tmp
```

`salt.modules.btrfs.subvolume_list`(*path*, *parent\_id=False*, *absolute=False*, *ogeneration=False*, *generation=False*, *subvolumes=False*, *uuid=False*, *parent\_uuid=False*, *sent\_subvolume\_uuid=False*, *snapshots=False*, *readonly=False*, *deleted=False*, *generation\_cmp=None*, *ogeneration\_cmp=None*, *sort=None*)

List the subvolumes present in the filesystem.

**path**

Mount point for the subvolume

**parent\_id**

Print parent ID

**absolute**

Print all the subvolumes in the filesystem and distinguish between absolute and relative path with respect to the given <path>

**ogeneration**

Print the ogeneration of the subvolume

**generation**

Print the generation of the subvolume

**subvolumes**

Print only subvolumes below specified <path>

**uuid**

Print the UUID of the subvolume

**parent\_uuid**

Print the parent uuid of subvolumes (and snapshots)

**sent\_subvolume\_uuid**

Print the UUID of the sent subvolume, where the subvolume is the result of a receive operation

**snapshots**

Only snapshot subvolumes in the filesystem will be listed

**readonly**

Only readonly subvolumes in the filesystem will be listed

**deleted**

Only deleted subvolumes that are not cleaned

**generation\_cmp**

List subvolumes in the filesystem that its generation is >=, <= or = value. '+' means >= value, '-' means <= value, If there is neither '+' nor '-', it means = value

**ogeneration\_cmp**

List subvolumes in the filesystem that its ogeneration is >=, <= or = value

**sort**

List subvolumes in order by specified items. Possible values: \* rootid \* gen \* ogen \* path You can add '+' or '-' in front of each items, '+' means ascending, '-' means descending. The default is ascending. You can combite it in a list.

CLI Example:

```
salt '*' btrfs.subvolume_list /var/volumes/tmp
salt '*' btrfs.subvolume_list /var/volumes/tmp path=True
salt '*' btrfs.subvolume_list /var/volumes/tmp sort='[-rootid]'
```

**salt.modules.btrfs.subvolume\_set\_default**(*subvolid*, *path*)

Set the subvolume as default

**subvolid**

ID of the new default subvolume

**path**

Mount point for the filesystem

CLI Example:

```
salt '*' btrfs.subvolume_set_default 257 /var/volumes/tmp
```

**salt.modules.btrfs.subvolume\_show**(*path*)

Show information of a given subvolume

**path**

Mount point for the filesystem

CLI Example:

```
salt '*' btrfs.subvolume_show /var/volumes/tmp
```

**salt.modules.btrfs.subvolume\_snapshot**(*source*, *dest=None*, *name=None*, *read\_only=False*)

Create a snapshot of a source subvolume

**source**

Source subvolume from where to create the snapshot

**dest**

If only dest is given, the subvolume will be named as the basename of the source

**name**

Name of the snapshot

**read\_only**

Create a read only snapshot

CLI Example:

```
salt '*' btrfs.subvolume_snapshot /var/volumes/tmp dest=/.snapshots
salt '*' btrfs.subvolume_snapshot /var/volumes/tmp name=backup
```

**salt.modules.btrfs.subvolume\_sync**(*path*, *subvolids=None*, *sleep=None*)

Wait until given subvolume are completely removed from the filesystem after deletion.

**path**

Mount point for the filesystem

**subvolid**s

List of IDs of subvolumes to wait for

**sleep**

Sleep N seconds between checks (default: 1)

CLI Example:

```
salt '*' btrfs.subvolume_sync /var/volumes/tmp
salt '*' btrfs.subvolume_sync /var/volumes/tmp subvolid='[257]'
```

**salt.modules.btrfs.usage**(*path*)

Show in which disk the chunks are allocated.

CLI Example:

```
salt '*' btrfs.usage /your/mountpoint
```

**salt.modules.btrfs.version**()

Return BTRFS version.

CLI Example:

```
salt '*' btrfs.version
```

## 26.6.72 salt.modules.cabal

### Manage and query Cabal packages

New in version 2015.8.0.

**salt.modules.cabal.install**(*pkg=None, pkgs=None, user=None, install\_global=False, env=None*)

Install a cabal package.

**pkg**

A package name in format accepted by cabal-install. See: <https://wiki.haskell.org/Cabal-Install>

**pkgs**

A list of packages names in same format as *pkg*

**user**

The user to run cabal install with

**install\_global**

Install package globally instead of locally

**env**

Environment variables to set when invoking cabal. Uses the same *env* format as the *cmd.run* execution function

CLI Example:

```
salt '*' cabal.install shellcheck
salt '*' cabal.install shellcheck-0.3.5
```

`salt.modules.cabal.list_` (*pkg=None, user=None, installed=False, env=None*)

List packages matching a search string.

**pkg**

Search string for matching package names

**user**

The user to run cabal list with

**installed**

If True, only return installed packages.

**env**

Environment variables to set when invoking cabal. Uses the same env format as the `cmd.run` execution function

CLI Example:

```
salt '*' cabal.list
salt '*' cabal.list ShellCheck
```

`salt.modules.cabal.uninstall` (*pkg, user=None, env=None*)

Uninstall a cabal package.

**pkg**

The package to uninstall

**user**

The user to run ghc-pkg unregister with

**env**

Environment variables to set when invoking cabal. Uses the same env format as the `cmd.run` execution function

CLI Example:

```
salt '*' cabal.uninstall ShellCheck
```

`salt.modules.cabal.update` (*user=None, env=None*)

Updates list of known packages.

**user**

The user to run cabal update with

**env**

Environment variables to set when invoking cabal. Uses the same env format as the `cmd.run` execution function.

CLI Example:

```
salt '*' cabal.update
```

## 26.6.73 salt.modules.capirca\_acl

### Capirca ACL

Generate ACL (firewall) configuration for network devices.

New in version 2017.7.0.

#### codeauthor

Mircea Ulinic <ping@mirceaulinic.net> & Robert Ankeny <robankeny@google.com>

#### maturity

new

#### depends

capirca

#### platform

unix

### Dependencies

The firewall configuration is generated by [Capirca](#).

To install Capirca, execute: `pip install capirca`.

```

salt.modules.capirca_acl.get_filter_config(platform, filter_name, filter_options=None,
                                           terms=None, prepend=True, pillar_key='acl',
                                           pillarenv=None, saltenv=None, merge_pillar=True,
                                           only_lower_merge=False, revision_id=None,
                                           revision_no=None, revision_date=True,
                                           revision_date_format='%Y/%m/%d')

```

Return the configuration of a policy filter.

#### platform

The name of the Capirca platform.

#### filter\_name

The name of the policy filter.

#### filter\_options

Additional filter options. These options are platform-specific. See the complete list of [options](#).

#### terms

List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

#### prepend: **True**

When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

#### pillar\_key: **acl**

The key in the pillar containing the default attributes values. Default: `acl`.

#### pillarenv

Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**

Included only for compatibility with *pillarenv\_from\_saltenv*, and is otherwise ignored.

**merge\_pillar: True**

Merge the CLI variables with the pillar. Default: True.

**only\_lower\_merge: False**

Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: False.

**revision\_id**

Add a comment in the filter config having the description for the changes applied.

**revision\_no**

The revision count.

**revision\_date: True**

Boolean flag: display the date when the filter configuration was generated. Default: True.

**revision\_date\_format: %Y/%m/%d**

The date format to be used when generating the performe data. Default: %Y/%m/%d (<year>/<month>/<day>).

CLI Example:

```
salt '*' capirca.get_filter_config ciscoxr my-filter pillar_key=netacl
```

Output Example:

```
! $Id:$
! $Date:$
! $Revision:$
no ipv4 access-list my-filter
ipv4 access-list my-filter
 remark $Id:$
 remark my-term
deny ipv4 any eq 1234 any
deny ipv4 any eq 1235 any
 remark my-other-term
permit tcp any range 5678 5680 any
exit
```

The filter configuration has been loaded from the pillar, having the following structure:

```
netacl:
- my-filter:
  terms:
  - my-term:
    source_port: [1234, 1235]
    action: reject
  - my-other-term:
    source_port:
      - [5678, 5680]
    protocol: tcp
    action: accept
```

```
salt.modules.capirca_acl.get_filter_pillar(filter_name, pillar_key='acl', pillarenv=None,
                                          saltenv=None)
```

Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

**filter\_name**

The name of the filter.

**pillar\_key**

The root key of the whole policy config.

**pillarenv**

Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**

Included only for compatibility with *pillarenv\_from\_saltenv*, and is otherwise ignored.

```
salt.modules.campirca_acl.get_policy_config(platform, filters=None, prepend=True,
                                           pillar_key='acl', pillarenv=None, saltenv=None,
                                           merge_pillar=True, only_lower_merge=False,
                                           revision_id=None, revision_no=None,
                                           revision_date=True,
                                           revision_date_format='%Y/%m/%d')
```

Return the configuration of the whole policy.

**platform**

The name of the Capirca platform.

**filters**

List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless *merge\_pillar* is set as *False*.

**prepend: True**

When *merge\_pillar* is set as *True*, the final list of filters generated by merging the filters from *filters* with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to *False*.

**pillar\_key: acl**

The key in the pillar containing the default attributes values. Default: *acl*.

**pillarenv**

Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**

Included only for compatibility with *pillarenv\_from\_saltenv*, and is otherwise ignored.

**merge\_pillar: True**

Merge the CLI variables with the pillar. Default: *True*.

**only\_lower\_merge: False**

Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: *False*.

**revision\_id**

Add a comment in the policy config having the description for the changes applied.

**revision\_no**

The revision count.

**revision\_date: True**

Boolean flag: display the date when the policy configuration was generated. Default: *True*.

**revision\_date\_format: %Y/%m/%d**

The date format to be used when generating the performe data. Default: %Y/%m/%d (<year>/<month>/<day>).

CLI Example:

```
salt '*' capirca.get_policy_config juniper pillar_key=netacl
```

Output Example:

```
firewall {
  family inet {
    replace:
    /*
    ** $Id:$
    ** $Date:$
    ** $Revision:$
    **
    */
    filter my-filter {
      term my-term {
        from {
          source-port [ 1234 1235 ];
        }
        then {
          reject;
        }
      }
      term my-other-term {
        from {
          protocol tcp;
          source-port 5678-5680;
        }
        then accept;
      }
    }
  }
}
firewall {
  family inet {
    replace:
    /*
    ** $Id:$
    ** $Date:$
    ** $Revision:$
    **
    */
    filter my-other-filter {
      interface-specific;
      term dummy-term {
        from {
          protocol [ tcp udp ];
        }
        then {
```

(continues on next page)

(continued from previous page)

```

    }
    }
    }
    }
    reject;
}

```

The policy configuration has been loaded from the pillar, having the following structure:

```

netacl:
- my-filter:
  options:
  - not-interface-specific
  terms:
  - my-term:
    source_port: [1234, 1235]
    action: reject
  - my-other-term:
    source_port:
      - [5678, 5680]
    protocol: tcp
    action: accept
- my-other-filter:
  terms:
  - dummy-term:
    protocol:
      - tcp
      - udp
    action: reject

```

`salt.modules.capirca_acl.get_term_config`(*platform, filter\_name, term\_name, filter\_options=None, pillar\_key='acl', pillarenv=None, saltenv=None, merge\_pillar=True, revision\_id=None, revision\_no=None, revision\_date=True, revision\_date\_format='%Y/%m/%d', source\_service=None, destination\_service=None, \*\*term\_fields*)

Return the configuration of a single policy term.

#### platform

The name of the Capirca platform.

#### filter\_name

The name of the policy filter.

#### term\_name

The name of the term.

#### filter\_options

Additional filter options. These options are platform-specific. E.g.: `inet6`, `bridge`, `object-group`. See the complete list of [options](#).

#### pillar\_key: **acl**

The key in the pillar containing the default attributes values. Default: `acl`. If the pillar contains the following structure:

```
firewall:
- my-filter:
  terms:
  - my-term:
    source_port: 1234
    source_address:
    - 1.2.3.4/32
    - 5.6.7.8/32
```

The `pillar_key` field would be specified as `firewall`.

#### **pillarenv**

Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

#### **saltenv**

Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

#### **merge\_pillar: True**

Merge the CLI variables with the pillar. Default: `True`.

#### **revision\_id**

Add a comment in the term config having the description for the changes applied.

#### **revision\_no**

The revision count.

#### **revision\_date: True**

Boolean flag: display the date when the term configuration was generated. Default: `True`.

#### **revision\_date\_format: %Y/%m/%d**

The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

#### **source\_service**

A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `source_port` and protocol.

As this module is available on Unix platforms only, it reads the [IANA](#) port assignment from `/etc/services`.

If the user requires additional shortcuts to be referenced, they can add entries under `/etc/services`, which can be managed using the *file state*.

#### **destination\_service**

A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `destination_port` and protocol. Allows the same options as `source_service`.

#### **term\_fields**

Term attributes. To see what fields are supported, please consult the list of supported [keywords](#). Some platforms have few other [optional](#) keywords.

---

**Note:** The following fields are accepted:

- `action`
- `address`
- `address_exclude`
- `comment`

- counter
- expiration
- destination\_address
- destination\_address\_exclude
- destination\_port
- destination\_prefix
- forwarding\_class
- forwarding\_class\_except
- logging
- log\_name
- loss\_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol\_except
- qos
- pan\_application
- routing\_instance
- source\_address
- source\_address\_exclude
- source\_port
- source\_prefix
- verbatim
- packet\_length
- fragment\_offset
- hop\_limit
- icmp\_type
- ether\_type
- traffic\_class\_count
- traffic\_type
- translated
- dscp\_set
- dscp\_match

- dscp\_except
  - next\_ip
  - flexible\_match\_range
  - source\_prefix\_except
  - destination\_prefix\_except
  - vpn
  - source\_tag
  - destination\_tag
  - source\_interface
  - destination\_interface
  - flattened
  - flattened\_addr
  - flattened\_saddr
  - flattened\_daddr
  - priority
- 

**Note:** The following fields can be also a single value and a list of values:

- action
- address
- address\_exclude
- comment
- destination\_address
- destination\_address\_exclude
- destination\_port
- destination\_prefix
- forwarding\_class
- forwarding\_class\_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol\_except
- pan\_application
- source\_address

- source\_address\_exclude
- source\_port
- source\_prefix
- verbatim
- icmp\_type
- ether\_type

- dscp\_match
- dscp\_except
- flexible\_match\_range
- source\_prefix\_except
- destination\_prefix\_except
- source\_tag
- destination\_tag
- source\_service
- destination\_service

Example: `destination_address` can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
- 172.17.17.1/24
- 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
- ntp
- snmp
- ldap
- bgpd
```

---

**Note:** The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:
- [1000, 2000]
- [3000, 4000]
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

---

CLI Example:

```
salt '*' capirca.get_term_config arista filter-name term-name source_
→address=1.2.3.4 destination_address=5.6.7.8 action=accept
```

Output Example:

```
! $Date: 2017/03/22 $
no ip access-list filter-name
ip access-list filter-name
remark term-name
permit ip host 1.2.3.4 host 5.6.7.8
exit
```

```
salt.modules.capirca_acl.get_term_pillar(filter_name, term_name, pillar_key='acl',
                                         pillarenv=None, saltenv=None)
```

Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

**filter\_name**

The name of the filter.

**term\_name**

The name of the term.

**pillar\_key: `acl`**

The root key of the whole policy config. Default: `acl`.

**pillarenv**

Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**

Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

## 26.6.74 salt.modules.cassandra\_cql

Cassandra Database Module

New in version 2015.5.0.

This module works with Cassandra v2 and v3 and hence generates queries based on the internal schema of said version.

**depends**

DataStax Python Driver for Apache Cassandra <https://github.com/datastax/python-driver> pip install cassandra-driver

**referenced by**

Salt's `cassandra_cql` returner

**configuration**

The Cassandra cluster members and connection port can either be specified in the master or minion config, the minion's pillar or be passed to the module.

Example configuration in the config for a single node:

```
cassandra:
  cluster: 192.168.50.10
  port: 9000
```

Example configuration in the config for a cluster:

```
cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin
```

Changed in version 2016.11.0.

Added support for `ssl_options` and `protocol_version`.

Example configuration with `ssl_options`:

If `ssl_options` are present in `cassandra` config the `cassandra_cql` returner will use SSL. SSL isn't used if `ssl_options` isn't specified.

```
cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin

  ssl_options:
    ca_certs: /etc/ssl/certs/ca-bundle.trust.crt

    # SSL version should be one from the ssl module
    # This is an optional parameter
  ssl_version: PROTOCOL_TLSv1
```

Additionally you can also specify the `protocol_version` to use.

```
cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin

  # defaults to 4, if not set
  protocol_version: 3
```

Also all configuration could be passed directly to module as arguments.

```
salt minion1 cassandra_cql.info contact_points=delme-nextgen-01 port=9042 cql_user=cassandra
cql_pass=cassandra protocol_version=4
```

```
salt minion1 cassandra_cql.info ssl_options="{\"ca_certs\": /path/to/-ca.crt}'
```

We can also provide the load balancing policy as arguments

```
salt minion1 cassandra_cql.cql_query "alter user cassandra with password
'cassandra2' ;" contact_points=scylladb cql_user=user1 cql_pass=password
port=9142 protocol_version=4 ssl_options={'ca_certs': 'path-to-client-ca.crt'}
load_balancing_policy=DCAwareRoundRobinPolicy load_balancing_policy_args={'local_dc':
'datacenter1'}
```

```
salt.modules.cassandra_cql.cql_query(query, contact_points=None, port=None, cql_user=None,
cql_pass=None, protocol_version=None,
load_balancing_policy=None,
load_balancing_policy_args=None, ssl_options=None)
```

Run a query on a Cassandra cluster and return a dictionary.

#### Parameters

- **query** (*str*) -- The query to execute.
- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **params** (*str*) -- The parameters for the query, optional.
- **protocol\_version** (*int*) -- Cassandra protocol version to use.
- **load\_balancing\_policy** (*str*) -- cassandra.policy class name to use
- **load\_balancing\_policy\_args** (*dict*) -- cassandra.policy constructor args
- **ssl\_options** (*dict*) -- Cassandra protocol version to use.

#### Returns

A dictionary from the return values of the query

#### Return type

*list[dict]*

CLI Example:

```
salt 'cassandra-server' cassandra_cql.cql_query "SELECT * FROM users_by_
name WHERE first_name = 'jane'"
```

```
salt.modules.cassandra_cql.cql_query_with_prepare(query, statement_name,
statement_arguments,
asynchronous=False,
callback_errors=None,
contact_points=None, port=None,
cql_user=None, cql_pass=None,
protocol_version=None,
load_balancing_policy=None,
load_balancing_policy_args=None,
ssl_options=None, **kwargs)
```

Run a query on a Cassandra cluster and return a dictionary.

This function should not be used asynchronously for SELECTs -- it will not return anything and we don't currently have a mechanism for handling a future that will return results.

#### Parameters

- **query** (*str*) -- The query to execute.
- **statement\_name** (*str*) -- Name to assign the prepared statement in the `__context__` dictionary
- **statement\_arguments** (*list[str]*) -- Bind parameters for the SQL statement
- **asynchronous** (*bool*) -- Run this query in asynchronous mode
- **async** (*bool*) -- Run this query in asynchronous mode (an alias to 'asynchronous') NOTE: currently it overrides 'asynchronous' and it will be dropped in version 3001!
- **callback\_errors** (*Function callable*) -- Function to call after query runs if there is an error
- **contact\_points** (*str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **params** (*str*) -- The parameters for the query, optional.
- **protocol\_version** -- Cassandra protocol version to use.
- **load\_balancing\_policy** (*str*) -- `cassandra.policy` class name to use
- **load\_balancing\_policy\_args** (*dict*) -- `cassandra.policy` constructor args
- **ssl\_options** (*dict*) -- Cassandra protocol version to use.

#### Returns

A dictionary from the return values of the query

#### Return type

`list[dict]`

CLI Example:

```
# Insert data asynchronously
salt this-node cassandra_cql.cql_query_with_prepare "name_insert" "INSERT
→ INTO USERS (first_name, last_name) VALUES (?, ?)" statement_
→ arguments=['John', 'Doe'], asynchronous=True

# Select data, should not be asynchronous because there is not currently
→ a facility to return data from a future
salt this-node cassandra_cql.cql_query_with_prepare "name_select" "SELECT
→ * FROM USERS WHERE first_name=?" statement_arguments=['John
→ ']
```

```
salt.modules.cassandra_cql.create_keyspace(keyspace, replication_strategy='SimpleStrategy',
                                           replication_factor=1, replication_datacenters=None,
                                           contact_points=None, port=None, cql_user=None,
                                           cql_pass=None, protocol_version=None,
                                           load_balancing_policy=None,
                                           load_balancing_policy_args=None,
                                           ssl_options=None)
```

Create a new keyspace in Cassandra.

#### Parameters

- **keyspace** (*str*) -- The keyspace name
- **replication\_strategy** (*str*) -- either *SimpleStrategy* or *NetworkTopologyStrategy*
- **replication\_factor** (*int*) -- number of replicas of data on multiple nodes. not used if using *NetworkTopologyStrategy*
- **replication\_datacenters** (*str* | *dict*[*str*, *int*]) -- string or dict of data-center names to replication factors, required if using *NetworkTopologyStrategy* (will be a dict if coming from state file).
- **contact\_points** (*str* | *list*[*str*]) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **protocol\_version** (*int*) -- Cassandra protocol version to use.
- **load\_balancing\_policy** (*str*) -- cassandra.policy class name to use
- **load\_balancing\_policy\_args** (*dict*) -- cassandra.policy constructor args
- **ssl\_options** (*dict*) -- Cassandra protocol version to use.

#### Returns

The info for the keyspace or False if it does not exist.

#### Return type

dict

CLI Example:

```
# CLI Example:
salt 'minion1' cassandra_cql.create_keyspace keyspace=newkeyspace

salt 'minion1' cassandra_cql.create_keyspace keyspace=newkeyspace
→ replication_strategy=NetworkTopologyStrategy replication_
→ datacenters='{ "datacenter_1": 3, "datacenter_2": 2}'
```

```
salt.modules.cassandra_cql.create_user(username, password, superuser=False, contact_points=None,
                                       port=None, cql_user=None, cql_pass=None,
                                       protocol_version=None, load_balancing_policy=None,
                                       load_balancing_policy_args=None, ssl_options=None)
```

Create a new cassandra user with credentials and superuser status.

#### Parameters

- **username** (*str*) -- The name of the new user.
- **password** (*str*) -- The password of the new user.
- **superuser** (*bool*) -- Is the new user going to be a superuser? default: False
- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **protocol\_version** (*int*) -- Cassandra protocol version to use.
- **load\_balancing\_policy** (*str*) -- cassandra.policy class name to use
- **load\_balancing\_policy\_args** (*dict*) -- cassandra.policy constructor args
- **ssl\_options** (*dict*) -- Cassandra protocol version to use.

Returns

Return type

CLI Example:

```
salt 'minion1' cassandra_cql.create_user username=joe password=secret
salt 'minion1' cassandra_cql.create_user username=joe password=secret
→superuser=True
salt 'minion1' cassandra_cql.create_user username=joe password=secret
→superuser=True contact_points=minion1
```

`salt.modules.cassandra_cql.drop_keyspace` (*keyspace*, *contact\_points=None*, *port=None*, *cql\_user=None*, *cql\_pass=None*, *protocol\_version=None*, *load\_balancing\_policy=None*, *load\_balancing\_policy\_args=None*, *ssl\_options=None*)

Drop a keyspace if it exists in a Cassandra cluster.

Parameters

- **keyspace** (*str*) -- The keyspace to drop.
- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **protocol\_version** (*int*) -- Cassandra protocol version to use.
- **load\_balancing\_policy** (*str*) -- cassandra.policy class name to use
- **load\_balancing\_policy\_args** (*dict*) -- cassandra.policy constructor args
- **ssl\_options** (*dict*) -- Cassandra protocol version to use.

Returns

The info for the keyspace or False if it does not exist.

**Return type**

dict

CLI Example:

```
salt 'minion1' cassandra_cql.drop_keyspace keyspace=test

salt 'minion1' cassandra_cql.drop_keyspace keyspace=test contact_
→points=minion1
```

```
salt.modules.cassandra_cql.grant_permission(username, resource=None, resource_type='keyspace',
                                           permission=None, contact_points=None, port=None,
                                           cql_user=None, cql_pass=None,
                                           protocol_version=None,
                                           load_balancing_policy=None,
                                           load_balancing_policy_args=None,
                                           ssl_options=None)
```

Grant permissions to a user.

**Parameters**

- **username** (*str*) -- The name of the user to grant permissions to.
- **resource** (*str*) -- The resource (keyspace or table), if None, permissions for all resources are granted.
- **resource\_type** (*str*) -- The resource\_type (keyspace or table), defaults to 'keyspace'.
- **permission** (*str*) -- A permission name (e.g. select), if None, all permissions are granted.
- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **protocol\_version** (*int*) -- Cassandra protocol version to use.
- **load\_balancing\_policy** (*str*) -- cassandra.policy class name to use
- **load\_balancing\_policy\_args** (*dict*) -- cassandra.policy constructor args
- **ssl\_options** (*dict*) -- Cassandra protocol version to use.

**Returns****Return type**

CLI Example:

```
salt 'minion1' cassandra_cql.grant_permission

salt 'minion1' cassandra_cql.grant_permission username=joe resource=test_
→keyspace permission=select

salt 'minion1' cassandra_cql.grant_permission username=joe resource=test_
→table resource_type=table           permission=select contact_
→points=minion1
```

```
salt.modules.cassandra_cql.info(contact_points=None, port=None, cql_user=None, cql_pass=None,
                                protocol_version=None, load_balancing_policy=None,
                                load_balancing_policy_args=None, ssl_options=None)
```

Show the Cassandra information for this cluster.

#### Parameters

- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **protocol\_version** (*int*) -- Cassandra protocol version to use.
- **load\_balancing\_policy** (*str*) -- cassandra.policy class name to use
- **load\_balancing\_policy\_args** (*dict*) -- cassandra.policy constructor args
- **ssl\_options** (*dict*) -- Cassandra protocol version to use.

#### Returns

The information for this Cassandra cluster.

#### Return type

dict

CLI Example:

```
salt 'minion1' cassandra_cql.info
salt 'minion1' cassandra_cql.info contact_points=minion1
```

```
salt.modules.cassandra_cql.keyspace_exists(keyspace, contact_points=None, port=None,
                                             cql_user=None, cql_pass=None,
                                             protocol_version=None, load_balancing_policy=None,
                                             load_balancing_policy_args=None,
                                             ssl_options=None)
```

Check if a keyspace exists in a Cassandra cluster.

:param keyspace The keyspace name to check for. :type keyspace: str :param contact\_points: The Cassandra cluster addresses, can either be a string or a list of IPs. :type contact\_points: str | list[str] :param cql\_user: The Cassandra user if authentication is turned on. :type cql\_user: str :param cql\_pass: The Cassandra user password if authentication is turned on. :type cql\_pass: str :param port: The Cassandra cluster port, defaults to None. :type port: int :param protocol\_version: Cassandra protocol version to use. :type protocol\_version: int :param load\_balancing\_policy: cassandra.policy class name to use :type load\_balancing\_policy: str :param load\_balancing\_policy\_args: cassandra.policy constructor args :type load\_balancing\_policy\_args: dict :param ssl\_options: Cassandra protocol version to use. :type ssl\_options: dict :return: The info for the keyspace or False if it does not exist. :rtype: dict

CLI Example:

```
salt 'minion1' cassandra_cql.keyspace_exists keyspace=system
```

`salt.modules.cassandra_cql.list_column_families` (*keyspace=None, contact\_points=None, port=None, cql\_user=None, cql\_pass=None, protocol\_version=None, load\_balancing\_policy=None, load\_balancing\_policy\_args=None, ssl\_options=None*)

List column families in a Cassandra cluster for all keyspaces or just the provided one.

#### Parameters

- **keyspace** (*str*) -- The keyspace to provide the column families for, optional.
- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **protocol\_version** (*int*) -- Cassandra protocol version to use.
- **load\_balancing\_policy** (*str*) -- `cassandra.policy` class name to use
- **load\_balancing\_policy\_args** (*dict*) -- `cassandra.policy` constructor args
- **ssl\_options** (*dict*) -- Cassandra protocol version to use.

#### Returns

The column families in this Cassandra cluster.

#### Return type

`list[dict]`

CLI Example:

```
salt 'minion1' cassandra_cql.list_column_families
salt 'minion1' cassandra_cql.list_column_families contact_points=minion1
salt 'minion1' cassandra_cql.list_column_families keyspace=system
```

`salt.modules.cassandra_cql.list_keyspaces` (*contact\_points=None, port=None, cql\_user=None, cql\_pass=None, protocol\_version=None, load\_balancing\_policy=None, load\_balancing\_policy\_args=None, ssl\_options=None*)

List keyspaces in a Cassandra cluster.

#### Parameters

- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **protocol\_version** (*int*) -- Cassandra protocol version to use.
- **load\_balancing\_policy** (*str*) -- `cassandra.policy` class name to use

- **load\_balancing\_policy\_args** (*dict*) -- cassandra.policy constructor args
- **ssl\_options** (*dict*) -- Cassandra protocol version to use.

**Returns**

The keyspaces in this Cassandra cluster.

**Return type**

`list[dict]`

CLI Example:

```
salt 'minion1' cassandra_cql.list_keyspaces

salt 'minion1' cassandra_cql.list_keyspaces contact_points=minion1
→port=9000
```

`salt.modules.cassandra_cql.list_permissions` (*username=None, resource=None, resource\_type='keyspace', permission=None, contact\_points=None, port=None, cql\_user=None, cql\_pass=None, protocol\_version=None, load\_balancing\_policy=None, load\_balancing\_policy\_args=None, ssl\_options=None*)

List permissions.

**Parameters**

- **username** (*str*) -- The name of the user to list permissions for.
- **resource** (*str*) -- The resource (keyspace or table), if None, permissions for all resources are listed.
- **resource\_type** (*str*) -- The resource\_type (keyspace or table), defaults to 'keyspace'.
- **permission** (*str*) -- A permission name (e.g. select), if None, all permissions are listed.
- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **protocol\_version** (*int*) -- Cassandra protocol version to use.
- **load\_balancing\_policy** (*str*) -- cassandra.policy class name to use
- **load\_balancing\_policy\_args** (*dict*) -- cassandra.policy constructor args
- **ssl\_options** (*dict*) -- Cassandra protocol version to use.

**Returns**

Dictionary of permissions.

**Return type**

`dict`

CLI Example:

```

salt 'minion1' cassandra_cql.list_permissions

salt 'minion1' cassandra_cql.list_permissions username=joe resource=test_
→keyspace permission=select

salt 'minion1' cassandra_cql.list_permissions username=joe resource=test_
→table resource_type=table permission=select contact_
→points=minion1

```

`salt.modules.cassandra_cql.list_users` (*contact\_points=None, port=None, cql\_user=None, cql\_pass=None, protocol\_version=None, load\_balancing\_policy=None, load\_balancing\_policy\_args=None, ssl\_options=None*)

List existing users in this Cassandra cluster.

#### Parameters

- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **protocol\_version** (*int*) -- Cassandra protocol version to use.
- **load\_balancing\_policy** (*str*) -- cassandra.policy class name to use
- **load\_balancing\_policy\_args** (*dict*) -- cassandra.policy constructor args
- **ssl\_options** (*dict*) -- Cassandra protocol version to use.

#### Returns

The list of existing users.

#### Return type

dict

CLI Example:

```

salt 'minion1' cassandra_cql.list_users

salt 'minion1' cassandra_cql.list_users contact_points=minion1

```

`salt.modules.cassandra_cql.version` (*contact\_points=None, port=None, cql\_user=None, cql\_pass=None, protocol\_version=None, load\_balancing\_policy=None, load\_balancing\_policy\_args=None, ssl\_options=None*)

Show the Cassandra version.

#### Parameters

- **contact\_points** (*str* | *list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql\_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql\_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

- **protocol\_version** (*int*) -- Cassandra protocol version to use.
- **load\_balancing\_policy** (*str*) -- cassandra.policy class name to use
- **load\_balancing\_policy\_args** (*dict*) -- cassandra.policy constructor args
- **ssl\_options** (*dict*) -- Cassandra protocol version to use.

**Returns**

The version for this Cassandra cluster.

**Return type**

str

CLI Example:

```
salt 'minion1' cassandra_cql.version
salt 'minion1' cassandra_cql.version contact_points=minion1
```

### 26.6.75 salt.modules.celery

Support for scheduling celery tasks. The worker is independent of salt and thus can run in a different virtualenv or on a different python version, as long as broker, backend and serializer configurations match. Also note that celery and packages required by the celery broker, e.g. redis must be installed to load the salt celery execution module.

---

**Note:** A new app (and thus new connections) is created for each task execution

---

`salt.modules.celery.run_task` (*task\_name*, *args=None*, *kwargs=None*, *broker=None*, *backend=None*, *wait\_for\_result=False*, *timeout=None*, *propagate=True*, *interval=0.5*, *no\_ack=True*, *raise\_timeout=True*, *config=None*)

Execute celery tasks. For celery specific parameters see celery documentation.

CLI Example:

```
salt '*' celery.run_task tasks.sleep args=[4] broker=redis://localhost \
backend=redis://localhost wait_for_result=true
```

**task\_name**

The task name, e.g. tasks.sleep

**args**

Task arguments as a list

**kwargs**

Task keyword arguments

**broker**

Broker for celeryapp, see celery documentation

**backend**

Result backend for celeryapp, see celery documentation

**wait\_for\_result**

Wait until task result is read from result backend and return result, Default: False

**timeout**

Timeout waiting for result from celery, see celery AsyncResult.get documentation

**propagate**

Propagate exceptions from celery task, see celery AsyncResult.get documentation, Default: True

**interval**

Interval to check for task result, see celery AsyncResult.get documentation, Default: 0.5

**no\_ack**

see celery AsyncResult.get documentation. Default: True

**raise\_timeout**

Raise timeout exception if waiting for task result times out. Default: False

**config**

Config dict for celery app, See celery documentation

### 26.6.76 salt.modules.ceph

Module to provide ceph control with salt.

**depends**

- ceph\_cfg Python module

New in version 2016.11.0.

**salt.modules.ceph.ceph\_version()**

Get the version of ceph installed

CLI Example:

```
salt '*' ceph.ceph_version
```

**salt.modules.ceph.cluster\_quorum(\*\*kwargs)**

Get the cluster's quorum status

CLI Example:

```
salt '*' ceph.cluster_quorum \  
    'cluster_name'='ceph' \  
    'cluster_uuid'='cluster_uuid'
```

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

**salt.modules.ceph.cluster\_status(\*\*kwargs)**

Get the cluster status, including health if in quorum

CLI Example:

```
salt '*' ceph.cluster_status \  
    'cluster_name'='ceph' \  
    'cluster_uuid'='cluster_uuid'
```

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

`salt.modules.ceph.keyring_auth_add(**kwargs)`

Add keyring to authorized list

CLI Example:

```
salt '*' ceph.keyring_auth_add \
    'keyring_type'='admin' \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

**keyring\_type (required)**

One of admin, mon, osd, rgw, mds

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

`salt.modules.ceph.keyring_auth_del(**kwargs)`

Remove keyring from authorised list

CLI Example:

```
salt '*' ceph.keyring_osd_auth_del \
    'keyring_type'='admin' \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

**keyring\_type (required)**

One of admin, mon, osd, rgw, mds

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

`salt.modules.ceph.keyring_auth_list(**kwargs)`

List all cephx authorization keys

CLI Example:

```
salt '*' ceph.keyring_auth_list \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

**cluster\_name**

The cluster name. Defaults to ceph.

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

`salt.modules.ceph.keyring_create(**kwargs)`

Create keyring for cluster

CLI Example:

```
salt '*' ceph.keyring_create \  
    'keyring_type'='admin' \  
    'cluster_name'='ceph' \  
    'cluster_uuid'='cluster_uuid'
```

**keyring\_type (required)**

One of admin, mon, osd, rgw, mds

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

`salt.modules.ceph.keyring_present(**kwargs)`

Returns True if the keyring is present on disk, otherwise False

CLI Example:

```
salt '*' ceph.keyring_present \  
    'keyring_type'='admin' \  
    'cluster_name'='ceph' \  
    'cluster_uuid'='cluster_uuid'
```

**keyring\_type (required)**

One of admin, mon, osd, rgw, mds

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

`salt.modules.ceph.keyring_purge(**kwargs)`

Delete keyring for cluster

CLI Example:

```
salt '*' ceph.keyring_purge \  
    'keyring_type'='admin' \  
    'cluster_name'='ceph' \  
    'cluster_uuid'='cluster_uuid'
```

**keyring\_type (required)**

One of admin, mon, osd, rgw, mds

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

If no ceph config file is found, this command will fail.

`salt.modules.ceph.keyring_save(**kwargs)`

Create save keyring locally

CLI Example:

```
salt '*' ceph.keyring_save \
    'keyring_type'='admin' \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

**keyring\_type (required)**

One of admin, mon, osd, rgw, mds

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

`salt.modules.ceph.mds_create(**kwargs)`

Create a mds

CLI Example:

```
salt '*' ceph.mds_create \
    'name' = 'mds.name' \
    'port' = 1000, \
    'addr' = 'fqdn.example.org' \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

**name (required)**

The MDS name (must start with mds.)

**port (required)**

Port to which the MDS will listen

**addr (required)**

Address or IP address for the MDS to listen

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

`salt.modules.ceph.mds_destroy(**kwargs)`

Remove a mds

CLI Example:

```
salt '*' ceph.mds_destroy \
    'name' = 'mds.name' \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

**name (required)**

The MDS name (must start with mds.)

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

`salt.modules.ceph.mon_active(**kwargs)`

Returns True if the mon daemon is running, otherwise False

CLI Example:

```
salt '*' ceph.mon_active \  
    'cluster_name'='ceph' \  
    'cluster_uuid'='cluster_uuid'
```

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

`salt.modules.ceph.mon_create(**kwargs)`

Create a mon node

CLI Example:

```
salt '*' ceph.mon_create \  
    'cluster_name'='ceph' \  
    'cluster_uuid'='cluster_uuid'
```

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

`salt.modules.ceph.mon_is(**kwargs)`

Returns True if the target is a mon node, otherwise False

CLI Example:

```
salt '*' ceph.mon_is \  
    'cluster_name'='ceph' \  
    'cluster_uuid'='cluster_uuid'
```

**cluster\_name**

The cluster name. Defaults to ceph.

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

`salt.modules.ceph.mon_quorum(**kwargs)`

Returns True if the mon daemon is in the quorum, otherwise False

CLI Example:

```
salt '*' ceph.mon_quorum \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

`salt.modules.ceph.mon_status(**kwargs)`

Get status from mon daemon

CLI Example:

```
salt '*' ceph.mon_status \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

`salt.modules.ceph.osd_activate(**kwargs)`

Activate an OSD

CLI Example:

```
salt '*' ceph.osd_activate 'osd_dev'='/dev/vdc'
```

`salt.modules.ceph.osd_discover()`

List all OSD by cluster

CLI Example:

```
salt '*' ceph.osd_discover
```

`salt.modules.ceph.osd_prepare(**kwargs)`

Prepare an OSD

CLI Example:

```
salt '*' ceph.osd_prepare 'osd_dev'='/dev/vdc' \
    'journal_dev'='device' \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid' \
    'osd_fs_type'='xfs' \
    'osd_uuid'='2a143b73-6d85-4389-a9e9-b8a78d9e1e07' \
    'journal_uuid'='4562a5db-ff6f-4268-811d-12fd4a09ae98'
```

**cluster\_uuid**

The device to store the osd data on.

**journal\_dev**

The journal device. defaults to osd\_dev.

**cluster\_name**

The cluster name. Defaults to ceph.

**cluster\_uuid**

The cluster date will be added too. Defaults to the value found in local config.

**osd\_fs\_type**

set the file system to store OSD data with. Defaults to "xfs".

**osd\_uuid**

set the OSD data UUID. If set will return if OSD with data UUID already exists.

**journal\_uuid**

set the OSD journal UUID. If set will return if OSD with journal UUID already exists.

**salt.modules.ceph.partition\_is**(*dev*)

Check whether a given device path is a partition or a full disk.

CLI Example:

```
salt '*' ceph.partition_is /dev/sdc1
```

**salt.modules.ceph.partition\_list**()

List partitions by disk

CLI Example:

```
salt '*' ceph.partition_list
```

**salt.modules.ceph.partition\_list\_journal**()

List all OSD journal partitions by partition

CLI Example:

```
salt '*' ceph.partition_list_journal
```

**salt.modules.ceph.partition\_list\_osd**()

List all OSD data partitions by partition

CLI Example:

```
salt '*' ceph.partition_list_osd
```

**salt.modules.ceph.pool\_add**(*pool\_name*, *\*\*kwargs*)

Create a pool

CLI Example:

```
salt '*' ceph.pool_add pool_name \  
    'cluster_name'='ceph' \  
    'cluster_uuid'='cluster_uuid'
```

**cluster\_name**

The cluster name. Defaults to ceph.

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**pg\_num**

Default to 8

**pgp\_num**

Default to pg\_num

**pool\_type**

can take values "replicated" or "erasure"

**erasure\_code\_profile**

The "erasure\_code\_profile"

**crush\_ruleset**

The crush map rule set

`salt.modules.ceph.pool_del(pool_name, **kwargs)`

Delete a pool

CLI Example:

```
salt '*' ceph.pool_del pool_name \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

**cluster\_name**

The cluster name. Defaults to ceph.

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

`salt.modules.ceph.pool_list(**kwargs)`

List all pools

CLI Example:

```
salt '*' ceph.pool_list \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

**cluster\_name**

The cluster name. Defaults to ceph.

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

`salt.modules.ceph.purge(**kwargs)`

purge ceph configuration on the node

CLI Example:

```
salt '*' ceph.purge \  
    'cluster_name'='ceph' \  
    'cluster_uuid'='cluster_uuid'
```

**cluster\_name**

The cluster name. Defaults to ceph.

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

`salt.modules.ceph.rgw_create(**kwargs)`

Create a rgw

CLI Example:

```
salt '*' ceph.rgw_create \  
    'name' = 'rgw.name' \  
    'cluster_name'='ceph' \  
    'cluster_uuid'='cluster_uuid'
```

**name (required)**

The RGW client name. Must start with rgw.

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

`salt.modules.ceph.rgw_destroy(**kwargs)`

Remove a rgw

CLI Example:

```
salt '*' ceph.rgw_destroy \  
    'name' = 'rgw.name' \  
    'cluster_name'='ceph' \  
    'cluster_uuid'='cluster_uuid'
```

**name (required)**

The RGW client name (must start with rgw.)

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

`salt.modules.ceph.rgw_pools_create(**kwargs)`

Create pools for rgw

CLI Example:

```
salt '*' ceph.rgw_pools_create
```

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

`salt.modules.ceph.rgw_pools_missing(**kwargs)`

Show pools missing for rgw

CLI Example:

```
salt '*' ceph.rgw_pools_missing
```

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**cluster\_name**

The cluster name. Defaults to ceph.

`salt.modules.ceph.zap(target=None, **kwargs)`

Destroy the partition table and content of a given disk.

```
salt '*' ceph.osd_prepare 'dev'='/dev/vdc' \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

**dev**

The block device to format.

**cluster\_name**

The cluster name. Defaults to ceph.

**cluster\_uuid**

The cluster UUID. Defaults to value found in ceph config file.

### 26.6.77 salt.modules.chassis

Glue execution module to link to the *fx2 proxymodule*.

Depends: *iDRAC Remote execution module (salt.modules.dracr)*

For documentation on commands that you can direct to a Dell chassis via proxy, look in the documentation for *salt.modules.dracr*.

This execution module calls through to a function in the fx2 proxy module called `chconfig`. That function looks up the function passed in the `cmd` parameter in *salt.modules.dracr* and calls it.

New in version 2015.8.2.

`salt.modules.chassis.chassis_credentials()`

`salt.modules.chassis.cmd(cmd, *args, **kwargs)`

## 26.6.78 salt.modules.chef

Execute chef in server or solo mode

`salt.modules.chef.client` (*whyrun=False, localmode=False, logfile=None, \*\*kwargs*)

Execute a chef client run and return a dict with the stderr, stdout, return code, and pid.

CLI Example:

```
salt '*' chef.client server=https://localhost
```

### **server**

The chef server URL

### **client\_key**

Set the client key file location

### **config**

The configuration file to use

### **config-file-jail**

Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).

### **environment**

Set the Chef Environment on the node

### **group**

Group to set privilege to

### **json-attributes**

Load attributes from a JSON file or URL

### **localmode**

Point chef-client at local repository if True

### **log\_level**

Set the log level (debug, info, warn, error, fatal)

### **logfile**

Set the log file location

### **node-name**

The node name for this client

### **override-runlist**

Replace current run list with specified items for a single run

### **pid**

Set the PID file location, defaults to /tmp/chef-client.pid

### **run-lock-timeout**

Set maximum duration to wait for another client run to finish, default is indefinitely.

### **runlist**

Permanently replace current run list with specified items

### **user**

User to set privilege to

### **validation\_key**

Set the validation key file location, used for registering new clients

**whyrun**

Enable whyrun mode when set to True

`salt.modules.chef.solo` (*whyrun=False, logfile=None, \*\*kwargs*)

Execute a chef solo run and return a dict with the stderr, stdout, return code, and pid.

CLI Example:

```
salt '*' chef.solo override-runlist=test
```

**config**

The configuration file to use

**environment**

Set the Chef Environment on the node

**group**

Group to set privilege to

**json-attributes**

Load attributes from a JSON file or URL

**log\_level**

Set the log level (debug, info, warn, error, fatal)

**logfile**

Set the log file location

**node-name**

The node name for this client

**override-runlist**

Replace current run list with specified items for a single run

**recipe-url**

Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache

**run-lock-timeout**

Set maximum duration to wait for another client run to finish, default is indefinitely.

**user**

User to set privilege to

**whyrun**

Enable whyrun mode when set to True

## 26.6.79 salt.modules.chocolatey

A module that wraps calls to the Chocolatey package manager (<http://chocolatey.org>)

New in version 2014.1.0.

`salt.modules.chocolatey.add_source` (*name, source\_location, username=None, password=None, priority=None*)

Instructs Chocolatey to add a source.

**Parameters**

- **name** (*str*) -- The name of the source to be added as a chocolatey repository.
- **source** (*str*) -- Location of the source you want to work with.

- **username** (*str*) -- Provide username for chocolatey sources that need authentication credentials.
- **password** (*str*) -- Provide password for chocolatey sources that need authentication credentials.
- **priority** (*int*) -- The priority order of this source as compared to other sources, lower is better. Defaults to 0 (no priority). All priorities above 0 will be evaluated first, then zero-based values will be evaluated in config file order.

CLI Example:

```
salt '*' chocolatey.add_source <source name> <source_location>
salt '*' chocolatey.add_source <source name> <source_location>
  ↳ priority=100
salt '*' chocolatey.add_source <source name> <source_location> user=<user>
  ↳ password=<password>
```

`salt.modules.chocolatey.bootstrap` (*force=False, source=None, version=None*)

Download and install the latest version of the Chocolatey package manager via the official bootstrap.

Chocolatey requires Windows PowerShell and the .NET v4.0 runtime. Depending on the host's version of Windows, `chocolatey.bootstrap` will attempt to ensure these prerequisites are met by downloading and executing the appropriate installers from Microsoft.

---

**Note:** If PowerShell is installed, you may have to restart the host machine for Chocolatey to work.

---

---

**Note:** If you're installing offline using the source parameter, the PowerShell and .NET requirements must already be met on the target. This shouldn't be a problem on Windows versions 2012/8 and later

---

---

**Note:** If you're installing chocolatey version 2.0+ the system requires .NET 4.8. Installing this requires a reboot, therefore this module will not automatically install .NET 4.8.

---

#### Parameters

- **force** (*bool*) -- Run the bootstrap process even if Chocolatey is found in the path.
- **source** (*str*) -- The location of the `.nupkg` file or `.ps1` file to run from an alternate location. This can be one of the following types of URLs:
  - `salt://`
  - `http(s)://`
  - `ftp://`
  - `file://` - A local file on the systemNew in version 3001.
- **version** (*str*) -- The version of chocolatey to install. The latest version is installed if this value is `None`. Default is `None`  
New in version 3007.1.

**Returns**

The stdout of the Chocolatey installation script

**Return type**

str

CLI Example:

```
# To bootstrap Chocolatey
salt '*' chocolatey.bootstrap
salt '*' chocolatey.bootstrap force=True

# To bootstrap Chocolatey offline from a file on the salt master
salt '*' chocolatey.bootstrap source=salt://files/chocolatey.nupkg

# To bootstrap Chocolatey from a file on C:\Temp
salt '*' chocolatey.bootstrap source=C:\Temp\chocolatey.nupkg

# To bootstrap Chocolatey version 1.4.0
salt '*' chocolatey.bootstrap version=1.4.0
```

salt.modules.chocolatey.**chocolatey\_version**(*refresh=False*)

Returns the version of Chocolatey installed on the minion.

**Parameters**

**refresh** (*bool*) -- Refresh the cached version of chocolatey

New in version 3007.1.

CLI Example:

```
salt '*' chocolatey.chocolatey_version
```

salt.modules.chocolatey.**disable\_source**(*name*)

Instructs Chocolatey to disable a source.

**Parameters**

**name** (*str*) -- Name of the source repository to disable.

CLI Example:

```
salt '*' chocolatey.disable_source <name>
```

salt.modules.chocolatey.**enable\_source**(*name*)

Instructs Chocolatey to enable a source.

**Parameters**

**name** (*str*) -- Name of the source repository to enable.

CLI Example:

```
salt '*' chocolatey.enable_source <name>
```

salt.modules.chocolatey.**install**(*name, version=None, source=None, force=False, pre\_versions=False, install\_args=None, override\_args=False, force\_x86=False, package\_args=None, allow\_multiple=False, execution\_timeout=None*)

Instructs Chocolatey to install a package.

### Parameters

- **name** (*str*) -- The name of the package to be installed. Only accepts a single argument. Required.
- **version** (*str*) -- Install a specific version of the package. Defaults to latest version. Default is None.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is None.

Alternate Sources:

- cygwin
- python
- ruby
- webpi
- windowsfeatures

- **force** (*bool*) -- Reinstall the current version of an existing package. Do not use with `allow_multiple`. Default is `False`.
- **pre\_versions** (*bool*) -- Include pre-release packages. Default is `False`.
- **install\_args** (*str*) -- A list of install arguments you want to pass to the installation process, i.e. product key or feature list. Default is `None`.
- **override\_args** (*bool*) -- Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to `False` `install_args` will be appended to the end of the default arguments. Default is `None`.
- **force\_x86** (*bool*) -- Force x86 (32bit) installation on 64bit systems. Default is `False`.
- **package\_args** (*str*) -- Arguments you want to pass to the package. Default is `None`.
- **allow\_multiple** (*bool*) -- Allow multiple versions of the package to be installed. Do not use with `force`. Does not work with all packages. Default is `False`.

New in version 2017.7.0.

- **execution\_timeout** (*str*) -- Chocolatey execution timeout value you want to pass to the installation process. Default is `None`.

New in version 2018.3.0.

### Returns

The output of the `chocolatey` command

### Return type

*str*

CLI Example:

```
salt '*' chocolatey.install <package name>
salt '*' chocolatey.install <package name> version=<package version>
salt '*' chocolatey.install <package name> install_args=<args> override_
→args=True
```

`salt.modules.chocolatey.install_cygwin` (*name*, *install\_args=None*, *override\_args=False*)

Instructs Chocolatey to install a package via Cygwin.

**Parameters**

- **name** (*str*) -- The name of the package to be installed. Only accepts a single argument.
- **install\_args** (*str*) -- A list of install arguments you want to pass to the installation process, i.e. product key or feature list
- **override\_args** (*bool*) -- Set to True if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install\_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.install_cygwin <package name>
salt '*' chocolatey.install_cygwin <package name> install_args=<args>
↳override_args=True
```

`salt.modules.chocolatey.install_gem(name, version=None, install_args=None, override_args=False)`

Instructs Chocolatey to install a package via Ruby's Gems.

**Parameters**

- **name** (*str*) -- The name of the package to be installed. Only accepts a single argument.
- **version** (*str*) -- Install a specific version of the package. Defaults to the latest version available.
- **install\_args** (*str*) -- A list of install arguments you want to pass to the installation process, i.e. product key or feature list
- **override\_args** (*bool*) -- Set to True if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install\_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.install_gem <package name>
salt '*' chocolatey.install_gem <package name> version=<package version>
salt '*' chocolatey.install_gem <package name> install_args=<args>
↳override_args=True
```

`salt.modules.chocolatey.install_missing(name, version=None, source=None)`

Instructs Chocolatey to install a package if it doesn't already exist.

Changed in version 2014.7.0: If the minion has Chocolatey >= 0.9.8.24 installed, this function calls `chocolatey.install` instead, as `installmissing` is deprecated as of that version and will be removed in Chocolatey 1.0.

**Parameters**

- **name** (*str*) -- The name of the package to be installed. Only accepts a single argument.
- **version** (*str*) -- Install a specific version of the package. Defaults to the latest version available.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.

CLI Example:

```
salt '*' chocolatey.install_missing <package name>
salt '*' chocolatey.install_missing <package name> version=<package>
→version>
```

`salt.modules.chocolatey.install_python` (*name*, *version=None*, *install\_args=None*, *override\_args=False*)

Instructs Chocolatey to install a package via Python's `easy_install`.

#### Parameters

- **name** (*str*) -- The name of the package to be installed. Only accepts a single argument.
- **version** (*str*) -- Install a specific version of the package. Defaults to the latest version available.
- **install\_args** (*str*) -- A list of install arguments you want to pass to the installation process, i.e. product key or feature list.
- **override\_args** (*bool*) -- Set to `True` if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to `False` `install_args` will be appended to the end of the default arguments.

CLI Example:

```
salt '*' chocolatey.install_python <package name>
salt '*' chocolatey.install_python <package name> version=<package>
→version>
salt '*' chocolatey.install_python <package name> install_args=<args>
→override_args=True
```

`salt.modules.chocolatey.install_webpi` (*name*, *install\_args=None*, *override\_args=False*)

Instructs Chocolatey to install a package via the Microsoft Web PI service.

#### Parameters

- **name** (*str*) -- The name of the package to be installed. Only accepts a single argument.
- **install\_args** (*str*) -- A list of install arguments you want to pass to the installation process, i.e. product key or feature list.
- **override\_args** (*bool*) -- Set to `True` if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to `False` `install_args` will be appended to the end of the default arguments.

CLI Example:

```
salt '*' chocolatey.install_webpi <package name>
salt '*' chocolatey.install_webpi <package name> install_args=<args>
→override_args=True
```

`salt.modules.chocolatey.install_windowsfeatures` (*name*)

Instructs Chocolatey to install a Windows Feature via the Deployment Image Servicing and Management tool.

#### Parameters

- **name** (*str*) -- The name of the feature to be installed. Only accepts a single argument.

CLI Example:

```
salt '*' chocolatey.install_windowsfeatures <package name>
```

`salt.modules.chocolatey.list_` (*narrow=None, all\_versions=False, pre\_versions=False, source=None, local\_only=False, exact=False*)

Instructs Chocolatey to pull a vague package list from the repository.

#### Parameters

- **narrow** (*str*) -- Term used to narrow down results. Searches against name/description/tag. Default is None.
- **all\_versions** (*bool*) -- Display all available package versions in results. Default is False.
- **pre\_versions** (*bool*) -- Display pre-release packages in results. Default is False.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed if None is passed. Default is None.
- **local\_only** (*bool*) -- Only display packages that are installed locally. Default is False.
- **exact** (*bool*) -- Only display packages that match `narrow` exactly. Default is False.

New in version 2017.7.0.

#### Returns

A dictionary of results.

#### Return type

dict

CLI Example:

```
salt '*' chocolatey.list <narrow>
salt '*' chocolatey.list <narrow> all_versions=True
```

`salt.modules.chocolatey.list_sources()`

Returns the list of installed sources.

CLI Example:

```
salt '*' chocolatey.list_sources
```

`salt.modules.chocolatey.list_webpi()`

Instructs Chocolatey to pull a full package list from the Microsoft Web PI repository.

#### Returns

List of webpi packages

#### Return type

str

CLI Example:

```
salt '*' chocolatey.list_webpi
```

`salt.modules.chocolatey.list_windowsfeatures()`

Instructs Chocolatey to pull a full package list from the Windows Features list, via the Deployment Image Servicing and Management tool.

#### Returns

List of Windows Features

**Return type**

str

CLI Example:

```
salt '*' chocolatey.list_windowsfeatures
```

`salt.modules.chocolatey.unbootstrap()`

Uninstall chocolatey from the system by doing the following:

- Delete the Chocolatey Directory
- Remove Chocolatey from the path
- Remove Chocolatey environment variables

New in version 3001.

**Returns**

A list of items that were removed, otherwise an empty list

**Return type**

list

CLI Example:

```
salt * chocolatey.unbootstrap
```

`salt.modules.chocolatey.uninstall(name, version=None, uninstall_args=None, override_args=False, force=False)`

Instructs Chocolatey to uninstall a package.

**Parameters**

- **name** (*str*) -- The name of the package to be uninstalled. Only accepts a single argument.
- **version** (*str*) -- Uninstalls a specific version of the package. Defaults to the latest version installed.
- **uninstall\_args** (*str*) -- A list of uninstall arguments you want to pass to the uninstallation process, i.e. product key or feature list.
- **override\_args** -- Set to `True` if you want to override the original uninstall arguments (for the native uninstaller) in the package and use your own. When this is set to `False` `uninstall_args` will be appended to the end of the default arguments.

CLI Example:

```
salt '*' chocolatey.uninstall <package name>
salt '*' chocolatey.uninstall <package name> version=<package version>
salt '*' chocolatey.uninstall <package name> version=<package version>
↳uninstall_args=<args> override_args=True
```

`salt.modules.chocolatey.update(name, source=None, pre_versions=False)`

Instructs Chocolatey to update packages on the system.

**Parameters**

- **name** (*str*) -- The name of the package to update, or "all" to update everything installed on the system.

- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.
- **pre\_versions** (*bool*) -- Include pre-release packages in comparison. Defaults to False.

CLI Example:

```
salt "*" chocolatey.update all
salt "*" chocolatey.update <package name> pre_versions=True
```

`salt.modules.chocolatey.upgrade` (*name*, *version=None*, *source=None*, *force=False*, *pre\_versions=False*, *install\_args=None*, *override\_args=False*, *force\_x86=False*, *package\_args=None*)

New in version 2016.3.4.

Instructs Chocolatey to upgrade packages on the system. (update is being deprecated). This command will install the package if not installed.

#### Parameters

- **name** (*str*) -- The name of the package to update, or "all" to update everything installed on the system.
- **version** (*str*) -- Install a specific version of the package. Defaults to latest version.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.
- **force** (*bool*) -- Reinstall the same version already installed.
- **pre\_versions** (*bool*) -- Include pre-release packages in comparison. Defaults to False.
- **install\_args** (*str*) -- A list of install arguments you want to pass to the installation process, i.e. product key or feature list.
- **override\_args** (*bool*) -- Set to True if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False `install_args` will be appended to the end of the default arguments.
- **force\_x86** (*bool*) -- Force x86 (32bit) installation on 64bit systems. Defaults to False.
- **package\_args** (*str*) -- A list of arguments you want to pass to the package.

#### Returns

Results of the `chocolatey` command

#### Return type

`str`

CLI Example:

```
salt "*" chocolatey.upgrade all
salt "*" chocolatey.upgrade <package name> pre_versions=True
```

`salt.modules.chocolatey.version` (*name*, *check\_remote=False*, *source=None*, *pre\_versions=False*)

Instructs Chocolatey to check an installed package version, and optionally compare it to one available from a remote feed.

#### Parameters

- **name** (*str*) -- The name of the package to check. Required.

- **check\_remote** (*bool*) -- Get the version number of the latest package from the remote feed. Default is `False`.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is `None`.
- **pre\_versions** (*bool*) -- Include pre-release packages in comparison. Default is `False`.

**Returns**

A dictionary of currently installed software and versions

**Return type**

`dict`

CLI Example:

```
salt "*" chocolatey.version <package name>
salt "*" chocolatey.version <package name> check_remote=True
```

### 26.6.80 salt.modules.chronos

Module providing a simple management interface to a chronos cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.

**salt.modules.chronos.has\_job** (*name*)

Return whether the given job is currently configured.

CLI Example:

```
salt chronos-minion-id chronos.has_job my-job
```

**salt.modules.chronos.job** (*name*)

Return the current server configuration for the specified job.

CLI Example:

```
salt chronos-minion-id chronos.job my-job
```

**salt.modules.chronos.jobs** ()

Return a list of the currently installed job names.

CLI Example:

```
salt chronos-minion-id chronos.jobs
```

**salt.modules.chronos.rm\_job** (*name*)

Remove the specified job from the server.

CLI Example:

```
salt chronos-minion-id chronos.rm_job my-job
```

`salt.modules.chronos.update_job(name, config)`

Update the specified job with the given configuration.

CLI Example:

```
salt chronos-minion-id chronos.update_job my-job '<config yaml>'
```

### 26.6.81 salt.modules.chroot

Module for chroot :maintainer: Alberto Planas <aplanas@suse.com> :maturity: new :depends: None :platform: Linux

`salt.modules.chroot.apply_(root, mods=None, **kwargs)`

Apply an state inside a chroot.

This function will call `chroot.highstate` or `chroot.sls` based on the arguments passed to this function. It exists as a more intuitive way of applying states.

**root**

Path to the chroot environment

For a formal description of the possible parameters accepted in this function, check `state.apply_` documentation.

CLI Example:

```
salt myminion chroot.apply /chroot
salt myminion chroot.apply /chroot stuff
salt myminion chroot.apply /chroot stuff pillar='{"foo": "bar"}'
```

`salt.modules.chroot.call(root, function, *args, **kwargs)`

Executes a Salt function inside a chroot environment.

The chroot does not need to have Salt installed, but Python is required.

**root**

Path to the chroot environment

**function**

Salt execution module function

CLI Example:

```
salt myminion chroot.call /chroot test.ping
salt myminion chroot.call /chroot ssh.set_auth_key user key=mykey
```

`salt.modules.chroot.create(root)`

Create a basic chroot environment.

Note that this environment is not functional. The caller needs to install the minimal required binaries, including Python if `chroot.call` is called.

**root**

Path to the chroot environment

CLI Example:

```
salt myminion chroot.create /chroot
```

`salt.modules.chroot.exist`(*root*)

Return True if the chroot environment is present.

**root**

Path to the chroot environment

CLI Example:

```
salt myminion chroot.exist /chroot
```

`salt.modules.chroot.highstate`(*root*, *\*\*kwargs*)

Retrieve the state data from the salt master for this minion and execute it inside the chroot.

**root**

Path to the chroot environment

For a formal description of the possible parameters accepted in this function, check *state.highstate* documentation.

CLI Example:

```
salt myminion chroot.highstate /chroot
salt myminion chroot.highstate /chroot pillar='{"foo": "bar"}'
```

`salt.modules.chroot.in_chroot`()

Return True if the process is inside a chroot jail

New in version 3004.

CLI Example:

```
salt myminion chroot.in_chroot
```

`salt.modules.chroot.sls`(*root*, *mods*, *saltenv='base'*, *test=None*, *exclude=None*, *\*\*kwargs*)

Execute the states in one or more SLS files inside the chroot.

**root**

Path to the chroot environment

**saltenv**

Specify a salt fileserver environment to be used when applying states

**mods**

List of states to execute

**test**

Run states in test-only (dry-run) mode

**exclude**

Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

For a formal description of the possible parameters accepted in this function, check *state.sls* documentation.

CLI Example:

```
salt '*' chroot.sls /chroot stuff pillar='{"foo": "bar"}'
```

## 26.6.82 salt.modules.cimc

Module to provide Cisco UCS compatibility to Salt

```
codeauthor
    Spencer Ervin <spencer_ervin@hotmail.com>

maturity
    new

depends
    none

platform
    unix
```

### Configuration

This module accepts connection configuration details either as parameters, or as configuration settings in pillar as a Salt proxy. Options passed into opts will be ignored if options are passed into pillar.

See also:

*Cisco UCS Proxy Module*

### About

This execution module was designed to handle connections to a Cisco UCS server. This module adds support to send connections directly to the device through the rest API.

`salt.modules.cimc.activate_backup_image` (*reset=False*)

Activates the firmware backup image.

CLI Example:

#### Parameters

**reset** (*bool*) -- Reset the CIMC device on activate.

```
salt '*' cimc.activate_backup_image
salt '*' cimc.activate_backup_image reset=True
```

`salt.modules.cimc.create_user` (*uid=None, username=None, password=None, priv=None*)

Create a CIMC user with username and password.

#### Parameters

- **uid** (*int*) -- The user ID slot to create the user account in.
- **username** (*str*) -- The name of the user.
- **password** (*str*) -- The clear text password of the user.
- **priv** (*str*) -- The privilege level of the user.

CLI Example:

```
salt '*' cimc.create_user 11 username=admin password=foobar priv=admin
```

`salt.modules.cimc.get_bios_defaults()`

Get the default values of BIOS tokens.

CLI Example:

```
salt '*' cimc.get_bios_defaults
```

`salt.modules.cimc.get_bios_settings()`

Get the C240 server BIOS token values.

CLI Example:

```
salt '*' cimc.get_bios_settings
```

`salt.modules.cimc.get_boot_order()`

Retrieves the configured boot order table.

CLI Example:

```
salt '*' cimc.get_boot_order
```

`salt.modules.cimc.get_cpu_details()`

Get the CPU product ID details.

CLI Example:

```
salt '*' cimc.get_cpu_details
```

`salt.modules.cimc.get_disks()`

Get the HDD product ID details.

CLI Example:

```
salt '*' cimc.get_disks
```

`salt.modules.cimc.get_ethernet_interfaces()`

Get the adapter Ethernet interface details.

CLI Example:

```
salt '*' cimc.get_ethernet_interfaces
```

`salt.modules.cimc.get_fibre_channel_interfaces()`

Get the adapter fibre channel interface details.

CLI Example:

```
salt '*' cimc.get_fibre_channel_interfaces
```

`salt.modules.cimc.get_firmware()`

Retrieves the current running firmware versions of server components.

CLI Example:

```
salt '*' cimc.get_firmware
```

`salt.modules.cimc.get_hostname()`

Retrieves the hostname from the device.

New in version 2019.2.0.

CLI Example:

```
salt '*' cimc.get_hostname
```

`salt.modules.cimc.get_ldap()`

Retrieves LDAP server details.

CLI Example:

```
salt '*' cimc.get_ldap
```

`salt.modules.cimc.get_management_interface()`

Retrieve the management interface details.

CLI Example:

```
salt '*' cimc.get_management_interface
```

`salt.modules.cimc.get_memory_token()`

Get the memory RAS BIOS token.

CLI Example:

```
salt '*' cimc.get_memory_token
```

`salt.modules.cimc.get_memory_unit()`

Get the IMM/Memory unit product ID details.

CLI Example:

```
salt '*' cimc.get_memory_unit
```

`salt.modules.cimc.get_network_adapters()`

Get the list of network adapters and configuration details.

CLI Example:

```
salt '*' cimc.get_network_adapters
```

`salt.modules.cimc.get_ntp()`

Retrieves the current running NTP configuration.

CLI Example:

```
salt '*' cimc.get_ntp
```

`salt.modules.cimc.get_pci_adapters()`

Get the PCI adapter product ID details.

CLI Example:

```
salt '*' cimc.get_disks
```

**salt.modules.cimc.get\_power\_configuration()**

Get the configuration of the power settings from the device. This is only available on some C-Series servers.

New in version 2019.2.0.

CLI Example:

```
salt '*' cimc.get_power_configuration
```

**salt.modules.cimc.get\_power\_supplies()**

Retrieves the power supply unit details.

CLI Example:

```
salt '*' cimc.get_power_supplies
```

**salt.modules.cimc.get\_snmp\_config()**

Get the snmp configuration details.

CLI Example:

```
salt '*' cimc.get_snmp_config
```

**salt.modules.cimc.get\_syslog()**

Get the Syslog client-server details.

CLI Example:

```
salt '*' cimc.get_syslog
```

**salt.modules.cimc.get\_syslog\_settings()**

Get the Syslog configuration settings from the system.

New in version 2019.2.0.

CLI Example:

```
salt '*' cimc.get_syslog_settings
```

**salt.modules.cimc.get\_system\_info()**

Get the system information.

CLI Example:

```
salt '*' cimc.get_system_info
```

**salt.modules.cimc.get\_users()**

Get the CIMC users.

CLI Example:

```
salt '*' cimc.get_users
```

**salt.modules.cimc.get\_vic\_adapters()**

Get the VIC adapter general profile details.

CLI Example:

```
salt '*' cimc.get_vic_adapters
```

`salt.modules.cimc.get_vic_uplinks()`

Get the VIC adapter uplink port details.

CLI Example:

```
salt '*' cimc.get_vic_uplinks
```

`salt.modules.cimc.mount_share` (*name=None, remote\_share=None, remote\_file=None, mount\_type='nfs', username=None, password=None*)

Mounts a remote file through a remote share. Currently, this feature is supported in version 1.5 or greater. The remote share can be either NFS, CIFS, or WWW.

**Some of the advantages of CIMC Mounted vMedia include:**

Communication between mounted media and target stays local (inside datacenter) Media mounts can be scripted/automated No vKVM requirements for media connection Multiple share types supported Connections supported through all CIMC interfaces

Note: CIMC Mounted vMedia is enabled through BIOS configuration.

#### Parameters

- **name** (*str*) -- The name of the volume on the CIMC device.
- **remote\_share** (*str*) -- The file share link that will be used to mount the share. This can be NFS, CIFS, or WWW. This
- **file**. (*must be the directory path and not the full path to the remote*) --
- **remote\_file** (*str*) -- The name of the remote file to mount. It must reside within remote\_share.
- **mount\_type** (*str*) -- The type of share to mount. Valid options are nfs, cifs, and www.
- **username** (*str*) -- An optional requirement to pass credentials to the remote share. If not provided, an
- **made**. (*unauthenticated connection attempt will be*)--
- **password** (*str*) -- An optional requirement to pass a password to the remote share. If not provided, an
- **made**. --

CLI Example:

```
salt '*' cimc.mount_share name=WIN7 remote_share=10.xxx.27.xxx:/nfs
→remote_file=sl1huu.iso

salt '*' cimc.mount_share name=WIN7 remote_share=10.xxx.27.xxx:/nfs
→remote_file=sl1huu.iso username=bob password=badpassword
```

`salt.modules.cimc.reboot()`

Power cycling the server.

CLI Example:

```
salt '*' cimc.reboot
```

`salt.modules.cimc.set_hostname(hostname=None)`

Sets the hostname on the server.

New in version 2019.2.0.

#### Parameters

**hostname** (*str*) -- The new hostname to set.

CLI Example:

```
salt '*' cimc.set_hostname foobar
```

`salt.modules.cimc.set_logging_levels(remote=None, local=None)`

Sets the logging levels of the CIMC devices. The logging levels must match the following options: emergency, alert, critical, error, warning, notice, informational, debug.

New in version 2019.2.0.

#### Parameters

- **remote** (*str*) -- The logging level for SYSLOG logs.
- **local** (*str*) -- The logging level for the local device.

CLI Example:

```
salt '*' cimc.set_logging_levels remote=error local=notice
```

`salt.modules.cimc.set_ntp_server(server1="", server2="", server3="", server4="")`

Sets the NTP servers configuration. This will also enable the client NTP service.

#### Parameters

- **server1** (*str*) -- The first IP address or FQDN of the NTP servers.
- **server2** (*str*) -- The second IP address or FQDN of the NTP servers.
- **server3** (*str*) -- The third IP address or FQDN of the NTP servers.
- **server4** (*str*) -- The fourth IP address or FQDN of the NTP servers.

CLI Example:

```
salt '*' cimc.set_ntp_server 10.10.10.1
```

```
salt '*' cimc.set_ntp_server 10.10.10.1 foo.bar.com
```

`salt.modules.cimc.set_power_configuration(policy=None, delayType=None, delayValue=None)`

Sets the power configuration on the device. This is only available for some C-Series servers.

New in version 2019.2.0.

#### Parameters

- **policy** (*str*) -- The action to be taken when chassis power is restored after
- **following** (*delayed with this option. This can be one of the*) --
  - reset: The server is allowed to boot up normally when power is restored. The server can restart immediately or, optionally, after a fixed or random delay.
  - stay-off: The server remains off until it is manually restarted.

last-state: The server restarts and the system attempts to restore any processes that were running before power was lost.

- **delayType** (*str*) -- If the selected policy is reset, the restart can be
  - **following** -- fixed: The server restarts after a fixed delay.
  - random: The server restarts after a random delay.
- **delayValue** (*int*) -- If a fixed delay is selected, once chassis power is
- **rebooting** (*restored and the Cisco IMC has finished*)--
- **for** (*the system waits*)--
- **an** (*the specified number of seconds before restarting the server. Enter*)--
- **240.** (*integer between 0 and*)--

CLI Example:

```
salt '*' cimc.set_power_configuration stay-off
salt '*' cimc.set_power_configuration reset fixed 0
```

`salt.modules.cimc.set_syslog_server` (*server=None, type='primary'*)

Set the SYSLOG server on the host.

#### Parameters

- **server** (*str*) -- The hostname or IP address of the SYSLOG server.
- **type** (*str*) -- Specifies the type of SYSLOG server. This can either be primary (default) or secondary.

CLI Example:

```
salt '*' cimc.set_syslog_server foo.bar.com
salt '*' cimc.set_syslog_server foo.bar.com primary
salt '*' cimc.set_syslog_server foo.bar.com secondary
```

`salt.modules.cimc.set_user` (*uid=None, username=None, password=None, priv=None, status=None*)

Sets a CIMC user with specified configurations.

New in version 2019.2.0.

#### Parameters

- **uid** (*int*) -- The user ID slot to create the user account in.
- **username** (*str*) -- The name of the user.
- **password** (*str*) -- The clear text password of the user.
- **priv** (*str*) -- The privilege level of the user.
- **status** (*str*) -- The account status of the user.

CLI Example:

```
salt '*' cimc.set_user 11 username=admin password=foobar priv=admin active
```

`salt.modules.cimc.tftp_update_bios` (*server=None, path=None*)

Update the BIOS firmware through TFTP.

#### Parameters

- **server** (*str*) -- The IP address or hostname of the TFTP server.
- **path** (*str*) -- The TFTP path and filename for the BIOS image.

CLI Example:

```
salt '*' cimc.tftp_update_bios foo.bar.com HP-SL2.cap
```

`salt.modules.cimc.tftp_update_cimc` (*server=None, path=None*)

Update the CIMC firmware through TFTP.

#### Parameters

- **server** (*str*) -- The IP address or hostname of the TFTP server.
- **path** (*str*) -- The TFTP path and filename for the CIMC image.

CLI Example:

```
salt '*' cimc.tftp_update_cimc foo.bar.com HP-SL2.bin
```

## 26.6.83 salt.modules.ciscoconfparse\_mod

Execution module for `ciscoconfparse`

New in version 2019.2.0.

This module can be used for basic configuration parsing, audit or validation for a variety of network platforms having Cisco IOS style configuration (one space indentation), including: Cisco IOS, Cisco Nexus, Cisco IOS-XR, Cisco IOS-XR, Cisco ASA, Arista EOS, Brocade, HP Switches, Dell PowerConnect Switches, or Extreme Networks devices. In newer versions, `ciscoconfparse` provides support for brace-delimited configuration style as well, for platforms such as: Juniper Junos, Palo Alto, or F5 Networks.

See <http://www.pennington.net/py/ciscoconfparse/index.html> for further details.

#### depends

`ciscoconfparse`

This module depends on the Python library with the same name, `ciscoconfparse` - to install execute: `pip install ciscoconfparse`.

`salt.modules.ciscoconfparse_mod.filter_lines` (*config=None, config\_path=None, parent\_regex=None, child\_regex=None, saltenv='base'*)

Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent respects the regular expressions configured via the `parent_regex` argument, and the child matches the `child_regex` regular expression. The result is a list of dictionaries with the following keys:

- **match**: a boolean value that tells whether `child_regex` matched any children lines.
- **parent**: the parent line (as text).
- **child**: the child line (as text). If no child line matched, this field will be `None`.

Note that the return list contains the elements that matched the parent condition, the `parent_regex` regular expression. Therefore, the `parent` field will always have a valid value, while `match` and `child` may default to `False` and `None` respectively when there is not child match.

CLI Example:

```
salt '*' ciscoconfparse.filter_lines config_path=https://bit.ly/2mAdq7zX
→parent_regex='Gigabit' child_regex='shutdown'
```

Example output (for the example above):

```
[
  {
    'parent': 'interface GigabitEthernet1',
    'match': False,
    'child': None
  },
  {
    'parent': 'interface GigabitEthernet2',
    'match': True,
    'child': ' shutdown'
  },
  {
    'parent': 'interface GigabitEthernet3',
    'match': True,
    'child': ' shutdown'
  }
]
```

`salt.modules.ciscoconfparse_mod.find_lines` (*config=None, config\_path=None, regex=None, saltenv='base'*)

Return all the lines (as text) that match the expression in the `regex` argument.

#### **config**

The configuration sent as text.

---

**Note:** This argument is ignored when `config_path` is specified.

---

#### **config\_path**

The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., `salt://`, `https://`, `ftp://`, `s3://`, etc.

#### **regex**

The regular expression to match the lines against.

#### **saltenv: base**

Salt fileserver environment from which to retrieve the file. This argument is ignored when `config_path` is not a `salt://` URL.

CLI Example:

```
salt '*' ciscoconfparse.find_lines config_path=https://bit.ly/2mAdq7zX
→regex='ip address'
```

Output example:

```
cisco-ios-router:
- ip address dhcp
- ip address 172.20.0.1 255.255.255.0
- no ip address
```

`salt.modules.ciscoconfparse_mod.find_lines_w_child`(*config=None, config\_path=None, parent\_regex=None, child\_regex=None, ignore\_ws=False, saltenv='base'*)

Return a list of parent lines (as text) matching the regular expression `parent_regex` that have children lines matching `child_regex`.

**config**

The configuration sent as text.

---

**Note:** This argument is ignored when `config_path` is specified.

---

**config\_path**

The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., `salt://`, `https://`, `ftp://`, `s3://`, etc.

**parent\_regex**

The regular expression to match the parent lines against.

**child\_regex**

The regular expression to match the child lines against.

**ignore\_ws: False**

Whether to ignore the white spaces.

**saltenv: base**

Salt files server environment from which to retrieve the file. This argument is ignored when `config_path` is not a `salt://` URL.

CLI Example:

```
salt '*' ciscoconfparse.find_lines_w_child config_path=https://bit.ly/
→2mAdq7z parent_line='line con' child_line='stopbits'
salt '*' ciscoconfparse.find_lines_w_child config_path=https://bit.ly/
→2uIRxau parent_regex='ge-(.*)' child_regex='unit \d+'
```

`salt.modules.ciscoconfparse_mod.find_lines_wo_child`(*config=None, config\_path=None, parent\_regex=None, child\_regex=None, ignore\_ws=False, saltenv='base'*)

Return a list of parent `ciscoconfparse.IOSCfgLine` lines as text, which matched the `parent_regex` and whose children did *not* match `child_regex`. Only the parent `ciscoconfparse.IOSCfgLine` text lines will be returned. For simplicity, this method only finds oldest ancestors without immediate children that match.

**config**

The configuration sent as text.

---

**Note:** This argument is ignored when `config_path` is specified.

---

**config\_path**

The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., `salt://`, `https://`, `ftp://`, `s3://`, etc.

**parent\_regex**

The regular expression to match the parent lines against.

**child\_regex**

The regular expression to match the child lines against.

**ignore\_ws: False**

Whether to ignore the white spaces.

**saltenv: base**

Salt fileserver environment from which to retrieve the file. This argument is ignored when `config_path` is not a `salt://` URL.

CLI Example:

```
salt '*' ciscoconfparse.find_lines_wo_child config_path=https://bit.ly/
↳2mAdq7z parent_line='line con' child_line='stopbits'
```

`salt.modules.ciscoconfparse_mod.find_objects` (*config=None, config\_path=None, regex=None, saltenv='base'*)

Return all the line objects that match the expression in the `regex` argument.

**Warning:** This function is mostly valuable when invoked from other Salt components (i.e., execution modules, states, templates etc.). For CLI usage, please consider using `ciscoconfparse.find_lines`

**config**

The configuration sent as text.

---

**Note:** This argument is ignored when `config_path` is specified.

---

**config\_path**

The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., `salt://`, `https://`, `ftp://`, `s3://`, etc.

**regex**

The regular expression to match the lines against.

**saltenv: base**

Salt fileserver environment from which to retrieve the file. This argument is ignored when `config_path` is not a `salt://` URL.

Usage example:

```
objects = __salt__['ciscoconfparse.find_objects'](config_path='salt://
↳path/to/config.txt',
                                                regex='Gigabit')
for obj in objects:
    print(obj.text)
```

```
salt.modules.ciscoconfparse_mod.find_objects_w_child(config=None, config_path=None,
                                                    parent_regex=None,
                                                    child_regex=None, ignore_ws=False,
                                                    saltenv='base')
```

Parse through the children of all parent lines matching `parent_regex`, and return a list of child objects, which matched the `child_regex`.

**Warning:** This function is mostly valuable when invoked from other Salt components (i.e., execution modules, states, templates etc.). For CLI usage, please consider using `ciscoconfparse.find_lines_w_child`

#### **config**

The configuration sent as text.

---

**Note:** This argument is ignored when `config_path` is specified.

---

#### **config\_path**

The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., `salt://`, `https://`, `ftp://`, `s3://`, etc.

#### **parent\_regex**

The regular expression to match the parent lines against.

#### **child\_regex**

The regular expression to match the child lines against.

#### **ignore\_ws: False**

Whether to ignore the white spaces.

#### **saltenv: base**

Salt fileserver environment from which to retrieve the file. This argument is ignored when `config_path` is not a `salt://` URL.

Usage example:

```
objects = __salt__['ciscoconfparse.find_objects_w_child'](config_path=
↳ 'https://bit.ly/2mAdq7z',
                                                         parent_regex=
↳ 'line con',
                                                         child_regex=
↳ 'stopbits')
for obj in objects:
    print(obj.text)
```

```
salt.modules.ciscoconfparse_mod.find_objects_wo_child(config=None, config_path=None,
                                                    parent_regex=None,
                                                    child_regex=None, ignore_ws=False,
                                                    saltenv='base')
```

Return a list of parent `ciscoconfparse.IOSCfgLine` objects, which matched the `parent_regex` and whose children did *not* match `child_regex`. Only the parent `ciscoconfparse.IOSCfgLine` objects will be returned. For simplicity, this method only finds oldest ancestors without immediate children that match.

**Warning:** This function is mostly valuable when invoked from other Salt components (i.e., execution modules, states, templates etc.). For CLI usage, please consider using `ciscoconfparse.find_lines_wo_child`

**config**

The configuration sent as text.

---

**Note:** This argument is ignored when `config_path` is specified.

---

**config\_path**

The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., `salt://`, `https://`, `ftp://`, `s3://`, etc.

**parent\_regex**

The regular expression to match the parent lines against.

**child\_regex**

The regular expression to match the child lines against.

**ignore\_ws: False**

Whether to ignore the white spaces.

**saltenv: base**

Salt filesrv environment from which to retrieve the file. This argument is ignored when `config_path` is not a `salt://` URL.

Usage example:

```
objects = __salt__['ciscoconfparse.find_objects_wo_child'](config_path=
→ 'https://bit.ly/2mAdq7z',
parent_regex=
→ 'line con',
child_regex=
→ 'stopbits')
for obj in objects:
    print(obj.text)
```

## 26.6.84 salt.modules.cisconso

Execution module for Cisco Network Services Orchestrator Proxy minions

New in version 2016.11.0.

For documentation on setting up the `cisconso` proxy minion look in the documentation for [salt.proxy.cisconso](#).

`salt.modules.cisconso.apply_rollback(datastore, name)`

Apply a system rollback

**Parameters**

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **name** (str) -- an ID of the rollback to restore

```
salt cisco-nso ciscoconso.apply_rollback 52
```

`salt.modules.ciscoconso.get_data(datastore, path)`

Get the configuration of the device tree at the given path

**Parameters**

- **datastore** (`DatastoreType(str enum)`) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (`list, str OR tuple`) -- The device path to set the value at, a list of element names in order, / separated

**Returns**

The network configuration at that tree

**Return type**

dict

```
salt cisco-nso ciscoconso.get_data running 'devices/ex0'
```

`salt.modules.ciscoconso.get_rollback(name)`

Get the backup of stored a configuration rollback

**Parameters**

**name** (`str`) -- Typically an ID of the backup

**Return type**

str

**Returns**

the contents of the rollback snapshot

```
salt cisco-nso ciscoconso.get_rollback 52
```

`salt.modules.ciscoconso.get_rollbacks()`

Get a list of stored configuration rollbacks

```
salt cisco-nso ciscoconso.get_rollbacks
```

`salt.modules.ciscoconso.info()`

Return system information for grains of the NSO proxy minion

```
salt '*' ciscoconso.info
```

`salt.modules.ciscoconso.set_data_value(datastore, path, data)`

Set a data entry in a datastore

**Parameters**

- **datastore** (`DatastoreType(str enum)`) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (`list, str OR tuple`) -- The device path to set the value at, a list of element names in order, / separated
- **data** (`dict`) -- The new value at the given path

**Return type**

bool

**Returns**

True if successful, otherwise error.

```
salt cisco-nso cisco.set_data_value running 'devices/ex0/routes' 10.0.
→0.20/24
```

**26.6.85 salt.modules.cloud**

Salt-specific interface for calling Salt Cloud directly

**salt.modules.cloud.action**(*fun=None, cloudmap=None, names=None, provider=None, instance=None, \*\*kwargs*)

Execute a single action on the given provider/instance

CLI Example:

```
salt minionname cloud.action start instance=myinstance
salt minionname cloud.action stop instance=myinstance
salt minionname cloud.action show_image provider=my-ec2-config image=ami-
→1624987f
```

**salt.modules.cloud.create**(*provider, names, opts=None, \*\*kwargs*)

Create an instance using Salt Cloud

CLI Example:

```
salt minionname cloud.create my-ec2-config myinstance image=ami-1624987f
→size='t1.micro' ssh_username=ec2-user securitygroup=default delvol_on_
→destroy=True
```

**salt.modules.cloud.destroy**(*names*)

Destroy the named VM(s)

CLI Example:

```
salt minionname cloud.destroy myinstance
```

**salt.modules.cloud.full\_query**(*query\_type='list\_nodes\_full'*)

List all available cloud provider data

CLI Example:

```
salt minionname cloud.full_query
```

**salt.modules.cloud.get\_instance**(*name, provider=None*)

Return details on an instance.

Similar to the cloud action show\_instance but returns only the instance details.

CLI Example:

```
salt minionname cloud.get_instance myinstance
```

SLS Example:

```
{{ salt['cloud.get_instance']('myinstance')['mac_address'] }}
```

`salt.modules.cloud.has_instance` (*name*, *provider=None*)

Return true if the instance is found on a provider

CLI Example:

```
salt minionname cloud.has_instance myinstance
```

`salt.modules.cloud.list_images` (*provider='all'*)

List cloud provider images for the given providers

CLI Example:

```
salt minionname cloud.list_images my-gce-config
```

`salt.modules.cloud.list_locations` (*provider='all'*)

List cloud provider locations for the given providers

CLI Example:

```
salt minionname cloud.list_locations my-gce-config
```

`salt.modules.cloud.list_sizes` (*provider='all'*)

List cloud provider sizes for the given providers

CLI Example:

```
salt minionname cloud.list_sizes my-gce-config
```

`salt.modules.cloud.map_run` (*path=None*, *\*\*kwargs*)

Execute a salt cloud map file

Cloud Map data can be retrieved from several sources:

- a local file (provide the path to the file to the 'path' argument)
- a JSON-formatted map directly (provide the appropriately formatted to using the 'map\_data' argument)
- the Salt Pillar (provide the map name of under 'pillar:cloud:maps' to the 'map\_pillar' argument)

---

**Note:** Only one of these sources can be read at a time. The options are listed in their order of precedence.

---

CLI Examples:

```
salt minionname cloud.map_run /path/to/cloud.map
salt minionname cloud.map_run path=/path/to/cloud.map
salt minionname cloud.map_run map_pillar='<map_pillar>'
  .. versionchanged:: 2018.3.1
salt minionname cloud.map_run map_data='<actual map data>'
```

`salt.modules.cloud.network_create` (*provider*, *names*, *\*\*kwargs*)

Create private network

CLI Example:

```
salt minionname cloud.network_create my-nova names=['salt'] cidr='192.168.
→100.0/24'
```

`salt.modules.cloud.network_list(provider)`

List private networks

CLI Example:

```
salt minionname cloud.network_list my-nova
```

`salt.modules.cloud.profile_(profile, names, vm_overrides=None, opts=None, **kwargs)`

Spin up an instance using Salt Cloud

CLI Example:

```
salt minionname cloud.profile my-gce-config myinstance
```

`salt.modules.cloud.query(query_type='list_nodes')`

List cloud provider data for all providers

CLI Examples:

```
salt minionname cloud.query
salt minionname cloud.query list_nodes_full
salt minionname cloud.query list_nodes_select
```

`salt.modules.cloud.select_query(query_type='list_nodes_select')`

List selected nodes

CLI Example:

```
salt minionname cloud.select_query
```

`salt.modules.cloud.virtual_interface_create(provider, names, **kwargs)`

Attach private interfaces to a server

CLI Example:

```
salt minionname cloud.virtual_interface_create my-nova names=['salt-master
→'] net_name='salt'
```

`salt.modules.cloud.virtual_interface_list(provider, names, **kwargs)`

List virtual interfaces on a server

CLI Example:

```
salt minionname cloud.virtual_interface_list my-nova names=['salt-master']
```

`salt.modules.cloud.volume_attach(provider, names, **kwargs)`

Attach volume to a server

CLI Example:

```
salt minionname cloud.volume_attach my-nova myblock server_name=myserver
→device='/dev/xvdf'
```

`salt.modules.cloud.volume_create(provider, names, **kwargs)`

Create volume

CLI Example:

```
salt minionname cloud.volume_create my-nova myblock size=100 voltype=SSD
```

`salt.modules.cloud.volume_delete(provider, names, **kwargs)`

Delete volume

CLI Example:

```
salt minionname cloud.volume_delete my-nova myblock
```

`salt.modules.cloud.volume_detach(provider, names, **kwargs)`

Detach volume from a server

CLI Example:

```
salt minionname cloud.volume_detach my-nova myblock server_name=myserver
```

`salt.modules.cloud.volume_list(provider)`

List block storage volumes

CLI Example:

```
salt minionname cloud.volume_list my-nova
```

### 26.6.86 salt.modules.cmdmod

A module for shelling out.

Keep in mind that this module is insecure, in that it can give whomever has access to the master root execution access to all salt minions.

`salt.modules.cmdmod.exec_code(lang, code, cwd=None, args=None, **kwargs)`

Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. The stdout will be returned.

All parameters from `cmd.run_all` except `python_shell` can be used.

CLI Example:

```
salt '*' cmd.exec_code ruby 'puts "cheese"'
salt '*' cmd.exec_code ruby 'puts "cheese" args=["arg1", "arg2"] env={"FOO": "bar"}'
```

`salt.modules.cmdmod.exec_code_all(lang, code, cwd=None, args=None, **kwargs)`

Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. All cmd artifacts (stdout, stderr, retcode, pid) will be returned.

All parameters from `cmd.run_all` except `python_shell` can be used.

CLI Example:

```
salt '*' cmd.exec_code_all ruby 'puts "cheese"'
salt '*' cmd.exec_code_all ruby 'puts "cheese" args=["arg1", "arg2"]'
→env={'"F00": "bar"}'
```

`salt.modules.cmdmod.has_exec(cmd)`

Returns true if the executable is available on the minion, false otherwise

CLI Example:

```
salt '*' cmd.has_exec cat
```

`salt.modules.cmdmod.powershell(cmd, cwd=None, stdin=None, runas=None, shell='powershell', env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv=None, use_vt=False, password=None, depth=None, encode_cmd=False, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs)`

Execute the passed PowerShell command and return the output as a dictionary.

Other `cmd.*` functions (besides `cmd.powershell_all`) return the raw text output of the command. This function appends `| ConvertTo-JSON` to the command and then parses the JSON into a Python dictionary. If you want the raw textual result of your PowerShell command you should use `cmd.run` with the `shell=powershell` option.

For example:

```
salt '*' cmd.run '$PSVersionTable.CLRVersion' shell=powershell
salt '*' cmd.run 'Get-NetTCPConnection' shell=powershell
```

New in version 2016.3.0.

**Warning:** This passes the `cmd` argument directly to PowerShell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

In addition to the normal `cmd.run` parameters, this command offers the `depth` parameter to change the Windows default depth for the `ConvertTo-JSON` powershell command. The Windows default is 2. If you need more depth, set that here.

**Note:** For some commands, setting the depth to a value greater than 4 greatly increases the time it takes for the command to return and in many cases returns useless data.

### Parameters

- **cmd** (*str*) -- The powershell command to run.
- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **shell** (*str*) -- Specify an alternate shell. Defaults to "powershell". Can also use "pwsh" for powershell core if present on the system
- **python\_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** (*dict*) -- Environment variables to be set prior to execution.

---

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.powershell 'some command' env='{"FOO":  
→"bar"}'
```

---

**Note:** When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses *Path* as opposed to *PATH* for other systems.

---

- **clean\_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_encoding** (*str*) -- Control the encoding used to decode the command's output.

---

**Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

---

New in version 2018.3.0.

- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the debug loglevel regardless, unless `quiet` is used for this value.

---

- **ignore\_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **hide\_output** (*bool*) -- If `True`, suppress stdout and stderr in the return data.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **reset\_system\_locale** (*bool*) -- Resets the system locale
- **saltenv** (*str*) -- The salt environment to use. Default is 'base'
- **depth** (*int*) -- The number of levels of contained objects to be included. Default is 2. Values greater than 4 seem to greatly increase the time it takes for the command to complete for some commands. eg: `dir`

New in version 2016.3.4.

- **encode\_cmd** (*bool*) -- Encode the command before executing. Use in cases where characters may be dropped or incorrectly converted when executed. Default is `False`.
- **success\_retcodes** (*list*) --

This parameter will allow a list of

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **success\_stdout** (*list*) --

This parameter will allow a list of

strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **success\_stderr** (*list*) --

This parameter will allow a list of

strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **stdin\_raw\_newlines** (*bool*) --

**False**

If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

**Returns****dict**

A dictionary of data returned by the powershell command.

CLI Example:

```
salt '*' cmd.powershell "$PSVersionTable.CLRVersion"
```

```
salt.modules.cmdmod.powershell_all(cmd, cwd=None, stdin=None, runas=None, shell='powershell',
                                     env=None, clean_env=False, template=None, rstrip=True,
                                     umask=None, output_encoding=None, output_loglevel='debug',
                                     quiet=False, timeout=None, reset_system_locale=True,
                                     ignore_retcode=False, saltenv=None, use_vt=False,
                                     password=None, depth=None, encode_cmd=False, force_list=False,
                                     success_retcodes=None, success_stdout=None,
                                     success_stderr=None, **kwargs)
```

Execute the passed PowerShell command and return a dictionary with a `result` field representing the output of the command, as well as other fields showing us what the PowerShell invocation wrote to `stderr`, the process id, and the exit code of the invocation.

This function appends `| ConvertTo-JSON` to the command before actually invoking powershell.

An unquoted empty string is not valid JSON, but it's very normal for the Powershell output to be exactly that. Therefore, we do not attempt to parse empty Powershell output (which would result in an exception). Instead we treat this as a special case and one of two things will happen:

- If the value of the `force_list` parameter is `True`, then the `result` field of the return dictionary will be an empty list.
- If the value of the `force_list` parameter is `False`, then the return dictionary **will not have a result key added to it**. We aren't setting `result` to `None` in this case, because `None` is the Python representation of "null" in JSON. (We likewise can't use `False` for the equivalent reason.)

If Powershell's output is not an empty string and Python cannot parse its content, then a `CommandExecutionError` exception will be raised.

If Powershell's output is not an empty string, Python is able to parse its content, and the type of the resulting Python object is other than `list` then one of two things will happen:

- If the value of the `force_list` parameter is `True`, then the `result` field will be a singleton list with the Python object as its sole member.
- If the value of the `force_list` parameter is `False`, then the value of `result` will be the unmodified Python object.

If Powershell's output is not an empty string, Python is able to parse its content, and the type of the resulting Python object is `list`, then the value of `result` will be the unmodified Python object. The `force_list` parameter has no effect in this case.

---

**Note:** An example of why the `force_list` parameter is useful is as follows: The Powershell command `dir x | Convert-ToJson` results in

- no output when `x` is an empty directory.

- a dictionary object when `x` contains just one item.
- a list of dictionary objects when `x` contains multiple items.

By setting `force_list` to `True` we will always end up with a list of dictionary items, representing files, no matter how many files `x` contains. Conversely, if `force_list` is `False`, we will end up with no `result` key in our return dictionary when `x` is an empty directory, and a dictionary object when `x` contains just one file.

If you want a similar function but with a raw textual result instead of a Python dictionary, you should use `cmd.run_all` in combination with `shell=powershell`.

The remaining fields in the return dictionary are described in more detail in the Returns section.

Example:

```
salt '*' cmd.run_all '$PSVersionTable.CLRVersion' shell=powershell
salt '*' cmd.run_all 'Get-NetTCPConnection' shell=powershell
```

New in version 2018.3.0.

**Warning:** This passes the `cmd` argument directly to PowerShell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

In addition to the normal `cmd.run` parameters, this command offers the `depth` parameter to change the Windows default depth for the `ConvertTo-JSON` powershell command. The Windows default is 2. If you need more depth, set that here.

**Note:** For some commands, setting the `depth` to a value greater than 4 greatly increases the time it takes for the command to return and in many cases returns useless data.

### Parameters

- **cmd** (*str*) -- The powershell command to run.
- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.
- **shell** (*str*) -- Specify an alternate shell. Defaults to "powershell". Can also use "pwsh" for powershell core if present on the system

- **python\_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** (*dict*) -- Environment variables to be set prior to execution.

---

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.powershell_all 'some command' env='{ "FOO
↳ ": "bar" }'
```

---

**Note:** When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses *Path* as opposed to *PATH* for other systems.

---

- **clean\_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_encoding** (*str*) -- Control the encoding used to decode the command's output.

---

**Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of *test.versions\_report*.

---

New in version 2018.3.0.

- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the *debug* loglevel regardless, unless *quiet* is used for this value.

---

- **ignore\_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as *True* to skip logging the output if the command has a nonzero exit code.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **reset\_system\_locale** (*bool*) -- Resets the system locale

- **ignore\_retcode** -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **saltenv** (*str*) -- The salt environment to use. Default is 'base'
- **depth** (*int*) -- The number of levels of contained objects to be included. Default is 2. Values greater than 4 seem to greatly increase the time it takes for the command to complete for some commands. eg: `dir`
- **encode\_cmd** (*bool*) -- Encode the command before executing. Use in cases where characters may be dropped or incorrectly converted when executed. Default is `False`.
- **force\_list** (*bool*) -- The purpose of this parameter is described in the preamble of this function's documentation. Default value is `False`.
- **success\_retcodes** (*list*) --

This parameter will allow a list of

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **success\_stdout** (*list*) --

This parameter will allow a list of

strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **success\_stderr** (*list*) --

This parameter will allow a list of

strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **stdin\_raw\_newlines** (*bool*) --

`False`

If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

## Returns

A dictionary with the following entries:

### result

For a complete description of this field, please refer to this function's preamble. This key will not be added to the dictionary when `force_list` is `False` and Powershell's output is the empty string.

### stderr

What the PowerShell invocation wrote to `stderr`.

**pid**

The process id of the PowerShell invocation

**retcode**

This is the exit code of the invocation of PowerShell. If the final execution status (in PowerShell) of our command (with `| ConvertTo-JSON` appended) is `False` this should be non-0. Likewise if PowerShell exited with `$LASTEXITCODE` set to some non-0 value, then `retcode` will end up with this value.

**Return type**

dict

CLI Example:

```
salt '*' cmd.powershell_all "$PSVersionTable.CLRVersion"
```

CLI Example:

```
salt '*' cmd.powershell_all "dir mydirectory" force_list=True
```

```
salt.modules.cmdmod.retcode(cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh',
python_shell=None, env=None, clean_env=False, template=None,
umask=None, output_encoding=None, output_loglevel='debug',
log_callback=None, timeout=None, reset_system_locale=True,
ignore_retcode=False, saltenv=None, use_vt=False, password=None,
success_retcodes=None, success_stdout=None, success_stderr=None,
**kwargs)
```

Execute a shell command and return the command's return code.

**Parameters**

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home`
- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

**Warning:** For versions 2018.3.3 and above on macosx while using `runas`, to pass special characters to the command you need to escape the characters on the shell.

Example:

```
cmd.retcode 'echo \'\'h=\'"baz\'\'\'\' runas=macuser
```

- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **group** (*str*) -- Group to run command as. Not currently supported on Windows.
- **shell** (*str*) -- Specify an alternate shell. Defaults to the system's default shell.
- **python\_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** (*dict*) -- Environment variables to be set prior to execution.

---

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.retcode 'some command' env='{"FOO": "bar"}
↪'
```

---

**Note:** When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses *Path* as opposed to *PATH* for other systems.

- **clean\_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_encoding** (*str*) -- Control the encoding used to decode the command's output.

---

**Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of *test.versions\_report*.

---

New in version 2018.3.0.

- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the *debug* loglevel regardless, unless *quiet* is used for this value.

- **ignore\_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as *True* to skip logging the output if the command has a nonzero exit code.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.

- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **success\_retcodes** (*list*) --

This parameter will allow a list of

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **success\_stdout** (*list*) --

This parameter will allow a list of

strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **success\_stderr** (*list*) --

This parameter will allow a list of

strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **stdin\_raw\_newlines** (*bool*) --

False

If True, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

#### Return type

`int`

#### Return type

None

#### Returns

Return Code as an int or None if there was an exception.

CLI Example:

```
salt '*' cmd.retcode "file /bin/bash"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.retcode template=jinja "file {{grains.pythonpath[0]}}/python"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.retcode "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

```

salt.modules.cmdmod.run(cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh',
                        python_shell=None, env=None, clean_env=False, template=None, rstrip=True,
                        umask=None, output_encoding=None, output_loglevel='debug',
                        log_callback=None, hide_output=False, timeout=None, reset_system_locale=True,
                        ignore_retcodes=False, saltenv=None, use_vt=False, redirect_stderr=True, bg=False,
                        password=None, encoded_cmd=False, raise_err=False, prepend_path=None,
                        success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs)

```

Execute the passed command and return the output as a string

#### Parameters

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home`
- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running.

**Warning:** For versions 2018.3.3 and above on macosx while using `runas`, on linux while using `run`, to pass special characters to the command you need to escape the characters on the shell.

Example:

```
cmd.run 'echo \'\'h=\'"baz\'\'\'\' runas=macuser
```

- **group** (*str*) -- Group to run command as. Not currently supported on Windows.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **shell** (*str*) -- Specify an alternate shell. Defaults to the system's default shell.
- **python\_shell** (*bool*) -- If `False`, let python handle the positional arguments. Set to `True` to use shell features, such as pipes or redirection.
- **bg** (*bool*) -- If `True`, run command in background and do not await or deliver its results

New in version 2016.3.0.

- **env** (*dict*) -- Environment variables to be set prior to execution.

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run 'some command' env={'F00': "bar"}
```

---

**Note:** When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses *Path* as opposed to *PATH* for other systems.

---

- **clean\_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend\_path** (*str*) -- \$PATH segment to prepend (trailing ':' not necessary) to \$PATH  
New in version 2018.3.0.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_encoding** (*str*) -- Control the encoding used to decode the command's output.

---

**Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

---

New in version 2018.3.0.

- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

- **ignore\_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **hide\_output** (*bool*) -- If `True`, suppress stdout and stderr in the return data.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **redirect\_stderr** (*bool*) -- If set to `True`, then `stderr` will be redirected to `stdout`. This is helpful for cases where obtaining both the `retcode` and `output` is desired. Default is `True`

New in version 3006.9.

- **encoded\_cmd** (*bool*) -- Specify if the supplied command is encoded. Only applies to shell `'powershell'` and `'pwsh'`.

New in version 2018.3.0.

Older versions of `powershell` seem to return raw `xml` data in the return. To avoid raw `xml` data in the return, prepend your command with the following before encoding:

```
$ProgressPreference='SilentlyContinue'; <your command>
```

The following `powershell` code block will encode the `Write-Output` command so that it will not have the raw `xml` data in the return:

```
# target string
$Command = '$ProgressPreference="SilentlyContinue"; Write-
↳Output "hello"'

# Convert to Base64 encoded string
$Encoded = [convert]::ToBase64String([System.Text.
↳encoding]::Unicode.GetBytes($command))

Write-Output $Encoded
```

- **raise\_err** (*bool*) -- If `True` and the command has a nonzero exit code, a `CommandExecutionError` exception will be raised.

**Warning:** This function does not process commands through a shell unless the `python_shell` flag is set to `True`. This means that any shell-specific functionality such as `'echo'` or the use of pipes, redirection or `&&`, should either be migrated to `cmd.shell` or have the `python_shell=True` flag set here.

The use of `python_shell=True` means that the shell will accept `_any_` input including potentially malicious commands such as `'good_command;rm -rf/'`. Be absolutely certain that you have sanitized your input prior to using `python_shell=True`

### Parameters

- **success\_retcodes** (*list*) --

This parameter will allow a list of

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **success\_stdout** (*list*) --

This parameter will allow a list of

strings that when found in standard out should be considered a success. If `stdout` returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **success\_stderr** (*list*) --

This parameter will allow a list of

strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **stdin\_raw\_newlines** (*bool*) --

False

If True, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

- **windows\_codepage** (*int*) --

65001

Only applies to Windows: the minion uses `C:WindowsSystem32chcp.com` to verify or set the code page before the command `cmd` is executed. Code page 65001 corresponds with UTF-8 and allows international localization of Windows.

New in version 3002.

CLI Example:

```
salt '*' cmd.run "ls -l | awk '/foo/{print \\$2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/
→{print \\$2}'"
```

Specify an alternate shell with the `shell` parameter:

```
salt '*' cmd.run "Get-ChildItem C:\\ " shell='powershell'
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.run "grep f" stdin='one\\n\\ntwo\\n\\nthree\\n\\nfour\\n\\nfive\\n'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' cmd.run cmd='sed -e s/=/:/g'
```

```
salt.modules.cmdmod.run_all(cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh',
python_shell=None, env=None, clean_env=False, template=None,
rstrip=True, umask=None, output_encoding=None, output_loglevel='debug',
log_callback=None, hide_output=False, timeout=None,
reset_system_locale=True, ignore_retcode=False, saltenv=None,
use_vt=False, redirect_stderr=False, password=None, encoded_cmd=False,
prepend_path=None, success_retcodes=None, success_stdout=None,
success_stderr=None, **kwargs)
```

Execute the passed command and return a dict of return data

### Parameters

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home`
- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

**Warning:** For versions 2018.3.3 and above on macosx while using `runas`, to pass special characters to the command you need to escape the characters on the shell.

Example:

```
cmd.run_all 'echo \'\'h=\'"baz\'\'\'\' runas=macuser
```

- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **group** (*str*) -- Group to run command as. Not currently supported on Windows.
- **shell** (*str*) -- Specify an alternate shell. Defaults to the system's default shell.
- **python\_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** (*dict*) -- Environment variables to be set prior to execution.

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run_all 'some command' env='{"FOO": "bar"}
→'
```

**Note:** When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses *Path* as opposed to *PATH* for other systems.

- **clean\_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend\_path** (*str*) -- \$PATH segment to prepend (trailing ':' not necessary) to \$PATH

New in version 2018.3.0.

- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_encoding** (*str*) -- Control the encoding used to decode the command's output.

---

**Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

---

New in version 2018.3.0.

- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

- **ignore\_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **hide\_output** (*bool*) -- If `True`, suppress stdout and stderr in the return data.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **encoded\_cmd** (*bool*) -- Specify if the supplied command is encoded. Only applies to shell 'powershell' and 'pwsh'.

New in version 2018.3.0.

Older versions of powershell seem to return raw xml data in the return. To avoid raw xml data in the return, prepend your command with the following before encoding:

```
$ProgressPreference='SilentlyContinue'; <your command>
```

The following powershell code block will encode the *Write-Output* command so that it will not have the raw xml data in the return:

```
# target string
$Command = '$ProgressPreference="SilentlyContinue"; Write-
↳Output "hello"'

# Convert to Base64 encoded string
$Encoded = [convert]::ToBase64String([System.Text.
↳encoding]::Unicode.GetBytes($command))

Write-Output $Encoded
```

- **redirect\_stderr** (*bool*) -- If set to `True`, then `stderr` will be redirected to `stdout`. This is helpful for cases where obtaining both the `retcode` and output is desired, but it is not desired to have the output separated into both `stdout` and `stderr`.

New in version 2015.8.2.

- **password** -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **bg** (*bool*) -- If `True`, run command in background and do not await or deliver its results

New in version 2016.3.6.

- **success\_retcodes** (*list*) --

This parameter will allow a list of

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **success\_stdout** (*list*) --

This parameter will allow a list of

strings that when found in standard out should be considered a success. If `stdout` returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **success\_stderr** (*list*) --

This parameter will allow a list of

strings that when found in standard error should be considered a success. If `stderr` returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **stdin\_raw\_newlines** (*bool*) --

False

If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.run_all "ls -l | awk '/foo/{print \$2}'"
```

The `template` arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_all template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/
→{print \$2}'"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.run_all "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

```
salt.modules.cmdmod.run_bg(cmd, cwd=None, runas=None, group=None, shell='/bin/sh',
python_shell=None, env=None, clean_env=False, template=None,
umask=None, timeout=None, output_encoding=None,
output_loglevel='debug', log_callback=None, reset_system_locale=True,
ignore_retcode=False, saltenv=None, password=None, prepend_path=None,
success_retcodes=None, success_stdout=None, success_stderr=None,
**kwargs)
```

New in version 2016.3.0.

Execute the passed command in the background and return its PID

---

**Note:** If the init system is `systemd` and the backgrounded task should run even if the `salt-minion` process is restarted, prepend `systemd-run --scope` to the command. This will reparent the process in its own scope separate from `salt-minion`, and will not be affected by restarting the minion service.

---

#### Parameters

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home`
- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **group** (*str*) -- Group to run command as. Not currently supported on Windows.
- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **output\_encoding** (*str*) -- Control the encoding used to decode the command's output.

---

**Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

---

New in version 2018.3.0.

- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

- **ignore\_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

**Warning:** For versions 2018.3.3 and above on macosx while using `runas`, to pass special characters to the command you need to escape the characters on the shell.

Example:

```
cmd.run_bg 'echo \'\'h=\'"baz\'\'\'\' runas=macuser'
```

- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.  
New in version 2016.3.0.
- **shell** -- Specify an alternate shell. Defaults to the system's default shell.
- **python\_shell** (*bool*) -- If `False`, let python handle the positional arguments. Set to `True` to use shell features, such as pipes or redirection.
- **env** (*dict*) -- Environment variables to be set prior to execution.

---

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run_bg 'some command' env={'FOO': 'bar'}
```

---

**Note:** When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses *Path* as opposed to *PATH* for other systems.

---

- **clean\_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend\_path** (*str*) -- \$PATH segment to prepend (trailing ':' not necessary) to \$PATH  
New in version 2018.3.0.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.

**Warning:** This function does not process commands through a shell unless the `python_shell` argument is set to `True`. This means that any shell-specific functionality such as `'echo'` or the use of pipes, redirection or `&&`, should either be migrated to `cmd.shell` or have the `python_shell=True` flag set here.

The use of `python_shell=True` means that the shell will accept `_any_` input including potentially malicious commands such as `'good_command;rm -rf /'`. Be absolutely certain that you have sanitized your input prior to using `python_shell=True`.

### Parameters

- **success\_retcodes** (*list*) --

This parameter will allow a list of

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **success\_stdout** (*list*) --

This parameter will allow a list of

strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **success\_stderr** (*list*) --

This parameter will allow a list of

strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **stdin\_raw\_newlines** (*bool*) --

False

If True, Salt will not automatically convert the characters `\\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.run_bg "fstrim-all"
```

The `template` arg can be set to `'jinja'` or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_bg template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/
→{print \\$2}'"
```

Specify an alternate shell with the `shell` parameter:

```
salt '*' cmd.run_bg "Get-ChildItem C:\\ " shell='powershell'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' cmd.run_bg cmd='ls -lR / | sed -e s/=/:/g > /tmp/dontwait'
```

```
salt.modules.cmdmod.run_chroot(root, cmd, cwd=None, stdin=None, runas=None, group=None,
shell='/bin/sh', python_shell=True, binds=None, env=None,
clean_env=False, template=None, rstrip=True, umask=None,
output_encoding=None, output_loglevel='quiet', log_callback=None,
hide_output=False, timeout=None, reset_system_locale=True,
ignore_retcode=False, saltenv=None, use_vt=False, bg=False,
success_retcodes=None, success_stdout=None, success_stderr=None,
**kwargs)
```

New in version 2014.7.0.

This function runs `cmd.run_all` wrapped within a chroot, with dev and proc mounted in the chroot

#### Parameters

- **root** (*str*) -- Path to the root of the jail to use.
  - **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:
  - **runas** (*str*) -- User to run script as.
  - **group** (*str*) -- Group to run script as.
  - **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
  - **cmd** (*str*) -- The command to run. ex: `ls -lart /home`
  - **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
  - **runas** -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.
  - **shell** -- Specify an alternate shell. Defaults to the system's default shell.
  - **python\_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
  - **binds** (*list*) -- List of directories that will be exported inside the chroot with the `bind` option.
- New in version 3000.
- **env** (*dict*) -- Environment variables to be set prior to execution.

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run_chroot 'some command' env='{"FOO":
↳ "bar"}'
```

---

**Note:** When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses *Path* as opposed to *PATH* for other systems.

---

- **clean\_env** (*dict*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_encoding** (*str*) -- Control the encoding used to decode the command's output.

---

**Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

---

New in version 2018.3.0.

- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

- **ignore\_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **hide\_output** (*bool*) -- If `True`, suppress stdout and stderr in the return data.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **success\_retcodes** --

This parameter will allow a list of

non-zero return codes that should be considered a success. If the return code returned

from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **success\_stdout** (*list*) --

This parameter will allow a list of

strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **success\_stderr** (*list*) --

This parameter will allow a list of

strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

#### Parar str stdin

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

CLI Example:

```
salt '*' cmd.run_chroot /var/lib/lxc/container_name/rootfs 'sh /tmp/
↳bootstrap.sh'
```

```
salt.modules.cmdmod.run_stderr(cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh',
python_shell=None, env=None, clean_env=False, template=None,
rstrip=True, umask=None, output_encoding=None,
output_loglevel='debug', log_callback=None, hide_output=False,
timeout=None, reset_system_locale=True, ignore_retcode=False,
saltenv=None, use_vt=False, password=None, prepend_path=None,
success_retcodes=None, success_stdout=None, success_stderr=None,
**kwargs)
```

Execute a command and only return the standard error

#### Parameters

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home`
- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

**Warning:** For versions 2018.3.3 and above on macosx while using runas, to pass special characters to the command you need to escape the characters on the shell.

Example:

```
cmd.run_stderr 'echo \'\'h=\'"baz\'\'\'\' runas=macuser
```

- **password** (*str*) -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.  
New in version 2016.3.0.
- **group** (*str*) -- Group to run command as. Not currently supported on Windows.
- **shell** (*str*) -- Specify an alternate shell. Defaults to the system's default shell.
- **python\_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** (*dict*) -- Environment variables to be set prior to execution.

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run_stderr 'some command' env={'FOO':  
↪ "bar"}
```

**Note:** When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses *Path* as opposed to *PATH* for other systems.

- **clean\_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend\_path** (*str*) -- \$PATH segment to prepend (trailing ':' not necessary) to \$PATH  
New in version 2018.3.0.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_encoding** (*str*) -- Control the encoding used to decode the command's output.

**Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

New in version 2018.3.0.

- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

- **ignore\_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **hide\_output** (*bool*) -- If `True`, suppress stdout and stderr in the return data.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **success\_retcodes** (*list*) --

This parameter will allow a list of

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **success\_stdout** (*list*) --

This parameter will allow a list of

strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **success\_stderr** (*list*) --

This parameter will allow a list of

strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **stdin\_raw\_newlines** (*bool*) --

False

If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.run_stderr "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_stderr template=jinja "ls -l /tmp/{{grains.id}} | awk '/
→foo/{print \$2}'"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.run_stderr "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

```
salt.modules.cmdmod.run_stdout(cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh',
python_shell=None, env=None, clean_env=False, template=None,
rstrip=True, umask=None, output_encoding=None,
output_loglevel='debug', log_callback=None, hide_output=False,
timeout=None, reset_system_locale=True, ignore_retcode=False,
saltenv=None, use_vt=False, password=None, prepend_path=None,
success_retcodes=None, success_stdout=None, success_stderr=None,
**kwargs)
```

Execute a command, and only return the standard out

#### Parameters

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home`
- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

**Warning:** For versions 2018.3.3 and above on macosx while using `runas`, to pass special characters to the command you need to escape the characters on the shell.

Example:

```
cmd.run_stdout 'echo \'\'h=\'"baz\'\'\'\' runas=macuser
```

- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **group** (*str*) -- Group to run command as. Not currently supported on Windows.
- **shell** (*str*) -- Specify an alternate shell. Defaults to the system's default shell.

- **python\_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** (*dict*) -- Environment variables to be set prior to execution.

---

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run_stdout 'some command' env='{"FOO":
↳ "bar"}'
```

---

**Note:** When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses *Path* as opposed to *PATH* for other systems.

- **clean\_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend\_path** (*str*) -- \$PATH segment to prepend (trailing ':' not necessary) to \$PATH  
New in version 2018.3.0.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_encoding** (*str*) -- Control the encoding used to decode the command's output.

---

**Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of *test.versions\_report*.

---

New in version 2018.3.0.

- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the *debug* loglevel regardless, unless *quiet* is used for this value.

- **ignore\_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as *True* to skip logging the output if the command has a nonzero exit code.
- **hide\_output** (*bool*) -- If *True*, suppress stdout and stderr in the return data.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **success\_retcodes** (*list*) --

**This parameter will allow a list of**

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **success\_stdout** (*list*) --

**This parameter will allow a list of**

strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **success\_stderr** (*list*) --

**This parameter will allow a list of**

strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **stdin\_raw\_newlines** (*bool*) --

**False**

If True, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.run_stdout "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_stdout template=jinja "ls -l /tmp/{{grains.id}} | awk '/  
→foo/{print \$2}'"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.run_stdout "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

`salt.modules.cmdmod.script` (*source*, *args*=None, *cwd*=None, *stdin*=None, *runas*=None, *group*=None, *shell*='/bin/sh', *python\_shell*=None, *env*=None, *template*=None, *umask*=None, *output\_encoding*=None, *output\_loglevel*='debug', *log\_callback*=None, *hide\_output*=False, *timeout*=None, *reset\_system\_locale*=True, *saltenv*=None, *use\_vt*=False, *bg*=False, *password*=None, *success\_retcodes*=None, *success\_stdout*=None, *success\_stderr*=None, *\*\*kwargs*)

Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

#### Parameters

- **source** (*str*) -- The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`
- **args** (*str*) -- String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it:

```
salt myminion cmd.script salt://foo.sh "arg1 'arg two' arg3"
```

- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the directory returned from Python's `tempfile.mkstemp`.
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

---

**Note:** For Window's users, specifically Server users, it may be necessary to specify your `runas` user using the User Logon Name instead of the legacy logon name. Traditionally, logons would be in the following format.

Domain/user

In the event this causes issues when executing scripts, use the UPN format which looks like the following.

user@domain.local

More information <<https://github.com/saltstack/salt/issues/55080>>

---

- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **group** (*str*) -- Group to run script as. Not currently supported on Windows.
- **shell** (*str*) -- Specify an alternate shell. Defaults to the system's default shell.
- **python\_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **bg** (*bool*) -- If True, run script in background and do not await or deliver its results

- **env** (*dict*) -- Environment variables to be set prior to execution.

---

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.script 'some command' env='{"FOO": "bar"}'
```

---

**Note:** When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses *Path* as opposed to *PATH* for other systems.

---

- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_encoding** (*str*) -- Control the encoding used to decode the command's output.

---

**Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of *test.versions\_report*.

---

New in version 2018.3.0.

- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the *debug* loglevel regardless, unless *quiet* is used for this value.

---

- **ignore\_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as *True* to skip logging the output if the command has a nonzero exit code.
- **hide\_output** (*bool*) -- If *True*, suppress stdout and stderr in the return data.

---

**Note:** This is separate from *output\_loglevel*, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

- **timeout** (*int*) -- If the command has not terminated after *timeout* seconds, send the subprocess *sigterm*, and if *sigterm* is ignored, follow up with *sigkill*
- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **success\_retcodes** (*list*) --

This parameter will allow a list of

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **success\_stdout** (*list*) --

This parameter will allow a list of

strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **success\_stderr** (*list*) --

This parameter will allow a list of

strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **stdin\_raw\_newlines** (*bool*) --

False

If True, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.script salt://scripts/runme.sh
salt '*' cmd.script salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt '*' cmd.script salt://scripts/windows_task.ps1 args=' -Input c:\tmp\
→infile.txt' shell='powershell'
```

```
salt '*' cmd.script salt://scripts/runme.sh stdin='one\ntwo\nthree\nfour\
→nfive\n'
```

`salt.modules.cmdmod.script_retcode` (*source*, *args=None*, *cwd=None*, *stdin=None*, *runas=None*, *group=None*, *shell='/bin/sh'*, *python\_shell=None*, *env=None*, *template='jinja'*, *umask=None*, *timeout=None*, *reset\_system\_locale=True*, *saltenv=None*, *output\_encoding=None*, *output\_loglevel='debug'*, *log\_callback=None*, *use\_vt=False*, *password=None*, *success\_retcodes=None*, *success\_stdout=None*, *success\_stderr=None*, *\*\*kwargs*)

Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

The script can also be formatted as a template, the default is jinja.

Only evaluate the script return code and do not block for terminal output

Parameters

- **source** (*str*) -- The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs
- **args** (*str*) -- String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: "arg1 'arg two' arg3"
- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by *runas* (or the user under which Salt is running if *runas* is not specified).
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying *runas*. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **group** (*str*) -- Group to run script as. Not currently supported on Windows.
- **shell** (*str*) -- Specify an alternate shell. Defaults to the system's default shell.
- **python\_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** (*dict*) -- Environment variables to be set prior to execution.

---

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.script_retcode 'some command' env='{"FOO": "bar"}'
```

---

**Note:** When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses *Path* as opposed to *PATH* for other systems.

---

- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_encoding** (*str*) -- Control the encoding used to decode the command's output.

---

**Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

---

New in version 2018.3.0.

- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

- **ignore\_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **timeout** (*int*) -- If the command has not terminated after timeout seconds, send the subprocess `sigterm`, and if `sigterm` is ignored, follow up with `sigkill`
- **use\_vt** (*bool*) -- Use VT utils (`saltstack`) to stream the command output more interactively to the console and the logs. This is experimental.
- **success\_retcodes** (*list*) --

This parameter will allow a list of

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **success\_stdout** (*list*) --

This parameter will allow a list of

strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **success\_stderr** (*list*) --

This parameter will allow a list of

strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **stdin\_raw\_newlines** (*bool*) --

False

If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.script_retcodes salt://scripts/runme.sh
salt '*' cmd.script_retcodes salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt '*' cmd.script_retcodes salt://scripts/windows_task.ps1 args=' -Input
→c:\tmp\infile.txt' shell='powershell'
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.script_retcodes salt://scripts/runme.sh stdin='one\ntwo\
→nthree\nfour\nfive\n'
```

```
salt.modules.cmdmod.shell(cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh',
env=None, clean_env=False, template=None, rstrip=True, umask=None,
output_encoding=None, output_loglevel='debug', log_callback=None,
hide_output=False, timeout=None, reset_system_locale=True,
ignore_retcodes=False, saltenv=None, use_vt=False, bg=False, password=None,
prepend_path=None, success_retcodes=None, success_stdout=None,
success_stderr=None, **kwargs)
```

Execute the passed command and return the output as a string.

New in version 2015.5.0.

#### Parameters

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home`
- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

**Warning:** For versions 2018.3.3 and above on macosx while using `runas`, to pass special characters to the command you need to escape the characters on the shell.

Example:

```
cmd.shell 'echo \'\'h=\"baz\"\'\'\' runas=macuser
```

- **group** (*str*) -- Group to run command as. Not currently supported on Windows.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.

- **shell** (*int*) -- Shell to execute under. Defaults to the system default shell.
- **bg** (*bool*) -- If True, run command in background and do not await or deliver its results

- **env** (*dict*) -- Environment variables to be set prior to execution.

---

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.shell 'some command' env='{"FOO": "bar"}'
```

---

**Note:** When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses *Path* as opposed to *PATH* for other systems.

---

- **clean\_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend\_path** (*str*) -- \$PATH segment to prepend (trailing ':' not necessary) to \$PATH  
New in version 2018.3.0.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output\_encoding** (*str*) -- Control the encoding used to decode the command's output.

---

**Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of *test.versions\_report*.

---

New in version 2018.3.0.

- **output\_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the *debug* loglevel regardless, unless *quiet* is used for this value.

---

- **ignore\_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as *True* to skip logging the output if the command has a nonzero exit code.
- **hide\_output** (*bool*) -- If *True*, suppress stdout and stderr in the return data.

---

**Note:** This is separate from *output\_loglevel*, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use\_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**Warning:** This passes the cmd argument directly to the shell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

#### Parameters

- **success\_retcodes** (*list*) --

This parameter will allow a list of

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **success\_stdout** (*list*) --

This parameter will allow a list of

strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **success\_stderr** (*list*) --

This parameter will allow a list of

strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **stdin\_raw\_newlines** (*bool*) --

False

If True, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.shell "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.shell template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/
→{print \$2}'"
```

Specify an alternate shell with the shell parameter:

```
salt '*' cmd.shell "Get-ChildItem C:\ " shell='powershell'
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.shell "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' cmd.shell cmd='sed -e s/=/:/g'
```

`salt.modules.cmdmod.shell_info(shell, list_modules=False)`

New in version 2016.11.0.

Provides information about a shell or script languages which often use `#!`. The values returned are dependent on the shell or scripting languages all return the `installed`, `path`, `version`, `version_raw`

#### Parameters

- **shell** (*str*) -- Name of the shell. Support shells/script languages include
- **bash** --
- **cmd** --
- **perl** --
- **php** --
- **powershell** --
- **python** --
- **zsh** (*ruby and*) --
- **list\_modules** (*bool*) -- True to list modules available to the shell.
- **modules.** (*Currently only lists powershell*) --

#### Returns

A dictionary of information about the shell

#### Return type

dict

```
{'version': '<2 or 3 numeric components dot-separated>',
 'version_raw': '<full version string>',
 'path': '<full path to binary>',
 'installed': <True, False or None>,
 '<attribute>': '<attribute value>'}
```

#### Note:

- `installed` is always returned, if `None` or `False` also returns error and may also return `stdout` for diagnostics.
- `version` is for use in determine if a shell/script language has a particular feature set, not for package management.

- The shell must be within the executable search path.

CLI Example:

```
salt '*' cmd.shell_info bash
salt '*' cmd.shell_info powershell
```

**Codeauthor**

Damon Atkins <<https://github.com/damon-atkins>>

`salt.modules.cmdmod.shells()`

Lists the valid shells on this system via the `/etc/shells` file

New in version 2015.5.0.

CLI Example:

```
salt '*' cmd.shells
```

`salt.modules.cmdmod.tty(device, echo="")`

Echo a string to a specific tty

CLI Example:

```
salt '*' cmd.tty tty0 'This is a test'
salt '*' cmd.tty pts3 'This is a test'
```

`salt.modules.cmdmod.which(cmd)`

Returns the path of an executable available on the minion, None otherwise

CLI Example:

```
salt '*' cmd.which cat
```

`salt.modules.cmdmod.which_bin(cmds)`

Returns the first command found in a list of commands

CLI Example:

```
salt '*' cmd.which_bin '[pip2, pip, pip-python]'
```

### 26.6.87 salt.modules.composer

Use composer to install PHP dependencies for a directory

`salt.modules.composer.did_composer_install(dir)`

Test to see if the vendor directory exists in this directory

**dir**

Directory location of the `composer.json` file

CLI Example:

```
salt '*' composer.did_composer_install /var/www/application
```

`salt.modules.composer.install` (*directory, composer=None, php=None, runas=None, prefer\_source=None, prefer\_dist=None, no\_scripts=None, no\_plugins=None, optimize=None, no\_dev=None, quiet=False, composer\_home='/root', env=None*)

Install composer dependencies for a directory.

If composer has not been installed globally making it available in the system PATH & making it executable, the `composer` and `php` parameters will need to be set to the location of the executables.

#### **directory**

Directory location of the composer.json file.

#### **composer**

Location of the composer.phar file. If not set composer will just execute "composer" as if it is installed globally. (i.e. /path/to/composer.phar)

#### **php**

Location of the php executable to use with composer. (i.e. /usr/bin/php)

#### **runas**

Which system user to run composer as.

#### **prefer\_source**

--prefer-source option of composer.

#### **prefer\_dist**

--prefer-dist option of composer.

#### **no\_scripts**

--no-scripts option of composer.

#### **no\_plugins**

--no-plugins option of composer.

#### **optimize**

--optimize-autoloader option of composer. Recommended for production.

#### **no\_dev**

--no-dev option for composer. Recommended for production.

#### **quiet**

--quiet option for composer. Whether or not to return output from composer.

#### **composer\_home**

\$COMPOSER\_HOME environment variable

#### **env**

A list of environment variables to be set prior to execution.

CLI Example:

```
salt '*' composer.install /var/www/application
salt '*' composer.install /var/www/application no_dev=True
→ optimize=True
```

`salt.modules.composer.selfupdate` (*composer=None, php=None, runas=None, quiet=False, composer\_home='/root'*)

Update composer itself.

If composer has not been installed globally making it available in the system PATH & making it executable, the `composer` and `php` parameters will need to be set to the location of the executables.

**composer**

Location of the composer.phar file. If not set composer will just execute "composer" as if it is installed globally. (i.e. /path/to/composer.phar)

**php**

Location of the php executable to use with composer. (i.e. /usr/bin/php)

**runas**

Which system user to run composer as.

**quiet**

--quiet option for composer. Whether or not to return output from composer.

**composer\_home**

\$COMPOSER\_HOME environment variable

CLI Example:

```
salt '*' composer.selfupdate
```

`salt.modules.composer.update` (*directory*, *composer=None*, *php=None*, *runas=None*, *prefer\_source=None*, *prefer\_dist=None*, *no\_scripts=None*, *no\_plugins=None*, *optimize=None*, *no\_dev=None*, *quiet=False*, *composer\_home='/root'*, *env=None*)

Update composer dependencies for a directory.

If *composer install* has not yet been run, this runs *composer install* instead.

If composer has not been installed globally making it available in the system PATH & making it executable, the composer and php parameters will need to be set to the location of the executables.

**directory**

Directory location of the composer.json file.

**composer**

Location of the composer.phar file. If not set composer will just execute "composer" as if it is installed globally. (i.e. /path/to/composer.phar)

**php**

Location of the php executable to use with composer. (i.e. /usr/bin/php)

**runas**

Which system user to run composer as.

**prefer\_source**

--prefer-source option of composer.

**prefer\_dist**

--prefer-dist option of composer.

**no\_scripts**

--no-scripts option of composer.

**no\_plugins**

--no-plugins option of composer.

**optimize**

--optimize-autoloader option of composer. Recommended for production.

**no\_dev**

--no-dev option for composer. Recommended for production.

**quiet**

--quiet option for composer. Whether or not to return output from composer.

**composer\_home**

\$COMPOSER\_HOME environment variable

**env**

A list of environment variables to be set prior to execution.

CLI Example:

```
salt '*' composer.update /var/www/application
salt '*' composer.update /var/www/application no_dev=True
↳optimize=True
```

**26.6.88 salt.modules.config**

Return config information

**salt.modules.config.backup\_mode**(*backup=""*)

Return the backup mode

CLI Example:

```
salt '*' config.backup_mode
```

**salt.modules.config.dot\_vals**(*value*)

Pass in a configuration value that should be preceded by the module name and a dot, this will return a list of all read key/value pairs

CLI Example:

```
salt '*' config.dot_vals host
```

**salt.modules.config.gather\_bootstrap\_script**(*bootstrap=None*)

Download the salt-bootstrap script, and return its location

**bootstrap**

URL of alternate bootstrap script

CLI Example:

```
salt '*' config.gather_bootstrap_script
```

**salt.modules.config.get**(*key, default="", delimiter=':', merge=None, omit\_opts=False, omit\_pillar=False, omit\_master=False, omit\_grains=False*)

New in version 0.14.0.

Attempt to retrieve the named value from the minion config file, pillar, grains or the master config. If the named value is not available, return the value specified by the `default` argument. If this argument is not specified, `default` falls back to an empty string.

Values can also be retrieved from nested dictionaries. Assume the below data structure:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key, in the sub-dictionary corresponding to the `pkg` key, the following command can be used:

```
salt myminion config.get pkg:apache
```

The `:` (colon) is used to represent a nested dictionary level.

Changed in version 2015.5.0: The `delimiter` argument was added, to allow delimiters other than `:` to be used.

This function traverses these data stores in this order, returning the first match found:

- Minion configuration
- Minion's grains
- Minion's pillar data
- Master configuration (requires `pillar_opts` to be set to `True` in Minion config file in order to work)

This means that if there is a value that is going to be the same for the majority of minions, it can be configured in the Master config file, and then overridden using the grains, pillar, or Minion config file.

Adding config options to the Master or Minion configuration file is easy:

```
my-config-option: value
cafe-menu:
- egg and bacon
- egg sausage and bacon
- egg and spam
- egg bacon and spam
- egg bacon sausage and spam
- spam bacon sausage and spam
- spam egg spam spam bacon and spam
- spam sausage spam spam bacon spam tomato and spam
```

---

**Note:** Minion configuration options built into Salt (like those defined *here*) will *always* be defined in the Minion configuration and thus *cannot be overridden by grains or pillar data*. However, additional (user-defined) configuration options (as in the above example) will not be in the Minion configuration by default and thus can be overridden using grains/pillar data by leaving the option out of the minion config file.

---

## Arguments

### `delimiter`

New in version 2015.5.0.

Override the delimiter used to separate nested levels of a data structure.

### `merge`

New in version 2015.5.0.

If passed, this parameter will change the behavior of the function so that, instead of traversing each data store above in order and returning the first match, the data stores are first merged together and then searched. The pillar data is merged into the master config data, then the grains are merged, followed by the Minion config data. The resulting data structure is then searched for a match. This allows for configurations to be more flexible.

---

**Note:** The merging described above does not mean that grain data will end up in the Minion's pillar data, or pillar data will end up in the master config data, etc. The data is just combined for the purposes of searching an amalgam of the different data stores.

---

The supported merge strategies are as follows:

- **recurse** - If a key exists in both dictionaries, and the new value is not a dictionary, it is replaced. Otherwise, the sub-dictionaries are merged together into a single dictionary, recursively on down, following the same criteria. For example:

```
>>> dict1 = {'foo': {'bar': 1, 'qux': True},
             'hosts': ['a', 'b', 'c'],
             'only_x': None}
>>> dict2 = {'foo': {'baz': 2, 'qux': False},
             'hosts': ['d', 'e', 'f'],
             'only_y': None}
>>> merged
{'foo': {'bar': 1, 'baz': 2, 'qux': False},
 'hosts': ['d', 'e', 'f'],
 'only_dict1': None,
 'only_dict2': None}
```

- **overwrite** - If a key exists in the top level of both dictionaries, the new value completely overwrites the old. For example:

```
>>> dict1 = {'foo': {'bar': 1, 'qux': True},
             'hosts': ['a', 'b', 'c'],
             'only_x': None}
>>> dict2 = {'foo': {'baz': 2, 'qux': False},
             'hosts': ['d', 'e', 'f'],
             'only_y': None}
>>> merged
{'foo': {'baz': 2, 'qux': False},
 'hosts': ['d', 'e', 'f'],
 'only_dict1': None,
 'only_dict2': None}
```

CLI Example:

```
salt '*' config.get pkg:apache
salt '*' config.get lxc.container_profile:centos merge=recurse
```

`salt.modules.config.items()`

Return the complete config from the currently running minion process. This includes defaults for values not set in the config file.

CLI Example:

```
salt '*' config.items
```

`salt.modules.config.manage_mode(mode)`

Return a mode value, normalized to a string

CLI Example:

```
salt '*' config.manage_mode
```

`salt.modules.config.merge(value, default="", omit_opts=False, omit_master=False, omit_pillar=False)`

Retrieves an option based on key, merging all matches.

Same as `option()` except that it merges all matches, rather than taking the first match.

CLI Example:

```
salt '*' config.merge schedule
```

`salt.modules.config.option(value, default=None, omit_opts=False, omit_grains=False, omit_pillar=False, omit_master=False, omit_all=False, wildcard=False)`

Returns the setting for the specified config value. The priority for matches is the same as in `config.get`, only this function does not recurse into nested data structures. Another difference between this function and `config.get` is that it comes with a set of "sane defaults". To view these, you can run the following command:

```
salt '*' config.option '*' omit_all=True wildcard=True
```

#### default

The default value if no match is found. If not specified, then the fallback default will be an empty string, unless `wildcard=True`, in which case the return will be an empty dictionary.

#### omit\_opts

[False] Pass as `True` to exclude matches from the minion configuration file

#### omit\_grains

[False] Pass as `True` to exclude matches from the grains

#### omit\_pillar

[False] Pass as `True` to exclude matches from the pillar data

#### omit\_master

[False] Pass as `True` to exclude matches from the master configuration file

#### omit\_all

[True] Shorthand to omit all of the above and return matches only from the "sane defaults".

New in version 3000.

#### wildcard

[False] If used, this will perform pattern matching on keys. Note that this will also significantly change the return data. Instead of only a value being returned, a dictionary mapping the matched keys to their values is returned. For example, using `wildcard=True` with a key of `'foo.ba*` could return a dictionary like so:

```
{'foo.bar': True, 'foo.baz': False}
```

New in version 3000.

CLI Example:

```
salt '*' config.option redis.host
```

`salt.modules.config.valid_fileproto(uri)`

Returns a boolean value based on whether or not the URI passed has a valid remote file protocol designation

CLI Example:

```
salt '*' config.valid_fileproto salt://path/to/file
```

## 26.6.89 salt.modules.consul

Interact with Consul

<https://www.consul.io>

`salt.modules.consul.acl_clone`(*consul\_url=None, token=None, \*\*kwargs*)

Information about an ACL token.

### Parameters

- **consul\_url** -- The Consul server URL.
- **id** -- Unique identifier for the ACL to update.

### Returns

Boolean, message of success or failure, and new ID of cloned ACL.

CLI Example:

```
salt '*' consul.acl_info id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

`salt.modules.consul.acl_create`(*consul\_url=None, token=None, \*\*kwargs*)

Create a new ACL token.

### Parameters

- **consul\_url** -- The Consul server URL.
- **name** -- Meaningful indicator of the ACL's purpose.
- **type** -- Type is either client or management. A management token is comparable to a root user and has the ability to perform any action including creating, modifying, and deleting ACLs.
- **rules** -- The Consul server URL.

### Returns

Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.acl_create
```

`salt.modules.consul.acl_delete`(*consul\_url=None, token=None, \*\*kwargs*)

Delete an ACL token.

### Parameters

- **consul\_url** -- The Consul server URL.
- **id** -- Unique identifier for the ACL to update.

### Returns

Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.acl_delete id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

`salt.modules.consul.acl_info`(*consul\_url=None, \*\*kwargs*)

Information about an ACL token.

### Parameters

- **consul\_url** -- The Consul server URL.
- **id** -- Unique identifier for the ACL to update.

**Returns**

Information about the ACL requested.

CLI Example:

```
salt '*' consul.acl_info id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

`salt.modules.consul.acl_list`(*consul\_url=None, token=None, \*\*kwargs*)

List the ACL tokens.

**Parameters**

**consul\_url** -- The Consul server URL.

**Returns**

List of ACLs

CLI Example:

```
salt '*' consul.acl_list
```

`salt.modules.consul.acl_update`(*consul\_url=None, token=None, \*\*kwargs*)

Update an ACL token.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **name** -- Meaningful indicator of the ACL's purpose.
- **id** -- Unique identifier for the ACL to update.
- **type** -- Type is either client or management. A management token is comparable to a root user and has the ability to perform any action including creating, modifying, and deleting ACLs.
- **rules** -- The Consul server URL.

**Returns**

Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.acl_update
```

`salt.modules.consul.agent_check_deregister`(*consul\_url=None, token=None, checkid=None*)

The agent will take care of deregistering the check from the Catalog.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **checkid** -- The ID of the check to deregister from Consul.

**Returns**

Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_deregister checkid='Memory Utilization'
```

`salt.modules.consul.agent_check_fail` (*consul\_url=None, token=None, checkid=None, \*\*kwargs*)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to critical and the TTL clock is reset.

#### Parameters

- **consul\_url** -- The Consul server URL.
- **checkid** -- The ID of the check to deregister from Consul.
- **note** -- A human-readable message with the status of the check.

#### Returns

Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_fail checkid='redis_check1' note='Forcing
→check into critical state.'
```

`salt.modules.consul.agent_check_pass` (*consul\_url=None, token=None, checkid=None, \*\*kwargs*)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to passing and the TTL clock is reset.

#### Parameters

- **consul\_url** -- The Consul server URL.
- **checkid** -- The ID of the check to mark as passing.
- **note** -- A human-readable message with the status of the check.

#### Returns

Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_pass checkid='redis_check1' note='Forcing
→check into passing state.'
```

`salt.modules.consul.agent_check_register` (*consul\_url=None, token=None, \*\*kwargs*)

The register endpoint is used to add a new check to the local agent.

#### Parameters

- **consul\_url** -- The Consul server URL.
- **name** -- The description of what the check is for.
- **id** -- The unique name to use for the check, if not provided 'name' is used.
- **notes** -- Human readable description of the check.
- **script** -- If script is provided, the check type is a script, and Consul will evaluate that script based on the interval parameter.
- **http** -- Check will perform an HTTP GET request against the value of HTTP (expected to be a URL) based on the interval parameter.
- **ttl** -- If a TTL type is used, then the TTL update endpoint must be used periodically to update the state of the check.

- **interval** -- Interval at which the check should run.

**Returns**

Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_register name='Memory Utilization' script='/usr/local/bin/check_mem.py' interval='15s'
```

`salt.modules.consul.agent_check_warn(consul_url=None, token=None, checkid=None, **kwargs)`

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to warning and the TTL clock is reset.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **checkid** -- The ID of the check to deregister from Consul.
- **note** -- A human-readable message with the status of the check.

**Returns**

Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_warn checkid='redis_check1' note='Forcing check into warning state.'
```

`salt.modules.consul.agent_checks(consul_url=None, token=None)`

Returns the checks the local agent is managing

**Parameters**

**consul\_url** -- The Consul server URL.

**Returns**

Returns the checks the local agent is managing

CLI Example:

```
salt '*' consul.agent_checks
```

`salt.modules.consul.agent_join(consul_url=None, token=None, address=None, **kwargs)`

Triggers the local agent to join a node

**Parameters**

- **consul\_url** -- The Consul server URL.
- **address** -- The address for the agent to connect to.
- **wan** -- Causes the agent to attempt to join using the WAN pool.

**Returns**

Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_join address='192.168.1.1'
```

`salt.modules.consul.agent_leave` (*consul\_url=None, token=None, node=None*)

Used to instruct the agent to force a node into the left state.

#### Parameters

- **consul\_url** -- The Consul server URL.
- **node** -- The node the agent will force into left state

#### Returns

Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_leave node='web1.example.com'
```

`salt.modules.consul.agent_maintenance` (*consul\_url=None, token=None, \*\*kwargs*)

Manages node maintenance mode

#### Parameters

- **consul\_url** -- The Consul server URL.
- **enable** -- The enable flag is required. Acceptable values are either true (to enter maintenance mode) or false (to resume normal operation).
- **reason** -- If provided, its value should be a text string explaining the reason for placing the node into maintenance mode.

#### Returns

Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_maintenance enable='False' reason='Upgrade in
→progress'
```

`salt.modules.consul.agent_members` (*consul\_url=None, token=None, \*\*kwargs*)

Returns the members as seen by the local serf agent

#### Parameters

**consul\_url** -- The Consul server URL.

#### Returns

Returns the members as seen by the local serf agent

CLI Example:

```
salt '*' consul.agent_members
```

`salt.modules.consul.agent_self` (*consul\_url=None, token=None*)

Returns the local node configuration

#### Parameters

**consul\_url** -- The Consul server URL.

#### Returns

Returns the local node configuration

CLI Example:

```
salt '*' consul.agent_self
```

`salt.modules.consul.agent_service_deregister` (*consul\_url=None, token=None, serviceid=None*)

Used to remove a service.

#### Parameters

- **consul\_url** -- The Consul server URL.
- **serviceid** -- A serviceid describing the service.

#### Returns

Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_service_deregister serviceid='redis'
```

`salt.modules.consul.agent_service_maintenance` (*consul\_url=None, token=None, serviceid=None, \*\*kwargs*)

Used to place a service into maintenance mode.

#### Parameters

- **consul\_url** -- The Consul server URL.
- **serviceid** -- A name of the service.
- **enable** -- Whether the service should be enabled or disabled.
- **reason** -- A human readable message of why the service was enabled or disabled.

#### Returns

Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_service_deregister serviceid='redis' enable='True'
→reason='Down for upgrade'
```

`salt.modules.consul.agent_service_register` (*consul\_url=None, token=None, \*\*kwargs*)

The used to add a new service, with an optional health check, to the local agent.

#### Parameters

- **consul\_url** -- The Consul server URL.
- **name** -- A name describing the service.
- **address** -- The address used by the service, defaults to the address of the agent.
- **port** -- The port used by the service.
- **id** -- Unique ID to identify the service, if not provided the value of the name parameter is used.
- **tags** -- Identifying tags for service, string or list.
- **script** -- If script is provided, the check type is a script, and Consul will evaluate that script based on the interval parameter.
- **http** -- Check will perform an HTTP GET request against the value of HTTP (expected to be a URL) based on the interval parameter.

- **check\_ttl** -- If a TTL type is used, then the TTL update endpoint must be used periodically to update the state of the check.
- **check\_interval** -- Interval at which the check should run.

**Returns**

Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_service_register name='redis' tags='["master", "v1"]
→' address="127.0.0.1" port="8080" check_script="/usr/local/bin/check_
→redis.py" interval="10s"
```

`salt.modules.consul.agent_services`(*consul\_url=None, token=None*)

Returns the services the local agent is managing

**Parameters**

**consul\_url** -- The Consul server URL.

**Returns**

Returns the services the local agent is managing

CLI Example:

```
salt '*' consul.agent_services
```

`salt.modules.consul.catalog_datacenters`(*consul\_url=None, token=None*)

Return list of available datacenters from catalog.

**Parameters**

**consul\_url** -- The Consul server URL.

**Returns**

The list of available datacenters.

CLI Example:

```
salt '*' consul.catalog_datacenters
```

`salt.modules.consul.catalog_deregister`(*consul\_url=None, token=None, \*\*kwargs*)

Deregisters a node, service, or check

**Parameters**

- **consul\_url** -- The Consul server URL.
- **node** -- The node to deregister.
- **datacenter** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **checkid** -- The ID of the health check to deregister.
- **serviceid** -- The ID of the service to deregister.

**Returns**

Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.catalog_register node='node1' serviceid='redis_server1'
→checkid='redis_check1'
```

`salt.modules.consul.catalog_node` (*consul\_url=None, token=None, node=None, \*\*kwargs*)

Information about the registered node.

#### Parameters

- **consul\_url** -- The Consul server URL.
- **node** -- The node to request information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

#### Returns

Information about the requested node.

CLI Example:

```
salt '*' consul.catalog_service service='redis'
```

`salt.modules.consul.catalog_nodes` (*consul\_url=None, token=None, \*\*kwargs*)

Return list of available nodes from catalog.

#### Parameters

- **consul\_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

#### Returns

The list of available nodes.

CLI Example:

```
salt '*' consul.catalog_nodes
```

`salt.modules.consul.catalog_register` (*consul\_url=None, token=None, \*\*kwargs*)

Registers a new node, service, or check

#### Parameters

- **consul\_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **node** -- The node to register.
- **address** -- The address of the node.
- **service** -- The service that will be registered.
- **service\_address** -- The address that the service listens on.
- **service\_port** -- The port for the service.
- **service\_id** -- A unique identifier for the service, if this is not provided "name" will be used.
- **service\_tags** -- Any tags associated with the service.

- **check** -- The name of the health check to register
- **check\_status** -- The initial status of the check, must be one of unknown, passing, warning, or critical.
- **check\_service** -- The service that the check is performed against.
- **check\_id** -- Unique identifier for the service.
- **check\_notes** -- An opaque field that is meant to hold human-readable text.

**Returns**

Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.catalog_register node='node1' address='192.168.1.1'
↳service='redis' service_address='127.0.0.1' service_port='8080' service_
↳id='redis_server1'
```

`salt.modules.consul.catalog_service` (*consul\_url=None, token=None, service=None, \*\*kwargs*)

Information about the registered service.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **tag** -- Filter returned services with tag parameter.

**Returns**

Information about the requested service.

CLI Example:

```
salt '*' consul.catalog_service service='redis'
```

`salt.modules.consul.catalog_services` (*consul\_url=None, token=None, \*\*kwargs*)

Return list of available services rom catalog.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

**Returns**

The list of available services.

CLI Example:

```
salt '*' consul.catalog_services
```

`salt.modules.consul.delete` (*consul\_url=None, token=None, key=None, \*\*kwargs*)

Delete values from Consul

**Parameters**

- **consul\_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.

- **recurse** -- Delete values recursively beginning at the value of key.
- **cas** -- This flag is used to turn the DELETE into a Check-And-Set operation.

**Returns**

Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.delete key='web'
salt '*' consul.delete key='web' recurse='True'
```

`salt.modules.consul.event_fire`(*consul\_url=None, token=None, name=None, \*\*kwargs*)

List the ACL tokens.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **name** -- The name of the event to fire.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **node** -- Filter by node name.
- **service** -- Filter by service name.
- **tag** -- Filter by tag name.

**Returns**

List of ACLs

CLI Example:

```
salt '*' consul.event_fire name='deploy'
```

`salt.modules.consul.event_list`(*consul\_url=None, token=None, \*\*kwargs*)

List the recent events.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **name** -- The name of the event to fire.

**Returns**

List of ACLs

CLI Example:

```
salt '*' consul.event_list
```

`salt.modules.consul.get`(*consul\_url=None, key=None, token=None, recurse=False, decode=False, raw=False*)

Get key from Consul

**Parameters**

- **consul\_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.
- **recurse** -- Return values recursively beginning at the value of key.

- **decode** -- By default values are stored as Base64 encoded values, decode will return the whole key with the value decoded.
- **raw** -- Simply return the decoded value of the key.

#### Returns

The keys in Consul.

CLI Example:

```
salt '*' consul.get key='web/key1'
salt '*' consul.get key='web' recurse=True
salt '*' consul.get key='web' recurse=True decode=True
```

By default values stored in Consul are base64 encoded, passing the decode option will show them as the decoded values.

```
salt '*' consul.get key='web' recurse=True decode=True raw=True
```

By default Consul will return other information about the key, the raw option will return only the raw value.

`salt.modules.consul.health_checks` (*consul\_url=None, token=None, service=None, \*\*kwargs*)

Health information about the registered service.

#### Parameters

- **consul\_url** -- The Consul server URL.
- **service** -- The service to request health information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

#### Returns

Health information about the requested node.

CLI Example:

```
salt '*' consul.health_checks service='redis1'
```

`salt.modules.consul.health_node` (*consul\_url=None, token=None, node=None, \*\*kwargs*)

Health information about the registered node.

#### Parameters

- **consul\_url** -- The Consul server URL.
- **node** -- The node to request health information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

#### Returns

Health information about the requested node.

CLI Example:

```
salt '*' consul.health_node node='node1'
```

`salt.modules.consul.health_service` (*consul\_url=None, token=None, service=None, \*\*kwargs*)

Health information about the registered service.

#### Parameters

- **consul\_url** -- The Consul server URL.
- **service** -- The service to request health information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **tag** -- Filter returned services with tag parameter.
- **passing** -- Filter results to only nodes with all checks in the passing state.

**Returns**

Health information about the requested node.

CLI Example:

```
salt '*' consul.health_service service='redis1'
salt '*' consul.health_service service='redis1' passing='True'
```

`salt.modules.consul.health_state` (*consul\_url=None, token=None, state=None, \*\*kwargs*)

Returns the checks in the state provided on the path.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **state** -- The state to show checks for. The supported states are any, unknown, passing, warning, or critical. The any state is a wildcard that can be used to return all checks.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

**Returns**

The checks in the provided state.

CLI Example:

```
salt '*' consul.health_state state='redis1'
salt '*' consul.health_state service='redis1' passing='True'
```

`salt.modules.consul.list_` (*consul\_url=None, token=None, key=None, \*\*kwargs*)

List keys in Consul

**Parameters**

- **consul\_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.

**Returns**

The list of keys.

CLI Example:

```
salt '*' consul.list
salt '*' consul.list key='web'
```

`salt.modules.consul.put` (*consul\_url=None, token=None, key=None, value=None, \*\*kwargs*)

Put values into Consul

**Parameters**

- **consul\_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.
- **value** -- The value to set the key to.
- **flags** -- This can be used to specify an unsigned value between 0 and  $2^{64}-1$ . Clients can choose to use this however makes sense for their application.
- **cas** -- This flag is used to turn the PUT into a Check-And-Set operation.
- **acquire** -- This flag is used to turn the PUT into a lock acquisition operation.
- **release** -- This flag is used to turn the PUT into a lock release operation.

#### Returns

Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.put key='web/key1' value="Hello there"

salt '*' consul.put key='web/key1' value="Hello there" acquire='d5d371f4-
→c380-5280-12fd-8810be175592'

salt '*' consul.put key='web/key1' value="Hello there" release='d5d371f4-
→c380-5280-12fd-8810be175592'
```

`salt.modules.consul.session_create`(*consul\_url=None, token=None, \*\*kwargs*)

Used to create a session.

#### Parameters

- **consul\_url** -- The Consul server URL.
- **lockdelay** -- Duration string using a "s" suffix for seconds. The default is 15s.
- **node** -- Must refer to a node that is already registered, if specified. By default, the agent's own node name is used.
- **name** -- A human-readable name for the session
- **checks** -- A list of associated health checks. It is highly recommended that, if you override this list, you include the default "serfHealth".
- **behavior** -- Can be set to either release or delete. This controls the behavior when a session is invalidated. By default, this is release, causing any locks that are held to be released. Changing this to delete causes any locks that are held to be deleted. delete is useful for creating ephemeral key/value entries.
- **ttl** -- Session is invalidated if it is not renewed before the TTL expires

#### Returns

Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.session_create node='node1' name='my-session' behavior=
→'delete' ttl='3600s'
```

`salt.modules.consul.session_destroy`(*consul\_url=None, token=None, session=None, \*\*kwargs*)

Destroy session

**Parameters**

- **consul\_url** -- The Consul server URL.
- **session** -- The ID of the session to destroy.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

**Returns**

Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.session_destroy session='c1c4d223-91cb-3d1f-1ee8-
↳ f2af9e7b6716'
```

`salt.modules.consul.session_info(consul_url=None, token=None, session=None, **kwargs)`

Information about a session

**Parameters**

- **consul\_url** -- The Consul server URL.
- **session** -- The ID of the session to return information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

**Returns**

Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.session_info session='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
↳ '
```

`salt.modules.consul.session_list(consul_url=None, token=None, return_list=False, **kwargs)`

Used to list sessions.

**Parameters**

- **consul\_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **return\_list** -- By default, all information about the sessions is returned, using the return\_list parameter will return a list of session IDs.

**Returns**

A list of all available sessions.

CLI Example:

```
salt '*' consul.session_list
```

`salt.modules.consul.status_leader(consul_url=None, token=None)`

Returns the current Raft leader

**Parameters**

**consul\_url** -- The Consul server URL.

**Returns**

The address of the Raft leader.

CLI Example:

```
salt '*' consul.status_leader
```

`salt.modules.consul.status_peers`(*consul\_url*, *token=None*)

Returns the current Raft peer set

**Parameters**

**consul\_url** -- The Consul server URL.

**Returns**

Retrieves the Raft peers for the datacenter in which the agent is running.

CLI Example:

```
salt '*' consul.status_peers
```

### 26.6.90 salt.modules.container\_resource

Common resources for LXC and systemd-nspawn containers

New in version 2015.8.0.

These functions are not designed to be called directly, but instead from the `lxc`, `nspawn`, and `docker` execution modules. They provide for common logic to be re-used for common actions.

`salt.modules.container_resource.cache_file`(*source*)

Wrapper for `cp.cache_file` which raises an error if the file was unable to be cached.

CLI Example:

```
salt myminion container_resource.cache_file salt://foo/bar/baz.txt
```

`salt.modules.container_resource.copy_to`(*name*, *source*, *dest*, *container\_type=None*, *path=None*, *exec\_driver=None*, *overwrite=False*, *makedirs=False*)

Common logic for copying files to containers

**path**

path to the container parent (for LXC only) default: `/var/lib/lxc` (system default)

CLI Example:

```
salt myminion container_resource.copy_to mycontainer /local/file/path /
↳container/file/path container_type=docker exec_driver=nsenter
```

`salt.modules.container_resource.run`(*name*, *cmd*, *container\_type=None*, *exec\_driver=None*, *output=None*, *no\_start=False*, *stdin=None*, *python\_shell=True*, *output\_loglevel='debug'*, *ignore\_retcode=False*, *path=None*, *use\_vt=False*, *keep\_env=None*)

Common logic for running shell commands in containers

**path**

path to the container parent (for LXC only) default: `/var/lib/lxc` (system default)

CLI Example:

```
salt myminion container_resource.run mycontainer 'ps aux' container_
→type=docker exec_driver=nsenter output=stdout
```

## 26.6.91 salt.modules.cp

Minion side functions for salt-cp

`salt.modules.cp.cache_dest` (*url*, *saltenv=None*)

New in version 3000.

Changed in version 3005: *saltenv* will use value from config if not explicitly set

Returns the expected cache path for the file, if cached using `cp.cache_file`.

---

**Note:** This only returns the `_expected_path`, it does not tell you if the URL is really cached. To check if the URL is cached, use `cp.is_cached` instead.

---

CLI Examples:

```
salt '*' cp.cache_dest https://foo.com/bar.rpm
salt '*' cp.cache_dest salt://my/file
salt '*' cp.cache_dest salt://my/file saltenv=dev
```

`salt.modules.cp.cache_dir` (*path*, *saltenv=None*, *include\_empty=False*, *include\_pat=None*,  
*exclude\_pat=None*)

Changed in version 3005: *saltenv* will use value from config if not explicitly set

Download and cache everything under a directory from the master

**include\_pat**

[None] Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

New in version 2014.7.0.

**exclude\_pat**

[None] Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

---

**Note:** If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

---

New in version 2014.7.0.

CLI Examples:

```
salt '*' cp.cache_dir salt://path/to/dir
salt '*' cp.cache_dir salt://path/to/dir include_pat='E@*.py$'
```

`salt.modules.cp.cache_file` (*path*, *saltenv=None*, *source\_hash=None*, *verify\_ssl=True*, *use\_etag=False*)

Changed in version 3005: *saltenv* will use value from config if not explicitly set

Used to cache a single file on the Minion

Returns the location of the new cached file on the Minion

**source\_hash**

If `name` is an http(s) or ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

New in version 2018.3.0.

**verify\_ssl**

If `False`, remote https file sources (`https://`) and `source_hash` will not attempt to validate the servers certificate. Default is `True`.

New in version 3002.

**use\_etag**

If `True`, remote http/https file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the `source_hash` parameter.

New in version 3005.

CLI Example:

```
salt '*' cp.cache_file salt://path/to/file
```

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to cache the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.cache_file salt://foo/bar.conf saltenv=config
salt '*' cp.cache_file salt://foo/bar.conf?saltenv=config
```

If the path being cached is a `salt://` URI, and the path does not exist, then `False` will be returned.

---

**Note:** It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

---

`salt.modules.cp.cache_file_ssh`(*path*, *saltenv=None*, *source\_hash=None*, *verify\_ssl=True*, *use\_etag=False*)

This function is an alias of `cache_file`.

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Used to cache a single file on the Minion

Returns the location of the new cached file on the Minion

**source\_hash**

If `name` is an http(s) or ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

New in version 2018.3.0.

**verify\_ssl**

If `False`, remote https file sources (`https://`) and `source_hash` will not attempt to validate the servers certificate. Default is `True`.

New in version 3002.

**use\_etag**

If `True`, remote http/https file sources will attempt to use the ETag header to determine if

the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the `source_hash` parameter.

New in version 3005.

CLI Example:

```
salt '*' cp.cache_file salt://path/to/file
```

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to cache the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.cache_file salt://foo/bar.conf saltenv=config
salt '*' cp.cache_file salt://foo/bar.conf?saltenv=config
```

If the path being cached is a `salt://` URI, and the path does not exist, then `False` will be returned.

---

**Note:** It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

---

`salt.modules.cp.cache_files` (*paths*, *saltenv=None*)

Changed in version 3005: `saltenv` will use value from `config` if not explicitly set

Used to gather many files from the Master, the gathered files will be saved in the minion `cachedir` reflective to the paths retrieved from the Master

CLI Example:

```
salt '*' cp.cache_files salt://pathto/file1,salt://pathto/file1
```

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to cache the files. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.cache_files salt://foo/bar.conf,salt://foo/baz.conf
→ saltenv=config
salt '*' cp.cache_files salt://foo/bar.conf?saltenv=config,salt://foo/baz.
→ conf?saltenv=config
```

The querystring method is less useful when all files are being cached from the same environment, but is a good way of caching files from multiple different environments in the same command. For example, the below command will cache the first file from the `config1` environment, and the second one from the `config2` environment.

```
salt '*' cp.cache_files salt://foo/bar.conf?saltenv=config1,salt://foo/
→ bar.conf?saltenv=config2
```

---

**Note:** It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

---

`salt.modules.cp.cache_local_file(path)`

Cache a local file on the minion in the localfiles cache

CLI Example:

```
salt '*' cp.cache_local_file /etc/hosts
```

`salt.modules.cp.cache_master(saltenv=None)`

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Retrieve all of the files on the master and cache them locally

CLI Example:

```
salt '*' cp.cache_master
```

`salt.modules.cp.envs()`

List available environments for fileserver

CLI Example:

```
salt '*' cp.envs
```

`salt.modules.cp.get_dir(path, dest, saltenv=None, template=None, gzip=None, **kwargs)`

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Used to recursively copy a directory from the salt master

CLI Example:

```
salt '*' cp.get_dir salt://path/to/dir/ /minion/dest
```

`get_dir` supports the same `template` and `gzip` arguments as `get_file`.

`salt.modules.cp.get_file(path, dest, saltenv=None, makedirs=False, template=None, gzip=None, **kwargs)`

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Changed in version 2018.3.0: `dest` can now be a directory

Used to get a single file from the salt master

CLI Example:

```
salt '*' cp.get_file salt://path/to/file /minion/dest
```

Template rendering can be enabled on both the source and destination file names like so:

```
salt '*' cp.get_file "salt://{{grains.os}}/vimrc" /etc/vimrc
→template=jinja
```

This example would instruct all Salt minions to download the `vimrc` from a directory with the same name as their `os` grain and copy it to `/etc/vimrc`

For larger files, the `cp.get_file` module also supports `gzip` compression. Because `gzip` is CPU-intensive, this should only be used in scenarios where the compression ratio is very high (e.g. pretty-printed JSON or YAML files).

Use the `gzip` named argument to enable it. Valid values are 1..9, where 1 is the lightest compression and 9 the heaviest. 1 uses the least CPU on the master (and minion), 9 uses the most.

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to retrieve the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.get_file salt://foo/bar.conf /etc/foo/bar.conf saltenv=config
salt '*' cp.get_file salt://foo/bar.conf?saltenv=config /etc/foo/bar.conf
```

---

**Note:** It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

---

`salt.modules.cp.get_file_str`(*path*, *saltenv=None*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Download a file from a URL to the Minion cache directory and return the contents of that file

Returns `False` if Salt was unable to cache a file from a URL.

CLI Example:

```
salt '*' cp.get_file_str salt://my/file
```

`salt.modules.cp.get_template`(*path*, *dest*, *template='jinja'*, *saltenv=None*, *makedirs=False*, *\*\*kwargs*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Render a file as a template before setting it down. Warning, order is not the same as in `fileclient.cp` for non breaking old API.

CLI Example:

```
salt '*' cp.get_template salt://path/to/template /minion/dest
```

`salt.modules.cp.get_url`(*path*, *dest=""*, *saltenv=None*, *makedirs=False*, *source\_hash=None*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Changed in version 2018.3.0: `dest` can now be a directory

Used to get a single file from a URL.

#### **path**

A URL to download a file from. Supported URL schemes are: `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://` and `file://` (local filesystem). If no scheme was specified, this is equivalent of using `file://`. If a `file://` URL is given, the function just returns absolute path to that file on a local filesystem. The function returns `False` if Salt was unable to fetch a file from a `salt://` URL.

#### **dest**

The default behaviour is to write the fetched file to the given destination path. If this parameter is omitted or set as empty string (`' '`), the function places the remote file on the local filesystem inside the Minion cache directory and returns the path to that file.

---

**Note:** To simply return the file contents instead, set destination to `None`. This works with `salt://`, `http://`, `https://` and `file://` URLs. The files fetched by `http://` and `https://` will not be cached.

---

#### **saltenv**

Salt fileserver environment from which to retrieve the file. Ignored if `path` is not a `salt://` URL.

**source\_hash**

If `path` is an http(s) or ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Example:

```
salt '*' cp.get_url salt://my/file /tmp/this_file_is_mine
salt '*' cp.get_url http://www.slashdot.org /tmp/index.html
```

**salt.modules.cp.hash\_file**(*path, saltenv=None*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Return the hash of a file, to get the hash of a file on the salt master file server prepend the path with `salt://<file on server>` otherwise, prepend the file with `/` for a local file.

CLI Example:

```
salt '*' cp.hash_file salt://path/to/file
```

**salt.modules.cp.hash\_file\_ssh**(*path, saltenv=None*)

This function is an alias of `hash_file`.

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Return the hash of a file, to get the hash of a file on the salt master file server prepend the path with `salt://<file on server>` otherwise, prepend the file with `/` for a local file.

CLI Example:

```
salt '*' cp.hash_file salt://path/to/file
```

**salt.modules.cp.is\_cached**(*path, saltenv=None*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Returns the full path to a file if it is cached locally on the minion otherwise returns a blank string

CLI Example:

```
salt '*' cp.is_cached salt://path/to/file
```

**salt.modules.cp.list\_master**(*saltenv=None, prefix=""*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

List all of the files stored on the master

CLI Example:

```
salt '*' cp.list_master
```

**salt.modules.cp.list\_master\_dirs**(*saltenv=None, prefix=""*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

List all of the directories stored on the master

CLI Example:

```
salt '*' cp.list_master_dirs
```

`salt.modules.cp.list_master_symlinks` (*saltenv=None, prefix=""*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

List all of the symlinks stored on the master

CLI Example:

```
salt '*' cp.list_master_symlinks
```

`salt.modules.cp.list_minion` (*saltenv=None*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

List all of the files cached on the minion

CLI Example:

```
salt '*' cp.list_minion
```

`salt.modules.cp.list_states` (*saltenv=None*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

List all of the available state files in an environment

CLI Example:

```
salt '*' cp.list_states
```

`salt.modules.cp.push` (*path, keep\_symlinks=False, upload\_path=None, remove\_source=False*)

WARNING Files pushed to the master will have global read permissions..

Push a file from the minion up to the master, the file will be saved to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`)

Since this feature allows a minion to push a file up to the master server it is disabled by default for security purposes. To enable, set `file_recv` to `True` in the master configuration file, and restart the master.

**keep\_symlinks**

Keep the path value without resolving its canonical form

**upload\_path**

Provide a different path inside the master's minion files cachedir

**remove\_source**

Remove the source file on the minion

New in version 2016.3.0.

CLI Example:

```
salt '*' cp.push /etc/fstab
salt '*' cp.push /etc/system-release keep_symlinks=True
salt '*' cp.push /etc/fstab upload_path='/new/path/fstab'
salt '*' cp.push /tmp/filename remove_source=True
```

`salt.modules.cp.push_dir` (*path, glob=None, upload\_path=None*)

Push a directory from the minion up to the master, the files will be saved to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`). It also has a `glob` for matching specific files using globbing.

New in version 2014.7.0.

Since this feature allows a minion to push files up to the master server it is disabled by default for security purposes. To enable, set `file_recv` to `True` in the master configuration file, and restart the master.

#### **upload\_path**

Provide a different path and directory name inside the master's minion files `cachedir`

CLI Example:

```
salt '*' cp.push /usr/lib/mysql
salt '*' cp.push /usr/lib/mysql upload_path='/newmysql/path'
salt '*' cp.push_dir /etc/modprobe.d/ glob='*.conf'
```

#### **salt.modules.cp.recv(files, dest)**

Used with `salt-cp`, pass the files dict, and the destination.

This function receives small fast copy files from the master via `salt-cp`. It does not work via the CLI.

CLI Example:

```
salt '*' cp.recv
```

#### **salt.modules.cp.recv\_chunked(dest, chunk, append=False, compressed=True, mode=None)**

This function receives files copied to the minion using `salt-cp` and is not intended to be used directly on the CLI.

CLI Example:

```
salt '*' cp.recv_chunked
```

#### **salt.modules.cp.stat\_file(path, saltenv=None, octal=True)**

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Return the permissions of a file, to get the permissions of a file on the salt master file server prepend the path with `salt://<file on server>` otherwise, prepend the file with `/` for a local file.

CLI Example:

```
salt '*' cp.stat_file salt://path/to/file
```

## 26.6.92 salt.modules.cpan

Manage Perl modules using CPAN

New in version 2015.5.0.

#### **salt.modules.cpan.install(module)**

Install a Perl module from CPAN

CLI Example:

```
salt '*' cpan.install Template::Alloy
```

#### **salt.modules.cpan.list\_()**

List installed Perl modules, and the version installed

CLI Example:

```
salt '*' cpan.list
```

`salt.modules.cpan.remove`(*module*, *details=False*)

Attempt to remove a Perl module that was installed from CPAN. Because the `cpan` command doesn't actually support "uninstall"-like functionality, this function will attempt to do what it can, with what it has from CPAN.

Until this function is declared stable, USE AT YOUR OWN RISK!

CLI Example:

```
salt '*' cpan.remove Old::Package
```

`salt.modules.cpan.show`(*module*)

Show information about a specific Perl module

CLI Example:

```
salt '*' cpan.show Template::Alloy
```

`salt.modules.cpan.show_config`()

Return a dict of CPAN configuration values

CLI Example:

```
salt '*' cpan.show_config
```

## 26.6.93 salt.modules.cron

Work with cron

---

**Note:** Salt does not escape cron metacharacters automatically. You should backslash-escape percent characters and any other metacharacters that might be interpreted incorrectly by the shell.

---

`salt.modules.cron.get_entry`(*user*, *identifier=None*, *cmd=None*)

Return the specified entry from user's crontab. *identifier* will be used if specified, otherwise will lookup *cmd*. Either *identifier* or *cmd* should be specified.

**user:**

User's crontab to query

**identifier:**

Search for line with identifier

**cmd:**

Search for cron line with cmd

CLI Example:

```
salt '*' cron.get_entry root identifier=task1
```

`salt.modules.cron.list_tab`(*user*)

Return the contents of the specified user's crontab

CLI Example:

```
salt '*' cron.list_tab root
```

`salt.modules.cron.ls`(*user*)

This function is an alias of `list_tab`.

Return the contents of the specified user's crontab

CLI Example:

```
salt '*' cron.list_tab root
```

`salt.modules.cron.raw_cron`(*user*)

Return the contents of the user's crontab

CLI Example:

```
salt '*' cron.raw_cron root
```

`salt.modules.cron.rm`(*user, cmd, minute=None, hour=None, daymonth=None, month=None, dayweek=None, identifier=None*)

This function is an alias of `rm_job`.

Remove a cron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' cron.rm_job root /usr/local/weekly
salt '*' cron.rm_job root /usr/bin/foo dayweek=1
```

`salt.modules.cron.rm_env`(*user, name*)

Remove cron environment variable for a specified user.

CLI Example:

```
salt '*' cron.rm_env root MAILTO
```

`salt.modules.cron.rm_job`(*user, cmd, minute=None, hour=None, daymonth=None, month=None, dayweek=None, identifier=None*)

Remove a cron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' cron.rm_job root /usr/local/weekly
salt '*' cron.rm_job root /usr/bin/foo dayweek=1
```

`salt.modules.cron.rm_special`(*user, cmd, special=None, identifier=None*)

Remove a special cron job for a specified user.

CLI Example:

```
salt '*' cron.rm_special root /usr/bin/foo
```

`salt.modules.cron.set_env`(*user, name, value=None*)

Set up an environment variable in the crontab.

CLI Example:

```
salt '*' cron.set_env root MAILTO user@example.com
```

`salt.modules.cron.set_job`(*user, minute, hour, daymonth, month, dayweek, cmd, commented=False, comment=None, identifier=None*)

Sets a cron job up for a specified user.

CLI Example:

```
salt '*' cron.set_job root '*' '*' '*' '*' 1 /usr/local/weekly
```

`salt.modules.cron.set_special`(*user, special, cmd, commented=False, comment=None, identifier=None*)

Set up a special command in the crontab.

CLI Example:

```
salt '*' cron.set_special root @hourly 'echo foobar'
```

`salt.modules.cron.write_cron_file`(*user, path*)

Writes the contents of a file to a user's crontab

CLI Example:

```
salt '*' cron.write_cron_file root /tmp/new_cron
```

Changed in version 2015.8.9.

---

**Note:** Some OS' do not support specifying user via the *crontab* command i.e. (Solaris, AIX)

---

`salt.modules.cron.write_cron_file_verbose`(*user, path*)

Writes the contents of a file to a user's crontab and return error message on error

CLI Example:

```
salt '*' cron.write_cron_file_verbose root /tmp/new_cron
```

Changed in version 2015.8.9.

---

**Note:** Some OS' do not support specifying user via the *crontab* command i.e. (Solaris, AIX)

---

## 26.6.94 salt.modules.cryptdev

Salt module to manage Unix cryptsetup jobs and the crypttab file

New in version 2018.3.0.

`salt.modules.cryptdev.active`()

List existing device-mapper device details.

`salt.modules.cryptdev.close`(*name*)

Close a crypt device using cryptsetup.

CLI Example:

```
salt '*' cryptdev.close foo
```

`salt.modules.cryptdev.crypttab` (*config=/etc/crypttab*)

List the contents of the crypttab

CLI Example:

```
salt '*' cryptdev.crypttab
```

`salt.modules.cryptdev.open` (*name, device, keyfile*)

Open a crypt device using cryptsetup. The keyfile must not be None or 'none', because cryptsetup will otherwise ask for the password interactively.

CLI Example:

```
salt '*' cryptdev.open foo /dev/sdz1 /path/to/keyfile
```

`salt.modules.cryptdev.rm_crypttab` (*name, config=/etc/crypttab*)

Remove the named mapping from the crypttab. If the described entry does not exist, nothing is changed, but the command succeeds by returning 'absent'. If a line is removed, it returns 'change'.

CLI Example:

```
salt '*' cryptdev.rm_crypttab foo
```

`salt.modules.cryptdev.set_crypttab` (*name, device, password='none', options="", config=/etc/crypttab', test=False, match\_on='name'*)

Verify that this device is represented in the crypttab, change the device to match the name passed, or add the name if it is not present.

CLI Example:

```
salt '*' cryptdev.set_crypttab foo /dev/sdz1 mypassword swap,size=256
```

## 26.6.95 salt.modules.csf

### Support for Config Server Firewall (CSF)

**maintainer**

Mostafa Hussein <mostafa.hussein91@gmail.com>

**maturity**

new

**platform**

Linux

`salt.modules.csf.allow` (*ip, port=None, proto='tcp', direction='in', port\_origin='d', ip\_origin='s', ttl=None, comment=""*)

Add an rule to csf allowed hosts See `_access_rule()`. 1- Add an IP:

CLI Example:

```
salt '*' csf.allow 127.0.0.1
salt '*' csf.allow 127.0.0.1 comment="Allow localhost"
```

`salt.modules.csf.allow_port(port, proto='tcp', direction='both')`

Like `allow_ports`, but it will append to the existing entry instead of replacing it. Takes a single port instead of a list of ports.

CLI Example:

```
salt '*' csf.allow_port 22 proto='tcp' direction='in'
```

`salt.modules.csf.allow_ports(ports, proto='tcp', direction='in')`

Fully replace the incoming or outgoing ports line in the `csf.conf` file - e.g. `TCP_IN`, `TCP_OUT`, `UDP_IN`, `UDP_OUT`, etc.

CLI Example:

```
salt '*' csf.allow_ports ports="[22,80,443,4505,4506]" proto='tcp'
→direction='in'
```

`salt.modules.csf.build_directions(direction)`

`salt.modules.csf.deny(ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='d', ttl=None, comment="")`

Add an rule to csf denied hosts See `_access_rule()`. 1- Deny an IP:

CLI Example:

```
salt '*' csf.deny 127.0.0.1
salt '*' csf.deny 127.0.0.1 comment="Too localhosty"
```

`salt.modules.csf.disable()`

Disable csf permanently

CLI Example:

```
salt '*' csf.disable
```

`salt.modules.csf.disable_testing_mode()`

`salt.modules.csf.enable()`

Activate csf if not running

CLI Example:

```
salt '*' csf.enable
```

`salt.modules.csf.enable_testing_mode()`

`salt.modules.csf.exists(method, ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='d', ttl=None, comment="")`

Returns true a rule for the ip already exists based on the method supplied. Returns false if not found.

CLI Example:

```
salt '*' csf.exists allow 1.2.3.4
salt '*' csf.exists tempdeny 1.2.3.4
```

`salt.modules.csf.get_option(option)`

`salt.modules.csf.get_ports(proto='tcp', direction='in')`

Lists ports from csf.conf based on direction and protocol. e.g. - TCP\_IN, TCP\_OUT, UDP\_IN, UDP\_OUT, etc..

CLI Example:

```
salt '*' csf.allow_port 22 proto='tcp' direction='in'
```

`salt.modules.csf.get_skipped_nics(ipv6=False)`

`salt.modules.csf.get_testing_status()`

`salt.modules.csf.reload()`

Restart csf

CLI Example:

```
salt '*' csf.reload
```

`salt.modules.csf.remove_rule(method, ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, comment=")`

`salt.modules.csf.remove_temp_rule(ip)`

`salt.modules.csf.running()`

Check csf status

CLI Example:

```
salt '*' csf.running
```

`salt.modules.csf.set_option(option, value)`

`salt.modules.csf.skip_nic(nic, ipv6=False)`

`salt.modules.csf.skip_nics(nics, ipv6=False)`

`salt.modules.csf.split_option(option)`

`salt.modules.csf.tempallow(ip=None, ttl=None, port=None, direction=None, comment=")`

Add an rule to the temporary ip allow list. See `_access_rule()`. 1- Add an IP:

CLI Example:

```
salt '*' csf.tempallow 127.0.0.1 3600 port=22 direction='in' comment='#
→Temp dev ssh access'
```

`salt.modules.csf.tempdeny(ip=None, ttl=None, port=None, direction=None, comment=")`

Add a rule to the temporary ip deny list. See `_access_rule()`. 1- Add an IP:

CLI Example:

```
salt '*' csf.tempdeny 127.0.0.1 300 port=22 direction='in' comment='#
→Brute force attempt'
```

`salt.modules.csf.unallow(ip)`

Remove a rule from the csf denied hosts See `_access_rule()`. 1- Deny an IP:

CLI Example:

```
salt '*' csf.unallow 127.0.0.1
```

`salt.modules.csf.undeny(ip)`

Remove a rule from the csf denied hosts See `_access_rule()`. 1- Deny an IP:

CLI Example:

```
salt '*' csf.undeny 127.0.0.1
```

## 26.6.96 salt.modules.cyg

Manage cygwin packages.

Module file to accompany the cyg state.

`salt.modules.cyg.check_valid_package(package, cyg_arch='x86_64', mirrors=None)`

Check if the package is valid on the given mirrors.

### Parameters

- **package** -- The name of the package
- **cyg\_arch** -- The cygwin architecture
- **mirrors** -- any mirrors to check

Returns (bool): True if Valid, otherwise False

CLI Example:

```
salt '*' cyg.check_valid_package <package name>
```

`salt.modules.cyg.install(packages=None, cyg_arch='x86_64', mirrors=None)`

Install one or several packages.

### packages

[None] The packages to install

### cyg\_arch

[x86\_64] Specify the architecture to install the package under Current options are x86 and x86\_64

CLI Example:

```
salt '*' cyg.install dos2unix
salt '*' cyg.install dos2unix mirrors="[{'http://mirror': 'http://url/to/
→public/key}']"
```

`salt.modules.cyg.list_(package="", cyg_arch='x86_64')`

List locally installed packages.

### package

[""] package name to check. else all

### cyg\_arch :

Cygwin architecture to use Options are x86 and x86\_64

CLI Example:

```
salt '*' cyg.list
```

`salt.modules.cyg.uninstall`(*packages*, *cyg\_arch*='x86\_64', *mirrors*=None)

Uninstall one or several packages.

**packages**

The packages to uninstall.

**cyg\_arch**

[x86\_64] Specify the architecture to remove the package from Current options are x86 and x86\_64

CLI Example:

```
salt '*' cyg.uninstall dos2unix
salt '*' cyg.uninstall dos2unix mirrors="[{'http://mirror': 'http://url/
→to/public/key}]"
```

`salt.modules.cyg.update`(*cyg\_arch*='x86\_64', *mirrors*=None)

Update all packages.

**cyg\_arch**

[x86\_64] Specify the cygwin architecture update Current options are x86 and x86\_64

CLI Example:

```
salt '*' cyg.update
salt '*' cyg.update dos2unix mirrors="[{'http://mirror': 'http://url/to/
→public/key}]"
```

### 26.6.97 salt.modules.daemontools

daemontools service module. This module will create daemontools type service watcher.

This module is compatible with the `service` states, so it can be used to maintain services using the `provider` argument:

```
myservice:
  service.running:
    - provider: daemontools
```

`salt.modules.daemontools.available`(*name*)

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' daemontools.available foo
```

`salt.modules.daemontools.disabled`(*name*)

Return True if the named service is enabled, false otherwise

New in version 2015.5.6.

CLI Example:

```
salt '*' daemontools.disabled <service name>
```

`salt.modules.daemontools.enabled(name, **kwargs)`

Return True if the named service is enabled, false otherwise A service is considered enabled if in your service directory: - an executable `./run` file exist - a file named "down" does not exist

New in version 2015.5.7.

**name**

Service name

CLI Example:

```
salt '*' daemontools.enabled <service name>
```

`salt.modules.daemontools.full_restart(name)`

Calls `daemontools.restart()` function

CLI Example:

```
salt '*' daemontools.full_restart <service name>
```

`salt.modules.daemontools.get_all()`

Return a list of all available services

CLI Example:

```
salt '*' daemontools.get_all
```

`salt.modules.daemontools.missing(name)`

The inverse of `daemontools.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' daemontools.missing foo
```

`salt.modules.daemontools.reload_(name)`

Wrapper for `term()`

CLI Example:

```
salt '*' daemontools.reload <service name>
```

`salt.modules.daemontools.restart(name)`

Restart service via `daemontools`. This will stop/start service

CLI Example:

```
salt '*' daemontools.restart <service name>
```

`salt.modules.daemontools.start(name)`

Starts service via `daemontools`

CLI Example:

```
salt '*' daemontools.start <service name>
```

`salt.modules.daemontools.status`(*name*, *sig=None*)

Return the status for a service via daemontools, return pid if running

CLI Example:

```
salt '*' daemontools.status <service name>
```

`salt.modules.daemontools.stop`(*name*)

Stops service via daemontools

CLI Example:

```
salt '*' daemontools.stop <service name>
```

`salt.modules.daemontools.term`(*name*)

Send a TERM to service via daemontools

CLI Example:

```
salt '*' daemontools.term <service name>
```

## 26.6.98 salt.modules.data

Manage a local persistent data structure that can hold any arbitrary data specific to the minion

`salt.modules.data.cas`(*key*, *value*, *old\_value*)

Check and set a value in the minion datastore

CLI Example:

```
salt '*' data.cas <key> <value> <old_value>
```

`salt.modules.data.clear`()

Clear out all of the data in the minion datastore, this function is destructive!

CLI Example:

```
salt '*' data.clear
```

`salt.modules.data.dump`(*new\_data*)

Replace the entire datastore with a passed data structure

CLI Example:

```
salt '*' data.dump '{"eggs": "spam"}'
```

`salt.modules.data.get`(*key*, *default=None*)

Get a (list of) value(s) from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.get key
salt '*' data.get '["key1", "key2"]'
```

`salt.modules.data.has_key`(*key*)

Check if key is in the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.has_key <mykey>
```

`salt.modules.data.items`()

Get items from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.items
```

`salt.modules.data.keys`()

Get all keys from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.keys
```

`salt.modules.data.load`()

Return all of the data in the minion datastore

CLI Example:

```
salt '*' data.load
```

`salt.modules.data.pop`(*key*, *default=None*)

Pop (return & delete) a value from the minion datastore

New in version 2015.5.2.

CLI Example:

```
salt '*' data.pop <key> "there was no val"
```

`salt.modules.data.update`(*key*, *value*)

Update a key with a value in the minion datastore

CLI Example:

```
salt '*' data.update <key> <value>
```

`salt.modules.data.values`()

Get values from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.values
```

## 26.6.99 salt.modules.datadog\_api

An execution module that interacts with the Datadog API

### depends

datadog Python module

**Note:** The following parameters are required for all functions:

### api\_key

The datadog API key

### app\_key

The datadog application key

Full argument reference is available on the Datadog API reference page <https://docs.datadoghq.com/api/>

**salt.modules.datadog\_api.cancel\_downtime**(*api\_key=None, app\_key=None, scope=None, id=None*)

Cancel a downtime by id or by scope.

CLI Example:

```
salt-call datadog.cancel_downtime scope='host:app01' \
                                api_key='0123456789' \
                                app_key='9876543210'
```

Arguments - Either scope or id is required.

### Parameters

- **id** -- The downtime ID
- **scope** -- The downtime scope

**salt.modules.datadog\_api.post\_event**(*api\_key=None, app\_key=None, title=None, text=None, date\_happened=None, priority=None, host=None, tags=None, alert\_type=None, aggregation\_key=None, source\_type\_name=None*)

Post an event to the Datadog stream.

CLI Example

```
salt-call datadog.post_event api_key='0123456789' \
                             app_key='9876543210' \
                             title='Salt Highstate' \
                             text="Salt highstate was run on $(salt-call
→grains.get id)" \
                             tags='["service:salt", "event:highstate"]'
```

Required arguments

### Parameters

- **title** -- The event title. Limited to 100 characters.
- **text** -- The body of the event. Limited to 4000 characters. The text supports markdown.

Optional arguments

### Parameters

- **date\_happened** -- POSIX timestamp of the event.
- **priority** -- The priority of the event ('normal' or 'low').
- **host** -- Host name to associate with the event.
- **tags** -- A list of tags to apply to the event.
- **alert\_type** -- "error", "warning", "info" or "success".
- **aggregation\_key** -- An arbitrary string to use for aggregation, max length of 100 characters.
- **source\_type\_name** -- The type of event being posted.

```
salt.modules.datadog_api.schedule_downtime(scope, api_key=None, app_key=None,
                                           monitor_id=None, start=None, end=None,
                                           message=None, recurrence=None, timezone=None,
                                           test=False)
```

Schedule downtime for a scope of monitors.

CLI Example:

```
salt-call datadog.schedule_downtime 'host:app2' \
                                     stop=$(date --date='30 minutes' +%s) \
                                     app_key='0123456789' \
                                     api_key='9876543210'
```

Optional arguments

#### Parameters

- **monitor\_id** -- The ID of the monitor
- **start** -- Start time in seconds since the epoch
- **end** -- End time in seconds since the epoch
- **message** -- A message to send in a notification for this downtime
- **recurrence** -- Repeat this downtime periodically
- **timezone** -- Specify the timezone

### 26.6.100 salt.modules.ddns

Support for RFC 2136 dynamic DNS updates.

#### depends

- dnspython Python module

#### configuration

If you want to use TSIG authentication for the server, there are a couple of optional configuration parameters made available to support this (the keyname is only needed if the keyring contains more than one key):

```
keyfile: keyring file (default=None)
keyname: key name in file (default=None)
keyalgorithm: algorithm used to create the key
              (default='HMAC-MD5.SIG-ALG.REG.INT').
```

(continues on next page)

(continued from previous page)

```
Other possible values: hmac-sha1, hmac-sha224, hmac-sha256,
hmac-sha384, hmac-sha512
```

The keyring file needs to be in json format and the key name needs to end with an extra period in the file, similar to this:

```
{"keyname.": "keycontent"}
```

```
salt.modules.ddns.add_host(zone, name, ttl, ip, nameserver='127.0.0.1', replace=True, timeout=5, port=53,
**kwargs)
```

Add, replace, or update the A and PTR (reverse) records for a host.

CLI Example:

```
salt ns1 ddns.add_host example.com host1 60 10.1.1.1
```

```
salt.modules.ddns.delete(zone, name, rdtype=None, data=None, nameserver='127.0.0.1', timeout=5,
port=53, **kwargs)
```

Delete a DNS record.

CLI Example:

```
salt ns1 ddns.delete example.com host1 A
```

```
salt.modules.ddns.delete_host(zone, name, nameserver='127.0.0.1', timeout=5, port=53, **kwargs)
```

Delete the forward and reverse records for a host.

Returns true if any records are deleted.

CLI Example:

```
salt ns1 ddns.delete_host example.com host1
```

```
salt.modules.ddns.update(zone, name, ttl, rdtype, data, nameserver='127.0.0.1', timeout=5, replace=False,
port=53, **kwargs)
```

Add, replace, or update a DNS record. nameserver must be an IP address and the minion running this module must have update privileges on that server. If replace is true, first deletes all records for this name and type.

CLI Example:

```
salt ns1 ddns.update example.com host1 60 A 10.0.0.1
```

### 26.6.101 salt.modules.deb\_apache

**Warning:** This module will be removed from Salt in version 3009 in favor of the [apache Salt Extension](#).

Support for Apache

Please note: The functions in here are Debian-specific. Placing them in this separate file will allow them to load only on Debian-based systems, while still loading under the `apache` namespace.

`salt.modules.deb_apache.a2disconf`(*conf*)

New in version 2016.3.0.

Runs a2disconf for the given conf.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2disconf security
```

`salt.modules.deb_apache.a2dismod`(*mod*)

Runs a2dismod for the given mod.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2dismod vhost_alias
```

`salt.modules.deb_apache.a2dissite`(*site*)

Runs a2dissite for the given site.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2dissite example.com
```

`salt.modules.deb_apache.a2enconf`(*conf*)

New in version 2016.3.0.

Runs a2enconf for the given conf.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2enconf security
```

`salt.modules.deb_apache.a2enmod`(*mod*)

Runs a2enmod for the given mod.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2enmod vhost_alias
```

`salt.modules.deb_apache.a2ensite`(*site*)

Runs a2ensite for the given site.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2ensite example.com
```

`salt.modules.deb_apache.check_conf_enabled(conf)`

New in version 2016.3.0.

Checks to see if the specific conf symlink is in `/etc/apache2/conf-enabled`.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.check_conf_enabled security
salt '*' apache.check_conf_enabled security.conf
```

`salt.modules.deb_apache.check_mod_enabled(mod)`

Checks to see if the specific mod symlink is in `/etc/apache2/mods-enabled`.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.check_mod_enabled status
salt '*' apache.check_mod_enabled status.load
salt '*' apache.check_mod_enabled status.conf
```

`salt.modules.deb_apache.check_site_enabled(site)`

Checks to see if the specific site symlink is in `/etc/apache2/sites-enabled`.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.check_site_enabled example.com
salt '*' apache.check_site_enabled example.com.conf
```

### 26.6.102 salt.modules.deb\_postgres

Module to provide Postgres compatibility to salt for debian family specific tools.

`salt.modules.deb_postgres.cluster_create(version, name='main', port=None, locale=None, encoding=None, datadir=None, allow_group_access=None, data_checksums=None, wal_segsize=None)`

Adds a cluster to the Postgres server.

CLI Example:

```
salt '*' postgres.cluster_create '9.3'
salt '*' postgres.cluster_create '9.3' 'main'
salt '*' postgres.cluster_create '9.3' locale='fr_FR'
salt '*' postgres.cluster_create '11' data_checksums=True wal_segsize='32'
```

`salt.modules.deb_postgres.cluster_exists(version, name='main')`

Checks if a given version and name of a cluster exists.

CLI Example:

```
salt '*' postgres.cluster_exists '9.3'
salt '*' postgres.cluster_exists '9.3' 'main'
```

`salt.modules.deb_postgres.cluster_list` (*verbose=False*)

Return a list of cluster of Postgres server (tuples of version and name).

CLI Example:

```
salt '*' postgres.cluster_list
salt '*' postgres.cluster_list verbose=True
```

`salt.modules.deb_postgres.cluster_remove` (*version, name='main', stop=False*)

Remove a cluster on a Postgres server. By default it doesn't try to stop the cluster.

CLI Example:

```
salt '*' postgres.cluster_remove '9.3'
salt '*' postgres.cluster_remove '9.3' 'main'
salt '*' postgres.cluster_remove '9.3' 'main' stop=True
```

### 26.6.103 salt.modules.debconfmod

Support for Debconf

`salt.modules.debconfmod.get_selections` (*fetchempty=True*)

Answers to debconf questions for all packages in the following format:

```
{'package': [['question', 'type', 'value'], ...]}
```

CLI Example:

```
salt '*' debconf.get_selections
```

`salt.modules.debconfmod.set_` (*package, question, type, value, \*extra*)

Set answers to debconf questions for a package.

CLI Example:

```
salt '*' debconf.set <package> <question> <type> <value> [<value> ...]
```

`salt.modules.debconfmod.set_file` (*path, saltenv='base', \*\*kwargs*)

Set answers to debconf questions from a file.

CLI Example:

```
salt '*' debconf.set_file salt://pathto/pkg.selections
```

`salt.modules.debconfmod.set_template` (*path, template, context, defaults, saltenv='base', \*\*kwargs*)

Set answers to debconf questions from a template.

**path**  
location of the file containing the package selections

**template**  
template format

**context**  
variables to add to the template environment

**default**  
default values for the template environment

CLI Example:

```
salt '*' debconf.set_template salt://path/to/pkg.selections.jinja jinja
↪None None
```

`salt.modules.debconfmod.show(name)`

Answers to debconf questions for a package in the following format:

```
[['question', 'type', 'value'], ...]
```

If debconf doesn't know about a package, we return None.

CLI Example:

```
salt '*' debconf.show <package name>
```

#### 26.6.104 salt.modules.debian\_ip

The networking module for Debian-based distros

References:

- <http://www.debian.org/doc/manuals/debian-reference/ch05.en.html>

`salt.modules.debian_ip.apply_network_settings(**settings)`

Apply global network configuration.

CLI Example:

```
salt '*' ip.apply_network_settings
```

`salt.modules.debian_ip.build_bond(iface, **settings)`

Create a bond script in /etc/modprobe.d with the passed settings and load the bonding kernel module.

CLI Example:

```
salt '*' ip.build_bond bond0 mode=balance-alb
```

`salt.modules.debian_ip.build_interface(iface, iface_type, enabled, **settings)`

Build an interface script for a network interface.

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

`salt.modules.debian_ip.build_network_settings(**settings)`

Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

`salt.modules.debian_ip.build_routes(iface, **settings)`

Add route scripts for a network interface using up commands.

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

`salt.modules.debian_ip.down(iface, iface_type)`

Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0 eth
```

`salt.modules.debian_ip.get_bond(iface)`

Return the content of a bond script

CLI Example:

```
salt '*' ip.get_bond bond0
```

`salt.modules.debian_ip.get_interface(iface)`

Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.debian_ip.get_network_settings()`

Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

`salt.modules.debian_ip.get_routes(iface)`

Return the routes for the interface

CLI Example:

```
salt '*' ip.get_routes eth0
```

`salt.modules.debian_ip.up(iface, iface_type)`

Start up a network interface

CLI Example:

```
salt '*' ip.up eth0 eth
```

## 26.6.105 salt.modules.debian\_service

Service support for Debian systems (uses update-rc.d and /sbin/service)

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

`salt.modules.debian_service.available(name)`

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.debian_service.disable(name, **kwargs)`

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.debian_service.disabled(name)`

Return True if the named service is disabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.debian_service.enable(name, **kwargs)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.debian_service.enabled(name, **kwargs)`

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.debian_service.force_reload(name)`

Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.debian_service.get_all()`

Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.debian_service.get_disabled()`

Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.debian_service.get_enabled()`

Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.debian_service.missing(name)`

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.debian_service.reload_(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.debian_service.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.debian_service.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.debian_service.status(name, sig=None)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

**Parameters**

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Signature to use to find the service via ps

**Returns**

True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type**

bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.debian_service.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

### 26.6.106 salt.modules.debuild\_pkgbuild

Debian Package builder system

New in version 2015.8.0.

This system allows for all of the components to build debs safely in chrooted environments. This also provides a function to generate debian repositories

This module implements the pkgbuild interface

`salt.modules.debuild_pkgbuild.build(runas, tgt, dest_dir, spec, sources, deps, env, template, saltenv='base', log_dir='/var/log/salt/pkgbuild')`

Given the package destination directory, the tarball containing debian files (e.g. control) and package sources, use pbuilder to safely build the platform package

CLI Example:

Debian

```
salt '*' pkgbuild.make_src_pkg deb-8-x86_64 /var/www/html
      https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/
      ↪deb/python-libnacl.control
      https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.
      ↪tar.gz
```

This example command should build the libnacl package for Debian using pbuilder and place it in /var/www/html/ on the minion

`salt.modules.debuild_pkgbuild.make_repo(repodir, keyid=None, env=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='root', timeout=15.0)`

Make a package repository and optionally sign it and packages present

Given the repodir (directory to create repository in), create a Debian repository and optionally sign it and packages present. This state is best used with onchanges linked to your package building states.

**repodir**

The directory to find packages that will be in the repository.

**keyid**

Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. This consists of the last 8 hex digits of the GPG key ID.

Utilizes Public and Private keys associated with `keyid` which have been loaded into the minion's Pillar data. Leverages `gpg-agent` and `gpg-preset-passphrase` for caching keys, etc. These pillar values are assumed to be filenames which are present in `gnupghome`. The pillar keys shown below have to match exactly.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_keyname: gpg_pkg_key.pem
gpg_pkg_pub_keyname: gpg_pkg_key.pub
```

#### env

Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

#### use\_passphrase

[False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

#### gnupghome

[/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with `keyid`.

#### runas

[root] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

---

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

---

#### timeout

[15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html
```

`salt.modules.debuild_pkgbuild.make_src_pkg(dest_dir, spec, sources, env=None, saltenv='base', runas='root')`

Create a platform specific source package from the given platform spec/control file and sources

CLI Example:

#### Debian

```
salt '*' pkgbuild.make_src_pkg /var/www/html/
    https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/
↳ deb/python-libnacl.control.tar.xz
    https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.
↳ tar.gz
```

This example command should build the libnacl SOURCE package and place it in `/var/www/html/` on the minion

**dest\_dir**

Absolute path for directory to write source package

**spec**

Absolute path to spec file or equivalent

**sources**

Absolute path to source files to build source package from

**env**

[None] A list or dictionary of environment variables to be set prior to execution. Example:

```
- env:
  - DEB_BUILD_OPTIONS: 'nocheck'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

saltenv: base

Salt environment variables

**runas**

[root] New in version 2019.2.1.

User to create the files and directories

---

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

---

### 26.6.107 salt.modules.defaults

Module to work with salt formula defaults files

`salt.modules.defaults.deepcopy` (*source*)

Allows deep copy of objects in formulas.

By default, Python does not copy objects, it creates bindings between a target and an object.

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

`salt.modules.defaults.get` (*key*, *default=""*)

`defaults.get` is used much like `pillar.get` except that it will read a default value for a pillar from `defaults.json` or `defaults.yaml` files that are stored in the root of a salt formula.

CLI Example:

```
salt '*' defaults.get core:users:root
```

The `defaults` is computed from pillar key. The first entry is considered as the formula namespace.

For example, querying `core:users:root` will try to load `salt://core/defaults.yaml` and `salt://core/defaults.json`.

`salt.modules.defaults.merge`(*dest, src, merge\_lists=False, in\_place=True, convert\_none=True*)

Allows deep merging of dicts in formulas.

**merge\_lists**

[False] If True, it will also merge lists instead of replace their items.

**in\_place**

[True] If True, it will merge into dest dict, if not it will make a new copy from that dict and return it.

**convert\_none**

[True] If True, it will convert src and dest to empty dicts if they are None. If True and dest is None but in\_place is True, raises TypeError. If False it will make a new copy from that dict and return it.

New in version 3005.

CLI Example:

```
salt '*' defaults.merge '{a: b}' '{d: e}'
```

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

`salt.modules.defaults.update`(*dest, defaults, merge\_lists=True, in\_place=True, convert\_none=True*)

Allows setting defaults for group of data set e.g. group for nodes.

This function is a combination of defaults.merge and defaults.deepcopy to avoid redundant in jinja.

Example:

```
group01:
  defaults:
    enabled: True
    extra:
      - test
      - stage
  nodes:
    host01:
      index: foo
      upstream: bar
    host02:
      index: foo2
      upstream: bar2
```

```
{% do salt['defaults.update'](group01.nodes, group01.defaults) %}
```

Each node will look like the following:

```
host01:
  enabled: True
  index: foo
  upstream: bar
  extra:
    - test
    - stage
```

**merge\_lists**

[True] If True, it will also merge lists instead of replace their items.

**in\_place**

[True] If True, it will merge into dest dict. if not it will make a new copy from that dict and return it.

**convert\_none**

[True] If True, it will convert src and dest to empty dicts if they are None. If True and dest is None but in\_place is True, raises TypeError. If False it will make a new copy from that dict and return it.

New in version 3005.

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

**26.6.108 salt.modules.devinfo**

Module for devinfo :maintainer: Alberto Planas <aplanas@suse.com> :maturity: new :depends: None :platform: Linux

`salt.modules.devinfo.filter_(udev_in=None, udev_ex=None)`

Returns a list of devices, filtered under udev keys.

**udev\_in**

A dictionary of key:values that are expected in the device udev information

**udev\_ex**

A dictionary of key:values that are not expected in the device udev information (excluded)

The key is a lower case string, joined by dots, that represent a path in the udev information dictionary. For example, 'e.id\_bus' will represent the udev entry `udev[E][ID_BUS]`

If the udev entry is a list, the algorithm will check that at least one item match one item of the value of the parameters.

Returns list of devices that match `udev_in` and do not match `udev_ex`.

CLI Example:

```
salt '*' devinfo.filter udev_in='{ "e.id_bus": "ata" }'
```

`salt.modules.devinfo.hwinfo(items=None, short=True, listmd=False, devices=None)`

Probe for hardware

**items**

List of hardware items to inspect. Default ['bios', 'cpu', 'disk', 'memory', 'network', 'partition']

**short**

Show only a summary. Default True.

**listmd**

Report RAID devices. Default False.

**devices**

List of devices to show information from. Default None.

CLI Example:

```
salt '*' devinfo.hwinfo
salt '*' devinfo.hwinfo items='["disk"]' short=no
salt '*' devinfo.hwinfo items='["disk"]' short=no devices='["/dev/sda"]'
salt '*' devinfo.hwinfo devices=/dev/sda
```

### 26.6.109 salt.modules.devmap

Device-Mapper module

`salt.modules.devmap.multipath_flush(device)`

Device-Mapper Multipath flush

CLI Example:

```
salt '*' devmap.multipath_flush mpath1
```

`salt.modules.devmap.multipath_list()`

Device-Mapper Multipath list

CLI Example:

```
salt '*' devmap.multipath_list
```

### 26.6.110 salt.modules.dig

Compendium of generic DNS utilities. The 'dig' command line tool must be installed in order to use this module.

`salt.modules.dig.A(host, nameserver=None)`

Return the A record for host.

Always returns a list.

CLI Example:

```
salt ns1 dig.A www.google.com
```

`salt.modules.dig.AAAA(host, nameserver=None)`

Return the AAAA record for host.

Always returns a list.

CLI Example:

```
salt ns1 dig.AAAA www.google.com
```

`salt.modules.dig.CNAME(host, nameserver=None)`

Return the CNAME record for host.

New in version 3005.

CLI Example:

```
salt ns1 dig.CNAME mail.google.com
```

`salt.modules.dig.MX(domain, resolve=False, nameserver=None)`

Return a list of lists for the MX of domain.

If the `resolve` argument is True, resolve IPs for the servers.

It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don't use the resolver here, resolve them in a separate step.

CLI Example:

```
salt ns1 dig.MX google.com
```

`salt.modules.dig.NS`(*domain*, *resolve=True*, *nameserver=None*)

Return a list of IPs of the nameservers for *domain*

If *resolve* is `False`, don't resolve names.

CLI Example:

```
salt ns1 dig.NS google.com
```

`salt.modules.dig.PTR`(*host*, *nameserver=None*)

New in version 3006.0.

Return the PTR record for *host*.

Always returns a list.

CLI Example:

```
salt ns1 dig.PTR 1.2.3.4
```

`salt.modules.dig.SPF`(*domain*, *record='SPF'*, *nameserver=None*)

Return the allowed IPv4 ranges in the SPF record for *domain*.

If *record* is `SPF` and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.

CLI Example:

```
salt ns1 dig.SPF google.com
```

`salt.modules.dig.TXT`(*host*, *nameserver=None*)

Return the TXT record for *host*.

Always returns a list.

CLI Example:

```
salt ns1 dig.TXT google.com
```

`salt.modules.dig.a`(*host*, *nameserver=None*)

Return the A record for *host*.

Always returns a list.

CLI Example:

```
salt ns1 dig.A www.google.com
```

`salt.modules.dig.aaaa`(*host*, *nameserver=None*)

Return the AAAA record for *host*.

Always returns a list.

CLI Example:

```
salt ns1 dig.AAAA www.google.com
```

`salt.modules.dig.check_ip(addr)`

Check if address is a valid IP. returns True if valid, otherwise False.

CLI Example:

```
salt ns1 dig.check_ip 127.0.0.1
salt ns1 dig.check_ip 1111:2222:3333:4444:5555:6666:7777:8888
```

`salt.modules.dig.cname(host, nameserver=None)`

Return the CNAME record for host.

New in version 3005.

CLI Example:

```
salt ns1 dig.CNAME mail.google.com
```

`salt.modules.dig.mx(domain, resolve=False, nameserver=None)`

Return a list of lists for the MX of domain.

If the `resolve` argument is True, resolve IPs for the servers.

It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don't use the resolver here, resolve them in a separate step.

CLI Example:

```
salt ns1 dig.MX google.com
```

`salt.modules.dig.ns(domain, resolve=True, nameserver=None)`

Return a list of IPs of the nameservers for domain

If `resolve` is False, don't resolve names.

CLI Example:

```
salt ns1 dig.NS google.com
```

`salt.modules.dig.ptr(host, nameserver=None)`

New in version 3006.0.

Return the PTR record for host.

Always returns a list.

CLI Example:

```
salt ns1 dig.PTR 1.2.3.4
```

`salt.modules.dig.spf(domain, record='SPF', nameserver=None)`

Return the allowed IPv4 ranges in the SPF record for domain.

If record is SPF and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.

CLI Example:

```
salt ns1 dig.SPF google.com
```

## 26.6.111 salt.modules.disk

Module for managing disks and blockdevices

`salt.modules.disk.blkid` (*device=None, token=None*)

Return block device attributes: UUID, LABEL, etc. This function only works on systems where blkid is available.

**device**

Device name from the system

**token**

Any valid token used for the search

CLI Example:

```
salt '*' disk.blkid
salt '*' disk.blkid /dev/sda
salt '*' disk.blkid token='UUID=6a38ee5-7235-44e7-8b22-816a403bad5d'
salt '*' disk.blkid token='TYPE=ext4'
```

`salt.modules.disk.dump` (*device, args=None*)

Return all contents of dumpe2fs for a specified device

**device**

The device path to dump.

**args**

A list of attributes to return. Returns all by default.

CLI Example:

```
salt '*' disk.dump /dev/sda1
```

`salt.modules.disk.format_` (*device, fs\_type='ext4', inode\_size=None, lazy\_itable\_init=None, fat=None, force=False*)

Format a filesystem onto a device

New in version 2016.11.0.

**device**

The device in which to create the new filesystem

**fs\_type**

The type of filesystem to create

**inode\_size**

Size of the inodes

This option is only enabled for ext and xfs filesystems

**lazy\_itable\_init**

If enabled and the `uninit_bg` feature is enabled, the inode table will not be fully initialized by `mke2fs`. This speeds up filesystem initialization noticeably, but it requires the kernel to finish initializing the filesystem in the background when the filesystem is first mounted. If the option value is omitted, it defaults to 1 to enable lazy inode table zeroing.

This option is only enabled for ext filesystems

**fat**

FAT size option. Can be 12, 16 or 32, and can only be used on fat or vfat filesystems.

**force**

Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

CLI Example:

```
salt '*' disk.format /dev/sdX1
```

**salt.modules.disk.fstype**(*device*)

Return the filesystem name of the specified device

New in version 2016.11.0.

**device**

The name of the device

CLI Example:

```
salt '*' disk.fstype /dev/sdX1
```

**salt.modules.disk.get\_fstype\_from\_path**(*path*)

Return the filesystem type of the underlying device for a specified path.

New in version 3006.0.

**path**

The path for the function to evaluate.

CLI Example:

```
salt '*' disk.get_fstype_from_path /root
```

**salt.modules.disk.hdparms**(*disks*, *args*='aAbBcCdGHiJkMmNnQrRuW')

Retrieve disk parameters.

New in version 2016.3.0.

**disks**

Single disk or list of disks to query.

**args**

Sequence of hdparm flags to fetch.

CLI Example:

```
salt '*' disk.hdparms /dev/sda
```

**salt.modules.disk.hpa**(*disks*, *size*=None)

Get/set Host Protected Area settings

T13 INCITS 346-2001 (1367D) defines the BEER (Boot Engineering Extension Record) and PARTIES (Protected Area Run Time Interface Extension Services), allowing for a Host Protected Area on a disk.

It's often used by OEMS to hide parts of a disk, and for overprovisioning SSD's

**Warning:** Setting the HPA might clobber your data, be very careful with this on active disks!

New in version 2016.3.0.

CLI Example:

```
salt '*' disk.hpa /dev/sda
salt '*' disk.hpa /dev/sda 5%
salt '*' disk.hpa /dev/sda 10543256
```

`salt.modules.disk.inodeusage` (*args=None*)

Return inode usage information for volumes mounted on this minion

**args**

Sequence of flags to pass to the `df` command.

CLI Example:

```
salt '*' disk.inodeusage
```

`salt.modules.disk.iostat` (*interval=1, count=5, disks=None*)

Gather and return (averaged) IO stats.

New in version 2016.3.0.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' disk.iostat 1 5 disks=sda
```

`salt.modules.disk.percent` (*args=None*)

Return partition information for volumes mounted on this minion

**args**

Specify a single partition for which to return data.

CLI Example:

```
salt '*' disk.percent /var
```

`salt.modules.disk.resize2fs` (*device*)

Resizes the filesystem.

CLI Example:

```
salt '*' disk.resize2fs /dev/sda1
```

`salt.modules.disk.smart_attributes` (*dev, attributes=None, values=None*)

Fetch SMART attributes Providing attributes will deliver only requested attributes Providing values will deliver only requested values for attributes

Default is the Backblaze recommended set (<https://www.backblaze.com/blog/hard-drive-smart-stats/>): (5,187,188,197,198)

New in version 2016.3.0.

CLI Example:

```
salt '*' disk.smart_attributes /dev/sda
salt '*' disk.smart_attributes /dev/sda attributes=(5,187,188,197,198)
```

`salt.modules.disk.tune`(*device*, *\*\*kwargs*)

Set attributes for the specified device

CLI Example:

```
salt '*' disk.tune /dev/sda1 read-ahead=1024 read-write=True
```

Valid options are: `read-ahead`, `filesystem-read-ahead`, `read-only`, `read-write`.

See the `blockdev(8)` manpage for a more complete description of these options.

`salt.modules.disk.usage`(*args=None*)

Return usage information for volumes mounted on this minion

**args**

Sequence of flags to pass to the `df` command.

Changed in version 2019.2.0: Default for SunOS changed to 1 kilobyte blocks

CLI Example:

```
salt '*' disk.usage
```

`salt.modules.disk.wipe`(*device*)

Remove the filesystem information

CLI Example:

```
salt '*' disk.wipe /dev/sda1
```

## 26.6.112 salt.modules.djangomod

Manage Django sites

`salt.modules.djangomod.collectstatic`(*settings\_module*, *bin\_env=None*, *no\_post\_process=False*, *ignore=None*, *dry\_run=False*, *clear=False*, *link=False*, *no\_default\_ignore=False*, *pythonpath=None*, *env=None*, *runas=None*)

Collect static files from each of your applications into a single location that can easily be served in production.

CLI Example:

```
salt '*' django.collectstatic <settings_module>
```

`salt.modules.djangomod.command`(*settings\_module*, *command*, *bin\_env=None*, *pythonpath=None*, *env=None*, *runas=None*, *\*args*, *\*\*kwargs*)

Run arbitrary django management command

CLI Example:

```
salt '*' django.command <settings_module> <command>
```

`salt.modules.djangomod.createsuperuser`(*settings\_module*, *username*, *email*, *bin\_env=None*, *database=None*, *pythonpath=None*, *env=None*, *runas=None*)

Create a super user for the database. This function defaults to use the `--noinput` flag which prevents the creation of a password for the superuser.

CLI Example:

```
salt '*' django.createsuperuser <settings_module> user user@example.com
```

`salt.modules.djangomod.loaddata` (*settings\_module*, *fixtures*, *bin\_env=None*, *database=None*, *pythonpath=None*, *env=None*)

Load fixture data

**Fixtures:**

comma separated list of fixtures to load

CLI Example:

```
salt '*' django.loaddata <settings_module> <comma delimited list of
↳ fixtures>
```

`salt.modules.djangomod.migrate` (*settings\_module*, *app\_label=None*, *migration\_name=None*, *bin\_env=None*, *database=None*, *pythonpath=None*, *env=None*, *noinput=True*, *runas=None*)

Run migrate

Execute the Django-Admin migrate command (requires Django 1.7 or higher).

New in version 3000.

**settings\_module**

Specifies the settings module to use. The settings module should be in Python package syntax, e.g. `mysite.settings`. If this isn't provided, `django-admin` will use the `DJANGO_SETTINGS_MODULE` environment variable.

**app\_label**

Specific app to run migrations for, instead of all apps. This may involve running other apps' migrations too, due to dependencies.

**migration\_name**

Named migration to be applied to a specific app. Brings the database schema to a state where the named migration is applied, but no later migrations in the same app are applied. This may involve unapplying migrations if you have previously migrated past the named migration. Use the name `zero` to unapply all migrations for an app.

**bin\_env**

Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`). If a directory path is specified, it is assumed to be a virtualenv.

**database**

Database to migrate. Defaults to `'default'`.

**pythonpath**

Adds the given filesystem path to the Python import search path. If this isn't provided, `django-admin` will use the `PYTHONPATH` environment variable.

**env**

A list of environment variables to be set prior to execution.

Example:

```
module.run:
- name: django.migrate
```

(continues on next page)

(continued from previous page)

- **settings\_module**: my\_django\_app.settings
- **env**:
  - **DATABASE\_USER**: 'mydbuser'

**noinput**

Suppresses all user prompts. Defaults to True.

**runas**

The user name to run the command as.

CLI Example:

```
salt '*' django.migrate <settings_module>
salt '*' django.migrate <settings_module> <app_label>
salt '*' django.migrate <settings_module> <app_label> <migration_name>
```

**salt.modules.djangomod.syncdb**(*settings\_module, bin\_env=None, migrate=False, database=None, pythonpath=None, env=None, noinput=True, runas=None*)

Run syncdb

Execute the Django-Admin syncdb command, if South is available on the minion the `migrate` option can be passed as True calling the migrations to run after the syncdb completes

NOTE: The syncdb command was deprecated in Django 1.7 and removed in Django 1.9. For Django versions 1.9 or higher use the `migrate` command instead.

CLI Example:

```
salt '*' django.syncdb <settings_module>
```

## 26.6.113 salt.modules.dnsmasq

Module for managing dnsmasq

**salt.modules.dnsmasq.fullversion**()

Shows installed version of dnsmasq and compile options.

CLI Example:

```
salt '*' dnsmasq.fullversion
```

**salt.modules.dnsmasq.get\_config**(*config\_file='/etc/dnsmasq.conf'*)

Dumps all options from the config file.

**config\_file**

The location of the config file from which to obtain contents. Defaults to `/etc/dnsmasq.conf`.

CLI Examples:

```
salt '*' dnsmasq.get_config
salt '*' dnsmasq.get_config config_file=/etc/dnsmasq.conf
```

**salt.modules.dnsmasq.set\_config**(*config\_file='/etc/dnsmasq.conf, follow=True, \*\*kwargs*)

Sets a value or a set of values in the specified file. By default, if `conf-dir` is configured in this file, salt will attempt to set the option in any file inside the `conf-dir` where it has already been enabled. If it does not find it inside any files, it will append it to the main config file. Setting `follow` to False will turn off this behavior.

If a config option currently appears multiple times (such as `dhcp-host`, which is specified at least once per host), the new option will be added to the end of the main config file (and not to any includes). If you need an option added to a specific include file, specify it as the `config_file`.

#### Parameters

- **config\_file** (*string*) -- config file where settings should be updated / added.
- **follow** (*bool*) -- attempt to set the config option inside any file within the `conf-dir` where it has already been enabled.
- **kwargs** -- key value pairs that contain the configuration settings that you want set.

CLI Examples:

```
salt '*' dnsmasq.set_config domain=mydomain.com
salt '*' dnsmasq.set_config follow=False domain=mydomain.com
salt '*' dnsmasq.set_config config_file=/etc/dnsmasq.conf domain=mydomain.
↪com
```

`salt.modules.dnsmasq.version()`

Shows installed version of dnsmasq.

CLI Example:

```
salt '*' dnsmasq.version
```

### 26.6.114 salt.modules.dnsutil

Compendium of generic DNS utilities.

---

**Note:** Some functions in the `dnsutil` execution module depend on `dig`.

---

`salt.modules.dnsutil.A(host, nameserver=None)`

Return the A record(s) for `host`.

Always returns a list.

CLI Example:

```
salt ns1 dnsutil.A www.google.com
```

`salt.modules.dnsutil.AAAA(host, nameserver=None)`

Return the AAAA record(s) for `host`.

Always returns a list.

New in version 2014.7.5.

CLI Example:

```
salt ns1 dnsutil.AAAA www.google.com
```

`salt.modules.dnsutil.MX(domain, resolve=False, nameserver=None)`

Return a list of lists for the MX of `domain`.

If the 'resolve' argument is True, resolve IPs for the servers.

It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don't use the resolver here, resolve them in a separate step.

CLI Example:

```
salt ns1 dnsutil.MX google.com
```

`salt.modules.dnsutil.NS`(*domain*, *resolve=True*, *nameserver=None*)

Return a list of IPs of the nameservers for *domain*

If 'resolve' is False, don't resolve names.

CLI Example:

```
salt ns1 dnsutil.NS google.com
```

`salt.modules.dnsutil.SPF`(*domain*, *record='SPF'*, *nameserver=None*)

Return the allowed IPv4 ranges in the SPF record for *domain*.

If record is SPF and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.

CLI Example:

```
salt ns1 dnsutil.SPF google.com
```

`salt.modules.dnsutil.check_ip`(*ip\_addr*)

Check that string *ip\_addr* is a valid IP

CLI Example:

```
salt ns1 dnsutil.check_ip 127.0.0.1
```

`salt.modules.dnsutil.hosts_append`(*hostsfile='/etc/hosts'*, *ip\_addr=None*, *entries=None*)

Append a single line to the */etc/hosts* file.

CLI Example:

```
salt '*' dnsutil.hosts_append /etc/hosts 127.0.0.1 ad1.yuk.co,ad2.yuk.co
```

`salt.modules.dnsutil.hosts_remove`(*hostsfile='/etc/hosts'*, *entries=None*)

Remove a host from the */etc/hosts* file. If doing so will leave a line containing only an IP address, then the line will be deleted. This function will leave comments and blank lines intact.

CLI Examples:

```
salt '*' dnsutil.hosts_remove /etc/hosts ad1.yuk.co
salt '*' dnsutil.hosts_remove /etc/hosts ad2.yuk.co,ad1.yuk.co
```

`salt.modules.dnsutil.parse_hosts`(*hostsfile='/etc/hosts'*, *hosts=None*)

Parse */etc/hosts* file.

CLI Example:

```
salt '*' dnsutil.parse_hosts
```

`salt.modules.dnsutil.parse_zone` (*zonefile=None, zone=None*)

Parses a zone file. Can be passed raw zone data on the API level.

CLI Example:

```
salt ns1 dnsutil.parse_zone /var/lib/named/example.com.zone
```

`salt.modules.dnsutil.serial` (*zone="", update=False*)

Return, store and update a dns serial for your zone files.

zone: a keyword for a specific zone

update: store an updated version of the serial in a grain

If `update` is `False`, the function will retrieve an existing serial or return the current date if no serial is stored. Nothing will be stored

If `update` is `True`, the function will set the serial to the current date if none exist or if the existing serial is for a previous date. If a serial for greater than the current date is already stored, the function will increment it.

This module stores the serial in a grain, you can explicitly set the stored value as a grain named `dnsserial_<zone_name>`.

CLI Example:

```
salt ns1 dnsutil.serial example.com
```

### 26.6.115 salt.modules.dockercompose

**Warning:** This module will be removed from Salt in version 3009 in favor of the [docker Salt Extension](#).

Module to import docker-compose via saltstack

New in version 2016.3.0.

**maintainer**

Jean Praloran <[jeanpralo@gmail.com](mailto:jeanpralo@gmail.com)>

**maturity**

new

**depends**

docker-compose>=1.5

**platform**

all

## Introduction

This module allows one to deal with docker-compose file in a directory.

This is a first version only, the following commands are missing at the moment but will be built later on if the community is interested in this module:

- run
- logs
- port
- scale

## Installation Prerequisites

This execution module requires at least version 1.4.0 of both `docker-compose` and `Docker`. `docker-compose` can easily be installed using `pip.install`:

```
salt myminion pip.install docker-compose>=1.5.0
```

## How to use this module?

In order to use the module if you have no docker-compose file on the server you can issue the command `create`, it takes two arguments the path where the `docker-compose.yml` will be stored and the content of this latter:

```
# salt-call -l debug dockercompose.create /tmp/toto '
database:
image: mongo:3.0
command: mongod --smallfiles --quiet --logpath=/dev/null
'
```

Then you can execute a list of method defined at the bottom with at least one argument (the path where the `docker-compose.yml` will be read) and an optional python list which corresponds to the services names:

```
# salt-call -l debug dockercompose.up /tmp/toto
# salt-call -l debug dockercompose.restart /tmp/toto '[database]'
# salt-call -l debug dockercompose.stop /tmp/toto
# salt-call -l debug dockercompose.rm /tmp/toto
```

## Docker-compose method supported

- up
- restart
- stop
- start
- pause
- unpause
- kill

- rm
- ps
- pull
- build

## Functions

- **docker-compose.yml management**
  - *dockercompose.create*
  - *dockercompose.get*
- **Manage containers**
  - *dockercompose.restart*
  - *dockercompose.stop*
  - *dockercompose.pause*
  - *dockercompose.unpause*
  - *dockercompose.start*
  - *dockercompose.kill*
  - *dockercompose.rm*
  - *dockercompose.up*
- **Manage containers image:**
  - *dockercompose.pull*
  - *dockercompose.build*
- **Gather information about containers:**
  - *dockercompose.ps*
- **Manage service definitions:**
  - *dockercompose.service\_create*
  - *dockercompose.service\_upsert*
  - *dockercompose.service\_remove*
  - *dockercompose.service\_set\_tag*

## Detailed Function Documentation

`salt.modules.dockercompose.build(path, service_names=None)`

Build image for containers in the docker-compose file, `service_names` is a python list, if omitted build images for all containers. Please note that at the moment the module does not allow you to upload your Dockerfile, nor any other file you could need with your docker-compose.yml, you will have to make sure the files you need are actually in the directory specified in the *build* keyword

### **path**

Path where the docker-compose file is stored on the server

**service\_names**

If specified will pull only the image for the specified services

CLI Example:

```
salt myminion dockercompose.build /path/where/docker-compose/stored
salt myminion dockercompose.build /path/where/docker-compose/stored
↳ '[janus]'
```

`salt.modules.dockercompose.create(path, docker_compose)`

Create and validate a docker-compose file into a directory

**path**

Path where the docker-compose file will be stored on the server

**docker\_compose**

docker\_compose file

CLI Example:

```
salt myminion dockercompose.create /path/where/docker-compose/stored
↳ content
```

`salt.modules.dockercompose.get(path)`

Get the content of the docker-compose file into a directory

**path**

Path where the docker-compose file is stored on the server

CLI Example:

```
salt myminion dockercompose.get /path/where/docker-compose/stored
```

`salt.modules.dockercompose.kill(path, service_names=None)`

Kill containers in the docker-compose file, `service_names` is a python list, if omitted kill all containers

**path**

Path where the docker-compose file is stored on the server

**service\_names**

If specified will kill only the specified services

CLI Example:

```
salt myminion dockercompose.kill /path/where/docker-compose/stored
salt myminion dockercompose.kill /path/where/docker-compose/stored
↳ '[janus]'
```

`salt.modules.dockercompose.pause(path, service_names=None)`

Pause running containers in the docker-compose file, `service_names` is a python list, if omitted pause all containers

**path**

Path where the docker-compose file is stored on the server

**service\_names**

If specified will pause only the specified services

CLI Example:

```
salt myminion dockercompose.pause /path/where/docker-compose/stored
salt myminion dockercompose.pause /path/where/docker-compose/stored
→ '[janus]'
```

### `salt.modules.dockercompose.ps(path)`

List all running containers and report some information about them

#### **path**

Path where the docker-compose file is stored on the server

CLI Example:

```
salt myminion dockercompose.ps /path/where/docker-compose/stored
```

### `salt.modules.dockercompose.pull(path, service_names=None)`

Pull image for containers in the docker-compose file, `service_names` is a python list, if omitted pull all images

#### **path**

Path where the docker-compose file is stored on the server

#### **service\_names**

If specified will pull only the image for the specified services

CLI Example:

```
salt myminion dockercompose.pull /path/where/docker-compose/stored
salt myminion dockercompose.pull /path/where/docker-compose/stored
→ '[janus]'
```

### `salt.modules.dockercompose.restart(path, service_names=None)`

Restart container(s) in the docker-compose file, `service_names` is a python list, if omitted restart all containers

#### **path**

Path where the docker-compose file is stored on the server

#### **service\_names**

If specified will restart only the specified services

CLI Example:

```
salt myminion dockercompose.restart /path/where/docker-compose/stored
salt myminion dockercompose.restart /path/where/docker-compose/stored
→ '[janus]'
```

### `salt.modules.dockercompose.rm(path, service_names=None)`

Remove stopped containers in the docker-compose file, `service_names` is a python list, if omitted remove all stopped containers

#### **path**

Path where the docker-compose file is stored on the server

#### **service\_names**

If specified will remove only the specified stopped services

CLI Example:

```
salt myminion dockercompose.rm /path/where/docker-compose/stored
salt myminion dockercompose.rm /path/where/docker-compose/stored '[janus]'
```

`salt.modules.dockercompose.service_create`(*path*, *service\_name*, *definition*)

Create the definition of a docker-compose service This fails when the service already exists This does not pull or up the service This wil re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces

**path**

Path where the docker-compose file is stored on the server

**service\_name**

Name of the service to create

**definition**

Service definition as yaml or json string

CLI Example:

```
salt myminion dockercompose.service_create /path/where/docker-compose/  
→stored service_name definition
```

`salt.modules.dockercompose.service_remove`(*path*, *service\_name*)

Remove the definition of a docker-compose service This does not rm the container This wil re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces

**path**

Path where the docker-compose file is stored on the server

**service\_name**

Name of the service to remove

CLI Example:

```
salt myminion dockercompose.service_remove /path/where/docker-compose/  
→stored service_name
```

`salt.modules.dockercompose.service_set_tag`(*path*, *service\_name*, *tag*)

Change the tag of a docker-compose service This does not pull or up the service This wil re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces

**path**

Path where the docker-compose file is stored on the server

**service\_name**

Name of the service to remove

**tag**

Name of the tag (often used as version) that the service image should have

CLI Example:

```
salt myminion dockercompose.service_create /path/where/docker-compose/  
→stored service_name tag
```

`salt.modules.dockercompose.service_upsert`(*path*, *service\_name*, *definition*)

Create or update the definition of a docker-compose service This does not pull or up the service This wil re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces

**path**

Path where the docker-compose file is stored on the server

**service\_name**

Name of the service to create

**definition**

Service definition as yaml or json string

CLI Example:

```
salt myminion dockercompose.service_upsert /path/where/docker-compose/
↳ stored service_name definition
```

`salt.modules.dockercompose.start`(*path*, *service\_names=None*)

Start containers in the docker-compose file, *service\_names* is a python list, if omitted start all containers

**path**

Path where the docker-compose file is stored on the server

**service\_names**

If specified will start only the specified services

CLI Example:

```
salt myminion dockercompose.start /path/where/docker-compose/stored
salt myminion dockercompose.start /path/where/docker-compose/stored
↳ ['janus']
```

`salt.modules.dockercompose.stop`(*path*, *service\_names=None*)

Stop running containers in the docker-compose file, *service\_names* is a python list, if omitted stop all containers

**path**

Path where the docker-compose file is stored on the server

**service\_names**

If specified will stop only the specified services

CLI Example:

```
salt myminion dockercompose.stop /path/where/docker-compose/stored
salt myminion dockercompose.stop /path/where/docker-compose/stored
↳ ['janus']
```

`salt.modules.dockercompose.unpause`(*path*, *service\_names=None*)

Un-Pause containers in the docker-compose file, *service\_names* is a python list, if omitted unpause all containers

**path**

Path where the docker-compose file is stored on the server

**service\_names**

If specified will un-pause only the specified services

CLI Example:

```
salt myminion dockercompose.pause /path/where/docker-compose/stored
salt myminion dockercompose.pause /path/where/docker-compose/stored
↳ ['janus']
```

`salt.modules.dockercompose.up`(*path*, *service\_names=None*)

Create and start containers defined in the docker-compose.yml file located in *path*, *service\_names* is a python list, if omitted create and start all containers

**path**

Path where the docker-compose file is stored on the server

**service\_names**

If specified will create and start only the specified services

CLI Example:

```
salt myminion dockercompose.up /path/where/docker-compose/stored
salt myminion dockercompose.up /path/where/docker-compose/stored '[janus]'
```

## 26.6.116 salt.modules.dockermod

**Warning:** This module will be removed from Salt in version 3009 in favor of the [docker Salt Extension](#).

Management of Docker Containers

New in version 2015.8.0.

Changed in version 2017.7.0: This module has replaced the legacy docker execution module.

**depends**

[docker](#) Python module

---

**Note:** Older releases of the Python bindings for Docker were called [docker-py](#) in PyPI. All releases of [docker](#), and releases of [docker-py](#)  $\geq 1.6.0$  are supported. These python bindings can easily be installed using [pip.install](#):

```
salt myminion pip.install docker
```

To upgrade from [docker-py](#) to [docker](#), you must first uninstall [docker-py](#), and then install [docker](#):

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

---

### Authentication

If you have previously performed a `docker login` from the minion, then the credentials saved in `~/.docker/config.json` will be used for any actions which require authentication. If not, then credentials can be configured in any of the following locations:

- Minion config file
- Grains
- Pillar data
- Master config file (requires `pillar_opts` to be set to `True` in Minion config file in order to work)

---

**Important:** Versions prior to 3000 require that Docker credentials are configured in Pillar data. Be advised that Pillar data is still recommended though, because this keeps the configuration from being stored on the Minion.

Also, keep in mind that if one gets your `~/.docker/config.json`, the password can be decoded from its contents.

The configuration schema is as follows:

```
docker-registries:
  <registry_url>:
    username: <username>
    password: <password>
```

For example:

```
docker-registries:
  hub:
    username: foo
    password: s3cr3t
```

**Note:** As of the 2016.3.7, 2016.11.4, and 2017.7.0 releases of Salt, credentials for the Docker Hub can be configured simply by specifying `hub` in place of the registry URL. In earlier releases, it is necessary to specify the actual registry URL for the Docker Hub (i.e. `https://index.docker.io/v1/`).

More than one registry can be configured. Salt will look for Docker credentials in the `docker-registries` Pillar key, as well as any key ending in `-docker-registries`. For example:

```
docker-registries:
  'https://mydomain.tld/registry:5000':
    username: foo
    password: s3cr3t

foo-docker-registries:
  https://index.foo.io/v1/:
    username: foo
    password: s3cr3t

bar-docker-registries:
  https://index.bar.io/v1/:
    username: foo
    password: s3cr3t
```

To login to the configured registries, use the `docker.login` function. This only needs to be done once for a given registry, and it will store/update the credentials in `~/.docker/config.json`.

**Note:** For Salt releases before 2016.3.7 and 2016.11.4, `docker.login` is not available. Instead, Salt will try to authenticate using each of your configured registries for each push/pull, behavior which is not correct and has been resolved in newer releases.

## Configuration Options

The following configuration options can be set to fine-tune how Salt uses Docker:

- `docker.url`: URL to the docker service (default: local socket).
- `docker.version`: API version to use (should not need to be set manually in the vast majority of cases)
- `docker.exec_driver`: Execution driver to use, one of `nsenter`, `lxc-attach`, or `docker-exec`. See the *Executing Commands Within a Running Container* section for more details on how this config parameter is used.

These configuration options are retrieved using `config.get` (click the link for further information).

## Executing Commands Within a Running Container

---

**Note:** With the release of Docker 1.13.1, the Execution Driver has been removed. Starting in versions 2016.3.6, 2016.11.4, and 2017.7.0, Salt defaults to using `docker exec` to run commands in containers, however for older Salt releases it will be necessary to set the `docker.exec_driver` config option to either `docker-exec` or `nsenter` for Docker versions 1.13.1 and newer.

---

Multiple methods exist for executing commands within Docker containers:

- `lxc-attach`: Default for older versions of docker
- `nsenter`: Enters container namespace to run command
- `docker-exec`: Native support for executing commands in Docker containers (added in Docker 1.3)

Adding a configuration option (see `config.get`) called `docker.exec_driver` will tell Salt which execution driver to use:

```
docker.exec_driver: docker-exec
```

If this configuration option is not found, Salt will use the appropriate interface (either `nsenter` or `lxc-attach`) based on the `Execution Driver` value returned from `docker info`. `docker-exec` will not be used by default, as it is presently (as of version 1.6.2) only able to execute commands as the effective user of the container. Thus, if a `USER` directive was used to run as a non-privileged user, `docker-exec` would be unable to perform the action as root. Salt can still use `docker-exec` as an execution driver, but must be explicitly configured (as in the example above) to do so at this time.

If possible, try to manually specify the execution driver, as it will save Salt a little work.

This execution module provides functions that shadow those from the `cmd` module. They are as follows:

- `docker.retcode`
- `docker.run`
- `docker.run_all`
- `docker.run_stderr`
- `docker.run_stdout`
- `docker.script`
- `docker.script_retcode`

## Detailed Function Documentation

**class** salt.modules.dockermod.**DockerJSONDecoder** (\*, *object\_hook=None, parse\_float=None, parse\_int=None, parse\_constant=None, strict=True, object\_pairs\_hook=None*)

**decode** (*s, \_w=None*)

Return the Python representation of *s* (a `str` instance containing a JSON document).

salt.modules.dockermod.**apply\_** (*name, mods=None, \*\*kwargs*)

New in version 2019.2.0.

Apply states! This function will call highstate or state.sls based on the arguments passed in, `apply` is intended to be the main gateway for all state executions.

CLI Example:

```

salt 'docker' docker.apply web01
salt 'docker' docker.apply web01 test
salt 'docker' docker.apply web01 test,pkgs

```

salt.modules.dockermod.**build** (*path=None, repository=None, tag=None, cache=True, rm=True, api\_response=False, fileobj=None, dockerfile=None, buildargs=None*)

Changed in version 2018.3.0: If the built image should be tagged, then the `repository` and `tag` must now be passed separately using the `repository` and `tag` arguments, rather than together in the (now deprecated) `image` argument.

Builds a docker image from a Dockerfile or a URL

**path**

Path to directory on the Minion containing a Dockerfile

**repository**

Optional repository name for the image being built

New in version 2018.3.0.

**tag**

[latest] Tag name for the image (required if `repository` is passed)

New in version 2018.3.0.

**image**

Deprecated since version 2018.3.0: Use both `repository` and `tag` instead

**cache**

[True] Set to `False` to force the build process not to use the Docker image cache, and pull all required intermediate image layers

**rm**

[True] Remove intermediate containers created during build

**api\_response**

[False] If `True`: an `API_Response` key will be present in the return data, containing the raw output from the Docker API.

**fileobj**

Allows for a file-like object containing the contents of the Dockerfile to be passed in place of a file `path` argument. This argument should not be used from the CLI, only from other Salt code.

**dockerfile**

Allows for an alternative Dockerfile to be specified. Path to alternative Dockerfile is relative to the build path for the Docker container.

New in version 2016.11.0.

**buildargs**

A dictionary of build arguments provided to the docker build process.

**RETURN DATA**

A dictionary containing one or more of the following keys:

- **Id** - ID of the newly-built image
- **Time\_Elapsed** - Time in seconds taken to perform the build
- **Intermediate\_Containers** - IDs of containers created during the course of the build process

*(Only present if rm=False)*

- **Images** - A dictionary containing one or more of the following keys:
  - **Already\_Pulled** - Layers that that were already present on the Minion
  - **Pulled** - Layers that that were pulled

*(Only present if the image specified by the "repository" and "tag" arguments was not present on the Minion, or if cache=False)*

- **Status** - A string containing a summary of the pull action (usually a message saying that an image was downloaded, or that it was up to date).

*(Only present if the image specified by the "repository" and "tag" arguments was not present on the Minion, or if cache=False)*

CLI Example:

```
salt myminion docker.build /path/to/docker/build/dir
salt myminion docker.build https://github.com/myuser/myrepo.git
→ repository=myimage tag=latest
salt myminion docker.build /path/to/docker/build/dir dockerfile=Dockefile.
→ different repository=myimage tag=dev
```

`salt.modules.dockermod.call`(*name, function, \*args, \*\*kwargs*)

Executes a Salt function inside a running container

New in version 2016.11.0.

The container does not need to have Salt installed, but Python is required.

**name**

Container name or ID

**function**

Salt execution module function

CLI Example:

```
salt myminion docker.call test.ping
salt myminion test.arg arg1 arg2 key1=val1
salt myminion dockerng.call compassionate_mirzakhani test.arg arg1 arg2
→ key1=val1
```

`salt.modules.dockermod.commit` (*name, repository, tag='latest', message=None, author=None*)

Changed in version 2018.3.0: The repository and tag must now be passed separately using the `repository` and `tag` arguments, rather than together in the (now deprecated) `image` argument.

Commits a container, thereby promoting it to an image. Equivalent to running the `docker commit` Docker CLI command.

**name**

Container name or ID to commit

**repository**

Repository name for the image being committed

New in version 2018.3.0.

**tag**

[latest] Tag name for the image

New in version 2018.3.0.

**image**

Deprecated since version 2018.3.0: Use both `repository` and `tag` instead

**message**

Commit message (Optional)

**author**

Author name (Optional)

**RETURN DATA**

A dictionary containing the following keys:

- `Id` - ID of the newly-created image
- `Image` - Name of the newly-created image
- `Time_Elapsed` - Time in seconds taken to perform the commit

CLI Example:

```
salt myminion docker.commit mycontainer myuser/myimage mytag
```

`salt.modules.dockermod.compare_container` (*first, second, ignore=None*)

This function is an alias of `compare_containers`.

New in version 2017.7.0.

Changed in version 2018.3.0: Renamed from `docker.compare_container` to `docker.compare_containers` (old function name remains as an alias)

Compare two containers' Config and HostConfig and return any differences between the two.

**first**

Name or ID of first container

**second**

Name or ID of second container

**ignore**

A comma-separated list (or Python list) of keys to ignore when comparing. This is useful when comparing two otherwise identical containers which have different hostnames.

CLI Examples:

```
salt myminion docker.compare_containers foo bar
salt myminion docker.compare_containers foo bar ignore=Hostname
```

`salt.modules.dockermod.compare_container_networks` (*first*, *second*)

New in version 2018.3.0.

Returns the differences between two containers' networks. When a network is only present one of the two containers, that network's diff will simply be represented with `True` for the side of the diff in which the network is present) and `False` for the side of the diff in which the network is absent.

This function works by comparing the contents of both containers' `Networks` keys (under `NetworkSettings`) in the return data from `docker.inspect_container`. Because each network contains some items that either A) only set at runtime, B) naturally varying from container to container, or both, by default the following keys in each network are examined:

- **Aliases**
- **Links**
- **IPAMConfig**

The exception to this is if `IPAMConfig` is unset (i.e. `null`) in one container but not the other. This happens when no static IP configuration is set, and automatic IP configuration is in effect. So, in order to report on changes between automatic IP configuration in one container and static IP configuration in another container (as we need to do for the `docker_container.running` state), automatic IP configuration will also be checked in these cases.

This function uses the `docker.compare_container_networks` minion config option to determine which keys to examine. This provides flexibility in the event that features added in a future Docker release necessitate changes to how Salt compares networks. In these cases, rather than waiting for a new Salt release one can just set `docker.compare_container_networks`.

Changed in version 3000: This config option can now also be set in pillar data and grains. Additionally, it can be set in the master config file, provided that `pillar_opts` is enabled on the minion.

---

**Note:** The checks for automatic IP configuration described above only apply if `IPAMConfig` is among the keys set for static IP checks in `docker.compare_container_networks`.

---

**first**

Name or ID of first container (old)

**second**

Name or ID of second container (new)

CLI Example:

```
salt myminion docker.compare_container_networks foo bar
```

`salt.modules.dockermod.compare_containers` (*first*, *second*, *ignore=None*)

New in version 2017.7.0.

Changed in version 2018.3.0: Renamed from `docker.compare_container` to `docker.compare_containers` (old function name remains as an alias)

Compare two containers' `Config` and `HostConfig` and return any differences between the two.

**first**

Name or ID of first container

**second**

Name or ID of second container

**ignore**

A comma-separated list (or Python list) of keys to ignore when comparing. This is useful when comparing two otherwise identical containers which have different hostnames.

CLI Examples:

```
salt myminion docker.compare_containers foo bar
salt myminion docker.compare_containers foo bar ignore=Hostname
```

`salt.modules.dockermod.compare_networks` (*first*, *second*, *ignore*='Name,Id,Created,Containers')

New in version 2018.3.0.

Compare two networks and return any differences between the two

**first**

Name or ID of first container

**second**

Name or ID of second container

**ignore**

[Name,Id,Created,Containers] A comma-separated list (or Python list) of keys to ignore when comparing.

CLI Example:

```
salt myminion docker.compare_network foo bar
```

`salt.modules.dockermod.connect_container_to_network` (*container*, *net\_id*, *\*\*kwargs*)

New in version 2015.8.3.

Changed in version 2017.7.0: Support for `ipv4_address` argument added

Changed in version 2018.3.0: All arguments are now passed through to `connect_container_to_network()`, allowing for any new arguments added to this function to be supported automatically.

Connect container to network. See the `connect_container_to_network()` docs for information on supported arguments.

**container**

Container name or ID

**net\_id**

Network name or ID

CLI Examples:

```
salt myminion docker.connect_container_to_network web-1 mynet
salt myminion docker.connect_container_to_network web-1 mynet ipv4_
↪address=10.20.0.10
salt myminion docker.connect_container_to_network web-1
↪1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

`salt.modules.dockermod.connected` (*name*, *verbose*=False)

New in version 2018.3.0.

Return a list of running containers attached to the specified network

**name**

Network name

**verbose**

[False] If True, return extended info about each container (IP configuration, etc.)

CLI Example:

```
salt myminion docker.connected net_name
```

`salt.modules.dockermod.copy_from`(*name, source, dest, overwrite=False, makedirs=False*)

Copy a file from inside a container to the Minion

**name**

Container name

**source**

Path of the file on the container's filesystem

**dest**

Destination on the Minion. Must be an absolute path. If the destination is a directory, the file will be copied into that directory.

**overwrite**[False] Unless this option is set to True, then if a file exists at the location specified by the `dest` argument, an error will be raised.**makedirs**

[False] Create the parent directory on the container if it does not already exist.

**RETURN DATA**

A boolean (True if successful, otherwise False)

CLI Example:

```
salt myminion docker.copy_from mycontainer /var/log/nginx/access.log /  
↪home/myuser
```

`salt.modules.dockermod.copy_to`(*name, source, dest, exec\_driver=None, overwrite=False, makedirs=False*)

Copy a file from the host into a container

**name**

Container name

**source**

File to be copied to the container. Can be a local path on the Minion or a remote file from the Salt fileservers.

**dest**

Destination on the container. Must be an absolute path. If the destination is a directory, the file will be copied into that directory.

**exec\_driver**[None] If not passed, the execution driver will be detected as described *above*.**overwrite**[False] Unless this option is set to True, then if a file exists at the location specified by the `dest` argument, an error will be raised.

**makedirs**

[False] Create the parent directory on the container if it does not already exist.

**RETURN DATA**

A boolean (True if successful, otherwise False)

CLI Example:

```
salt myminion docker.copy_to mycontainer /tmp/foo /root/foo
```

`salt.modules.dockermod.cp`(*name, source, dest, overwrite=False, makedirs=False*)

This function is an alias of `copy_from`.

Copy a file from inside a container to the Minion

**name**

Container name

**source**

Path of the file on the container's filesystem

**dest**

Destination on the Minion. Must be an absolute path. If the destination is a directory, the file will be copied into that directory.

**overwrite**

[False] Unless this option is set to True, then if a file exists at the location specified by the `dest` argument, an error will be raised.

**makedirs**

[False] Create the parent directory on the container if it does not already exist.

**RETURN DATA**

A boolean (True if successful, otherwise False)

CLI Example:

```
salt myminion docker.copy_from mycontainer /var/log/nginx/access.  
→ log /home/myuser
```

`salt.modules.dockermod.create`(*image, name=None, start=False, skip\_translate=None, ignore\_collisions=False, validate\_ip\_addrs=True, client\_timeout=60, \*\*kwargs*)

Create a new container

**image**

Image from which to create the container

**name**

Name for the new container. If not provided, Docker will randomly generate one for you (it will be included in the return data).

**start**

[False] If True, start container after creating it

New in version 2018.3.0.

**skip\_translate**

This function translates Salt CLI or SLS input into the format which docker-py expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs

in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and *all* translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. An example of using this option to skip translation would be:

```
salt myminion docker.create image=centos:7.3.1611 skip_
↳translate=environment environment="{ 'FOO': 'bar' }"
```

See the following links for more information:

- [docker-py Low-level API](#)
- [Docker Engine API](#)

#### **ignore\_collisions**

[False] Since many of docker-py's arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument. However, if both the alias and the docker-py version of the same argument (e.g. `env` and `environment`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the docker-py version of the argument.

#### **validate\_ip\_addrs**

[True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`

#### **client\_timeout**

[60] Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

---

**Note:** This is only used if Salt needs to pull the requested image.

---

## CONTAINER CONFIGURATION ARGUMENTS

#### **auto\_remove (or *rm*)**

[False] Enable auto-removal of the container on daemon side when the container's process exits (analogous to running a docker container with `--rm` on the CLI).

Examples:

- `auto_remove=True`
- `rm=True`

#### **binds**

Files/directories to bind mount. Each bind mount should be passed in one of the following formats:

- `<host_path>:<container_path>` - `host_path` is mounted within the container as `container_path` with read-write access.
- `<host_path>:<container_path>:<selinux_context>` - `host_path` is mounted within the container as `container_path` with read-write access. Additionally, the specified selinux context will be set within the container.
- `<host_path>:<container_path>:<read_only>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined.

- `<host_path>:<container_path>:<read_only>,<selinux_context>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined. Additionally, the specified selinux context will be set within the container.

`<read_only>` can be either `rw` for read-write access, or `ro` for read-only access. When omitted, it is assumed to be read-write.

`<selinux_context>` can be `z` if the volume is shared between multiple containers, or `Z` if the volume should be private.

---

**Note:** When both `<read_only>` and `<selinux_context>` are specified, there must be a comma before `<selinux_context>`.

---

Binds can be expressed as a comma-separated list or a Python list, however in cases where both `ro/rw` and an selinux context are specified, the binds *must* be specified as a Python list.

Examples:

- `binds=/srv/www:/var/www:ro`
- `binds=/srv/www:/var/www:rw`
- `binds=/srv/www:/var/www`
- `binds=["/srv/www:/var/www:ro,Z"]`
- `binds=["/srv/www:/var/www:rw,Z"]`
- `binds=/srv/www:/var/www:Z`

---

**Note:** The second and third examples above are equivalent to each other, as are the last two examples.

---

#### **blkio\_weight**

Block IO weight (relative weight), accepts a weight value between 10 and 1000.

Example: `blkio_weight=100`

#### **blkio\_weight\_device**

Block IO weight (relative device weight), specified as a list of expressions in the format `PATH:WEIGHT`

Example: `blkio_weight_device=/dev/sda:100`

#### **cap\_add**

List of capabilities to add within the container. Can be passed as a comma-separated list or a Python list. Requires Docker 1.2.0 or newer.

Examples:

- `cap_add=SYS_ADMIN,MKNOD`
- `cap_add=["SYS_ADMIN, MKNOD"]`

#### **cap\_drop**

List of capabilities to drop within the container. Can be passed as a comma-separated string or a Python list. Requires Docker 1.2.0 or newer.

Examples:

- `cap_drop=SYS_ADMIN,MKNOD,`
- `cap_drop=["SYS_ADMIN, MKNOD"]`

**command (or *cmd*)**

Command to run in the container

Example: `command=bash` or `cmd=bash`

Changed in version 2015.8.1: `cmd` is now also accepted

**cpuset\_cpus (or *cpuset*)**

CPUs on which to allow execution, specified as a string containing a range (e.g. `0-3`) or a comma-separated list of CPUs (e.g. `0,1`).

Examples:

- `cpuset_cpus="0-3"`
- `cpuset="0,1"`

**cpuset\_mems**

Memory nodes on which to allow execution, specified as a string containing a range (e.g. `0-3`) or a comma-separated list of MEMs (e.g. `0,1`). Only effective on NUMA systems.

Examples:

- `cpuset_mems="0-3"`
- `cpuset_mems="0,1"`

**cpu\_group**

The length of a CPU period in microseconds

Example: `cpu_group=100000`

**cpu\_period**

Microseconds of CPU time that the container can get in a CPU period

Example: `cpu_period=50000`

**cpu\_shares**

CPU shares (relative weight), specified as an integer between 2 and 1024.

Example: `cpu_shares=512`

**detach**

[False] If True, run the container's command in the background (daemon mode)

Example: `detach=True`

**devices**

List of host devices to expose within the container

Examples:

- `devices="/dev/net/tun,/dev/xvda1:/dev/xvda1,/dev/xvdb1:/dev/xvdb1:r"`
- `devices="['/dev/net/tun', '/dev/xvda1:/dev/xvda1', '/dev/xvdb1:/dev/xvdb1:r']"`

**device\_read\_bps**

Limit read rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is either an integer number of bytes, or a string ending in `kb`, `mb`, or `gb`.

Examples:

- `device_read_bps="/dev/sda:1mb,/dev/sdb:5mb"`
- `device_read_bps="['/dev/sda:100mb', '/dev/sdb:5mb']"`

**device\_read\_iops**

Limit read rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations.

Examples:

- `device_read_iops="/dev/sda:1000,/dev/sdb:500"`
- `device_read_iops="['/dev/sda:1000', '/dev/sdb:500']"`

**device\_write\_bps**

Limit write rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is either an integer number of bytes, or a string ending in `kb`, `mb` or `gb`.

Examples:

- `device_write_bps="/dev/sda:100mb,/dev/sdb:50mb"`
- `device_write_bps="['/dev/sda:100mb', '/dev/sdb:50mb']"`

**device\_write\_iops**

Limit write rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations.

Examples:

- `device_write_iops="/dev/sda:1000,/dev/sdb:500"`
- `device_write_iops="['/dev/sda:1000', '/dev/sdb:500']"`

**dns**

List of DNS nameservers. Can be passed as a comma-separated list or a Python list.

Examples:

- `dns=8.8.8.8,8.8.4.4`
- `dns="['8.8.8.8', '8.8.4.4']"`

---

**Note:** To skip IP address validation, use `validate_ip_addrs=False`

---

**dns\_opt**

Additional options to be added to the container's `resolv.conf` file

Example: `dns_opt=ndots:9`

**dns\_search**

List of DNS search domains. Can be passed as a comma-separated list or a Python list.

Examples:

- `dns_search=foo1.domain.tld,foo2.domain.tld`
- `dns_search=["foo1.domain.tld, foo2.domain.tld"]`

**domainname**

The domain name to use for the container

Example: `domainname=domain.tld`

**entrypoint**

Entrypoint for the container. Either a string (e.g. `"mycmd --arg1 --arg2"`) or a Python list (e.g. `"['mycmd', '--arg1', '--arg2']"`)

Examples:

- `entrypoint="cat access.log"`
- `entrypoint=["'cat', 'access.log']"`

**environment (or *env*)**

Either a dictionary of environment variable names and their values, or a Python list of strings in the format `VARNAME=value`.

Examples:

- `environment='VAR1=value,VAR2=value'`
- `environment=["'VAR1=value', 'VAR2=value']"`
- `environment="{ 'VAR1': 'value', 'VAR2': 'value' }"`

**extra\_hosts**

Additional hosts to add to the container's `/etc/hosts` file. Can be passed as a comma-separated list or a Python list. Requires Docker 1.3.0 or newer.

Examples:

- `extra_hosts=web1:10.9.8.7,web2:10.9.8.8`
- `extra_hosts=["'web1:10.9.8.7', 'web2:10.9.8.8']"`
- `extra_hosts="{ 'web1': '10.9.8.7', 'web2': '10.9.8.8' }"`

---

**Note:** To skip IP address validation, use `validate_ip_addrs=False`

---

**group\_add**

List of additional group names and/or IDs that the container process will run as

Examples:

- `group_add=web,network`
- `group_add=["'web', 'network']"`

**hostname**

Hostname of the container. If not provided, and if a name has been provided, the `hostname` will default to the name that was passed.

Example: `hostname=web1`

**Warning:** If the container is started with `network_mode=host`, the `hostname` will be overridden by the `hostname` of the Minion.

**interactive (or *stdin\_open*): False**

Leave `stdin` open, even if not attached

Examples:

- `interactive=True`
- `stdin_open=True`

**ipc\_mode (or *ipc*)**

Set the IPC mode for the container. The default behavior is to create a private IPC namespace for the container, but this option can be used to change that behavior:

- `container:<container_name_or_id>` reuses another container shared memory, semaphores and message queues
- `host`: use the host's shared memory, semaphores and message queues

Examples:

- `ipc_mode=container:foo`
- `ipc=host`

**Warning:** Using `host` gives the container full access to local shared memory and is therefore considered insecure.

### isolation

Specifies the type of isolation technology used by containers

Example: `isolation=hyperv`

---

**Note:** The default value on Windows server is `process`, while the default value on Windows client is `hyperv`. On Linux, only `default` is supported.

---

### labels (or *label*)

Add metadata to the container. Labels can be set both with and without values:

Examples:

- `labels=foo,bar=baz`
- `labels=["'foo', 'bar=baz']"`

Changed in version 2018.3.0: Labels both with and without values can now be mixed. Earlier releases only permitted one method or the other.

### links

Link this container to another. Links should be specified in the format `<container_name_or_id>:<link_alias>`. Multiple links can be passed, either as a comma separated list or a Python list.

Examples:

- `links=web1:link1,web2:link2,`
- `links=["'web1:link1', 'web2:link2']"`
- `links={'web1': 'link1', 'web2': 'link2'}"`

### log\_driver

Set container's logging driver. Requires Docker 1.6 or newer.

Example:

- `log_driver=syslog`

---

**Note:** The logging driver feature was improved in Docker 1.13 introducing option name changes. Please see Docker's [Configure logging drivers](#) documentation for more information.

---

### log\_opt

Config options for the `log_driver` config option. Requires Docker 1.6 or newer.

Example:

- `log_opt="syslog-address=tcp://192.168.0.42,syslog-facility=daemon"`
- `log_opt="['syslog-address=tcp://192.168.0.42', 'syslog-facility=daemon']"`
- `log_opt="{ 'syslog-address': 'tcp://192.168.0.42', 'syslog-facility': 'daemon' }"`

#### **lxc\_conf**

Additional LXC configuration parameters to set before starting the container.

Examples:

- `lxc_conf="lxc.utsname=docker,lxc.arch=x86_64"`
- `lxc_conf="['lxc.utsname=docker', 'lxc.arch=x86_64']"`
- `lxc_conf="{ 'lxc.utsname': 'docker', 'lxc.arch': 'x86_64' }"`

---

**Note:** These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has been deprecated for some time.

---

#### **mac\_address**

MAC address to use for the container. If not specified, a random MAC address will be used.

Example: `mac_address=01:23:45:67:89:0a`

#### **mem\_limit (or *memory*)**

[0] Memory limit. Can be specified in bytes or using single-letter units (i.e. 512M, 2G, etc.). A value of 0 (the default) means no memory limit.

Examples:

- `mem_limit=512M`
- `memory=1073741824`

#### **mem\_swappiness**

Tune a container's memory swappiness behavior. Accepts an integer between 0 and 100.

Example: `mem_swappiness=60`

#### **memswap\_limit (or *memory\_swap*)**

[-1] Total memory limit (memory plus swap). Set to -1 to disable swap. A value of 0 means no swap limit.

Examples:

- `memswap_limit=1G`
- `memory_swap=2147483648`

#### **network\_disabled**

[False] If True, networking will be disabled within the container

Example: `network_disabled=True`

#### **network\_mode**

[bridge] One of the following:

- `bridge` - Creates a new network stack for the container on the docker bridge

- `none` - No networking (equivalent of the Docker CLI argument `--net=none`). Not to be confused with Python's `None`.
- `container:<name_or_id>` - Reuses another container's network stack
- `host` - Use the host's network stack inside the container

**Warning:** Using `host` mode gives the container full access to the hosts system's services (such as D-Bus), and is therefore considered insecure.

Examples:

- `network_mode=null`
- `network_mode=container:web1`

#### **oom\_kill\_disable**

Whether to disable OOM killer

Example: `oom_kill_disable=False`

#### **oom\_score\_adj**

An integer value containing the score given to the container in order to tune OOM killer preferences

Example: `oom_score_adj=500`

#### **pid\_mode**

Set to `host` to use the host container's PID namespace within the container. Requires Docker 1.5.0 or newer.

Example: `pid_mode=host`

#### **pids\_limit**

Set the container's PID limit. Set to `-1` for unlimited.

Example: `pids_limit=2000`

#### **port\_bindings (or *publish*)**

Bind exposed ports which were exposed using the `ports` argument to `docker.create`. These should be passed in the same way as the `--publish` argument to the `docker run` CLI command:

- `ip:hostPort:containerPort` - Bind a specific IP and port on the host to a specific port within the container.
- `ip::containerPort` - Bind a specific IP and an ephemeral port to a specific port within the container.
- `hostPort:containerPort` - Bind a specific port on all of the host's interfaces to a specific port within the container.
- `containerPort` - Bind an ephemeral port on all of the host's interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or passed as a Python list. The below two examples are equivalent:

- `port_bindings="5000:5000,2123:2123/udp,8080"`
- `port_bindings="['5000:5000', '2123:2123/udp', 8080]"`

Port bindings can also include ranges:

- `port_bindings="14505-14506:4505-4506"`

---

**Note:** When specifying a protocol, it must be passed in the `containerPort` value, as seen in the examples above.

---

#### **ports**

A list of ports to expose on the container. Can be passed as comma-separated list or a Python list. If the protocol is omitted, the port will be assumed to be a TCP port.

Examples:

- `ports=1111,2222/udp`
- `ports="[1111, '2222/udp']"`

#### **privileged**

[False] If `True`, runs the `exec` process with extended privileges

Example: `privileged=True`

#### **publish\_all\_ports (or *publish\_all*): False**

Publish all ports to the host

Example: `publish_all_ports=True`

#### **read\_only**

[False] If `True`, mount the container's root filesystem as read only

Example: `read_only=True`

#### **restart\_policy (or *restart*)**

Set a restart policy for the container. Must be passed as a string in the format `policy[:retry_count]` where `policy` is one of `always`, `unless-stopped`, or `on-failure`, and `retry_count` is an optional limit to the number of retries. The retry count is ignored when using the `always` or `unless-stopped` restart policy.

Examples:

- `restart_policy=on-failure:5`
- `restart_policy=always`

#### **security\_opt**

Security configuration for MLS systems such as SELinux and AppArmor. Can be passed as a comma-separated list or a Python list.

Examples:

- `security_opt=apparmor:unconfined,param2:value2`
- `security_opt=['"apparmor:unconfined", "param2:value2"]'`

---

**Important:** Some security options can contain commas. In these cases, this argument *must* be passed as a Python list, as splitting by comma will result in an invalid configuration.

---

---

**Note:** See the documentation for `security_opt` at <https://docs.docker.com/engine/reference/run/#security-configuration>

---

#### **shm\_size**

Size of `/dev/shm`

Example: `shm_size=128M`

#### **stop\_signal**

The signal used to stop the container. The default is SIGTERM.

Example: `stop_signal=SIGRTMIN+3`

#### **stop\_timeout**

Timeout to stop the container, in seconds

Example: `stop_timeout=5`

#### **storage\_opt**

Storage driver options for the container

Examples:

- `storage_opt='dm.basesize=40G'`
- `storage_opt="['dm.basesize=40G']"`
- `storage_opt="{ 'dm.basesize': '40G' }"`

#### **sysctls (or *sysctl*)**

Set sysctl options for the container

Examples:

- `sysctl='fs.nr_open=1048576, kernel.pid_max=32768'`
- `sysctls="['fs.nr_open=1048576', 'kernel.pid_max=32768']"`
- `sysctls="{ 'fs.nr_open': '1048576', 'kernel.pid_max': '32768' }"`

#### **tmpfs**

A map of container directories which should be replaced by tmpfs mounts, and their corresponding mount options. Can be passed as Python list of PATH:VALUE mappings, or a Python dictionary. However, since commas usually appear in the values, this option *cannot* be passed as a comma-separated list.

Examples:

- `tmpfs="['/run:rw,noexec,nosuid,size=65536k', '/var/lib/mysql:rw,noexec,nosuid,size=600m']"`
- `tmpfs="{ '/run': 'rw,noexec,nosuid,size=65536k', '/var/lib/mysql': 'rw,noexec,nosuid,size=600m' }"`

#### **tty**

[False] Attach TTYS

Example: `tty=True`

#### **ulimits (or *ulimit*)**

List of ulimits. These limits should be passed in the format `<ulimit_name>:<soft_limit>:<hard_limit>`, with the hard limit being optional. Can be passed as a comma-separated list or a Python list.

Examples:

- `ulimits="nofile=1024:1024,nproc=60"`
- `ulimits="['nofile=1024:1024', 'nproc=60']"`

**user**

User under which to run exec process

Example: `user=foo`

**usersns\_mode (or *user\_ns\_mode*)**

Sets the user namespace mode, when the user namespace remapping option is enabled.

Example: `usersns_mode=host`

**volumes (or *volume*)**

List of directories to expose as volumes. Can be passed as a comma-separated list or a Python list.

Examples:

- `volumes=/mnt/vol1,/mnt/vol2`
- `volume=["/mnt/vol1", "/mnt/vol2"]`

**volumes\_from**

Container names or IDs from which the container will get volumes. Can be passed as a comma-separated list or a Python list.

Example: `volumes_from=foo, volumes_from=foo,bar, volumes_from=["foo, bar"]`

**volume\_driver**

Sets the container's volume driver

Example: `volume_driver=foobar`

**working\_dir (or *workdir*)**

Working directory inside the container

Examples:

- `working_dir=/var/log/nginx`
- `workdir=/var/www/myapp`

**RETURN DATA**

A dictionary containing the following keys:

- `Id` - ID of the newly-created container
- `Name` - Name of the newly-created container

CLI Example:

```
# Create a data-only container
salt myminion docker.create myuser/mycontainer volumes="/mnt/vol1,/mnt/
→vol2"
# Create a CentOS 7 container that will stay running once started
salt myminion docker.create centos:7 name=mycent7 interactive=True
→tty=True command=bash
```

`salt.modules.dockermod.create_network`(*name*, *skip\_translate=None*, *ignore\_collisions=False*, *validate\_ip\_addrs=True*, *client\_timeout=60*, *\*\*kwargs*)

Changed in version 2018.3.0: Support added for network configuration options other than driver and driver\_opts, as well as IPAM configuration.

Create a new network

---

**Note:** This function supports all arguments for network and IPAM pool configuration which are available for the release of docker-py installed on the minion. For that reason, the arguments described below in the *NETWORK CONFIGURATION ARGUMENTS* and *IP ADDRESS MANAGEMENT (IPAM)* sections may not accurately reflect what is available on the minion. The `docker.get_client_args` function can be used to check the available arguments for the installed version of docker-py (they are found in the `network_config` and `ipam_config` sections of the return data), but Salt will not prevent a user from attempting to use an argument which is unsupported in the release of Docker which is installed. In those cases, network creation be attempted but will fail.

---

**name**

Network name

**skip\_translate**

This function translates Salt CLI or SLS input into the format which docker-py expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and *all* translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. See the following links for more information:

- [docker-py Low-level API](#)
- [Docker Engine API](#)

New in version 2018.3.0.

**ignore\_collisions**

[False] Since many of docker-py's arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument. However, if both the alias and the docker-py version of the same argument (e.g. `options` and `driver_opts`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the docker-py version of the argument.

New in version 2018.3.0.

**validate\_ip\_addrs**

[True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`

---

**Note:** When validating subnets, whether or not the IP portion of the subnet is a valid subnet boundary will not be checked. The IP will portion will be validated, and the subnet size will be checked to confirm it is a valid number (1-32 for IPv4, 1-128 for IPv6).

---

New in version 2018.3.0.

**NETWORK CONFIGURATION ARGUMENTS****driver**

Network driver

Example: `driver=macvlan`

**driver\_opts (or *driver\_opt*, or *options*)**

Options for the network driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`.

Examples:

- `driver_opts='macvlan_mode=bridge,parent=eth0'`
- `driver_opts=['macvlan_mode=bridge', 'parent=eth0']`
- `driver_opts={'macvlan_mode': 'bridge', 'parent': 'eth0'}`

**check\_duplicate**

[True] If True, checks for networks with duplicate names. Since networks are primarily keyed based on a random ID and not on the name, and network name is strictly a user-friendly alias to the network which is uniquely identified using ID, there is no guaranteed way to check for duplicates. This option provides a best effort, checking for any networks which have the same name, but it is not guaranteed to catch all name collisions.

Example: `check_duplicate=False`

**internal**

[False] If True, restricts external access to the network

Example: `internal=True`

**labels**

Add metadata to the network. Labels can be set both with and without values:

Examples (*with* values):

- `labels="label1=value1,label2=value2"`
- `labels=['label1=value1', 'label2=value2']`
- `labels={'label1': 'value1', 'label2': 'value2'}`

Examples (*without* values):

- `labels=label1,label2`
- `labels=['label1', 'label2']`

**enable\_ipv6 (or *ipv6*)**

[False] Enable IPv6 on the network

Example: `enable_ipv6=True`

---

**Note:** While it should go without saying, this argument must be set to True to *configure an IPv6 subnet*. Also, if this option is turned on without an IPv6 subnet explicitly configured, you will get an error unless you have set up a fixed IPv6 subnet. Consult the [Docker IPv6 docs](#) for information on how to do this.

---

**attachable**

[False] If True, and the network is in the global scope, non-service containers on worker nodes will be able to connect to the network.

Example: `attachable=True`

---

**Note:** While support for this option was added in API version 1.24, its value was not added to the inspect results until API version 1.26. The version of Docker which is available for CentOS 7 runs API version

1.24, meaning that while Salt can pass this argument to the API, it has no way of knowing the value of this config option in an existing Docker network.

**scope**

Specify the network's scope (`local`, `global` or `swarm`)

Example: `scope=local`

**ingress**

[False] If `True`, create an ingress network which provides the routing-mesh in swarm mode

Example: `ingress=True`

**IP ADDRESS MANAGEMENT (IPAM)**

This function supports networks with either IPv4, or both IPv4 and IPv6. If configuring IPv4, then you can pass the IPAM arguments as shown below, as individual arguments on the Salt CLI. However, if configuring IPv4 and IPv6, the arguments must be passed as a list of dictionaries, in the `ipam_pools` argument. See the **CLI Examples** below. [These docs](#) also have more information on these arguments.

*IPAM ARGUMENTS***ipam\_driver**

IPAM driver to use, if different from the default one

Example: `ipam_driver=foo`

**ipam\_opts**

Options for the IPAM driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`.

Examples:

- `ipam_opts='foo=bar,baz=qux'`
- `ipam_opts="['foo=bar', 'baz=quz']"`
- `ipam_opts="{ 'foo': 'bar', 'baz': 'qux' }"`

*IPAM POOL ARGUMENTS***subnet**

Subnet in CIDR format that represents a network segment

Example: `subnet=192.168.50.0/25`

**iprange (or *ip\_range*)**

Allocate container IP from a sub-range within the subnet

Subnet in CIDR format that represents a network segment

Example: `iprange=192.168.50.64/26`

**gateway**

IPv4 gateway for the master subnet

Example: `gateway=192.168.50.1`

**aux\_addresses (or *aux\_address*)**

A dictionary of mapping container names to IP addresses which should be allocated for them should they connect to the network. Either a dictionary of option names and values or a Python list of strings in the format `host=ipaddr`.

Examples:

- `aux_addresses='foo.bar.tld=192.168.50.10,hello.world.tld=192.168.50.11'`
- `aux_addresses="['foo.bar.tld=192.168.50.10', 'hello.world.tld=192.168.50.11']"`
- `aux_addresses="{ 'foo.bar.tld': '192.168.50.10', 'hello.world.tld': '192.168.50.11' }"`

CLI Examples:

```
salt myminion docker.create_network web_network driver=bridge
# IPv4
salt myminion docker.create_network macvlan_network driver=macvlan driver_
↳opts="{ 'parent': 'eth0' }" gateway=172.20.0.1 subnet=172.20.0.0/24
# IPv4 and IPv6
salt myminion docker.create_network mynet ipam_pools='[{"subnet": "10.0.0.
↳0/24", "gateway": "10.0.0.1"}, {"subnet": "fe3f:2180:26:1::60/123",
↳"gateway": "fe3f:2180:26:1::61"}]'
```

`salt.modules.dockermod.create_volume` (*name*, *driver=None*, *driver\_opts=None*)

Create a new volume

New in version 2015.8.4.

**name**

name of volume

**driver**

Driver of the volume

**driver\_opts**

Options for the driver volume

CLI Example:

```
salt myminion docker.create_volume my_volume driver=local
```

`salt.modules.dockermod.dangling` (*prune=False*, *force=False*)

Return top-level images (those on which no other images depend) which do not have a tag assigned to them. These include:

- Images which were once tagged but were later untagged, such as those which were superseded by committing a new copy of an existing tagged image.
- Images which were loaded using `docker.load` (or the `docker load` Docker CLI command), but not tagged.

**prune**

[False] Remove these images

**force**

[False] If True, and if `prune=True`, then forcibly remove these images.

**RETURN DATA**

If `prune=False`, the return data will be a list of dangling image IDs.

If `prune=True`, the return data will be a dictionary with each key being the ID of the dangling image, and the following information for each image:

- Comment - Any error encountered when trying to prune a dangling image  
(Only present if prune failed)
- Removed - A boolean (True if prune was successful, False if not)

CLI Example:

```
salt myminion docker.dangling
salt myminion docker.dangling prune=True
```

`salt.modules.dockermod.depends`(*name*)

Returns the containers and images, if any, which depend on the given image

**name**

Name or ID of image

**RETURN DATA**

A dictionary containing the following keys:

- Containers - A list of containers which depend on the specified image
- Images - A list of IDs of images which depend on the specified image

CLI Example:

```
salt myminion docker.depends myimage
salt myminion docker.depends 0123456789ab
```

`salt.modules.dockermod.diff`(*name*)

Get information on changes made to container's filesystem since it was created. Equivalent to running the `docker diff` Docker CLI command.

**name**

Container name or ID

**RETURN DATA**

A dictionary containing any of the following keys:

- Added - A list of paths that were added.
- Changed - A list of paths that were changed.
- Deleted - A list of paths that were deleted.

These keys will only be present if there were changes, so if the container has no differences the return dict will be empty.

CLI Example:

```
salt myminion docker.diff mycontainer
```

`salt.modules.dockermod.disconnect_all_containers_from_network`(*network\_id*)

New in version 2018.3.0.

Runs `docker.disconnect_container_from_network` on all containers connected to the specified network, and returns the names of all containers that were disconnected.

**network\_id**

Network name or ID

CLI Examples:

```
salt myminion docker.disconnect_all_containers_from_network mynet
salt myminion docker.disconnect_all_containers_from_network
→1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abacc21e14f7f014f729b2bc
```

`salt.modules.dockermod.disconnect_container_from_network`(*container*, *network\_id*)

New in version 2015.8.3.

Disconnect container from network

**container**

Container name or ID

**network\_id**

Network name or ID

CLI Examples:

```
salt myminion docker.disconnect_container_from_network web-1 mynet
salt myminion docker.disconnect_container_from_network web-1
→1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abacc21e14f7f014f729b2bc
```

`salt.modules.dockermod.exists`(*name*)

Check if a given container exists

**name**

Container name or ID

**RETURN DATA**

A boolean (True if the container exists, otherwise False)

CLI Example:

```
salt myminion docker.exists mycontainer
```

`salt.modules.dockermod.export`(*name*, *path*, *overwrite=False*, *makedirs=False*, *compression=None*, *\*\*kwargs*)

Exports a container to a tar archive. It can also optionally compress that tar archive, and push it up to the Master.

**name**

Container name or ID

**path**

Absolute path on the Minion where the container will be exported

**overwrite**

[False] Unless this option is set to True, then if a file exists at the location specified by the `path` argument, an error will be raised.

**makedirs**

[False] If True, then if the parent directory of the file specified by the `path` argument does not exist, Salt will attempt to create it.

**compression**

[None] Can be set to any of the following:

- `gzip` or `gz` for gzip compression
- `bzip2` or `bz2` for bzip2 compression

- `xz` or `lzma` for XZ compression (requires `xz-utils`, as well as the `lzma` module from Python 3.3, available in Python 2 and Python 3.0-3.2 as `backports.lzma`)

This parameter can be omitted and Salt will attempt to determine the compression type by examining the filename passed in the `path` parameter.

#### push

[False] If True, the container will be pushed to the master using `cp.push`.

---

**Note:** This requires `file_recv` to be set to True on the Master.

---

#### RETURN DATA

A dictionary will containing the following keys:

- `Path` - Path of the file that was exported
- `Push` - Reports whether or not the file was successfully pushed to the Master  
(Only present if `push=True`)
- `Size` - Size of the file, in bytes
- `Size_Human` - Size of the file, in human-readable units
- `Time_Elapsed` - Time in seconds taken to perform the export

CLI Examples:

```
salt myminion docker.export mycontainer /tmp/mycontainer.tar
salt myminion docker.export mycontainer /tmp/mycontainer.tar.xz push=True
```

`salt.modules.dockermod.freeze(name)`

This function is an alias of `pause`.

Pauses a container

#### name

Container name or ID

#### RETURN DATA

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `comment` - Only present if the container cannot be paused

CLI Example:

```
salt myminion docker.pause mycontainer
```

`salt.modules.dockermod.get_client_args(limit=None)`

New in version 2016.3.6,2016.11.4,2017.7.0.

Changed in version 2017.7.0: Replaced the container config args with the ones from the API's `create_container` function.

Changed in version 2018.3.0: Added ability to limit the input to specific client functions

Many functions in Salt have been written to support the full list of arguments for a given function in the `docker-py Low-level API`. However, depending on the version of `docker-py` installed on the minion, the available arguments may differ. This function will get the arguments for various functions in the installed version of `docker-py`, to be used as a reference.

#### limit

An optional list of categories for which to limit the return. This is useful if only a specific set of arguments is desired, and also keeps other function's argspecs from needlessly being examined.

#### AVAILABLE LIMITS

- `create_container` - arguments accepted by `create_container()` (used by `docker.create`)
- `host_config` - arguments accepted by `create_host_config()` (used to build the host config for `docker.create`)
- `connect_container_to_network` - arguments used by `connect_container_to_network()` to construct an endpoint config when connecting to a network (used by `docker.connect_container_to_network`)
- `create_network` - arguments accepted by `create_network()` (used by `docker.create_network`)
- `ipam_config` - arguments used to create an IPAM pool (used by `docker.create_network` in the process of constructing an IPAM config dictionary)

CLI Example:

```
salt myminion docker.get_client_args
salt myminion docker.get_client_args logs
salt myminion docker.get_client_args create_container,connect_container_
→to_network
```

`salt.modules.dockermod.highstate` (*name*, *saltenv='base'*, *\*\*kwargs*)

Apply a highstate to the running container

New in version 2019.2.0.

The container does not need to have Salt installed, but Python is required.

#### name

Container name or ID

#### saltenv

[base] Specify the environment from which to retrieve the SLS indicated by the *mods* parameter.

CLI Example:

```
salt myminion docker.highstate compassionate_mirzakhani
```

`salt.modules.dockermod.history` (*name*, *quiet=False*)

Return the history for an image. Equivalent to running the `docker history` Docker CLI command.

#### name

Container name or ID

#### quiet

[False] If True, the return data will simply be a list of the commands run to build the container.

```
$ salt myminion docker.history nginx:latest quiet=True
myminion:
  - FROM scratch
```

(continues on next page)

(continued from previous page)

```

- ADD

- echo "deb http://nginx.org/packages/mainline/debian/ wheezy
→ nginx" >> /etc/apt/sources.list
- ENV NGINX_VERSION=1.7.10-1~wheezy
- apt-get update && apt-get install -y ca-certificates nginx=$
→ {NGINX_VERSION} && rm -rf /var/lib/apt/lists/*
- ln -sf /dev/stdout /var/log/nginx/access.log
- ln -sf /dev/stderr /var/log/nginx/error.log
- VOLUME [/var/cache/nginx]
- EXPOSE map[80/tcp:{}] 443/tcp:{}]
- CMD [nginx -g daemon off;]
https://github.com/saltstack/salt/pull/22421

```

## RETURN DATA

If `quiet=False`, the return value will be a list of dictionaries containing information about each step taken to build the image. The keys in each step include the following:

- `Command` - The command executed in this build step
- `Id` - Layer ID
- `Size` - Cumulative image size, in bytes
- `Size_Human` - Cumulative image size, in human-readable units
- `Tags` - Tag(s) assigned to this layer
- `Time_Created_Epoch` - Time this build step was completed (Epoch time)
- `Time_Created_Local` - Time this build step was completed (Minion's local timezone)

CLI Example:

```
salt myminion docker.exists mycontainer
```

`salt.modules.dockermod.images` (*verbose=False*, *\*\*kwargs*)

Returns information about the Docker images on the Minion. Equivalent to running the `docker images` Docker CLI command.

**all**

[False] If True, untagged images will also be returned

**verbose**

[False] If True, a `docker inspect` will be run on each image returned.

## RETURN DATA

A dictionary with each key being an image ID, and each value some general info about that image (time created, size, tags associated with the image, etc.)

CLI Example:

```
salt myminion docker.images
salt myminion docker.images all=True
```

`salt.modules.dockermod.import_` (*source*, *repository*, *tag*='latest', *api\_response*=False)

Changed in version 2018.3.0: The repository and tag must now be passed separately using the `repository` and `tag` arguments, rather than together in the (now deprecated) `image` argument.

Imports content from a local tarball or a URL as a new docker image

**source**

Content to import (URL or absolute path to a tarball). URL can be a file on the Salt fileservers (i.e. `salt:/path/to/rootfs/tarball.tar.xz`). To import a file from a saltenv other than `base` (e.g. `dev`), pass it at the end of the URL (ex. `salt://path/to/rootfs/tarball.tar.xz?saltenv=dev`).

**repository**

Repository name for the image being imported

New in version 2018.3.0.

**tag**

[latest] Tag name for the image

New in version 2018.3.0.

**image**

Deprecated since version 2018.3.0: Use both `repository` and `tag` instead

**api\_response**

[False] If True an `api_response` key will be present in the return data, containing the raw output from the Docker API.

**RETURN DATA**

A dictionary containing the following keys:

- `Id` - ID of the newly-created image
- `Image` - Name of the newly-created image
- `Time_Elapsed` - Time in seconds taken to perform the commit

CLI Example:

```
salt myminion docker.import /tmp/cent7-minimal.tar.xz myuser/centos
salt myminion docker.import /tmp/cent7-minimal.tar.xz myuser/centos:7
salt myminion docker.import salt://dockerimages/cent7-minimal.tar.xz
→myuser/centos:7
```

`salt.modules.dockermod.info`()

Returns a dictionary of system-wide information. Equivalent to running the `docker info` Docker CLI command.

CLI Example:

```
salt myminion docker.info
```

`salt.modules.dockermod.inspect` (*name*)

Changed in version 2017.7.0: Volumes and networks are now checked, in addition to containers and images.

This is a generic container/image/volume/network inspecton function. It will run the following functions in order:

- `docker.inspect_container`
- `docker.inspect_image`
- `docker.inspect_volume`
- `docker.inspect_network`

The first of these to find a match will be returned.

**name**

Container/image/volume/network name or ID

**RETURN DATA**

A dictionary of container/image/volume/network information

CLI Example:

```
salt myminion docker.inspect mycontainer
salt myminion docker.inspect busybox
```

`salt.modules.dockermod.inspect_container`(*name*)

Retrieves container information. Equivalent to running the `docker inspect` Docker CLI command, but will only look for container information.

**name**

Container name or ID

**RETURN DATA**

A dictionary of container information

CLI Example:

```
salt myminion docker.inspect_container mycontainer
salt myminion docker.inspect_container 0123456789ab
```

`salt.modules.dockermod.inspect_image`(*name*)

Retrieves image information. Equivalent to running the `docker inspect` Docker CLI command, but will only look for image information.

---

**Note:** To inspect an image, it must have been pulled from a registry or built locally. Images on a Docker registry which have not been pulled cannot be inspected.

---

**name**

Image name or ID

**RETURN DATA**

A dictionary of image information

CLI Examples:

```
salt myminion docker.inspect_image busybox
salt myminion docker.inspect_image centos:6
salt myminion docker.inspect_image 0123456789ab
```

`salt.modules.dockermod.inspect_network(network_id)`

Inspect Network

**network\_id**

ID of network

CLI Example:

```
salt myminion docker.inspect_network
→ 1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

`salt.modules.dockermod.inspect_volume(name)`

Inspect Volume

New in version 2015.8.4.

**name**

Name of volume

CLI Example:

```
salt myminion docker.inspect_volume my_volume
```

`salt.modules.dockermod.kill(name)`

Kill all processes in a running container instead of performing a graceful shutdown

**name**

Container name or ID

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container cannot be killed

CLI Example:

```
salt myminion docker.kill mycontainer
```

`salt.modules.dockermod.layers(name)`

Returns a list of the IDs of layers belonging to the specified image, with the top-most layer (the one corresponding to the passed name) appearing last.

**name**

Image name or ID

CLI Example:

```
salt myminion docker.layers centos:7
```

`salt.modules.dockermod.list_containers(**kwargs)`

Returns a list of containers by name. This is different from `docker.ps` in that `docker.ps` returns its results organized by container ID.

**all**

[False] If True, stopped containers will be included in return data

CLI Example:

```
salt myminion docker.list_containers
```

`salt.modules.dockermod.list_tags()`

Returns a list of tagged images

CLI Example:

```
salt myminion docker.list_tags
```

`salt.modules.dockermod.load(path, repository=None, tag=None)`

Changed in version 2018.3.0: If the loaded image should be tagged, then the repository and tag must now be passed separately using the `repository` and `tag` arguments, rather than together in the (now deprecated) `image` argument.

Load a tar archive that was created using `docker.save` (or via the Docker CLI using `docker save`).

#### path

Path to docker tar archive. Path can be a file on the Minion, or the URL of a file on the Salt fileserver (i.e. `salt://path/to/docker/saved/image.tar`). To load a file from a saltenv other than base (e.g. `dev`), pass it at the end of the URL (ex. `salt://path/to/rootfs/tarball.tar.xz?saltenv=dev`).

#### repository

If specified, the topmost layer of the newly-loaded image will be tagged with the specified repo using `docker.tag`. If a repository name is provided, then the `tag` argument is also required.

New in version 2018.3.0.

#### tag

Tag name to go along with the repository name, if the loaded image is to be tagged.

New in version 2018.3.0.

#### image

Deprecated since version 2018.3.0: Use both `repository` and `tag` instead

#### RETURN DATA

A dictionary will be returned, containing the following keys:

- `Path` - Path of the file that was saved
- `Layers` - A list containing the IDs of the layers which were loaded. Any layers in the file that was loaded, which were already present on the Minion, will not be included.
- `Image` - Name of tag applied to topmost layer  
(Only present if tag was specified and tagging was successful)
- `Time_Elapsed` - Time in seconds taken to load the file
- `Warning` - Message describing any problems encountered in attempt to tag the topmost layer  
(Only present if tag was specified and tagging failed)

CLI Example:

```
salt myminion docker.load /path/to/image.tar
salt myminion docker.load salt://path/to/docker/saved/image.tar
→ repository=myuser/myimage tag=mytag
```

**salt.modules.dockermod.login**(\*registries)

New in version 2016.3.7,2016.11.4,2017.7.0.

Performs a `docker login` to authenticate to one or more configured repositories. See the documentation at the top of this page to configure authentication credentials.

Multiple registry URLs (matching those configured in Pillar) can be passed, and Salt will attempt to login to *just* those registries. If no registry URLs are provided, Salt will attempt to login to *all* configured registries.

**RETURN DATA**

A dictionary containing the following keys:

- **Results** - A dictionary mapping registry URLs to the authentication result. `True` means a successful login, `False` means a failed login.
- **Errors** - A list of errors encountered during the course of this function.

CLI Example:

```
salt myminion docker.login
salt myminion docker.login hub
salt myminion docker.login hub https://mydomain.tld/registry/
```

**salt.modules.dockermod.logout**(\*registries)

New in version 3001.

Performs a `docker logout` to remove the saved authentication details for one or more configured repositories.

Multiple registry URLs (matching those configured in Pillar) can be passed, and Salt will attempt to logout of *just* those registries. If no registry URLs are provided, Salt will attempt to logout of *all* configured registries.

**RETURN DATA**

A dictionary containing the following keys:

- **Results** - A dictionary mapping registry URLs to the authentication result. `True` means a successful logout, `False` means a failed logout.
- **Errors** - A list of errors encountered during the course of this function.

CLI Example:

```
salt myminion docker.logout
salt myminion docker.logout hub
salt myminion docker.logout hub https://mydomain.tld/registry/
```

**salt.modules.dockermod.logs**(name, \*\*kwargs)

Changed in version 2018.3.0: Support for all of `docker-py`'s `logs()` function's arguments, with the exception of `stream`.

Returns the logs for the container. An interface to `docker-py`'s `logs()` function.

**name**

Container name or ID

**stdout**

[True] Return stdout lines

**stderr**

[True] Return stdout lines

**timestamps**

[False] Show timestamps

**tail**

[all] Output specified number of lines at the end of logs. Either an integer number of lines or the string `all`.

**since**

Show logs since the specified time, passed as a UNIX epoch timestamp. Optionally, if `timelib` is installed on the minion the timestamp can be passed as a string which will be resolved to a date using `timelib.strptime()`.

**follow**

[False] If `True`, this function will block until the container exits and return the logs when it does. The default behavior is to return what is in the log at the time this function is executed.

CLI Examples:

```
# All logs
salt myminion docker.logs mycontainer
# Last 100 lines of log
salt myminion docker.logs mycontainer tail=100
# Just stderr
salt myminion docker.logs mycontainer stdout=False
# Logs since a specific UNIX timestamp
salt myminion docker.logs mycontainer since=1511688459
# Flexible format for "since" argument (requires timelib)
salt myminion docker.logs mycontainer since='1 hour ago'
salt myminion docker.logs mycontainer since='1 week ago'
salt myminion docker.logs mycontainer since='1 fortnight ago'
```

`salt.modules.dockermod.networks` (*names=None, ids=None*)

Changed in version 2017.7.0: The `names` and `ids` can be passed as a comma-separated list now, as well as a Python list.

Changed in version 2018.3.0: The `Containers` key for each network is no longer always empty.

List existing networks

**names**

Filter by name

**ids**

Filter by id

CLI Example:

```
salt myminion docker.networks names=network-web
salt myminion docker.networks
→ ids=1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

`salt.modules.dockermod.pause` (*name*)

Pauses a container

**name**

Container name or ID

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `comment` - Only present if the container cannot be paused

CLI Example:

```
salt myminion docker.pause mycontainer
```

`salt.modules.dockermod.pid`(*name*)

Returns the PID of a container

**name**

Container name or ID

CLI Example:

```
salt myminion docker.pid mycontainer
salt myminion docker.pid 0123456789ab
```

`salt.modules.dockermod.port`(*name*, *private\_port=None*)

Returns port mapping information for a given container. Equivalent to running the `docker port` Docker CLI command.

**name**

Container name or ID

Changed in version 2019.2.0: This value can now be a pattern expression (using the pattern-matching characters defined in `fnmatch`). If a pattern expression is used, this function will return a dictionary mapping container names which match the pattern to the mappings for those containers. When no pattern expression is used, a dictionary of the mappings for the specified container name will be returned.

**private\_port**

[None] If specified, get information for that specific port. Can be specified either as a port number (i.e. 5000), or as a port number plus the protocol (i.e. 5000/udp).

If this argument is omitted, all port mappings will be returned.

#### RETURN DATA

A dictionary of port mappings, with the keys being the port and the values being the mapping(s) for that port.

CLI Examples:

```
salt myminion docker.port mycontainer
salt myminion docker.port mycontainer 5000
salt myminion docker.port mycontainer 5000/udp
```

`salt.modules.dockermod.prune`(*containers=False*, *networks=False*, *images=False*, *build=False*, *volumes=False*, *system=None*, *\*\*filters*)

New in version 2019.2.0.

Prune Docker's various subsystems

---

**Note:** This requires `docker-py` version 2.1.0 or later.

---

**containers**

[False] If True, prunes stopped containers ([documentation](#))

**images**

[False] If True, prunes unused images ([documentation](#))

**networks**

[False] If False, prunes unreferenced networks ([documentation](#))

**build**

[False] If True, clears the builder cache

---

**Note:** Only supported in Docker 17.07.x and newer. Additionally, filters do not apply to this argument.

---

**volumes**

[False] If True, prunes unreferenced volumes ([documentation](#))

**system**

If True, prunes containers, images, networks, and builder cache. Assumed to be True if none of containers, images, networks, or build are set to True.

---

**Note:** volumes=True must still be used to prune volumes

---

**filters**

- `dangling=True` (images only) - remove only dangling images
- `until=<timestamp>` - only remove objects created before given timestamp. Not applicable to volumes. See the documentation links above for examples of valid time expressions.
- `label` - only remove objects matching the label expression. Valid expressions include `labelname` or `labelname=value`.

CLI Examples:

```
salt myminion docker.prune system=True
salt myminion docker.prune system=True until=12h
salt myminion docker.prune images=True dangling=True
salt myminion docker.prune images=True label=foo,bar=baz
```

`salt.modules.dockermod.ps_` (*filters=None, \*\*kwargs*)

Returns information about the Docker containers on the Minion. Equivalent to running the `docker ps` Docker CLI command.

**all**

[False] If True, stopped containers will also be returned

**host: False**

If True, local host's network topology will be included

**verbose**

[False] If True, a `docker inspect` will be run on each container returned.

**filters: None**

A dictionary of filters to be processed on the container list. Available filters:

- `exited (int)`: Only containers with specified exit code
- `status (str)`: One of restarting, running, paused, exited
- `label (str)`: format either "key" or "key=value"

## RETURN DATA

A dictionary with each key being an container ID, and each value some general info about that container (time created, name, command, etc.)

CLI Example:

```
salt myminion docker.ps
salt myminion docker.ps all=True
salt myminion docker.ps filters="{ 'label': 'role=web' }"
```

`salt.modules.dockermod.pull` (*image*, *insecure\_registry=False*, *api\_response=False*, *client\_timeout=60*)

Changed in version 2018.3.0: If no tag is specified in the `image` argument, all tags for the image will be pulled. For this reason is it recommended to pass `image` using the `repo:tag` notation.

Pulls an image from a Docker registry

### `image`

Image to be pulled

### `insecure_registry`

[False] If True, the Docker client will permit the use of insecure (non-HTTPS) registries.

### `api_response`

[False] If True, an `API_Response` key will be present in the return data, containing the raw output from the Docker API.

---

**Note:** This may result in a lot of additional return data, especially for larger images.

---

### `client_timeout`

Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

## RETURN DATA

A dictionary will be returned, containing the following keys:

- **Layers** - A dictionary containing one or more of the following keys:
  - `Already_Pulled` - Layers that that were already present on the Minion
  - `Pulled` - Layers that that were pulled
- **Status** - A string containing a summary of the pull action (usually a message saying that an image was downloaded, or that it was up to date).
- **Time\_Elapsed** - Time in seconds taken to perform the pull

CLI Example:

```
salt myminion docker.pull centos
salt myminion docker.pull centos:6
```

`salt.modules.dockermod.push` (*image*, *insecure\_registry=False*, *api\_response=False*, *client\_timeout=60*)

Changed in version 2015.8.4: The `Id` and `Image` keys are no longer present in the return data. This is due to changes in the Docker Remote API.

Pushes an image to a Docker registry. See the documentation at top of this page to configure authentication credentials.

**image**

Image to be pushed. If just the repository name is passed, then all tagged images for the specified repo will be pushed. If the image name is passed in `repo:tag` notation, only the specified image will be pushed.

**insecure\_registry**

[False] If True, the Docker client will permit the use of insecure (non-HTTPS) registries.

**api\_response**

[False] If True, an `API_Response` key will be present in the return data, containing the raw output from the Docker API.

**client\_timeout**

Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- **Layers** - A dictionary containing one or more of the following keys:
  - `Already_Pushed` - Layers that that were already present on the Minion
  - `Pushed` - Layers that that were pushed
- `Time_Elapsed` - Time in seconds taken to perform the push

CLI Example:

```
salt myminion docker.push myuser/mycontainer
salt myminion docker.push myuser/mycontainer:mytag
```

`salt.modules.dockermod.remove_network(network_id)`

Remove a network

**network\_id**

Network name or ID

CLI Examples:

```
salt myminion docker.remove_network mynet
salt myminion docker.remove_network❏
↪1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

`salt.modules.dockermod.remove_volume(name)`

Remove a volume

New in version 2015.8.4.

**name**

Name of volume

CLI Example:

```
salt myminion docker.remove_volume my_volume
```

`salt.modules.dockermod.rename(name, new_name)`

New in version 2017.7.0.

Renames a container. Returns `True` if successful, and raises an error if the API returns one. If unsuccessful and the API returns no error (should not happen), then `False` will be returned.

**name**

Name or ID of existing container

**new\_name**

New name to assign to container

CLI Example:

```
salt myminion docker.rename foo bar
```

**salt.modules.dockermod.resolve\_image\_id**(*name*)

New in version 2018.3.0.

Given an image name (or partial image ID), return the full image ID. If no match is found among the locally-pulled images, then `False` will be returned.

CLI Examples:

```
salt myminion docker.resolve_image_id foo
salt myminion docker.resolve_image_id foo:bar
salt myminion docker.resolve_image_id 36540f359ca3
```

**salt.modules.dockermod.resolve\_tag**(*name*, *\*\*kwargs*)

New in version 2017.7.2.

Changed in version 2018.3.0: Instead of matching against pulled tags using `docker.list_tags`, this function now simply inspects the passed image name using `docker.inspect_image` and returns the first matching tag. If no matching tags are found, it is assumed that the passed image is an untagged image ID, and the full ID is returned.

Inspects the specified image name and returns the first matching tag in the inspect results. If the specified image is not pulled locally, this function will return `False`.

**name**

Image name to resolve. If the image is found but there are no tags, this means that the image name passed was an untagged image. In this case the image ID will be returned.

**all**

[False] If `True`, a list of all matching tags will be returned. If the image is found but there are no tags, then a list will still be returned, but it will simply contain the image ID.

New in version 2018.3.0.

**tags**

Deprecated since version 2018.3.0.

CLI Examples:

```
salt myminion docker.resolve_tag busybox
salt myminion docker.resolve_tag centos:7 all=True
salt myminion docker.resolve_tag c9f378ac27d9
```

**salt.modules.dockermod.restart**(*name*, *timeout=10*)

Restarts a container

**name**

Container name or ID

**timeout**

[10] Timeout in seconds after which the container will be killed (if it has not yet gracefully shut down)

## RETURN DATA

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `restarted` - If restart was successful, this key will be present and will be set to `True`.

CLI Examples:

```
salt myminion docker.restart mycontainer
salt myminion docker.restart mycontainer timeout=20
```

```
salt.modules.dockermod.retcode(name, cmd, exec_driver=None, stdin=None, python_shell=True,
                                output_loglevel='debug', use_vt=False, ignore_retcode=False,
                                keep_env=None)
```

Run `cmd.retcode` within a container

### name

Container name or ID in which to run the command

### cmd

Command to run

### exec\_driver

[None] If not passed, the execution driver will be detected as described *above*.

### stdin

[None] Standard input to be used for the command

### output\_loglevel

[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

### use\_vt

[False] Use SaltStack's `utils.vt` to stream output to console.

### keep\_env

[None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.retcode mycontainer 'ls -l /etc'
```

```
salt.modules.dockermod.rm_(name, force=False, volumes=False, **kwargs)
```

Removes a container

### name

Container name or ID

### force

[False] If `True`, the container will be killed first before removal, as the Docker API will not permit a running container to be removed. This option is set to `False` by default to prevent accidental removal of a running container.

### stop

[False] If `True`, the container will be stopped first before removal, as the Docker API will not permit a running container to be removed. This option is set to `False` by default to prevent accidental removal of a running container.

New in version 2017.7.0.

**timeout**

Optional timeout to be passed to `docker.stop` if stopping the container.

New in version 2018.3.0.

**volumes**

[False] Also remove volumes associated with container

**RETURN DATA**

A list of the IDs of containers which were removed

CLI Example:

```
salt myminion docker.rm mycontainer
salt myminion docker.rm mycontainer force=True
```

`salt.modules.dockermod.rmi(*names, **kwargs)`

Removes an image

**name**

Name (in `repo:tag` notation) or ID of image.

**force**

[False] If True, the image will be removed even if the Minion has containers created from that image

**prune**

[True] If True, untagged parent image layers will be removed as well, set this to False to keep them.

**RETURN DATA**

A dictionary will be returned, containing the following two keys:

- Layers - A list of the IDs of image layers that were removed
- Tags - A list of the tags that were removed
- Errors - A list of any errors that were encountered

CLI Examples:

```
salt myminion docker.rmi busybox
salt myminion docker.rmi busybox force=True
salt myminion docker.rmi foo bar baz
```

`salt.modules.dockermod.run(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)`

Run `cmd.run` within a container

**name**

Container name or ID in which to run the command

**cmd**

Command to run

**exec\_driver**

[None] If not passed, the execution driver will be detected as described *above*.

**stdin**

[None] Standard input to be used for the command

**output\_loglevel**

[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt**

[False] Use SaltStack's `utils.vt` to stream output to console.

**keep\_env**

[None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run mycontainer 'ls -l /etc'
```

```
salt.modules.dockermod.run_all(name, cmd, exec_driver=None, stdin=None, python_shell=True,
                               output_loglevel='debug', use_vt=False, ignore_retcode=False,
                               keep_env=None)
```

Run `cmd.run_all` within a container

---

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

---

**name**

Container name or ID in which to run the command

**cmd**

Command to run

**exec\_driver**

[None] If not passed, the execution driver will be detected as described *above*.

**stdin**

[None] Standard input to be used for the command

**output\_loglevel**

[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt**

[False] Use SaltStack's `utils.vt` to stream output to console.

**keep\_env**

[None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run_all mycontainer 'ls -l /etc'
```

```
salt.modules.dockermod.run_container(image, name=None, skip_translate=None,
                                     ignore_collisions=False, validate_ip_addrs=True,
                                     client_timeout=60, bg=False, replace=False, force=False,
                                     networks=None, **kwargs)
```

New in version 2018.3.0.

Equivalent to `docker run` on the Docker CLI. Runs the container, waits for it to exit, and returns the container's logs when complete.

---

**Note:** Not to be confused with `docker.run`, which provides a `cmd.run`-like interface for executing commands in a running container.

---

This function accepts the same arguments as `docker.create`, with the exception of `start`. In addition, it accepts the arguments from `docker.logs`, with the exception of `follow`, to control how logs are returned. Finally, the `bg` argument described below can be used to optionally run the container in the background (the default behavior is to block until the container exits).

#### **bg**

[False] If `True`, this function will not wait for the container to exit and will not return its logs. It will however return the container's name and ID, allowing for `docker.logs` to be used to view the logs.

---

**Note:** The logs will be inaccessible once the container exits if `auto_remove` is set to `True`, so keep this in mind.

---

#### **replace**

[False] If `True`, and if the named container already exists, this will remove the existing container. The default behavior is to return a `False` result when the container already exists.

#### **force**

[False] If `True`, and the named container already exists, *and* `replace` is also set to `True`, then the container will be forcibly removed. Otherwise, the state will not proceed and will return a `False` result.

#### **networks**

Networks to which the container should be connected. If automatic IP configuration is being used, the networks can be a simple list of network names. If custom IP configuration is being used, then this argument must be passed as a dictionary.

CLI Examples:

```
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/
↳myscript.sh
# Run container in the background
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/
↳myscript.sh bg=True
# Connecting to two networks using automatic IP configuration
salt myminion docker.run_container myuser/myimage command='perl /scripts/
↳sync.py' networks=net1,net2
# net1 using automatic IP, net2 using static IPv4 address
salt myminion docker.run_container myuser/myimage command='perl /scripts/
↳sync.py' networks='{"net1": {}, "net2": {"ipv4_address": "192.168.27.12
↳"}}'
```

`salt.modules.dockermod.run_stderr` (*name*, *cmd*, *exec\_driver=None*, *stdin=None*, *python\_shell=True*, *output\_loglevel='debug'*, *use\_vt=False*, *ignore\_retcode=False*, *keep\_env=None*)

Run `cmd.run_stderr` within a container

#### **name**

Container name or ID in which to run the command

**cmd**

Command to run

**exec\_driver**

[None] If not passed, the execution driver will be detected as described *above*.

**stdin**

[None] Standard input to be used for the command

**output\_loglevel**

[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt**

[False] Use SaltStack's `utils.vt` to stream output to console.

**keep\_env**

[None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run_stderr mycontainer 'ls -l /etc'
```

`salt.modules.dockermod.run_stdout` (*name*, *cmd*, *exec\_driver=None*, *stdin=None*, *python\_shell=True*, *output\_loglevel='debug'*, *use\_vt=False*, *ignore\_retcode=False*, *keep\_env=None*)

Run `cmd.run_stdout` within a container

**name**

Container name or ID in which to run the command

**cmd**

Command to run

**exec\_driver**

[None] If not passed, the execution driver will be detected as described *above*.

**stdin**

[None] Standard input to be used for the command

**output\_loglevel**

[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use\_vt**

[False] Use SaltStack's `utils.vt` to stream output to console.

**keep\_env**

[None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run_stdout mycontainer 'ls -l /etc'
```

`salt.modules.dockermod.save` (*name*, *path*, *overwrite=False*, *makedirs=False*, *compression=None*, *\*\*kwargs*)

Saves an image and to a file on the minion. Equivalent to running the `docker save` Docker CLI command, but unlike `docker save` this will also work on named images instead of just images IDs.

**name**

Name or ID of image. Specify a specific tag by using the `repo:tag` notation.

**path**

Absolute path on the Minion where the image will be exported

**overwrite**

[False] Unless this option is set to `True`, then if the destination file exists an error will be raised.

**makedirs**

[False] If `True`, then if the parent directory of the file specified by the `path` argument does not exist, Salt will attempt to create it.

**compression**

[None] Can be set to any of the following:

- `gzip` or `gz` for gzip compression
- `bzip2` or `bz2` for bzip2 compression
- `xz` or `lzma` for XZ compression (requires `xz-utils`, as well as the `lzma` module from Python 3.3, available in Python 2 and Python 3.0-3.2 as `backports.lzma`)

This parameter can be omitted and Salt will attempt to determine the compression type by examining the filename passed in the `path` parameter.

---

**Note:** Since the Docker API does not support `docker save`, compression will be a bit slower with this function than with `docker.export` since the image(s) will first be saved and then the compression done afterwards.

---

**push**

[False] If `True`, the container will be pushed to the master using `cp.push`.

---

**Note:** This requires `file_recv` to be set to `True` on the Master.

---

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- `Path` - Path of the file that was saved
- `Push` - Reports whether or not the file was successfully pushed to the Master  
(Only present if `push=True`)
- `Size` - Size of the file, in bytes
- `Size_Human` - Size of the file, in human-readable units
- `Time_Elapsed` - Time in seconds taken to perform the save

CLI Examples:

```
salt myminion docker.save centos:7 /tmp/cent7.tar
salt myminion docker.save 0123456789ab cdef01234567 /tmp/saved.tar
```

`salt.modules.dockermod.script` (*name*, *source*, *saltenv*='base', *args*=None, *template*=None, *exec\_driver*=None, *stdin*=None, *python\_shell*=True, *output\_loglevel*='debug', *ignore\_retcode*=False, *use\_vt*=False, *keep\_env*=None)

Run `cmd.script` within a container

---

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

---

**name**  
Container name or ID

**source**  
Path to the script. Can be a local path on the Minion or a remote file from the Salt fileserver.

**args**  
A string containing additional command-line options to pass to the script.

**template**  
[None] Templating engine to use on the script before running.

**exec\_driver**  
[None] If not passed, the execution driver will be detected as described *above*.

**stdin**  
[None] Standard input to be used for the script

**output\_loglevel**  
[debug] Level at which to log the output from the script. Set to `quiet` to suppress logging.

**use\_vt**  
[False] Use SaltStack's `utils.vt` to stream output to console.

**keep\_env**  
[None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.script mycontainer salt://docker_script.py
salt myminion docker.script mycontainer salt://scripts/runme.sh 'arg1'
→ arg2 "arg 3"
salt myminion docker.script mycontainer salt://scripts/runme.sh stdin=
→ 'one\ntwo\nthree\nfour\nfive\n' output_loglevel=quiet
```

```
salt.modules.dockermod.script_retcode(name, source, saltenv='base', args=None, template=None,
                                       exec_driver=None, stdin=None, python_shell=True,
                                       output_loglevel='debug', ignore_retcode=False, use_vt=False,
                                       keep_env=None)
```

Run `cmd.script_retcode` within a container

**name**  
Container name or ID

**source**  
Path to the script. Can be a local path on the Minion or a remote file from the Salt fileserver.

**args**  
A string containing additional command-line options to pass to the script.

**template**

[None] Templating engine to use on the script before running.

**exec\_driver**

[None] If not passed, the execution driver will be detected as described *above*.

**stdin**

[None] Standard input to be used for the script

**output\_loglevel**

[debug] Level at which to log the output from the script. Set to `quiet` to suppress logging.

**use\_vt**

[False] Use SaltStack's `utils.vt` to stream output to console.

**keep\_env**

[None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.script_retcodes mycontainer salt://docker_script.py
salt myminion docker.script_retcodes mycontainer salt://scripts/runme.sh
→ 'arg1 arg2 "arg 3"'
salt myminion docker.script_retcodes mycontainer salt://scripts/runme.sh
→ stdin='one\two\ntthree\nfour\nfive\n' output_loglevel=quiet
```

`salt.modules.dockermod.search`(*name*, *official=False*, *trusted=False*)

Searches the registry for an image

**name**

Search keyword

**official**

[False] Limit results to official builds

**trusted**

[False] Limit results to `trusted builds`

**RETURN DATA**

A dictionary with each key being the name of an image, and the following information for each image:

- `Description` - Image description
- `Official` - A boolean (`True` if an official build, `False` if not)
- `Stars` - Number of stars the image has on the registry
- `Trusted` - A boolean (`True` if a trusted build, `False` if not)

CLI Example:

```
salt myminion docker.search centos
salt myminion docker.search centos official=True
```

`salt.modules.dockermod.signal_`(*name*, *signal*)

Send a signal to a container. Signals can be either strings or numbers, and are defined in the **Standard Signals** section of the `signal(7)` manpage. Run `man 7 signal` on a Linux host to browse this manpage.

**name**  
Container name or ID

**signal**  
Signal to send to container

#### RETURN DATA

If the signal was successfully sent, True will be returned. Otherwise, an error will be raised.

CLI Example:

```
salt myminion docker.signal mycontainer SIGHUP
```

`salt.modules.dockermod.sls`(*name*, *mods=None*, *\*\*kwargs*)

Apply the states defined by the specified SLS modules to the running container

New in version 2016.11.0.

The container does not need to have Salt installed, but Python is required.

**name**  
Container name or ID

**mods**  
[None] A string containing comma-separated list of SLS with defined states to apply to the container.

**saltenv**  
[base] Specify the environment from which to retrieve the SLS indicated by the *mods* parameter.

**pillarenv**  
Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2018.3.0.

**pillar**  
Custom Pillar values, passed as a dictionary of key-value pairs

---

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

New in version 2018.3.0.

CLI Example:

```
salt myminion docker.sls compassionate_mirzakhani mods=rails,web
```

`salt.modules.dockermod.sls_build`(*repository*, *tag='latest'*, *base='opensuse/python'*, *mods=None*, *dryrun=False*, *\*\*kwargs*)

Changed in version 2018.3.0: The repository and tag must now be passed separately using the `repository` and `tag` arguments, rather than together in the (now deprecated) `image` argument.

Build a Docker image using the specified SLS modules on top of base image

New in version 2016.11.0.

The base image does not need to have Salt installed, but Python is required.

**repository**

Repository name for the image to be built

New in version 2018.3.0.

**tag**

[latest] Tag name for the image to be built

New in version 2018.3.0.

**name**

Deprecated since version 2018.3.0: Use both `repository` and `tag` instead

**base**

[opensuse/python] Name or ID of the base image

**mods**

A string containing comma-separated list of SLS with defined states to apply to the base image.

**saltenv**

[base] Specify the environment from which to retrieve the SLS indicated by the `mods` parameter.

**pillarenv**

Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2018.3.0.

**pillar**

Custom Pillar values, passed as a dictionary of key-value pairs

---

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

New in version 2018.3.0.

**dryrun: False**

when set to True the container will not be committed at the end of the build. The dryrun succeed also when the state contains errors.

**RETURN DATA**

A dictionary with the ID of the new container. In case of a dryrun, the state result is returned and the container gets removed.

CLI Example:

```
salt myminion docker.sls_build imgname base=mybase mods=rails,web
```

`salt.modules.dockermod.start_(name)`

Start a container

**name**

Container name or ID

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state

- `result` - A boolean noting whether or not the action was successful
- `comment` - Only present if the container cannot be started

CLI Example:

```
salt myminion docker.start mycontainer
```

`salt.modules.dockermod.state`(*name*)

Returns the state of the container

**name**

Container name or ID

**RETURN DATA**

A string representing the current state of the container (either `running`, `paused`, or `stopped`)

CLI Example:

```
salt myminion docker.state mycontainer
```

`salt.modules.dockermod.stop`(*name*, *timeout=None*, *\*\*kwargs*)

Stops a running container

**name**

Container name or ID

**unpause**

[False] If True and the container is paused, it will be unpaused before attempting to stop the container.

**timeout**

Timeout in seconds after which the container will be killed (if it has not yet gracefully shut down)

Changed in version 2017.7.0: If this argument is not passed, then the container's configuration will be checked. If the container was created using the `stop_timeout` argument, then the configured timeout will be used, otherwise the timeout will be 10 seconds.

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `comment` - Only present if the container can not be stopped

CLI Examples:

```
salt myminion docker.stop mycontainer
salt myminion docker.stop mycontainer unpause=True
salt myminion docker.stop mycontainer timeout=20
```

`salt.modules.dockermod.tag_`(*name*, *repository*, *tag='latest'*, *force=False*)

Changed in version 2018.3.0: The repository and tag must now be passed separately using the `repository` and `tag` arguments, rather than together in the (now deprecated) `image` argument.

Tag an image into a repository and return True. If the tag was unsuccessful, an error will be raised.

**name**

ID of image

**repository**

Repository name for the image to be built

New in version 2018.3.0.

**tag**

[latest] Tag name for the image to be built

New in version 2018.3.0.

**image**

Deprecated since version 2018.3.0: Use both `repository` and `tag` instead

**force**

[False] Force apply tag

CLI Example:

```
salt myminion docker.tag 0123456789ab myrepo/mycontainer mytag
```

**salt.modules.dockermod.top**(*name*)

Runs the *docker top* command on a specific container

**name**

Container name or ID

CLI Example:

**RETURN DATA**

A list of dictionaries containing information about each process

```
salt myminion docker.top mycontainer
salt myminion docker.top 0123456789ab
```

**salt.modules.dockermod.unfreeze**(*name*)

This function is an alias of `unpause`.

Unpauses a container

**name**

Container name or ID

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `comment` - Only present if the container can not be unpaused

CLI Example:

```
salt myminion docker.pause mycontainer
```

**salt.modules.dockermod.unpause**(*name*)

Unpauses a container

**name**

Container name or ID

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `comment` - Only present if the container can not be unpaused

CLI Example:

```
salt myminion docker.pause mycontainer
```

**salt.modules.dockermod.version()**

Returns a dictionary of Docker version information. Equivalent to running the `docker version` Docker CLI command.

CLI Example:

```
salt myminion docker.version
```

**salt.modules.dockermod.volumes** (*filters=None*)

List existing volumes

New in version 2015.8.4.

**filters**

There is one available filter: `dangling=true`

CLI Example:

```
salt myminion docker.volumes filters="{dangling': True}"
```

**salt.modules.dockermod.wait** (*name, ignore\_already\_stopped=False, fail\_on\_exit\_status=False*)

Wait for the container to exit gracefully, and return its exit code

---

**Note:** This function will block until the container is stopped.

---

**name**

Container name or ID

**ignore\_already\_stopped**

Boolean flag that prevents execution to fail, if a container is already stopped.

**fail\_on\_exit\_status**

Boolean flag to report execution as failure if `exit_status` is different than 0.

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `exit_status` - Exit status for the container
- `comment` - Only present if the container is already stopped

CLI Example:

```
salt myminion docker.wait mycontainer
```

### 26.6.117 salt.modules.dpkg\_lowpkg

Support for DEB packages

`salt.modules.dpkg_lowpkg.bin_pkg_info`(*path*, *saltenv='base'*)

New in version 2015.8.0.

Parses DEB metadata and returns a dictionary of information about the package (name, version, etc.).

#### path

Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.deb`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

#### saltenv

[base] Salt fileserver environment from which to retrieve the package. Ignored if path is a local file path on the minion.

CLI Example:

```
salt '*' lowpkg.bin_pkg_info /root/foo-1.2.3-1ubuntu1_all.deb
salt '*' lowpkg.bin_pkg_info salt://foo-1.2.3-1ubuntu1_all.deb
```

`salt.modules.dpkg_lowpkg.file_dict`(\**packages*, \*\**kwargs*)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_dict hostname
salt '*' lowpkg.file_dict hostname mount
salt '*' lowpkg.file_dict
```

`salt.modules.dpkg_lowpkg.file_list`(\**packages*, \*\**kwargs*)

List the files that belong to a package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_list hostname
salt '*' lowpkg.file_list hostname mount
salt '*' lowpkg.file_list
```

`salt.modules.dpkg_lowpkg.info`(\**packages*, \*\**kwargs*)

Returns a detailed summary of package information for provided package names. If no packages are specified, all packages will be returned.

New in version 2015.8.1.

#### packages

The names of the packages for which to return information.

#### failhard

Whether to throw an exception if none of the packages are installed. Defaults to True.

New in version 2016.11.3.

CLI Example:

```
salt '*' lowpkg.info
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info 'php5*' failhard=false
```

`salt.modules.dpkg_lowpkg.list_pkgs(*packages, **kwargs)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

External dependencies:

Virtual package resolution requires aptitude. Because this function uses dpkg, virtual packages will be reported **as not** installed.

CLI Example:

```
salt '*' lowpkg.list_pkgs
salt '*' lowpkg.list_pkgs hostname
salt '*' lowpkg.list_pkgs hostname mount
```

`salt.modules.dpkg_lowpkg.unpurge(*packages)`

Change package selection for each package specified to 'install'

CLI Example:

```
salt '*' lowpkg.unpurge curl
```

### 26.6.118 salt.modules.drac

Manage Dell DRAC

`salt.modules.drac.change_password(username, password, uid=None)`

Change users password

CLI Example:

```
salt dell drac.change_password [USERNAME] [PASSWORD] [UID - optional]
salt dell drac.change_password diana secret
```

`salt.modules.drac.create_user(username, password, permissions, users=None)`

Create user accounts

CLI Example:

```
salt dell drac.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell drac.create_user diana secret login,test_alerts,clear_logs
```

DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user\_management : Configure Users

- `clear_logs` : Clear Logs
- `server_control_commands` : Execute Server Control Commands
- `console_redirection` : Access Console Redirection
- `virtual_media` : Access Virtual Media
- `test_alerts` : Test Alerts
- `debug_commands` : Execute Debug Commands

`salt.modules.drac.delete_user` (*username*, *uid=None*)

Delete a user

CLI Example:

```
salt dell drac.delete_user [USERNAME] [UID - optional]
salt dell drac.delete_user diana 4
```

`salt.modules.drac.email_alerts` (*action*)

Enable/Disable email alerts

CLI Example:

```
salt dell drac.email_alerts True
salt dell drac.email_alerts False
```

`salt.modules.drac.list_users` ()

List all DRAC users

CLI Example:

```
salt dell drac.list_users
```

`salt.modules.drac.nameservers` (*\*ns*)

Configure the nameservers on the DRAC

CLI Example:

```
salt dell drac.nameservers [NAMESERVERS]
salt dell drac.nameservers ns1.example.com ns2.example.com
```

`salt.modules.drac.network_info` ()

Return Network Configuration

CLI Example:

```
salt dell drac.network_info
```

`salt.modules.drac.server_hardreset` ()

Performs a reset (reboot) operation on the managed server.

CLI Example:

```
salt dell drac.server_hardreset
```

`salt.modules.drac.server_poweroff()`

Powers down the managed server.

CLI Example:

```
salt dell drac.server_poweroff
```

`salt.modules.drac.server_poweron()`

Powers up the managed server.

CLI Example:

```
salt dell drac.server_poweron
```

`salt.modules.drac.server_pxe()`

Configure server to PXE perform a one off PXE boot

CLI Example:

```
salt dell drac.server_pxe
```

`salt.modules.drac.server_reboot()`

Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on the system's front panel to power down and then power up the system.

CLI Example:

```
salt dell drac.server_reboot
```

`salt.modules.drac.set_network(ip, netmask, gateway)`

Configure Network

CLI Example:

```
salt dell drac.set_network [DRAC IP] [NETMASK] [GATEWAY]
salt dell drac.set_network 192.168.0.2 255.255.255.0 192.168.0.1
```

`salt.modules.drac.set_permissions(username, permissions, uid=None)`

Configure users permissions

CLI Example:

```
salt dell drac.set_permissions [USERNAME] [PRIVILEGES] [USER INDEX -X
↪optional]
salt dell drac.set_permissions diana login,test_alerts,clear_logs 4
```

#### DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user\_management : Configure Users
- clear\_logs : Clear Logs
- server\_control\_commands : Execute Server Control Commands
- console\_redirection : Access Console Redirection

- `virtual_media` : Access Virtual Media
- `test_alerts` : Test Alerts
- `debug_commands` : Execute Debug Commands

`salt.modules.drac.set_snmp`(*community*)

Configure SNMP community string

CLI Example:

```
salt dell drac.set_snmp [COMMUNITY]
salt dell drac.set_snmp public
```

`salt.modules.drac.syslog`(*server*, *enable=True*)

Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. However, if you want to disable syslog you will need to specify a server followed by False

CLI Example:

```
salt dell drac.syslog [SYSLOG IP] [ENABLE/DISABLE]
salt dell drac.syslog 0.0.0.0 False
```

`salt.modules.drac.system_info`()

Return System information

CLI Example:

```
salt dell drac.system_info
```

### 26.6.119 salt.modules.dracr

Manage Dell DRAC.

New in version 2015.8.2.

`salt.modules.dracr.bare_rac_cmd`(*cmd*, *host=None*, *admin\_username=None*, *admin\_password=None*)

`salt.modules.dracr.change_password`(*username*, *password*, *uid=None*, *host=None*,  
*admin\_username=None*, *admin\_password=None*, *module=None*)

Change user's password

CLI Example:

```
salt dell dracr.change_password [USERNAME] [PASSWORD] uid=[OPTIONAL]
  host=<remote DRAC> admin_username=<DRAC user>
  admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```

Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have 'root' as UID 1, so if you can depend on that then setting the password is much quicker. Raises an error if the supplied password is greater than 20 chars.

`salt.modules.dracr.create_user` (*username, password, permissions, users=None, host=None, admin\_username=None, admin\_password=None*)

Create user accounts

CLI Example:

```
salt dell dracr.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell dracr.create_user diana secret login,test_alerts,clear_logs
```

#### DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user\_management : Configure Users
- clear\_logs : Clear Logs
- server\_control\_commands : Execute Server Control Commands
- console\_redirection : Access Console Redirection
- virtual\_media : Access Virtual Media
- test\_alerts : Test Alerts
- debug\_commands : Execute Debug Commands

`salt.modules.dracr.delete_user` (*username, uid=None, host=None, admin\_username=None, admin\_password=None*)

Delete a user

CLI Example:

```
salt dell dracr.delete_user [USERNAME] [UID - optional]
salt dell dracr.delete_user diana 4
```

`salt.modules.dracr.deploy_password` (*username, password, host=None, admin\_username=None, admin\_password=None, module=None*)

Change the QuickDeploy password, used for switches as well

CLI Example:

```
salt dell dracr.deploy_password [USERNAME] [PASSWORD]
  host=<remote DRAC> admin_username=<DRAC user>
  admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```

Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have 'root' as UID 1, so if you can depend on that then setting the password is much quicker.

`salt.modules.dracr.deploy_snmp` (*snmp, host=None, admin\_username=None, admin\_password=None, module=None*)

Change the QuickDeploy SNMP community string, used for switches as well

CLI Example:

```
salt dell dracr.deploy_snmp SNMP_STRING
    host=<remote DRAC or CMC> admin_username=<DRAC user>
    admin_password=<DRAC PW>
salt dell dracr.deploy_password diana secret
```

`salt.modules.dracr.email_alerts` (*action*, *host=None*, *admin\_username=None*, *admin\_password=None*)

Enable/Disable email alerts

CLI Example:

```
salt dell dracr.email_alerts True
salt dell dracr.email_alerts False
```

`salt.modules.dracr.get_chassis_datacenter` (*host=None*, *admin\_username=None*,  
*admin\_password=None*)

Get the datacenter of the chassis.

**host**

The chassis host.

**admin\_username**

The username used to access the chassis.

**admin\_password**

The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_location host=111.222.333.444
    admin_username=root admin_password=secret
```

`salt.modules.dracr.get_chassis_location` (*host=None*, *admin\_username=None*,  
*admin\_password=None*)

Get the location of the chassis.

**host**

The chassis host.

**admin\_username**

The username used to access the chassis.

**admin\_password**

The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_location host=111.222.333.444
    admin_username=root admin_password=secret
```

`salt.modules.dracr.get_chassis_name` (*host=None*, *admin\_username=None*, *admin\_password=None*)

Get the name of a chassis.

**host**

The chassis host.

**admin\_username**

The username used to access the chassis.

**admin\_password**

The password used to access the chassis.

CLI Example:

```
salt '*' dracr.get_chassis_name host=111.222.333.444
    admin_username=root admin_password=secret
```

```
salt.modules.dracr.get_dns_dracname(host=None, admin_username=None, admin_password=None)
```

```
salt.modules.dracr.get_general(cfg_sec, cfg_var, host=None, admin_username=None,
    admin_password=None)
```

```
salt.modules.dracr.get_slotname(slot, host=None, admin_username=None, admin_password=None)
```

Get the name of a slot number in the chassis.

**slot**

The number of the slot for which to obtain the name.

**host**

The chassis host.

**admin\_username**

The username used to access the chassis.

**admin\_password**

The password used to access the chassis.

CLI Example:

```
salt-call --local dracr.get_slotname 0 host=111.222.333.444
    admin_username=root admin_password=secret
```

```
salt.modules.dracr.idrac_general(blade_name, command, idrac_password=None, host=None,
    admin_username=None, admin_password=None)
```

Run a generic racadm command against a particular blade in a chassis. Blades are usually named things like 'server-1', 'server-2', etc. If the iDRAC has a different password than the CMC, then you can pass it with the `idrac_password` kwarg.

**Parameters**

- **blade\_name** -- Name of the blade to run the command on
- **command** -- Command like to pass to racadm
- **idrac\_password** -- Password for the iDRAC if different from the CMC
- **host** -- Chassis hostname
- **admin\_username** -- CMC username
- **admin\_password** -- CMC password

**Returns**

stdout if the retcode is 0, otherwise a standard `cmd.run_all` dictionary

CLI Example:

```
salt fx2 chassis.cmd idrac_general server-1 'get BIOS.SysProfileSettings'
```

```
salt.modules.dracr.inventory(host=None, admin_username=None, admin_password=None)
```

`salt.modules.dracr.list_slotnames` (*host=None, admin\_username=None, admin\_password=None*)

List the names of all slots in the chassis.

**host**

The chassis host.

**admin\_username**

The username used to access the chassis.

**admin\_password**

The password used to access the chassis.

CLI Example:

```
salt-call --local dracr.list_slotnames host=111.222.333.444
admin_username=root admin_password=secret
```

`salt.modules.dracr.list_users` (*host=None, admin\_username=None, admin\_password=None, module=None*)

List all DRAC users

CLI Example:

```
salt dell dracr.list_users
```

`salt.modules.dracr.nameservers` (*ns, host=None, admin\_username=None, admin\_password=None, module=None*)

Configure the nameservers on the DRAC

CLI Example:

```
salt dell dracr.nameservers [NAMESERVERS]
salt dell dracr.nameservers ns1.example.com ns2.example.com
admin_username=root admin_password=calvin module=server-1
host=192.168.1.1
```

`salt.modules.dracr.network_info` (*host=None, admin\_username=None, admin\_password=None, module=None*)

Return Network Configuration

CLI Example:

```
salt dell dracr.network_info
```

`salt.modules.dracr.server_hardreset` (*host=None, admin\_username=None, admin\_password=None, module=None*)

Performs a reset (reboot) operation on the managed server.

**host**

The chassis host.

**admin\_username**

The username used to access the chassis.

**admin\_password**

The password used to access the chassis.

**module**

The element to hard reset on the chassis such as a blade. If not provided, the chassis will be reset.

CLI Example:

```
salt dell dracr.server_hardreset
salt dell dracr.server_hardreset module=server-1
```

`salt.modules.dracr.server_power` (*status, host=None, admin\_username=None, admin\_password=None, module=None*)

**status**

One of 'powerup', 'powerdown', 'powercycle', 'hardreset', 'graceshutdown'

**host**

The chassis host.

**admin\_username**

The username used to access the chassis.

**admin\_password**

The password used to access the chassis.

**module**

The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.

CLI Example:

```
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

`salt.modules.dracr.server_poweroff` (*host=None, admin\_username=None, admin\_password=None, module=None*)

Powers down the managed server.

**host**

The chassis host.

**admin\_username**

The username used to access the chassis.

**admin\_password**

The password used to access the chassis.

**module**

The element to power off on the chassis such as a blade. If not provided, the chassis will be powered off.

CLI Example:

```
salt dell dracr.server_poweroff
salt dell dracr.server_poweroff module=server-1
```

`salt.modules.dracr.server_poweron` (*host=None, admin\_username=None, admin\_password=None, module=None*)

Powers up the managed server.

**host**

The chassis host.

**admin\_username**

The username used to access the chassis.

**admin\_password**

The password used to access the chassis.

**module**

The element to power on located on the chassis such as a blade. If not provided, the chassis will be powered on.

CLI Example:

```
salt dell dracr.server_poweron
salt dell dracr.server_poweron module=server-1
```

`salt.modules.dracr.server_powerstatus` (*host=None, admin\_username=None, admin\_password=None, module=None*)

return the power status for the passed module

CLI Example:

```
salt dell drac.server_powerstatus
```

`salt.modules.dracr.server_pxe` (*host=None, admin\_username=None, admin\_password=None*)

Configure server to PXE perform a one off PXE boot

CLI Example:

```
salt dell dracr.server_pxe
```

`salt.modules.dracr.server_reboot` (*host=None, admin\_username=None, admin\_password=None, module=None*)

Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on the system's front panel to power down and then power up the system.

**host**

The chassis host.

**admin\_username**

The username used to access the chassis.

**admin\_password**

The password used to access the chassis.

**module**

The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.

CLI Example:

```
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

`salt.modules.dracr.set_chassis_datacenter` (*location, host=None, admin\_username=None, admin\_password=None*)

Set the location of the chassis.

**location**

The name of the datacenter to be set on the chassis.

**host**

The chassis host.

**admin\_username**

The username used to access the chassis.

**admin\_password**

The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_datacenter datacenter-name host=111.222.333.444
      admin_username=root admin_password=secret
```

```
salt.modules.dracr.set_chassis_location(location, host=None, admin_username=None,
                                       admin_password=None)
```

Set the location of the chassis.

**location**

The name of the location to be set on the chassis.

**host**

The chassis host.

**admin\_username**

The username used to access the chassis.

**admin\_password**

The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_location location-name host=111.222.333.444
      admin_username=root admin_password=secret
```

```
salt.modules.dracr.set_chassis_name(name, host=None, admin_username=None,
                                    admin_password=None)
```

Set the name of the chassis.

**name**

The name to be set on the chassis.

**host**

The chassis host.

**admin\_username**

The username used to access the chassis.

**admin\_password**

The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_name my-chassis host=111.222.333.444
      admin_username=root admin_password=secret
```

```
salt.modules.dracr.set_dns_dracname(name, host=None, admin_username=None,
                                    admin_password=None)
```

```
salt.modules.dracr.set_general(cfg_sec, cfg_var, val, host=None, admin_username=None,
                               admin_password=None)
```

```
salt.modules.dracr.set_network(ip, netmask, gateway, host=None, admin_username=None,
                               admin_password=None)
```

Configure Network on the CMC or individual iDRAC. Use `set_niccfg` for blade and switch addresses.

CLI Example:

```
salt dell dracr.set_network [DRAC IP] [NETMASK] [GATEWAY]
salt dell dracr.set_network 192.168.0.2 255.255.255.0 192.168.0.1
admin_username=root admin_password=calvin host=192.168.1.1
```

`salt.modules.dracr.set_niccfg`(*ip=None, netmask=None, gateway=None, dhcp=False, host=None, admin\_username=None, admin\_password=None, module=None*)

`salt.modules.dracr.set_nicvlan`(*vlan=None, host=None, admin\_username=None, admin\_password=None, module=None*)

`salt.modules.dracr.set_permissions`(*username, permissions, uid=None, host=None, admin\_username=None, admin\_password=None*)

Configure users permissions

CLI Example:

```
salt dell dracr.set_permissions [USERNAME] [PRIVILEGES]
[USER INDEX - optional]
salt dell dracr.set_permissions diana login,test_alerts,clear_logs 4
```

#### DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user\_management : Configure Users
- clear\_logs : Clear Logs
- server\_control\_commands : Execute Server Control Commands
- console\_redirection : Access Console Redirection
- virtual\_media : Access Virtual Media
- test\_alerts : Test Alerts
- debug\_commands : Execute Debug Commands

`salt.modules.dracr.set_slotname`(*slot, name, host=None, admin\_username=None, admin\_password=None*)

Set the name of a slot in a chassis.

**slot**

The slot number to change.

**name**

The name to set. Can only be 15 characters long.

**host**

The chassis host.

**admin\_username**

The username used to access the chassis.

**admin\_password**

The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_slotname 2 my-slotname host=111.222.333.444
      admin_username=root admin_password=secret
```

`salt.modules.dracr.set_snmp` (*community, host=None, admin\_username=None, admin\_password=None*)

Configure CMC or individual iDRAC SNMP community string. Use `deploy_snmp` for configuring chassis switch SNMP.

CLI Example:

```
salt dell dracr.set_snmp [COMMUNITY]
salt dell dracr.set_snmp public
```

`salt.modules.dracr.syslog` (*server, enable=True, host=None, admin\_username=None, admin\_password=None, module=None*)

Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. However, if you want to disable syslog you will need to specify a server followed by `False`

CLI Example:

```
salt dell dracr.syslog [SYSLOG IP] [ENABLE/DISABLE]
salt dell dracr.syslog 0.0.0.0 False
```

`salt.modules.dracr.system_info` (*host=None, admin\_username=None, admin\_password=None, module=None*)

Return System information

CLI Example:

```
salt dell dracr.system_info
```

`salt.modules.dracr.update_firmware` (*filename, host=None, admin\_username=None, admin\_password=None*)

Updates firmware using local firmware file

```
salt dell dracr.update_firmware firmware.exe
```

This executes the following command on your FX2 (using username and password stored in the pillar data)

```
racadm update -f firmware.exe -u user -p pass
```

`salt.modules.dracr.update_firmware_nfs_or_cifs` (*filename, share, host=None, admin\_username=None, admin\_password=None*)

Executes the following for CIFS (using username and password stored in the pillar data)

```
racadm update -f <updatefile> -u user -p pass -l //IP-Address/share
```

Or for NFS (using username and password stored in the pillar data)

```
racadm update -f <updatefile> -u user -p pass -l IP-address:/share
```

Salt command for CIFS:

```
salt dell dracr.update_firmware_nfs_or_cifs      firmware.exe //IP-
→Address/share
```

Salt command for NFS:

```
salt dell dracr.update_firmware_nfs_or_cifs      firmware.exe IP-  
→address:/share
```

### 26.6.120 salt.modules.drbd

DRBD administration module

`salt.modules.drbd.overview()`

Show status of the DRBD devices, support two nodes only. `drbd-overview` is removed since `drbd-utils-9.6.0`, use `status` instead.

CLI Example:

```
salt '*' drbd.overview
```

`salt.modules.drbd.status(name='all')`

Using `drbdadm` to show status of the DRBD devices, available in the latest `drbd9`. Support multiple nodes, multiple volumes.

**Parameters**

**name** (*str*) -- Resource name.

**Returns**

drbd status of resource.

**Return type**

`list(dict(res))`

CLI Example:

```
salt '*' drbd.status  
salt '*' drbd.status name=<resource name>
```

### 26.6.121 salt.modules.dummyproxy\_pkg

Package support for the dummy proxy used by the test suite

`salt.modules.dummyproxy_pkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)`

`salt.modules.dummyproxy_pkg.installed(name, version=None, refresh=False, fromrepo=None, skip_verify=False, pkgs=None, sources=None, **kwargs)`

`salt.modules.dummyproxy_pkg.list_pkgs(versions_as_list=False, **kwargs)`

`salt.modules.dummyproxy_pkg.remove(name=None, pkgs=None, **kwargs)`

`salt.modules.dummyproxy_pkg.upgrade(name=None, pkgs=None, refresh=True, skip_verify=True, normalize=True, **kwargs)`

`salt.modules.dummyproxy_pkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 26.6.122 salt.modules.dummyproxy\_service

Provide the service module for the dummy proxy used in integration tests

`salt.modules.dummyproxy_service.enabled(name, sig=None)`

Only the 'redbull' service is 'enabled' in the test

New in version 2016.11.3.

`salt.modules.dummyproxy_service.get_all()`

Return a list of all available services

New in version 2016.11.3.

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.dummyproxy_service.list_()`

Return a list of all available services.

New in version 2016.11.3.

CLI Example:

```
salt '*' service.list
```

`salt.modules.dummyproxy_service.restart(name, sig=None)`

Restart the specified service with dummy.

New in version 2016.11.3.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.dummyproxy_service.running(name, sig=None)`

Return whether this service is running.

New in version 2016.11.3.

`salt.modules.dummyproxy_service.start(name, sig=None)`

Start the specified service on the dummy

New in version 2016.11.3.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.dummyproxy_service.status`(*name*, *sig=None*)

Return the status for a service via dummy, returns a bool whether the service is running.

New in version 2016.11.3.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.dummyproxy_service.stop`(*name*, *sig=None*)

Stop the specified service on the dummy

New in version 2016.11.3.

CLI Example:

```
salt '*' service.stop <service name>
```

### 26.6.123 salt.modules.ebuildpkg

Support for Portage

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

#### optdepends

- portage Python adapter

For now all package names *MUST* include the package category, i.e. `'vim'` will not work, `'app-editors/vim'` will.

`salt.modules.ebuildpkg.available_version`(*\*names*, *\*\*kwargs*)

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.ebuildpkg.check_db`(*\*names*, *\*\*kwargs*)

New in version 0.17.0.

Returns a dict containing the following information for each specified package:

1. A key `found`, which will be a boolean value denoting if a match was found in the package database.
2. If `found` is `False`, then a second key called `suggestions` will be present, which will contain a list of possible matches. This list will be empty if the package name was specified in `category/pkgname` format, since the suggestions are only intended to disambiguate ambiguous package names (ones submitted without a category).

CLI Examples:

```
salt '*' pkg.check_db <package1> <package2> <package3>
```

`salt.modules.ebuildpkg.check_extra_requirements`(*pkgname*, *pkgver*)

Check if the installed package already has the given requirements.

CLI Example:

```
salt '*' pkg.check_extra_requirements 'sys-devel/gcc' '~>4.1.2:4.
→1::gentoo[nls,fortran]'
```

`salt.modules.ebuildpkg.depclean`(*name=None*, *slot=None*, *fromrepo=None*, *pkgs=None*)

Portage has a function to remove unused dependencies. If a package is provided, it will only removed the package if no other package depends on it.

**name**

The name of the package to be cleaned.

**slot**

Restrict the remove to a specific slot. Ignored if *name* is None.

**fromrepo**

Restrict the remove to a specific slot. Ignored if *name* is None.

**pkgs**

Clean multiple packages. *slot* and *fromrepo* arguments are ignored if this argument is present. Must be passed as a python list.

Return a list containing the removed packages:

CLI Example:

```
salt '*' pkg.depclean <package name>
```

`salt.modules.ebuildpkg.ex_mod_init`(*low*)

If the config option `ebuild.enforce_nice_config` is set to True, this module will enforce a nice tree structure for `/etc/portage/package.*` configuration files.

New in version 0.17.0: Initial automatic enforcement added when `pkg` is used on a Gentoo system.

Changed in version 2014.7.0: Configure option added to make this behaviour optional, defaulting to off.

See also:

`ebuild.ex_mod_init` is called automatically when a state invokes a `pkg` state on a Gentoo system. `salt.states.pkg.mod_init()`

`ebuild.ex_mod_init` uses `portage_config.enforce_nice_config` to do the lifting. `salt.modules.portage_config.enforce_nice_config()`

CLI Example:

```
salt '*' pkg.ex_mod_init
```

`salt.modules.ebuildpkg.install`(*name=None*, *refresh=False*, *pkgs=None*, *sources=None*, *slot=None*, *fromrepo=None*, *uses=None*, *binhost=None*, *\*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage

of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add `refresh=True` to sync the portage tree before package is installed.

**name**

The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to emerge a package from the portage tree. To install a tbz2 package manually, use the "sources" option described below.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh**

Whether or not to sync the portage tree before installing.

**version**

Install a specific version of the package, e.g. 1.0.9-r1. Ignored if "pkgs" or "sources" is passed.

**slot**

Similar to version, but specifies a valid slot to be installed. It will install the latest available version in the specified slot. Ignored if "pkgs" or "sources" or "version" is passed.

CLI Example:

```
salt '*' pkg.install sys-devel/gcc slot='4.4'
```

**fromrepo**

Similar to slot, but specifies the repository from the package will be installed. It will install the latest available version in the specified repository. Ignored if "pkgs" or "sources" or "version" is passed.

CLI Example:

```
salt '*' pkg.install salt fromrepo='gentoo'
```

**uses**

Similar to slot, but specifies a list of use flag. Ignored if "pkgs" or "sources" or "version" is passed.

CLI Example:

```
salt '*' pkg.install sys-devel/gcc uses='["nptl","-nossp"]'
```

Multiple Package Installation Options:

**pkgs**

A list of packages to install from the portage tree. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['foo","bar","~category/  
↪package:slot::repository[use]']
```

**sources**

A list of tbz2 packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.tbz2"}, {"bar":
↳ "salt://bar.tbz2"}]'
```

**binhost**

has two options `try` and `force`. `try` - tells emerge to try and install the package from a configured binhost. `force` - forces emerge to install the package from a binhost otherwise it fails out.

Returns a dict containing the new package names and versions:

```
{ '<package>': { 'old': '<old-version>',
                 'new': '<new-version>' } }
```

`salt.modules.ebuildpkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.ebuildpkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed in a dict:

```
{ '<package_name>': '<version>' }
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.ebuildpkg.list_upgrades(refresh=True, backtrack=3, **kwargs)`

List all available package upgrades.

**refresh**

Whether or not to sync the portage tree before checking for upgrades.

**backtrack**

Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an unsatisfied dependency (default: '3').

New in version 2015.8.0.

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.ebuildpkg.porttree_matches(name)`

Returns a list containing the matches for a given package name from the portage tree. Note that the specific version of the package will not be provided for packages that have several versions in the portage tree, but rather the name of the package (i.e. "dev-python/paramiko").

`salt.modules.ebuildpkg.purge(name=None, slot=None, fromrepo=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd >= 205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage

of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Portage does not have a purge, this function calls `remove` followed by `depclean` to emulate a purge process

**name**

The name of the package to be deleted.

**slot**

Restrict the remove to a specific slot. Ignored if name is None.

**fromrepo**

Restrict the remove to a specific slot. Ignored if name is None.

Multiple Package Options:

**pkgs**

Uninstall multiple packages. `slot` and `fromrepo` arguments are ignored if this argument is present. Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package name> slot=4.4
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.ebuildpkg.refresh_db(**kwargs)`

Update the portage tree using the first available method from the following list:

- `emaint sync`
- `eix-sync`
- `emerge-webrsync`
- `emerge --sync`

To prevent the portage tree from being synced within one day of the previous sync, add the following pillar data for this minion:

```
portage:
  sync_wait_one_day: True
```

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.ebuildpkg.remove(name=None, slot=None, fromrepo=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `emerge` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages via `emerge --unmerge`.

**name**

The name of the package to be deleted.

**slot**

Restrict the remove to a specific slot. Ignored if name is None.

**fromrepo**

Restrict the remove to a specific slot. Ignored if name is None.

Multiple Package Options:

**pkgs**

Uninstall multiple packages. `slot` and `fromrepo` arguments are ignored if this argument is present. Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package name> slot=4.4 fromrepo=gentoo
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.ebuildpkg.update` (*pkg*, *slot=None*, *fromrepo=None*, *refresh=False*, *binhost=None*, *\*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd`  $\geq$  205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Updates the passed package (emerge --update package)

**slot**

Restrict the update to a particular slot. It will update to the latest version within the slot.

**fromrepo**

Restrict the update to a particular repository. It will update to the latest version within the repository.

**binhost**

has two options `try` and `force`. `try` - tells emerge to try and install the package from a configured `binhost`. `force` - forces emerge to install the package from a `binhost` otherwise it fails out.

Return a dict containing the new package names and versions:

```
{ '<package>': {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.update <package name>
```

`salt.modules.ebuildpkg.upgrade` (*refresh=True*, *binhost=None*, *backtrack=3*, *\*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd`  $\geq$  205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage

of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade (`emerge -uDN @world`)

**binhost**

has two options `try` and `force`. `try` - tells emerge to try and install the package from a configured binhost. `force` - forces emerge to install the package from a binhost otherwise it fails out.

**backtrack**

Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an unsatisfied dependency (default: '3').

New in version 2015.8.0.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.ebuildpkg.upgrade_available(name, **kwargs)`

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.ebuildpkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.ebuildpkg.version_clean(version)`

Clean the version string removing extra data.

CLI Example:

```
salt '*' pkg.version_clean <version_string>
```

`salt.modules.ebuildpkg.version_cmp(pkg1, pkg2, **kwargs)`

Do a `cmp`-style comparison on two packages. Return -1 if `pkg1 < pkg2`, 0 if `pkg1 == pkg2`, and 1 if `pkg1 > pkg2`. Return `None` if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```

### 26.6.124 salt.modules.eix

Support for Eix

`salt.modules.eix.sync()`

Sync portage/overlay trees and update the eix database

CLI Example:

```
salt '*' eix.sync
```

`salt.modules.eix.update()`

Update the eix database

CLI Example:

```
salt '*' eix.update
```

### 26.6.125 salt.modules.elasticsearch

Elasticsearch - A distributed RESTful search and analytics server

Module to provide Elasticsearch compatibility to Salt (compatible with Elasticsearch version 1.5.2+)

New in version 2015.8.0.

**depends**

`elasticsearch-py`

**configuration**

This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```
elasticsearch:
  host: '10.10.10.100:9200'

elasticsearch-cluster:
  hosts:
    - '10.10.10.100:9200'
    - '10.10.10.101:9200'
    - '10.10.10.102:9200'

elasticsearch-extra:
  hosts:
    - '10.10.10.100:9200'
  use_ssl: True
  verify_certs: True
  ca_certs: /path/to/custom_ca_bundle.pem
  number_of_shards: 1
  number_of_replicas: 0
  functions_blacklist:
    - 'saltutil.find_job'
    - 'pillar.items'
    - 'grains.items'
  proxies:
```

(continues on next page)

(continued from previous page)

- **http:** http://proxy:3128
- **https:** http://proxy:1080

When specifying proxies the requests backend will be used and the 'proxies' data structure is passed as-is to that module.

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

Some functionality might be limited by elasticsearch-py and Elasticsearch server versions.

`salt.modules.elasticsearch.alias_create` (*indices, alias, hosts=None, body=None, profile=None, source=None*)

Create an alias for a specific index/indices

**indices**

Single or multiple indices separated by comma, use `_all` to perform the operation on all indices.

**alias**

Alias name

**body**

Optional definition such as routing or filter as defined in <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-aliases.html>

**source**

URL of file specifying optional definition such as routing or filter. Cannot be used in combination with `body`.

CLI Example:

```
salt myminion elasticsearch.alias_create testindex_v1 testindex
```

`salt.modules.elasticsearch.alias_delete` (*indices, aliases, hosts=None, body=None, profile=None, source=None*)

Delete an alias of an index

**indices**

Single or multiple indices separated by comma, use `_all` to perform the operation on all indices.

**aliases**

Alias names separated by comma

CLI Example:

```
salt myminion elasticsearch.alias_delete testindex_v1 testindex
```

`salt.modules.elasticsearch.alias_exists` (*aliases, indices=None, hosts=None, profile=None*)

Return a boolean indicating whether given alias exists

**indices**

Single or multiple indices separated by comma, use `_all` to perform the operation on all indices.

**aliases**

Alias names separated by comma

CLI Example:

```
salt myminion elasticsearch.alias_exists None testindex
```

`salt.modules.elasticsearch.alias_get` (*indices=None, aliases=None, hosts=None, profile=None*)

Check for the existence of an alias and if it exists, return it

**indices**

Single or multiple indices separated by comma, use `_all` to perform the operation on all indices.

**aliases**

Alias names separated by comma

CLI Example:

```
salt myminion elasticsearch.alias_get testindex
```

`salt.modules.elasticsearch.cluster_get_settings` (*flat\_settings=False, include\_defaults=False, hosts=None, profile=None*)

New in version 3000.

Return Elasticsearch cluster settings.

**flat\_settings**

Return settings in flat format.

**include\_defaults**

Whether to return all default clusters setting.

CLI Example:

```
salt myminion elasticsearch.cluster_get_settings
```

`salt.modules.elasticsearch.cluster_health` (*index=None, level='cluster', local=False, hosts=None, profile=None*)

New in version 2017.7.0.

Return Elasticsearch cluster health.

**index**

Limit the information returned to a specific index

**level**

Specify the level of detail for returned information, default 'cluster', valid choices are: 'cluster', 'indices', 'shards'

**local**

Return local information, do not retrieve the state from master node

CLI Example:

```
salt myminion elasticsearch.cluster_health
```

`salt.modules.elasticsearch.cluster_put_settings` (*body=None, flat\_settings=False, hosts=None, profile=None*)

New in version 3000.

Set Elasticsearch cluster settings.

**body**

The settings to be updated. Can be either 'transient' or 'persistent' (survives cluster restart) <http://www.elastic.co/guide/en/elasticsearch/reference/current/cluster-update-settings.html>

**flat\_settings**

Return settings in flat format.

CLI Example:

```
salt myminion elasticsearch.cluster_put_settings '{"persistent": {  
  ↪ "indices.recovery.max_bytes_per_sec": "50mb"}}'  
salt myminion elasticsearch.cluster_put_settings '{"transient": {"indices.  
  ↪ recovery.max_bytes_per_sec": "50mb"}}'
```

`salt.modules.elasticsearch.cluster_stats` (*nodes=None, hosts=None, profile=None*)

New in version 2017.7.0.

Return Elasticsearch cluster stats.

**nodes**

List of cluster nodes (id or name) to display stats for. Use `_local` for connected node, empty for all

CLI Example:

```
salt myminion elasticsearch.cluster_stats
```

`salt.modules.elasticsearch.document_create` (*index, doc\_type, body=None, id=None, hosts=None, profile=None, source=None*)

Create a document in a specified index

**index**

Index name where the document should reside

**doc\_type**

Type of the document

**body**

Document to store

**source**

URL of file specifying document to store. Cannot be used in combination with `body`.

**id**

Optional unique document identifier for specified `doc_type` (empty for random)

CLI Example:

```
salt myminion elasticsearch.document_create testindex doctype1 '{}'
```

`salt.modules.elasticsearch.document_delete` (*index, doc\_type, id, hosts=None, profile=None*)

Delete a document from an index

**index**

Index name where the document resides

**doc\_type**

Type of the document

**id**

Document identifier

CLI Example:

```
salt myminion elasticsearch.document_delete testindex doctype1 AUx-  
  ↪ 384m0Bug_8U80wQZ
```

`salt.modules.elasticsearch.document_exists(index, id, doc_type='_all', hosts=None, profile=None)`

Return a boolean indicating whether given document exists

**index**

Index name where the document resides

**id**

Document identifier

**doc\_type**

Type of the document, use `_all` to fetch the first document matching the ID across all types

CLI Example:

```
salt myminion elasticsearch.document_exists testindex AUx-384m0Bug_8U80wQZ
```

`salt.modules.elasticsearch.document_get(index, id, doc_type='_all', hosts=None, profile=None)`

Check for the existence of a document and if it exists, return it

**index**

Index name where the document resides

**id**

Document identifier

**doc\_type**

Type of the document, use `_all` to fetch the first document matching the ID across all types

CLI Example:

```
salt myminion elasticsearch.document_get testindex AUx-384m0Bug_8U80wQZ
```

`salt.modules.elasticsearch.flush_synced(hosts=None, profile=None, **kwargs)`

New in version 3000.

Perform a normal flush, then add a generated unique marker (`sync_id`) to all shards. <http://www.elastic.co/guide/en/elasticsearch/reference/current/indices-synced-flush.html>

**index**

(Optional, string) A comma-separated list of index names; use `_all` or empty string for all indices. Defaults to `'_all'`.

**ignore\_unavailable**

(Optional, boolean) If true, missing or closed indices are not included in the response. Defaults to false.

**allow\_no\_indices**

(Optional, boolean) If true, the request does not return an error if a wildcard expression or `_all` value retrieves only missing or closed indices. This parameter also applies to index aliases that point to a missing or closed index.

**expand\_wildcards**

(Optional, string) Controls what kind of indices that wildcard expressions can expand to.

Valid values are:

```
all - Expand to open and closed indices.
open - Expand only to open indices.
closed - Expand only to closed indices.
none - Wildcard expressions are not accepted.
```

The defaults settings for the above parameters depend on the API being used.

CLI Example:

```
salt myminion elasticsearch.flush_synced index='index1,index2' ignore_
↳unavailable=True allow_no_indices=True expand_wildcards='all'
```

```
salt.modules.elasticsearch.index_close(index, allow_no_indices=True, expand_wildcards='open',
                                         ignore_unavailable=True, hosts=None, profile=None)
```

New in version 2017.7.0.

Close specified index.

**index**

Index to be closed

**allow\_no\_indices**

Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes `_all` string or when no indices have been specified)

**expand\_wildcards**

Whether to expand wildcard expression to concrete indices that are open, closed or both., default 'open', valid choices are: 'open', 'closed', 'none', 'all'

**ignore\_unavailable**

Whether specified concrete indices should be ignored when unavailable (missing or closed)

CLI Example:

```
salt myminion elasticsearch.index_close testindex
```

```
salt.modules.elasticsearch.index_create(index, body=None, hosts=None, profile=None,
                                         source=None)
```

Create an index

**index**

Index name

**body**

Index definition, such as settings and mappings as defined in <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html>

**source**

URL to file specifying index definition. Cannot be used in combination with `body`.

CLI Example:

```
salt myminion elasticsearch.index_create testindex
salt myminion elasticsearch.index_create testindex2 '{"settings" : {"index
↳" : {"number_of_shards" : 3, "number_of_replicas" : 2}}}'
```

```
salt.modules.elasticsearch.index_delete(index, hosts=None, profile=None)
```

Delete an index

**index**

Index name

CLI Example:

```
salt myminion elasticsearch.index_delete testindex
```

`salt.modules.elasticsearch.index_exists` (*index*, *hosts=None*, *profile=None*)

Return a boolean indicating whether given index exists

**index**  
Index name

CLI Example:

```
salt myminion elasticsearch.index_exists testindex
```

`salt.modules.elasticsearch.index_get` (*index*, *hosts=None*, *profile=None*)

Check for the existence of an index and if it exists, return it

**index**  
Index name

CLI Example:

```
salt myminion elasticsearch.index_get testindex
```

`salt.modules.elasticsearch.index_get_settings` (*hosts=None*, *profile=None*, *\*\*kwargs*)

New in version 3000.

Check for the existence of an index and if it exists, return its settings <http://www.elastic.co/guide/en/elasticsearch/reference/current/indices-get-settings.html>

**index**  
(Optional, string) A comma-separated list of index names; use `_all` or empty string for all indices. Defaults to `'_all'`.

**name**  
(Optional, string) The name of the settings that should be included

**allow\_no\_indices**  
(Optional, boolean) Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes `_all` string or when no indices have been specified)

**expand\_wildcards**  
(Optional, string) Whether to expand wildcard expression to concrete indices that are open, closed or both. Valid choices are: `'open'`, `'closed'`, `'none'`, `'all'`

**flat\_settings**  
(Optional, boolean) Return settings in flat format

**ignore\_unavailable**  
(Optional, boolean) Whether specified concrete indices should be ignored when unavailable (missing or closed)

**include\_defaults**  
(Optional, boolean) Whether to return all default setting for each of the indices.

**local**  
(Optional, boolean) Return local information, do not retrieve the state from master node

The defaults settings for the above parameters depend on the API version being used.

CLI Example:

```
salt myminion elasticsearch.index_get_settings index=testindex
```

`salt.modules.elasticsearch.index_open` (*index*, *allow\_no\_indices=True*, *expand\_wildcards='closed'*, *ignore\_unavailable=True*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Open specified index.

**index**

Index to be opened

**allow\_no\_indices**

Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes `_all` string or when no indices have been specified)

**expand\_wildcards**

Whether to expand wildcard expression to concrete indices that are open, closed or both., default 'closed', valid choices are: 'open', 'closed', 'none', 'all'

**ignore\_unavailable**

Whether specified concrete indices should be ignored when unavailable (missing or closed)

CLI Example:

```
salt myminion elasticsearch.index_open testindex
```

`salt.modules.elasticsearch.index_put_settings` (*body=None*, *hosts=None*, *profile=None*, *source=None*, *\*\*kwargs*)

New in version 3000.

Update existing index settings <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-update-settings.html>

**body**

The index settings to be updated.

**source**

URL to file specifying index definition. Cannot be used in combination with `body`.

**index**

(Optional, string) A comma-separated list of index names; use `_all` or empty string to perform the operation on all indices

**allow\_no\_indices**

(Optional, boolean) Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes `_all` string or when no indices have been specified)

**expand\_wildcards**

(Optional, string) Whether to expand wildcard expression to concrete indices that are open, closed or both. Valid choices are: 'open', 'closed', 'none', 'all'

**flat\_settings**

(Optional, boolean) Return settings in flat format (default: false)

**ignore\_unavailable**

(Optional, boolean) Whether specified concrete indices should be ignored when unavailable (missing or closed)

**master\_timeout**

(Optional, time units) Explicit operation timeout for connection to master node

**preserve\_existing**

(Optional, boolean) Whether to update existing settings. If set to true existing settings on an index remain unchanged, the default is false

The defaults settings for the above parameters depend on the API version being used.

---

**Note:** Elasticsearch time units can be found here: <https://www.elastic.co/guide/en/elasticsearch/reference/current/common-options.html#time-units>

---

CLI Example:

```
salt myminion elasticsearch.index_put_settings index=testindex body='{
  ↪"settings" : {"index" : {"number_of_replicas" : 2}}}'
```

`salt.modules.elasticsearch.index_template_create` (*name*, *body=None*, *hosts=None*, *profile=None*, *source=None*)

Create an index template

**name**

Index template name

**body**

Template definition as specified in <http://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html>

**source**

URL to file specifying template definition. Cannot be used in combination with `body`.

CLI Example:

```
salt myminion elasticsearch.index_template_create testindex_templ '{
  ↪"template": "logstash-*", "order": 1, "settings": { "number_of_shards": 1
  ↪1 } }'
```

`salt.modules.elasticsearch.index_template_delete` (*name*, *hosts=None*, *profile=None*)

Delete an index template (type) along with its data

**name**

Index template name

CLI Example:

```
salt myminion elasticsearch.index_template_delete testindex_templ user
```

`salt.modules.elasticsearch.index_template_exists` (*name*, *hosts=None*, *profile=None*)

Return a boolean indicating whether given index template exists

**name**

Index template name

CLI Example:

```
salt myminion elasticsearch.index_template_exists testindex_templ
```

`salt.modules.elasticsearch.index_template_get` (*name*, *hosts=None*, *profile=None*)

Retrieve template definition of index or index/type

**name**

Index template name

CLI Example:

```
salt myminion elasticsearch.index_template_get testindex_templ
```

`salt.modules.elasticsearch.info` (*hosts=None, profile=None*)

New in version 2017.7.0.

Return Elasticsearch information.

CLI Example:

```
salt myminion elasticsearch.info
salt myminion elasticsearch.info profile=elasticsearch-extra
```

`salt.modules.elasticsearch.mapping_create` (*index, doc\_type, body=None, hosts=None, profile=None, source=None*)

Create a mapping in a given index

**index**

Index for the mapping

**doc\_type**

Name of the document type

**body**

Mapping definition as specified in <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-put-mapping.html>

**source**

URL to file specifying mapping definition. Cannot be used in combination with body.

CLI Example:

```
salt myminion elasticsearch.mapping_create testindex user '{ "user" : {
  ↪"properties" : { "message" : {"type" : "string", "store" : true } } } }'
```

`salt.modules.elasticsearch.mapping_delete` (*index, doc\_type, hosts=None, profile=None*)

Delete a mapping (type) along with its data. As of Elasticsearch 5.0 this is no longer available.

**index**

Index for the mapping

**doc\_type**

Name of the document type

CLI Example:

```
salt myminion elasticsearch.mapping_delete testindex user
```

`salt.modules.elasticsearch.mapping_get` (*index, doc\_type, hosts=None, profile=None*)

Retrieve mapping definition of index or index/type

**index**

Index for the mapping

**doc\_type**

Name of the document type

CLI Example:

```
salt myminion elasticsearch.mapping_get testindex user
```

`salt.modules.elasticsearch.node_info` (*nodes=None, flat\_settings=False, hosts=None, profile=None*)

New in version 2017.7.0.

Return Elasticsearch node information.

**nodes**

List of cluster nodes (id or name) to display stats for. Use `_local` for connected node, empty for all

**flat\_settings**

Flatten settings keys

CLI Example:

```
salt myminion elasticsearch.node_info flat_settings=True
```

`salt.modules.elasticsearch.ping` (*allow\_failure=False, hosts=None, profile=None*)

New in version 2017.7.0.

Test connection to Elasticsearch instance. This method does not fail if not explicitly specified.

**allow\_failure**

Throw exception if ping fails

CLI Example:

```
salt myminion elasticsearch.ping allow_failure=True
salt myminion elasticsearch.ping profile=elasticsearch-extra
```

`salt.modules.elasticsearch.pipeline_create` (*id, body, hosts=None, profile=None*)

New in version 2017.7.0.

Create Ingest pipeline by supplied definition. Available since Elasticsearch 5.0.

**id**

Pipeline id

**body**

Pipeline definition as specified in <https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html>

CLI Example:

```
salt myminion elasticsearch.pipeline_create mypipeline '{"description":
  ↳"my custom pipeline", "processors": [{"set" : {"field": "collector_
  ↳timestamp_millis", "value": "{[_ingest.timestamp]}"}]}'
```

`salt.modules.elasticsearch.pipeline_delete` (*id, hosts=None, profile=None*)

New in version 2017.7.0.

Delete Ingest pipeline. Available since Elasticsearch 5.0.

**id**

Pipeline id

CLI Example:

```
salt myminion elasticsearch.pipeline_delete mypipeline
```

`salt.modules.elasticsearch.pipeline_get` (*id*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Retrieve Ingest pipeline definition. Available since Elasticsearch 5.0.

**id**

Pipeline id

CLI Example:

```
salt myminion elasticsearch.pipeline_get mypipeline
```

`salt.modules.elasticsearch.pipeline_simulate` (*id*, *body*, *verbose=False*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Simulate existing Ingest pipeline on provided data. Available since Elasticsearch 5.0.

**id**

Pipeline id

**body**

Pipeline definition as specified in <https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html>

**verbose**

Specify if the output should be more verbose

CLI Example:

```
salt myminion elasticsearch.pipeline_simulate mypipeline '{"docs": [{"_
→ index:"index", "_type":"type", "_id":"id", "_source":{"foo":"bar"}}, {"_
→ index:"index", "_type":"type", "_id":"id", "_source":{"foo":"rab"}}]}'
→ verbose=True
```

`salt.modules.elasticsearch.repository_create` (*name*, *body*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Create repository for storing snapshots. Note that shared repository paths have to be specified in `path.repo` Elasticsearch configuration option.

**name**

Repository name

**body**

Repository definition as in <https://www.elastic.co/guide/en/elasticsearch/reference/current/modules-snapshots.html>

CLI Example:

```
salt myminion elasticsearch.repository_create testrepo '{"type":"fs",
→ "settings":{"location":"/tmp/test","compress":true}}'
```

`salt.modules.elasticsearch.repository_delete` (*name*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Delete existing repository.

**name**  
Repository name

CLI Example:

```
salt myminion elasticsearch.repository_delete testrepo
```

`salt.modules.elasticsearch.repository_get`(*name*, *local=False*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Get existing repository details.

**name**  
Repository name

**local**  
Retrieve only local information, default is false

CLI Example:

```
salt myminion elasticsearch.repository_get testrepo
```

`salt.modules.elasticsearch.repository_verify`(*name*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Obtain list of cluster nodes which successfully verified this repository.

**name**  
Repository name

CLI Example:

```
salt myminion elasticsearch.repository_verify testrepo
```

`salt.modules.elasticsearch.search_template_create`(*id*, *body*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Create search template by supplied definition

**id**  
Template ID

**body**  
Search template definition

CLI Example:

```
salt myminion elasticsearch.search_template_create mytemplate '{"template
→":{"query":{"match":{"title":"{{query_string}}"}}}}'
```

`salt.modules.elasticsearch.search_template_delete`(*id*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Delete existing search template definition.

**id**  
Template ID

CLI Example:

```
salt myminion elasticsearch.search_template_delete mytemplate
```

`salt.modules.elasticsearch.search_template_get` (*id*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Obtain existing search template definition.

**id**

Template ID

CLI Example:

```
salt myminion elasticsearch.search_template_get mytemplate
```

`salt.modules.elasticsearch.snapshot_create` (*repository*, *snapshot*, *body=None*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Create snapshot in specified repository by supplied definition.

**repository**

Repository name

**snapshot**

Snapshot name

**body**

Snapshot definition as in <https://www.elastic.co/guide/en/elasticsearch/reference/current/modules-snapshots.html>

CLI Example:

```
salt myminion elasticsearch.snapshot_create testrepo testsnapshot '{
  → "indices": "index_1,index_2", "ignore_unavailable": true, "include_global_
  → state": false}'
```

`salt.modules.elasticsearch.snapshot_delete` (*repository*, *snapshot*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Delete snapshot from specified repository.

**repository**

Repository name

**snapshot**

Snapshot name

CLI Example:

```
salt myminion elasticsearch.snapshot_delete testrepo testsnapshot
```

`salt.modules.elasticsearch.snapshot_get` (*repository*, *snapshot*, *ignore\_unavailable=False*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Obtain snapshot residing in specified repository.

**repository**

Repository name

**snapshot**

Snapshot name, use `_all` to obtain all snapshots in specified repository

**ignore\_unavailable**

Ignore unavailable snapshots

CLI Example:

```
salt myminion elasticsearch.snapshot_get testrepo testsnapshot
```

`salt.modules.elasticsearch.snapshot_restore` (*repository*, *snapshot*, *body=None*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Restore existing snapshot in specified repository by supplied definition.

**repository**

Repository name

**snapshot**

Snapshot name

**body**

Restore definition as in <https://www.elastic.co/guide/en/elasticsearch/reference/current/modules-snapshots.html>

CLI Example:

```
salt myminion elasticsearch.snapshot_restore testrepo testsnapshot '{
  ↪ "indices": "index_1,index_2", "ignore_unavailable": true, "include_global_
  ↪ state": true}'
```

`salt.modules.elasticsearch.snapshot_status` (*repository=None*, *snapshot=None*, *ignore\_unavailable=False*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Obtain status of all currently running snapshots.

**repository**

Particular repository to look for snapshots

**snapshot**

Snapshot name

**ignore\_unavailable**

Ignore unavailable snapshots

CLI Example:

```
salt myminion elasticsearch.snapshot_status ignore_unavailable=True
```

## 26.6.126 salt.modules.environ

Support for getting and setting the environment variables of the current salt process.

`salt.modules.environ.get(key, default="")`

Get a single salt process environment variable.

**key**

String used as the key for environment lookup.

**default**

If the key is not found in the environment, return this value. Default: ""

CLI Example:

```
salt '*' environ.get foo
salt '*' environ.get baz default=False
```

`salt.modules.environ.has_value(key, value=None)`

Determine whether the key exists in the current salt process environment dictionary. Optionally compare the current value of the environment against the supplied value string.

**key**

Must be a string. Used as key for environment lookup.

**value:**

Optional. If key exists in the environment, compare the current value with this value. Return True if they are equal.

CLI Example:

```
salt '*' environ.has_value foo
```

`salt.modules.environ.item(keys, default="")`

Get one or more salt process environment variables. Returns a dict.

**keys**

Either a string or a list of strings that will be used as the keys for environment lookup.

**default**

If the key is not found in the environment, return this value. Default: ""

CLI Example:

```
salt '*' environ.item foo
salt '*' environ.item '[foo, baz]' default=None
```

`salt.modules.environ.items()`

Return a dict of the entire environment set for the salt process

CLI Example:

```
salt '*' environ.items
```

`salt.modules.environ.setenv(envIRON, false_unsets=False, clear_all=False, update_minion=False, permanent=False)`

Set multiple salt process environment variables from a dict. Returns a dict.

**environ**

Must be a dict. The top-level keys of the dict are the names of the environment variables to set. Each key's value must be a string or False. Refer to the 'false\_unsets' parameter for behavior when a value set to False.

**false\_unsets**

If a key's value is False and false\_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and false\_unsets is not True, then the key's value will be set to an empty string. Default: False

**clear\_all**

USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear\_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False

**update\_minion**

If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

**permanent**

On Windows minions this will set the environment variable in the registry so that it is always added as an environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```
salt '*' environ.setenv '{"foo": "bar", "baz": "quux"}'
salt '*' environ.setenv '{"a": "b", "c": False}' false_unsets=True
```

`salt.modules.environ.setval` (*key*, *val*, *false\_unsets=False*, *permanent=False*)

Set a single salt process environment variable. Returns True on success.

**key**

The environment key to set. Must be a string.

**val**

The value to set. Must be a string or False. Refer to the 'false\_unsets' parameter for behavior when set to False.

**false\_unsets**

If val is False and false\_unsets is True, then the key will be removed from the salt processes environment dict entirely. If val is False and false\_unsets is not True, then the key's value will be set to an empty string. Default: False.

**permanent**

On Windows minions this will set the environment variable in the registry so that it is always added as an environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```
salt '*' environ.setval foo bar
salt '*' environ.setval baz val=False false_unsets=True
salt '*' environ.setval baz bar permanent=True
salt '*' environ.setval baz bar permanent=HKLM
```

## 26.6.127 salt.modules.eselect

Support for eselect, Gentoo's configuration and management tool.

**salt.modules.eselect.exec\_action**(*module*, *action*, *module\_parameter=None*, *action\_parameter=None*, *state\_only=False*)

Execute an arbitrary action on a module.

**module**

name of the module to be executed

**action**

name of the module's action to be run

**module\_parameter**

additional params passed to the defined module

**action\_parameter**

additional params passed to the defined action

**state\_only**

don't return any output but only the success/failure of the operation

CLI Example (updating the php implementation used for apache2):

```
salt '*' eselect.exec_action php update action_parameter='apache2'
```

**salt.modules.eselect.get\_current\_target**(*module*, *module\_parameter=None*, *action\_parameter=None*)

Get the currently selected target for the given module.

**module**

name of the module to be queried for its current target

**module\_parameter**

additional params passed to the defined module

**action\_parameter**

additional params passed to the 'show' action

CLI Example (current target of system-wide java-vm):

```
salt '*' eselect.get_current_target java-vm action_parameter='system'
```

CLI Example (current target of kernel symlink):

```
salt '*' eselect.get_current_target kernel
```

**salt.modules.eselect.get\_modules**()

List available eselect modules.

CLI Example:

```
salt '*' eselect.get_modules
```

**salt.modules.eselect.get\_target\_list**(*module*, *action\_parameter=None*)

List available targets for the given module.

**module**

name of the module to be queried for its targets

**action\_parameter**

additional params passed to the defined action

New in version 2016.11.0.

CLI Example:

```
salt '*' eselect.get_target_list kernel
```

`salt.modules.eselect.set_target(module, target, module_parameter=None, action_parameter=None)`

Set the target for the given module. Target can be specified by index or name.

**module**

name of the module for which a target should be set

**target**

name of the target to be set for this module

**module\_parameter**

additional params passed to the defined module

**action\_parameter**

additional params passed to the defined action

CLI Example (setting target of system-wide java-vm):

```
salt '*' eselect.set_target java-vm icedtea-bin-7 action_parameter='system
→'
```

CLI Example (setting target of kernel symlink):

```
salt '*' eselect.set_target kernel linux-3.17.5-gentoo
```

### 26.6.128 salt.modules.esxcluster

Module used to access the esxcluster proxy connection methods

**Warning:** This module will be deprecated in a future release of Salt. VMware strongly recommends using the [VMware Salt extensions](#) instead of the ESX cluster module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.

`salt.modules.esxcluster.get_details()`

### 26.6.129 salt.modules.esxdatacenter

Module used to access the esxdatacenter proxy connection methods

**Warning:** This module will be deprecated in a future release of Salt. VMware strongly recommends using the [VMware Salt extensions](#) instead of the ESX data center module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.

```
salt.modules.esxdatacenter.get_details()
```

### 26.6.130 salt.modules.esxi

Glues the VMware vSphere Execution Module to the VMware ESXi Proxy Minions to the *esxi proxymodule*.

**Warning:** This module will be deprecated in a future release of Salt. VMware strongly recommends using the [VMware Salt extensions](#) instead of the ESXi module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.

Depends: *vSphere Remote Execution Module (salt.modules.vsphere)*

For documentation on commands that you can direct to an ESXi host via proxy, look in the documentation for *salt.modules.vsphere*.

This execution module calls through to a function in the ESXi proxy module called `ch_config`, which looks up the function passed in the `command` parameter in *salt.modules.vsphere* and calls it.

To execute commands with an ESXi Proxy Minion using the vSphere Execution Module, use the `esxi.cmd <vsphere-function-name>` syntax. Both `args` and `kwargs` needed for various vsphere execution module functions must be passed through in a `kwargs`-type manner.

```
salt 'esxi-proxy' esxi.cmd system_info
salt 'esxi-proxy' esxi.cmd get_service_policy service_name='ssh'
```

```
salt.modules.esxi.cmd(command, *args, **kwargs)
```

```
salt.modules.esxi.get_details()
```

### 26.6.131 salt.modules.esxvm

Module used to access the esx proxy connection methods

**Warning:** This module will be deprecated in a future release of Salt. VMware strongly recommends using the [VMware Salt extensions](#) instead of the ESX VSM module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.

```
salt.modules.esxvm.get_details()
```

## 26.6.132 salt.modules.etcd\_mod

Execution module to work with etcd

### depends

- python-etcd or etcd3-py

### Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

In order to choose whether to use etcd API v2 or v3, you can put the following configuration option in the same place as your etcd configuration. This option defaults to true, meaning you will use v2 unless you specify otherwise.

```
etcd.require_v2: True
```

When using API v3, there are some specific options available to be configured within your etcd profile. They are defaulted to the following...

```
etcd.encode_keys: False
etcd.encode_values: True
etcd.raw_keys: False
etcd.raw_values: False
etcd.unicode_errors: "surrogateescape"
```

`etcd.encode_keys` indicates whether you want to pre-encode keys using msgpack before adding them to etcd.

---

**Note:** If you set `etcd.encode_keys` to `True`, all recursive functionality will no longer work. This includes `tree` and `ls` and all other methods if you set `recurse/recursive` to `True`. This is due to the fact that when encoding with msgpack, keys like `/salt` and `/salt/stack` will have differing byte prefixes, and etcd v3 searches recursively using prefixes.

---

`etcd.encode_values` indicates whether you want to pre-encode values using msgpack before adding them to etcd. This defaults to `True` to avoid data loss on non-string values wherever possible.

`etcd.raw_keys` determines whether you want the raw key or a string returned.

`etcd.raw_values` determines whether you want the raw value or a string returned.

`etcd.unicode_errors` determines what you policy to follow when there are encoding/decoding errors.

---

**Note:** The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the `pillar_opts` must be set to `True`.

---

Be aware that setting `pillar_opts` to `True` has security implications as this makes all master configuration settings available in all minion's pillars.

---

`salt.modules.etcd_mod.get_(key, recurse=False, profile=None, **kwargs)`

New in version 2014.7.0.

Get a value from etcd, by direct path. Returns `None` on failure.

CLI Examples:

```
salt myminion etcd.get /path/to/key
salt myminion etcd.get /path/to/key profile=my_etcd_config
salt myminion etcd.get /path/to/key recurse=True profile=my_etcd_config
salt myminion etcd.get /path/to/key host=127.0.0.1 port=2379
```

`salt.modules.etcd_mod.ls_(path='/', profile=None, **kwargs)`

New in version 2014.7.0.

Return all keys and dirs inside a specific path. Returns an empty dict on failure.

CLI Example:

```
salt myminion etcd.ls /path/to/dir/
salt myminion etcd.ls /path/to/dir/ profile=my_etcd_config
salt myminion etcd.ls /path/to/dir/ host=127.0.0.1 port=2379
```

`salt.modules.etcd_mod.rm_(key, recurse=False, profile=None, **kwargs)`

New in version 2014.7.0.

Delete a key from etcd. Returns `True` if the key was deleted, `False` if it was not and `None` if there was a failure.

CLI Example:

```
salt myminion etcd.rm /path/to/key
salt myminion etcd.rm /path/to/key profile=my_etcd_config
salt myminion etcd.rm /path/to/key host=127.0.0.1 port=2379
salt myminion etcd.rm /path/to/dir recurse=True profile=my_etcd_config
```

`salt.modules.etcd_mod.set_(key, value, profile=None, ttl=None, directory=False, **kwargs)`

New in version 2014.7.0.

Set a key in etcd by direct path. Optionally, create a directory or set a TTL on the key. Returns `None` on failure.

CLI Example:

```
salt myminion etcd.set /path/to/key value
salt myminion etcd.set /path/to/key value profile=my_etcd_config
salt myminion etcd.set /path/to/key value host=127.0.0.1 port=2379
salt myminion etcd.set /path/to/dir ' ' directory=True
salt myminion etcd.set /path/to/key value ttl=5
```

`salt.modules.etcd_mod.tree(path='/', profile=None, **kwargs)`

New in version 2014.7.0.

Recurse through etcd and return all values. Returns `None` on failure.

CLI Example:

```
salt myminion etcd.tree
salt myminion etcd.tree profile=my_etcd_config
salt myminion etcd.tree host=127.0.0.1 port=2379
salt myminion etcd.tree /path/to/keys profile=my_etcd_config
```

`salt.modules.etcd_mod.update`(*fields*, *path=""*, *profile=None*, *\*\*kwargs*)

New in version 2016.3.0.

Sets a dictionary of values in one call. Useful for large updates in syndic environments. The dictionary can contain a mix of formats such as:

```
{
  '/some/example/key': 'bar',
  '/another/example/key': 'baz'
}
```

Or it may be a straight dictionary, which will be flattened to look like the above format:

```
{
  'some': {
    'example': {
      'key': 'bar'
    }
  },
  'another': {
    'example': {
      'key': 'baz'
    }
  }
}
```

You can even mix the two formats and it will be flattened to the first format. Leading and trailing '/' will be removed.

Empty directories can be created by setting the value of the key to an empty dictionary.

The 'path' parameter will optionally set the root of the path to use.

CLI Example:

```
salt myminion etcd.update "{ '/path/to/key': 'baz', '/another/key': 'bar' }"
salt myminion etcd.update "{ '/path/to/key': 'baz', '/another/key': 'bar' }"
→" profile=my_etcd_config
salt myminion etcd.update "{ '/path/to/key': 'baz', '/another/key': 'bar' }"
→" host=127.0.0.1 port=2379
salt myminion etcd.update "{ '/path/to/key': 'baz', '/another/key': 'bar' }"
→" path='/some/root'
```

`salt.modules.etcd_mod.watch`(*key*, *recurse=False*, *profile=None*, *timeout=0*, *index=None*, *\*\*kwargs*)

New in version 2016.3.0.

Makes a best effort to watch for a key or tree change in etcd. Returns a dict containing the new key value ( or None if the key was deleted ), the modifiedIndex of the key, whether the key changed or not, the path to the key that changed and whether it is a directory or not.

If something catastrophic happens, returns {}

CLI Example:

```
salt myminion etcd.watch /path/to/key
salt myminion etcd.watch /path/to/key timeout=10
salt myminion etcd.watch /patch/to/key profile=my_etcd_config index=10
salt myminion etcd.watch /patch/to/key host=127.0.0.1 port=2379
```

### 26.6.133 salt.modules.ethtool

Module for running ethtool command

New in version 2016.3.0.

**codeauthor**

Krzysztof Pawlowski <msciciel@msciciel.eu>

**maturity**

new

**depends**

python-ethtool

**platform**

linux

**salt.modules.ethtool.set\_coalesce**(*devname*, *\*\*kwargs*)

Changes the coalescing settings of the specified network device

CLI Example:

```
salt '*' ethtool.set_coalesce <devname> [adaptive_rx=on|off] [adaptive_
→tx=on|off] [rx_usec=N] [rx_frames=N]
    [rx_usec_irq=N] [rx_frames_irq=N] [tx_usec=N] [tx_frames=N] [tx_
→usec_irq=N] [tx_frames_irq=N]
    [stats_block_usec=N] [pkt_rate_low=N] [rx_usec_low=N] [rx_frames_
→low=N] [tx_usec_low=N] [tx_frames_low=N]
    [pkt_rate_high=N] [rx_usec_high=N] [rx_frames_high=N] [tx_usec_
→high=N] [tx_frames_high=N]
    [sample_interval=N]
```

**salt.modules.ethtool.set\_feature**(*devname*, *\*\*kwargs*)

New in version 3006.0.

Changes the feature parameters of the specified network device

CLI Example:

```
salt '*' ethtool.set_feature <devname> sg=off
```

**salt.modules.ethtool.set\_offload**(*devname*, *\*\*kwargs*)

Changes the offload parameters and other features of the specified network device

CLI Example:

```
salt '*' ethtool.set_offload <devname> tcp_segmentation_offload=on
```

`salt.modules.ethtool.set_pause(devname, **kwargs)`

New in version 3006.0.

Changes the pause parameters of the specified network device

CLI Example:

```
salt '*' ethtool.set_pause <devname> autoneg=off rx=off tx=off
```

`salt.modules.ethtool.set_ring(devname, **kwargs)`

Changes the rx/tx ring parameters of the specified network device

CLI Example:

```
salt '*' ethtool.set_ring <devname> [rx=N] [rx_mini=N] [rx_jumbo=N] [tx=N]
```

`salt.modules.ethtool.show_coalesce(devname)`

Queries the specified network device for coalescing information

CLI Example:

```
salt '*' ethtool.show_coalesce <devname>
```

`salt.modules.ethtool.show_driver(devname)`

Queries the specified network device for associated driver information

CLI Example:

```
salt '*' ethtool.show_driver <devname>
```

`salt.modules.ethtool.show_features(devname)`

New in version 3006.0.

Queries the specified network device for associated feature information

CLI Example:

```
salt '*' ethtool.show_features <devname>
```

`salt.modules.ethtool.show_offload(devname)`

Queries the specified network device for the state of protocol offload and other features

CLI Example:

```
salt '*' ethtool.show_offload <devname>
```

`salt.modules.ethtool.show_pause(devname)`

New in version 3006.0.

Queries the specified network device for associated pause information

CLI Example:

```
salt '*' ethtool.show_pause <devname>
```

`salt.modules.ethtool.show_ring(devname)`

Queries the specified network device for rx/tx ring parameter information

CLI Example:

```
salt '*' ethtool.show_ring <devname>
```

### 26.6.134 salt.modules.event

Use the *Salt Event System* to fire events from the master to the minion and vice-versa.

`salt.modules.event.fire(data, tag)`

Fire an event on the local minion event bus. Data must be formed as a dict.

CLI Example:

```
salt '*' event.fire '{"data": "my event data"}' 'tag'
```

`salt.modules.event.fire_master(data, tag, preload=None)`

Fire an event off up to the master server

CLI Example:

```
salt '*' event.fire_master '{"data": "my event data"}' 'tag'
```

`salt.modules.event.send(tag, data=None, preload=None, with_env=False, with_grains=False, with_pillar=False, with_env_opts=False, **kwargs)`

Send an event to the Salt Master

New in version 2014.7.0.

#### Parameters

- **tag** -- A tag to give the event. Use slashes to create a namespace for related events. E.g., `myco/build/buildserver1/start`, `myco/build/buildserver1/success`, `myco/build/buildserver1/failure`.
- **data** -- A dictionary of data to send in the event. This is free-form. Send any data points that are needed for whoever is consuming the event. Arguments on the CLI are interpreted as YAML so complex data structures are possible.
- **with\_env** (Specify `True` to include all environment variables, or specify a list of strings of variable names to include.) -- Include environment variables from the current shell environment in the event data as `environ`. This is a short-hand for working with systems that seed the environment with relevant data such as Jenkins.
- **with\_grains** (Specify `True` to include all grains, or specify a list of strings of grain names to include.) -- Include grains from the current minion in the event data as `grains`.
- **with\_pillar** (Specify `True` to include all Pillar values, or specify a list of strings of Pillar keys to include. It is a best-practice to only specify a relevant subset of Pillar data.) -- Include Pillar values from the current minion in the event data as `pillar`. Remember Pillar data is often sensitive data so be careful. This is useful for passing ephemeral Pillar values through an event. Such as passing the `pillar={}` kwarg in `state.sls` from the Master, through an event on the Minion, then back to the Master.
- **with\_env\_opts** (Specify `True` to include `saltenv` and `pillarenv` values or `False` to omit them.) -- Include `saltenv` and `pillarenv` set on minion at the moment when event is send into event data.
- **kwargs** -- Any additional keyword arguments passed to this function will be interpreted as key-value pairs and included in the event data. This provides a convenient alternative to YAML for simple values.

CLI Example:

```
salt-call event.send myco/mytag foo=Foo bar=Bar
salt-call event.send 'myco/mytag' '{foo: Foo, bar: Bar}'
```

### 26.6.135 salt.modules.extfs

Module for managing ext2/3/4 file systems

`salt.modules.extfs.attributes` (*device*, *args=None*)

Return attributes from dumpe2fs for a specified device

CLI Example:

```
salt '*' extfs.attributes /dev/sda1
```

`salt.modules.extfs.blocks` (*device*, *args=None*)

Return block and inode info from dumpe2fs for a specified device

CLI Example:

```
salt '*' extfs.blocks /dev/sda1
```

`salt.modules.extfs.dump` (*device*, *args=None*)

Return all contents of dumpe2fs for a specified device

CLI Example:

```
salt '*' extfs.dump /dev/sda1
```

`salt.modules.extfs.mkfs` (*device*, *fs\_type*, *full\_return=False*, *\*\*kwargs*)

Create a file system on the specified device

**full\_return**

[False] If True, the full `cmd.run_all` dictionary will be returned instead of just stdout/stderr text. Useful for setting the result of the `module.run` state.

CLI Example:

```
salt '*' extfs.mkfs /dev/sda1 fs_type=ext4 opts='acl,noexec'
```

Valid options are:

- **block\_size**: 1024, 2048 or 4096
- **check**: check for bad blocks
- **direct**: use direct IO
- **ext\_opts**: extended file system options (comma-separated)
- **fragment\_size**: size of fragments
- **force**: setting force to True will cause mke2fs to specify the -F option twice (it is already set once); this is truly dangerous
- **blocks\_per\_group**: number of blocks in a block group
- **number\_of\_groups**: ext4 option for a virtual block group

- **bytes\_per\_inode**: set the bytes/inode ratio
- **inode\_size**: size of the inode
- **journal**: set to True to create a journal (default on ext3/4)
- **journal\_opts**: options for the fs journal (comma separated)
- **blocks\_file**: read bad blocks from file
- **label**: label to apply to the file system
- **reserved**: percentage of blocks reserved for super-user
- **last\_dir**: last mounted directory
- **test**: set to True to not actually create the file system (mke2fs -n)
- **number\_of\_inodes**: override default number of inodes
- **creator\_os**: override "creator operating system" field
- **opts**: mount options (comma separated)
- **revision**: set the filesystem revision (default 1)
- **super**: write superblock and group descriptors only
- **fs\_type**: set the filesystem type (REQUIRED)
- **usage\_type**: how the filesystem is going to be used
- **uuid**: set the UUID for the file system
- **cluster\_size**: specify the size of cluster in bytes for file systems using the bigalloc feature
- **root\_directory**: copy the contents of the given directory into the root directory of the file system
- **errors\_behavior**: change the behavior of the kernel code when errors are detected

See the `mke2fs(8)` manpage for a more complete description of these options.

`salt.modules.extfs.tune` (*device*, *full\_return=False*, *\*\*kwargs*)

Set attributes for the specified device (using `tune2fs`)

#### **full\_return**

[False] If True, the full `cmd.run_all` dictionary will be returned instead of just `stdout/stderr` text. Useful for setting the result of the `module.run` state.

CLI Example:

```
salt '*' extfs.tune /dev/sda1 force=True label=wildstallyns opts='acl,  
↪noexec'
```

Valid options are:

- **max**: max mount count
- **count**: mount count
- **error**: error behavior
- **extended\_opts**: extended options (comma separated)
- **force**: force, even if there are errors (set to True)
- **group**: group name or gid that can use the reserved blocks
- **interval**: interval between checks

- **journal**: set to True to create a journal (default on ext3/4)
- **journal\_opts**: options for the fs journal (comma separated)
- **label**: label to apply to the file system
- **reserved\_percentage**: percentage of blocks reserved for super-user
- **last\_dir**: last mounted directory
- **opts**: mount options (comma separated)
- **feature**: set or clear a feature (comma separated)
- **mmp\_check**: mmp check interval
- **reserved**: reserved blocks count
- **quota\_opts**: quota options (comma separated)
- **time**: time last checked
- **user**: user or uid who can use the reserved blocks
- **uuid**: set the UUID for the file system

See the `mke2fs(8)` manpage for a more complete description of these options.

### 26.6.136 salt.modules.file

Manage information about regular files, directories, and special files on the minion, set/read user, group, mode, and data

**class** `salt.modules.file.AttrChanges`(*added*, *removed*)

#### **added**

Alias for field number 0

#### **removed**

Alias for field number 1

`salt.modules.file.access`(*path*, *mode*)

New in version 2014.1.0.

Test whether the Salt process has the specified access to the file. One of the following modes must be specified:

```
f: Test the existence of the path
r: Test the readability of the path
w: Test the writability of the path
x: Test whether the path can be executed
```

CLI Example:

```
salt '*' file.access /path/to/file f
salt '*' file.access /path/to/file x
```

`salt.modules.file.append`(*path*, *\*args*, *\*\*kwargs*)

New in version 0.9.5.

Append text to the end of a file

**path**

path to file

**\*args**

strings to append to file

CLI Example:

```
salt '*' file.append /etc/motd \  
    "With all thine offerings thou shalt offer salt." \  
    "Salt is what makes things taste bad when it isn't in them."
```

---

**Attention**

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, args. For example:

```
salt '*' file.append /etc/motd args='cheese=spam'  
salt '*' file.append /etc/motd args="['cheese=spam', 'spam=cheese']"
```

---

**salt.modules.file.apply\_template\_on\_contents**(*contents, template, context, defaults, saltenv*)

Return the contents after applying the templating engine

**contents**

template string

**template**

template format

**context**

Overrides default context variables passed to the template.

**defaults**

Default context passed to the template.

CLI Example:

```
salt '*' file.apply_template_on_contents \  
    contents='This is a {{ template }} string.' \  
    template=jinja \  
    "context={}" "defaults={'template': 'cool'}" \  
    saltenv=base
```

**salt.modules.file.basename**(*path*)

Returns the final component of a pathname

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- set filename = salt['file.basename'](source_file) %}
```

CLI Example:

```
salt '*' file.basename 'test/test.config'
```

`salt.modules.file.blockreplace` (*path*, *marker\_start*='#-- start managed zone --', *marker\_end*='#-- end managed zone --', *content*="", *append\_if\_not\_found*=False, *prepend\_if\_not\_found*=False, *backup*='.bak', *dry\_run*=False, *show\_changes*=True, *append\_newline*=False, *insert\_before\_match*=None, *insert\_after\_match*=None)

New in version 2014.1.0.

Replace content of a text block in a file, delimited by line markers

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal.

---

**Note:** This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

---

#### **path**

Filesystem path to the file to be edited

#### **marker\_start**

The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

#### **marker\_end**

The line content identifying the end of the content block. As of versions 2017.7.5 and 2018.3.1, everything up to the text matching the marker will be replaced, so it's important to ensure that your marker includes the beginning of the text you wish to replace.

#### **content**

The content to be used between the two lines identified by `marker_start` and `marker_stop`.

#### **append\_if\_not\_found: False**

If markers are not found and set to `True` then, the markers and content will be appended to the file.

#### **prepend\_if\_not\_found: False**

If markers are not found and set to `True` then, the markers and content will be prepended to the file.

#### **insert\_before\_match**

If markers are not found, this parameter can be set to a regex which will insert the block before the first found occurrence in the file.

New in version 3001.

#### **insert\_after\_match**

If markers are not found, this parameter can be set to a regex which will insert the block after the first found occurrence in the file.

New in version 3001.

#### **backup**

The file extension to use for a backup of the file if any edit is made. Set to `False` to skip making a backup.

#### **dry\_run: False**

If `True`, do not make any edits to the file and simply return the changes that *would* be made.

#### **show\_changes: True**

Controls how changes are presented. If `True`, this function will return a unified diff of the changes made. If `False`, then it will return a boolean (`True` if any changes were made, otherwise `False`).

**append\_newline: False**

Controls whether or not a newline is appended to the content block. If the value of this argument is `True` then a newline will be added to the content block. If it is `False`, then a newline will *not* be added to the content block. If it is `None` then a newline will only be added to the content block if it does not already end in a newline.

New in version 2016.3.4.

Changed in version 2017.7.5,2018.3.1: New behavior added when value is `None`.

Changed in version 2019.2.0: The default value of this argument will change to `None` to match the behavior of the `file.blockreplace state`

CLI Example:

```
salt '*' file.blockreplace /etc/hosts '#-- start managed zone foobar : DO
↳NOT EDIT --' \
'#-- end managed zone foobar --' '$'10.0.1.1 foo.foobar\n10.0.1.2 bar.
↳foobar' True
```

`salt.modules.file.chattr(*files, **kwargs)`

New in version 2018.3.0.

Change the attributes of files. This function accepts one or more files and the following options:

**operator**

Can be wither add or remove. Determines whether attributes should be added or removed from files

**attributes**

One or more of the following characters: aAcCdDeijPsStTu, representing attributes to add to/remove from files

**version**

a version number to assign to the file(s)

**flags**

One or more of the following characters: RVf, representing flags to assign to chattr (recurse, verbose, suppress most errors)

CLI Example:

```
salt '*' file.chattr foo1.txt foo2.txt operator=add attributes=ai
salt '*' file.chattr foo3.txt operator=remove attributes=i version=2
```

`salt.modules.file.check_file_meta(name, sfn, source, source_sum, user, group, mode, attrs, saltenv, contents=None, seuser=None, serole=None, setype=None, serange=None, verify_ssl=True, follow_symlinks=False)`

Check for the changes in the file metadata.

CLI Example:

```
salt '*' file.check_file_meta /etc/httpd/conf.d/httpd.conf None salt://
↳http/httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root root '755'
↳None base
```

---

**Note:** Supported hash types include sha512, sha384, sha256, sha224, sha1, and md5.

---

<b>name</b>	Path to file destination
<b>sfn</b>	Template-processed source file contents
<b>source</b>	URL to file source
<b>source_sum</b>	File checksum information as a dictionary
	<pre>{hash_type: md5, hsum: &lt;md5sum&gt;}</pre>
<b>user</b>	Destination file user owner
<b>group</b>	Destination file group owner
<b>mode</b>	Destination file permissions mode
<b>attrs</b>	Destination file attributes
	New in version 2018.3.0.
<b>saltenv</b>	Salt environment used to resolve source files
<b>contents</b>	File contents
<b>seuser</b>	selinux user attribute
	New in version 3001.
<b>serole</b>	selinux role attribute
	New in version 3001.
<b>setype</b>	selinux type attribute
	New in version 3001.
<b>serange</b>	selinux range attribute
	New in version 3001.
<b>verify_ssl</b>	If <code>False</code> , remote https file sources ( <code>https://</code> ) will not attempt to validate the servers certificate. Default is <code>True</code> .
	New in version 3002.
<b>follow_symlinks</b>	If the desired path is a symlink, follow it and check the permissions of the file to which the symlink points.
	New in version 3005.

`salt.modules.file.check_hash`(*path*, *file\_hash*)

Check if a file matches the given hash string

Returns True if the hash matches, otherwise False.

**path**

Path to a file local to the minion.

**hash**

The hash to check against the file specified in the `path` argument.

Changed in version 2016.11.4.

For this and newer versions the hash can be specified without an accompanying hash type (e.g. `e138491e9d5b97023cea823fe17bac22`), but for earlier releases it is necessary to also specify the hash type in the format `<hash_type>=<hash_value>` (e.g. `md5=e138491e9d5b97023cea823fe17bac22`).

CLI Example:

```
salt '*' file.check_hash /etc/fstab e138491e9d5b97023cea823fe17bac22
salt '*' file.check_hash /etc/fstab md5=e138491e9d5b97023cea823fe17bac22
```

`salt.modules.file.check_managed`(*name*, *source*, *source\_hash*, *source\_hash\_name*, *user*, *group*, *mode*, *attrs*, *template*, *context*, *defaults*, *saltenv*, *contents=None*, *skip\_verify=False*, *seuser=None*, *serole=None*, *setype=None*, *serange=None*, *follow\_symlinks=False*, *\*\*kwargs*)

Check to see what changes need to be made for a file

**follow\_symlinks**

If the desired path is a symlink, follow it and check the permissions of the file to which the symlink points.

New in version 3005.

CLI Example:

```
salt '*' file.check_managed /etc/httpd/conf.d/httpd.conf salt://http/
→httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755'
→jinja True None None base
```

`salt.modules.file.check_managed_changes`(*name*, *source*, *source\_hash*, *source\_hash\_name*, *user*, *group*, *mode*, *attrs*, *template*, *context*, *defaults*, *saltenv*, *contents=None*, *skip\_verify=False*, *keep\_mode=False*, *seuser=None*, *serole=None*, *setype=None*, *serange=None*, *verify\_ssl=True*, *follow\_symlinks=False*, *\*\*kwargs*)

Return a dictionary of what changes need to be made for a file

Changed in version 3001: selinux attributes added

**verify\_ssl**

If False, remote https file sources (`https://`) and `source_hash` will not attempt to validate the servers certificate. Default is True.

New in version 3002.

**follow\_symlinks**

If the desired path is a symlink, follow it and check the permissions of the file to which the symlink points.

New in version 3005.

CLI Example:

```
salt '*' file.check_managed_changes /etc/httpd/conf.d/httpd.conf salt://
↳http/httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755
↳' jinja True None None base
```

`salt.modules.file.check_perms` (*name, ret, user, group, mode, attrs=None, follow\_symlinks=False, seuser=None, serole=None, setype=None, serange=None*)

Changed in version 3001: Added selinux options

Check the permissions on files, modify attributes and chown if needed. File attributes are only verified if `lsattr(1)` is installed.

CLI Example:

```
salt '*' file.check_perms /etc/sudoers '{}' root root 400 ai
```

Changed in version 2014.1.3: `follow_symlinks` option added

`salt.modules.file.chgrp` (*path, group*)

Change the group of a file

**path**

path to the file or directory

**group**

group owner

CLI Example:

```
salt '*' file.chgrp /etc/passwd root
```

`salt.modules.file.chown` (*path, user, group*)

Chown a file, pass the file the desired user and group

**path**

path to the file or directory

**user**

user owner

**group**

group owner

CLI Example:

```
salt '*' file.chown /etc/passwd root root
```

`salt.modules.file.comment` (*path, regex, char='#, backup='.bak')*

Deprecated since version 0.17.0: Use `replace()` instead.

Comment out specified lines in a file

**path**

The full path to the file to be edited

**regex**

A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing `^` or `$` characters outside the parenthesis (e.g., the pattern `^foo$` will be rewritten as `^(foo)$`)

**char: #**

The character to be inserted at the beginning of a line in order to comment it out

**backup: .bak**

The file will be backed up before edit with this file extension

**Warning:** This backup will be overwritten each time `sed / comment / uncomment` is called. Meaning the backup will only be useful after the first invocation.

CLI Example:

```
salt '*' file.comment /etc/modules pcspr
```

`salt.modules.file.comment_line` (*path, regex, char='#, cmnt=True, backup='.bak'*)

Comment or Uncomment a line in a text file.

**Parameters**

- **path** -- string The full path to the text file.
- **regex** -- string A regex expression that begins with `^` that will find the line you wish to comment. Can be as simple as `^color =`
- **char** -- string The character used to comment a line in the type of file you're referencing. Default is `#`
- **cmnt** -- boolean True to comment the line. False to uncomment the line. Default is True.
- **backup** -- string The file extension to give the backup file. Default is `.bak` Set to `False/None` to not keep a backup.

**Returns**

boolean Returns True if successful, False if not

CLI Example:

The following example will comment out the `pcspr` line in the `/etc/modules` file using the default `#` character and create a backup file named `modules.bak`

```
salt '*' file.comment_line '/etc/modules' '^pcspr'
```

CLI Example:

The following example will uncomment the `log_level` setting in `minion` config file if it is set to either `warning`, `info`, or `debug` using the `#` character and create a backup file named `minion.bk`

```
salt '*' file.comment_line 'C:\salt\conf\minion' '^log_level:(
→(warning|info|debug)' '#' False '.bk'
```

`salt.modules.file.contains` (*path, text*)

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the file at `path` contains `text`

CLI Example:

```
salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

`salt.modules.file.contains_glob`(*path*, *glob\_expr*)

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the given glob matches a string in the named file

CLI Example:

```
salt '*' file.contains_glob /etc/foobar '*cheese*'
```

`salt.modules.file.contains_regex`(*path*, *regex*, *lchar=""*)

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the given regular expression matches on any line in the text of a given file.

If the *lchar* argument (leading char) is specified, it will strip *lchar* from the left side of each line before trying to match

CLI Example:

```
salt '*' file.contains_regex /etc/crontab
```

`salt.modules.file.copy`(*src*, *dst*, *recurse=False*, *remove\_existing=False*)

Copy a file or directory from source to dst

In order to copy a directory, the *recurse* flag is required, and will by default overwrite files in the destination with the same path, and retain all other existing files. (similar to `cp -r` on unix)

*remove\_existing* will remove all files in the target directory, and then copy files from the source.

---

**Note:** The copy function accepts paths that are local to the Salt minion. This function does not support `salt://`, `http://`, or the other additional file paths that are supported by `states.file.managed` and `states.file.recurse`.

---

CLI Example:

```
salt '*' file.copy /path/to/src /path/to/dst
salt '*' file.copy /path/to/src_dir /path/to/dst_dir recurse=True
salt '*' file.copy /path/to/src_dir /path/to/dst_dir recurse=True remove_
→existing=True
```

`salt.modules.file.delete_backup`(*path*, *backup\_id*)

New in version 0.17.0.

Delete a previous version of a file that was backed up using Salt's *file state backup* system.

**path**

The path on the minion to check for backups

**backup\_id**

The numeric id for the backup you wish to delete, as found using `file.list_backups`

CLI Example:

```
salt '*' file.delete_backup /var/cache/salt/minion/file_backup/home/foo/
→bar/baz.txt 0
```

`salt.modules.file.directory_exists(path)`

Tests to see if path is a valid directory. Returns True/False.

CLI Example:

```
salt '*' file.directory_exists /etc
```

`salt.modules.file.dirname(path)`

Returns the directory component of a pathname

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- from salt['file.dirname'](tpldir) + '/vars.jinja' import parent_vars
->%}
```

CLI Example:

```
salt '*' file.dirname 'test/path/filename.config'
```

`salt.modules.file.diskusage(path)`

Recursively calculate disk usage of path and return it in bytes

CLI Example:

```
salt '*' file.diskusage /path/to/check
```

`salt.modules.file.extract_hash(hash_fn, hash_type='sha256', file_name="", source="", source_hash_name=None)`

Changed in version 2016.3.5: Prior to this version, only the `file_name` argument was considered for file-name matches in the hash file. This would be problematic for cases in which the user was relying on a remote checksum file that they do not control, and they wished to use a different name for that file on the minion from the filename on the remote server (and in the checksum file). For example, managing `/tmp/myfile.tar.gz` when the remote file was at `https://mydomain.tld/different_name.tar.gz`. The `file.managed` state now also passes this function the source URI as well as the `source_hash_name` (if specified). In cases where `source_hash_name` is specified, it takes precedence over both the `file_name` and `source`. When it is not specified, `file_name` takes precedence over `source`. This allows for better capability for matching hashes.

Changed in version 2016.11.0: File name and source URI matches are no longer disregarded when `source_hash_name` is specified. They will be used as fallback matches if there is no match to the `source_hash_name` value.

This routine is called from the `file.managed` state to pull a hash from a remote file. Regular expressions are used line by line on the `source_hash` file, to find a potential candidate of the indicated hash type. This avoids many problems of arbitrary file layout rules. It specifically permits pulling hash codes from debian `*.dsc` files.

If no exact match of a hash and filename are found, then the first hash found (if any) will be returned. If no hashes at all are found, then `None` will be returned.

For example:

```
openerp_7.0-latest-1.tar.gz:
file.managed:
- name: /tmp/openerp_7.0-20121227-075624-1_all.deb
```

(continues on next page)

(continued from previous page)

```

- source: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-
→20121227-075624-1.tar.gz
- source_hash: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-
→20121227-075624-1.dsc

```

CLI Example:

```
salt '*' file.extract_hash /path/to/hash/file sha512 /etc/foo
```

**salt.modules.file.file\_exists**(*path*)

Tests to see if path is a valid file. Returns True/False.

CLI Example:

```
salt '*' file.file_exists /etc/passwd
```

**salt.modules.file.find**(*path*, \**args*, \*\**kwargs*)Approximate the Unix `find(1)` command and return a list of paths that meet the specified criteria.

The options include match criteria:

```

name      = path-glob           # case sensitive
iname     = path-glob           # case insensitive
regex     = path-regex          # case sensitive
iregex    = path-regex          # case insensitive
type      = file-types          # match any listed type
user      = users               # match any listed user
group     = groups              # match any listed group
size      = [+ -]number[size-unit] # default unit = byte
mtime     = interval            # modified since date
grep      = regex               # search file contents

```

and/or actions:

```

delete [= file-types]           # default type = 'f'
exec   = command [arg ...]      # where {} is replaced by pathname
print  [= print-opts]

```

and/or depth criteria:

```

maxdepth = maximum depth to transverse in path
mindepth = minimum depth to transverse before checking files or
→directories

```

The default action is `print=path`

path-glob:

```

*          = match zero or more chars
?          = match any char
[abc]      = match a, b, or c
[!abc] or [^abc] = match anything except a, b, and c
[x-y]      = match chars x through y
[!x-y] or [^x-y] = match anything except chars x through y
{a,b,c}    = match a or b or c

```

`path-regex`: a Python Regex (regular expression) pattern to match pathnames

`file-types`: a string of one or more of the following:

```
a: all file types
b: block device
c: character device
d: directory
p: FIFO (named pipe)
f: plain file
l: symlink
s: socket
```

`users`: a space and/or comma separated list of user names and/or uids

`groups`: a space and/or comma separated list of group names and/or gids

`size-unit`:

```
b: bytes
k: kilobytes
m: megabytes
g: gigabytes
t: terabytes
```

`interval`:

```
[<num>w] [<num>d] [<num>h] [<num>m] [<num>s]
```

where:

```
w: week
d: day
h: hour
m: minute
s: second
```

`print-opts`: a comma and/or space separated list of one or more of the following:

```
group: group name
md5: MD5 digest of file contents
mode: file permissions (as integer)
mtime: last modification time (as time_t)
name: file basename
path: file absolute path
size: file size in bytes
type: file type
user: user name
```

CLI Examples:

```
salt '*' file.find / type=f name=\*.bak size=+10m
salt '*' file.find /var mtime=+30d size=+10m print=path,size,mtime
salt '*' file.find /var/log name=\*.[0-9] mtime=+30d size=+10m delete
```

`salt.modules.file.get_devmm(name)`

Get major/minor info from a device

CLI Example:

```
salt '*' file.get_devmm /dev/chr
```

```
salt.modules.file.get_diff(file1, file2, saltenv='base', show_filenames=True, show_changes=True,
                           template=False, source_hash_file1=None, source_hash_file2=None)
```

Return unified diff of two files

#### file1

The first file to feed into the diff utility

Changed in version 2018.3.0: Can now be either a local or remote file. In earlier releases, this had to be a file local to the minion.

#### file2

The second file to feed into the diff utility

Changed in version 2018.3.0: Can now be either a local or remote file. In earlier releases, this had to be a file on the salt fileserver (i.e. `salt://somefile.txt`)

#### show\_filenames: True

Set to `False` to hide the filenames in the top two lines of the diff.

#### show\_changes: True

If set to `False`, and there are differences, then instead of a diff a simple message stating that `show_changes` is set to `False` will be returned.

#### template: False

Set to `True` if two templates are being compared. This is not useful except for within states, with the `obfuscate_templates` option set to `True`.

New in version 2018.3.0.

#### source\_hash\_file1

If `file1` is an `http(s)/ftp` URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

#### source\_hash\_file2

If `file2` is an `http(s)/ftp` URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Examples:

```
salt '*' file.get_diff /home/fred/.vimrc salt://users/fred/.vimrc
salt '*' file.get_diff /tmp/foo.txt /tmp/bar.txt
```

```
salt.modules.file.get_gid(path, follow_symlinks=True)
```

Return the id of the group that owns a given file

#### path

file or directory of which to get the gid

#### follow\_symlinks

indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_gid /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

`salt.modules.file.get_group`(*path*, *follow\_symlinks=True*)

Return the group that owns a given file

**path**

file or directory of which to get the group

**follow\_symlinks**

indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_group /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

`salt.modules.file.get_hash`(*path*, *form='sha256'*, *chunk\_size=65536*)

Get the hash sum of a file

This is better than `get_sum` for the following reasons:

- It does not read the entire file into memory.
- It does not return a string on error. The returned value of `get_sum` cannot really be trusted since it is vulnerable to collisions: `get_sum(..., 'xyz') == 'Hash xyz not supported'`

**path**

path to the file or directory

**form**

desired sum format

**chunk\_size**

amount to sum at once

CLI Example:

```
salt '*' file.get_hash /etc/shadow
```

`salt.modules.file.get_managed`(*name*, *template*, *source*, *source\_hash*, *source\_hash\_name*, *user*, *group*, *mode*, *attrs*, *saltenv*, *context*, *defaults*, *skip\_verify=False*, *verify\_ssl=True*, *use\_etag=False*, *source\_hash\_sig=None*, *signed\_by\_any=None*, *signed\_by\_all=None*, *keyring=None*, *gnupghome=None*, *\*\*kwargs*)

Return the managed file data for `file.managed`

**name**

location where the file lives on the server

**template**

template format

**source**

managed source file

**source\_hash**

hash of the source file

**source\_hash\_name**

When `source_hash` refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.3.5.

**user**

Owner of file

**group**

Group owner of file

**mode**

Permissions of file

**attrs**

Attributes of file

New in version 2018.3.0.

**context**

Variables to add to the template context

**defaults**

Default values of for `context_dict`

**skip\_verify**

If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

**verify\_ssl**

If `False`, remote `https` file sources (`https://`) and `source_hash` will not attempt to validate the servers certificate. Default is `True`.

New in version 3002.

**use\_etag**

If `True`, remote `http/https` file sources will attempt to use the `ETag` header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the `source_hash` parameter.

New in version 3005.

**source\_hash\_sig**

When `source` is a remote file source, `source_hash` is a file, `skip_verify` is not true and `use_etag` is not true, ensure a valid GPG signature exists on the source hash file. Set this to `true` for an inline (clearsigned) signature, or to a file URI retrievable by `:py:func:`cp.cache_file` <salt.modules.cp.cache_file>` for a detached one.

New in version 3007.0.

**signed\_by\_any**

When verifying `source_hash_sig`, require at least one valid signature from one of a list of key fingerprints. This is passed to `gpg.verify`.

New in version 3007.0.

**signed\_by\_all**

When verifying `source_hash_sig`, require a valid signature from each of the key fingerprints in this list. This is passed to `gpg.verify`.

New in version 3007.0.

**keyring**

When verifying `source_hash_sig`, use this keyring.

New in version 3007.0.

**gnupghome**

When verifying `source_hash_sig`, use this GnuPG home.

New in version 3007.0.

CLI Example:

```
salt '*' file.get_managed /etc/httpd/conf.d/httpd.conf jinja salt://http/
↳httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' None root root '755'
↳base None None
```

`salt.modules.file.get_mode`(*path*, *follow\_symlinks=True*)

Return the mode of a file

**path**

file or directory of which to get the mode

**follow\_symlinks**

indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_mode /etc/passwd
```

Changed in version 2014.1.0: `follow_symlinks` option added

`salt.modules.file.get_selinux_context`(*path*)

Get an SELinux context from a given path

CLI Example:

```
salt '*' file.get_selinux_context /etc/hosts
```

`salt.modules.file.get_source_sum`(*file\_name=""*, *source=""*, *source\_hash=None*,  
*source\_hash\_name=None*, *saltenv='base'*, *verify\_ssl=True*,  
*source\_hash\_sig=None*, *signed\_by\_any=None*, *signed\_by\_all=None*,  
*keyring=None*, *gnupghome=None*)

New in version 2016.11.0.

Used by `file.get_managed` to obtain the hash and hash type from the parameters specified below.

**file\_name**

Optional file name being managed, for matching with `file.extract_hash`.

**source**

Source file, as used in `file` and other states. If `source_hash` refers to a file containing hashes, then this filename will be used to match a filename in that file. If the `source_hash` is a hash expression, then this argument will be ignored.

**source\_hash**

Hash file/expression, as used in `file` and other states. If this value refers to a remote URL or absolute path to a local file, it will be cached and `file.extract_hash` will be used to obtain a hash from it.

**source\_hash\_name**

Specific file name to look for when `source_hash` refers to a remote file, used to disambiguate ambiguous matches.

**saltenv: base**

Salt fileserver environment from which to retrieve the `source_hash`. This value will only be used when `source_hash` refers to a file on the Salt fileserver (i.e. one beginning with `salt://`).

**verify\_ssl**

If `False`, remote https file sources (`https://`) and `source_hash` will not attempt to validate the servers certificate. Default is `True`.

New in version 3002.

**source\_hash\_sig**

When `source` is a remote file source and `source_hash` is a file, ensure a valid GPG signature exists on the source hash file. Set this to `true` for an inline (clearsigned) signature, or to a file URI retrievable by `:py:func:cp.cache_file <salt.modules.cp.cache_file>` for a detached one.

New in version 3007.0.

**signed\_by\_any**

When verifying `source_hash_sig`, require at least one valid signature from one of a list of key fingerprints. This is passed to `gpg.verify`.

New in version 3007.0.

**signed\_by\_all**

When verifying `source_hash_sig`, require a valid signature from each of the key fingerprints in this list. This is passed to `gpg.verify`.

New in version 3007.0.

**keyring**

When verifying `source_hash_sig`, use this keyring.

New in version 3007.0.

**gnupghome**

When verifying `source_hash_sig`, use this GnuPG home.

New in version 3007.0.

## CLI Example:

```
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/
→foo.tar.gz source_hash=499ae16dcae71eeb7c3a30c75ea7a1a6
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/
→foo.tar.gz source_hash=https://mydomain.tld/hashes.md5
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/
→foo.tar.gz source_hash=https://mydomain.tld/hashes.md5 source_hash_
→name=./dir2/foo.tar.gz
```

`salt.modules.file.get_sum(path, form='sha256')`

Return the checksum for the given file. The following checksum algorithms are supported:

- md5
- sha1
- sha224
- sha256 (default)
- sha384
- sha512

**path**  
path to the file or directory

**form**  
desired sum format

CLI Example:

```
salt '*' file.get_sum /etc/passwd sha512
```

`salt.modules.file.get_uid(path, follow_symlinks=True)`

Return the id of the user that owns a given file

**path**  
file or directory of which to get the uid

**follow\_symlinks**  
indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_uid /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

`salt.modules.file.get_user(path, follow_symlinks=True)`

Return the user that owns a given file

**path**  
file or directory of which to get the user

**follow\_symlinks**  
indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_user /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

`salt.modules.file.gid_to_group(gid)`

Convert the group id to the group name on this system

**gid**  
gid to convert to a group name

CLI Example:

```
salt '*' file.gid_to_group 0
```

`salt.modules.file.grep(path, pattern, *opts)`

Grep for a string in the specified file

---

**Note:** This function's return value is slated for refinement in future versions of Salt

Windows does not support the `grep` functionality.

---

**path**

Path to the file to be searched

---

**Note:** Globbing is supported (i.e. `/var/log/foo/*.log`, but if globbing is being used then the path should be quoted to keep the shell from attempting to expand the glob expression.

---

**pattern**

Pattern to match. For example: `test`, or `a[0-5]`

**opts**

Additional command-line flags to pass to the `grep` command. For example: `-v`, or `-i -B2`

---

**Note:** The options should come after a double-dash (as shown in the examples below) to keep Salt's own argument parser from interpreting them.

---

CLI Example:

```
salt '*' file.grep /etc/passwd nobody
salt '*' file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i
salt '*' file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i
→-B2
salt '*' file.grep "/etc/sysconfig/network-scripts/*" ipaddr -- -i -l
```

`salt.modules.file.group_to_gid(group)`

Convert the group to the gid on this system

**group**

group to convert to its gid

CLI Example:

```
salt '*' file.group_to_gid root
```

`salt.modules.file.is_blkdev(name)`

Check if a file exists and is a block device.

CLI Example:

```
salt '*' file.is_blkdev /dev/blk
```

`salt.modules.file.is_chrdev(name)`

Check if a file exists and is a character device.

CLI Example:

```
salt '*' file.is_chrdev /dev/chr
```

`salt.modules.file.is_fifo(name)`

Check if a file exists and is a FIFO.

CLI Example:

```
salt '*' file.is_fifo /dev/fifo
```

`salt.modules.file.is_hardlink(path)`

Check if the path is a hard link by verifying that the number of links is larger than 1

CLI Example:

```
salt '*' file.is_hardlink /path/to/link
```

`salt.modules.file.is_link(path)`

Check if the path is a symbolic link

CLI Example:

```
salt '*' file.is_link /path/to/link
```

`salt.modules.file.join(*args)`

Return a normalized file system path for the underlying OS

New in version 2014.7.0.

This can be useful at the CLI but is frequently useful when scripting combining path variables:

```
{% set www_root = '/var' %}
{% set app_dir = 'myapp' %}

myapp_config:
  file:
    - managed
    - name: {{ salt['file.join'](www_root, app_dir, 'config.yaml') }}
```

CLI Example:

```
salt '*' file.join '/' 'usr' 'local' 'bin'
```

`salt.modules.file.lchown(path, user, group)`

Chown a file, pass the file the desired user and group without following symlinks.

**path**

path to the file or directory

**user**

user owner

**group**

group owner

CLI Example:

```
salt '*' file.chown /etc/passwd root root
```

`salt.modules.file.line(path, content=None, match=None, mode=None, location=None, before=None, after=None, show_changes=True, backup=False, quiet=False, indent=True)`

New in version 2015.8.0.

Line-focused editing of a file.

---

**Note:** `file.line` exists for historic reasons, and is not generally recommended. It has a lot of quirks. You may find `file.replace` to be more suitable.

---

`file.line` is most useful if you have single lines in a file (potentially a config file) that you would like to manage. It can remove, add, and replace a single line at a time.

**path**

Filesystem path to the file to be edited.

**content**

Content of the line. Allowed to be empty if `mode= 'delete'`.

**match**

Match the target line for an action by a fragment of a string or regular expression.

If neither `before` nor `after` are provided, and `match` is also `None`, `match` falls back to the `content` value.

**mode**

Defines how to edit a line. One of the following options is required:

- **ensure**  
If line does not exist, it will be added. If `before` and `after` are specified either zero lines, or lines that contain the `content` line are allowed to be in between `before` and `after`. If there are lines, and none of them match then it will produce an error.
- **replace**  
If line already exists, the entire line will be replaced.
- **delete**  
Delete the line, if found.
- **insert**  
Nearly identical to `ensure`. If a line does not exist, it will be added.  
  
The differences are that multiple (and non-matching) lines are allowed between `before` and `after`, if they are specified. The line will always be inserted right before `before`. `insert` also allows the use of `location` to specify that the line should be added at the beginning or end of the file.

---

**Note:** If `mode='insert'` is used, at least one of `location`, `before`, or `after` is required. If `location` is used, `before` and `after` are ignored.

---

**location**

In `mode='insert'` only, whether to place the `content` at the beginning or end of a the file. If `location` is provided, `before` and `after` are ignored. Valid locations:

- **start**  
Place the content at the beginning of the file.
- **end**  
Place the content at the end of the file.

**before**

Regular expression or an exact case-sensitive fragment of the string. Will be tried as **both** a regex **and** a part of the line. Must match **exactly** one line in the file. This value is only used in `ensure` and `insert` modes. The content will be inserted just before this line, with matching indentation unless `indent=False`.

**after**

Regular expression or an exact case-sensitive fragment of the string. Will be tried as **both** a regex **and** a part of the line. Must match **exactly** one line in the file. This value is only used in `ensure` and `insert`

modes. The `content` will be inserted directly after this line, unless `before` is also provided. If `before` is not provided, indentation will match this line, unless `indent=False`.

#### `show_changes`

Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`

---

**Note:** Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

---

#### `backup`

Create a backup of the original file with the extension: "Year-Month-Day-Hour-Minutes-Seconds".

#### `quiet`

Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.

#### `indent`

Keep indentation with the previous line. This option is not considered when the `delete` mode is specified. Default is `True`

CLI Example:

```
salt '*' file.line /etc/nsswitch.conf "networks:          files dns" after=
→ "hosts:.*?" mode='ensure'
```

---

**Note:** If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' file.line /path/to/file content="CREATEMAIL_SPOOL=no" match=
→ "CREATE_MAIL_SPOOL=yes" mode="replace"
```

#### Examples:

Here's a simple config file.

```
[some_config]
# Some config file
# this line will go away

here=False
away=True
goodybe=away
```

```
salt \* file.line /some/file.conf mode=delete match=away
```

This will produce:

```
[some_config]
# Some config file

here=False
```

(continues on next page)

(continued from previous page)

```
away=True
goodbye=away
```

If that command is executed 2 more times, this will be the result:

```
[some_config]
# Some config file

here=False
```

If we reset the file to its original state and run

```
salt \* file.line /some/file.conf mode=replace match=away content=here
```

Three passes with this state will result in this file:

```
[some_config]
# Some config file
here

here=False
here
here
```

Each pass replacing the first line found.

Given this file:

```
insert after me
something
insert before me
```

The following command

```
salt \* file.line /some/file.txt mode=insert after="insert after me"
→before="insert before me" content=thrice
```

If that command is executed 3 times, the result will be:

```
insert after me
something
thrice
thrice
thrice
insert before me
```

If the mode is `ensure` instead, it will fail each time. To succeed, we need to remove the incorrect line between before and after:

```
insert after me
insert before me
```

With an `ensure` mode, this will insert `thrice` the first time and make no changes for subsequent calls. For something simple this is fine, but if you have instead blocks like this:

```
Begin SomeBlock
  foo = bar
End

Begin AnotherBlock
  another = value
End
```

And you try to use ensure this way:

```
salt '*' file.line /tmp/fun.txt mode="ensure" content="this = should be
→my content" after="Begin SomeBlock" before="End"
```

This will fail because there are multiple End lines. Without that problem, it still would fail because there is a non-matching line, `foo = bar`. Ensure **only** allows either zero, or the matching line present to be present in between before and after.

`salt.modules.file.link`(*src*, *path*)

New in version 2014.1.0.

Create a hard link to a file

CLI Example:

```
salt '*' file.link /path/to/file /path/to/link
```

`salt.modules.file.list_backup`(*path*, *limit=None*)

This function is an alias of `list_backups`.

New in version 0.17.0.

Lists the previous versions of a file backed up using Salt's *file state backup* system.

**path**

The path on the minion to check for backups

**limit**

Limit the number of results to the most recent N backups

CLI Example:

```
salt '*' file.list_backups /foo/bar/baz.txt
```

`salt.modules.file.list_backups`(*path*, *limit=None*)

New in version 0.17.0.

Lists the previous versions of a file backed up using Salt's *file state backup* system.

**path**

The path on the minion to check for backups

**limit**

Limit the number of results to the most recent N backups

CLI Example:

```
salt '*' file.list_backups /foo/bar/baz.txt
```

`salt.modules.file.list_backups_dir` (*path*, *limit=None*)

Lists the previous versions of a directory backed up using Salt's *file state backup* system.

**path**

The directory on the minion to check for backups

**limit**

Limit the number of results to the most recent N backups

CLI Example:

```
salt '*' file.list_backups_dir /foo/bar/baz/
```

`salt.modules.file.lsattr` (*path*)

New in version 2018.3.0.

Changed in version 2018.3.1: If `lsattr` is not installed on the system, `None` is returned.

Changed in version 2018.3.4: If on AIX, `None` is returned even if in filesystem as `lsattr` on AIX is not the same thing as the linux version.

Obtain the modifiable attributes of the given file. If *path* is to a directory, an empty list is returned.

**path**

path to file to obtain attributes of. File/directory must exist.

CLI Example:

```
salt '*' file.lsattr foo1.txt
```

`salt.modules.file.lstat` (*path*)

New in version 2014.1.0.

Returns the `lstat` attributes for the given file or dir. Does not support symbolic links.

CLI Example:

```
salt '*' file.lstat /path/to/file
```

`salt.modules.file.makedirs_` (*path*, *user=None*, *group=None*, *mode=None*)

Ensure that the directory containing this path is available.

---

**Note:** The path must end with a trailing slash otherwise the directory/directories will be created up to the parent directory. For example if *path* is `/opt/code`, then it would be treated as `/opt/` but if the path ends with a trailing slash like `/opt/code/`, then it would be treated as `/opt/code/`.

---

CLI Example:

```
salt '*' file.makedirs /opt/code/
```

`salt.modules.file.makedirs_perms` (*name*, *user=None*, *group=None*, *mode='0755'*)

Taken and modified from `os.makedirs` to set user, group and mode for each directory created.

CLI Example:

```
salt '*' file.makedirs_perms /opt/code
```

`salt.modules.file.manage_file` (*name, sfn, ret, source, source\_sum, user, group, mode, attrs, saltenv, backup, makedirs=False, template=None, show\_changes=True, contents=None, dir\_mode=None, follow\_symlinks=True, skip\_verify=False, keep\_mode=False, encoding=None, encoding\_errors='strict', seuser=None, serole=None, setype=None, serange=None, verify\_ssl=True, use\_etag=False, signature=None, source\_hash\_sig=None, signed\_by\_any=None, signed\_by\_all=None, keyring=None, gnupghome=None, \*\*kwargs*)

Checks the destination against what was retrieved with `get_managed` and makes the appropriate modifications (if necessary).

**name**

location to place the file

**sfn**

location of cached file on the minion

This is the path to the file stored on the minion. This file is placed on the minion using `cp.cache_file`. If the hash sum of that file matches the `source_sum`, we do not transfer the file to the minion again.

This file is then grabbed and if it has `template` set, it renders the file to be placed into the correct place on the system using `salt.files.utils.copyfile()`

**ret**

The initial state return data structure. Pass in `None` to use the default structure.

**source**

file reference on the master

**source\_sum**

sum hash for source

**user**

user owner

**group**

group owner

**backup**

`backup_mode`

**attrs**

attributes to be set on file: " means remove all of them

New in version 2018.3.0.

**makedirs**

make directories if they do not exist

**template**

format of templating

**show\_changes**

Include diff in state return

**contents:**

contents to be placed in the file

**dir\_mode**

mode for directories created with `makedirs`

**skip\_verify: False**

If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

**keep\_mode: False**

If `True`, and the `source` is a file from the Salt fileserver (or a local file on the minion), the mode of the destination file will be set to the mode of the source file.

---

**Note:** `keep_mode` does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserver and thus cannot mirror the mode on the salt-ssh minion

---

**encoding**

If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See <https://docs.python.org/3/library/codecs.html#standard-encodings> for the list of available encodings.

New in version 2017.7.0.

**encoding\_errors: 'strict'**

Default is `'strict'`. See <https://docs.python.org/2/library/codecs.html#codec-base-classes> for the error handling schemes.

New in version 2017.7.0.

**seuser**

selinux user attribute

New in version 3001.

**serange**

selinux range attribute

New in version 3001.

**setype**

selinux type attribute

New in version 3001.

**serange**

selinux range attribute

New in version 3001.

**verify\_ssl**

If `False`, remote https file sources (`https://`) will not attempt to validate the servers certificate. Default is `True`.

New in version 3002.

**use\_etag**

If `True`, remote http/https file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the `source_hash` parameter.

New in version 3005.

**signature**

Ensure a valid GPG signature exists on the selected `source` file. Set this to `true` for inline signatures, or to a file URI retrievable by `:py:func:`cp.cache_file <salt.modules.cp.cache_file>` for a detached one.

---

**Note:** A signature is only enforced directly after caching the file, before it is moved to its final destination. Existing target files (with the correct checksum) will neither be checked nor deleted.

It will be enforced regardless of source type and will be required on the final output, therefore this does not lend itself well when templates are rendered. The file will not be modified, meaning inline signatures are not removed.

---

New in version 3007.0.

**source\_hash\_sig**

When `source` is a remote file source, `source_hash` is a file, `skip_verify` is not `true` and `use_etag` is not `true`, ensure a valid GPG signature exists on the source hash file. Set this to `true` for an inline (clearsigned) signature, or to a file URI retrievable by `:py:func:`cp.cache_file <salt.modules.cp.cache_file>` for a detached one.

---

**Note:** A signature on the `source_hash` file is enforced regardless of changes since its contents are used to check if an existing file is in the correct state - but only for remote sources! As for `signature`, existing target files will not be modified, only the cached `source_hash` and `source_hash_sig` files will be removed.

---

New in version 3007.0.

**signed\_by\_any**

When verifying signatures either on the managed file or its source hash file, require at least one valid signature from one of a list of key fingerprints. This is passed to `gpg.verify`.

New in version 3007.0.

**signed\_by\_all**

When verifying signatures either on the managed file or its source hash file, require a valid signature from each of the key fingerprints in this list. This is passed to `gpg.verify`.

New in version 3007.0.

**keyring**

When verifying signatures, use this keyring.

New in version 3007.0.

**gnupghome**

When verifying signatures, use this GnuPG home.

New in version 3007.0.

CLI Example:

```
salt '*' file.manage_file /etc/httpd/conf.d/httpd.conf '{}' salt://
→ http/httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root root '755' '
→ ' base ''
```

Changed in version 2014.7.0: `follow_symlinks` option added

`salt.modules.file.mkdir`(*dir\_path*, *user=None*, *group=None*, *mode=None*)

Ensure that a directory is available.

CLI Example:

```
salt '*' file.mkdir /opt/jetty/context
```

`salt.modules.file.mknod`(*name*, *ntype*, *major=0*, *minor=0*, *user=None*, *group=None*, *mode='0660'*)

New in version 0.17.0.

Create a block device, character device, or fifo pipe. Identical to the gnu `mknod`.

CLI Examples:

```
salt '*' file.mknod /dev/chr c 180 31
salt '*' file.mknod /dev/blk b 8 999
salt '*' file.nknod /dev/fifo p
```

`salt.modules.file.mknod_blkdev`(*name*, *major*, *minor*, *user=None*, *group=None*, *mode='0660'*)

New in version 0.17.0.

Create a block device.

CLI Example:

```
salt '*' file.mknod_blkdev /dev/blk 8 999
```

`salt.modules.file.mknod_chrdev`(*name*, *major*, *minor*, *user=None*, *group=None*, *mode='0660'*)

New in version 0.17.0.

Create a character device.

CLI Example:

```
salt '*' file.mknod_chrdev /dev/chr 180 31
```

`salt.modules.file.mknod_fifo`(*name*, *user=None*, *group=None*, *mode='0660'*)

New in version 0.17.0.

Create a FIFO pipe.

CLI Example:

```
salt '*' file.mknod_fifo /dev/fifo
```

`salt.modules.file.move`(*src*, *dst*, *disallow\_copy\_and\_unlink=False*)

Move a file or directory

#### **disallow\_copy\_and\_unlink**

If `True`, the operation is offloaded to the `file.rename` execution module function. This will use `os.rename` underneath, which will fail in the event that `src` and `dst` are on different filesystems. If `False` (the default), `shutil.move` will be used in order to fall back on a "copy then unlink" approach, which is required for moving across filesystems.

New in version 3006.0.

CLI Example:

```
salt '*' file.move /path/to/src /path/to/dst
```

`salt.modules.file.normpath(path)`

Returns Normalize path, eliminating double slashes, etc.

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- from salt['file.normpath'](tpldir + '/../vars.jinja') import parent_
->vars %}
```

CLI Example:

```
salt '*' file.normpath 'a/b/c/..'
```

`salt.modules.file.open_files(by_pid=False)`

Return a list of all physical open files on the system.

CLI Examples:

```
salt '*' file.open_files
salt '*' file.open_files by_pid=True
```

`salt.modules.file.pardir()`

Return the relative parent directory path symbol for underlying OS

New in version 2014.7.0.

This can be useful when constructing Salt Formulas.

```
{% set pardir = salt['file.pardir']() %}
{% set final_path = salt['file.join']('subdir', pardir, 'confdir') %}
```

CLI Example:

```
salt '*' file.pardir
```

`salt.modules.file.patch(originalfile, patchfile, options="", dry_run=False)`

New in version 0.10.4.

Apply a patch to a file or directory.

Equivalent to:

```
patch <options> -i <patchfile> <originalfile>
```

Or, when a directory is patched:

```
patch <options> -i <patchfile> -d <originalfile> -p0
```

**originalfile**

The full path to the file or directory to be patched

**patchfile**

A patch file to apply to originalfile

**options**

Options to pass to patch.

---

**Note:** Windows now supports using patch as of 3004.

In order to use this function in Windows, please install the patch binary through your own means and ensure it's found in the system Path. If installing through git-for-windows, please select the optional "Use Git and optional Unix tools from the Command Prompt" option when installing Git.

---

CLI Example:

```
salt '*' file.patch /opt/file.txt /tmp/file.txt.patch
salt '*' file.patch C:\file1.txt C:\file3.patch
```

`salt.modules.file.path_exists_glob(path)`

Tests to see if path after expansion is a valid path (file or directory). Expansion allows usage of ? \* and character ranges []. Tilde expansion is not supported. Returns True/False.

New in version 2014.7.0.

CLI Example:

```
salt '*' file.path_exists_glob /etc/pam*/pass*
```

`salt.modules.file.prepend(path, *args, **kwargs)`

New in version 2014.7.0.

Prepend text to the beginning of a file

**path**

path to file

**\*args**

strings to prepend to the file

CLI Example:

```
salt '*' file.prepend /etc/motd \
    "With all thine offerings thou shalt offer salt." \
    "Salt is what makes things taste bad when it isn't in them."
```

---

### Attention

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, args. For example:

```
salt '*' file.prepend /etc/motd args='cheese=spam'
salt '*' file.prepend /etc/motd args="['cheese=spam', 'spam=cheese']"
```

---

`salt.modules.file.psed(path, before, after, limit="", backup='.bak', flags='gMS', escape_all=False, multi=False)`

Deprecated since version 0.17.0: Use `replace()` instead.

Make a simple edit to a file (pure Python version)

Equivalent to:

```
sed <backup> <options> "/<limit>/ s/<before>/<after>/<flags> <file>"
```

**path**

The full path to the file to be edited

**before**

A pattern to find in order to replace with after

**after**

Text that will replace before

**limit: ''**

An initial pattern to search for before searching for before

**backup: .bak**

The file will be backed up before edit with this file extension; **WARNING:** each time sed/comment/uncomment is called will overwrite this backup

**flags: gMS**

Flags to modify the search. Valid values are:

- g: Replace all occurrences of the pattern, not just the first.
- I: Ignore case.
- L: Make \w, \W, \b, \B, \s and \S dependent on the locale.
- M: Treat multiple lines as a single line.
- S: Make . match all characters, including newlines.
- U: Make \w, \W, \b, \B, \d, \D, \s and \S dependent on Unicode.
- X: Verbose (whitespace is ignored).

**multi: False**

If True, treat the entire file as a single line

Forward slashes and single quotes will be escaped automatically in the before and after patterns.

CLI Example:

```
salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

`salt.modules.file.read`(*path*, *binary=False*)

New in version 2017.7.0.

Return the content of the file.

**Parameters**

**binary** (*bool*) -- Whether to read and return binary data

CLI Example:

```
salt '*' file.read /path/to/file
```

`salt.modules.file.readdir`(*path*)

New in version 2014.1.0.

Return a list containing the contents of a directory

CLI Example:

```
salt '*' file.readdir /path/to/dir/
```

`salt.modules.file.readlink`(*path*, *canonicalize=False*)

New in version 2014.1.0.

Return the path that a symlink points to

#### Parameters

- **path** (*str*) -- The path to the symlink
- **canonicalize** (*bool*) -- Get the canonical path eliminating any symbolic links encountered in the path

#### Returns

The path that the symlink points to

#### Return type

*str*

#### Raises

- ***SaltInvocationError*** -- path is not absolute
- ***SaltInvocationError*** -- path is not a link
- ***CommandExecutionError*** -- error reading the symbolic link

CLI Example:

```
salt '*' file.readlink /path/to/link
```

`salt.modules.file.remove`(*path*, *\*\*kwargs*)

Remove the named file. If a directory is supplied, it will be recursively deleted.

CLI Example:

```
salt '*' file.remove /tmp/foo
```

Changed in version 3000: The method now works on all types of file system entries, not just files, directories and symlinks.

`salt.modules.file.remove_backup`(*path*, *backup\_id*)

This function is an alias of `delete_backup`.

New in version 0.17.0.

Delete a previous version of a file that was backed up using Salt's *file state backup* system.

#### path

The path on the minion to check for backups

#### backup\_id

The numeric id for the backup you wish to delete, as found using *file.list\_backups*

CLI Example:

```
salt '*' file.delete_backup /var/cache/salt/minion/file_backup/
↳ home/foo/bar/baz.txt 0
```

`salt.modules.file.rename(src, dst)`

Rename a file or directory

CLI Example:

```
salt '*' file.rename /path/to/src /path/to/dst
```

`salt.modules.file.replace(path, pattern, repl, count=0, flags=8, bufsize=1, append_if_not_found=False, prepend_if_not_found=False, not_found_content=None, backup='.bak', dry_run=False, search_only=False, show_changes=True, ignore_if_missing=False, preserve_inode=True, backslash_literal=False)`

New in version 0.17.0.

Replace occurrences of a pattern in a file. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made.

This is a pure Python implementation that wraps Python's `sub()`.

**path**

Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.

**pattern**

A regular expression, to be matched using Python's `search()`.

**repl**

The replacement text

**count: 0**

Maximum number of pattern occurrences to be replaced. If `count` is a positive integer `n`, only `n` occurrences will be replaced, otherwise all occurrences will be replaced.

**flags (list or int)**

A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., [`'IGNORECASE'`, `'MULTILINE'`]. Optionally, `flags` may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to 8 (which supports `'MULTILINE'`).

**bufsize (int or str)**

How much of the file to buffer into memory at once. The default value `1` processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

**append\_if\_not\_found: False**

New in version 2014.7.0.

If set to `True`, and `pattern` is not found, then the content will be appended to the file.

**prepend\_if\_not\_found: False**

New in version 2014.7.0.

If set to `True` and `pattern` is not found, then the content will be prepended to the file.

**not\_found\_content**

New in version 2014.7.0.

Content to use for `append/prepend` if not found. If `None` (default), uses `repl`. Useful when `repl` uses references to group in `pattern`.

**backup: .bak**

The file extension to use for a backup of the file before editing. Set to `False` to skip making a backup.

**dry\_run: False**

If set to `True`, no changes will be made to the file, the function will just return the changes that would have been made (or a `True/False` value if `show_changes` is set to `False`).

**search\_only: False**

If set to `true`, this no changes will be performed on the file, and this function will simply return `True` if the pattern was matched, and `False` if not.

**show\_changes: True**

If `True`, return a diff of changes made. Otherwise, return `True` if changes were made, and `False` if not.

---

**Note:** Using this option will store two copies of the file in memory (the original version and the edited version) in order to generate the diff. This may not normally be a concern, but could impact performance if used with large files.

---

**ignore\_if\_missing: False**

New in version 2015.8.0.

If set to `True`, this function will simply return `False` if the file doesn't exist. Otherwise, an error will be thrown.

**preserve\_inode: True**

New in version 2015.8.0.

Preserve the inode of the file, so that any hard links continue to share the inode with the original filename. This works by *copying* the file, reading from the copy, and writing to the file at the original inode. If `False`, the file will be *moved* rather than copied, and a new file will be written to a new inode, but using the original filename. Hard links will then share an inode with the backup, instead (if using `backup` to create a backup copy).

**backslash\_literal: False**

New in version 2016.11.7.

Interpret backslashes as literal backslashes for the `repl` and not escape characters. This will help when using `append/prepend` so that the backslashes are not interpreted for the `repl` on the second run of the state.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the `kwarg`:

```
salt '*' file.replace /path/to/file pattern='=' repl=':'
salt '*' file.replace /path/to/file pattern="bind-address\s*=" repl='bind-
→address:'
```

CLI Examples:

```
salt '*' file.replace /etc/httpd/httpd.conf pattern='LogLevel warn' repl=
→'LogLevel info'
salt '*' file.replace /some/file pattern='before' repl='after' flags=
→'[MULTILINE, IGNORECASE]'
```

`salt.modules.file.restore_backup`(*path*, *backup\_id*)

New in version 0.17.0.

Restore a previous version of a file that was backed up using Salt's *file state backup* system.

**path**

The path on the minion to check for backups

**backup\_id**

The numeric id for the backup you wish to restore, as found using `file.list_backups`

CLI Example:

```
salt '*' file.restore_backup /foo/bar/baz.txt 0
```

`salt.modules.file.restorecon`(*path*, *recursive=False*)

Reset the SELinux context on a given path

CLI Example:

```
salt '*' file.restorecon /home/user/.ssh/authorized_keys
```

`salt.modules.file.rmdir`(*path*, *recurse=False*, *verbose=False*, *older\_than=None*)

New in version 2014.1.0.

Changed in version 3006.0: Changed return value for failure to a boolean.

Remove the specified directory. Fails if a directory is not empty.

**recurse**

When `recurse` is set to `True`, all empty directories within the path are pruned.

New in version 3006.0.

**verbose**

When `verbose` is set to `True`, a dictionary is returned which contains more information about the removal process.

New in version 3006.0.

**older\_than**

When `older_than` is set to a number, it is used to determine the **number of days** which must have passed since the last modification timestamp before a directory will be allowed to be removed. Setting the value to 0 is equivalent to leaving it at the default of `None`.

New in version 3006.0.

CLI Example:

```
salt '*' file.rmdir /tmp/foo/
```

`salt.modules.file.search`(*path*, *pattern*, *flags=8*, *bufsize=1*, *ignore\_if\_missing=False*, *multiline=False*)

New in version 0.17.0.

Search for occurrences of a pattern in a file

Except for `multiline`, params are identical to `replace()`.

**multiline**

If true, inserts 'MULTILINE' into `flags` and sets `bufsize` to 'file'.

New in version 2015.8.0.

CLI Example:

```
salt '*' file.search /etc/crontab 'mymaintenance.sh'
```

`salt.modules.file.sed`(*path*, *before*, *after*, *limit=""*, *backup='.bak'*, *options='-r -e'*, *flags='g'*, *escape\_all=False*, *negate\_match=False*)

Deprecated since version 0.17.0: Use `replace()` instead.

Make a simple edit to a file

Equivalent to:

```
sed <backup> <options> "/<limit>/ s/<before>/<after>/<flags> <file>"
```

**path**

The full path to the file to be edited

**before**

A pattern to find in order to replace with `after`

**after**

Text that will replace `before`

**limit: ''**

An initial pattern to search for before searching for `before`

**backup: .bak**

The file will be backed up before edit with this file extension; **WARNING:** each time `sed/comment/uncomment` is called will overwrite this backup

**options: -r -e**

Options to pass to `sed`

**flags: g**

Flags to modify the `sed` search; e.g., `i` for case-insensitive pattern matching

**negate\_match: False**

Negate the search command (!)

New in version 0.17.0.

Forward slashes and single quotes will be escaped automatically in the `before` and `after` patterns.

CLI Example:

```
salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

`salt.modules.file.sed_contains`(*path*, *text*, *limit=""*, *flags='g'*)

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the file at `path` contains `text`. Utilizes `sed` to perform the search (line-wise search).

Note: the `p` flag will be added to any flags you pass in.

CLI Example:

```
salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

`salt.modules.file.seek_read`(*path*, *size*, *offset*)

New in version 2014.1.0.

Seek to a position on a file and read it

**path**

path to file

**seek**

amount to read at once

**offset**

offset to start into the file

CLI Example:

```
salt '*' file.seek_read /path/to/file 4096 0
```

**salt.modules.file.seek\_write**(*path, data, offset*)

New in version 2014.1.0.

Seek to a position on a file and write to it

**path**

path to file

**data**

data to write to file

**offset**

position in file to start writing

CLI Example:

```
salt '*' file.seek_write /path/to/file 'some data' 4096
```

**salt.modules.file.set\_mode**(*path, mode*)

Set the mode of a file

**path**

file or directory of which to set the mode

**mode**

mode to set the path to

CLI Example:

```
salt '*' file.set_mode /etc/passwd 0644
```

**salt.modules.file.set\_selinux\_context**(*path, user=None, role=None, type=None, range=None, persist=False*)

Changed in version 3001: Added persist option

Set a specific SELinux label on a given path

CLI Example:

```
salt '*' file.set_selinux_context path <user> <role> <type> <range>
salt '*' file.set_selinux_context /etc/yum.repos.d/epel.repo system_u
↪object_r system_conf_t s0
```

**salt.modules.file.source\_list**(*source, source\_hash, saltenv*)

Check the source list and return the source to use

CLI Example:

```
salt '*' file.source_list salt://http/httpd.conf '{hash_type: 'md5', 'hsum
↪': <md5sum>}' base
```

`salt.modules.file.stats`(*path*, *hash\_type=None*, *follow\_symlinks=True*)

Return a dict containing the stats for a given file

CLI Example:

```
salt '*' file.stats /etc/passwd
```

`salt.modules.file.statvfs`(*path*)

New in version 2014.1.0.

Perform a statvfs call against the filesystem that the file resides on

CLI Example:

```
salt '*' file.statvfs /path/to/file
```

`salt.modules.file.symlink`(*src*, *path*, *force=False*, *atomic=False*, *follow\_symlinks=True*)

Create a symbolic link (symlink, soft link) to a file

#### Parameters

- **src** (*str*) -- The path to a file or directory
- **path** (*str*) -- The path to the link. Must be an absolute path
- **force** (*bool*) -- Overwrite an existing symlink with the same name .. versionadded:: 3005
- **atomic** (*bool*) -- Use atomic file operations to create the symlink .. versionadded:: 3006.0
- **follow\_symlinks** (*bool*) -- If set to False, use `os.path.lexists()` for existence checks instead of `os.path.exists()`. .. versionadded:: 3007.0

#### Returns

True if successful, otherwise raises `CommandExecutionError`

#### Return type

bool

CLI Example:

```
salt '*' file.symlink /path/to/file /path/to/link
```

`salt.modules.file.touch`(*name*, *atime=None*, *mtime=None*)

New in version 0.9.5.

Just like the `touch` command, create a file if it doesn't exist or simply update the atime and mtime if it already does.

#### atime:

Access time in Unix epoch time. Set it to 0 to set atime of the file with Unix date of birth. If this parameter isn't set, atime will be set with current time.

#### mtime:

Last modification in Unix epoch time. Set it to 0 to set mtime of the file with Unix date of birth. If this parameter isn't set, mtime will be set with current time.

CLI Example:

```
salt '*' file.touch /var/log/emptyfile
```

`salt.modules.file.truncate`(*path*, *length*)

New in version 2014.1.0.

Seek to a position on a file and delete everything after that point

**path**

path to file

**length**

offset into file to truncate

CLI Example:

```
salt '*' file.truncate /path/to/file 512
```

`salt.modules.file.uid_to_user`(*uid*)

Convert a uid to a user name

**uid**

uid to convert to a username

CLI Example:

```
salt '*' file.uid_to_user 0
```

`salt.modules.file.uncomment`(*path*, *regex*, *char*='#', *backup*='.bak')

Deprecated since version 0.17.0: Use `replace()` instead.

Uncomment specified commented lines in a file

**path**

The full path to the file to be edited

**regex**

A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading ^ character will be stripped for convenience (for easily switching between `comment()` and `uncomment()`).

**char: #**

The character to remove in order to uncomment a line

**backup: .bak**

The file will be backed up before edit with this file extension; **WARNING:** each time `sed/comment/uncomment` is called will overwrite this backup

CLI Example:

```
salt '*' file.uncomment /etc/hosts.deny 'ALL: PARANOID'
```

`salt.modules.file.user_to_uid`(*user*)

Convert user name to a uid

**user**

user name to convert to its uid

CLI Example:

```
salt '*' file.user_to_uid root
```

`salt.modules.file.write`(*path*, \**args*, \*\**kwargs*)

New in version 2014.7.0.

Write text to a file, overwriting any existing contents.

**path**

path to file

**\*args**

strings to write to the file

CLI Example:

```
salt '*' file.write /etc/motd \
    "With all thine offerings thou shalt offer salt."
```

---

### Attention

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, `args`. For example:

```
salt '*' file.write /etc/motd args='cheese=spam'
salt '*' file.write /etc/motd args="['cheese=spam','spam=cheese']"
```

---

## 26.6.137 salt.modules.firewalld

Support for `firewalld`.

New in version 2015.2.0.

`salt.modules.firewalld.add_interface`(*zone*, *interface*, *permanent=True*)

Bind an interface to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.add_interface zone eth0
```

`salt.modules.firewalld.add_masquerade`(*zone=None*, *permanent=True*)

Enable masquerade on a zone. If `zone` is omitted, default zone will be used.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.add_masquerade
```

To enable masquerade on a specific zone

```
salt '*' firewalld.add_masquerade dmz
```

`salt.modules.firewalld.add_port(zone, port, permanent=True, force_masquerade=False)`

Allow specific ports in a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.add_port internal 443/tcp
```

**force\_masquerade**

when a zone is created ensure masquerade is also enabled on that zone.

`salt.modules.firewalld.add_port_fwd(zone, src, dest, proto='tcp', dstaddr="", permanent=True, force_masquerade=False)`

Add port forwarding.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.add_port_fwd public 80 443 tcp
```

**force\_masquerade**

when a zone is created ensure masquerade is also enabled on that zone.

`salt.modules.firewalld.add_rich_rule(zone, rule, permanent=True)`

Add a rich rule to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.add_rich_rule zone 'rule'
```

`salt.modules.firewalld.add_service(service, zone=None, permanent=True)`

Add a service for zone. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewalld.add_service ssh
```

To assign a service to a specific zone:

```
salt '*' firewalld.add_service ssh my_zone
```

`salt.modules.firewalld.add_service_port(service, port)`

Add a new port to the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.add_service_port zone 80
```

`salt.modules.firewalld.add_service_protocol`(*service, protocol*)

Add a new protocol to the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.add_service_protocol zone ssh
```

`salt.modules.firewalld.add_source`(*zone, source, permanent=True*)

Bind a source to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.add_source zone 192.168.1.0/24
```

`salt.modules.firewalld.allow_icmp`(*zone, icmp, permanent=True*)

Allow a specific ICMP type on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.allow_icmp zone echo-reply
```

`salt.modules.firewalld.block_icmp`(*zone, icmp, permanent=True*)

Block a specific ICMP type on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.block_icmp zone echo-reply
```

`salt.modules.firewalld.default_zone`()

Print default zone for connections and interfaces

CLI Example:

```
salt '*' firewalld.default_zone
```

`salt.modules.firewalld.delete_service`(*name, restart=True*)

Delete an existing service

CLI Example:

```
salt '*' firewalld.delete_service my_service
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.delete_service my_service False
```

`salt.modules.firewalld.delete_zone`(*zone, restart=True*)

Delete an existing zone

CLI Example:

```
salt '*' firewallld.delete_zone my_zone
```

By default firewallld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewallld.delete_zone my_zone False
```

`salt.modules.firewallld.get_icmp_types` (*permanent=True*)

Print predefined icmp types

CLI Example:

```
salt '*' firewallld.get_icmp_types
```

`salt.modules.firewallld.get_interfaces` (*zone, permanent=True*)

List interfaces bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewallld.get_interfaces zone
```

`salt.modules.firewallld.get_masquerade` (*zone=None, permanent=True*)

Show if masquerading is enabled on a zone. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewallld.get_masquerade zone
```

`salt.modules.firewallld.get_rich_rules` (*zone, permanent=True*)

List rich rules bound to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.get_rich_rules zone
```

`salt.modules.firewallld.get_service_ports` (*service*)

List ports of a service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.get_service_ports zone
```

`salt.modules.firewallld.get_service_protocols` (*service*)

List protocols of a service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.get_service_protocols zone
```

`salt.modules.firewalld.get_services(permanent=True)`

Print predefined services

CLI Example:

```
salt '*' firewalld.get_services
```

`salt.modules.firewalld.get_sources(zone, permanent=True)`

List sources bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.get_sources zone
```

`salt.modules.firewalld.get_zones(permanent=True)`

Print predefined zones

CLI Example:

```
salt '*' firewalld.get_zones
```

`salt.modules.firewalld.list_all(zone=None, permanent=True)`

List everything added for or enabled in a zone

CLI Example:

```
salt '*' firewalld.list_all
```

List a specific zone

```
salt '*' firewalld.list_all my_zone
```

`salt.modules.firewalld.list_icmp_block(zone, permanent=True)`

List ICMP blocks on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.list_icmp_block zone
```

`salt.modules.firewalld.list_port_fwd(zone, permanent=True)`

List port forwarding

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.list_port_fwd public
```

`salt.modules.firewalld.list_ports(zone, permanent=True)`

List all ports in a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.list_ports
```

`salt.modules.firewallld.list_services` (*zone=None, permanent=True*)

List services added for zone as a space separated list. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewallld.list_services
```

List a specific zone

```
salt '*' firewallld.list_services my_zone
```

`salt.modules.firewallld.list_zones` (*permanent=True*)

List everything added for or enabled in all zones

CLI Example:

```
salt '*' firewallld.list_zones
```

`salt.modules.firewallld.make_permanent` ()

Make current runtime configuration permanent.

New in version 2016.3.0.

CLI Example:

```
salt '*' firewallld.make_permanent
```

`salt.modules.firewallld.new_service` (*name, restart=True*)

Add a new service

CLI Example:

```
salt '*' firewallld.new_service my_service
```

By default firewallld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewallld.new_service my_service False
```

`salt.modules.firewallld.new_zone` (*zone, restart=True*)

Add a new zone

CLI Example:

```
salt '*' firewallld.new_zone my_zone
```

By default firewallld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewallld.new_zone my_zone False
```

`salt.modules.firewallld.reload_rules` ()

Reload the firewall rules, which makes the permanent configuration the new runtime configuration without losing state information.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.reload_rules
```

`salt.modules.firewallld.remove_interface`(*zone, interface, permanent=True*)

Remove an interface bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewallld.remove_interface zone eth0
```

`salt.modules.firewallld.remove_masquerade`(*zone=None, permanent=True*)

Remove masquerade on a zone. If zone is omitted, default zone will be used.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.remove_masquerade
```

To remove masquerade on a specific zone

```
salt '*' firewallld.remove_masquerade dmz
```

`salt.modules.firewallld.remove_port`(*zone, port, permanent=True*)

Remove a specific port from a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.remove_port internal 443/tcp
```

`salt.modules.firewallld.remove_port_fwd`(*zone, src, dest, proto='tcp', dstaddr='', permanent=True*)

Remove Port Forwarding.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewallld.remove_port_fwd public 80 443 tcp
```

`salt.modules.firewallld.remove_rich_rule`(*zone, rule, permanent=True*)

Add a rich rule to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.remove_rich_rule zone 'rule'
```

`salt.modules.firewallld.remove_service`(*service, zone=None, permanent=True*)

Remove a service from zone. This option can be specified multiple times. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewallld.remove_service ssh
```

To remove a service from a specific zone

```
salt '*' firewallld.remove_service ssh dmz
```

`salt.modules.firewalld.remove_service_port`(*service*, *port*)

Remove a port from the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.remove_service_port zone 80
```

`salt.modules.firewalld.remove_service_protocol`(*service*, *protocol*)

Remove a protocol from the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewallld.remove_service_protocol zone ssh
```

`salt.modules.firewalld.remove_source`(*zone*, *source*, *permanent=True*)

Remove a source bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewallld.remove_source zone 192.168.1.0/24
```

`salt.modules.firewalld.set_default_zone`(*zone*)

Set default zone

CLI Example:

```
salt '*' firewallld.set_default_zone damian
```

`salt.modules.firewalld.version`()

Return version from firewall-cmd

CLI Example:

```
salt '*' firewallld.version
```

### 26.6.138 salt.modules.freebsd\_sysctl

Module for viewing and modifying sysctl parameters

`salt.modules.freebsd_sysctl.assign`(*name*, *value*)

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

`salt.modules.freebsd_sysctl.get(name)`

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

`salt.modules.freebsd_sysctl.persist(name, value, config='/etc/sysctl.conf')`

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/boot/loader.conf
```

`salt.modules.freebsd_sysctl.show(config_file=False)`

Return a list of sysctl parameters for this minion

**config:** Pull the data from the system configuration file instead of the live data.

CLI Example:

```
salt '*' sysctl.show
```

### 26.6.139 salt.modules.freebsd\_update

Support for freebsd-update utility on FreeBSD.

New in version 2017.7.0.

**maintainer**

George Mamalakis <mamalos@gmail.com>

**maturity**

new

**platform**

FreeBSD

`salt.modules.freebsd_update.fetch(**kwargs)`

New in version 2016.3.4.

freebsd-update fetch wrapper. Based on the currently installed world and the configuration options set, fetch all available binary updates.

**kwargs:**

Parameters of freebsd-update command.

`salt.modules.freebsd_update.ids(**kwargs)`

New in version 2016.3.4.

freebsd-update IDS wrapper function. Compares the system against a "known good" index of the installed release.

**kwargs:**

Parameters of freebsd-update command.

`salt.modules.freebsd_update.install(**kwargs)`

New in version 2016.3.4.

freebsd-update install wrapper. Install the most recently fetched updates or upgrade.

**kwargs:**

Parameters of freebsd-update command.

`salt.modules.freebsd_update.rollback(**kwargs)`

New in version 2016.3.4.

freebsd-update rollback wrapper. Uninstalls the most recently installed updates.

**kwargs:**

Parameters of freebsd-update command.

`salt.modules.freebsd_update.update(**kwargs)`

New in version 2016.3.4.

Command that simplifies freebsd-update by running freebsd-update fetch first and then freebsd-update install.

**kwargs:**

Parameters of freebsd-update command.

`salt.modules.freebsd_update.upgrade(**kwargs)`

New in version 2016.3.4.

Dummy function used only to print a message that upgrade is not available. The reason is that upgrade needs manual intervention and reboot, so even if used with:

```
yes | freebsd-upgrade -r VERSION
```

the additional freebsd-update install that needs to run after the reboot cannot be implemented easily.

**kwargs:**

Parameters of freebsd-update command.

### 26.6.140 salt.modules.freebsdjail

The jail module for FreeBSD

`salt.modules.freebsdjail.fstab(jail)`

Display contents of a fstab(5) file defined in specified jail's configuration. If no file is defined, return False.

CLI Example:

```
salt '*' jail.fstab <jail name>
```

`salt.modules.freebsdjail.get_enabled()`

Return which jails are set to be run

CLI Example:

```
salt '*' jail.get_enabled
```

`salt.modules.freebsdjail.is_enabled()`

See if jail service is actually enabled on boot

CLI Example:

```
salt '*' jail.is_enabled <jail name>
```

`salt.modules.freebsdjail.restart(jail=)`

Restart the specified jail or all, if none specified

CLI Example:

```
salt '*' jail.restart [<jail name>]
```

`salt.modules.freebsdjail.show_config(jail)`

Display specified jail's configuration

CLI Example:

```
salt '*' jail.show_config <jail name>
```

`salt.modules.freebsdjail.start(jail=)`

Start the specified jail or all, if none specified

CLI Example:

```
salt '*' jail.start [<jail name>]
```

`salt.modules.freebsdjail.status(jail)`

See if specified jail is currently running

CLI Example:

```
salt '*' jail.status <jail name>
```

`salt.modules.freebsdjail.stop(jail=)`

Stop the specified jail or all, if none specified

CLI Example:

```
salt '*' jail.stop [<jail name>]
```

`salt.modules.freebsdjail.sysctl()`

Dump all jail related kernel states (sysctl)

CLI Example:

```
salt '*' jail.sysctl
```

### 26.6.141 salt.modules.freebsdkernel

Module to manage FreeBSD kernel modules

`salt.modules.freebsdkernel.available()`

Return a list of all available kernel modules

CLI Example:

```
salt '*' kmod.available
```

`salt.modules.freebsdmod.check_available(mod)`

Check to see if the specified kernel module is available

CLI Example:

```
salt '*' kmod.check_available vmm
```

`salt.modules.freebsdmod.is_loaded(mod)`

Check to see if the specified kernel module is loaded

CLI Example:

```
salt '*' kmod.is_loaded vmm
```

`salt.modules.freebsdmod.load(mod, persist=False)`

Load the specified kernel module

**mod**

Name of the module to add

**persist**

Write the module to `sysrc kld_modules` to make it load on system reboot

CLI Example:

```
salt '*' kmod.load bhyve
```

`salt.modules.freebsdmod.lsmod()`

Return a dict containing information about currently loaded modules

CLI Example:

```
salt '*' kmod.lsmod
```

`salt.modules.freebsdmod.mod_list(only_persist=False)`

Return a list of the loaded module names

CLI Example:

```
salt '*' kmod.mod_list
```

`salt.modules.freebsdmod.remove(mod, persist=False, comment=True)`

Remove the specified kernel module

**mod**

Name of module to remove

**persist**

Also remove module from `/boot/loader.conf`

**comment**

If `persist` is set don't remove line from `/boot/loader.conf` but only comment it

CLI Example:

```
salt '*' kmod.remove vmm
```

## 26.6.142 salt.modules.freebsdpkg

Remote package support using pkg\_add(1)

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

**Warning:** This module has been completely rewritten. Up to and including version 0.17.0, it supported `pkg_add(1)`, but checked for the existence of a `pkgng` local database and, if found, would provide some of `pkgng`'s functionality. The rewrite of this module has removed all `pkgng` support, and moved it to the `pkgng` execution module. For versions `<= 0.17.0`, the documentation here should not be considered accurate. If your Minion is running one of these versions, then the documentation for this module can be viewed using the `sys.doc` function:

```
salt bsdminion sys.doc pkg
```

This module acts as the default package provider for FreeBSD 9 and older. If you need to use `pkgng` on a FreeBSD 9 system, you will need to override the `pkg` provider by setting the `providers` parameter in your Minion config file, in order to use `pkgng`.

### providers:

```
pkg: pkgng
```

More information on `pkgng` support can be found in the documentation for the `pkgng` module.

This module will respect the `PACKAGEROOT` and `PACKAGESITE` environment variables, if set, but these values can also be overridden in several ways:

1. **Salt configuration parameters.** The configuration parameters `freebsdpkg.PACKAGEROOT` and `freebsdpkg.PACKAGESITE` are recognized. These config parameters are looked up using `config.get` and can thus be specified in the Master config file, Grains, Pillar, or in the Minion config file. Example:

```
freebsdpkg.PACKAGEROOT: ftp://ftp.freebsd.org/
freebsdpkg.PACKAGESITE: ftp://ftp.freebsd.org/pub/FreeBSD/ports/ia64/
↳ packages-9-stable/Latest/
```

2. **CLI arguments.** Both the `packageroot` (used interchangeably with `fromrepo` for API compatibility) and `packagesite` CLI arguments are recognized, and override their config counterparts from section 1 above.

```
salt -G 'os:FreeBSD' pkg.install zsh fromrepo=ftp://ftp2.freebsd.org/
salt -G 'os:FreeBSD' pkg.install zsh packageroot=ftp://ftp2.freebsd.
↳ org/
salt -G 'os:FreeBSD' pkg.install zsh packagesite=ftp://ftp2.freebsd.
↳ org/pub/FreeBSD/ports/ia64/packages-9-stable/Latest/
```

.. note::

These arguments can also be passed through `in` states:

```
.. code-block:: yaml
```

```
zsh:
```

(continues on next page)

(continued from previous page)

```
pkg.installed:
  - fromrepo: ftp://ftp2.freebsd.org/
```

`salt.modules.freebsdpkg.available_version(*names, **kwargs)`

This function is an alias of `latest_version`.

`pkg_add(1)` is not capable of querying for remote packages, so this function will always return results as if there is no package available for install or upgrade.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.freebsdpkg.delete(name=None, pkgs=None, **kwargs)`

This function is an alias of `remove`.

Remove packages using `pkg_delete(1)`

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.freebsdpkg.file_dict(*packages, **kwargs)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.freebsdpkg.file_list(*packages, **kwargs)`

List the files that belong to a package. Not specifying any packages will return a list of `_every_file` on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.freebsdpkg.install` (*name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, \*\*kwargs*)

Install package(s) using `pkg_add(1)`

**name**

The name of the package to be installed.

**refresh**

Whether or not to refresh the package database before installing.

**fromrepo or packageroot**

Specify a package repository from which to install. Overrides the system default, as well as the `PACK-AGEROOT` environment variable.

**packagesite**

Specify the exact directory from which to install the remote package. Overrides the `PACKAGESITE` environment variable, if present.

Multiple Package Installation Options:

**pkgs**

A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['foo', 'bar']
```

**sources**

A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.deb"}, {"bar":
→ "salt://bar.deb"}]
```

Return a dict containing the new package names and versions:

```
{ '<package>': {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

`salt.modules.freebsdpkg.latest_version` (*\*names, \*\*kwargs*)

`pkg_add(1)` is not capable of querying for remote packages, so this function will always return results as if there is no package available for install or upgrade.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.freebsdpkg.list_pkgs` (*versions\_as\_list=False, with\_origin=False, \*\*kwargs*)

List the packages currently installed as a dict:

```
{ '<package_name>': '<version>'}
```

**with\_origin**

[False] Return a nested dictionary containing both the origin name and version for each installed package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.freebsd_pkg.purge`(*name=None, pkgs=None, \*\*kwargs*)

This function is an alias of `remove`.

Remove packages using `pkg_delete(1)`

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.freebsd_pkg.refresh_db`(*\*\*kwargs*)

`pkg_add(1)` does not use a local database of available packages, so this function simply returns `True`. it exists merely for API compatibility.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.freebsd_pkg.remove`(*name=None, pkgs=None, \*\*kwargs*)

Remove packages using `pkg_delete(1)`

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.freebsdpkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**with\_origin**

[False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 26.6.143 salt.modules.freebsdports

Install software from the FreeBSD ports(7) system

New in version 2014.1.0.

This module allows you to install ports using `BATCH=yes` to bypass configuration prompts. It is recommended to use the `ports` state to install ports, but it is also possible to use this module exclusively from the command line.

```
salt minion-id ports.config security/nmap IPV6=off
salt minion-id ports.install security/nmap
```

`salt.modules.freebsdports.config(name, reset=False, **kwargs)`

Modify configuration options for a given port. Multiple options can be specified. To see the available options for a port, use `ports.showconfig`.

**name**

The port name, in category/name format

**reset**

[False] If True, runs a `make rmconfig` for the port, clearing its configuration before setting the desired options

CLI Examples:

```
salt '*' ports.config security/nmap IPV6=off
```

`salt.modules.freebsdports.deinstall(name)`

De-install a port.

CLI Example:

```
salt '*' ports.deinstall security/nmap
```

`salt.modules.freebsdports.install(name, clean=True)`

Install a port from the ports tree. Installs using `BATCH=yes` for non-interactive building. To set config options for a given port, use `ports.config`.

**clean**

[True] If True, cleans after installation. Equivalent to running `make install clean BATCH=yes`.

---

**Note:** It may be helpful to run this function using the `-t` option to set a higher timeout, since compiling a port may cause the Salt command to exceed the default timeout.

---

CLI Example:

```
salt -t 1200 '*' ports.install security/nmap
```

**salt.modules.freebsdports.list\_all()**

Lists all ports available.

CLI Example:

```
salt '*' ports.list_all
```

**Warning:** Takes a while to run, and returns a LOT of output

**salt.modules.freebsdports.rmconfig(name)**

Clear the cached options for the specified port; run a `make rmconfig`

**name**

The name of the port to clear

CLI Example:

```
salt '*' ports.rmconfig security/nmap
```

**salt.modules.freebsdports.search(name)**

Search for matches in the ports tree. Globs are supported, and the category is optional

CLI Examples:

```
salt '*' ports.search 'security/*'  
salt '*' ports.search 'security/n*'  
salt '*' ports.search nmap
```

**Warning:** Takes a while to run

**salt.modules.freebsdports.showconfig(name, default=False, dict\_return=False)**

Show the configuration options for a given port.

**default**

[False] Show the default options for a port (not necessarily the same as the current configuration)

**dict\_return**

[False] Instead of returning the output of `make showconfig`, return the data in an dictionary

CLI Example:

```
salt '*' ports.showconfig security/nmap
salt '*' ports.showconfig security/nmap default=True
```

`salt.modules.freebsdports.update` (*extract=False*)

Update the ports tree

**extract**

[False] If True, runs a `portsnap extract` after fetching, should be used for first-time installation of the ports tree.

CLI Example:

```
salt '*' ports.update
```

### 26.6.144 salt.modules.freebsdservice

The service module for FreeBSD

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

`salt.modules.freebsdservice.available` (*name, jail=None*)

Check that the given service is available.

Changed in version 2016.3.4.

**jail:** optional jid or jail name

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.freebsdservice.disable` (*name, \*\*kwargs*)

Disable the named service to start at boot

Arguments the same as for `enable()`

Changed in version 2016.3.4.

**jail** (optional keyword argument)

the jail's id or name

**chroot** (optional keyword argument)

the jail's chroot, if the jail's /etc is not mounted read-write

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.freebsdservice.disabled` (*name, \*\*kwargs*)

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.freebsdservice.enable(name, **kwargs)`

Enable the named service to start at boot

**name**

service name

**config**

[/etc/rc.conf] Config file for managing service. If config value is empty string, then /etc/rc.conf.d/<service> used. See man rc.conf(5) for details.

Also service.config variable can be used to change default.

Changed in version 2016.3.4.

**jail (optional keyword argument)**

the jail's id or name

**chroot (optional keyword argument)**

the jail's chroot, if the jail's /etc is not mounted read-write

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.freebsdservice.enabled(name, **kwargs)`

Return True if the named service is enabled, false otherwise

**name**

Service name

Changed in version 2016.3.4.

Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.freebsdservice.get_all(jail=None)`

Return a list of all available services

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.freebsdservice.get_disabled(jail=None)`

Return what services are available but not enabled to start at boot

Changed in version 2016.3.4.

Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.freebsdservice.get_enabled(jail=None)`

Return what services are set to run on boot

Changed in version 2016.3.4.

Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.freebsdservice.missing(name, jail=None)`

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.freebsdservice.reload_(name, jail=None)`

Restart the named service

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.freebsdservice.restart(name, jail=None)`

Restart the named service

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.freebsdservice.start(name, jail=None)`

Start the specified service

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.freebsdservice.status(name, sig=None, jail=None)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2016.3.4.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

**Parameters**

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Signature to use to find the service via ps

**Returns**

True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type**

bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.freebsdservice.stop`(*name*, *jail=None*)

Stop the specified service

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.stop <service name>
```

### 26.6.145 salt.modules.freezer

Module for freezer :maintainer: Alberto Planas <aplanas@suse.com> :maturity: new :depends: None :platform: Linux

`salt.modules.freezer.compare`(*old*, *new*)

Display the difference between two frozen states. The results are shown as a dictionary with keys for packages and repositories. Each key may contain a changes dictionary showing items that differ between the two frozen states. Items shown in the "old" changes but not the "new" were removed. Items in "new" but not "old" were added. Items shown in both probably updated/changed versions between freezes.

**old**

Name of the "old" frozen state. Required.

**new**

Name of the "new" frozen state. Required.

CLI Example:

```
salt '*' freezer.freeze pre_install post_install
```

`salt.modules.freezer.freeze`(*name=None*, *force=False*, *\*\*kwargs*)

Save the list of package and repos in a freeze file.

As this module is build on top of the pkg module, the user can send extra attributes to the underlying pkg module via kwargs. This function will call `pkg.list_pkgs` and `pkg.list_repos`, and any additional arguments will be passed through to those functions.

**name**

Name of the frozen state. Optional.

**force**

If true, overwrite the state. Optional.

CLI Example:

```
salt '*' freezer.freeze
salt '*' freezer.freeze pre_install
salt '*' freezer.freeze force=True root=/chroot
```

`salt.modules.freezer.list_()`

Return the list of frozen states.

CLI Example:

```
salt '*' freezer.list
```

`salt.modules.freezer.restore(name=None, clean=False, **kwargs)`

Make sure that the system contains the packages and repos from a frozen state.

Read the list of packages and repositories from the freeze file, and compare it with the current list of packages and repos. If there is any difference, all the missing packages and repos will be installed, and all the extra packages and repos will be removed.

As this module is build on top of the pkg module, the user can send extra attributes to the underlying pkg module via kwargs. This function will call `pkg.list_repos`, `pkg.mod_repo`, `pkg.list_pkgs`, `pkg.install`, `pkg.remove` and `pkg.del_repo`, and any additional arguments will be passed through to those functions.

**name**

Name of the frozen state. Optional.

**clean**

If True remove the frozen information YAML from the cache

New in version 3000.

CLI Example:

```
salt '*' freezer.restore
salt '*' freezer.restore root=/chroot
```

`salt.modules.freezer.status(name=None)`

Return True if there is already a frozen state.

A frozen state is merely a list of packages (including the version) in a specific time. This information can be used to compare with the current list of packages, and revert the installation of some extra packages that are in the system.

**name**

Name of the frozen state. Optional.

CLI Example:

```
salt '*' freezer.status
salt '*' freezer.status pre_install
```

## 26.6.146 salt.modules.gcp\_addon

A route is a rule that specifies how certain packets should be handled by the virtual network. Routes are associated with virtual machine instances by tag, and the set of routes for a particular VM is called its routing table. For each packet leaving a virtual machine, the system searches that machine's routing table for a single best matching route.

New in version 2018.3.0.

This module will create a route to send traffic destined to the Internet through your gateway instance.

### codeauthor

*Pratik Bandarkar <pratik.bandarkar@gmail.com>*

### maturity

new

### depends

google-api-python-client

### platform

Linux

```
salt.modules.gcp_addon.route_create(credential_file=None, project_id=None, name=None,
                                     dest_range=None, next_hop_instance=None,
                                     instance_zone=None, tags=None, network=None,
                                     priority=None)
```

Create a route to send traffic destined to the Internet through your gateway instance

### credential\_file

[string] File location of application default credential. For more information, refer: <https://developers.google.com/identity/protocols/application-default-credentials>

### project\_id

[string] Project ID where instance and network resides.

### name

[string] name of the route to create

### next\_hop\_instance

[string] the name of an instance that should handle traffic matching this route.

### instance\_zone

[string] zone where instance("next\_hop\_instance") resides

### network

[string] Specifies the network to which the route will be applied.

### dest\_range

[string] The destination range of outgoing packets that the route will apply to.

### tags

[list] (optional) Identifies the set of instances that this route will apply to.

### priority

[int] (optional) Specifies the priority of this route relative to other routes. default=1000

CLI Example:

```
salt 'salt-master.novalocal' gcp.route_create
    credential_file=/root/secret_key.json
    project_id=cp100-170315
```

(continues on next page)

(continued from previous page)

```

name=derby-db-route1
next_hop_instance=instance-1
instance_zone=us-central1-a
network=default
dest_range=0.0.0.0/0
tags=['no-ip']
priority=700

```

In above example, the instances which are having tag "no-ip" will route the packet to instance "instance-1"(if packet is intended to other network)

### 26.6.147 salt.modules.gem

Manage ruby gems.

**salt.modules.gem.install** (*gems*, *ruby=None*, *gem\_bin=None*, *runas=None*, *version=None*, *rdoc=False*, *ri=False*, *pre\_releases=False*, *proxy=None*, *source=None*)

Installs one or several gems.

#### Parameters

- **gems** -- string The gems to install
- **gem\_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if **gem\_bin** is specified.
- **runas** -- string : None The user to run gem as.
- **version** -- string : None Specify the version to install for the gem. Doesn't play nice with multiple gems at once
- **rdoc** -- boolean : False Generate RDoc documentation for the gem(s). For rubygems > 3 this is interpreted as the --no-document arg and the ri option will then be ignored
- **ri** -- boolean : False Generate RI documentation for the gem(s). For rubygems > 3 this is interpreted as the --no-document arg and the rdoc option will then be ignored
- **pre\_releases** -- boolean : False Include pre-releases in the available versions
- **proxy** -- string : None Use the specified HTTP proxy server for all outgoing traffic. Format: [http://hostname\[{}:port\]](http://hostname[{}:port])

#### source

[None] Use the specified HTTP gem source server to download gem. Format: [http://hostname\[{}:port\]](http://hostname[{}:port])

CLI Example:

```

salt '*' gem.install vagrant
salt '*' gem.install redphone gem_bin=/opt/sensu/embedded/bin/gem

```

**salt.modules.gem.list\_** (*prefix=""*, *ruby=None*, *runas=None*, *gem\_bin=None*)

List locally installed gems.

#### Parameters

- **prefix** -- string : Only list gems when the name matches this prefix.
- **gem\_bin** -- string : None Full path to **gem** binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if **gem\_bin** is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.list
```

`salt.modules.gem.list_upgrades` (*ruby=None, runas=None, gem\_bin=None*)

New in version 2015.8.0.

Check if an upgrade is available for installed gems

**gem\_bin**

[None] Full path to **gem** binary to use.

**ruby**

[None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if **gem\_bin** is specified.

**runas**

[None] The user to run gem as.

CLI Example:

```
salt '*' gem.list_upgrades
```

`salt.modules.gem.sources_add` (*source\_uri, ruby=None, runas=None, gem\_bin=None*)

Add a gem source.

**Parameters**

- **source\_uri** -- string The source URI to add.
- **gem\_bin** -- string : None Full path to **gem** binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if **gem\_bin** is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.sources_add http://rubygems.org/
```

`salt.modules.gem.sources_list` (*ruby=None, runas=None, gem\_bin=None*)

List the configured gem sources.

**Parameters**

- **gem\_bin** -- string : None Full path to **gem** binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if **gem\_bin** is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.sources_list
```

`salt.modules.gem.sources_remove`(*source\_uri*, *ruby=None*, *runas=None*, *gem\_bin=None*)

Remove a gem source.

#### Parameters

- **source\_uri** -- string The source URI to remove.
- **gem\_bin** -- string : None Full path to `gem` binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.sources_remove http://rubygems.org/
```

`salt.modules.gem.uninstall`(*gems*, *ruby=None*, *runas=None*, *gem\_bin=None*)

Uninstall one or several gems.

#### Parameters

- **gems** -- string The gems to uninstall.
- **gem\_bin** -- string : None Full path to `gem` binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.uninstall vagrant
```

`salt.modules.gem.update`(*gems*, *ruby=None*, *runas=None*, *gem\_bin=None*)

Update one or several gems.

#### Parameters

- **gems** -- string The gems to update.
- **gem\_bin** -- string : None Full path to `gem` binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.update vagrant
```

`salt.modules.gem.update_system`(*version=""*, *ruby=None*, *runas=None*, *gem\_bin=None*)

Update rubygems.

#### Parameters

- **version** -- string : (newest) The version of rubygems to install.
- **gem\_bin** -- string : None Full path to `gem` binary to use.

- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.update_system
```

`salt.modules.gem.version`(*ruby=None, runas=None, gem\_bin=None*)

Print out the version of gem

#### Parameters

- **gem\_bin** -- string : None Full path to `gem` binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.version
```

## 26.6.148 salt.modules.genesis

Module for managing container and VM images

New in version 2014.7.0.

`salt.modules.genesis.avail_platforms`()

Return which platforms are available

CLI Example:

```
salt myminion genesis.avail_platforms
```

`salt.modules.genesis.bootstrap`(*platform, root, img\_format='dir', fs\_format='ext2', fs\_opts=None, arch=None, flavor=None, repo\_url=None, static\_qemu=None, img\_size=None, mount\_dir=None, pkg\_cache=None, pkgs=None, exclude\_pkgs=None, epel\_url='http://download.fedoraproject.org/pub/epel/6/i386/epel-release-6-8.noarch.rpm'*)

Create an image for a specific platform.

Please note that this function *MUST* be run as root, as images that are created make files belonging to root.

#### platform

Which platform to use to create the image. Currently supported platforms are rpm, deb and pacman.

#### root

Local path to create the root of the image filesystem.

#### img\_format

Which format to create the image in. By default, just copies files into a directory on the local filesystem (`dir`). Future support will exist for `sparse`.

#### fs\_format

When using a non-`dir` `img_format`, which filesystem to format the image to. By default, `ext2`.

**fs\_opts**

When using a non-`dir` `img_format`, a dict of `opts` may be specified.

**arch**

Architecture to install packages for, if supported by the underlying bootstrap tool. Currently only used for `deb`.

**flavor**

Which flavor of operating system to install. This correlates to a specific directory on the distribution repositories. For instance, `wheezy` on Debian.

**repo\_url**

Mainly important for Debian-based repos. Base URL for the mirror to install from. (e.x.: <http://ftp.debian.org/debian/>)

**static\_qemu**

Local path to the static qemu binary required for this arch. (e.x.: `/usr/bin/qemu-amd64-static`)

**pkg\_confs**

The location of the conf files to copy into the image, to point the installer to the right repos and configuration.

**img\_size**

If `img_format` is not `dir`, then the size of the image must be specified.

**mount\_dir**

If `img_format` is not `dir`, then the image must be mounted somewhere. If the `mount_dir` is not specified, then it will be created at `/opt/salt-genesis.<random_uuid>`. This directory will be unmounted and removed when the process is finished.

**pkg\_cache**

This points to a directory containing a cache of package files to be copied to the image. It does not need to be specified.

**pkgs**

A list of packages to be installed on this image. For RedHat, this will include `yum`, `centos-release` and `iputils` by default.

**exclude\_pkgs**

A list of packages to be excluded. If you do not want to install the defaults, you need to include them in this list.

**epel\_url**

The URL to download the EPEL release package from.

CLI Examples:

```
salt myminion genesis.bootstrap pacman /root/arch
salt myminion genesis.bootstrap rpm /root/redhat
salt myminion genesis.bootstrap deb /root/wheezy arch=amd64
→flavor=wheezy static_qemu=/usr/bin/qemu-x86_64-static
```

**salt.modules.genesis.ldd\_deps** (*filename, ret=None*)

Recurse through a set of dependencies reported by `ldd`, to find associated dependencies.

Please note that this does not necessarily resolve all (non-package) dependencies for a file; but it does help.

CLI Example:

```
salt myminion genesis.ldd_deps bash
salt myminion genesis.ldd_deps /bin/bash
```

`salt.modules.genesis.mksls` (*fmt, src, dst=None*)

Convert an installation file/script to an SLS file. Currently supports `kickstart`, `preseed`, and `autoyast`.

CLI Examples:

```
salt <minion> genesis.mksls kickstart /path/to/kickstart.cfg
salt <minion> genesis.mksls kickstart /path/to/kickstart.cfg /path/to/
→dest.sls
```

New in version 2015.8.0.

`salt.modules.genesis.pack` (*name, root, path=None, pack\_format='tar', compress='bz2'*)

Pack up a directory structure, into a specific format

CLI Examples:

```
salt myminion genesis.pack centos /root/centos
salt myminion genesis.pack centos /root/centos pack_format='tar'
```

`salt.modules.genesis.unpack` (*name, dest=None, path=None, pack\_format='tar', compress='bz2'*)

Unpack an image into a directory structure

CLI Example:

```
salt myminion genesis.unpack centos /root/centos
```

### 26.6.149 `salt.modules.gentoo_service`

Top level package command wrapper, used to translate the os detected by grains to the correct service manager

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

---

`salt.modules.gentoo_service.available` (*name*)

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.gentoo_service.disable` (*name, \*\*kwargs*)

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name> <runlevels=single-runlevel>
salt '*' service.disable <service name> <runlevels=[runlevel1,runlevel2]>
```

`salt.modules.gentoo_service.disabled` (*name*)

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name> <runlevels=[runlevel]>
```

`salt.modules.gentoo_service.enable(name, **kwargs)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name> <runlevels=single-runlevel>
salt '*' service.enable <service name> <runlevels=[runlevel1,runlevel2]>
```

`salt.modules.gentoo_service.enabled(name, **kwargs)`

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name> <runlevels=single-runlevel>
salt '*' service.enabled <service name> <runlevels=[runlevel1,runlevel2]>
```

`salt.modules.gentoo_service.get_all()`

Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.gentoo_service.get_disabled()`

Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.gentoo_service.get_enabled()`

Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.gentoo_service.missing(name)`

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.gentoo_service.reload_(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.gentoo_service.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.gentoo_service.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.gentoo_service.status(name, sig=None)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

#### Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Signature to use to find the service via ps

#### Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

#### Return type

`bool`

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.gentoo_service.stop(name)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

`salt.modules.gentoo_service.zap(name)`

Resets service state

CLI Example:

```
salt '*' service.zap <service name>
```

## 26.6.150 salt.modules.gentoolkitmod

Support for Gentoolkit

`salt.modules.gentoolkitmod.eclean_dist(destructive=False, package_names=False, size_limit=0, time_limit=0, fetch_restricted=False, exclude_file='/etc/eclean/distfiles.exclude')`

Clean obsolete portage sources

#### destructive

Only keep minimum for reinstallation

**package\_names**

Protect all versions of installed packages. Only meaningful if used with `destructive=True`

**size\_limit <size>**

Don't delete distfiles bigger than `<size>`. `<size>` is a size specification: "10M" is "ten megabytes", "200K" is "two hundreds kilobytes", etc. Units are: G, M, K and B.

**time\_limit <time>**

Don't delete distfiles files modified since `<time>` `<time>` is an amount of time: "1y" is "one year", "2w" is "two weeks", etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).

**fetch\_restricted**

Protect fetch-restricted files. Only meaningful if used with `destructive=True`

**exclude\_file**

Path to exclusion file. Default is `/etc/eclean/distfiles.exclude` This is the same default `eclean-dist` uses. Use `None` if this file exists and you want to ignore.

Returns a dict containing the cleaned, saved, and deprecated dists:

```
{'cleaned': {<dist file>: <size>},
 'deprecated': {<package>: <dist file>},
 'saved': {<package>: <dist file>},
 'total_cleaned': <size>}
```

CLI Example:

```
salt '*' gentoolkit.eclean_dist destructive=True
```

`salt.modules.gentoolkitmod.eclean_pkg`(*destructive=False, package\_names=False, time\_limit=0, exclude\_file='/etc/eclean/packages.exclude'*)

Clean obsolete binary packages

**destructive**

Only keep minimum for reinstallation

**package\_names**

Protect all versions of installed packages. Only meaningful if used with `destructive=True`

**time\_limit <time>**

Don't delete distfiles files modified since `<time>` `<time>` is an amount of time: "1y" is "one year", "2w" is "two weeks", etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).

**exclude\_file**

Path to exclusion file. Default is `/etc/eclean/packages.exclude` This is the same default `eclean-pkg` uses. Use `None` if this file exists and you want to ignore.

Returns a dict containing the cleaned binary packages:

```
{'cleaned': {<dist file>: <size>},
 'total_cleaned': <size>}
```

CLI Example:

```
salt '*' gentoolkit.eclean_pkg destructive=True
```

`salt.modules.gentoolkitmod.glsa_check_list`(*glsa\_list*)

List the status of Gentoo Linux Security Advisories

**glsa\_list**

can contain an arbitrary number of GLSA ids, filenames containing GLSAs or the special identifiers 'all' and 'affected'

Returns a dict containing glsa ids with a description, status, and CVEs:

```
{<glsa_id>: {'description': <glsa_description>,
  'status': <glsa status>,
  'CVEs': [<list of CVEs>]}
```

CLI Example:

```
salt '*' gentoolkit.glsa_check_list 'affected'
```

**salt.modules.gentoolkitmod.revdep\_rebuild** (*lib=None*)

Fix up broken reverse dependencies

**lib**

Search for reverse dependencies for a particular library rather than every library on the system. It can be a full path to a library or basic regular expression.

CLI Example:

```
salt '*' gentoolkit.revdep_rebuild
```

### 26.6.151 salt.modules.git

Support for the Git SCM

**salt.modules.git.add** (*cwd, filename, opts="", git\_opts="", user=None, password=None, ignore\_retcode=False, output\_encoding=None*)

Changed in version 2015.8.0: The `--verbose` command line argument is now implied

Interface to `git-add(1)`

**cwd**

The path to the git checkout

**filename**

The location of the file/directory to add, relative to `cwd`

**opts**

Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts**

Any additional options to add to git command itself (not the `add` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

## CLI Examples:

```
salt myminion git.add /path/to/repo foo/bar.py
salt myminion git.add /path/to/repo foo/bar.py opts='--dry-run'
```

`salt.modules.git.archive` (*cwd*, *output*, *rev='HEAD'*, *prefix=None*, *git\_opts=""*, *user=None*, *password=None*, *ignore\_retcode=False*, *output\_encoding=None*, *\*\*kwargs*)

Changed in version 2015.8.0: Returns `True` if successful, raises an error if not.

Interface to `git-archive(1)`, exports a tarball/zip file of the repository

**cwd**

The path to be archived

---

**Note:** `git archive` permits a partial archive to be created. Thus, this path does not need to be the root of the git repository. Only the files within the directory specified by `cwd` (and its subdirectories) will be in the resulting archive. For example, if there is a git checkout at `/tmp/foo`, then passing `/tmp/foo/bar` as the `cwd` will result in just the files underneath `/tmp/foo/bar` to be exported as an archive.

---

**output**

The path of the archive to be created

**overwrite**

[False] Unless set to `True`, Salt will not overwrite an existing archive at the path specified by the `output` argument.

New in version 2015.8.0.

**rev**

[HEAD] The revision from which to create the archive

#### format

Manually specify the file format of the resulting archive. This argument can be omitted, and `git archive` will attempt to guess the archive type (and compression) from the filename. `zip`, `tar`, `tar.gz`, and `tgz` are extensions that are recognized automatically, and `git` can be configured to support other archive types with the addition of `git` configuration keys.

See the [git-archive\(1\)](#) manpage explanation of the `--format` argument (as well as the CONFIGURATION section of the manpage) for further information.

New in version 2015.8.0.

#### prefix

Prepend `<prefix>` to every filename in the archive. If unspecified, the name of the directory at the top level of the repository will be used as the prefix (e.g. if `cwd` is set to `/foo/bar/baz`, the prefix will be `baz`, and the resulting archive will contain a top-level directory by that name).

---

**Note:** The default behavior if the `--prefix` option for `git archive` is not specified is to not prepend a prefix, so Salt's behavior differs slightly from `git archive` in this respect. Use `prefix=''` to create an archive with no prefix.

---

Changed in version 2015.8.0: The behavior of this argument has been changed slightly. As of this version, it is necessary to include the trailing slash when specifying a prefix, if the prefix is intended to create a top-level directory.

#### git\_opts

Any additional options to add to `git` command itself (not the `archive` subcommand), in a single string. This is useful for passing `-c` to run `git` with temporary changes to the `git` configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in `git` 1.7.2 and newer.

---

#### user

User under which to run the `git` command. By default, the command is run by the user under which the minion is running.

#### password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

#### ignore\_retcode

[False] If `True`, do not log an error to the minion log if the `git` command returns a nonzero exit status.

New in version 2015.8.0.

#### output\_encoding

Use this option to specify which encoding to use to decode the output from any `git` commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Example:

```
salt myminion git.archive /path/to/repo /path/to/archive.tar
```

```
salt.modules.git.branch(cwd, name=None, opts="", git_opts="", user=None, password=None,
                        ignore_retcode=False, output_encoding=None)
```

Interface to `git-branch(1)`

#### **cwd**

The path to the git checkout

#### **name**

Name of the branch on which to operate. If not specified, the current branch will be assumed.

#### **opts**

Any additional options to add to the command line, in a single string

---

**Note:** To create a branch based on something other than HEAD, pass the name of the revision as `opts`. If the revision is in the format `remotename/branch`, then this will also set the remote tracking branch.

Additionally, on the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

#### **git\_opts**

Any additional options to add to git command itself (not the `branch` subcommand), in a single string. This is useful for passing `-C` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

#### **user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

#### **password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

#### **ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

#### **output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```
# Set remote tracking branch
salt myminion git.branch /path/to/repo mybranch opts='--set-upstream-to
→origin/mybranch'
# Create new branch
salt myminion git.branch /path/to/repo mybranch upstream/somebranch
# Delete branch
salt myminion git.branch /path/to/repo mybranch opts='-d'
# Rename branch (2015.8.0 and later)
salt myminion git.branch /path/to/repo newbranch opts='-m oldbranch'
```

`salt.modules.git.checkout` (*cwd*, *rev=None*, *force=False*, *opts=""*, *git\_opts=""*, *user=None*, *password=None*, *ignore\_retcode=False*, *output\_encoding=None*)

Interface to `git-checkout(1)`

#### **cwd**

The path to the git checkout

#### **opts**

Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

#### **git\_opts**

Any additional options to add to git command itself (not the `checkout` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

#### **rev**

The remote branch or revision to checkout.

Changed in version 2015.8.0: Optional when using `-b` or `-B` in `opts`.

#### **force**

[False] Force a checkout even if there might be overwritten changes

#### **user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

#### **password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

#### **ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

## CLI Examples:

```
# Checking out local local revisions
salt myminion git.checkout /path/to/repo somebranch user=jeff
salt myminion git.checkout /path/to/repo opts='testbranch -- conf/file1
→file2'
salt myminion git.checkout /path/to/repo rev=origin/mybranch opts='--track
→'
# Checking out remote revision into new branch
salt myminion git.checkout /path/to/repo upstream/master opts='-b
→newbranch'
# Checking out current revision into new branch (2015.8.0 and later)
salt myminion git.checkout /path/to/repo opts='-b newbranch'
```

```
salt.modules.git.clone(cwd, url=None, name=None, opts="", git_opts="", user=None, password=None,
identity=None, https_user=None, https_pass=None, ignore_retcode=False,
saltenv='base', output_encoding=None)
```

Interface to `git-clone(1)`**cwd**

Location of git clone

Changed in version 2015.8.0: If `name` is passed, then the clone will be made *within* this directory.

**url**

The URL of the repository to be cloned

Changed in version 2015.8.0: Argument renamed from `repository` to `url`

**name**

Optional alternate name for the top-level directory to be created by the clone

New in version 2015.8.0.

**opts**

Any additional options to add to the command line, in a single string

**git\_opts**

Any additional options to add to git command itself (not the `clone` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

### password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

### identity

Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

### https\_user

Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

### https\_pass

Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

### ignore\_retcode

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

### saltenv

The default salt environment to pull sls files from

New in version 2016.3.1.

### output\_encoding

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Example:

```
salt myminion git.clone /path/to/repo_parent_dir git://github.com/  
→saltstack/salt.git
```

`salt.modules.git.commit`(*cwd*, *message*, *opts=""*, *git\_opts=""*, *user=None*, *password=None*, *filename=None*, *ignore\_retcode=False*, *output\_encoding=None*)

Interface to `git-commit(1)`

**cwd**

The path to the git checkout

**message**

Commit message

**opts**

Any additional options to add to the command line, in a single string. These opts will be added to the end of the git command being run.

---

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

The `-m` option should not be passed here, as the commit message will be defined by the `message` argument.

---

**git\_opts**

Any additional options to add to git command itself (not the `commit` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**filename**

The location of the file/directory to commit, relative to `cwd`. This argument is optional, and can be used to commit a file without first staging it.

---

**Note:** This argument only works on files which are already tracked by the git repository.

---

New in version 2015.8.0.

**ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.commit /path/to/repo 'The commit message'
salt myminion git.commit /path/to/repo 'The commit message' filename=foo/
↳ bar.py
```

```
salt.modules.git.config_get(key, cwd=None, user=None, password=None, ignore_retcode=False,
                             output_encoding=None, **kwargs)
```

Get the value of a key in the git configuration file

**key**

The name of the configuration key to get

Changed in version 2015.8.0: Argument renamed from `setting_name` to `key`

**cwd**

The path to the git checkout

Changed in version 2015.8.0: Now optional if `global` is set to `True`

**global**

[False] If `True`, query the global git configuration. Otherwise, only the local git configuration will be queried.

New in version 2015.8.0.

**all**

[False] If `True`, return a list of all values set for `key`. If the key does not exist, `None` will be returned.

New in version 2015.8.0.

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```

salt myminion git.config_get user.name cwd=/path/to/repo
salt myminion git.config_get user.email global=True
salt myminion git.config_get core.gitproxy cwd=/path/to/repo all=True

```

`salt.modules.git.config_get_regex`(*key*, *value\_regex*=None, *cwd*=None, *user*=None, *password*=None, *ignore\_retcode*=False, *output\_encoding*=None, *\*\*kwargs*)

This function is an alias of `config_get_regexp`.

New in version 2015.8.0.

Get the value of a key or keys in the git configuration file using regexes for more flexible matching. The return data is a dictionary mapping keys to lists of values matching the `value_regex`. If no values match, an empty dictionary will be returned.

**key**

Regex on which key names will be matched

**value\_regex**

If specified, return all values matching this regex. The return data will be a dictionary mapping keys to lists of values matching the regex.

---

**Important:** Only values matching the `value_regex` will be part of the return data. So, if key matches a multivar, then it is possible that not all of the values will be returned. To get all values set for a multivar, simply omit the `value_regex` argument.

---

**cwd**

The path to the git checkout

**global**

[False] If True, query the global git configuration. Otherwise, only the local git configuration will be queried.

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode**

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```
# Matches any values for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar
# Matches any value starting with 'baz' set for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar 'baz.*'
# Matches any key starting with 'user.'
salt myminion git.config_get_regexp '^user\.' global=True
```

`salt.modules.git.config_get_regexp`(*key*, *value\_regex*=None, *cwd*=None, *user*=None, *password*=None, *ignore\_retcode*=False, *output\_encoding*=None, *\*\*kwargs*)

New in version 2015.8.0.

Get the value of a key or keys in the git configuration file using regexes for more flexible matching. The return data is a dictionary mapping keys to lists of values matching the `value_regex`. If no values match, an empty dictionary will be returned.

#### key

Regex on which key names will be matched

#### value\_regex

If specified, return all values matching this regex. The return data will be a dictionary mapping keys to lists of values matching the regex.

---

**Important:** Only values matching the `value_regex` will be part of the return data. So, if `key` matches a multivar, then it is possible that not all of the values will be returned. To get all values set for a multivar, simply omit the `value_regex` argument.

---

#### cwd

The path to the git checkout

#### global

[False] If True, query the global git configuration. Otherwise, only the local git configuration will be queried.

#### user

User under which to run the git command. By default, the command is run by the user under which the minion is running.

#### password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

#### ignore\_retcode

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

#### output\_encoding

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```
# Matches any values for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar
# Matches any value starting with 'baz' set for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar 'baz.*'
# Matches any key starting with 'user.'
salt myminion git.config_get_regexp '^user\.' global=True
```

`salt.modules.git.config_set` (*key*, *value=None*, *multivar=None*, *cwd=None*, *user=None*, *password=None*, *ignore\_retcode=False*, *output\_encoding=None*, *\*\*kwargs*)

Changed in version 2015.8.0: Return the value(s) of the key being set

Set a key in the git configuration file

#### **cwd**

The path to the git checkout. Must be an absolute path, or the word `global` to indicate that a global key should be set.

Changed in version 2014.7.0: Made `cwd` argument optional if `is_global=True`

#### **key**

The name of the configuration key to set

Changed in version 2015.8.0: Argument renamed from `setting_name` to `key`

#### **value**

The value to set for the specified key. Incompatible with the `multivar` argument.

Changed in version 2015.8.0: Argument renamed from `setting_value` to `value`

#### **add**

[False] Add a value to a key, creating/updating a multivar

New in version 2015.8.0.

#### **multivar**

Set a multivar all at once. Values can be comma-separated or passed as a Python list. Incompatible with the `value` argument.

New in version 2015.8.0.

#### **user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

#### **password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

#### **ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

#### **global**

[False] If `True`, set a global variable

#### **output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.config_set user.email me@example.com cwd=/path/to/repo
salt myminion git.config_set user.email foo@bar.com global=True
```

`salt.modules.git.config_unset`(*key*, *value\_regex=None*, *cwd=None*, *user=None*, *password=None*, *ignore\_retcode=False*, *output\_encoding=None*, *\*\*kwargs*)

New in version 2015.8.0.

Unset a key in the git configuration file

**cwd**

The path to the git checkout. Must be an absolute path, or the word `global` to indicate that a global key should be unset.

**key**

The name of the configuration key to unset

**value\_regex**

Regular expression that matches exactly one key, used to delete a single value from a multivar. Ignored if `all` is set to `True`.

**all**

[False] If `True` unset all values for a multivar. If `False`, and `key` is a multivar, an error will be raised.

**global**

[False] If `True`, unset set a global variable. Otherwise, a local variable will be unset.

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Example:

```
salt myminion git.config_unset /path/to/repo foo.bar
salt myminion git.config_unset /path/to/repo foo.bar all=True
```

`salt.modules.git.current_branch`(*cwd*, *user=None*, *password=None*, *ignore\_retcode=False*, *output\_encoding=None*)

Returns the current branch name of a local checkout. If HEAD is detached, return the SHA1 of the revision which is currently checked out.

**cwd**

The path to the git checkout

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying *user*. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode**

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Example:

```
salt myminion git.current_branch /path/to/repo
```

`salt.modules.git.describe`(*cwd*, *rev='HEAD'*, *user=None*, *password=None*, *ignore\_retcode=False*, *output\_encoding=None*)

Returns the `git-describe(1)` string (or the SHA1 hash if there are no tags) for the given revision.

**cwd**

The path to the git checkout

**rev**

[HEAD] The revision to describe

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying *user*. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode**

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.describe /path/to/repo
salt myminion git.describe /path/to/repo develop
```

`salt.modules.git.diff`(*cwd*, *item1=None*, *item2=None*, *opts=""*, *git\_opts=""*, *user=None*, *password=None*, *no\_index=False*, *cached=False*, *paths=None*, *output\_encoding=None*)

New in version 2015.8.12,2016.3.3,2016.11.0.

Interface to `git-diff(1)`

**cwd**

The path to the git checkout

**item1 and item2**

Revision(s) to pass to the `git diff` command. One or both of these arguments may be ignored if some of the options below are set to True. When `cached` is False, and no revisions are passed to this function, then the current working tree will be compared against the index (i.e. unstaged changes). When two revisions are passed, they will be compared to each other.

**opts**

Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts**

Any additional options to add to git command itself (not the `diff` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

#### `no_index`

[False] When it is necessary to diff two files in the same repo against each other, and not diff two different revisions, set this option to `True`. If this is left `False` in these instances, then a normal `git diff` will be performed against the index (i.e. unstaged changes), and files in the `paths` option will be used to narrow down the diff output.

---

**Note:** Requires Git 1.5.1 or newer. Additionally, when set to `True`, `item1` and `item2` will be ignored.

---

#### `cached`

[False] If `True`, compare staged changes to `item1` (if specified), otherwise compare them to the most recent commit.

---

**Note:** `item2` is ignored if this option is set to `True`.

---

#### `paths`

File paths to pass to the `git diff` command. Can be passed as a comma-separated list or a Python list.

#### `output_encoding`

Use this option to specify which encoding to use to decode the output from any `git` commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Example:

```
# Perform diff against the index (staging area for next commit)
salt myminion git.diff /path/to/repo
# Compare staged changes to the most recent commit
salt myminion git.diff /path/to/repo cached=True
# Compare staged changes to a specific revision
salt myminion git.diff /path/to/repo mybranch cached=True
# Perform diff against the most recent commit (includes staged changes)
salt myminion git.diff /path/to/repo HEAD
# Diff two commits
salt myminion git.diff /path/to/repo abcdef1 aabbccd
# Diff two commits, only showing differences in the specified paths
salt myminion git.diff /path/to/repo abcdef1 aabbccd paths=path/to/file1,
→path/to/file2
# Diff two files with one being outside the working tree
salt myminion git.diff /path/to/repo no_index=True paths=path/to/file1,/
→absolute/path/to/file2
```

`salt.modules.git.discard_local_changes` (`cwd`, `path='.`, `user=None`, `password=None`,  
`ignore_retcode=False`, `output_encoding=None`)

New in version 2019.2.0.

Runs a `git checkout -- <path>` from the directory specified by `cwd`.

**cwd**

The path to the git checkout

**path**

path relative to `cwd` (defaults to `.`)

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

**ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

CLI Example:

```
salt myminion git.discard_local_changes /path/to/repo
salt myminion git.discard_local_changes /path/to/repo path=foo
```

`salt.modules.git.fetch`(*cwd*, *remote=None*, *force=False*, *refspecs=None*, *opts=""*, *git\_opts=""*, *user=None*, *password=None*, *identity=None*, *ignore\_retcode=False*, *saltenv='base'*, *output\_encoding=None*)

Changed in version 2015.8.2: Return data is now a dictionary containing information on branches and tags that were added/updated

Interface to [git-fetch\(1\)](#)

**cwd**

The path to the git checkout

**remote**

Optional remote name to fetch. If not passed, then git will use its default behavior (as detailed in [git-fetch\(1\)](#)).

New in version 2015.8.0.

**force**

Force the fetch even when it is not a fast-forward.

New in version 2015.8.0.

**refspecs**

Override the refspec(s) configured for the remote with this argument. Multiple refspecs can be passed, comma-separated.

New in version 2015.8.0.

**opts**

Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts**

Any additional options to add to git command itself (not the `fetch` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity**

Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv**

The default salt environment to pull sls files from

New in version 2016.3.1.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Example:

```
salt myminion git.fetch /path/to/repo upstream
salt myminion git.fetch /path/to/repo identity=/root/.ssh/id_rsa
```

```
salt.modules.git.init(cwd, bare=False, template=None, separate_git_dir=None, shared=None, opts="",
                       git_opts="", user=None, password=None, ignore_retcode=False,
                       output_encoding=None)
```

Interface to `git-init(1)`

**cwd**

The path to the directory to be initialized

**bare**

[False] If True, init a bare repository

New in version 2015.8.0.

**template**

Set this argument to specify an alternate `template directory`

New in version 2015.8.0.

**separate\_git\_dir**

Set this argument to specify an alternate `$GIT_DIR`

New in version 2015.8.0.

**shared**

Set sharing permissions on git repo. See `git-init(1)` for more details.

New in version 2015.8.0.

**opts**

Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts**

Any additional options to add to git command itself (not the `init` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode**

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.init /path/to/repo
# Init a bare repo (before 2015.8.0)
salt myminion git.init /path/to/bare/repo.git opts='--bare'
# Init a bare repo (2015.8.0 and later)
salt myminion git.init /path/to/bare/repo.git bare=True
```

`salt.modules.git.is_worktree` (*cwd*, *user=None*, *password=None*, *output\_encoding=None*)

New in version 2015.8.0.

This function will attempt to determine if *cwd* is part of a worktree by checking its `.git` to see if it is a file containing a reference to another gitdir.

**cwd**

path to the worktree to be removed

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying *user*. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Example:

```
salt myminion git.is_worktree /path/to/repo
```

`salt.modules.git.list_branches` (*cwd*, *remote=False*, *user=None*, *password=None*, *ignore\_retcode=False*, *output\_encoding=None*)

New in version 2015.8.0.

Return a list of branches

**cwd**

The path to the git checkout

**remote**

[False] If True, list remote branches. Otherwise, local branches will be listed.

**Warning:** This option will only return remote branches of which the local checkout is aware, use `git.fetch` to update remotes.

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode**

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.list_branches /path/to/repo
salt myminion git.list_branches /path/to/repo remote=True
```

`salt.modules.git.list_tags` (*cwd*, *user=None*, *password=None*, *ignore\_retcode=False*, *output\_encoding=None*)

New in version 2015.8.0.

Return a list of tags

**cwd**

The path to the git checkout

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

#### **ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

#### **output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.list_tags /path/to/repo
```

```
salt.modules.git.list_worktrees(cwd, stale=False, user=None, password=None, output_encoding=None,
                               **kwargs)
```

New in version 2015.8.0.

Returns information on worktrees

Changed in version 2015.8.4: Version 2.7.0 added the `list` subcommand to `git-worktree(1)` which provides a lot of additional information. The return data has been changed to include this information, even for pre-2.7.0 versions of git. In addition, if a worktree has a detached head, then any tags which point to the worktree's HEAD will be included in the return data.

---

**Note:** By default, only worktrees for which the worktree directory is still present are returned, but this can be changed using the `all` and `stale` arguments (described below).

---

#### **cwd**

The path to the git checkout

#### **user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

#### **password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

#### **all**

[False] If `True`, then return all worktrees tracked under `$GIT_DIR/worktrees`, including ones for which the `gitdir` is no longer present.

#### **stale**

[False] If `True`, return *only* worktrees whose `gitdir` is no longer present.

---

**Note:** Only one of `all` and `stale` can be set to `True`.

---

### **output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.list_worktrees /path/to/repo
salt myminion git.list_worktrees /path/to/repo all=True
salt myminion git.list_worktrees /path/to/repo stale=True
```

`salt.modules.git.ls_remote` (*cwd=None, remote='origin', ref=None, opts="", git\_opts="", user=None, password=None, identity=None, https\_user=None, https\_pass=None, ignore\_retcode=False, output\_encoding=None, saltenv='base'*)

Interface to `git-ls-remote(1)`. Returns the upstream hash for a remote reference.

### **cwd**

The path to the git checkout. Optional (and ignored if present) when `remote` is set to a URL instead of a remote name.

### **remote**

[*origin*] The name of the remote to query. Can be the name of a git remote (which exists in the git checkout defined by the `cwd` parameter), or the URL of a remote repository.

Changed in version 2015.8.0: Argument renamed from `repository` to `remote`

### **ref**

The name of the ref to query. Optional, if not specified, all refs are returned. Can be a branch or tag name, or the full name of the reference (for example, to get the hash for a Github pull request number 1234, `ref` can be set to `refs/pull/1234/head`)

Changed in version 2015.8.0: Argument renamed from `branch` to `ref`

Changed in version 2015.8.4: Defaults to returning all refs instead of master.

### **opts**

Any additional options to add to the command line, in a single string

New in version 2015.8.0.

### **git\_opts**

Any additional options to add to git command itself (not the `ls-remote` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity**

Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**https\_user**

Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**https\_pass**

Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**ignore\_retcode**

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv**

The default salt environment to pull sls files from

New in version 2016.3.1.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Example:

```
salt myminion git.ls_remote /path/to/repo origin master
salt myminion git.ls_remote remote=https://mydomain.tld/repo.git
→ ref=mytag opts='--tags'
```

`salt.modules.git.merge` (*cwd*, *rev=None*, *opts=""*, *git\_opts=""*, *user=None*, *password=None*, *identity=None*, *ignore\_retcode=False*, *output\_encoding=None*, *\*\*kwargs*)

Interface to `git-merge(1)`

**cwd**

The path to the git checkout

**rev**

Revision to merge into the current branch. If not specified, the remote tracking branch will be merged.

New in version 2015.8.0.

**opts**

Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts**

Any additional options to add to git command itself (not the `merge` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity**

Path to a private key to use for ssh URLs. Salt will not attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input. Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`.

---

**Note:** For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

---

New in version 2018.3.5,2019.2.1,3000.

**ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Example:

```
# Fetch first...
salt myminion git.fetch /path/to/repo
# ... then merge the remote tracking branch
salt myminion git.merge /path/to/repo
# .. or merge another rev
salt myminion git.merge /path/to/repo rev=upstream/foo
```

```
salt.modules.git.merge_base(cwd, refs=None, octopus=False, is_ancestor=False, independent=False,
                           fork_point=None, opts="", git_opts="", user=None, password=None,
                           ignore_retcode=False, output_encoding=None, **kwargs)
```

New in version 2015.8.0.

Interface to `git-merge-base(1)`.

**cwd**

The path to the git checkout

**refs**

Any refs/commits to check for a merge base. Can be passed as a comma-separated list or a Python list.

**all**

[False] Return a list of all matching merge bases. Not compatible with any of the below options except for `octopus`.

**octopus**

[False] If `True`, then this function will determine the best common ancestors of all specified commits, in preparation for an n-way merge. See [here](#) for a description of how these bases are determined.

Set `all` to `True` with this option to return all computed merge bases, otherwise only the "best" will be returned.

**is\_ancestor**

[False] If `True`, then instead of returning the merge base, return a boolean telling whether or not the first commit is an ancestor of the second commit.

---

**Note:** This option requires two commits to be passed.

---

Changed in version 2015.8.2: Works properly in git versions older than 1.8.0, where the `--is-ancestor` CLI option is not present.

**independent**

[False] If `True`, this function will return the IDs of the refs/commits passed which cannot be reached by another commit.

**fork\_point**

If passed, then this function will return the commit where the commit diverged from the ref specified by `fork_point`. If no fork point is found, `None` is returned.

---

**Note:** At most one commit is permitted to be passed if a `fork_point` is specified. If no commits are passed, then HEAD is assumed.

---

**opts**

Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

This option should not be necessary unless new CLI arguments are added to `git-merge-base(1)` and are not yet supported in Salt.

---

**git\_opts**

Any additional options to add to git command itself (not the `merge-base` subcommand), in a single string. This is useful for passing `-C` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode**

[False] if True, do not log an error to the minion log if the git command returns a nonzero exit status.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

## CLI Examples:

```
salt myminion git.merge_base /path/to/repo HEAD upstream/mybranch
salt myminion git.merge_base /path/to/repo 8f2e542,4ad8cab,cdc9886
→octopus=True
salt myminion git.merge_base /path/to/repo refs=8f2e542,4ad8cab,cdc9886
→independent=True
salt myminion git.merge_base /path/to/repo refs=8f2e542,4ad8cab is_
→ancestor=True
salt myminion git.merge_base /path/to/repo fork_point=upstream/master
```

(continues on next page)

(continued from previous page)

```
salt myminion git.merge_base /path/to/repo refs=mybranch fork_
↳point=upstream/master
```

`salt.modules.git.merge_tree`(*cwd*, *ref1*, *ref2*, *base=None*, *user=None*, *password=None*, *ignore\_retcode=False*, *output\_encoding=None*)

New in version 2015.8.0.

Interface to `git-merge-tree(1)`, shows the merge results and conflicts from a 3-way merge without touching the index.

**cwd**

The path to the git checkout

**ref1**

First ref/commit to compare

**ref2**

Second ref/commit to compare

**base**

The base tree to use for the 3-way-merge. If not provided, then `git.merge_base` will be invoked on `ref1` and `ref2` to determine the merge base to use.

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode**

[False] if True, do not log an error to the minion log if the git command returns a nonzero exit status.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.merge_tree /path/to/repo HEAD upstream/dev
salt myminion git.merge_tree /path/to/repo HEAD upstream/dev base=aaf3c3d
```

`salt.modules.git.pull`(*cwd*, *opts=""*, *git\_opts=""*, *user=None*, *password=None*, *identity=None*, *ignore\_retcode=False*, *saltenv='base'*, *output\_encoding=None*)

Interface to `git-pull(1)`

**cwd**

The path to the git checkout

**opts**

Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts**

Any additional options to add to git command itself (not the `pull` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity**

Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv**

The default salt environment to pull sls files from

New in version 2016.3.1.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Example:

```
salt myminion git.pull /path/to/repo opts='--rebase origin master'
```

```
salt.modules.git.push(cwd, remote=None, ref=None, opts="", git_opts="", user=None, password=None,
                    identity=None, ignore_retcode=False, saltenv='base', output_encoding=None,
                    **kwargs)
```

Interface to `git-push(1)`

#### **cwd**

The path to the git checkout

#### **remote**

Name of the remote to which the ref should be pushed

New in version 2015.8.0.

#### **ref**

[master] Name of the ref to push

---

**Note:** Being a `refspec`, this argument can include a colon to define local and remote ref names.

---

#### **opts**

Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

#### **git\_opts**

Any additional options to add to git command itself (not the `push` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

#### **user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

#### **password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

#### **identity**

Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

#### **ignore\_retcode**

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

#### **saltenv**

The default salt environment to pull sls files from

New in version 2016.3.1.

#### **output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Example:

```
# Push master as origin/master
salt myminion git.push /path/to/repo origin master
# Push issue21 as upstream/develop
salt myminion git.push /path/to/repo upstream issue21:develop
# Delete remote branch 'upstream/temp'
salt myminion git.push /path/to/repo upstream :temp
```

`salt.modules.git.rebase`(*cwd*, *rev*='master', *opts*="", *git\_opts*="", *user*=None, *password*=None, *ignore\_retcode*=False, *output\_encoding*=None)

Interface to `git-rebase(1)`

#### **cwd**

The path to the git checkout

#### **rev**

[master] The revision to rebase onto the current branch

#### **opts**

Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts**

Any additional options to add to git command itself (not the `rebase` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Example:

```
salt myminion git.rebase /path/to/repo master
salt myminion git.rebase /path/to/repo 'origin master'
salt myminion git.rebase /path/to/repo origin/master opts='--onto
↪newbranch'
```

`salt.modules.git.remote_get`(*cwd*, *remote*='origin', *user*=None, *password*=None, *redact\_auth*=True, *ignore\_retcode*=False, *output\_encoding*=None)

Get the fetch and push URL for a specific remote

**cwd**

The path to the git checkout

**remote**

[origin] Name of the remote to query

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

#### **redact\_auth**

[True] Set to `False` to include the username/password if the remote uses HTTPS Basic Auth. Otherwise, this information will be redacted.

**Warning:** Setting this to `False` will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

New in version 2015.5.6.

#### **ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

#### **output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.remote_get /path/to/repo
salt myminion git.remote_get /path/to/repo upstream
```

`salt.modules.git.remote_refs`(*url*, *heads=False*, *tags=False*, *user=None*, *password=None*, *identity=None*, *https\_user=None*, *https\_pass=None*, *ignore\_retcode=False*, *output\_encoding=None*, *saltenv='base'*, *\*\*kwargs*)

New in version 2015.8.0.

Return the remote refs for the specified URL by running `git ls-remote`.

#### **url**

URL of the remote repository

#### **filter**

Optionally provide a ref name to `git ls-remote`. This can be useful to make this function run faster on repositories with many branches/tags.

New in version 2019.2.0.

#### **heads**

[False] Restrict output to heads. Can be combined with `tags`.

#### **tags**

[False] Restrict output to tags. Can be combined with `heads`.

#### **user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

#### **password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

#### identity

Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

#### https\_user

Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

#### https\_pass

Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

#### ignore\_retcode

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

#### saltenv

The default salt environment to pull sls files from

New in version 2016.3.1.

#### output\_encoding

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Example:

```
salt myminion git.remote_refs https://github.com/saltstack/salt.git
salt myminion git.remote_refs https://github.com/saltstack/salt.git
→filter=develop
```

```
salt.modules.git.remote_set(cwd, url, remote='origin', user=None, password=None, https_user=None,
                             https_pass=None, push_url=None, push_https_user=None,
                             push_https_pass=None, ignore_retcode=False, output_encoding=None)
```

#### cwd

The path to the git checkout

#### url

Remote URL to set

**remote**

[origin] Name of the remote to set

**push\_url**

If unset, the push URL will be identical to the fetch URL.

New in version 2015.8.0.

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**https\_user**

Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**https\_pass**

Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**push\_https\_user**

Set HTTP Basic Auth user for `push_url`. Ignored if `push_url` is unset. Only accepted for HTTPS URLs.

New in version 2015.8.0.

**push\_https\_pass**

Set HTTP Basic Auth password for `push_url`. Ignored if `push_url` is unset. Only accepted for HTTPS URLs.

New in version 2015.8.0.

**ignore\_retcode**

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

## CLI Examples:

```
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git
→ remote=upstream
salt myminion git.remote_set /path/to/repo https://github.com/user/repo.
→ git remote=upstream push_url=git@github.com:user/repo.git
```

`salt.modules.git.remotes` (*cwd*, *user=None*, *password=None*, *redact\_auth=True*, *ignore\_retcode=False*, *output\_encoding=None*)

Get fetch and push URLs for each remote in a git checkout

**cwd**

The path to the git checkout

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**redact\_auth**

[True] Set to `False` to include the username/password for authenticated remotes in the return data. Otherwise, this information will be redacted.

**Warning:** Setting this to `False` will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

New in version 2015.5.6.

**ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Example:

```
salt myminion git.remotes /path/to/repo
```

`salt.modules.git.reset` (*cwd*, *opts=""*, *git\_opts=""*, *user=None*, *password=None*, *identity=None*, *ignore\_retcode=False*, *output\_encoding=None*)

Interface to `git-reset(1)`, returns the stdout from the git command

**cwd**

The path to the git checkout

**opts**

Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

#### **git\_opts**

Any additional options to add to git command itself (not the `reset` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

#### **user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

#### **password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

#### **identity**

Path to a private key to use for ssh URLs. Salt will not attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input. Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`.

---

**Note:** For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

---

New in version 2018.3.5,2019.2.1,3000.

#### **ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

#### **output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

#### CLI Examples:

```
# Soft reset to a specific commit ID
salt myminion git.reset /path/to/repo ac3ee5c
# Hard reset
salt myminion git.reset /path/to/repo opts='--hard origin/master'
```

`salt.modules.git.rev_parse` (*cwd*, *rev=None*, *opts=""*, *git\_opts=""*, *user=None*, *password=None*, *ignore\_retcode=False*, *output\_encoding=None*)

New in version 2015.8.0.

Interface to `git-rev-parse(1)`

#### **cwd**

The path to the git checkout

#### **rev**

Revision to parse. See the [SPECIFYING REVISIONS](#) section of the `git-rev-parse(1)` manpage for details on how to format this argument.

This argument is optional when using the options in the *Options for Files* section of the `git-rev-parse(1)` manpage.

#### **opts**

Any additional options to add to the command line, in a single string

#### **git\_opts**

Any additional options to add to git command itself (not the `rev-parse` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

#### **user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

#### **password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

#### **ignore\_retcode**

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

#### **output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```
# Get the full SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD
# Get the short SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD opts='--short'
# Get the develop branch's upstream tracking branch
```

(continues on next page)

(continued from previous page)

```

salt myminion git.rev_parse /path/to/repo 'develop@{upstream}' opts='--
↳abbrev-ref'
# Get the SHA1 for the commit corresponding to tag v1.2.3
salt myminion git.rev_parse /path/to/repo 'v1.2.3^{commit}'
# Find out whether or not the repo at /path/to/repo is a bare repository
salt myminion git.rev_parse /path/to/repo opts='--is-bare-repository'

```

`salt.modules.git.revision`(*cwd*, *rev*='HEAD', *short*=False, *user*=None, *password*=None, *ignore\_retcode*=False, *output\_encoding*=None)

Returns the SHA1 hash of a given identifier (hash, branch, tag, HEAD, etc.)

**cwd**

The path to the git checkout

**rev**

[HEAD] The revision

**short**

[False] If True, return an abbreviated SHA1 git hash

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode**

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Example:

```
salt myminion git.revision /path/to/repo mybranch
```

`salt.modules.git.rm_`(*cwd*, *filename*, *opts*="", *git\_opts*="", *user*=None, *password*=None, *ignore\_retcode*=False, *output\_encoding*=None)

Interface to `git-rm`(1)

**cwd**

The path to the git checkout

**filename**

The location of the file/directory to remove, relative to `cwd`

---

**Note:** To remove a directory, `-r` must be part of the `opts` parameter.

---

**opts**

Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts**

Any additional options to add to git command itself (not the `rm` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode**

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

## CLI Examples:

```
salt myminion git.rm /path/to/repo foo/bar.py
salt myminion git.rm /path/to/repo foo/bar.py opts='--dry-run'
salt myminion git.rm /path/to/repo foo/baz opts='-r'
```

`salt.modules.git.stash(cwd, action='save', opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)`

Interface to `git-stash(1)`, returns the stdout from the git command

**cwd**

The path to the git checkout

**opts**

Any additional options to add to the command line, in a single string. Use this to complete the `git stash` command by adding the remaining arguments (i.e. `'save <stash comment>'`, `'apply stash@{2}'`, `'show'`, etc.). Omitting this argument will simply run `git stash`.

**git\_opts**

Any additional options to add to git command itself (not the `stash` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

## CLI Examples:

```
salt myminion git.stash /path/to/repo save opts='work in progress'
salt myminion git.stash /path/to/repo apply opts='stash@{1}'
salt myminion git.stash /path/to/repo drop opts='stash@{1}'
salt myminion git.stash /path/to/repo list
```

`salt.modules.git.status` (*cwd*, *user=None*, *password=None*, *ignore\_retcode=False*, *output\_encoding=None*)

Changed in version 2015.8.0: Return data has changed from a list of lists to a dictionary

Returns the changes to the repository

**cwd**

The path to the git checkout

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

#### **ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

#### **output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Example:

```
salt myminion git.status /path/to/repo
```

```
salt.modules.git.submodule(cwd, command, opts="", git_opts="", user=None, password=None,
                           identity=None, ignore_retcode=False, saltenv='base', output_encoding=None,
                           **kwargs)
```

Changed in version 2015.8.0: Added the `command` argument to allow for operations other than `update` to be run on submodules, and deprecated the `init` argument. To do a submodule update with `init=True` moving forward, use `command=update opts='--init'`

Interface to [git-submodule\(1\)](#)

#### **cwd**

The path to the submodule

#### **command**

Submodule command to run, see [git-submodule\(1\)](#) `<git submodule>` for more information. Any additional arguments after the command (such as the URL when adding a submodule) must be passed in the `opts` parameter.

New in version 2015.8.0.

#### **opts**

Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

#### **git\_opts**

Any additional options to add to git command itself (not the `submodule` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**init**

[False] If True, ensures that new submodules are initialized

Deprecated since version 2015.8.0: Pass `init` as the `command` parameter, or include `--init` in the `opts` param with `command` set to `update`.

**user**

User under which to run the `git` command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity**

Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**ignore\_retcode**

[False] If True, do not log an error to the minion log if the `git` command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv**

The default salt environment to pull sls files from

New in version 2016.3.1.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any `git` commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

## CLI Example:

```
# Update submodule and ensure it is initialized (before 2015.8.0)
salt myminion git.submodule /path/to/repo/sub/repo init=True
# Update submodule and ensure it is initialized (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo update opts='--init'

# Rebase submodule (2015.8.0 and later)
```

(continues on next page)

(continued from previous page)

```

salt myminion git.submodule /path/to/repo/sub/repo update opts='--rebase'

# Add submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo add opts='https://
↳mydomain.tld/repo.git'

# Unregister submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo deinit

```

`salt.modules.git.symbolic_ref(cwd, ref, value=None, opts="", git_opts="", user=None, password=None, ignore_retcode=False, output_encoding=None)`

New in version 2015.8.0.

Interface to `git-symbolic-ref(1)`

**cwd**

The path to the git checkout

**ref**

Symbolic ref to read/modify

**value**

If passed, then the symbolic ref will be set to this value and an empty string will be returned.

If not passed, then the ref to which `ref` points will be returned, unless `--delete` is included in `opts` (in which case the symbolic ref will be deleted).

**opts**

Any additional options to add to the command line, in a single string

**git\_opts**

Any additional options to add to git command itself (not the `symbolic-refs` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```
# Get ref to which HEAD is pointing
salt myminion git.symbolic_ref /path/to/repo HEAD
# Set/overwrite symbolic ref 'FOO' to local branch 'foo'
salt myminion git.symbolic_ref /path/to/repo FOO refs/heads/foo
# Delete symbolic ref 'FOO'
salt myminion git.symbolic_ref /path/to/repo FOO opts='--delete'
```

```
salt.modules.git.tag(cwd, name, ref='HEAD', message=None, opts="", git_opts="", user=None,
                    password=None, ignore_retcode=False, output_encoding=None)
```

New in version 2018.3.4.

Interface to `git-tag(1)`, adds and removes tags.

**cwd**

The path to the main git checkout or a linked worktree

**name**

Name of the tag

**ref**

[HEAD] Which ref to tag (defaults to local clone's HEAD)

---

**Note:** This argument is ignored when either `-d` or `--delete` is present in the `opts` passed to this function.

---

**message**

Optional message to include with the tag. If provided, an annotated tag will be created.

**opts**

Any additional options to add to the command line, in a single string

---

**Note:** Additionally, on the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

**git\_opts**

Any additional options to add to git command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

**ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

CLI Example:

```
# Create an non-annotated tag
salt myminion git.tag /path/to/repo v1.2
# Create an annotated tag
salt myminion git.tag /path/to/repo v1.2 message='Version 1.2'
# Delete the tag
salt myminion git.tag /path/to/repo v1.2 opts='-d'
```

`salt.modules.git.version(versioninfo=False)`

New in version 2015.8.0.

Returns the version of Git installed on the minion

**versioninfo**

[False] If `True`, return the version in a versioninfo list (e.g. [2, 5, 0])

CLI Example:

```
salt myminion git.version
```

`salt.modules.git.worktree_add(cwd, worktree_path, ref=None, reset_branch=None, force=None, detach=False, opts="", git_opts="", user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)`

New in version 2015.8.0.

Interface to `git-worktree(1)`, adds a worktree

**cwd**

The path to the git checkout

**worktree\_path**

Path to the new worktree. Can be either absolute, or relative to `cwd`.

**branch**

Name of new branch to create. If omitted, will be set to the basename of the `worktree_path`. For example, if the `worktree_path` is `/foo/bar/baz`, then `branch` will be `baz`.

**ref**

Name of the ref on which to base the new worktree. If omitted, then `HEAD` is use, and a new branch will be created, named for the basename of the `worktree_path`. For example, if the `worktree_path` is `/foo/bar/baz` then a new branch `baz` will be created, and pointed at `HEAD`.

**reset\_branch**

[False] If `False`, then `git-worktree(1)` will fail to create the `worktree` if the targeted branch already exists. Set this argument to `True` to reset the targeted branch to point at `ref`, and checkout the newly-reset branch into the new `worktree`.

**force**

[False] By default, `git-worktree(1)` will not permit the same branch to be checked out in more than one `worktree`. Set this argument to `True` to override this.

**opts**

Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` to avoid causing errors with Salt's own argument parsing.

All CLI options for adding `worktrees` as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to `git-worktree(1)` and are not yet supported in Salt.

---

**git\_opts**

Any additional options to add to `git` command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run `git` with temporary changes to the `git` configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in `git` 1.7.2 and newer.

---

**user**

User under which to run the `git` command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore\_retcode**

[False] If `True`, do not log an error to the minion log if the `git` command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any `git` commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

## CLI Examples:

```
salt myminion git.worktree_add /path/to/repo/main ../hotfix ref=origin/  
→master
```

(continues on next page)

(continued from previous page)

```
salt myminion git.worktree_add /path/to/repo/main ../hotfix
↳branch=hotfix21 ref=v2.1.9.3
```

```
salt.modules.git.worktree_prune(cwd, dry_run=False, verbose=True, expire=None, opts="", git_opts="",
                                user=None, password=None, ignore_retcode=False,
                                output_encoding=None)
```

New in version 2015.8.0.

Interface to `git-worktree(1)`, prunes stale worktree administrative data from the gitdir

#### **cwd**

The path to the main git checkout or a linked worktree

#### **dry\_run**

[False] If True, then this function will report what would have been pruned, but no changes will be made.

#### **verbose**

[True] Report all changes made. Set to False to suppress this output.

#### **expire**

Only prune unused worktree data older than a specific period of time. The date format for this parameter is described in the documentation for the `gc.pruneWorktreesExpire` config param in the `git-config(1)` manpage.

#### **opts**

Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` to avoid causing errors with Salt's own argument parsing.

All CLI options for pruning worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to `git-worktree(1)` and are not yet supported in Salt.

---

#### **git\_opts**

Any additional options to add to git command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.

---

#### **user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

#### **password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

#### **ignore\_retcode**

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.worktree_prune /path/to/repo
salt myminion git.worktree_prune /path/to/repo dry_run=True
salt myminion git.worktree_prune /path/to/repo expire=1.day.ago
```

`salt.modules.git.worktree_rm(cwd, user=None, output_encoding=None)`

New in version 2015.8.0.

Recursively removes the worktree located at `cwd`, returning `True` if successful. This function will attempt to determine if `cwd` is actually a worktree by invoking `git.is_worktree`. If the path does not correspond to a worktree, then an error will be raised and no action will be taken.

**Warning:** There is no undoing this action. Be **VERY** careful before running this function.

**cwd**

Path to the worktree to be removed

**user**

Used for path expansion when `cwd` is not an absolute path. By default, when `cwd` is not absolute, the path will be assumed to be relative to the home directory of the user under which the minion is running. Setting this option will change the home directory from which path expansion is performed.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.worktree_rm /path/to/worktree
```

## 26.6.152 salt.modules.github

Module for interacting with the GitHub v3 API.

New in version 2016.3.0.

### depends

PyGithub python module

### Configuration

Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'github' key by default, if defined.

For example:

```
github:
  token: abc1234
  org_name: my_organization

# optional: some functions require a repo_name, which
# can be set in the config file, or passed in at the CLI.
  repo_name: my_repo

# optional: it can be dangerous to change the privacy of a repository
# in an automated way. set this to True to allow privacy modifications
  allow_repo_privacy_changes: False
```

```
salt.modules.github.add_repo(name, description=None, homepage=None, private=None,
                             has_issues=None, has_wiki=None, has_downloads=None, auto_init=None,
                             gitignore_template=None, license_template=None, profile='github')
```

Create a new github repository.

### name

The name of the team to be created.

### description

The description of the repository.

### homepage

The URL with more information about the repository.

### private

The visibility of the repository. Note that private repositories require a paid GitHub account.

### has\_issues

Whether to enable issues for this repository.

### has\_wiki

Whether to enable the wiki for this repository.

### has\_downloads

Whether to enable downloads for this repository.

### auto\_init

Whether to create an initial commit with an empty README.

### gitignore\_template

The desired language or platform for a .gitignore, e.g "Haskell".

**license\_template**

The desired LICENSE template to apply, e.g "mit" or "mozilla".

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_repo 'repo_name'
```

New in version 2016.11.0.

```
salt.modules.github.add_team(name, description=None, repo_names=None, privacy=None,
                             permission=None, profile='github')
```

Create a new Github team within an organization.

**name**

The name of the team to be created.

**description**

The description of the team.

**repo\_names**

The names of repositories to add the team to.

**privacy**

The level of privacy for the team, can be 'secret' or 'closed'.

**permission**

The default permission for new repositories added to the team, can be 'pull', 'push' or 'admin'.

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_team 'team_name'
```

New in version 2016.11.0.

```
salt.modules.github.add_team_member(name, team_name, profile='github')
```

Adds a team member to a team with `team_name`.

**name**

The name of the team member to add.

**team\_name**

The name of the team of which to add the user.

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

```
salt.modules.github.add_team_repo(repo_name, team_name, profile='github', permission=None)
```

Adds a repository to a team with `team_name`.

**repo\_name**

The name of the repository to add.

**team\_name**

The name of the team of which to add the repository.

**profile**

The name of the profile configuration to use. Defaults to `github`.

**permission**

The permission for team members within the repository, can be 'pull', 'push' or 'admin'. If not specified, the default permission specified on the team will be used.

New in version 2017.7.0.

CLI Example:

```
salt myminion github.add_team_repo 'my_repo' 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.add_user` (*name*, *profile='github'*)

Add a GitHub user.

**name**

The user for which to obtain information.

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_user github-handle
```

`salt.modules.github.edit_repo` (*name*, *description=None*, *homepage=None*, *private=None*, *has\_issues=None*, *has\_wiki=None*, *has\_downloads=None*, *profile='github'*)

Updates an existing Github repository.

**name**

The name of the team to be created.

**description**

The description of the repository.

**homepage**

The URL with more information about the repository.

**private**

The visibility of the repository. Note that private repositories require a paid GitHub account.

**has\_issues**

Whether to enable issues for this repository.

**has\_wiki**

Whether to enable the wiki for this repository.

**has\_downloads**

Whether to enable downloads for this repository.

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_repo 'repo_name'
```

New in version 2016.11.0.

```
salt.modules.github.edit_team(name, description=None, privacy=None, permission=None,
                                profile='github')
```

Updates an existing Github team.

**name**

The name of the team to be edited.

**description**

The description of the team.

**privacy**

The level of privacy for the team, can be 'secret' or 'closed'.

**permission**

The default permission for new repositories added to the team, can be 'pull', 'push' or 'admin'.

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.edit_team 'team_name' description='Team description'
```

New in version 2016.11.0.

```
salt.modules.github.get_issue(issue_number, repo_name=None, profile='github', output='min')
```

Return information about a single issue in a named repository.

New in version 2016.11.0.

**issue\_number**

The number of the issue to retrieve.

**repo\_name**

The name of the repository from which to get the issue. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

**profile**

The name of the profile configuration to use. Defaults to `github`.

**output**

The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

CLI Example:

```
salt myminion github.get_issue 514
salt myminion github.get_issue 514 repo_name=salt
```

```
salt.modules.github.get_issue_comments(issue_number, repo_name=None, profile='github',
                                          since=None, output='min')
```

Return information about the comments for a given issue in a named repository.

New in version 2016.11.0.

**issue\_number**

The number of the issue for which to retrieve comments.

**repo\_name**

The name of the repository to which the issue belongs. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

**profile**

The name of the profile configuration to use. Defaults to `github`.

**since**

Only comments updated at or after this time are returned. This is a timestamp in ISO 8601 format: `YYYY-MM-DDTHH:MM:SSZ`.

**output**

The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

CLI Example:

```
salt myminion github.get_issue_comments 514
salt myminion github.get_issue 514 repo_name=salt
```

```
salt.modules.github.get_issues(repo_name=None, profile='github', milestone=None, state='open',
                               assignee=None, creator=None, mentioned=None, labels=None,
                               sort='created', direction='desc', since=None, output='min',
                               per_page=None)
```

Returns information for all issues in a given repository, based on the search options.

New in version 2016.11.0.

**repo\_name**

The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

**profile**

The name of the profile configuration to use. Defaults to `github`.

**milestone**

The number of a GitHub milestone, or a string of either `*` or `none`.

If a number is passed, it should refer to a milestone by its number field. Use the `github.get_milestone` function to obtain a milestone's number.

If the string `*` is passed, issues with any milestone are accepted. If the string `none` is passed, issues without milestones are returned.

**state**

Indicates the state of the issues to return. Can be either `open`, `closed`, or `all`. Default is `open`.

**assignee**

Can be the name of a user. Pass in `none` (as a string) for issues with no assigned user or `*` for issues assigned to any user.

**creator**

The user that created the issue.

**mentioned**

A user that's mentioned in the issue.

**labels**

A string of comma separated label names. For example, `bug,ui,@high`.

**sort**

What to sort results by. Can be either `created`, `updated`, or `comments`. Default is `created`.

**direction**

The direction of the sort. Can be either `asc` or `desc`. Default is `desc`.

**since**

Only issues updated at or after this time are returned. This is a timestamp in ISO 8601 format: `YYYY-MM-DDTHH:MM:SSZ`.

**output**

The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

**per\_page**

GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues gathered from GitHub, per page. If not set, GitHub defaults are used. Maximum is 100.

CLI Example:

```
salt myminion github.get_issues my-github-repo
```

`salt.modules.github.get_milestone` (*number=None, name=None, repo\_name=None, profile='github', output='min'*)

Return information about a single milestone in a named repository.

New in version 2016.11.0.

**number**

The number of the milestone to retrieve. If provided, this option will be favored over `name`.

**name**

The name of the milestone to retrieve.

**repo\_name**

The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

**profile**

The name of the profile configuration to use. Defaults to `github`.

**output**

The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

CLI Example:

```
salt myminion github.get_milestone 72
salt myminion github.get_milestone name=my_milestone
```

`salt.modules.github.get_milestones` (*repo\_name=None, profile='github', state='open', sort='due\_on', direction='asc', output='min', per\_page=None*)

Return information about milestones for a given repository.

New in version 2016.11.0.

**repo\_name**

The name of the repository for which to list issues. This argument is required, either passed via the CLI, or

defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

**profile**

The name of the profile configuration to use. Defaults to `github`.

**state**

The state of the milestone. Either `open`, `closed`, or `all`. Default is `open`.

**sort**

What to sort results by. Either `due_on` or `completeness`. Default is `due_on`.

**direction**

The direction of the sort. Either `asc` or `desc`. Default is `asc`.

**output**

The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

**per\_page**

GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues gathered from GitHub, per page. If not set, GitHub defaults are used.

CLI Example:

```
salt myminion github.get_milestones
```

```
salt.modules.github.get_prs(repo_name=None, profile='github', state='open', head=None, base=None,
                             sort='created', direction='desc', output='min', per_page=None)
```

Returns information for all pull requests in a given repository, based on the search options provided.

New in version 2017.7.0.

**repo\_name**

The name of the repository for which to list pull requests. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

**profile**

The name of the profile configuration to use. Defaults to `github`.

**state**

Indicates the state of the pull requests to return. Can be either `open`, `closed`, or `all`. Default is `open`.

**head**

Filter pull requests by head user and branch name in the format of `user:ref-name`. Example: `'github:new-script-format'`. Default is `None`.

**base**

Filter pulls by base branch name. Example: `gh-pages`. Default is `None`.

**sort**

What to sort results by. Can be either `created`, `updated`, `popularity` (comment count), or `long-running` (age, filtering by pull requests updated within the last month). Default is `created`.

**direction**

The direction of the sort. Can be either `asc` or `desc`. Default is `desc`.

**output**

The amount of data returned by each pull request. Defaults to `min`. Change to `full` to see all pull request output.

**per\_page**

GitHub paginates data in their API calls. Use this value to increase or decrease the number of pull requests gathered from GitHub, per page. If not set, GitHub defaults are used. Maximum is 100.

CLI Example:

```
salt myminion github.get_prs
salt myminion github.get_prs base=2016.11
```

`salt.modules.github.get_repo_info(repo_name, profile='github', ignore_cache=False)`

Return information for a given repo.

New in version 2016.11.0.

**repo\_name**

The name of the repository.

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.get_repo_info salt
salt myminion github.get_repo_info salt profile='my-github-profile'
```

`salt.modules.github.get_repo_teams(repo_name, profile='github')`

Return teams belonging to a repository.

New in version 2017.7.0.

**repo\_name**

The name of the repository from which to retrieve teams.

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.get_repo_teams salt
salt myminion github.get_repo_teams salt profile='my-github-profile'
```

`salt.modules.github.get_team(name, profile='github')`

Returns the team details if a team with the given name exists, or `None` otherwise.

**name**

The team name for which to obtain information.

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.get_team 'team_name'
```

`salt.modules.github.get_user(name, profile='github', user_details=False)`

Get a GitHub user by name.

**name**

The user for which to obtain information.

**profile**

The name of the profile configuration to use. Defaults to `github`.

**user\_details**

Prints user information details. Defaults to `False`. If the user is already in the organization and `user_details` is set to `False`, the `get_user` function returns `True`. If the user is not already present in the organization, user details will be printed by default.

CLI Example:

```
salt myminion github.get_user github-handle
salt myminion github.get_user github-handle user_details=true
```

`salt.modules.github.is_team_member` (*name*, *team\_name*, *profile*='github')

Returns `True` if the github user is in the team with `team_name`, or `False` otherwise.

**name**

The name of the user whose membership to check.

**team\_name**

The name of the team to check membership in.

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.is_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.list_members_without_mfa` (*profile*='github', *ignore\_cache*=False)

List all members (in lower case) without MFA turned on.

**profile**

The name of the profile configuration to use. Defaults to `github`.

**ignore\_cache**

Bypasses the use of cached team repos.

CLI Example:

```
salt myminion github.list_members_without_mfa
```

New in version 2016.11.0.

`salt.modules.github.list_private_repos` (*profile*='github')

List private repositories within the organization. Dependent upon the access rights of the profile token.

New in version 2016.11.0.

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.list_private_repos
salt myminion github.list_private_repos profile='my-github-profile'
```

`salt.modules.github.list_public_repos(profile='github')`

List public repositories within the organization.

New in version 2016.11.0.

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.list_public_repos
salt myminion github.list_public_repos profile='my-github-profile'
```

`salt.modules.github.list_repos(profile='github')`

List all repositories within the organization. Includes public and private repositories within the organization. Dependent upon the access rights of the profile token.

New in version 2016.11.0.

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.list_repos
salt myminion github.list_repos profile='my-github-profile'
```

`salt.modules.github.list_team_members(team_name, profile='github', ignore_cache=False)`

Gets the names of team members in lower case.

**team\_name**

The name of the team from which to list members.

**profile**

The name of the profile configuration to use. Defaults to `github`.

**ignore\_cache**

Bypasses the use of cached team members.

CLI Example:

```
salt myminion github.list_team_members 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.list_team_repos(team_name, profile='github', ignore_cache=False)`

Gets the repo details for a given team as a dict from `repo_name` to repo details. Note that repo names are always in lower case.

**team\_name**

The name of the team from which to list repos.

**profile**

The name of the profile configuration to use. Defaults to `github`.

**ignore\_cache**

Bypasses the use of cached team repos.

CLI Example:

```
salt myminion github.list_team_repos 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.list_teams` (*profile='github', ignore\_cache=False*)

Lists all teams with the organization.

**profile**

The name of the profile configuration to use. Defaults to `github`.

**ignore\_cache**

Bypasses the use of cached teams.

CLI Example:

```
salt myminion github.list_teams
```

New in version 2016.11.0.

`salt.modules.github.list_users` (*profile='github', ignore\_cache=False*)

List all users within the organization.

**profile**

The name of the profile configuration to use. Defaults to `github`.

**ignore\_cache**

Bypasses the use of cached users.

New in version 2016.11.0.

CLI Example:

```
salt myminion github.list_users
salt myminion github.list_users profile='my-github-profile'
```

`salt.modules.github.remove_repo` (*name, profile='github'*)

Remove a Github repository.

**name**

The name of the repository to be removed.

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_repo 'my-repo'
```

New in version 2016.11.0.

`salt.modules.github.remove_team` (*name, profile='github'*)

Remove a github team.

**name**

The name of the team to be removed.

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_team 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.remove_team_member` (*name*, *team\_name*, *profile*='github')

Removes a team member from a team with *team\_name*.

**name**

The name of the team member to remove.

**team\_name**

The name of the team from which to remove the user.

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.remove_team_repo` (*repo\_name*, *team\_name*, *profile*='github')

Removes a repository from a team with *team\_name*.

**repo\_name**

The name of the repository to remove.

**team\_name**

The name of the team of which to remove the repository.

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_team_repo 'my_repo' 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.remove_user` (*name*, *profile*='github')

Remove a Github user by name.

**name**

The user for which to obtain information.

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_user github-handle
```

## 26.6.153 salt.modules.glanceng

Glance module for interacting with OpenStack Glance

New in version 2018.3.0.

:depends:shade

Example configuration

```
glance:
  cloud: default
```

```
glance:
  auth:
    username: admin
    password: password123
    user_domain_name: mydomain
    project_name: myproject
    project_domain_name: myproject
    auth_url: https://example.org:5000/v3
    identity_api_version: 3
```

`salt.modules.glanceng.compare_changes(obj, **kwargs)`

Compare two dicts returning only keys that exist in the first dict and are different in the second one

`salt.modules.glanceng.get_openstack_cloud(auth=None)`

Return an openstack\_cloud

`salt.modules.glanceng.get_operator_cloud(auth=None)`

Return an operator\_cloud

`salt.modules.glanceng.image_create(auth=None, **kwargs)`

Create an image

CLI Example:

```
salt '*' glanceng.image_create name=cirros file=cirros.raw disk_format=raw
salt '*' glanceng.image_create name=cirros file=cirros.raw disk_
→format=raw hw_scsi_model=virtio-scsi hw_disk_bus=scsi
```

`salt.modules.glanceng.image_delete(auth=None, **kwargs)`

Delete an image

CLI Example:

```
salt '*' glanceng.image_delete name=image1
salt '*' glanceng.image_delete name=0e4febc2a5ab4f2c8f374b054162506d
```

`salt.modules.glanceng.image_get(auth=None, **kwargs)`

Get a single image

CLI Example:

```
salt '*' glanceng.image_get name=image1
salt '*' glanceng.image_get name=0e4febc2a5ab4f2c8f374b054162506d
```

`salt.modules.glanceng.image_list(auth=None, **kwargs)`

List images

CLI Example:

```
salt '*' glanceng.image_list
salt '*' glanceng.image_list
```

`salt.modules.glanceng.image_search(auth=None, **kwargs)`

Search for images

CLI Example:

```
salt '*' glanceng.image_search name=image1
salt '*' glanceng.image_search
```

`salt.modules.glanceng.setup_clouds(auth=None)`

Call functions to create Shade cloud objects in `__context__` to take advantage of Shade's in-memory caching across several states

`salt.modules.glanceng.update_image_properties(auth=None, **kwargs)`

Update properties for an image

CLI Example:

```
salt '*' glanceng.update_image_properties name=image1 hw_scsi_
→model=virtio-scsi hw_disk_bus=scsi
salt '*' glanceng.update_image_properties
→name=0e4febc2a5ab4f2c8f374b054162506d min_ram=1024
```

## 26.6.154 salt.modules.glassfish

Module for working with the Glassfish/Payara 4.x management API .. versionadded:: 2016.11.0 :depends: requests

`salt.modules.glassfish.create_admin_object_resource(name, server=None, **kwargs)`

Create a JMS destination

`salt.modules.glassfish.create_connector_c_pool(name, server=None, **kwargs)`

Create a connection pool

`salt.modules.glassfish.create_connector_resource(name, server=None, **kwargs)`

Create a connection resource

`salt.modules.glassfish.create_jdbc_connection_pool(name, server=None, **kwargs)`

Create a connection resource

`salt.modules.glassfish.create_jdbc_resource(name, server=None, **kwargs)`

Create a JDBC resource

`salt.modules.glassfish.delete_admin_object_resource(name, target='server', server=None)`

Delete a JMS destination

`salt.modules.glassfish.delete_connector_c_pool(name, target='server', cascade=True, server=None)`

Delete a connection pool

---

`salt.modules.glassfish.delete_connector_resource`(*name*, *target*='server', *server*=None)  
Delete a connection resource

`salt.modules.glassfish.delete_jdbc_connection_pool`(*name*, *target*='server', *cascade*=False, *server*=None)  
Delete a JDBC pool

`salt.modules.glassfish.delete_jdbc_resource`(*name*, *target*='server', *server*=None)  
Delete a JDBC resource

`salt.modules.glassfish.delete_system_properties`(*name*, *server*=None)  
Delete a system property

`salt.modules.glassfish.enum_admin_object_resource`(*server*=None)  
Enum JMS destinations

`salt.modules.glassfish.enum_connector_c_pool`(*server*=None)  
Enum connection pools

`salt.modules.glassfish.enum_connector_resource`(*server*=None)  
Enum connection resources

`salt.modules.glassfish.enum_jdbc_connection_pool`(*server*=None)  
Enum JDBC pools

`salt.modules.glassfish.enum_jdbc_resource`(*server*=None)  
Enum JDBC resources

`salt.modules.glassfish.get_admin_object_resource`(*name*, *server*=None)  
Get a specific JMS destination

`salt.modules.glassfish.get_connector_c_pool`(*name*, *server*=None)  
Get a specific connection pool

`salt.modules.glassfish.get_connector_resource`(*name*, *server*=None)  
Get a specific connection resource

`salt.modules.glassfish.get_jdbc_connection_pool`(*name*, *server*=None)  
Get a specific JDBC pool

`salt.modules.glassfish.get_jdbc_resource`(*name*, *server*=None)  
Get a specific JDBC resource

`salt.modules.glassfish.get_system_properties`(*server*=None)  
Get system properties

`salt.modules.glassfish.update_admin_object_resource`(*name*, *server*=None, *\*\*kwargs*)  
Update a JMS destination

`salt.modules.glassfish.update_connector_c_pool`(*name*, *server*=None, *\*\*kwargs*)  
Update a connection pool

`salt.modules.glassfish.update_connector_resource`(*name*, *server*=None, *\*\*kwargs*)  
Update a connection resource

`salt.modules.glassfish.update_jdbc_connection_pool`(*name*, *server*=None, *\*\*kwargs*)  
Update a JDBC pool

`salt.modules.glassfish.update_jdbc_resource`(*name*, *server=None*, *\*\*kwargs*)

Update a JDBC resource

`salt.modules.glassfish.update_system_properties`(*data*, *server=None*)

Update system properties

### 26.6.155 `salt.modules.glusterfs`

Manage a glusterfs pool

`salt.modules.glusterfs.add_volume_bricks`(*name*, *bricks*)

Add brick(s) to an existing volume

**name**

Volume name

**bricks**

List of bricks to add to the volume

CLI Example:

```
salt '*' glusterfs.add_volume_bricks <volume> <bricks>
```

`salt.modules.glusterfs.create_volume`(*name*, *bricks*, *stripe=False*, *replica=False*, *device\_vg=False*, *transport='tcp'*, *start=False*, *force=False*, *arbiter=False*)

Create a glusterfs volume

**name**

Name of the gluster volume

**bricks**

Bricks to create volume from, in `<peer>:<brick path>` format. For multiple bricks use list format: `["<peer1>:<brick1>", "<peer2>:<brick2>"]`

**stripe**

Stripe count, the number of bricks should be a multiple of the stripe count for a distributed striped volume

**replica**

Replica count, the number of bricks should be a multiple of the replica count for a distributed replicated volume

**arbiter**

If true, specifies volume should use arbiter brick(s). Valid configuration limited to "replica 3 arbiter 1" per Gluster documentation. Every third brick in the brick list is used as an arbiter brick.

New in version 2019.2.0.

**device\_vg**

If true, specifies volume should use block backend instead of regular posix backend. Block device backend volume does not support multiple bricks

**transport**

Transport protocol to use, can be 'tcp', 'rdma' or 'tcp,rdma'

**start**

Start the volume after creation

**force**

Force volume creation, this works even if creating in root FS

CLI Examples:

```
salt host1 glusterfs.create newvolume host1:/brick
salt gluster1 glusterfs.create vol2 '["gluster1:/export/vol2/brick",
↪ "gluster2:/export/vol2/brick"]' replica=2 start=True
```

`salt.modules.glusterfs.delete_volume` (*target*, *stop=True*)

Deletes a gluster volume

**target**

Volume to delete

**stop**

[True] If True, stop volume before delete

CLI Example:

```
salt '*' glusterfs.delete_volume <volume>
```

`salt.modules.glusterfs.disable_quota_volume` (*name*)

Disable quota on a glusterfs volume.

**name**

Name of the gluster volume

CLI Example:

```
salt '*' glusterfs.disable_quota_volume <volume>
```

`salt.modules.glusterfs.enable_quota_volume` (*name*)

Enable quota on a glusterfs volume.

**name**

Name of the gluster volume

CLI Example:

```
salt '*' glusterfs.enable_quota_volume <volume>
```

`salt.modules.glusterfs.get_max_op_version` ()

New in version 2019.2.0.

Returns the glusterfs volume's max op-version value Requires Glusterfs version > 3.9

CLI Example:

```
salt '*' glusterfs.get_max_op_version
```

`salt.modules.glusterfs.get_op_version` (*name*)

New in version 2019.2.0.

Returns the glusterfs volume op-version

**name**

Name of the glusterfs volume

CLI Example:

```
salt '*' glusterfs.get_op_version <volume>
```

`salt.modules.glusterfs.get_version()`

New in version 2019.2.0.

Returns the version of glusterfs.

CLI Example:

```
salt '*' glusterfs.get_version
```

`salt.modules.glusterfs.info(name=None)`

New in version 2015.8.4.

Return gluster volume info.

**name**

Optional name to retrieve only information of one volume

CLI Example:

```
salt '*' glusterfs.info
```

`salt.modules.glusterfs.list_quota_volume(name)`

List quotas of glusterfs volume

**name**

Name of the gluster volume

CLI Example:

```
salt '*' glusterfs.list_quota_volume <volume>
```

`salt.modules.glusterfs.list_volumes()`

List configured volumes

CLI Example:

```
salt '*' glusterfs.list_volumes
```

`salt.modules.glusterfs.peer(name)`

Add another node into the peer list.

**name**

The remote host to probe.

CLI Example:

```
salt 'one.gluster.*' glusterfs.peer two
```

GLUSTER direct CLI example (to show what salt is sending to gluster):

```
$ gluster peer probe ftp2
```

GLUSTER CLI 3.4.4 return example (so we know what we are parsing):

```
#if the "peer" is the local host: peer probe: success: on localhost not needed
```

```
#if the peer was just added: peer probe: success
```

```
#if the peer was already part of the cluster: peer probe: success: host ftp2 port 24007 already in peer list
```

**salt.modules.glusterfs.peer\_status()**

Return peer status information

The return value is a dictionary with peer UUIDs as keys and dicts of peer information as values. Hostnames are listed in one list. GlusterFS separates one of the hostnames but the only reason for this seems to be which hostname happens to be used first in peering.

CLI Example:

```
salt '*' glusterfs.peer_status
```

GLUSTER direct CLI example (to show what salt is sending to gluster):

```
$ gluster peer status
```

GLUSTER CLI 3.4.4 return example (so we know what we are parsing):

```
Number of Peers: 2
```

```
Hostname: ftp2 Port: 24007 Uuid: cbc256b-e66e-4ec7-a718-21082d396c24 State: Peer in Cluster (Connected)
```

```
Hostname: ftp3 Uuid: 5ea10457-6cb2-427b-a770-7897509625e9 State: Peer in Cluster (Connected)
```

**salt.modules.glusterfs.set\_op\_version(version)**

New in version 2019.2.0.

Set the glusterfs volume op-version

**version**

Version to set the glusterfs volume op-version

CLI Example:

```
salt '*' glusterfs.set_op_version <volume>
```

**salt.modules.glusterfs.set\_quota\_volume(name, path, size, enable\_quota=False)**

Set quota to glusterfs volume.

**name**

Name of the gluster volume

**path**

Folder path for restriction in volume ("")

**size**

Hard-limit size of the volume (MB/GB)

**enable\_quota**

Enable quota before set up restriction

CLI Example:

```
salt '*' glusterfs.set_quota_volume <volume> <path> <size> enable_
→quota=True
```

**salt.modules.glusterfs.start\_volume(name, force=False)**

Start a gluster volume

**name**

Volume name

**force**

Force the volume start even if the volume is started .. versionadded:: 2015.8.4

CLI Example:

```
salt '*' glusterfs.start mycluster
```

`salt.modules.glusterfs.status(name)`

Check the status of a gluster volume.

**name**

Volume name

CLI Example:

```
salt '*' glusterfs.status myvolume
```

`salt.modules.glusterfs.stop_volume(name, force=False)`

Stop a gluster volume

**name**

Volume name

**force**

Force stop the volume

New in version 2015.8.4.

CLI Example:

```
salt '*' glusterfs.stop_volume mycluster
```

`salt.modules.glusterfs.unset_quota_volume(name, path)`

Unset quota on glusterfs volume

**name**

Name of the gluster volume

**path**

Folder path for restriction in volume

CLI Example:

```
salt '*' glusterfs.unset_quota_volume <volume> <path>
```

## 26.6.156 salt.modules.gnomedesktop

GNOME implementations

`salt.modules.gnomedesktop.get(schema=None, key=None, user=None, **kwargs)`

Get key in a particular GNOME schema

CLI Example:

```
salt '*' gnome.get user=<username> schema=org.gnome.desktop.screensaver  
→key=idle-activation-enabled
```

`salt.modules.gnomedesktop.getClockFormat(**kwargs)`

Return the current clock format, either 12h or 24h format.

CLI Example:

```
salt '*' gnome.getClockFormat user=<username>
```

`salt.modules.gnomedesktop.getClockShowDate(**kwargs)`

Return the current setting, if the date is shown in the clock

CLI Example:

```
salt '*' gnome.getClockShowDate user=<username>
```

`salt.modules.gnomedesktop.getIdleActivation(**kwargs)`

Get whether the idle activation is enabled

CLI Example:

```
salt '*' gnome.getIdleActivation user=<username>
```

`salt.modules.gnomedesktop.getIdleDelay(**kwargs)`

Return the current idle delay setting in seconds

CLI Example:

```
salt '*' gnome.getIdleDelay user=<username>
```

`salt.modules.gnomedesktop.ping(**kwargs)`

A test to ensure the GNOME module is loaded

CLI Example:

```
salt '*' gnome.ping user=<username>
```

`salt.modules.gnomedesktop.setClockFormat(clockFormat, **kwargs)`

Set the clock format, either 12h or 24h format.

CLI Example:

```
salt '*' gnome.setClockFormat <12h|24h> user=<username>
```

`salt.modules.gnomedesktop.setClockShowDate(kvalue, **kwargs)`

Set whether the date is visible in the clock

CLI Example:

```
salt '*' gnome.setClockShowDate <True|False> user=<username>
```

`salt.modules.gnomedesktop.setIdleActivation(kvalue, **kwargs)`

Set whether the idle activation is enabled

CLI Example:

```
salt '*' gnome.setIdleActivation <True|False> user=<username>
```

`salt.modules.gnomedesktop.setIdleDelay` (*delaySeconds*, *\*\*kwargs*)

Set the current idle delay setting in seconds

CLI Example:

```
salt '*' gnome.setIdleDelay <seconds> user=<username>
```

`salt.modules.gnomedesktop.set_` (*schema=None*, *key=None*, *user=None*, *value=None*, *\*\*kwargs*)

Set key in a particular GNOME schema

CLI Example:

```
salt '*' gnome.set user=<username> schema=org.gnome.desktop.screensaver  
→key=idle-activation-enabled value=False
```

### 26.6.157 salt.modules.google\_chat

Module for sending messages to google chat.

New in version 2019.2.0.

To use this module you need to configure a webhook in the google chat room where you would like the message to be sent, see:

<https://developers.google.com/hangouts/chat/how-tos/webhooks>

`salt.modules.google_chat.send_message` (*url*, *message*)

Send a message to the google chat room specified in the webhook url.

```
salt '*' google_chat.send_message "https://chat.googleapis.com/v1/spaces/  
→example_space/messages?key=example_key" "This is a test message"
```

### 26.6.158 salt.modules.gpg

Manage GPG keychains, add keys, create keys, retrieve keys from key servers. Sign, encrypt, sign plus encrypt and verify text and files.

New in version 2015.5.0.

---

**Note:** The `python-gnupg` library and `gpg` binary are required to be installed. Be aware that the alternate `gnupg` and `pretty-bad-protocol` libraries are not supported.

---

**class** `salt.modules.gpg.FixedVerify` (*gpg*)

This is a workaround for <https://github.com/vsajip/python-gnupg/issues/214>. It ensures invalid or otherwise unverified signatures are not merged into `sig_info` in any way.

<https://github.com/vsajip/python-gnupg/commit/ee94a7ecc1a86484c9f02337e2bbdd05fd32b383>

**handle\_status** (*key*, *value*)

Handle status messages from the `gpg` child process. These are lines of the format

```
[GNUPG:] <key> <value>
```

**Parameters**

- **key** (*str*) -- Identifies what the status message is.
- **value** (*str*) -- Identifies additional data, which differs depending on the key.

```
salt.modules.gpg.create_key(key_type='RSA', key_length=1024, name_real='Autogenerated Key',
                             name_comment='Generated by SaltStack', name_email=None,
                             subkey_type=None, subkey_length=None, expire_date=None,
                             use_passphrase=False, user=None, gnupghome=None, keyring=None)
```

Create a key in the GPG keychain

---

**Note:** GPG key generation requires *a lot* of entropy and randomness. Difficult to do over a remote connection, consider having another process available which is generating randomness for the machine. Also especially difficult on virtual machines, consider the [rng-tools](#) package.

The create\_key process takes awhile so increasing the timeout may be necessary, e.g. -t 15.

---

#### key\_type

The type of the primary key to generate. It must be capable of signing. 'RSA' or 'DSA'.

#### key\_length

The length of the primary key in bits.

#### name\_real

The real name of the user identity which is represented by the key.

#### name\_comment

A comment to attach to the user id.

#### name\_email

An email address for the user.

#### subkey\_type

The type of the secondary key to generate.

#### subkey\_length

The length of the secondary key in bits.

#### expire\_date

The expiration date for the primary and any secondary key. You can specify an ISO date, A number of days/weeks/months/years, an epoch value, or 0 for a non-expiring key.

#### use\_passphrase

Whether to use a passphrase with the signing key. The passphrase is retrieved from the Pillar key `gpg_passphrase`.

#### user

Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

#### gnupghome

Specify the location where the GPG keyring and related files are stored.

#### keyring

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt -t 15 '*' gpg.create_key
```

`salt.modules.gpg.decrypt` (*user=None, text=None, filename=None, output=None, use\_passphrase=False, gnupghome=None, bare=False, keyring=None*)

Decrypt a message or a file

**user**

Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

**text**

The encrypted text to decrypt.

**filename**

The path of the encrypted file to decrypt.

**output**

Instead of printing to standard out, write the output to this path.

**use\_passphrase**

Whether to use a passphrase with the signing key. The passphrase is retrieved from Pillar value `gpg_passphrase`.

**gnupghome**

Specify the location where the GPG keyring and related files are stored.

**bare**

If `True`, return the (armored) decrypted block as a string without the standard comment/res dict.

**keyring**

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.decrypt filename='/path/to/important.file.gpg'
salt '*' gpg.decrypt filename='/path/to/important.file.gpg' use_
→passphrase=True
```

`salt.modules.gpg.delete_key` (*keyid=None, fingerprint=None, delete\_secret=False, user=None, gnupghome=None, use\_passphrase=True, keyring=None*)

Delete a key from the GPG keychain.

**keyid**

The keyid of the key to be deleted.

**fingerprint**

The fingerprint of the key to be deleted.

**delete\_secret**

Whether to delete a corresponding secret key prior to deleting the public key. Secret keys must be deleted before deleting any corresponding public keys.

**user**

Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

**gnupghome**

Specify the location where the GPG keyring and related files are stored.

**use\_passphrase**

Whether to use a passphrase with the signing key. The passphrase is retrieved from the Pillar key `gpg_passphrase`. Note that this defaults to True here, contrary to the rest of the module functions that provide this parameter.

New in version 3003.

**keyring**

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```

salt '*' gpg.delete_key keyid=3FAD9F1E

salt '*' gpg.delete_key
↳fingerprint=53C96788253E58416D20BCD352952C84C3252192

salt '*' gpg.delete_key keyid=3FAD9F1E user=username

salt '*' gpg.delete_key keyid=3FAD9F1E user=username delete_secret=True

```

```

salt.modules.gpg.encrypt(user=None, recipients=None, text=None, filename=None, output=None,
                        sign=None, use_passphrase=False, always_trust=False, gnupghome=None,
                        bare=False, keyring=None)

```

Encrypt a message or a file

**user**

Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

**recipients**

The key ID, fingerprint, user ID or email address associated with the recipients key can be used.

**text**

The text to encrypt.

**filename**

The path of the file to encrypt.

**output**

Instead of printing to standard out, write the output to this path.

**sign**

Whether to sign, in addition to encrypt, the data. True to use default key or fingerprint to specify a different key to sign with.

**use\_passphrase**

Whether to use a passphrase with the signing key. The passphrase is retrieved from the Pillar key `gpg_passphrase`.

**always\_trust**

Skip key validation and assume that used keys are fully trusted.

New in version 3006.0.

**gnupghome**

Specify the location where the GPG keyring and related files are stored.

**bare**

If `True`, return the (armored) encrypted block as a string without the standard comment/res dict.

**keyring**

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.encrypt text='Hello there. How are you?'
↳recipients=recipient@example.com

salt '*' gpg.encrypt filename='/path/to/important.file'
↳recipients=recipient@example.com

salt '*' gpg.encrypt filename='/path/to/important.file' sign=True use_
↳passphrase=True \
recipients=recipient@example.com
```

`salt.modules.gpg.export_key` (*keyids=None, secret=False, user=None, gnupghome=None, use\_passphrase=False, output=None, bare=False, keyring=None*)

Export a key from the GPG keychain

**keyids**

The key ID(s) of the key(s) to be exported. Can be specified as a comma separated string or a list. Anything which GnuPG itself accepts to identify a key for example, the key ID, fingerprint, user ID or email address could be used.

**secret**

Export the secret key identified by the `keyids` information passed.

**user**

Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

**gnupghome**

Specify the location where the GPG keyring and related files are stored.

**use\_passphrase**

Whether to use a passphrase to export the secret key. The passphrase is retrieved from the Pillar key `gpg_passphrase`.

New in version 3003.

**output**

Instead of printing to standard out, write the output to this path.

New in version 3006.0.

**bare**

If `True`, return the (armored) exported key block as a string without the standard comment/res dict.

New in version 3006.0.

**keyring**

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```

salt '*' gpg.export_key keyids=3FAD9F1E
salt '*' gpg.export_key keyids=3FAD9F1E secret=True
salt '*' gpg.export_key keyids="['3FAD9F1E','3FBD8F1E']" user=username

```

`salt.modules.gpg.get_key` (*keyid=None, fingerprint=None, user=None, gnupghome=None, keyring=None*)

Get a key from the GPG keychain

**keyid**

The key ID (short or long) of the key to be retrieved.

**fingerprint**

The fingerprint of the key to be retrieved.

**user**

Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

**gnupghome**

Specify the location where the GPG keyring and related files are stored.

**keyring**

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```

salt '*' gpg.get_key keyid=3FAD9F1E
salt '*' gpg.get_key fingerprint=53C96788253E58416D20BCD352952C84C3252192
salt '*' gpg.get_key keyid=3FAD9F1E user=username

```

`salt.modules.gpg.get_secret_key` (*keyid=None, fingerprint=None, user=None, gnupghome=None, keyring=None*)

Get a secret key from the GPG keychain

**keyid**

The key ID (short or long) of the key to be retrieved.

**fingerprint**

The fingerprint of the key to be retrieved.

**user**

Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

**gnupghome**

Specify the location where the GPG keyring and related files are stored.

**keyring**

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```

salt '*' gpg.get_secret_key keyid=3FAD9F1E

salt '*' gpg.get_secret_key
→fingerprint=53C96788253E58416D20BCD352952C84C3252192

salt '*' gpg.get_secret_key keyid=3FAD9F1E user=username

```

`salt.modules.gpg.import_key` (*text=None, filename=None, user=None, gnupghome=None, keyring=None*)

Import a key from text or a file

**text**

The text containing the key to import.

**filename**

The path of the file containing the key to import.

**user**

Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

**gnupghome**

Specify the location where the GPG keyring and related files are stored.

**keyring**

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```

salt '*' gpg.import_key text='-----BEGIN PGP PUBLIC KEY BLOCK-----\n ... -
→-----END PGP PUBLIC KEY BLOCK-----'
salt '*' gpg.import_key filename='/path/to/public-key-file'

```

`salt.modules.gpg.list_keys` (*user=None, gnupghome=None, keyring=None*)

List keys in GPG keychain

**user**

Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

**gnupghome**

Specify the location where the GPG keyring and related files are stored.

**keyring**

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```

salt '*' gpg.list_keys

```

`salt.modules.gpg.list_secret_keys` (*user=None, gnupghome=None, keyring=None*)

List secret keys in GPG keychain

**user**

Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

**gnupghome**

Specify the location where the GPG keyring and related files are stored.

**keyring**

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.list_secret_keys
```

`salt.modules.gpg.receive_keys` (*keyserver=None, keys=None, user=None, gnupghome=None, keyring=None*)

Receive key(s) from keyserver and add them to the keychain

**keyserver**

Keyserver to use for searching for GPG keys, defaults to keys.openpgp.org

**keys**

The keyID(s) to retrieve from the keyserver. Can be specified as a comma separated string or a list.

**user**

Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

**gnupghome**

Specify the location where the GPG keyring and related files are stored.

**keyring**

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.receive_keys keys='3FAD9F1E'
salt '*' gpg.receive_keys keys="['3FAD9F1E','3FBD9F2E']"
salt '*' gpg.receive_keys keys=3FAD9F1E user=username
```

`salt.modules.gpg.search_keys` (*text, keyserver=None, user=None, gnupghome=None*)

Search for keys on a keyserver

**text**

Text to search the keyserver for, e.g. email address, keyID or fingerprint.

**keyserver**

Keyserver to use for searching for GPG keys, defaults to keys.openpgp.org.

**user**

Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

**gnupghome**

Specify the location where the GPG keyring and related files are stored.

New in version 3007.0.

CLI Example:

```

salt '*' gpg.search_keys user@example.com

salt '*' gpg.search_keys user@example.com keyserver=keyserver.ubuntu.com

salt '*' gpg.search_keys user@example.com keyserver=keyserver.ubuntu.com
→user=username

```

`salt.modules.gpg.sign` (*user=None, keyid=None, text=None, filename=None, output=None, use\_passphrase=False, gnupghome=None, keyring=None*)

Sign a message or a file

**user**

Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

**keyid**

The keyid of the key to use for signing, defaults to the first key in the secret keyring.

**text**

The text to sign.

**filename**

The path of the file to sign.

**output**

Instead of printing to standard out, write the output to this path.

**use\_passphrase**

Whether to use a passphrase with the signing key. The passphrase is retrieved from the Pillar key `gpg_passphrase`.

**gnupghome**

Specify the location where the GPG keyring and related files are stored.

**keyring**

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```

salt '*' gpg.sign text='Hello there. How are you?'

salt '*' gpg.sign filename='/path/to/important.file'

salt '*' gpg.sign filename='/path/to/important.file' use_passphrase=True

```

`salt.modules.gpg.trust_key` (*keyid=None, fingerprint=None, trust\_level=None, user=None, gnupghome=None, keyring=None*)

Set the trust level for a key in the GPG keychain

**keyid**

The keyid of the key to set the trust level for.

**fingerprint**

The fingerprint of the key to set the trust level for.

**trust\_level**

The trust level to set for the specified key, must be one of the following: `expired`, `unknown`, `not_trusted`, `marginally`, `fully`, `ultimately`

**user**

Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

**gnupghome**

Specify the location where the GPG keyring and related files are stored.

New in version 3007.0.

**keyring**

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.trust_key keyid='3FAD9F1E' trust_level='marginally'
salt '*' gpg.trust_key fingerprint=
→ '53C96788253E58416D20BCD352952C84C3252192' trust_level='not_trusted'
salt '*' gpg.trust_key keys=3FAD9F1E trust_level='ultimately' user=
→ 'username'
```

`salt.modules.gpg.verify`(*text=None, user=None, filename=None, gnupghome=None, signature=None, trustmodel=None, signed\_by\_any=None, signed\_by\_all=None, keyring=None*)

Verify a message or a file

**text**

The text to verify.

**filename**

The path of the file to verify.

**user**

Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

**gnupghome**

Specify the location where the GPG keyring and related files are stored.

**signature**

Specify the path of a detached signature.

New in version 2018.3.0.

**trustmodel**

Explicitly define the used trust model. One of:

- pgp
- classic
- tofu
- tofu+pgp
- direct
- always
- auto

New in version 2019.2.0.

**signed\_by\_any**

A list of key fingerprints from which any valid signature will mark verification as passed. If none of the provided keys signed the data, verification will fail. Optional. Note that this does not take into account trust.

New in version 3007.0.

**signed\_by\_all**

A list of key fingerprints whose signatures are required for verification to pass. If a single provided key did not sign the data, verification will fail. Optional. Note that this does not take into account trust.

New in version 3007.0.

**keyring**

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.verify text='Hello there. How are you?'
salt '*' gpg.verify filename='/path/to/important.file'
salt '*' gpg.verify filename='/path/to/important.file' trustmodel=direct
```

## 26.6.159 salt.modules.grafana4

Module for working with the Grafana v4 API

New in version 2017.7.0.

**depends**

requests

**configuration**

This module requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

For example:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

`salt.modules.grafana4.create_datasource` (*orgname=None, profile='grafana', \*\*kwargs*)

Create a new datasource in an organisation.

**name**

Name of the data source.

**type**

Type of the datasource ('graphite', 'influxdb' etc.).

**access**

Use proxy or direct.

**url**

The URL to the data source API.

**user**

Optional - user to authenticate with the data source.

**password**

Optional - password to authenticate with the data source.

**database**

Optional - database to use with the data source.

**basicAuth**

Optional - set to True to use HTTP basic auth to authenticate with the data source.

**basicAuthUser**

Optional - HTTP basic auth username.

**basicAuthPassword**

Optional - HTTP basic auth password.

**jsonData**

Optional - additional json data to post (eg. "timeInterval").

**isDefault**

Optional - set data source as default.

**withCredentials**

Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.

**typeLogoUrl**

Optional - Logo to use for this datasources.

**orgname**

Name of the organization in which the data source should be created.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.create_datasource
```

```
salt.modules.grafana4.create_org(profile='grafana', **kwargs)
```

Create a new organization.

**name**

Name of the organization.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.create_org <name>
```

```
salt.modules.grafana4.create_org_user(orgname=None, profile='grafana', **kwargs)
```

Add user to the organization.

**loginOrEmail**

Login or email of the user.

**role**

Role of the user for this organization. Should be one of:

- Admin
- Editor
- Read Only Editor
- Viewer

**orgname**

Name of the organization in which users are added.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.create_org_user <orgname> loginOrEmail=<loginOrEmail>
↳role=<role>
```

`salt.modules.grafana4.create_update_dashboard` (*orgname=None, profile='grafana', \*\*kwargs*)

Create or update a dashboard.

**dashboard**

A dict that defines the dashboard to create/update.

**overwrite**

Whether the dashboard should be overwritten if already existing.

**orgname**

Name of the organization.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.create_update_dashboard dashboard=<dashboard>
↳overwrite=True orgname=<orgname>
```

`salt.modules.grafana4.create_user` (*profile='grafana', \*\*kwargs*)

Create a new user.

**login**

Login of the new user.

**password**

Password of the new user.

**email**

Email of the new user.

**name**

Optional - Full name of the new user.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.create_user login=<login> password=<password> email=
↳<email>
```

`salt.modules.grafana4.delete_dashboard` (*slug, orgname=None, profile='grafana'*)

Delete a dashboard.

**slug**

Slug (name) of the dashboard.

**orgname**

Name of the organization.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_dashboard <slug>
```

`salt.modules.grafana4.delete_datasource` (*datasourceid, orgname=None, profile='grafana'*)

Delete a datasource.

**datasourceid**

Id of the datasource.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_datasource <datasource_id>
```

`salt.modules.grafana4.delete_org` (*orgid, profile='grafana'*)

Delete an organization.

**orgid**

Id of the organization.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_org <org_id>
```

`salt.modules.grafana4.delete_org_user` (*userid, orgname=None, profile='grafana'*)

Remove user from the organization.

**userid**

Id of the user.

**orgname**

Name of the organization in which users are updated.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_org_user <user_id> <orgname>
```

`salt.modules.grafana4.delete_user` (*userid, profile='grafana'*)

Delete a user.

**userid**

Id of the user.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_user <user_id>
```

`salt.modules.grafana4.delete_user_org`(*userid, orgid, profile='grafana'*)

Remove a user from an organization.

**userid**

Id of the user.

**orgid**

Id of the organization.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_user_org <user_id> <org_id>
```

`salt.modules.grafana4.get_dashboard`(*slug, orgname=None, profile='grafana'*)

Get a dashboard.

**slug**

Slug (name) of the dashboard.

**orgname**

Name of the organization.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_dashboard <slug>
```

`salt.modules.grafana4.get_datasource`(*name, orgname=None, profile='grafana'*)

Show a single datasource in an organisation.

**name**

Name of the datasource.

**orgname**

Name of the organization.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_datasource <name> <orgname>
```

`salt.modules.grafana4.get_datasources`(*orgname=None, profile='grafana'*)

List all datasources in an organisation.

**orgname**

Name of the organization.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_datasources <orgname>
```

`salt.modules.grafana4.get_org`(*name*, *profile*='grafana')

Show a single organization.

**name**

Name of the organization.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_org <name>
```

`salt.modules.grafana4.get_org_address`(*orgname*=None, *profile*='grafana')

Get the organization address.

**orgname**

Name of the organization in which users are updated.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_org_address <orgname>
```

`salt.modules.grafana4.get_org_prefs`(*orgname*=None, *profile*='grafana')

Get the organization preferences.

**orgname**

Name of the organization in which users are updated.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_org_prefs <orgname>
```

`salt.modules.grafana4.get_org_users`(*orgname*=None, *profile*='grafana')

Get the list of users that belong to the organization.

**orgname**

Name of the organization.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_org_users <orgname>
```

`salt.modules.grafana4.get_orgs(profile='grafana')`

List all organizations.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_orgs
```

`salt.modules.grafana4.get_user(login, profile='grafana')`

Show a single user.

**login**

Login of the user.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_user <login>
```

`salt.modules.grafana4.get_user_data(userid, profile='grafana')`

Get user data.

**userid**

Id of the user.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_user_data <user_id>
```

`salt.modules.grafana4.get_user_orgs(userid, profile='grafana')`

Get the list of organisations a user belong to.

**userid**

Id of the user.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_user_orgs <user_id>
```

`salt.modules.grafana4.get_users(profile='grafana')`

List all users.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_users
```

`salt.modules.grafana4.switch_org`(*orgname*, *profile*='grafana')

Switch the current organization.

**name**

Name of the organization to switch to.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.switch_org <name>
```

`salt.modules.grafana4.update_datasource`(*datasourceid*, *orgname*=None, *profile*='grafana', *\*\*kwargs*)

Update a datasource.

**datasourceid**

Id of the datasource.

**name**

Name of the data source.

**type**

Type of the datasource ('graphite', 'influxdb' etc.).

**access**

Use proxy or direct.

**url**

The URL to the data source API.

**user**

Optional - user to authenticate with the data source.

**password**

Optional - password to authenticate with the data source.

**database**

Optional - database to use with the data source.

**basicAuth**

Optional - set to True to use HTTP basic auth to authenticate with the data source.

**basicAuthUser**

Optional - HTTP basic auth username.

**basicAuthPassword**

Optional - HTTP basic auth password.

**jsonData**

Optional - additional json data to post (eg. "timeInterval").

**isDefault**

Optional - set data source as default.

**withCredentials**

Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.

**typeLogoUrl**

Optional - Logo to use for this datasource.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_datasource <datasourceid>
```

`salt.modules.grafana4.update_org`(*orgid*, *profile*='grafana', *\*\*kwargs*)

Update an existing organization.

**orgid**

Id of the organization.

**name**

New name of the organization.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_org <org_id> name=<name>
```

`salt.modules.grafana4.update_org_address`(*orgname*=None, *profile*='grafana', *\*\*kwargs*)

Update the organization address.

**orgname**

Name of the organization in which users are updated.

**address1**

Optional - address1 of the org.

**address2**

Optional - address2 of the org.

**city**

Optional - city of the org.

**zip\_code**

Optional - zip\_code of the org.

**state**

Optional - state of the org.

**country**

Optional - country of the org.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_org_address <orgname> country=<country>
```

`salt.modules.grafana4.update_org_prefs`(*orgname*=None, *profile*='grafana', *\*\*kwargs*)

Update the organization preferences.

**orgname**

Name of the organization in which users are updated.

**theme**

Selected theme for the org.

**homeDashboardId**

Home dashboard for the org.

**timezone**

Timezone for the org (one of: "browser", "utc", or "").

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_org_prefs <orgname> theme=<theme> timezone=
↳<timezone>
```

`salt.modules.grafana4.update_org_user` (*userid*, *orgname=None*, *profile='grafana'*, *\*\*kwargs*)

Update user role in the organization.

**userid**

Id of the user.

**loginOrEmail**

Login or email of the user.

**role**

**Role of the user for this organization. Should be one of:**

- Admin
- Editor
- Read Only Editor
- Viewer

**orgname**

Name of the organization in which users are updated.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_org_user <user_id> <orgname> loginOrEmail=
↳<loginOrEmail> role=<role>
```

`salt.modules.grafana4.update_user` (*userid*, *profile='grafana'*, *\*\*kwargs*)

Update an existing user.

**userid**

Id of the user.

**login**

Optional - Login of the user.

**email**

Optional - Email of the user.

**name**

Optional - Full name of the user.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_user <user_id> login=<login> email=<email>
```

`salt.modules.grafana4.update_user_password(userid, profile='grafana', **kwargs)`

Update a user password.

**userid**

Id of the user.

**password**

New password of the user.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_user_password <user_id> password=<password>
```

`salt.modules.grafana4.update_user_permissions(userid, profile='grafana', **kwargs)`

Update a user password.

**userid**

Id of the user.

**isGrafanaAdmin**

Whether user is a Grafana admin.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.update_user_permissions <user_id> isGrafanaAdmin=  
-><true|false>
```

### 26.6.160 salt.modules.grains

Return/control aspects of the grains data

Grains set or altered with this module are stored in the 'grains' file on the minions. By default, this file is located at: /etc/salt/grains

---

**Note:** This does NOT override any grains set in the minion config file.

---

`salt.modules.grains.append(key, val, convert=False, delimiter=':')`

New in version 0.17.0.

Append a value to a list in the grains config file. If the grain doesn't exist, the grain key is added and the value is appended to the new grain as a list item.

**key**

The grain key to be appended to

**val**

The value to append to the grain key

**convert**

If convert is True, convert non-list contents into a list. If convert is False and the grain contains non-list contents, an error is given. Defaults to False.

**delimiter**

The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the default `:`. You can now append values to a list in nested dictionary grains. If the list doesn't exist at this level, it will be created.

New in version 2014.7.6.

CLI Example:

```
salt '*' grains.append key val
```

`salt.modules.grains.delkey` (*key*, *force=False*)

New in version 2017.7.0.

Remove a grain completely from the grain system, this will remove the grain key and value

**key**

The grain key from which to delete the value.

**force**

Force remove the grain even when it is a mapped value. Defaults to False

CLI Example:

```
salt '*' grains.delkey key
```

`salt.modules.grains.delval` (*key*, *destructive=False*, *force=False*)

New in version 0.17.0.

Delete a grain value from the grains config file. This will just set the grain value to None. To completely remove the grain, run `grains.delkey` or pass `destructive=True` to `grains.delval`.

**key**

The grain key from which to delete the value.

**destructive**

Delete the key, too. Defaults to False.

**force**

Force remove the grain even when it is a mapped value. Defaults to False

CLI Example:

```
salt '*' grains.delval key
```

`salt.modules.grains.equals` (*key*, *value*)

Used to make sure the minion's grain key/value matches.

Returns True if matches otherwise False.

New in version 2017.7.0.

CLI Example:

```
salt '*' grains.equals fqdn <expected_fqdn>
salt '*' grains.equals systemd:version 219
```

`salt.modules.grains.fetch`(*key*, *default=""*, *delimiter=':'*, *ordered=True*)

Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in grains looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```
pkg:apache
```

#### Parameters

- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

- **ordered** -- Outputs an ordered dict if applicable (default: True)

New in version 2016.11.0.

CLI Example:

```
salt '*' grains.get pkg:apache
salt '*' grains.get abc::def|ghi delimiter='|'
```

`salt.modules.grains.filter_by`(*lookup\_dict*, *grain='os\_family'*, *merge=None*, *default='default'*, *base=None*)

New in version 0.17.0.

Look up the given grain in a given dictionary for the current OS and return the result

Although this may occasionally be useful at the CLI, the primary intent of this function is for use in Jinja to make short work of creating lookup tables for OS-specific data. For example:

```
{% set apache = salt['grains.filter_by']({
    'Debian': {'pkg': 'apache2', 'srv': 'apache2'},
    'RedHat': {'pkg': 'httpd', 'srv': 'httpd'},
}, default='Debian') %}
```

```
myapache:
  pkg.installed:
    - name: {{ apache.pkg }}
  service.running:
    - name: {{ apache.srv }}
```

Values in the lookup table may be overridden by values in Pillar. An example Pillar to override values in the example above could be as follows:

```

apache:
  lookup:
    pkg: apache_13
    srv: apache

```

The call to `filter_by()` would be modified as follows to reference those Pillar values:

```

{% set apache = salt['grains.filter_by']({
  ...
}, merge=salt['pillar.get']('apache:lookup')) %}

```

### Parameters

- **lookup\_dict** -- A dictionary, keyed by a grain, containing a value or values relevant to systems matching that grain. For example, a key could be the grain for an OS and the value could be the name of a package on that particular OS.

Changed in version 2016.11.0: The dictionary key could be a globbing pattern. The function will return the corresponding `lookup_dict` value where grain value matches the pattern. For example:

```

# this will render 'got some salt' if Minion ID begins from
→ 'salt'
salt '*' grains.filter_by '{salt*: got some salt, default:
→ salt is not here}' id

```

- **grain** -- The name of a grain to match with the current system's grains. For example, the value of the "os\_family" grain for the current system could be used to pull values from the `lookup_dict` dictionary.

Changed in version 2016.11.0: The grain value could be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

- **merge** -- A dictionary to merge with the results of the grain selection from `lookup_dict`. This allows Pillar to override the values in the `lookup_dict`. This could be useful, for example, to override the values for non-standard package names such as when using a different Python version from the default Python version provided by the OS (e.g., `python26-mysql` instead of `python-mysql`).
- **default** -- default `lookup_dict`'s key used if the grain does not exist or if the grain value has no match on `lookup_dict`. If unspecified the value is "default".

New in version 2014.1.0.

- **base** -- A `lookup_dict` key to use for a base dictionary. The grain-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the grain selection dictionary and the merge dictionary. Default is unset.

New in version 2015.5.0.

CLI Example:

```

salt '*' grains.filter_by '{Debian: Debheads rule, RedHat: I love my hat}'
# this one will render {D: {E: I, G: H}, J: K}
salt '*' grains.filter_by '{A: B, C: {D: {E: F, G: H}}}' 'xxx' '{D: {E: I}

```

(continues on next page)

(continued from previous page)

```

→, J: K}' 'C'
# next one renders {A: {B: G}, D: J}
salt '*' grains.filter_by '{default: {A: {B: C}, D: E}, F: {A: {B: G}}}'
→H: {D: I}}' 'xxx' '{D: J}' 'F' 'default'
# next same as above when default='H' instead of 'F' renders {A: {B: C},
→D: J}

```

`salt.modules.grains.get(key, default="", delimiter=':', ordered=True)`

Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in grains looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```
pkg:apache
```

#### Parameters

- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

- **ordered** -- Outputs an ordered dict if applicable (default: True)

New in version 2016.11.0.

CLI Example:

```

salt '*' grains.get pkg:apache
salt '*' grains.get abc::def|ghi delimiter='|'

```

`salt.modules.grains.has_value(key)`

Determine whether a key exists in the grains dictionary.

Given a grains dictionary that contains the following structure:

```
{'pkg': {'apache': 'httpd'}}
```

One would determine if the apache key in the pkg dict exists by:

```
pkg:apache
```

CLI Example:

```
salt '*' grains.has_value pkg:apache
```

`salt.modules.grains.item(*args, **kwargs)`

Return one or more grains

CLI Example:

```
salt '*' grains.item os
salt '*' grains.item os osrelease oscodename
```

Sanitized CLI Example:

```
salt '*' grains.item host sanitize=True
```

`salt.modules.grains.items` (*sanitize=False*)

Return all of the minion's grains

CLI Example:

```
salt '*' grains.items
```

Sanitized CLI Example:

```
salt '*' grains.items sanitize=True
```

`salt.modules.grains.ls`()

Return a list of all available grains

CLI Example:

```
salt '*' grains.ls
```

`salt.modules.grains.remove` (*key, val, delimiter=':*)

New in version 0.17.0.

Remove a value from a list in the grains config file

**key**

The grain key to remove.

**val**

The value to remove.

**delimiter**

The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the default `:`. You can now append values to a list in nested dictionary grains. If the list doesn't exist at this level, it will be created.

New in version 2015.8.2.

CLI Example:

```
salt '*' grains.remove key val
```

`salt.modules.grains.set` (*key, val="", force=False, destructive=False, delimiter=':*)

Set a key to an arbitrary value. It is used like setval but works with nested keys.

This function is conservative. It will only overwrite an entry if its value and the given one are not a list or a dict. The `force` parameter is used to allow overwriting in all cases.

New in version 2015.8.0.

**Parameters**

- **force** -- Force writing over existing entry if given or existing values are list or dict. Defaults to False.

- **destructive** -- If an operation results in a key being removed, delete the key, too. Defaults to False.
- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict, the default being :

CLI Example:

```
salt '*' grains.set 'apps:myApp:port' 2209
salt '*' grains.set 'apps:myApp' '{port: 2209}'
```

`salt.modules.grains.setval`(*key, val, destructive=False, refresh\_pillar=True*)

Set a grains value in the grains config file

**key**

The grain key to be set.

**val**

The value to set the grain key to.

**destructive**

If an operation results in a key being removed, delete the key, too. Defaults to False.

**refresh\_pillar**

Whether pillar will be refreshed. Defaults to True.

CLI Example:

```
salt '*' grains.setval key val
salt '*' grains.setval key '{"sub-key': 'val', 'sub-key2': 'val2}'"
```

`salt.modules.grains.setvals`(*grains, destructive=False, refresh\_pillar=True*)

Set new grains values in the grains config file

**destructive**

If an operation results in a key being removed, delete the key, too. Defaults to False.

**refresh\_pillar**

Whether pillar will be refreshed. Defaults to True.

CLI Example:

```
salt '*' grains.setvals '{"key1': 'val1', 'key2': 'val2}'"
```

## 26.6.161 salt.modules.groupadd

Manage groups on Linux, OpenBSD and NetBSD

---

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *'group.info' is not available*), see [here](#).

---

`salt.modules.groupadd.add`(*name, gid=None, system=False, root=None, non\_unique=False, local=False*)

Changed in version 3006.0.

Add the specified group

**name**

Name of the new group

**gid**

Use GID for the new group

**system**

Create a system account

**root**

Directory to chroot into

**non\_unique**

Allow creating groups with duplicate (non-unique) GIDs

New in version 3006.0.

**local**

Specifically add the group locally rather than through remote providers (e.g. LDAP)

New in version 3007.0.

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.groupadd.adduser` (*name, username, root=None*)

Add a user in the group.

**name**

Name of the group to modify

**username**

Username to add to the group

**root**

Directory to chroot into

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

`salt.modules.groupadd.chgid` (*name, gid, root=None, non\_unique=False*)

Changed in version 3006.0.

Change the gid for a named group

**name**

Name of the group to modify

**gid**

Change the group ID to GID

**root**

Directory to chroot into

**non\_unique**

Allow modifying groups with duplicate (non-unique) GIDs

New in version 3006.0.

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.groupadd.delete` (*name*, *root=None*, *local=False*)

Remove the named group

**name**

Name group to delete

**root**

Directory to chroot into

**local (Only on systems with lgroupdel available):**

Ensure the group account is removed locally ignoring global account management (default is False).

New in version 3007.0.

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.groupadd.deluser` (*name*, *username*, *root=None*)

Remove a user from the group.

**name**

Name of the group to modify

**username**

Username to delete from the group

**root**

Directory to chroot into

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

`salt.modules.groupadd.getent` (*refresh=False*, *root=None*)

Return info on all groups

**refresh**

Force a refresh of group information

**root**

Directory to chroot into

CLI Example:

```
salt '*' group.getent
```

`salt.modules.groupadd.info` (*name*, *root=None*)

Return information about a group

**name**

Name of the group

**root**

Directory to chroot into

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.groupadd.members` (*name*, *members\_list*, *root=None*)

Replaces members of the group with a provided list.

**name**

Name of the group to modify

**members\_list**

Username list to set into the group

**root**

Directory to chroot into

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo'.

foo:x:1234:user1,user2,user3,...

### 26.6.162 salt.modules.grub\_legacy

Support for GRUB Legacy

`salt.modules.grub_legacy.conf` ()

Parse GRUB conf file

CLI Example:

```
salt '*' grub.conf
```

`salt.modules.grub_legacy.version` ()

Return server version from grub --version

CLI Example:

```
salt '*' grub.version
```

### 26.6.163 salt.modules.guestfs

Interact with virtual machine images via libguestfs

**depends**

- libguestfs

`salt.modules.guestfs.mount` (*location*, *access='rw'*, *root=None*)

Mount an image

CLI Example:

```
salt '*' guest.mount /srv/images/fedora.qcow
```

`salt.modules.guestfs.umount` (*name*, *disk=None*)

Unmount an image

CLI Example:

```
salt '*' guestfs.umount /mountpoint disk=/srv/images/fedora.qcow
```

## 26.6.164 salt.modules.hadoop

Support for hadoop

**maintainer**

Yann Jouanin <yann.jouanin@intelunix.fr>

**maturity**

new

**depends**

**platform**

linux

`salt.modules.hadoop.dfs` (*command=None*, *\*args*)

Execute a command on DFS

CLI Example:

```
salt '*' hadoop.dfs ls /
```

`salt.modules.hadoop.dfs_absent` (*path*)

Check if a file or directory is absent on the distributed FS.

CLI Example:

```
salt '*' hadoop.dfs_absent /some_random_file
```

Returns True if the file is absent

`salt.modules.hadoop.dfs_present` (*path*)

Check if a file or directory is present on the distributed FS.

CLI Example:

```
salt '*' hadoop.dfs_present /some_random_file
```

Returns True if the file is present

`salt.modules.hadoop.dfsadmin_report` (*arg=None*)

New in version 2019.2.0.

Reports basic filesystem information and statistics. Optional flags may be used to filter the list of displayed DataNodes.

**arg**

[live] [dead] [decommissioning]

CLI Example:

```
salt '*' hadoop.dfsadmin -report
```

`salt.modules.hadoop.namenode_format` (*force=None*)

Format a name node

```
salt '*' hadoop.namenode_format force=True
```

`salt.modules.hadoop.version`()

Return version from hadoop version

CLI Example:

```
salt '*' hadoop.version
```

### 26.6.165 salt.modules.haproxyconn

Support for haproxy

New in version 2014.7.0.

`salt.modules.haproxyconn.disable_server` (*name, backend, socket='/var/run/haproxy.sock'*)

Disable server in haproxy.

**name**

Server to disable

**backend**

haproxy backend, or all backends if "\*" is supplied

**socket**

haproxy stats socket, default `/var/run/haproxy.sock`

CLI Example:

```
salt '*' haproxy.disable_server db1.example.com mysql
```

`salt.modules.haproxyconn.enable_server` (*name, backend, socket='/var/run/haproxy.sock'*)

Enable Server in haproxy

**name**

Server to enable

**backend**

haproxy backend, or all backends if "\*" is supplied

**socket**

haproxy stats socket, default `/var/run/haproxy.sock`

CLI Example:

```
salt '*' haproxy.enable_server web1.example.com www
```

`salt.modules.haproxyconn.get_backend` (*backend, socket='/var/run/haproxy.sock'*)

Receive information about a specific backend.

**backend**

haproxy backend

**socket**

haproxy stats socket, default `/var/run/haproxy.sock`

CLI Example:

```
salt '*' haproxy.get_backend mysql
```

`salt.modules.haproxyconn.get_sessions`(*name*, *backend*, *socket*='/var/run/haproxy.sock')

New in version 2016.11.0.

Get number of current sessions on server in backend (scur)

**name**

Server name

**backend**

haproxy backend

**socket**

haproxy stats socket, default /var/run/haproxy.sock

CLI Example:

```
salt '*' haproxy.get_sessions web1.example.com www
```

`salt.modules.haproxyconn.get_weight`(*name*, *backend*, *socket*='/var/run/haproxy.sock')

Get server weight

**name**

Server name

**backend**

haproxy backend

**socket**

haproxy stats socket, default /var/run/haproxy.sock

CLI Example:

```
salt '*' haproxy.get_weight web1.example.com www
```

`salt.modules.haproxyconn.list_backends`(*servers*=*True*, *socket*='/var/run/haproxy.sock')

List HaProxy Backends

**socket**

haproxy stats socket, default /var/run/haproxy.sock

**servers**

list backends with servers

CLI Example:

```
salt '*' haproxy.list_backends
```

`salt.modules.haproxyconn.list_frontends`(*socket*='/var/run/haproxy.sock')

List HaProxy frontends

**socket**

haproxy stats socket, default /var/run/haproxy.sock

CLI Example:

```
salt '*' haproxy.list_frontends
```

`salt.modules.haproxyconn.list_servers` (*backend*, *socket*='/var/run/haproxy.sock', *objectify*=False)

List servers in haproxy backend.

**backend**

haproxy backend

**socket**

haproxy stats socket, default /var/run/haproxy.sock

CLI Example:

```
salt '*' haproxy.list_servers mysql
```

`salt.modules.haproxyconn.set_state` (*name*, *backend*, *state*, *socket*='/var/run/haproxy.sock')

Force a server's administrative state to a new state. This can be useful to disable load balancing and/or any traffic to a server. Setting the state to "ready" puts the server in normal mode, and the command is the equivalent of the "enable server" command. Setting the state to "maint" disables any traffic to the server as well as any health checks. This is the equivalent of the "disable server" command. Setting the mode to "drain" only removes the server from load balancing but still allows it to be checked and to accept new persistent connections. Changes are propagated to tracking servers if any.

**name**

Server name

**backend**

haproxy backend

**state**

A string of the state to set. Must be 'ready', 'drain', or 'maint'

**socket**

haproxy stats socket, default /var/run/haproxy.sock

CLI Example:

```
salt '*' haproxy.set_state my_proxy_server my_backend ready
```

`salt.modules.haproxyconn.set_weight` (*name*, *backend*, *weight*=0, *socket*='/var/run/haproxy.sock')

Set server weight

**name**

Server name

**backend**

haproxy backend

**weight**

Server Weight

**socket**

haproxy stats socket, default /var/run/haproxy.sock

CLI Example:

```
salt '*' haproxy.set_weight web1.example.com www 13
```

`salt.modules.haproxyconn.show_backends` (*socket*='/var/run/haproxy.sock')

Show HaProxy Backends

**socket**

haproxy stats socket, default /var/run/haproxy.sock

CLI Example:

```
salt '*' haproxy.show_backends
```

`salt.modules.haproxyconn.show_frontends` (*socket='/var/run/haproxy.sock'*)

Show HaProxy frontends

**socket**

haproxy stats socket, default /var/run/haproxy.sock

CLI Example:

```
salt '*' haproxy.show_frontends
```

`salt.modules.haproxyconn.wait_state` (*backend, server, value='up', timeout=300, socket='/var/run/haproxy.sock'*)

Wait for a specific server state

**backend**

haproxy backend

**server**

targeted server

**value**

state value

**timeout**

timeout before giving up state value, default 5 min

**socket**

haproxy stats socket, default /var/run/haproxy.sock

CLI Example:

```
salt '*' haproxy.wait_state mysql server01 up 60
```

### 26.6.166 salt.modules.hashutil

A collection of hashing and encoding functions

`salt.modules.hashutil.base64_b64decode` (*instr*)

Decode a base64-encoded string using the "modern" Python interface

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_b64decode 'Z2V0IHNhbHRlZA=='
```

`salt.modules.hashutil.base64_b64encode` (*instr*)

Encode a string as base64 using the "modern" Python interface.

Among other possible differences, the "modern" encoder does not include newline ('n') characters in the encoded output.

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_b64encode 'get salted'
```

`salt.modules.hashutil.base64_decodefile`(*instr*, *outfile*)

Decode a base64-encoded string and write the result to a file

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_decodefile instr='Z2V0IHNhbHRlZAo=' outfile='/
→path/to/binary_file'
```

`salt.modules.hashutil.base64_decodestring`(*instr*)

Decode a base64-encoded byte-like object using the "modern" Python interface

New in version 3000.

CLI Example:

```
salt '*' hashutil.base64_decodestring instr='Z2V0IHNhbHRlZAo='
```

`salt.modules.hashutil.base64_encodefile`(*fname*)

Read a file from the file system and return as a base64 encoded string

New in version 2016.3.0.

Pillar example:

```
path:
  to:
    data: |
      {{ salt.hashutil.base64_encodefile('/path/to/binary_file') |
→indent(6) }}
```

The `file.decode` state function can be used to decode this data and write it to disk.

CLI Example:

```
salt '*' hashutil.base64_encodefile /path/to/binary_file
```

`salt.modules.hashutil.base64_encodestring`(*instr*)

Encode a byte-like object as base64 using the "modern" Python interface.

Among other possible differences, the "modern" encoder includes a newline ('n') character after every 76 characters and always at the end of the encoded byte-like object.

New in version 3000.

CLI Example:

```
salt '*' hashutil.base64_encodestring 'get salted'
```

`salt.modules.hashutil.digest`(*instr*, *checksum*='md5')

Return a checksum digest for a string

**instr**

A string

**checksum**

[md5] The hashing algorithm to use to generate checksums. Valid options: md5, sha256, sha512.

CLI Example:

```
salt '*' hashutil.digest 'get salted'
```

`salt.modules.hashutil.digest_file`(*infile*, *checksum*='md5')

Return a checksum digest for a file

**infile**

A file path

**checksum**

[md5] The hashing algorithm to use to generate checksums. Wraps the `hashutil.digest` execution function.

CLI Example:

```
salt '*' hashutil.digest_file /path/to/file
```

`salt.modules.hashutil.github_signature`(*string*, *shared\_secret*, *challenge\_hmac*)

Verify a challenging hmac signature against a string / shared-secret for github webhooks.

New in version 2017.7.0.

Returns a boolean if the verification succeeded or failed.

CLI Example:

```
salt '*' hashutil.github_signature '{"ref":....}' 'shared secret'  
→ 'sha1=bc6550fc290acf5b42283fa8deaf55cea0f8c206'
```

`salt.modules.hashutil.hmac_compute`(*string*, *shared\_secret*)

New in version 3000.

Compute a HMAC SHA256 digest using a string and secret.

CLI Example:

```
salt '*' hashutil.hmac_compute 'get salted' 'shared secret'
```

`salt.modules.hashutil.hmac_signature`(*string*, *shared\_secret*, *challenge\_hmac*)

Verify a challenging hmac signature against a string / shared-secret

New in version 2014.7.0.

Returns a boolean if the verification succeeded or failed.

CLI Example:

```
salt '*' hashutil.hmac_signature 'get salted' 'shared secret'  
→ 'eBWf9bstXg+NIP5A0wppB5HMvZiYMPzEM9W5YMm/AmQ='
```

`salt.modules.hashutil.md5_digest`(*instr*)

Generate an md5 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.md5_digest 'get salted'
```

`salt.modules.hashutil.sha256_digest`(*instr*)

Generate an sha256 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.sha256_digest 'get salted'
```

`salt.modules.hashutil.sha512_digest`(*instr*)

Generate an sha512 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.sha512_digest 'get salted'
```

### 26.6.167 salt.modules.heat

Module for handling OpenStack Heat calls

New in version 2017.7.0.

#### depends

- heatclient Python module

#### configuration

This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.insecure: False  #(optional)
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
 # Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the heat functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' heat.flavor_list profile=openstack1
```

`salt.modules.heat.create_stack`(*name=None, template\_file=None, environment=None, parameters=None, poll=0, rollback=False, timeout=60, profile=None*)

Create a stack (heat stack-create)

**name**

Name of the new stack

**template\_file**

File of template

**environment**

File of environment

**parameters**

Parameter dict used to create the stack

**poll**

Poll and report events until stack complete

**rollback**

Enable rollback on create failure

**timeout**

Stack creation timeout in minutes

**profile**

Profile to build on

CLI Example:

```
salt '*' heat.create_stack name=mystack \  
    template_file=salt://template.yaml \  
    environment=salt://environment.yaml \  
    parameters="{\"image\": \"Debian 8\", \"flavor\": \"m1.small\"}" \  
    poll=5 rollback=False timeout=60 profile=openstack1
```

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *enviroment* was corrected to *environment*. The *enviroment* spelling mistake has been removed in Salt 3000.

`salt.modules.heat.delete_stack`(*name=None, poll=0, timeout=60, profile=None*)

Delete a stack (heat stack-delete)

**name**

Name of the stack

**poll**

Poll and report events until stack complete

**timeout**

Stack creation timeout in minute

**profile**

Profile to use

CLI Examples:

```
salt '*' heat.delete_stack name=mystack poll=5 \
    profile=openstack1
```

**salt.modules.heat.list\_stack**(*profile=None*)

Return a list of available stack (heat stack-list)

**profile**

Profile to use

CLI Example:

```
salt '*' heat.list_stack profile=openstack1
```

**salt.modules.heat.show\_stack**(*name=None, profile=None*)

Return details about a specific stack (heat stack-show)

**name**

Name of the stack

**profile**

Profile to use

CLI Example:

```
salt '*' heat.show_stack name=mystack profile=openstack1
```

**salt.modules.heat.template\_stack**(*name=None, profile=None*)

Return template a specific stack (heat stack-template)

**name**

Name of the stack

**profile**

Profile to use

CLI Example:

```
salt '*' heat.template_stack name=mystack profile=openstack1
```

**salt.modules.heat.update\_stack**(*name=None, template\_file=None, environment=None, parameters=None, poll=0, rollback=False, timeout=60, profile=None*)

Update a stack (heat stack-template)

**name**

Name of the stack

**template\_file**

File of template

**environment**

File of environment

**parameters**

Parameter dict used to update the stack

**poll**

Poll and report events until stack complete

**rollback**

Enable rollback on update failure

**timeout**

Stack creation timeout in minutes

**profile**

Profile to build on

CLI Example:

```
salt '*' heat.update_stack name=mystack \  
    template_file=salt://template.yaml \  
    environment=salt://environment.yaml \  
    parameters="{\"image\": \"Debian 8\", \"flavor\": \"m1.small\"}" \  
    poll=5 rollback=False timeout=60 profile=openstack1
```

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *enviroment* was corrected to *environment*. The *enviroment* spelling mistake has been removed in Salt 3000.

## 26.6.168 salt.modules.helm

Interface with Helm

**depends**

pyhelm Python package

---

**Note:** This module use the helm-cli. The helm-cli binary have to be present in your Salt-Minion path.

---

### Helm-CLI vs Salt-Modules

This module is a wrapper of the helm binary. All helm v3.0 command are implemented.

To install a chart with the helm-cli:

```
helm install grafana stable/grafana --wait --values /path/to/values.yaml
```

To install a chart with the Salt-Module:

```
salt '*' helm.install grafana stable/grafana values='/path/to/values.yaml' \  
→ flags=["wait"]
```

### Detailed Function Documentation

**salt.modules.helm.completion**(*shell, flags=None, kvflags=None*)

Generate auto-completions script for Helm for the specified shell (bash or zsh). Return the shell auto-completion content.

**shell**

(string) One of ['bash', 'zsh'].

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.completion bash
```

`salt.modules.helm.create` (*name, flags=None, kvflags=None*)

Creates a chart directory along with the common files and directories used in a chart. Return True if succeed, else the error message.

**name**

(string) The chart name to create.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.create NAME
```

`salt.modules.helm.dependency_build` (*chart, flags=None, kvflags=None*)

Build out the charts/ directory from the Chart.lock file. Return True if succeed, else the error message.

**chart**

(string) The chart name to build dependency.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.dependency_build CHART
```

`salt.modules.helm.dependency_list` (*chart, flags=None, kvflags=None*)

List all of the dependencies declared in a chart. Return chart dependencies if succeed, else the error message.

**chart**

(string) The chart name to list dependency.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.dependency_list CHART
```

`salt.modules.helm.dependency_update` (*chart, flags=None, kvflags=None*)

Update the on-disk dependencies to mirror Chart.yaml. Return True if succeed, else the error message.

**chart**

(string) The chart name to update dependency.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.dependency_update CHART
```

**salt.modules.helm.env** (*flags=None, kvflags=None*)

Prints out all the environment information in use by Helm. Return Helm environments variables if succeed, else the error message.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.env
```

**salt.modules.helm.get\_all** (*release, flags=None, kvflags=None*)

Prints a human readable collection of information about the notes, hooks, supplied values, and generated manifest file of the given release. Return release information if succeed, else the error message.

**release**

(string) Release name to get information from.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.get_all RELEASE
```

**salt.modules.helm.get\_hooks** (*release, flags=None, kvflags=None*)

Prints a human readable collection of information about the hooks of the given release. Return release hooks information if succeed, else the error message.

**release**

(string) Release name to get hooks information from.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.get_hooks RELEASE
```

**salt.modules.helm.get\_manifest** (*release, flags=None, kvflags=None*)

Prints a human readable collection of information about the manifest of the given release. Return release manifest information if succeed, else the error message.

**release**

(string) Release name to get manifest information from.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.get_manifest RELEASE
```

`salt.modules.helm.get_notes` (*release, flags=None, kvflags=None*)

Prints a human readable collection of information about the notes of the given release. Return release notes information if succeed, else the error message.

**release**

(string) Release name to get notes information from.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.get_notes RELEASE
```

`salt.modules.helm.get_values` (*release, flags=None, kvflags=None*)

Prints a human readable collection of information about the values of the given release. Return release values information if succeed, else the error message.

**release**

(string) Release name to get values information from.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.get_values RELEASE
# In YAML format
salt '*' helm.get_values RELEASE kvflags="{ 'output': 'yaml' }"
```

`salt.modules.helm.help_` (*command, flags=None, kvflags=None*)

Provides help for any command in the application. Return the full help if succeed, else the error message.

**command**

(string) Command to get help. ex: 'get'

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.help COMMAND
```

`salt.modules.helm.history` (*release*, *flags=None*, *kvflags=None*)

Prints historical revisions for a given release. Return release historic if succeed, else the error message.

**release**

(string) Release name to get history from.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.history RELEASE

# In YAML format
salt '*' helm.history RELEASE kvflags="{ 'output': 'yaml' }"
```

`salt.modules.helm.install` (*release*, *chart*, *values=None*, *version=None*, *namespace=None*, *set=None*, *flags=None*, *kvflags=None*)

Installs a chart archive. Return True if succeed, else the error message.

**release**

(string) Release name to get values information from.

**chart**

(string) Chart name to install.

**values**

(string) Absolute path to the values.yaml file.

**version**

(string) The exact chart version to install. If this is not specified, the latest version is installed.

**namespace**

(string) The namespace scope for this request.

**set**

(string or list) Set a values on the command line.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.install RELEASE CHART

# With values file.
salt '*' helm.install RELEASE CHART values='/path/to/values.yaml'
```

`salt.modules.helm.lint` (*path*, *values=None*, *namespace=None*, *set=None*, *flags=None*, *kvflags=None*)

Takes a path to a chart and runs a series of tests to verify that the chart is well-formed. Return True if succeed, else the error message.

**path**

(string) The path to the chart to lint.

**values**

(string) Absolute path to the values.yaml file.

**namespace**

(string) The namespace scope for this request.

**set**

(string or list) Set a values on the command line.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.lint PATH
```

**salt.modules.helm.list\_**(*namespace=None, flags=None, kvflags=None*)

Lists all of the releases. By default, it lists only releases that are deployed or failed. Return the list of release if succeed, else the error message.

**namespace**

(string) The namespace scope for this request.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.list
# In YAML format
salt '*' helm.list kvflags="{ 'output': 'yaml' }"
```

**salt.modules.helm.package**(*chart, flags=None, kvflags=None*)

Packages a chart into a versioned chart archive file. If a path is given, this will look at that path for a chart (which must contain a Chart.yaml file) and then package that directory. Return True if succeed, else the error message.

**chart**

(string) Chart name to package. Can be an absolute path.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.package CHART
```

(continues on next page)

(continued from previous page)

```
# With destination path.
salt '*' helm.package CHART kvflags="{ 'destination': '/path/to/the/package
→ '}"
```

`salt.modules.helm.plugin_install` (*path*, *flags=None*, *kvflags=None*)

Install a Helm plugin from a url to a VCS repo or a local path. Return True if succeed, else the error message.

**path**

(string) Path to the local plugin. Can be an url.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.plugin_install PATH
```

`salt.modules.helm.plugin_list` (*flags=None*, *kvflags=None*)

List installed Helm plugins. Return the plugin list if succeed, else the error message.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.plugin_list
```

`salt.modules.helm.plugin_uninstall` (*plugin*, *flags=None*, *kvflags=None*)

Uninstall a Helm plugin. Return True if succeed, else the error message.

**plugin**

(string) The plugin to uninstall.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.plugin_uninstall PLUGIN
```

`salt.modules.helm.plugin_update` (*plugin*, *flags=None*, *kvflags=None*)

Update a Helm plugin. Return True if succeed, else the error message.

**plugin**

(string) The plugin to update.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.plugin_update PLUGIN
```

`salt.modules.helm.pull` (*pkg, flags=None, kvflags=None*)

Retrieve a package from a package repository, and download it locally. Return True if succeed, else the error message.

**pkg**

(string) The package to pull. Can be url or repo/chartname.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.pull PKG

# With destination path to write the chart.
salt '*' helm.pull PKG kvflags="{ 'destination': '/path/to/the/chart' }"
```

`salt.modules.helm.repo_add` (*name, url, namespace=None, flags=None, kvflags=None*)

Add a chart repository. Return True if succeed, else the error message.

**name**

(string) The local name of the repository to install. Have to be unique.

**url**

(string) The url to the repository.

**namespace**

(string) The namespace scope for this request.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.repo_add NAME URL
```

`salt.modules.helm.repo_index` (*directory, namespace=None, flags=None, kvflags=None*)

Read the current directory and generate an index file based on the charts found. Return True if succeed, else the error message.

**directory**

(string) The path to the index.

**namespace**

(string) The namespace scope for this request.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.index DIRECTORY
```

`salt.modules.helm.repo_list` (*namespace=None, flags=None, kvflags=None*)

List a chart repository. Return the repository list if succeed, else the error message.

**namespace**

(string) The namespace scope for this request.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.repo_list
# In YAML format
salt '*' helm.repo_list kvflags="{ 'output': 'yaml' }"
```

`salt.modules.helm.repo_manage` (*present=None, absent=None, prune=False, namespace=None, flags=None, kvflags=None*)

Manage charts repository. Return the summery of all actions.

**present**

(list) List of repository to be present. It's a list of dict: [{'name': 'local\_name', 'url': 'repository\_url'}]

**absent**

(list) List of local name repository to be absent.

**prune**

(boolean - default: False) If True, all repository already present but not in the present list would be removed.

**namespace**

(string) The namespace scope for this request.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.repo_manage present="[{'name': 'LOCAL_NAME', 'url': 'REPO_
→URL'}]" absent="[ 'LOCAL_NAME' ]"
```

`salt.modules.helm.repo_remove` (*name, namespace=None, flags=None, kvflags=None*)

Remove a chart repository. Return True if succeed, else the error message.

**name**

(string) The local name of the repository to remove.

**namespace**

(string) The namespace scope for this request.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.repo_remove NAME
```

`salt.modules.helm.repo_update` (*namespace=None, flags=None, kvflags=None*)

Update all charts repository. Return True if succeed, else the error message.

**namespace**

(string) The namespace scope for this request.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.repo_update
```

`salt.modules.helm.rollback` (*release, revision, namespace=None, flags=None, kvflags=None*)

Rolls back a release to a previous revision. To see release revision number, execute the history module. Return True if succeed, else the error message.

**release**

(string) The name of the release to managed.

**revision**

(string) The revision number to roll back to.

**namespace**

(string) The namespace scope for this request.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.rollback RELEASE REVISION
# In dry-run mode.
salt '*' helm.rollback RELEASE REVISION flags=['dry-run']
```

`salt.modules.helm.search_hub` (*keyword, flags=None, kvflags=None*)

Search the Helm Hub or an instance of Monocular for Helm charts. Return the research result if succeed, else the error message.

**keyword**

(string) The keyword to search in the hub.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.search_hub KEYWORD

# In YAML format
salt '*' helm.search_hub KEYWORD kvflags="{ 'output': 'yaml' }"
```

`salt.modules.helm.search_repo`(*keyword, flags=None, kvflags=None*)

Search reads through all of the repositories configured on the system, and looks for matches. Search of these repositories uses the metadata stored on the system. Return the research result if succeed, else the error message.

**keyword**

(string) The keyword to search in the repo.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.search_hub KEYWORD

# In YAML format
salt '*' helm.search_hub KEYWORD kvflags="{ 'output': 'yaml' }"
```

`salt.modules.helm.show_all`(*chart, flags=None, kvflags=None*)

Inspects a chart (directory, file, or URL) and displays all its content (values.yaml, Charts.yaml, README). Return chart information if succeed, else the error message.

**chart**

(string) The chart to inspect.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.show_all CHART
```

`salt.modules.helm.show_chart`(*chart, flags=None, kvflags=None*)

Inspects a chart (directory, file, or URL) and displays the contents of the Charts.yaml file. Return chart information if succeed, else the error message.

**chart**

(string) The chart to inspect.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.show_chart CHART
```

`salt.modules.helm.show_readme` (*chart, flags=None, kvflags=None*)

Inspects a chart (directory, file, or URL) and displays the contents of the README file. Return chart information if succeed, else the error message.

**chart**

(string) The chart to inspect.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.show_readme CHART
```

`salt.modules.helm.show_values` (*chart, flags=None, kvflags=None*)

Inspects a chart (directory, file, or URL) and displays the contents of the values.yaml file. Return chart information if succeed, else the error message.

**chart**

(string) The chart to inspect.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.show_values CHART
```

`salt.modules.helm.status` (*release, namespace=None, flags=None, kvflags=None*)

Show the status of the release. Return the release status if succeed, else the error message.

**release**

(string) The release to status.

**namespace**

(string) The namespace scope for this request.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.status RELEASE
# In YAML format
salt '*' helm.status RELEASE kvflags="{ 'output': 'yaml' }"
```

`salt.modules.helm.template` (*name*, *chart*, *values=None*, *output\_dir=None*, *set=None*, *flags=None*, *kvflags=None*)

Render chart templates locally and display the output. Return the chart renderer if succeed, else the error message.

**name**

(string) The template name.

**chart**

(string) The chart to template.

**values**

(string) Absolute path to the values.yaml file.

**output\_dir**

(string) Absolute path to the output directory.

**set**

(string or list) Set a values on the command line.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.template NAME CHART

# With values file.
salt '*' helm.template NAME CHART values='/path/to/values.yaml' output_
→dir='path/to/output/dir'
```

`salt.modules.helm.test` (*release*, *flags=None*, *kvflags=None*)

Runs the tests for a release. Return the test result if succeed, else the error message.

**release**

(string) The release name to test.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.test RELEASE
```

`salt.modules.helm.uninstall` (*release*, *namespace=None*, *flags=None*, *kvflags=None*)

Uninstall the release name. Return True if succeed, else the error message.

**release**

(string) The name of the release to managed.

**namespace**

(string) The namespace scope for this request.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.uninstall RELEASE

# In dry-run mode.
salt '*' helm.uninstall RELEASE flags=['dry-run']
```

`salt.modules.helm.upgrade`(*release, chart, values=None, version=None, namespace=None, set=None, flags=None, kvflags=None*)

Upgrades a release to a new version of a chart. Return True if succeed, else the error message.

**release**

(string) The name of the release to managed.

**chart**

(string) The chart to managed.

**values**

(string) Absolute path to the values.yaml file.

**version**

(string) The exact chart version to install. If this is not specified, the latest version is installed.

**namespace**

(string) The namespace scope for this request.

**set**

(string or list) Set a values on the command line.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.upgrade RELEASE CHART

# In dry-run mode.
salt '*' helm.upgrade RELEASE CHART flags=['dry-run']

# With values file.
salt '*' helm.upgrade RELEASE CHART values='/path/to/values.yaml'
```

`salt.modules.helm.verify`(*path, flags=None, kvflags=None*)

Verify that the given chart has a valid provenance file. Return True if succeed, else the error message.

**path**

(string) The path to the chart file.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.verify PATH
```

`salt.modules.helm.version` (*flags=None, kvflags=None*)

Show the version for Helm. Return version information if succeed, else the error message.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.version
```

### 26.6.169 salt.modules.hg

Support for the Mercurial SCM

`salt.modules.hg.archive` (*cwd, output, rev='tip', fmt=None, prefix=None, user=None*)

Export a tarball from the repository

**cwd**

The path to the Mercurial repository

**output**

The path to the archive tarball

**rev: tip**

The revision to create an archive from

**fmt: None**

Format of the resulting archive. Mercurial supports: tar, tbz2, tgz, zip, uzip, and files formats.

**prefix**

[None] Prepend <prefix>/ to every filename in the archive

**user**

[None] Run hg as a user other than what the minion runs as

If `prefix` is not specified it defaults to the basename of the repo directory.

CLI Example:

```
salt '*' hg.archive /path/to/repo output=/tmp/archive.tgz fmt=tgz
```

`salt.modules.hg.clone` (*cwd, repository, opts=None, user=None, identity=None*)

Clone a new repository

**cwd**

The path to the Mercurial repository

**repository**

The hg URI of the repository

**opts**

[None] Any additional options to add to the command line

**user**

[None] Run hg as a user other than what the minion runs as

**identity**

[None] Private SSH key on the minion server for authentication ([ssh://](#))

New in version 2015.5.0.

CLI Example:

```
salt '*' hg.clone /path/to/repo https://bitbucket.org/birkenfeld/sphinx
```

`salt.modules.hg.describe` (*cwd*, *rev='tip'*, *user=None*)

Mimic git describe and return an identifier for the given revision

**cwd**

The path to the Mercurial repository

**rev: tip**

The path to the archive tarball

**user**

[None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' hg.describe /path/to/repo
```

`salt.modules.hg.pull` (*cwd*, *opts=None*, *user=None*, *identity=None*, *repository=None*)

Perform a pull on the given repository

**cwd**

The path to the Mercurial repository

**repository**

[None] Perform pull from the repository different from `.hg/hgrc:[paths]:default`

**opts**

[None] Any additional options to add to the command line

**user**

[None] Run hg as a user other than what the minion runs as

**identity**

[None] Private SSH key on the minion server for authentication ([ssh://](#))

New in version 2015.5.0.

CLI Example:

```
salt '*' hg.pull /path/to/repo opts=-u
```

`salt.modules.hg.revision` (*cwd*, *rev='tip'*, *short=False*, *user=None*)

Returns the long hash of a given identifier (hash, branch, tag, HEAD, etc)

**cwd**

The path to the Mercurial repository

**rev: tip**

The revision

**short: False**

Return an abbreviated commit hash

**user**

[None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' hg.revision /path/to/repo mybranch
```

**salt.modules.hg.status** (*cwd, opts=None, user=None*)

Show changed files of the given repository

**cwd**

The path to the Mercurial repository

**opts**

[None] Any additional options to add to the command line

**user**

[None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' hg.status /path/to/repo
```

**salt.modules.hg.update** (*cwd, rev, force=False, user=None*)

Update to a given revision

**cwd**

The path to the Mercurial repository

**rev**

The revision to update to

**force**

[False] Force an update

**user**

[None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt devserver1 hg.update /path/to/repo somebranch
```

### 26.6.170 salt.modules.highstate\_doc

This module renders highstate configuration into a more human readable format.

How it works:

*highstate* or *lowstate* data is parsed with a *processor* this defaults to *highstate\_doc.processor\_markdown*. The processed data is passed to a *jinja* template that builds up the document content.

configuration: Pillar

```
# the following defaults can be overridden
highstate_doc.config:

    # list of regex of state names to ignore in `highstate_doc.process_
    ↪ lowstates`
    filter_id_regex:
```

(continues on next page)

(continued from previous page)

```

- '.*!doc_skip$'

# list of regex of state functions to ignore in `highstate_doc.process_
→lowstates`
filter_state_function_regex:
- 'file.accumulated'

# dict of regex to replace text after `highstate_doc.render`. (remove
→passwords)
text_replace_regex:
  'password:.*^': '[PASSWORD]'

# limit size of files that can be included in doc (10000 bytes)
max_render_file_size: 10000

# advanced option to set a custom lowstate processor
processor: highstate_doc.processor_markdown

```

State example

```

{{sls}} note:
  highstate_doc.note:
    - name: example
    - order: 0
    - contents: |
      example `highstate_doc.note`
      -----
      This state does not do anything to the system! It is only used by
→a `processor`
      you can use `requisites` and `order` to move your docs around the
→rendered file.

{{sls}} a file we don't want in the doc !doc_skip:
  file.managed:
    - name: /root/passwords
    - contents: 'password: sadefgq34y45h56q'
    # also could use `highstate_doc.config: text_replace_regex` to replace
    # password string. `password:.*^': '[PASSWORD]'

```

To create the help document build a State that uses `highstate_doc.render`. For performance it's advised to not included this state in your `top.sls` file.

```

# example `salt://makereadme.sls`
make helpfile:
  file.managed:
    - name: /root/README.md
    - contents: {{salt.highstate_doc.render()|json}}
    - show_diff: {{opts['test']}}
    - mode: '0640'
    - order: last

```

Run our `makereadme.sls` state to create `/root/README.md`.

```
# first ensure `highstate` return without errors or changes
salt-call state.highstate
salt-call state.apply makereadme
# or if you don't want the extra `make helpfile` state
salt-call --out=newline_values_only salt.highstate_doc.render > /root/README.
↳md ; chmod 0600 /root/README.md
```

### Creating a document collection

From the master we can run the following script to creates a collection of all your minion documents.

```
salt '*' state.apply makereadme
```

```
#!/bin/python
import os
import salt.client
s = salt.client.LocalClient()
# NOTE: because of issues with `cp.push` use `highstate_doc.read_file`
o = s.cmd('*', 'highstate_doc.read_file', ['/root/README.md'])
for m in o:
    d = o.get(m)
    if d and not d.endswith('is not available.'):
        # mkdir m
        #directory = os.path.dirname(file_path)
        if not os.path.exists(m):
            os.makedirs(m)
        with open(m + '/README.md','wb') as f:
            f.write(d)
        print('ADDED: ' + m + '/README.md')
```

Once the master has a collection of all the README files. You can use pandoc to create HTML versions of the markdown.

```
# process all the readme.md files to readme.html
if which pandoc; then echo "Found pandoc"; else echo "** Missing pandoc";
↳exit 1; fi
if which gs; then echo "Found gs"; else echo "** Missing gs(ghostscript)";
↳exit 1; fi
readme_files=$(find $dest -type f -path "*"README.md" -print)
for f in $readme_files ; do
    ff=${f#$dest/}
    minion=${ff%%/*}
    echo "process: $dest/${minion}/${(basename $f)"
    cat $dest/${minion}/${(basename $f) |           pandoc --standalone --
↳from markdown_github --to html                --include-in-header $dest/style.
↳html > $dest/${minion}/${(basename $f)}.html
done
```

It is also nice to put the help files in source control.

```
# git init git add -A git commit -am 'updated docs' git push -f
```

## Other hints

If you wish to customize the document format:

```
# you could also create a new `processor` for perhaps reStructuredText
# highstate_doc.config:
#     processor: doc_custom.processor_rst

# example `salt://makereadme.jinja`
"""
{{opts['id']}}
=====

[# lowstates is set from highstate_doc.render() #]
[# if lowstates is missing use salt.highstate_doc.process_lowstates() #]
{% for s in lowstates %}
{{s.id}}
-----

{{s.function}}

{{s.markdown.requisite}}
{{s.markdown.details}}

{%- endfor %}
"""

# example `salt://makereadme.sls`
{% import_text "makereadme.jinja" as makereadme %}
{{sls}} or:
    file.managed:
        - name: /root/README_other.md
        - contents: {{salt.highstate_doc.render(jinja_template_
→text=makereadme)|json}}
        - mode: '0640'
```

Some `replace_text_regex` values that might be helpful:

```
CERTS
-----

``'-----BEGIN RSA PRIVATE KEY-----[\r\n\t\f\S]{0,2200}': 'XXXXXXX'``
``'-----BEGIN CERTIFICATE-----[\r\n\t\f\S]{0,2200}': 'XXXXXXX'``
``'-----BEGIN DH PARAMETERS-----[\r\n\t\f\S]{0,2200}': 'XXXXXXX'``
``'-----BEGIN PRIVATE KEY-----[\r\n\t\f\S]{0,2200}': 'XXXXXXX'``
``'-----BEGIN OPENSsh PRIVATE KEY-----[\r\n\t\f\S]{0,2200}': 'XXXXXXX'``
``'ssh-rsa .* ': 'ssh-rsa XXXXXXX '``
``'ssh-dss .* ': 'ssh-dss XXXXXXX '``

DB
--

``'DB_PASS.*': 'DB_PASS = XXXXXXX'``
``'5432:*:*:*.*': '5432:*:XXXXXXX'``
``"'PASSWORD': .*": "'PASSWORD': 'XXXXXXX',""``
```

(continues on next page)

(continued from previous page)

```

``" PASSWORD '.*': " PASSWORD 'XXXXXXXX'"``
``'PGPASSWORD=.* ': 'PGPASSWORD=XXXXXXXX'``
``"_replication password '.*': "_replication password 'XXXXXXXX'"``

OTHER
-----

``'EMAIL_HOST_PASSWORD =.*': 'EMAIL_HOST_PASSWORD =XXXXXXXX'``
``"net ads join -U '.*@MFCFADS.MATH.EXAMPLE.CA.* ": "net ads join -U '
↳*@MFCFADS.MATH.EXAMPLE.CA%XXXXXXXX "``
``"net ads join -U '.*@NEXUS.EXAMPLE.CA.* ": "net ads join -U '.*@NEXUS.
↳EXAMPLE.CA%XXXXXXXX "``
``'install-uptrack .* --autoinstall': 'install-uptrack XXXXXXXX --autoinstall

``'PASS_.*_PASS': 'PASS_XXXXXXX_PASS'``

HTACCESS
-----

``':{PLAIN}.*': ':{PLAIN}XXXXXXXX'``

```

`salt.modules.highstate_doc.markdown_basic_jinja_template` (\*\*kwargs)

Return text for a simple markdown jinja template

This function can be used from the `highstate_doc.render` modules `jinja_template_function` option.

`salt.modules.highstate_doc.markdown_default_jinja_template` (\*\*kwargs)

Return text for a markdown jinja template that included a header

This function can be used from the `highstate_doc.render` modules `jinja_template_function` option.

`salt.modules.highstate_doc.markdown_full_jinja_template` (\*\*kwargs)

Return text for an advanced markdown jinja template

This function can be used from the `highstate_doc.render` modules `jinja_template_function` option.

`salt.modules.highstate_doc.processor_lowstates` (\*\*kwargs)

return processed lowstate data that was not blacklisted

`render_module_function` is used to provide your own. defaults to `from_lowstate`

`salt.modules.highstate_doc.processor_markdown` (`lowstate_item`, `config`, \*\*kwargs)

Takes low state data and returns a dict of processed data that is by default used in a jinja template when rendering a markdown `highstate_doc`.

This `lowstate_item_markdown` given a lowstate item, returns a dict like:

```

vars:      # the raw lowstate_item that was processed
id:        # the 'id' of the state.
id_full:   # combo of the state type and id "state: id"
state:     # name of the salt state module
function:  # name of the state function
name:      # value of 'name:' passed to the salt state module
state_function: # the state name and function name
markdown:  # text data to describe a state
  requisites: # requisite like [watch_in, require_in]
  details:    # state name, parameters and other details like file
  → contents

```

`salt.modules.highstate_doc.read_file(name)`

output the contents of a file:

this is a workaround if the `cp.push` module does not work. <https://github.com/saltstack/salt/issues/37133>

help the master output the contents of a document that might be saved on the minions filesystem.

```

#!/bin/python
import os
import salt.client
s = salt.client.LocalClient()
o = s.cmd('*', 'highstate_doc.read_file', ['/root/README.md'])
for m in o:
    d = o.get(m)
    if d and not d.endswith('is not available.'):
        # mkdir m
        #directory = os.path.dirname(file_path)
        if not os.path.exists(m):
            os.makedirs(m)
        with open(m + '/README.md', 'wb') as fin:
            fin.write(d)
        print('ADDED: ' + m + '/README.md')

```

`salt.modules.highstate_doc.render(jinja_template_text=None, jinja_template_function='highstate_doc.markdown_default_jinja_template', **kwargs)`

Render highstate to a text format (default Markdown)

if `jinja_template_text` is not set, `jinja_template_function` is used.

`jinja_template_text`: jinja text that the render uses to create the document. `jinja_template_function`: a salt module call that returns template text.

#### Options

`highstate_doc.markdown_basic_jinja_template` `highstate_doc.markdown_default_jinja_template`  
`highstate_doc.markdown_full_jinja_template`

## 26.6.171 salt.modules.hosts

Manage the information in the hosts file

**salt.modules.hosts.add\_host**(*ip, alias*)

Add a host to an existing entry, if the entry is not in place then create it with the given host

CLI Example:

```
salt '*' hosts.add_host <ip> <alias>
```

**salt.modules.hosts.get\_alias**(*ip*)

Return the list of aliases associated with an ip

Aliases (host names) are returned in the order in which they appear in the hosts file. If there are no aliases associated with the IP, an empty list is returned.

CLI Example:

```
salt '*' hosts.get_alias <ip addr>
```

**salt.modules.hosts.get\_ip**(*host*)

Return the ip associated with the named host

CLI Example:

```
salt '*' hosts.get_ip <hostname>
```

**salt.modules.hosts.has\_pair**(*ip, alias*)

Return true if the alias is set

CLI Example:

```
salt '*' hosts.has_pair <ip> <alias>
```

**salt.modules.hosts.list\_hosts**()

Return the hosts found in the hosts file in this format:

```
{'<ip addr>': ['alias1', 'alias2', ...]}
```

CLI Example:

```
salt '*' hosts.list_hosts
```

**salt.modules.hosts.rm\_host**(*ip, alias*)

Remove a host entry from the hosts file

CLI Example:

```
salt '*' hosts.rm_host <ip> <alias>
```

**salt.modules.hosts.set\_comment**(*ip, comment*)

Set the comment for a host to an existing entry, if the entry is not in place then return False

CLI Example:

```
salt '*' hosts.set_comment <ip> <comment>
```

`salt.modules.hosts.set_host(ip, alias, comment=None)`

Set the host entry in the hosts file for the given ip, this will overwrite any previous entry for the given ip

Changed in version 2016.3.0: If `alias` does not include any host names (it is the empty string or contains only whitespace), all entries for the given IP address are removed.

CLI Example:

```
salt '*' hosts.set_host <ip> <alias>
```

### 26.6.172 salt.modules.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

`salt.modules.http.query(url, **kwargs)`

New in version 2015.5.0.

Query a resource, and decode the return data

Passes through all the parameters described in the [utils.http.query function](#):

```
salt.utils.http.query(url, method='GET', params=None, data=None, data_file=None,
                    header_dict=None, header_list=None, header_file=None, username=None,
                    password=None, auth=None, decode=False, decode_type='auto', status=False,
                    headers=False, text=False, cookies=None, cookie_jar=None,
                    cookie_format='lwp', persist_session=False, session_cookie_jar=None,
                    data_render=False, data_renderer=None, header_render=False,
                    header_renderer=None, template_dict=None, test=False, test_url=None,
                    node='minion', port=80, opts=None, backend=None, ca_bundle=None,
                    verify_ssl=None, cert=None, text_out=None, headers_out=None,
                    decode_out=None, stream=False, streaming_callback=None,
                    header_callback=None, handle=False, agent='Salt/3007.1', hide_fields=None,
                    raise_error=True, formdata=False, formdata_fieldname=None,
                    formdata_filename=None, decode_body=True, **kwargs)
```

Query a resource, and decode the return data

`raise_error`

[True] If False, and if a connection cannot be made, the error will be suppressed and the body of the return will simply be None.

CLI Example:

```
salt '*' http.query http://somelink.com/
salt '*' http.query http://somelink.com/ method=POST           params='{
  → "key1": "val1", "key2": "val2"}'
salt '*' http.query http://somelink.com/ method=POST           data='
  → <xml>somecontent</xml>'
```

`salt.modules.http.update_ca_bundle(target=None, source=None, merge_files=None)`

Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```
salt '*' http.update_ca_bundle
salt '*' http.update_ca_bundle target=/path/to/cacerts.pem
salt '*' http.update_ca_bundle source=https://example.com/cacerts.pem
```

If the `target` is not specified, it will be pulled from the `ca_cert` configuration variable available to the minion. If it cannot be found there, it will be placed at `<<FILE_ROOTS>>/cacerts.pem`.

If the `source` is not specified, it will be pulled from the `ca_cert_url` configuration variable available to the minion. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

`merge_files` may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```
salt '*' http.update_ca_bundle merge_files=/path/to/mycert.pem
```

`salt.modules.http.wait_for_successful_query` (*url*, *wait\_for=300*, *\*\*kwargs*)

Query a resource until a successful response, and decode the return data

CLI Example:

```
salt '*' http.wait_for_successful_query http://somelink.com/ wait_for=160
→request_interval=1
```

### 26.6.173 salt.modules.icinga2

Module to provide icinga2 compatibility to salt.

New in version 2017.7.0.

**depends**

- icinga2 server

`salt.modules.icinga2.generate_cert` (*domain*)

Generate an icinga2 client certificate and key.

**Returns::**

```
icinga2 pki new-cert --cn domain.tld --key /etc/icinga2/pki/domain.tld.key --cert
/etc/icinga2/pki/domain.tld.crt
```

CLI Example:

```
salt '*' icinga2.generate_cert domain.tld
```

`salt.modules.icinga2.generate_ticket` (*domain*)

Generate and save an icinga2 ticket.

**Returns::**

```
icinga2 pki ticket --cn domain.tld
```

CLI Example:

```
salt '*' icinga2.generate_ticket domain.tld
```

`salt.modules.icinga2.node_setup`(*domain, master, ticket*)

Setup the icinga2 node.

**Returns::**

```
icinga2 node setup --ticket TICKET_ID --endpoint master.domain.tld --zone domain.tld --master_host
master.domain.tld --trustedcert /etc/icinga2/pki/trusted-master.crt
```

CLI Example:

```
salt '*' icinga2.node_setup domain.tld master.domain.tld TICKET_ID
```

`salt.modules.icinga2.request_cert`(*domain, master, ticket, port*)

Request CA cert from master icinga2 node.

**Returns::**

```
icinga2 pki request --host master.domain.tld --port 5665 --ticket TICKET_ID --
key /etc/icinga2/pki/domain.tld.key --cert /etc/icinga2/pki/domain.tld.crt --trustedcert
/etc/icinga2/pki/trusted-master.crt --ca /etc/icinga2/pki/ca.crt
```

CLI Example:

```
salt '*' icinga2.request_cert domain.tld master.domain.tld TICKET_ID
```

`salt.modules.icinga2.save_cert`(*domain, master*)

Save the certificate for master icinga2 node.

**Returns::**

```
icinga2 pki save-cert --key /etc/icinga2/pki/domain.tld.key --cert /etc/icinga2/pki/domain.tld.crt --
trustedcert /etc/icinga2/pki/trusted-master.crt --host master.domain.tld
```

CLI Example:

```
salt '*' icinga2.save_cert domain.tld master.domain.tld
```

## 26.6.174 salt.modules.idem

### Idem Support

This module provides access to idem execution modules

New in version 3002.

`salt.modules.idem.exec_`(*path, acct\_file=None, acct\_key=None, acct\_profile=None, \*args, \*\*kwargs*)

Call an idem execution module

**path**

The idem path of the idem execution module to run

**acct\_file**

Path to the acct file used in generating idem ctx parameters. Defaults to the value in the ACCT\_FILE environment variable.

**acct\_key**

Key used to decrypt the acct file. Defaults to the value in the ACCT\_KEY environment variable.

**acct\_profile**

Name of the profile to add to idem's ctx.acct parameter. Defaults to the value in the ACCT\_PROFILE environment variable.

**args**  
Any positional arguments to pass to the idem exec function

**kwargs**  
Any keyword arguments to pass to the idem exec function

CLI Example:

```
salt '*' idem.exec test.ping
```

**Maturity**  
new

**Depends**  
acct, pop, pop-config, idem

**Platform**  
all

### 26.6.175 salt.modules.ifttt

Support for IFTTT

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

```
ifttt:  
secret_key: '280d4699-a817-4719-ba6f-ca56e573e44f'
```

`salt.modules.ifttt.trigger_event(event=None, **kwargs)`

Trigger a configured event in IFTTT.

**Parameters**  
**event** -- The name of the event to trigger.

**Returns**  
A dictionary with status, text, and error if result was failure.

### 26.6.176 salt.modules.ilo

Manage HP ILO

**depends**  
hponcfg (SmartStart Scripting Toolkit Linux Edition)

`salt.modules.ilo.change_password(username, password)`

Reset a users password

CLI Example:

```
salt '*' ilo.change_password damianMyerscough
```

`salt.modules.ilo.change_username(old_username, new_username)`

Change a username

CLI Example:

```
salt '*' ilo.change_username damian diana
```

`salt.modules.ilo.configure_network`(*ip, netmask, gateway*)

Configure Network Interface

CLI Example:

```
salt '*' ilo.configure_network [IP ADDRESS] [NETMASK] [GATEWAY]
```

`salt.modules.ilo.configure_snmp`(*community, snmp\_port=161, snmp\_trapport=161*)

Configure SNMP

CLI Example:

```
salt '*' ilo.configure_snmp [COMMUNITY STRING] [SNMP PORT] [SNMP TRAP
→PORT]
```

`salt.modules.ilo.create_user`(*name, password, \*privileges*)

Create user

CLI Example:

```
salt '*' ilo.create_user damian secretagent VIRTUAL_MEDIA_PRIV
```

If no permissions are specify the user will only have a read-only account.

Supported privileges:

- ADMIN\_PRIV Enables the user to administer user accounts.
- REMOTE\_CONS\_PRIV Enables the user to access the Remote Console functionality.
- RESET\_SERVER\_PRIV Enables the user to remotely manipulate the server power setting.
- VIRTUAL\_MEDIA\_PRIV Enables the user permission to access the virtual media functionality.
- CONFIG\_ILO\_PRIV Enables the user to configure iLO settings.

`salt.modules.ilo.delete_ssh_key`(*username*)

Delete a users SSH key from the ILO

CLI Example:

```
salt '*' ilo.delete_user_sshkey damian
```

`salt.modules.ilo.delete_user`(*username*)

Delete a user

CLI Example:

```
salt '*' ilo.delete_user damian
```

`salt.modules.ilo.disable_dhcp`()

Disable DHCP

CLI Example:

```
salt '*' ilo.disable_dhcp
```

`salt.modules.ilo.disable_ssh()`

Disable the SSH daemon

CLI Example:

```
salt '*' ilo.disable_ssh
```

`salt.modules.ilo.enable_dhcp()`

Enable DHCP

CLI Example:

```
salt '*' ilo.enable_dhcp
```

`salt.modules.ilo.enable_ssh()`

Enable the SSH daemon

CLI Example:

```
salt '*' ilo.enable_ssh
```

`salt.modules.ilo.get_user(username)`

Returns local user information, excluding the password

CLI Example:

```
salt '*' ilo.get_user damian
```

`salt.modules.ilo.global_settings()`

Show global settings

CLI Example:

```
salt '*' ilo.global_settings
```

`salt.modules.ilo.list_users()`

List all users

CLI Example:

```
salt '*' ilo.list_users
```

`salt.modules.ilo.list_users_info()`

List all users in detail

CLI Example:

```
salt '*' ilo.list_users_info
```

`salt.modules.ilo.network()`

Grab the current network settings

CLI Example:

```
salt '*' ilo.network
```

`salt.modules.ilo.set_http_port(port=80)`

Configure the port HTTP should listen on

CLI Example:

```
salt '*' ilo.set_http_port 8080
```

`salt.modules.ilo.set_https_port(port=443)`

Configure the port HTTPS should listen on

CLI Example:

```
salt '*' ilo.set_https_port 4334
```

`salt.modules.ilo.set_ssh_key(public_key)`

Configure SSH public keys for specific users

CLI Example:

```
salt '*' ilo.set_ssh_key "ssh-dss AAAAB3NzaC1kc3MAAACBA... damian"
```

The SSH public key needs to be DSA and the last argument in the key needs to be the username (case-sensitive) of the ILO username.

`salt.modules.ilo.set_ssh_port(port=22)`

Enable SSH on a user defined port

CLI Example:

```
salt '*' ilo.set_ssh_port 2222
```

### 26.6.177 salt.modules.incron

Work with incron

`salt.modules.incron.list_tab(user)`

Return the contents of the specified user's incrontab

CLI Example:

```
salt '*' incron.list_tab root
```

`salt.modules.incron.ls(user)`

This function is an alias of `list_tab`.

Return the contents of the specified user's incrontab

CLI Example:

```
salt '*' incron.list_tab root
```

`salt.modules.incron.raw_incron(user)`

Return the contents of the user's incrontab

CLI Example:

```
salt '*' incron.raw_incron root
```

`salt.modules.incron.raw_system_incron()`

Return the contents of the system wide inccrontab

CLI Example:

```
salt '*' incron.raw_system_incron
```

`salt.modules.incron.rm(user, path, mask, cmd)`

This function is an alias of `rm_job`.

Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' incron.rm_job root /path
```

`salt.modules.incron.rm_job(user, path, mask, cmd)`

Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' incron.rm_job root /path
```

`salt.modules.incron.set_job(user, path, mask, cmd)`

Sets an incron job up for a specified user.

CLI Example:

```
salt '*' incron.set_job root '/root' 'IN_MODIFY' 'echo "$$ $@ $# $% $&"'
```

`salt.modules.incron.write_incron_file(user, path)`

Writes the contents of a file to a user's inccrontab

CLI Example:

```
salt '*' incron.write_incron_file root /tmp/new_incron
```

`salt.modules.incron.write_incron_file_verbose(user, path)`

Writes the contents of a file to a user's inccrontab and return error message on error

CLI Example:

```
salt '*' incron.write_incron_file_verbose root /tmp/new_incron
```

## 26.6.178 salt.modules.influxdb08mod

InfluxDB - A distributed time series database

Module to provide InfluxDB compatibility to Salt (compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

### depends

- influxdb Python module (>= 1.0.0)

### configuration

This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```
influxdb08.host: 'localhost'
influxdb08.port: 8086
influxdb08.user: 'root'
influxdb08.password: 'root'
```

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into `pillar`.

`salt.modules.influxdb08mod.db_create` (*name*, *user=None*, *password=None*, *host=None*, *port=None*)

Create a database

#### name

Database name to create

#### user

The user to connect as

#### password

The password of the user

#### host

The host to connect to

#### port

The port to connect to

CLI Example:

```
salt '*' influxdb08.db_create <name>
salt '*' influxdb08.db_create <name> <user> <password> <host> <port>
```

`salt.modules.influxdb08mod.db_exists` (*name*, *user=None*, *password=None*, *host=None*, *port=None*)

Checks if a database exists in Influxdb

#### name

Database name to create

#### user

The user to connect as

#### password

The password of the user

#### host

The host to connect to

**port**

The port to connect to

CLI Example:

```
salt '*' influxdb08.db_exists <name>
salt '*' influxdb08.db_exists <name> <user> <password> <host> <port>
```

`salt.modules.influxdb08mod.db_list` (*user=None, password=None, host=None, port=None*)

List all InfluxDB databases

**user**

The user to connect as

**password**

The password of the user

**host**

The host to connect to

**port**

The port to connect to

CLI Example:

```
salt '*' influxdb08.db_list
salt '*' influxdb08.db_list <user> <password> <host> <port>
```

`salt.modules.influxdb08mod.db_remove` (*name, user=None, password=None, host=None, port=None*)

Remove a database

**name**

Database name to remove

**user**

The user to connect as

**password**

The password of the user

**host**

The host to connect to

**port**

The port to connect to

CLI Example:

```
salt '*' influxdb08.db_remove <name>
salt '*' influxdb08.db_remove <name> <user> <password> <host> <port>
```

`salt.modules.influxdb08mod.login_test` (*name, password, database=None, host=None, port=None*)

Checks if a credential pair can log in at all.

If a database is specified: it will check for database user existence. If a database is not specified: it will check for cluster admin existence.

**name**

The user to connect as

**password**

The password of the user

**database**

The database to try to log in to

**host**

The host to connect to

**port**

The port to connect to

CLI Example:

```

salt '*' influxdb08.login_test <name>
salt '*' influxdb08.login_test <name> <database>
salt '*' influxdb08.login_test <name> <database> <user> <password> <host>
  ↳<port>

```

`salt.modules.influxdb08mod.query`(*database, query, time\_precision='s', chunked=False, user=None, password=None, host=None, port=None*)

Querying data

**database**

The database to query

**query**

Query to be executed

**time\_precision**

Time precision to use ('s', 'm', or 'u')

**chunked**

Whether is chunked or not

**user**

The user to connect as

**password**

The password of the user

**host**

The host to connect to

**port**

The port to connect to

CLI Example:

```

salt '*' influxdb08.query <database> <query>
salt '*' influxdb08.query <database> <query> <time_precision> <chunked>
  ↳<user> <password> <host> <port>

```

`salt.modules.influxdb08mod.retention_policy_add`(*database, name, duration, replication, default=False, user=None, password=None, host=None, port=None*)

Add a retention policy.

**database**

The database to operate on.

**name**

Name of the policy to modify.

**duration**

How long InfluxDB keeps the data.

**replication**

How many copies of the data are stored in the cluster.

**default**

Whether this policy should be the default or not. Default is False.

CLI Example:

```
salt '*' influxdb.retention_policy_add metrics default 1d 1
```

`salt.modules.influxdb08mod.retention_policy_alter` (*database, name, duration, replication, default=False, user=None, password=None, host=None, port=None*)

Modify an existing retention policy.

**database**

The database to operate on.

**name**

Name of the policy to modify.

**duration**

How long InfluxDB keeps the data.

**replication**

How many copies of the data are stored in the cluster.

**default**

Whether this policy should be the default or not. Default is False.

CLI Example:

```
salt '*' influxdb08.retention_policy_modify metrics default 1d 1
```

`salt.modules.influxdb08mod.retention_policy_exists` (*database, name, user=None, password=None, host=None, port=None*)

Check if a retention policy exists.

**database**

The database to operate on.

**name**

Name of the policy to modify.

CLI Example:

```
salt '*' influxdb08.retention_policy_exists metrics default
```

`salt.modules.influxdb08mod.retention_policy_get` (*database, name, user=None, password=None, host=None, port=None*)

Get an existing retention policy.

**database**

The database to operate on.

**name**  
Name of the policy to modify.

CLI Example:

```
salt '*' influxdb08.retention_policy_get metrics default
```

`salt.modules.influxdb08mod.user_chpass`(*name*, *passwd*, *database=None*, *user=None*, *password=None*, *host=None*, *port=None*)

Change password for a cluster admin or a database user.

If a database is specified: it will update database user password. If a database is not specified: it will update cluster admin password.

**name**  
User name for whom to change the password

**passwd**  
New password

**database**  
The database on which to operate

**user**  
The user to connect as

**password**  
The password of the user

**host**  
The host to connect to

**port**  
The port to connect to

CLI Example:

```
salt '*' influxdb08.user_chpass <name> <passwd>
salt '*' influxdb08.user_chpass <name> <passwd> <database>
salt '*' influxdb08.user_chpass <name> <passwd> <database> <user>
→<password> <host> <port>
```

`salt.modules.influxdb08mod.user_create`(*name*, *passwd*, *database=None*, *user=None*, *password=None*, *host=None*, *port=None*)

Create a cluster admin or a database user.

If a database is specified: it will create database user. If a database is not specified: it will create a cluster admin.

**name**  
User name for the new user to create

**passwd**  
Password for the new user to create

**database**  
The database to create the user in

**user**  
The user to connect as

**password**

The password of the user

**host**

The host to connect to

**port**

The port to connect to

CLI Example:

```
salt '*' influxdb08.user_create <name> <passwd>
salt '*' influxdb08.user_create <name> <passwd> <database>
salt '*' influxdb08.user_create <name> <passwd> <database> <user>
↪ <password> <host> <port>
```

`salt.modules.influxdb08mod.user_exists`(*name*, *database=None*, *user=None*, *password=None*, *host=None*, *port=None*)

Checks if a cluster admin or database user exists.

If a database is specified: it will check for database user existence. If a database is not specified: it will check for cluster admin existence.

**name**

User name

**database**

The database to check for the user to exist

**user**

The user to connect as

**password**

The password of the user

**host**

The host to connect to

**port**

The port to connect to

CLI Example:

```
salt '*' influxdb08.user_exists <name>
salt '*' influxdb08.user_exists <name> <database>
salt '*' influxdb08.user_exists <name> <database> <user> <password> <host>
↪ <port>
```

`salt.modules.influxdb08mod.user_list`(*database=None*, *user=None*, *password=None*, *host=None*, *port=None*)

List cluster admins or database users.

If a database is specified: it will return database users list. If a database is not specified: it will return cluster admins list.

**database**

The database to list the users from

**user**

The user to connect as

**password**

The password of the user

**host**

The host to connect to

**port**

The port to connect to

CLI Example:

```
salt '*' influxdb08.user_list
salt '*' influxdb08.user_list <database>
salt '*' influxdb08.user_list <database> <user> <password> <host> <port>
```

```
salt.modules.influxdb08mod.user_remove(name, database=None, user=None, password=None,
                                       host=None, port=None)
```

Remove a cluster admin or a database user.

If a database is specified: it will remove the database user. If a database is not specified: it will remove the cluster admin.

**name**

User name to remove

**database**

The database to remove the user from

**user**

User name for the new user to delete

**user**

The user to connect as

**password**

The password of the user

**host**

The host to connect to

**port**

The port to connect to

CLI Example:

```
salt '*' influxdb08.user_remove <name>
salt '*' influxdb08.user_remove <name> <database>
salt '*' influxdb08.user_remove <name> <database> <user> <password> <host>
→ <port>
```

## 26.6.179 salt.modules.influxdbmod

InfluxDB - A distributed time series database

Module to provide InfluxDB compatibility to Salt (compatible with InfluxDB version 0.9+)

### depends

- influxdb Python module (>= 3.0.0)

### configuration

This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
influxdb.host: 'localhost'
influxdb.port: 8086
influxdb.user: 'root'
influxdb.password: 'root'
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

Most functions in this module allow you to override or provide some or all of these settings via keyword arguments:

```
salt '*' influxdb.foo_function influxdb_user='influxadmin'
↳ influxdb_password='s3cr1t'
```

would override user and password while still using the defaults for host and port.

**salt.modules.influxdbmod.alter\_retention\_policy** (*database, name, duration, replication, default=False, \*\*client\_args*)

Modify an existing retention policy.

### name

Name of the retention policy to modify.

### database

Name of the database for which the retention policy was defined.

### duration

New duration of given retention policy.

Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7 day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use 'INF' for duration. The minimum retention period is 1 hour.

### replication

New replication of given retention policy.

This determines how many independent copies of each data point are stored in a cluster.

### default

[False] Whether or not to set the modified policy as default.

CLI Example:

```
salt '*' influxdb.alter_retention_policy metrics default 1d 1
```

`salt.modules.influxdbmod.continuous_query_exists`(*database*, *name*, *\*\*client\_args*)

Check if continuous query with given name exists on the database.

**database**

Name of the database for which the continuous query was defined.

**name**

Name of the continuous query to check.

CLI Example:

```
salt '*' influxdb.continuous_query_exists metrics default
```

`salt.modules.influxdbmod.create_continuous_query`(*database*, *name*, *query*,  
*resample\_time=*None,  
*coverage\_period=*None, *\*\*client\_args*)

Create a continuous query.

**database**

Name of the database for which the continuous query will be created on.

**name**

Name of the continuous query to create.

**query**

The continuous query string.

**resample\_time**

[None] Duration between continuous query resampling.

**coverage\_period**

[None] Duration specifying time period per sample.

CLI Example:

```
salt '*' influxdb.create_continuous_query mydb cq_month 'SELECT mean(*)
→ INTO mydb.a_month.:MEASUREMENT FROM mydb.a_week././ */ GROUP BY time(5m),
→ *'
```

`salt.modules.influxdbmod.create_db`(*name*, *\*\*client\_args*)

Create a database.

**name**

Name of the database to create.

CLI Example:

```
salt '*' influxdb.create_db <name>
```

`salt.modules.influxdbmod.create_retention_policy`(*database*, *name*, *duration*, *replication*,  
*default=*False, *\*\*client\_args*)

Create a retention policy.

**database**

Name of the database for which the retention policy will be created.

**name**

Name of the new retention policy.

**duration**

Duration of the new retention policy.

Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7 day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use 'INF' for duration. The minimum retention period is 1 hour.

**replication**

Replication factor of the retention policy.

This determines how many independent copies of each data point are stored in a cluster.

**default**

[False] Whether or not the policy as default will be set as default.

CLI Example:

```
salt '*' influxdb.create_retention_policy metrics default 1d 1
```

`salt.modules.influxdbmod.create_user` (*name*, *passwd*, *admin=False*, *\*\*client\_args*)

Create a user.

**name**

Name of the user to create.

**passwd**

Password of the new user.

**admin**

[False] Whether the user should have cluster administration privileges or not.

CLI Example:

```
salt '*' influxdb.create_user <name> <password>
salt '*' influxdb.create_user <name> <password> admin=True
```

`salt.modules.influxdbmod.db_exists` (*name*, *\*\*client\_args*)

Checks if a database exists in InfluxDB.

**name**

Name of the database to check.

CLI Example:

```
salt '*' influxdb.db_exists <name>
```

`salt.modules.influxdbmod.drop_continuous_query` (*database*, *name*, *\*\*client\_args*)

Drop a continuous query.

**database**

Name of the database for which the continuous query will be drop from.

**name**

Name of the continuous query to drop.

CLI Example:

```
salt '*' influxdb.drop_continuous_query mydb my_cq
```

```
salt.modules.influxdbmod.drop_db(name, **client_args)
```

Drop a database.

**name**

Name of the database to drop.

CLI Example:

```
salt '*' influxdb.drop_db <name>
```

```
salt.modules.influxdbmod.drop_retention_policy(database, name, **client_args)
```

Drop a retention policy.

**database**

Name of the database for which the retention policy will be dropped.

**name**

Name of the retention policy to drop.

CLI Example:

```
salt '*' influxdb.drop_retention_policy mydb mypr
```

```
salt.modules.influxdbmod.get_continuous_query(database, name, **client_args)
```

Get an existing continuous query.

**database**

Name of the database for which the continuous query was defined.

**name**

Name of the continuous query to get.

CLI Example:

```
salt '*' influxdb.get_continuous_query mydb cq_month
```

```
salt.modules.influxdbmod.get_retention_policy(database, name, **client_args)
```

Get an existing retention policy.

**database**

Name of the database for which the retention policy was defined.

**name**

Name of the retention policy.

CLI Example:

```
salt '*' influxdb.get_retention_policy metrics default
```

```
salt.modules.influxdbmod.grant_admin_privileges(name, **client_args)
```

Grant cluster administration privileges to a user.

**name**

Name of the user to whom admin privileges will be granted.

CLI Example:

```
salt '*' influxdb.grant_admin_privileges <name>
```

`salt.modules.influxdbmod.grant_privilege(database, privilege, username, **client_args)`

Grant a privilege on a database to a user.

**database**

Name of the database to grant the privilege on.

**privilege**

Privilege to grant. Can be one of 'read', 'write' or 'all'.

**username**

Name of the user to grant the privilege to.

`salt.modules.influxdbmod.list_dbs(**client_args)`

List all InfluxDB databases.

CLI Example:

```
salt '*' influxdb.list_dbs
```

`salt.modules.influxdbmod.list_privileges(name, **client_args)`

List privileges from a user.

**name**

Name of the user from whom privileges will be listed.

CLI Example:

```
salt '*' influxdb.list_privileges <name>
```

`salt.modules.influxdbmod.list_users(**client_args)`

List all users.

CLI Example:

```
salt '*' influxdb.list_users
```

`salt.modules.influxdbmod.query(database, query, **client_args)`

Execute a query.

**database**

Name of the database to query on.

**query**

InfluxQL query string.

`salt.modules.influxdbmod.remove_user(name, **client_args)`

Remove a user.

**name**

Name of the user to remove

CLI Example:

```
salt '*' influxdb.remove_user <name>
```

`salt.modules.influxdbmod.retention_policy_exists(database, name, **client_args)`

Check if retention policy with given name exists.

**database**

Name of the database for which the retention policy was defined.

**name**

Name of the retention policy to check.

CLI Example:

```
salt '*' influxdb.retention_policy_exists metrics default
```

`salt.modules.influxdbmod.revoke_admin_privileges`(*name*, *\*\*client\_args*)

Revoke cluster administration privileges from a user.

**name**

Name of the user from whom admin privileges will be revoked.

CLI Example:

```
salt '*' influxdb.revoke_admin_privileges <name>
```

`salt.modules.influxdbmod.revoke_privilege`(*database*, *privilege*, *username*, *\*\*client\_args*)

Revoke a privilege on a database from a user.

**database**

Name of the database to grant the privilege on.

**privilege**

Privilege to grant. Can be one of 'read', 'write' or 'all'.

**username**

Name of the user to grant the privilege to.

`salt.modules.influxdbmod.set_user_password`(*name*, *passwd*, *\*\*client\_args*)

Change password of a user.

**name**

Name of the user for whom to set the password.

**passwd**

New password of the user.

CLI Example:

```
salt '*' influxdb.set_user_password <name> <password>
```

`salt.modules.influxdbmod.user_exists`(*name*, *\*\*client\_args*)

Check if a user exists.

**name**

Name of the user to check.

CLI Example:

```
salt '*' influxdb.user_exists <name>
```

`salt.modules.influxdbmod.user_info`(*name*, *\*\*client\_args*)

Get information about given user.

**name**

Name of the user for which to get information.

CLI Example:

```
salt '*' influxdb.user_info <name>
```

## 26.6.180 salt.modules.infoblox

This module have been tested on infoblox API v1.2.1, other versions of the API are likly workable.

### depends

libinfoblox, <https://github.com/steverweber/libinfoblox>

libinfoblox can be installed using *pip install libinfoblox*

API documents can be found on your infoblox server at:

<https://INFOBLOX/wapidoc>

### configuration

The following configuration defaults can be defined (pillar or config files `/etc/salt/master.d/infoblox.conf`):

```
infoblox.config:
  api_sslverify: True
  api_url: 'https://INFOBLOX/wapi/v1.2.1'
  api_user: 'username'
  api_key: 'password'
```

Many of the functions accept *api\_opts* to override the API config.

```
salt-call infoblox.get_host name=my.host.com api_url:
→ 'https://INFOBLOX/wapi/v1.2.1' api_user=admin
→ api_key=pass
```

`salt.modules.infoblox.create_a(data, **api_opts)`

Create A record.

This is a helper function to *create\_object*. See your infoblox API for full *data* format.

CLI Example:

```
salt-call infoblox.create_a data =
  name: 'fastlinux.math.example.ca'
  ipv4addr: '127.0.0.1'
  view: External
```

`salt.modules.infoblox.create_cname(data, **api_opts)`

Create a cname record.

CLI Example:

```
salt-call infoblox.create_cname data={
→ example server", "name": "example.example.com", "comment": "cname to
→ "zone": "example.com", "view": "Internal",
→ "canonical": "example-ha-0.example.com" }
```

`salt.modules.infoblox.create_host(data, **api_opts)`

Add host record

Avoid race conditions, use `func:nextavailableip` for `ipv[4,6]addr`s:

- `func:nextavailableip:network/ZG54dfgsrDFEFfsfsLzA:10.0.0.0/8/default`
- `func:nextavailableip:10.0.0.0/8`
- `func:nextavailableip:10.0.0.0/8,external`
- `func:nextavailableip:10.0.0.3-10.0.0.10`

See your infoblox API for full *data* format.

CLI Example:

```
salt-call infoblox.create_host data =
  {'name': 'hostname.example.ca',
   'aliases': ['hostname.math.example.ca'],
   'extattrs': [{'Business Contact': {'value': 'example@example.ca'}},
                {'Pol8 Classification': {'value': 'Restricted'}},
                {'Primary OU': {'value': 'CS'}},
                {'Technical Contact': {'value': 'example@example.ca'}}],
   'ipv4addrs': [{'configure_for_dhcp': True,
                  'ipv4addr': 'func:nextavailableip:129.97.139.0/24',
                  'mac': '00:50:56:84:6e:ae'}],
   'ipv6addrs': [], }
```

`salt.modules.infoblox.create_ipv4_range(data, **api_opts)`

Create a ipv4 range

This is a helper function to *create\_object* See your infoblox API for full *data* format.

CLI Example:

```
salt-call infoblox.create_ipv4_range data={
  start_addr: '129.97.150.160',
  end_addr: '129.97.150.170'}
```

`salt.modules.infoblox.create_object(object_type, data, **api_opts)`

Create raw infoblox object. This is a low level api call.

CLI Example:

```
salt-call infoblox.update_object object_type=record:host data={}
```

`salt.modules.infoblox.delete_a(name=None, ipv4addr=None, allow_array=False, **api_opts)`

Delete A record

If the A record is used as a round robin you can set `allow_array=True` to delete all records for the host-name.

CLI Examples:

```
salt-call infoblox.delete_a name=abc.example.com
salt-call infoblox.delete_a ipv4addr=192.168.3.5
salt-call infoblox.delete_a name=acname.example.com allow_array=True
```

`salt.modules.infoblox.delete_cname(name=None, canonical=None, **api_opts)`

Delete CNAME. This is a helper call to *delete\_object*.

If record is not found, return True

CLI Examples:

```
salt-call infoblox.delete_cname name=example.example.com
salt-call infoblox.delete_cname canonical=example-ha-0.example.com
```

`salt.modules.infoblox.delete_host` (*name=None, mac=None, ipv4addr=None, \*\*api\_opts*)

Delete host

CLI Example:

```
salt-call infoblox.delete_host name=example.domain.com
salt-call infoblox.delete_host ipv4addr=123.123.122.12
salt-call infoblox.delete_host ipv4addr=123.123.122.12
→ mac=00:50:56:84:6e:ae
```

`salt.modules.infoblox.delete_ipv4_range` (*start\_addr=None, end\_addr=None, \*\*api\_opts*)

Delete ip range.

CLI Example:

```
salt-call infoblox.delete_ipv4_range start_addr=123.123.122.12
```

`salt.modules.infoblox.delete_object` (*objref, \*\*api\_opts*)

Delete infoblox object. This is a low level api call.

CLI Example:

```
salt-call infoblox.delete_object objref=[ref_of_object]
```

`salt.modules.infoblox.diff_objects` (*obja, objb*)

Diff two complex infoblox objects. This is used from salt states to detect changes in objects.

Using `func:nextavailableip` will not cause a diff if the ipaddress is in range

`salt.modules.infoblox.get_a` (*name=None, ipv4addr=None, allow\_array=True, \*\*api\_opts*)

Get A record

CLI Examples:

```
salt-call infoblox.get_a name=abc.example.com
salt-call infoblox.get_a ipv4addr=192.168.3.5
```

`salt.modules.infoblox.get_cname` (*name=None, canonical=None, return\_fields=None, \*\*api\_opts*)

Get CNAME information.

CLI Examples:

```
salt-call infoblox.get_cname name=example.example.com
salt-call infoblox.get_cname canonical=example-ha-0.example.com
```

`salt.modules.infoblox.get_host` (*name=None, ipv4addr=None, mac=None, return\_fields=None, \*\*api\_opts*)

Get host information

CLI Examples:

```
salt-call infoblox.get_host hostname.domain.ca
salt-call infoblox.get_host ipv4addr=123.123.122.12
salt-call infoblox.get_host mac=00:50:56:84:6e:ae
```

`salt.modules.infoblox.get_host_advanced` (*name=None, ipv4addr=None, mac=None, \*\*api\_opts*)

Get all host information

CLI Example:

```
salt-call infoblox.get_host_advanced hostname.domain.ca
```

`salt.modules.infoblox.get_host_domainname` (*name, domains=None, \*\*api\_opts*)

Get host domain name

If no domains are passed, the hostname is checked for a zone in infoblox, if no zone split on first dot.

If domains are provided, the best match out of the list is returned.

If none are found the return is None

dots at end of names are ignored.

CLI Example:

```
salt-call uwl.get_host_domainname name=localhost.t.domain.com
↳ domains=['domain.com', 't.domain.com']
# returns: t.domain.com
```

`salt.modules.infoblox.get_host_hostname` (*name, domains=None, \*\*api\_opts*)

Get hostname

If no domains are passed, the hostname is checked for a zone in infoblox, if no zone split on first dot.

If domains are provided, the best match out of the list is truncated from the fqdn leaving the hostname.

If no matching domains are found the fqdn is returned.

dots at end of names are ignored.

CLI Examples:

```
salt-call infoblox.get_host_hostname fqdn=localhost.xxx.t.domain.com
↳ domains="['domain.com', 't.domain.com']"
#returns: localhost.xxx

salt-call infoblox.get_host_hostname fqdn=localhost.xxx.t.domain.com
#returns: localhost
```

`salt.modules.infoblox.get_host_ipv4` (*name=None, mac=None, allow\_array=False, \*\*api\_opts*)

Get ipv4 address from host record.

Use `allow_array` to return possible multiple values.

CLI Examples:

```
salt-call infoblox.get_host_ipv4 host=localhost.domain.com
salt-call infoblox.get_host_ipv4 mac=00:50:56:84:6e:ae
```

`salt.modules.infoblox.get_host_ipv4addr_info` (*ipv4addr=None, mac=None, discovered\_data=None, return\_fields=None, \*\*api\_opts*)

Get host ipv4addr information

CLI Examples:

```
salt-call infoblox.get_ipv4addr ipv4addr=123.123.122.12
salt-call infoblox.get_ipv4addr mac=00:50:56:84:6e:ae
salt-call infoblox.get_ipv4addr mac=00:50:56:84:6e:ae return_fields=host
→return_fields='mac,host,configure_for_dhcp,ipv4addr'
```

```
salt.modules.infoblox.get_host_ipv6addr_info(ipv6addr=None, mac=None,
                                             discovered_data=None, return_fields=None,
                                             **api_opts)
```

Get host ipv6addr information

CLI Example:

```
salt-call infoblox.get_host_ipv6addr_info
→ipv6addr=2001:db8:85a3:8d3:1349:8a2e:370:7348
```

```
salt.modules.infoblox.get_host_mac(name=None, allow_array=False, **api_opts)
```

Get mac address from host record.

Use `allow_array` to return possible multiple values.

CLI Example:

```
salt-call infoblox.get_host_mac host=localhost.domain.com
```

```
salt.modules.infoblox.get_ipv4_range(start_addr=None, end_addr=None, return_fields=None,
                                     **api_opts)
```

Get ip range

CLI Example:

```
salt-call infoblox.get_ipv4_range start_addr=123.123.122.12
```

```
salt.modules.infoblox.get_network(ipv4addr=None, network=None, return_fields=None, **api_opts)
```

Get list of all networks. This is helpful when looking up subnets to use with `func:nextavailableip`

This call is often slow and not cached!

some return\_fields comment,network,network\_view,ddns\_domainname,disable,enable\_ddns

CLI Example:

```
salt-call infoblox.get_network
```

```
salt.modules.infoblox.get_object(objref, data=None, return_fields=None, max_results=None,
                                ensure_none_or_one_result=False, **api_opts)
```

Get raw infoblox object. This is a low level api call.

CLI Example:

```
salt-call infoblox.get_object objref=[_ref of object]
```

```
salt.modules.infoblox.is_ipaddr_in_ipfunc_range(ipaddr, ipfunc)
```

Return true if the ipaddress is in the range of the `nextavailableip` function

CLI Example:

```
salt-call infoblox.is_ipaddr_in_ipfunc_range ipaddr="10.0.2.2"
→ " ipfunc="func:nextavailableip:10.0.0.0/8"
```

`salt.modules.infoblox.update_cname(name, data, **api_opts)`

Update CNAME. This is a helper call to `update_object`.

Find a CNAME `_ref` then call `update_object` with the record data.

CLI Example:

```
salt-call infoblox.update_cname name=example.example.com data="{
    'canonical': 'example-ha-0.example.com',
    'use_ttl': true,
    'ttl': 200,
    'comment': 'Salt managed CNAME'}"
```

`salt.modules.infoblox.update_host(name, data, **api_opts)`

Update host record. This is a helper call to `update_object`.

Find a hosts `_ref` then call `update_object` with the record data.

CLI Example:

```
salt-call infoblox.update_host name=fqdn data={}
```

`salt.modules.infoblox.update_object(objref, data, **api_opts)`

Update raw infoblox object. This is a low level api call.

CLI Example:

```
salt-call infoblox.update_object objref=[ref_of_object] data={}
```

### 26.6.181 salt.modules.ini\_manage

Edit ini files

```
maintainer
    <akilesh1597@gmail.com>

maturity
    new

depends
    re

platform
    all
```

(for example `/etc/sysctl.conf`)

`salt.modules.ini_manage.get_ini(file_name, separator='=', encoding=None)`

Retrieve the whole structure from an ini file and return it as a dictionary.

Parameters

- **file\_name** (*str*) -- The full path to the ini file.

- **separator** (*str*) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.

New in version 2016.11.0.

- **encoding** (*str*) -- A string value representing encoding of the target ini file. If None is passed, it uses the system default which is likely `utf-8`. Default is None

New in version 3006.6.

#### Returns

A dictionary containing the sections along with the values and names contained in each section

#### Return type

dict

API Example:

```
import salt.client
with salt.client.get_local_client() as sc:
    sc.cmd('target', 'ini.get_ini', [path_to_ini_file])
```

CLI Example:

```
salt '*' ini.get_ini /path/to/ini
```

`salt.modules.ini_manage.get_option(file_name, section, option, separator='=', encoding=None)`

Get value of a key from a section in an ini file. Returns None if no matching key was found.

#### Parameters

- **file\_name** (*str*) -- The full path to the ini file.
- **section** (*str*) -- A string value representing the section of the ini that the option is in. If the option is not in a section, leave this empty.
- **option** (*str*) -- A string value representing the option to search for.
- **separator** (*str*) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.

New in version 2016.11.0.

- **encoding** (*str*) -- A string value representing encoding of the target ini file. If None is passed, it uses the system default which is likely `utf-8`. Default is None

New in version 3006.6.

#### Returns

The value as defined in the ini file, or **None** if empty or not found

#### Return type

str

API Example:

```
import salt.client
with salt.client.get_local_client() as sc:
```

(continues on next page)

(continued from previous page)

```
sc.cmd('target', 'ini.get_option', [path_to_ini_file, section_name,
↪option])
```

CLI Example:

```
salt '*' ini.get_option /path/to/ini section_name option_name
```

`salt.modules.ini_manage.get_section`(*file\_name*, *section*, *separator*='=', *encoding*=None)

Retrieve a section from an ini file. Returns the section as a dictionary. If the section is not found, an empty dictionary is returned.

#### Parameters

- **file\_name** (*str*) -- The full path to the ini file.
- **section** (*str*) -- A string value representing name of the section to search for.
- **separator** (*str*) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.

New in version 2016.11.0.

- **encoding** (*str*) -- A string value representing encoding of the target ini file. If None is passed, it uses the system default which is likely utf-8. Default is None

New in version 3006.6.

#### Returns

A dictionary containing the names and values of all items in the section of the ini file. If the section is not found, an empty dictionary is returned

#### Return type

dict

API Example:

```
import salt.client
with salt.client.get_local_client() as sc:
    sc.cmd('target', 'ini.get_section', [path_to_ini_file, section_name])
```

CLI Example:

```
salt '*' ini.get_section /path/to/ini section_name
```

`salt.modules.ini_manage.remove_option`(*file\_name*, *section*, *option*, *separator*='=', *encoding*=None)

Remove a key/value pair from a section in an ini file. Returns the value of the removed key, or None if nothing was removed.

#### Parameters

- **file\_name** (*str*) -- The full path to the ini file.
- **section** (*str*) -- A string value representing the section of the ini that the option is in. If the option is not in a section, leave this empty.
- **option** (*str*) -- A string value representing the option to search for.
- **separator** (*str*) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.

New in version 2016.11.0.

- **encoding** (*str*) -- A string value representing encoding of the target ini file. If `None` is passed, it uses the system default which is likely `utf-8`. Default is `None`

New in version 3006.6.

#### Returns

A string value representing the option that was removed or `None` if nothing was removed

#### Return type

`str`

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.remove_option', [path_to_ini_file, section_name,
→option])
```

CLI Example:

```
salt '*' ini.remove_option /path/to/ini section_name option_name
```

`salt.modules.ini_manage.remove_section(file_name, section, separator='=', encoding=None)`

Remove a section in an ini file. Returns the removed section as a dictionary, or `None` if nothing is removed.

#### Parameters

- **file\_name** (*str*) -- The full path to the ini file.
- **section** (*str*) -- A string value representing the name of the section search for.
- **separator** (*str*) -- The character used to separate keys and values. Standard ini files use the `"="` character. The default is `=`.

New in version 2016.11.0.

- **encoding** (*str*) -- A string value representing encoding of the target ini file. If `None` is passed, it uses the system default which is likely `utf-8`. Default is `None`

New in version 3006.6.

#### Returns

A dictionary containing the names and values of all items in the section that was removed or `None` if nothing was removed

#### Return type

`dict`

API Example:

```
import salt.client
with salt.client.get_local_client() as sc:
    sc.cmd('target', 'ini.remove_section', [path_to_ini_file, section_
→name])
```

CLI Example:

```
salt '*' ini.remove_section /path/to/ini section_name
```

`salt.modules.ini_manage.set_option(file_name, sections=None, separator='=', encoding=None)`

Edit an ini file, replacing one or more sections. Returns a dictionary containing the changes made.

#### Parameters

- **file\_name** (*str*) -- The full path to the ini file.
- **sections** (*dict*) -- A dictionary representing the sections to be edited in the ini file. The keys are the section names and the values are a dictionary containing the options. If the ini file does not contain sections the keys and values represent the options. The default is None.

- **separator** (*str*) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.

New in version 2016.11.0.

- **encoding** (*str*) -- A string value representing encoding of the target ini file. If None is passed, it uses the system default which is likely utf-8. Default is None

New in version 3006.6.

#### Returns

A dictionary representing the changes made to the ini file

#### Return type

dict

API Example:

```
import salt.client
with salt.client.get_local_client() as sc:
    sc.cmd(
        'target', 'ini.set_option', ['path_to_ini_file', '{"section_to_
→change": {"key": "value"}}']
    )
```

CLI Example:

```
salt '*' ini.set_option /path/to/ini '{section_foo: {key: value}}'
```

## 26.6.182 salt.modules.inspectlib package

### Submodules

`salt.modules.inspectlib.collector`

**class** `salt.modules.inspectlib.collector.Inspector` (*cachedir=None, piddir=None, pidfilename=None*)

**DEFAULT\_MINION\_CONFIG\_PATH** = `'/etc/salt/minion'`

**IGNORE\_FS\_TYPES** = `['autofs', 'cifs', 'nfs', 'nfs4']`

**IGNORE\_MOUNTS** = `['proc', 'sysfs', 'devtmpfs', 'tmpfs', 'fuse.gvfs-fuse-daemon']`

```
IGNORE_PATHS = ['/tmp', '/var/tmp', '/lost+found', '/var/run',  
               '/var/lib/rpm', '/.snapshots', '/.zfs', '/etc/ssh', '/root', '/home']
```

```
MODE = ['configuration', 'payload', 'all']
```

```
build(format='qcow2', path='/tmp')
```

Build an image using Kiwi.

Parameters

- **format** --
- **path** --

Returns

```
create_snapshot()
```

Open new snapshot.

Returns

```
export(description, local=False, path='/tmp', format='qcow2')
```

Export description for Kiwi.

Parameters

- **local** --
- **path** --

Returns

```
request_snapshot(mode, priority=19, **kwargs)
```

Take a snapshot of the system.

```
reuse_snapshot()
```

Open an existing, latest snapshot.

Returns

```
snapshot(mode)
```

Take a snapshot of the system.

```
salt.modules.inspectlib.collector.is_alive(pidfile)
```

Check if PID is still alive.

```
salt.modules.inspectlib.collector.main(dbfile, pidfile, mode)
```

Main analyzer routine.

### **salt.modules.inspectlib.dbhandle**

```
class salt.modules.inspectlib.dbhandle.DBHandle(*args, **kwargs)
```

```
class salt.modules.inspectlib.dbhandle.DBHandleBase(path)
```

Handle for the *volatile* database, which serves the purpose of caching the inspected data. This database can be destroyed or corrupted, so it should be simply re-created from scratch.

```
close()
```

Close the database connection.

**flush** (*table*)

Flush the table.

**open** (*new=False*)

Init the database, if required.

**purge** ()

Purge whole database.

### **salt.modules.inspectlib.exceptions**

**exception** salt.modules.inspectlib.exceptions.**InspectorKiwiProcessorException**

Kiwi builder/exporter exception.

**exception** salt.modules.inspectlib.exceptions.**InspectorQueryException**

Exception that is only for the inspector query.

**exception** salt.modules.inspectlib.exceptions.**InspectorSnapshotException**

Snapshot exception.

**exception** salt.modules.inspectlib.exceptions.**SIException**

System information exception.

### **salt.modules.inspectlib.query**

**class** salt.modules.inspectlib.query.**Query** (*scope, cachedir=None*)

Query the system. This class is actually puts all Salt features together, so there would be no need to pick it from various places.

```
SCOPES = ['changes', 'configuration', 'identity', 'system', 'software',
           'services', 'payload', 'all']
```

**class** salt.modules.inspectlib.query.**SysInfo** (*systype*)

System information.

### **Module contents**

**class** salt.modules.inspectlib.**EnvLoader** (*cachedir=None, piddir=None, pidfilename=None*)

Load environment.

```
DB_FILE = '_minion_collector.db'
```

```
DEFAULT_CACHE_PATH = '/var/cache/salt'
```

```
DEFAULT_PID_PATH = '/var/run'
```

```
PID_FILE = '_minion_collector.pid'
```

### 26.6.183 salt.modules.inspectlib.entities

**class** salt.modules.inspectlib.entities.**AllowedDir**

Allowed directories

**class** salt.modules.inspectlib.entities.**IgnoredDir**

Ignored directories

**class** salt.modules.inspectlib.entities.**Package**

Package.

**class** salt.modules.inspectlib.entities.**PackageCfgFile**

Config file, belongs to the package

**class** salt.modules.inspectlib.entities.**PayloadFile**

Payload file.

### 26.6.184 salt.modules.inspectlib.fsdb

**codeauthor**

Bo Maryniuk <bo@suse.de>

**class** salt.modules.inspectlib.fsdb.**CsvDB**(*path*)

File-based CSV database. This database is in-memory operating relatively small plain text csv files.

**close**()

Close the database.

Returns

**create\_table\_from\_object**(*obj*)

Create a table from the object. NOTE: This method doesn't stores anything.

Parameters

**obj** --

Returns

**delete**(*obj*, *matches=None*, *mt=None*, *lt=None*, *eq=None*)

Delete object from the database.

Parameters

• **obj** --

• **matches** --

• **mt** --

• **lt** --

• **eq** --

Returns

**flush**(*table*)

Flush table.

Parameters

**table** --

**Returns****get** (*obj*, *matches=None*, *mt=None*, *lt=None*, *eq=None*)

Get objects from the table.

**Parameters**

- **table\_name** --
- **matches** -- Regexp.
- **mt** -- More than.
- **lt** -- Less than.
- **eq** -- Equals.

**Returns****is\_closed**()

Return if the database is closed.

**Returns****list**()

List all the databases on the given path.

**Returns****list\_tables**()

Load existing tables and their descriptions.

**Returns****new**()

Create a new database and opens it.

**Returns****open** (*dbname=None*)

Open database from the path with the name or latest. If there are no yet databases, create a new implicitly.

**Returns****purge** (*dbid*)

Purge the database.

**Parameters**

- **dbid** --

**Returns****store** (*obj*, *distinct=False*)

Store an object in the table.

**Parameters**

- **obj** -- An object to store
- **distinct** -- Store object only if there is none identical of such. If at least one field is different, store it.

**Returns**

**update** (*obj*, *matches=None*, *mt=None*, *lt=None*, *eq=None*)

Update object(s) in the database.

Parameters

- **obj** --
- **matches** --
- **mt** --
- **lt** --
- **eq** --

Returns

**class** salt.modules.inspectlib.fsdb.**CsvDBEntity**

Serializable object for the table.

### 26.6.185 salt.modules.inspectlib.kiwiproc

**class** salt.modules.inspectlib.kiwiproc.**KiwiExporter** (*grains*, *format*)

Exports system description as Kiwi configuration.

**export** (*name*)

Export to the Kiwi config.xml as text.

Returns

**load** (*\*\*descr*)

Load data by keys.

Parameters

**data** --

Returns

### 26.6.186 salt.modules.inspector

Module for full system inspection.

salt.modules.inspector.**build** (*format='qcow2'*, *path='/tmp'*)

Build an image from a current system description. The image is a system image can be output in bootable ISO or QCOW2 formats.

Node uses the image building library Kiwi to perform the actual build.

Parameters:

- **format**: Specifies output format: "qcow2" or "iso". Default: *qcow2*.
- **path**: Specifies output path where to store built image. Default: */tmp*.

CLI Example:

```
salt myminion inspector.build
salt myminion inspector.build format=iso path=/opt/builds/
```

`salt.modules.inspector.delete` (*all=False, \*databases*)

Remove description snapshots from the system.

::parameter: all. Default: False. Remove all snapshots, if set to True.

CLI Example:

```
salt myminion inspector.delete <ID> <ID1> <ID2>..
salt myminion inspector.delete all=True
```

`salt.modules.inspector.export` (*local=False, path='/tmp', format='qcow2'*)

Export an image description for Kiwi.

Parameters:

- **local**: Specifies True or False if the export has to be in the local file. Default: False.
- **path**: If *local=True*, then specifies the path where file with the Kiwi description is written. Default: */tmp*.

CLI Example:

```
salt myminion inspector.export
salt myminion inspector.export format=iso path=/opt/builds/
```

`salt.modules.inspector.inspect` (*mode='all', priority=19, \*\*kwargs*)

Start node inspection and save the data to the database for further query.

Parameters:

- **mode**: Clarify inspection mode: configuration, payload, all (default)  
  - **payload**
    - **filter**: Comma-separated directories to track payload.
- **priority**: (advanced) Set priority of the inspection. Default is low priority.

CLI Example:

```
salt '*' inspector.inspect
salt '*' inspector.inspect configuration
salt '*' inspector.inspect payload filter=/opt,/ext/oracle
```

`salt.modules.inspector.query` (*\*args, \*\*kwargs*)

Query the node for specific information.

Parameters:

- **scope**: Specify scope of the query.
  - **System**: Return system data.
  - **Software**: Return software information.
  - **Services**: Return known services.
  - **Identity**: Return user accounts information for this system.

#### accounts

Can be either 'local', 'remote' or 'all' (equal to "local,remote"). Remote accounts cannot be resolved on all systems, but only those, which supports 'passwd -S -a'.

**disabled**

True (or False, default) to return only disabled accounts.

– **payload:** Payload scope parameters:

**filter**

Include only results which path starts from the filter string.

**time**

Display time in Unix ticks or format according to the configured TZ (default) Values: ticks, tz (default)

**size**

Format size. Values: B, KB, MB, GB

**type**

Include payload type. Values (comma-separated): directory (or dir), link, file (default) Example (returns everything): type=directory,link,file

**owners**

Resolve UID/GID to an actual names or leave them numeric (default). Values: name (default), id

**brief**

Return just a list of payload elements, if True. Default: False.

– **all:** Return all information (default).

CLI Example:

```
salt '*' inspector.query scope=system
salt '*' inspector.query scope=payload type=file,link filter=/etc size=Kb
→brief=False
```

### `salt.modules.inspector.snapshots()`

List current description snapshots.

CLI Example:

```
salt myminion inspector.snapshots
```

## 26.6.187 `salt.modules.introspect`

Functions to perform introspection on a minion, and return data in a format usable by Salt States

### `salt.modules.introspect.enabled_service_owners()`

Return which packages own each of the services that are currently enabled.

CLI Example:

```
salt myminion introspect.enabled_service_owners
```

### `salt.modules.introspect.running_service_owners` (*exclude=('/dev', '/home', '/media', '/proc', '/run', '/sys', '/tmp', '/var')*)

Determine which packages own the currently running services. By default, excludes files whose full path starts with /dev, /home, /media, /proc, /run, /sys, /tmp and /var. This can be overridden by passing in a new list to exclude.

CLI Example:

```
salt myminion introspect.running_service_owners
```

`salt.modules.introspect.service_highstate` (*requires=True*)

Return running and enabled services in a highstate structure. By default also returns package dependencies for those services, which means that package definitions must be created outside this function. To drop the package dependencies, set `requires` to `False`.

CLI Example:

```
salt myminion introspect.service_highstate
salt myminion introspect.service_highstate requires=False
```

## 26.6.188 salt.modules.iosconfig

Cisco IOS configuration manipulation helpers

New in version 2019.2.0.

This module provides a collection of helper functions for Cisco IOS style configuration manipulation. This module does not have external dependencies and can be used from any Proxy or regular Minion.

`salt.modules.iosconfig.clean` (*config=None, path=None, saltenv='base'*)

Return a clean version of the config, without any special signs (such as `!` as an individual line) or empty lines, but just lines with significant value in the configuration of the network device.

**config**

The configuration sent as text. This argument is ignored when `path` is configured.

**path**

Absolute or remote path from where to load the configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv: base**

Salt fileserver environment from which to retrieve the file. Ignored if `path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.clean path=salt://path/to/my/config.txt
salt '*' iosconfig.clean path=https://bit.ly/2mAdq7z
```

`salt.modules.iosconfig.diff_text` (*candidate\_config=None, candidate\_path=None, running\_config=None, running\_path=None, saltenv='base'*)

Return the diff, as text, between the candidate and the running config.

**candidate\_config**

The candidate configuration sent as text. This argument is ignored when `candidate_path` is set.

**candidate\_path**

Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**running\_config**

The running configuration sent as text. This argument is ignored when `running_path` is set.

**running\_path**

Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv: base**

Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.diff_text candidate_path=salt://path/to/candidate.cfg
↳running_path=salt://path/to/running.cfg
```

```
salt.modules.iosconfig.diff_tree(candidate_config=None, candidate_path=None,
                                running_config=None, running_path=None, saltenv='base')
```

Return the diff, as Python dictionary, between the candidate and the running configuration.

**candidate\_config**

The candidate configuration sent as text. This argument is ignored when `candidate_path` is set.

**candidate\_path**

Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**running\_config**

The running configuration sent as text. This argument is ignored when `running_path` is set.

**running\_path**

Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv: base**

Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.diff_tree candidate_path=salt://path/to/candidate.cfg
↳running_path=salt://path/to/running.cfg
```

```
salt.modules.iosconfig.merge_diff(initial_config=None, initial_path=None, merge_config=None,
                                  merge_path=None, saltenv='base')
```

Return the merge diff, as text, after merging the merge config into the initial config.

**initial\_config**

The initial configuration sent as text. This argument is ignored when `initial_path` is set.

**initial\_path**

Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**merge\_config**

The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

**merge\_path**

Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv: base**

Salt fileserver environment from which to retrieve the file. Ignored if `initial_path` or `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.merge_diff initial_path=salt://path/to/running.cfg
→merge_path=salt://path/to/merge.cfg
```

`salt.modules.iosconfig.merge_text` (*initial\_config=None, initial\_path=None, merge\_config=None, merge\_path=None, saltenv='base'*)

Return the merge result of the `initial_config` with the `merge_config`, as plain text.

**initial\_config**

The initial configuration sent as text. This argument is ignored when `initial_path` is set.

**initial\_path**

Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

**merge\_config**

The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

**merge\_path**

Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

**saltenv: base**

Salt fileserver environment from which to retrieve the file. Ignored if `initial_path` or `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.merge_text initial_path=salt://path/to/running.cfg
→merge_path=salt://path/to/merge.cfg
```

`salt.modules.iosconfig.merge_tree` (*initial\_config=None, initial\_path=None, merge\_config=None, merge\_path=None, saltenv='base'*)

Return the merge tree of the `initial_config` with the `merge_config`, as a Python dictionary.

**initial\_config**

The initial configuration sent as text. This argument is ignored when `initial_path` is set.

**initial\_path**

Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

**merge\_config**

The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

**merge\_path**

Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

**saltenv: base**

Salt fileserver environment from which to retrieve the file. Ignored if `initial_path` or `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.merge_tree initial_path=salt://path/to/running.cfg
→merge_path=salt://path/to/merge.cfg
```

`salt.modules.iosconfig.tree` (*config=None, path=None, with\_tags=False, saltenv='base'*)

Transform Cisco IOS style configuration to structured Python dictionary. Depending on the value of the `with_tags` argument, this function may provide different views, valuable in different situations.

**config**

The configuration sent as text. This argument is ignored when `path` is configured.

**path**

Absolute or remote path from where to load the configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**with\_tags: False**

Whether this function should return a detailed view, with tags.

**saltenv: base**

Salt fileserver environment from which to retrieve the file. Ignored if `path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.tree path=salt://path/to/my/config.txt
salt '*' iosconfig.tree path=https://bit.ly/2mAdq7z
```

## 26.6.189 salt.modules.ipmi

Support IPMI commands over LAN. This module does not talk to the local systems hardware through IPMI drivers. It uses a python module `pyghmi`.

**depends**

Python module `pyghmi`. You can install `pyghmi` using `pip`:

```
pip install pyghmi
```

**configuration**

The following configuration defaults can be define (pillar or config files):

```
ipmi.config:
  api_host: 127.0.0.1
  api_user: admin
  api_pass: apassword
  api_port: 623
  api_kg: None
```

Usage can override the config defaults:

```
salt-call ipmi.get_user api_host=myipmienabled.system
                    api_user=admin api_pass=pass
                    uid=1
```

`salt.modules.ipmi.create_user` (*uid, name, password, channel=14, callback=False, link\_auth=True, ipmi\_msg=True, privilege\_level='administrator', \*\*kwargs*)

create/ensure a user is created with provided settings.

**Parameters**

- **privilege\_level** -- User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.) \* `callback` \* `user` \* `operator` \* `administrator` \* `proprietary` \* `no_access`

- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

CLI Examples:

```
salt-call ipmi.create_user uid=2 name=steverweber api_host=172.168.0.7
→api_pass=nevertell
```

`salt.modules.ipmi.fast_connect_test(**kwargs)`

Returns True if connection success. This uses an aggressive timeout value!

Parameters

**kwargs** --

- api\_host=127.0.0.1
- api\_user=admin
- api\_pass=example
- api\_port=623
- api\_kg=None

CLI Examples:

```
salt-call ipmi.fast_connect_test api_host=172.168.0.9
```

`salt.modules.ipmi.get_bootdev(**kwargs)`

Get current boot device override information.

Provides the current requested boot device. Be aware that not all IPMI devices support this. Even in BMCs that claim to, occasionally the BIOS or UEFI fail to honor it. This is usually only applicable to the next reboot.

Parameters

**kwargs** --

- api\_host=127.0.0.1
- api\_user=admin
- api\_pass=example
- api\_port=623
- api\_kg=None

CLI Example:

```
salt-call ipmi.get_bootdev api_host=127.0.0.1 api_user=admin api_pass=pass
```

`salt.modules.ipmi.get_channel_access(channel=14, read_mode='non_volatile', **kwargs)`

:param kwargs:api\_host='127.0.0.1' api\_user='admin' api\_pass='example' api\_port=623

Parameters

- **channel** -- number [1:7]
- **read\_mode** --
  - non\_volatile = get non-volatile Channel Access
  - volatile = get present volatile (active) setting of Channel Access
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

#### Return Data

A Python dict with the following keys/values:

```
{
  alerting:
  per_msg_auth:
  user_level_auth:
  access_mode: { (ONE OF)
    0: 'disabled',
    1: 'pre_boot',
    2: 'always',
    3: 'shared'
  }
  privilege_level: { (ONE OF)
    1: 'callback',
    2: 'user',
    3: 'operator',
    4: 'administrator',
    5: 'proprietary',
  }
}
```

#### CLI Examples:

```
salt-call ipmi.get_channel_access channel=1
```

`salt.modules.ipmi.get_channel_info(channel=14, **kwargs)`

Get channel info

#### Parameters

- **channel** -- number [1:7]
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623

- api\_kg=None

### Return Data

channel session supports

- no\_session: channel is session-less
- single: channel is single-session
- multi: channel is multi-session
- auto: channel is session-based (channel could alternate between single- and multi-session operation, as can occur with a serial/modem channel that supports connection mode auto-detect)

CLI Examples:

```
salt-call ipmi.get_channel_info
```

`salt.modules.ipmi.get_channel_max_user_count(channel=14, **kwargs)`

Get max users in channel

### Parameters

- **channel** -- number [1:7]
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

### Returns

int -- often 16

CLI Examples:

```
salt-call ipmi.get_channel_max_user_count
```

`salt.modules.ipmi.get_health(**kwargs)`

Get Summarize health

This provides a summary of the health of the managed system. It additionally provides an iterable list of reasons for warning, critical, or failed assessments.

good health: {'badreadings': [], 'health': 0}

### Parameters

- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

CLI Example:

```
salt-call ipmi.get_health api_host=127.0.0.1 api_user=admin api_pass=pass
```

`salt.modules.ipmi.get_power(**kwargs)`

Get current power state

The response, if successful, should contain 'powerstate' key and either 'on' or 'off' to indicate current state.

#### Parameters

##### **kwargs** --

- `api_host=127.0.0.1`
- `api_user=admin`
- `api_pass=example`
- `api_port=623`
- `api_kg=None`

CLI Example:

```
salt-call ipmi.get_power api_host=127.0.0.1 api_user=admin api_pass=pass
```

`salt.modules.ipmi.get_sensor_data(**kwargs)`

Get sensor readings

Iterates sensor reading objects

#### Parameters

##### **kwargs** --

- `api_host=127.0.0.1`
- `api_user=admin`
- `api_pass=example`
- `api_port=623`
- `api_kg=None`

CLI Example:

```
salt-call ipmi.get_sensor_data api_host=127.0.0.1 api_user=admin api_
→pass=pass
```

`salt.modules.ipmi.get_user(uid, channel=14, **kwargs)`

Get user from uid and access on channel

#### Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **kwargs** --
  - `api_host=127.0.0.1`
  - `api_user=admin`
  - `api_pass=example`

- api\_port=623
- api\_kg=None

## Return Data

```
name: (str)
uid: (int)
channel: (int)
access:
  - callback (bool)
  - link_auth (bool)
  - ipmi_msg (bool)
  - privilege_level: (str)[callback, user, operator administrator,
                        proprietary, no_access]
```

## CLI Examples:

```
salt-call ipmi.get_user uid=2
```

`salt.modules.ipmi.get_user_access`(*uid*, *channel*=14, *\*\*kwargs*)

Get user access

## Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

## Return Data

```
channel_info:
  - max_user_count = maximum number of user IDs on this channel
  - enabled_users = count of User ID slots presently in use
  - users_with_fixed_names = count of user IDs with fixed names
access:
  - callback
  - link_auth
  - ipmi_msg
  - privilege_level: [reserved, callback, user, operator
                    administrator, proprietary, no_access]
```

## CLI Examples:

```
salt-call ipmi.get_user_access uid=2
```

`salt.modules.ipmi.get_user_name`(*uid*, *return\_none\_on\_error*=True, *\*\*kwargs*)

Get user name

**Parameters**

- **uid** -- user number [1:16]
- **return\_none\_on\_error** -- return None on error
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_key=None

CLI Examples:

```
salt-call ipmi.get_user_name uid=2
```

`salt.modules.ipmi.get_users(channel=14, **kwargs)`  
get list of users and access information

**Parameters**

- **channel** -- number [1:7]
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_key=None

**Returns**

- name: (str)
- uid: (int)
- channel: (int)
- access:
  - callback (bool)
  - link\_auth (bool)
  - ipmi\_msg (bool)
  - privilege\_level: (str)[callback, user, operator, administrator, proprietary, no\_access]

CLI Examples:

```
salt-call ipmi.get_users api_host=172.168.0.7
```

`salt.modules.ipmi.raw_command(netfn, command, bridge_request=None, data=(), retry=True, delay_xmit=None, **kwargs)`

Send raw ipmi command

This allows arbitrary IPMI bytes to be issued. This is commonly used for certain vendor specific commands.

**Parameters**

- **netfn** -- Net function number
- **command** -- Command value
- **bridge\_request** -- The target slave address and channel number for the bridge request.
- **data** -- Command data as a tuple or list
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

**Returns**

dict -- The response from IPMI device

## CLI Examples:

```
salt-call ipmi.raw_command netfn=0x06 command=0x46 data=[0x02]
# this will return the name of the user with id 2 in bytes
```

`salt.modules.ipmi.set_bootdev`(*bootdev='default', persist=False, uefiboot=False, \*\*kwargs*)

Set boot device to use on next reboot

**Parameters**

- **bootdev** --
  - network: Request network boot
  - hd: Boot from hard drive
  - safe: Boot from hard drive, requesting 'safe mode'
  - optical: boot from CD/DVD/BD drive
  - setup: Boot into setup utility
  - default: remove any IPMI directed boot device request
- **persist** -- If true, ask that system firmware use this device beyond next boot. Be aware many systems do not honor this
- **uefiboot** -- If true, request UEFI boot explicitly. Strictly speaking, the spec suggests that if not set, the system should BIOS boot and offers no "don't care" option. In practice, this flag not being set does not preclude UEFI boot on any system I've encountered.
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

**Returns**

dict or True -- If callback is not provided, the response

CLI Examples:

```
salt-call ipmi.set_bootdev bootdev=network persist=True
```

```
salt.modules.ipmi.set_channel_access(channel=14, access_update_mode='non_volatile',  
                                     alerting=False, per_msg_auth=False, user_level_auth=False,  
                                     access_mode='always', privilege_update_mode='non_volatile',  
                                     privilege_level='administrator', **kwargs)
```

Set channel access

**Parameters**

- **channel** -- number [1:7]
- **access\_update\_mode** --
  - 'dont\_change' = don't set or change Channel Access
  - 'non\_volatile' = set non-volatile Channel Access
  - 'volatile' = set volatile (active) setting of Channel Access
- **alerting** -- PEF Alerting Enable/Disable
  - True = enable PEF Alerting
  - False = disable PEF Alerting on this channel (Alert Immediate command can still be used to generate alerts)
- **per\_msg\_auth** -- Per-message Authentication
  - True = enable
  - False = disable Per-message Authentication. [Authentication required to activate any session on this channel, but authentication not used on subsequent packets for the session.]
- **user\_level\_auth** -- User Level Authentication Enable/Disable
  - True = enable User Level Authentication. All User Level commands are to be authenticated per the Authentication Type that was negotiated when the session was activated.
  - False = disable User Level Authentication. Allow User Level commands to be executed without being authenticated. If the option to disable User Level Command authentication is accepted, the BMC will accept packets with Authentication Type set to None if they contain user level commands. For outgoing packets, the BMC returns responses with the same Authentication Type that was used for the request.
- **access\_mode** -- Access Mode for IPMI messaging (PEF Alerting is enabled/disabled separately from IPMI messaging)
  - disabled = disabled for IPMI messaging
  - pre\_boot = pre-boot only channel only available when system is in a powered down state or in BIOS prior to start of boot.
  - always = channel always available regardless of system mode. BIOS typically dedicates the serial connection to the BMC.
  - shared = same as always available, but BIOS typically leaves the serial port available for software use.

- **privilege\_update\_mode** -- Channel Privilege Level Limit. This value sets the maximum privilege level that can be accepted on the specified channel.
  - dont\_change = don't set or change channel Privilege Level Limit
  - non\_volatile = non-volatile Privilege Level Limit according
  - volatile = volatile setting of Privilege Level Limit
- **privilege\_level** -- Channel Privilege Level Limit
  - reserved = unused
  - callback
  - user
  - operator
  - administrator
  - proprietary = used by OEM
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

CLI Examples:

```
salt-call ipmi.set_channel_access privilege_level='administrator'
```

`salt.modules.ipmi.set_identify` (*on=True, duration=600, \*\*kwargs*)

Request identify light

Request the identify light to turn off, on for a duration, or on indefinitely. Other than error exceptions,

#### Parameters

- **on** -- Set to True to force on or False to force off
- **duration** -- Set if wanting to request turn on for a duration in seconds, None = indefinitely.
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

CLI Examples:

```
salt-call ipmi.set_identify
```

`salt.modules.ipmi.set_power` (*state='power\_on', wait=True, \*\*kwargs*)

Request power state change

#### Parameters

- **name** --
  - `power_on` -- system turn on
  - `power_off` -- system turn off (without waiting for OS)
  - `shutdown` -- request OS proper shutdown
  - `reset` -- reset (without waiting for OS)
  - `boot` -- If system is off, then 'on', else 'reset'
- **ensure** -- If (bool True), do not return until system actually completes requested state change for 300 seconds. If a non-zero (int), adjust the wait time to the requested number of seconds
- **kwargs** --
  - `api_host=127.0.0.1`
  - `api_user=admin`
  - `api_pass=example`
  - `api_port=623`
  - `api_kg=None`

#### Returns

dict -- A dict describing the response retrieved

CLI Examples:

```
salt-call ipmi.set_power state=shutdown wait=True
```

`salt.modules.ipmi.set_user_access` (*uid, channel=14, callback=True, link\_auth=True, ipmi\_msg=True, privilege\_level='administrator', \*\*kwargs*)

Set user access

#### Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **callback** -- User Restricted to Callback
  - False = User Privilege Limit is determined by the User Privilege Limit parameter, below, for both callback and non-callback connections.
  - True = User Privilege Limit is determined by the User Privilege Limit parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they 'call in' to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.
- **link\_auth** -- User Link authentication enable/disable (used to enable whether this user's name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.

- **ipmi\_msg** -- User IPMI Messaging: (used to enable/disable whether this user's name and password information will be used for IPMI Messaging. In this case, 'IPMI Messaging' refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.)
- **privilege\_level** -- User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.)
  - callback
  - user
  - operator
  - administrator
  - proprietary
  - no\_access
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

CLI Examples:

```
salt-call ipmi.set_user_access uid=2 privilege_level='operator'
```

`salt.modules.ipmi.set_user_name` (*uid*, *name*, **\*\*kwargs**)

Set user name

#### Parameters

- **uid** -- user number [1:16]
- **name** -- username (limit of 16bytes)
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

CLI Examples:

```
salt-call ipmi.set_user_name uid=2 name='steverweber'
```

`salt.modules.ipmi.set_user_password`(*uid*, *mode*='set\_password', *password*=None, *\*\*kwargs*)

Set user password and (modes)

#### Parameters

- **uid** -- id number of user. see: `get_names_uid()['name']`
- **mode** --
  - disable = disable user connections
  - enable = enable user connections
  - set\_password = set or ensure password
  - test\_password = test password is correct
- **password** -- max 16 char string (optional when mode is [disable or enable])
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

#### Returns

True on success when mode = test\_password, return False on bad password

CLI Example:

```
salt-call ipmi.set_user_password api_host=127.0.0.1 api_user=admin api_
→pass=pass                               uid=1 password=newPass
salt-call ipmi.set_user_password uid=1 mode=enable
```

`salt.modules.ipmi.user_delete`(*uid*, *channel*=14, *\*\*kwargs*)

Delete user (helper)

#### Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **kwargs** --
  - api\_host=127.0.0.1
  - api\_user=admin
  - api\_pass=example
  - api\_port=623
  - api\_kg=None

CLI Examples:

```
salt-call ipmi.user_delete uid=2
```

## 26.6.190 salt.modules.ipset

Support for ipset

`salt.modules.ipset.add`(*name=None, entry=None, family='ipv4', \*\*kwargs*)

Append an entry to the specified set.

CLI Example:

```
salt '*' ipset.add name 192.168.1.26
salt '*' ipset.add name 192.168.0.3,AA:BB:CC:DD:EE:FF
```

`salt.modules.ipset.check`(*name=None, entry=None, family='ipv4'*)

Check that an entry exists in the specified set.

**name**

The ipset name

**entry**

An entry in the ipset. This parameter can be a single IP address, a range of IP addresses, or a subnet block. Example:

```
192.168.0.1
192.168.0.2-192.168.0.19
192.168.0.0/25
```

**family**

IP protocol version: ipv4 or ipv6

CLI Example:

```
salt '*' ipset.check name '192.168.0.1 comment "Hello"'
```

`salt.modules.ipset.check_set`(*name=None, family='ipv4'*)

Check that given ipset set exists.

New in version 2014.7.0.

CLI Example:

```
salt '*' ipset.check_set name
```

`salt.modules.ipset.delete`(*name=None, entry=None, family='ipv4', \*\*kwargs*)

Delete an entry from the specified set.

CLI Example:

```
salt '*' ipset.delete name 192.168.0.3,AA:BB:CC:DD:EE:FF
```

`salt.modules.ipset.delete_set`(*name=None, family='ipv4'*)

New in version 2014.7.0.

Delete ipset set.

CLI Example:

```
salt '*' ipset.delete_set custom_set

IPv6:
salt '*' ipset.delete_set custom_set family=ipv6
```

`salt.modules.ipset.flush`(*name=None, family='ipv4'*)

Flush entries in the specified set, Flush all sets if set is not specified.

CLI Example:

```
salt '*' ipset.flush

salt '*' ipset.flush set

IPv6:
salt '*' ipset.flush

salt '*' ipset.flush set
```

`salt.modules.ipset.list_sets`(*family='ipv4'*)

New in version 2014.7.0.

List all ipset sets.

CLI Example:

```
salt '*' ipset.list_sets
```

`salt.modules.ipset.new_set`(*name=None, set\_type=None, family='ipv4', comment=False, \*\*kwargs*)

New in version 2014.7.0.

Create new custom set

CLI Example:

```
salt '*' ipset.new_set custom_set list:set

salt '*' ipset.new_set custom_set list:set comment=True

IPv6:
salt '*' ipset.new_set custom_set list:set family=ipv6
```

`salt.modules.ipset.rename_set`(*name=None, new\_set=None, family='ipv4'*)

New in version 2014.7.0.

Delete ipset set.

CLI Example:

```
salt '*' ipset.rename_set custom_set new_set=new_set_name

IPv6:
salt '*' ipset.rename_set custom_set new_set=new_set_name family=ipv6
```

`salt.modules.ipset.test`(*name=None, entry=None, family='ipv4', \*\*kwargs*)

Test if an entry is in the specified set.

CLI Example:

```
salt '*' ipset.test name 192.168.0.2

IPv6:
salt '*' ipset.test name fd81:fc56:9ac7::/48
```

`salt.modules.ipset.version()`

Return version from ipset --version

CLI Example:

```
salt '*' ipset.version
```

## 26.6.191 salt.modules.iptables

Support for iptables

### Configuration Options

The following options can be set in the minion config, grains, pillar, or master config. The configuration is read using `config.get`.

- `iptables.save_filters`: List of REGEX strings to FILTER OUT matching lines  
This is useful for filtering out chains, rules, etc that you do not wish to persist, such as ephemeral Docker rules. The default is to not filter out anything.

```
iptables.save_filters:
- "-j CATTLE_PREROUTING"
- "-j DOCKER"
- "-A POSTROUTING"
- "-A CATTLE_POSTROUTING"
- "-A FORWARD"
```

`salt.modules.iptables.append(table='filter', chain=None, rule=None, family='ipv4')`

Append a rule to the specified table/chain.

**This function accepts a rule in a standard iptables command format,** starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' iptables.append filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.append filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

`salt.modules.iptables.build_rule` (*table='filter', chain=None, command=None, position='', full=None, family='ipv4', \*\*kwargs*)

Build a well-formatted iptables rule based on kwargs. A *table* and *chain* are not required, unless *full* is True.

If *full* is True, then *table*, *chain* and *command* are required. *command* may be specified as either a short option (I) or a long option (`--insert`). This will return the iptables command, exactly as it would be used from the command line.

If a position is required (as with `-I` or `-D`), it may be specified as *position*. This will only be useful if *full* is True.

If *state* is passed, it will be ignored, use *connstate*. If *connstate* is passed in, it will automatically be changed to *state*.

To pass in jump options that doesn't take arguments, pass in an empty string.

---

**Note:** Whereas iptables will accept `-p, --proto[c[o[l]]]` as synonyms of `--protocol`, if `--proto` appears in an iptables command after the appearance of `-m policy`, it is interpreted as the `--proto` option of the policy extension (see the `iptables-extensions(8)` man page).

---

CLI Examples:

```
salt '*' iptables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=I position=3 \
    full=True match=state connstate=RELATED,ESTABLISHED jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state connstate=RELATED,ESTABLISHED \
    source='127.0.0.1' jump=ACCEPT

.. Invert Rules
salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state connstate=RELATED,ESTABLISHED \
    source='!127.0.0.1' jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state connstate=RELATED,ESTABLISHED \
    destination='not 127.0.0.1' jump=ACCEPT

IPv6:
salt '*' iptables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT \
    family=ipv6
salt '*' iptables.build_rule filter INPUT command=I position=3 \
    full=True match=state connstate=RELATED,ESTABLISHED jump=ACCEPT \
    family=ipv6
```

`salt.modules.iptables.check` (*table='filter', chain=None, rule=None, family='ipv4'*)

Check for the existence of a rule in the table and chain

**This function accepts a rule in a standard iptables command format,** starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```

salt '*' iptables.check_filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.check_filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6

```

`salt.modules.iptables.check_chain`(*table='filter', chain=None, family='ipv4'*)

New in version 2014.1.0.

Check for the existence of a chain in the table

CLI Example:

```

salt '*' iptables.check_chain filter INPUT

IPv6:
salt '*' iptables.check_chain filter INPUT family=ipv6

```

`salt.modules.iptables.delete`(*table, chain=None, position=None, rule=None, family='ipv4'*)

Delete a rule from the specified table/chain, specifying either the rule in its entirety, or the rule's position in the chain.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```

salt '*' iptables.delete filter INPUT position=3
salt '*' iptables.delete filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.delete filter INPUT position=3 family=ipv6
salt '*' iptables.delete filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6

```

`salt.modules.iptables.delete_chain`(*table='filter', chain=None, family='ipv4'*)

New in version 2014.1.0.

Delete custom chain to the specified table.

CLI Example:

```

salt '*' iptables.delete_chain filter CUSTOM_CHAIN

IPv6:
salt '*' iptables.delete_chain filter CUSTOM_CHAIN family=ipv6

```

`salt.modules.iptables.flush`(*table='filter', chain='', family='ipv4'*)

Flush the chain in the specified table, flush all chains in the specified table if not specified chain.

CLI Example:

```
salt '*' iptables.flush filter INPUT

IPv6:
salt '*' iptables.flush filter INPUT family=ipv6
```

`salt.modules.iptables.get_policy` (*table='filter', chain=None, family='ipv4'*)

Return the current policy for the specified table/chain

CLI Example:

```
salt '*' iptables.get_policy filter INPUT

IPv6:
salt '*' iptables.get_policy filter INPUT family=ipv6
```

`salt.modules.iptables.get_rules` (*family='ipv4'*)

Return a data structure of the current, in-memory rules

CLI Example:

```
salt '*' iptables.get_rules

IPv6:
salt '*' iptables.get_rules family=ipv6
```

`salt.modules.iptables.get_saved_policy` (*table='filter', chain=None, conf\_file=None, family='ipv4'*)

Return the current policy for the specified table/chain

CLI Examples:

```
salt '*' iptables.get_saved_policy filter INPUT
salt '*' iptables.get_saved_policy filter INPUT \
    conf_file=/etc/iptables.saved

IPv6:
salt '*' iptables.get_saved_policy filter INPUT family=ipv6
salt '*' iptables.get_saved_policy filter INPUT \
    conf_file=/etc/iptables.saved family=ipv6
```

`salt.modules.iptables.get_saved_rules` (*conf\_file=None, family='ipv4'*)

Return a data structure of the rules in the conf file

CLI Example:

```
salt '*' iptables.get_saved_rules

IPv6:
salt '*' iptables.get_saved_rules family=ipv6
```

`salt.modules.iptables.insert` (*table='filter', chain=None, position=None, rule=None, family='ipv4'*)

Insert a rule into the specified table/chain, at the specified position.

**This function accepts a rule in a standard iptables command format,** starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

If the position specified is a negative number, then the insert will be performed counting from the end of the list. For instance, a position of -1 will insert the rule as the second to last rule. To insert a rule in the last position, use the append function instead.

CLI Examples:

```
salt '*' iptables.insert filter INPUT position=3 \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.insert filter INPUT position=3 \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

`salt.modules.iptables.new_chain`(*table='filter', chain=None, family='ipv4'*)

New in version 2014.1.0.

Create new custom chain to the specified table.

CLI Example:

```
salt '*' iptables.new_chain filter CUSTOM_CHAIN

IPv6:
salt '*' iptables.new_chain filter CUSTOM_CHAIN family=ipv6
```

`salt.modules.iptables.save`(*filename=None, family='ipv4'*)

Save the current in-memory rules to disk

CLI Example:

```
salt '*' iptables.save /etc/sysconfig/iptables

IPv6:
salt '*' iptables.save /etc/sysconfig/iptables family=ipv6
```

`salt.modules.iptables.set_policy`(*table='filter', chain=None, policy=None, family='ipv4'*)

Set the current policy for the specified table/chain

CLI Example:

```
salt '*' iptables.set_policy filter INPUT ACCEPT

IPv6:
salt '*' iptables.set_policy filter INPUT ACCEPT family=ipv6
```

`salt.modules.iptables.version`(*family='ipv4'*)

Return version from iptables --version

CLI Example:

```
salt '*' iptables.version

IPv6:
salt '*' iptables.version family=ipv6
```

### 26.6.192 salt.modules.iwtools

Support for Wireless Tools for Linux

`salt.modules.iwtools.list_interfaces` (*style=None*)

List all of the wireless interfaces

CLI Example:

```
salt minion iwtools.list_interfaces
```

`salt.modules.iwtools.scan` (*iface, style=None*)

List networks on a wireless interface

CLI Examples:

```
salt minion iwtools.scan wlp3s0
salt minion iwtools.scan wlp3s0 list
```

`salt.modules.iwtools.set_mode` (*iface, mode*)

List networks on a wireless interface

CLI Example:

```
salt minion iwtools.set_mode wlp3s0 Managed
```

### 26.6.193 salt.modules.jboss7

Module for managing JBoss AS 7 through the CLI interface.

New in version 2015.5.0.

In order to run each function, `jboss_config` dictionary with the following properties must be passed:

- `cli_path`: the path to `jboss-cli` script, for example: `'/opt/jboss/jboss-7.0/bin/jboss-cli.sh'`
- `controller`: the IP address and port of controller, for example: `10.11.12.13:9999`
- `cli_user`: username to connect to jboss administration console if necessary
- `cli_password`: password to connect to jboss administration console if necessary

Example:

```
jboss_config:
  cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
  controller: 10.11.12.13:9999
  cli_user: 'jbossadm'
  cli_password: 'jbossadm'
```

`salt.modules.jboss7.create_datasource` (*jboss\_config, name, datasource\_properties, profile=None*)

Create datasource in running jboss instance

**jboss\_config**

Configuration dictionary with properties specified above.

**name**

Datasource name

**datasource\_properties**

A dictionary of datasource properties to be created:

- driver-name: mysql
- connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
- jndi-name: 'java:jboss/datasources/sampleDS'
- user-name: sampleuser
- password: secret
- min-pool-size: 3
- use-java-context: True

**profile**

The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.create_datasource '{"cli_path": "integration.modules.
↪sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999",
↪ "cli_user": "jbossadm", "cli_password": "jbossadm"}' 'my_datasource' '{
↪"driver-name": "mysql", "connection-url": "jdbc:mysql://localhost:3306/
↪sampleDatabase", "jndi-name": "java:jboss/datasources/sampleDS", "user-
↪name": "sampleuser", "password": "secret", "min-pool-size": 3, "use-
↪java-context": True}'
```

**salt.modules.jboss7.create\_simple\_binding**(*jboss\_config*, *binding\_name*, *value*, *profile=None*)

Create a simple jndi binding in the running jboss instance

**jboss\_config**

Configuration dictionary with properties specified above.

**binding\_name**

Binding name to be created

**value**

Binding value

**profile**

The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.create_simple_binding \
    '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_
↪valid_docs", \
    "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_
↪password": "jbossadm"}' \
    my_binding_name my_binding_value
```

**salt.modules.jboss7.deploy**(*jboss\_config*, *source\_file*)

Deploy the application on the jboss instance from the local file system where minion is running.

**jboss\_config**

Configuration dictionary with properties specified above.

**source\_file**

Source file to deploy from

CLI Example:

```
salt '*' jboss7.deploy '{"cli_path": "integration.modules.sysmod.
↳ SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_
↳ user": "jbossadm", "cli_password": "jbossadm"}' /opt/deploy_files/my_
↳ deploy
```

**salt.modules.jboss7.list\_deployments**(*jboss\_config*)

List all deployments on the jboss instance

**jboss\_config**

Configuration dictionary with properties specified above.

CLI Example:

```
salt '*' jboss7.list_deployments '{"cli_path": "integration.modules.
↳ sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.
↳ 13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}'
```

**salt.modules.jboss7.read\_datasource**(*jboss\_config*, *name*, *profile=None*)

Read datasource properties in the running jboss instance.

**jboss\_config**

Configuration dictionary with properties specified above.

**name**

Datasource name

**profile**

Profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.read_datasource '{"cli_path": "integration.modules.sysmod.
↳ SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_
↳ user": "jbossadm", "cli_password": "jbossadm"}'
```

**salt.modules.jboss7.read\_simple\_binding**(*jboss\_config*, *binding\_name*, *profile=None*)

Read jndi binding in the running jboss instance

**jboss\_config**

Configuration dictionary with properties specified above.

**binding\_name**

Binding name to be created

**profile**

The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.read_simple_binding '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs",
"controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}'
my_binding_name
```

`salt.modules.jboss7.reload_` (*jboss\_config*, *host=None*)

Reload running jboss instance

**jboss\_config**

Configuration dictionary with properties specified above.

**host**

The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the "name" attribute of the "host" element in host.xml

CLI Example:

```
salt '*' jboss7.reload '{"cli_path": "integration.modules.sysmod.
→SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_
→user": "jbossadm", "cli_password": "jbossadm"}'
```

`salt.modules.jboss7.remove_datasource` (*jboss\_config*, *name*, *profile=None*)

Remove an existing datasource from the running jboss instance.

**jboss\_config**

Configuration dictionary with properties specified above.

**name**

Datasource name

**profile**

The profile (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.remove_datasource '{"cli_path": "integration.modules.
→sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999",
→ "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_datasource_name
```

`salt.modules.jboss7.status` (*jboss\_config*, *host=None*, *server\_config=None*)

Get status of running jboss instance.

**jboss\_config**

Configuration dictionary with properties specified above.

**host**

The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the "name" attribute of the "host" element in host.xml

**server\_config**

The name of the Server Configuration. JBoss Domain mode only - and required if running in domain mode.

CLI Example:

```
salt '*' jboss7.status '{"cli_path": "integration.modules.sysmod.
→SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_
→user": "jbossadm", "cli_password": "jbossadm"}'
```

`salt.modules.jboss7.stop_server` (*jboss\_config*, *host=None*)

Stop running jboss instance

**jboss\_config**

Configuration dictionary with properties specified above.

**host**

The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the "name" attribute of the "host" element in host.xml

CLI Example:

```
salt '*' jboss7.stop_server '{"cli_path": "integration.modules.sysmod.
→SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_
→user": "jbossadm", "cli_password": "jbossadm"}'
```

**salt.modules.jboss7.undeploy** (*jboss\_config, deployment*)

Undeploy the application from jboss instance

**jboss\_config**

Configuration dictionary with properties specified above.

**deployment**

Deployment name to undeploy

CLI Example:

```
salt '*' jboss7.undeploy '{"cli_path": "integration.modules.sysmod.
→SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_
→user": "jbossadm", "cli_password": "jbossadm"}' my_deployment
```

**salt.modules.jboss7.update\_datasource** (*jboss\_config, name, new\_properties, profile=None*)

Update an existing datasource in running jboss instance. If the property doesn't exist it will be created, if it does, it will be updated with the new value

**jboss\_config**

Configuration dictionary with properties specified above.

**name**

Datasource name

**new\_properties**

A dictionary of datasource properties to be updated. For example:

- driver-name: mysql
- connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
- jndi-name: 'java:jboss/datasources/sampleDS'
- user-name: sampleuser
- password: secret
- min-pool-size: 3
- use-java-context: True

**profile**

The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.update_datasource '{"cli_path": "integration.modules.
→sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999",
→ "cli_user": "jbossadm", "cli_password": "jbossadm"}' 'my_datasource' '{
→"driver-name": "mysql", "connection-url": "jdbc:mysql://localhost:3306/
```

(continues on next page)

(continued from previous page)

```

↪sampleDatabase", "jndi-name": "java:jboss/datasources/sampleDS", "user-
↪name": "sampleuser", "password": "secret", "min-pool-size": 3, "use-
↪java-context": True}'

```

`salt.modules.jboss7.update_simple_binding(jboss_config, binding_name, value, profile=None)`

Update the simple jndi binding in the running jboss instance

**jboss\_config**

Configuration dictionary with properties specified above.

**binding\_name**

Binding name to be updated

**value**

New binding value

**profile**

The profile name (JBoss domain mode only)

CLI Example:

```

salt '*' jboss7.update_simple_binding '{"cli_path": "integration.modules.
↪sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999",
↪ "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_binding_name
↪my_binding_value

```

## 26.6.194 salt.modules.jboss7\_cli

Module for low-level interaction with JbossAS7 through CLI.

This module exposes two ways of interaction with the CLI, either through commands or operations.

---

**Note:** Following JBoss documentation (<https://developer.jboss.org/wiki/CommandLineInterface>): "Operations are considered a low level but comprehensive way to manage the AS controller, i.e. if it can't be done with operations it can't be done in any other way. Commands, on the other hand, are more user-friendly in syntax, although most of them still translate into operation requests and some of them even into a few composite operation requests, i.e. commands also simplify some management operations from the user's point of view."

---

The difference between calling a command or operation is in handling the result. Commands return a zero return code if operation is successful or return non-zero return code and print an error to standard output in plain text, in case of an error.

Operations return a json-like structure, that contain more information about the result. In case of a failure, they also return a specific return code. This module parses the output from the operations and returns it as a dictionary so that an execution of an operation can then be verified against specific errors.

**In order to run each function, jboss\_config dictionary with the following properties must be passed:**

- `cli_path`: the path to jboss-cli script, for example: `"/opt/jboss/jboss-7.0/bin/jboss-cli.sh"`
- `controller`: the IP address and port of controller, for example: `10.11.12.13:9999`
- `cli_user`: username to connect to jboss administration console if necessary
- `cli_password`: password to connect to jboss administration console if necessary

Example:

```

jboss_config:
  cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
  controller: 10.11.12.13:9999
  cli_user: 'jbossadm'
  cli_password: 'jbossadm'

```

`salt.modules.jboss7_cli.run_command(jboss_config, command, fail_on_error=True)`

Execute a command against jboss instance through the CLI interface.

**jboss\_config**

Configuration dictionary with properties specified above.

**command**

Command to execute against jboss instance

**fail\_on\_error (default=True)**

Is true, raise `CommandExecutionError` exception if execution fails. If false, 'success' property of the returned dictionary is set to False

CLI Example:

```

salt '*' jboss7_cli.run_command '{"cli_path": "integration.modules.sysmod.
→ SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_
→ user": "jbossadm", "cli_password": "jbossadm"}' my_command

```

`salt.modules.jboss7_cli.run_operation(jboss_config, operation, fail_on_error=True, retries=1)`

Execute an operation against jboss instance through the CLI interface.

**jboss\_config**

Configuration dictionary with properties specified above.

**operation**

An operation to execute against jboss instance

**fail\_on\_error (default=True)**

Is true, raise `CommandExecutionError` exception if execution fails. If false, 'success' property of the returned dictionary is set to False

**retries:**

Number of retries in case of "JBAS012144: Could not connect to remote" error.

CLI Example:

```

salt '*' jboss7_cli.run_operation '{"cli_path": "integration.modules.
→ sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999",
→ "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_operation

```

## 26.6.195 salt.modules.jenkinsmod

Module for controlling Jenkins

**depends**

python-jenkins

New in version 2016.3.0.

**depends**

python-jenkins Python module (not to be confused with jenkins)

**configuration**

This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
jenkins:
api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.jenkinsmod.build_job` (*name=None, parameters=None*)

Initiate a build for the provided job.

**Parameters**

- **name** -- The name of the job is check if it exists.
- **parameters** -- Parameters to send to the job.

**Returns**

True is successful, otherwise raise an exception.

CLI Example:

```
salt '*' jenkins.build_job jobname
```

`salt.modules.jenkinsmod.create_job` (*name=None, config\_xml=None, saltenv='base'*)

Return the configuration file.

**Parameters**

- **name** -- The name of the job is check if it exists.
- **config\_xml** -- The configuration file to use to create the job.
- **saltenv** -- The environment to look for the file in.

**Returns**

The configuration file used for the job.

CLI Example:

```
salt '*' jenkins.create_job jobname
salt '*' jenkins.create_job jobname config_xml='salt://jenkins/config.xml'
```

`salt.modules.jenkinsmod.delete_job` (*name=None*)

Return true is job is deleted successfully.

**Parameters**

**name** -- The name of the job to delete.

**Returns**

Return true if job is deleted successfully.

CLI Example:

```
salt '*' jenkins.delete_job jobname
```

`salt.modules.jenkinsmod.disable_job` (*name=None*)

Return true is job is disabled successfully.

**Parameters**

**name** -- The name of the job to disable.

**Returns**

Return true if job is disabled successfully.

CLI Example:

```
salt '*' jenkins.disable_job jobname
```

`salt.modules.jenkinsmod.enable_job`(*name=None*)

Return true is job is enabled successfully.

**Parameters**

**name** -- The name of the job to enable.

**Returns**

Return true if job is enabled successfully.

CLI Example:

```
salt '*' jenkins.enable_job jobname
```

`salt.modules.jenkinsmod.get_job_config`(*name=None*)

Return the current job configuration for the provided job.

**Parameters**

**name** -- The name of the job to return the configuration for.

**Returns**

The configuration for the job specified.

CLI Example:

```
salt '*' jenkins.get_job_config jobname
```

`salt.modules.jenkinsmod.get_job_info`(*name=None*)

Return information about the Jenkins job.

**Parameters**

**name** -- The name of the job is check if it exists.

**Returns**

Information about the Jenkins job.

CLI Example:

```
salt '*' jenkins.get_job_info jobname
```

`salt.modules.jenkinsmod.get_jobs`()

Return the currently configured jobs.

**Returns**

The currently configured jobs.

CLI Example:

```
salt '*' jenkins.get_jobs
```

`salt.modules.jenkinsmod.get_version()`

Return version of Jenkins

**Returns**

The version of Jenkins

CLI Example:

```
salt '*' jenkins.get_version
```

`salt.modules.jenkinsmod.job_exists(name=None)`

Check whether the job exists in configured Jenkins jobs.

**Parameters**

**name** -- The name of the job is check if it exists.

**Returns**

True if job exists, False if job does not exist.

CLI Example:

```
salt '*' jenkins.job_exists jobname
```

`salt.modules.jenkinsmod.job_status(name=None)`

Return the current status, enabled or disabled, of the job.

**Parameters**

**name** -- The name of the job to return status for

**Returns**

Return true if enabled or false if disabled.

CLI Example:

```
salt '*' jenkins.job_status jobname
```

`salt.modules.jenkinsmod.plugin_installed(name)`

New in version 2016.11.0.

Return if the plugin is installed for the provided plugin name.

**Parameters**

**name** -- The name of the parameter to confirm installation.

**Returns**

True if plugin exists, False if plugin does not exist.

CLI Example:

```
salt '*' jenkins.plugin_installed pluginName
```

`salt.modules.jenkinsmod.run(script)`

New in version 2017.7.0.

Execute a script on the jenkins master

**Parameters**

**script** -- The script

CLI Example:

```
salt '*' jenkins.run 'Jenkins.instance.doSafeRestart()'
```

`salt.modules.jenkinsmod.update_job`(*name=None, config\_xml=None, saltenv='base'*)

Return the updated configuration file.

#### Parameters

- **name** -- The name of the job is check if it exists.
- **config\_xml** -- The configuration file to use to create the job.
- **saltenv** -- The environment to look for the file in.

#### Returns

The configuration file used for the job.

CLI Example:

```
salt '*' jenkins.update_job jobname
salt '*' jenkins.update_job jobname config_xml='salt://jenkins/config.xml'
```

## 26.6.196 salt.modules.jinja

Module for checking jinja maps and verifying the result of loading JSON/YAML files

New in version 3000.

`salt.modules.jinja.import_json`(*path*)

Loads JSON data from the specified path

CLI Example:

```
salt myminion jinja.import_JSON myformula/foo.json
```

`salt.modules.jinja.import_yaml`(*path*)

Loads YAML data from the specified path

CLI Example:

```
salt myminion jinja.import_yaml myformula/foo.yaml
```

`salt.modules.jinja.load_map`(*path, value*)

Loads the map at the specified path, and returns the specified value from that map.

CLI Example:

```
# Assuming the map is loaded in your formula SLS as follows:
#
# {% from "myformula/map.jinja" import myformula with context %}
#
# the following syntax can be used to load the map and check the
# results:
salt myminion jinja.load_map myformula/map.jinja myformula
```

## 26.6.197 salt.modules.jira\_mod

### JIRA Execution module

New in version 2019.2.0.

Execution module to manipulate JIRA tickets via Salt.

This module requires the `jira` Python library to be installed.

Configuration example:

```
jira:
  server: https://jira.atlassian.org
  username: salt
  password: pass
```

`salt.modules.jira_mod.add_comment` (*issue\_key*, *comment*, *visibility=None*, *is\_internal=False*, *server=None*, *username=None*, *password=None*)

Add a comment to an existing ticket. Return `True` when it successfully added the comment.

**issue\_key**

The issue ID to add the comment to.

**comment**

The body of the comment to be added.

**visibility: None**

A dictionary having two keys:

- **type:** is `role` (or `group` if the JIRA server has configured comment visibility for groups).
- **value:** the name of the role (or group) to which viewing of this comment will be restricted.

**is\_internal: False**

Whether a comment has to be marked as `Internal` in Jira Service Desk.

CLI Example:

```
salt '*' jira.add_comment NE-123 'This is a comment'
```

`salt.modules.jira_mod.assign_issue` (*issue\_key*, *assignee*, *server=None*, *username=None*, *password=None*)

Assign the issue to an existing user. Return `True` when the issue has been properly assigned.

**issue\_key**

The JIRA ID of the ticket to manipulate.

**assignee**

The name of the user to assign the ticket to.

CLI Example:

```
salt '*' jira.assign_issue NET-123 example_user
```

`salt.modules.jira_mod.create_issue` (*project*, *summary*, *description*, *template\_engine='jinja'*, *context=None*, *defaults=None*, *saltenv='base'*, *issuetype='Bug'*, *priority='Normal'*, *labels=None*, *assignee=None*, *server=None*, *username=None*, *password=None*, *\*\*kwargs*)

Create a JIRA issue using the named settings. Return the JIRA ticket ID.

**project**

The name of the project to attach the JIRA ticket to.

**summary**

The summary (title) of the JIRA ticket. When the `template_engine` argument is set to a proper value of an existing Salt template engine (e.g., `jinja`, `mako`, etc.) it will render the `summary` before creating the ticket.

**description**

The full body description of the JIRA ticket. When the `template_engine` argument is set to a proper value of an existing Salt template engine (e.g., `jinja`, `mako`, etc.) it will render the `description` before creating the ticket.

**template\_engine: `jinja`**

The name of the template engine to be used to render the values of the `summary` and `description` arguments. Default: `jinja`.

**context: `None`**

The context to pass when rendering the `summary` and `description`. This argument is ignored when `template_engine` is set as `None`

**defaults: `None`**

Default values to pass to the Salt rendering pipeline for the `summary` and `description` arguments. This argument is ignored when `template_engine` is set as `None`.

**saltenv: `base`**

The Salt environment name (for the rendering system).

**issuetype: `Bug`**

The type of the JIRA ticket. Default: `Bug`.

**priority: `Normal`**

The priority of the JIRA ticket. Default: `Normal`.

**labels: `None`**

A list of labels to add to the ticket.

**assignee: `None`**

The name of the person to assign the ticket to.

## CLI Examples:

```
salt '*' jira.create_issue NET 'Ticket title' 'Ticket description'
salt '*' jira.create_issue NET 'Issue on {{ opts.id }}' 'Error detected'
→ on {{ opts.id }}' template_engine=jinja
```

`salt.modules.jira_mod.issue_closed`(*issue\_key*, *server=None*, *username=None*, *password=None*)

Check if the issue is closed.

**issue\_key**

The JIRA iD of the ticket to close.

## Returns:

- `True`: the ticket exists and it is closed.
- `False`: the ticket exists and it has not been closed.
- `None`: the ticket does not exist.

## CLI Example:

```
salt '*' jira.issue_closed NE-123
```

## 26.6.198 salt.modules.junos

Module to interact with Junos devices.

### maturity

new

### dependencies

junos-eznc, jxmlease

---

**Note:** Those who wish to use junos-eznc (PyEZ) version  $\geq$  2.1.0, must use the latest salt code from github until the next release.

---

Refer to [junos](#) for information on connecting to junos proxy.

**class** salt.modules.junos.**HandleFileCopy**(*path*, *\*\*kwargs*)

To figure out proper path either from proxy local file system or proxy cache or on master. If required, then only copy from master to proxy

salt.modules.junos.**cli**(*command=None*, *\*\*kwargs*)

Executes the CLI commands and returns the output in specified format. (default is text) The output can also be stored in a file.

### command (required)

The command to execute on the Junos CLI

### format

[text] Format in which to get the CLI output (either text or xml)

### dev\_timeout

[30] The NETCONF RPC timeout (in seconds)

### dest

Destination file where the RPC output is stored. Note that the file will be stored on the proxy minion. To push the files to the master use [cp.push](#).

CLI Examples:

```
salt 'device_name' junos.cli 'show system commit'
salt 'device_name' junos.cli 'show system alarms' format=xml dest=/home/
→user/cli_output.txt
```

salt.modules.junos.**commit**(*\*\*kwargs*)

To commit the changes loaded in the candidate configuration.

### dev\_timeout

[30] The NETCONF RPC timeout (in seconds)

### comment

Provide a comment for the commit

### confirm

Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

**sync**

[False] When `True`, on dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines.

**force\_sync**

[False] When `True`, on dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.

**full**

When `True`, requires all the daemons to check and evaluate the new configuration.

**detail**

When `True`, return commit detail

CLI Examples:

```
salt 'device_name' junos.commit comment='Committing via saltstack'
↪detail=True
salt 'device_name' junos.commit dev_timeout=60 confirm=10
salt 'device_name' junos.commit sync=True dev_timeout=90
```

**salt.modules.junos.commit\_check()**

Perform a commit check on the configuration

CLI Example:

```
salt 'device_name' junos.commit_check
```

**salt.modules.junos.diff(\*\*kwargs)**

Returns the difference between the candidate and the current configuration

**id**

[0] The rollback ID value (0-49)

**d\_id**

[0] The rollback ID value (0-49)

CLI Example:

```
salt 'device_name' junos.diff d_id=3
```

NOTE: Because of historical reasons and the internals of the Salt state compiler, there are three possible sources of the rollback ID--the positional argument, and the `id` and `d_id` kwargs. The precedence of the arguments are `id` (positional), `id` (kwarg), `d_id` (kwarg). In other words, if all three are passed, only the positional argument will be used. A warning is logged if more than one is passed.

**salt.modules.junos.dir\_copy(source, dest, force=False, \*\*kwargs)**

Copy a directory and recursively its contents from source to dest.

---

**Note:** This function only works on the Juniper native minion

---

Parameters:

`source` : Directory to use as the source

`dest` : Directory in which to place the source and its contents.

`force` : This function will not copy identical files unless `force` is `True`

New in version 3003.

CLI Example:

```
salt 'device_name' junos.dir_copy /etc/salt/pki re1:/
```

This will take the *pki* directory, its absolute path and copy it and its contents to routing engine 1 root directory. The result will be *re1:/etc/salt/pki/<files and dirs in /etc/salt/pki*.

`salt.modules.junos.facts()`

Displays the facts gathered during the connection. These facts are also stored in Salt grains.

CLI Example:

```
salt 'device_name' junos.facts
```

`salt.modules.junos.facts_refresh()`

Reload the facts dictionary from the device. Usually only needed if, the device configuration is changed by some other actor. This function will also refresh the facts stored in the salt grains.

CLI Example:

```
salt 'device_name' junos.facts_refresh
```

`salt.modules.junos.file_compare(file1, file2, **kwargs)`

Compare two files and return a dictionary indicating if they are different.

Dictionary includes *success* key. If False, one or more files do not exist or some other error occurred.

Under the hood, this uses the junos CLI command *file compare files ...*

---

**Note:** This function only works on Juniper native minions

---

New in version 3003.

CLI Example:

```
salt junos-router junos.file_compare /var/tmp/backup1/cmt.script /var/tmp/
→backup2/cmt.script

junos-router:
  identical:
    False
  success:
    True
```

`salt.modules.junos.file_copy(src, dest)`

Copies the file from the local device to the junos device

---

**Note:** This function does not work on Juniper native minions

---

**src**

The source path where the file is kept.

**dest**

The destination path on the where the file will be copied

New in version 3001.

CLI Example:

```
salt 'device_name' junos.file_copy /home/m2/info.txt info_copy.txt
```

`salt.modules.junos.fsenry_exists`(*dir*, *\*\*kwargs*)

Returns a dictionary indicating if *dir* refers to a file or a non-file (generally a directory) in the file system, or if there is no file by that name.

---

**Note:** This function only works on Juniper native minions

---

New in version 3003.

CLI Example:

```
salt junos-router junos.fsenry_exists /var/log

junos-router:
  is_dir:
    True
  exists:
    True
```

`salt.modules.junos.get_table`(*table*, *table\_file*, *path=None*, *target=None*, *key=None*, *key\_items=None*, *filters=None*, *table\_args=None*)

New in version 3001.

Retrieve data from a Junos device using Tables/Views

**table (required)**

Name of PyEZ Table

**table\_file (required)**

YAML file that has the table specified in table parameter

**path:**

Path of location of the YAML file. defaults to op directory in jnpr.junos.op

**target:**

if command need to run on FPC, can specify fpc target

**key:**

To overwrite key provided in YAML

**key\_items:**

To select only given key items

**filters:**

To select only filter for the dictionary from columns

**table\_args:**

key/value pair which should render Jinja template command or are passed as args to rpc call in op table

CLI Example:

```
salt 'device_name' junos.get_table RouteTable routes.yml
salt 'device_name' junos.get_table EthPortTable ethport.yml table_args='{
```

(continues on next page)

(continued from previous page)

```
↪ "interface_name": "ge-3/2/2"}'
salt 'device_name' junos.get_table EthPortTable ethport.yml salt://tables
```

`salt.modules.junos.install_config`(*path=None, \*\*kwargs*)

Installs the given configuration file into the candidate configuration. Commits the changes if the commit checks or throws an error.

**path (required)**

Path where the configuration/template file is present. If the file has a `.conf` extension, the content is treated as text format. If the file has a `.xml` extension, the content is treated as XML format. If the file has a `.set` extension, the content is treated as Junos OS `set` commands.

**mode**

[exclusive] The mode in which the configuration is locked. Can be one of `private`, `dynamic`, `batch`, `exclusive`, `ephemeral`

**dev\_timeout**

[30] Set NETCONF RPC timeout. Can be used for commands which take a while to execute.

**overwrite**

[False] Set to `True` if you want this file is to completely replace the configuration file. Sets action to `override`

---

**Note:** This option cannot be used if **format** is "set".

---

**replace**

[False] Specify whether the configuration file uses `replace:` statements. If `True`, only those statements under the `replace` tag will be changed.

**merge**

[False] If set to `True` will set the load-config action to `merge`. the default load-config action is 'replace' for `xml/json/text` config

**format**

Determines the format of the contents

**update**

[False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1.

**comment**

Provide a comment for the commit

**confirm**

Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

**diffs\_file**

Path to the file where the diff (difference in old configuration and the committed configuration) will be stored. Note that the file will be stored on the proxy minion. To push the files to the master use:

```
py:func:cp.push <salt.modules.cp.push>.
```

**template\_vars**

Variables to be passed into the template processing engine in addition to those present in pillar, the minion configuration, grains, etc. You may reference these variables in your template like so:

```
{{ template_vars["var_name"] }}
```

## CLI Examples:

```
salt 'device_name' junos.install_config 'salt://production/network/
→routers/config.set'
salt 'device_name' junos.install_config 'salt://templates/replace_config.
→conf' replace=True comment='Committed via SaltStack'
salt 'device_name' junos.install_config 'salt://my_new_configuration.conf
→' dev_timeout=300 diffs_file='/salt/confs/old_config.conf'
→overwrite=True
salt 'device_name' junos.install_config 'salt://syslog_template.conf'
→template_vars='{ "syslog_host": "10.180.222.7" }'
```

**salt.modules.junos.install\_os** (*path=None, \*\*kwargs*)

Installs the given image on the device. After the installation is complete the device is rebooted, if `reboot=True` is given as a keyworded argument.

**path** (required)

Path where the image file is present on the proxy minion

**remote\_path**

[/var/tmp] If the value of `path` is a file path on the local (Salt host's) filesystem, then the image is copied from the local filesystem to the `:remote_path:` directory on the target Junos device. The default is `/var/tmp`. If the value of `:path:` or is a URL, then the value of `:remote_path:` is unused.

**dev\_timeout**

[1800] The NETCONF RPC timeout (in seconds). This argument was added since most of the time the "package add" RPC takes a significant amount of time. So this `:timeout:` value will be used in the context of the SW installation process. Defaults to 30 minutes (30\*60=1800 seconds)

**timeout**

[1800] Alias to `dev_timeout` for backward compatibility

**reboot**

[False] Whether to reboot after installation

**no\_copy**

[False] If `True` the software package will not be SCP'd to the device

**bool validate:**

When `True` this method will perform a config validation against the new image

**bool issu: False**

When `True` allows unified in-service software upgrade (ISSU) feature enables you to upgrade between two different Junos OS releases with no disruption on the control plane and with minimal disruption of traffic.

**bool nssu: False**

When `True` allows nonstop software upgrade (NSSU) enables you to upgrade the software running on a Juniper Networks EX Series Virtual Chassis or a Juniper Networks EX Series Ethernet Switch with redundant Routing Engines with a single command and minimal disruption to network traffic.

**bool all\_re: True**

When `True` (default), executes the software install on all Routing Engines of the Junos device. When

False, execute the software install only on the current Routing Engine.

New in version 3001.

---

**Note:** Any additional keyword arguments specified are passed down to PyEZ `sw.install()` as is. Please refer to below URL for PyEZ `sw.install()` documentation: <https://pyez.readthedocs.io/en/latest/jnpr.junos.utils.html#jnpr.junos.utils.sw.SW.install>

---

CLI Examples:

```
salt 'device_name' junos.install_os 'salt://images/junos_image.tgz'
→reboot=True
salt 'device_name' junos.install_os 'salt://junos_16_1.tgz' dev_
→timeout=300
```

`salt.modules.junos.load`(*path=None, \*\*kwargs*)

Loads the configuration from the file provided onto the device.

**path** (required)

Path where the configuration/template file is present. If the file has a `.conf` extension, the content is treated as text format. If the file has a `.xml` extension, the content is treated as XML format. If the file has a `.set` extension, the content is treated as Junos OS `set` commands.

**overwrite**

[False] Set to `True` if you want this file is to completely replace the configuration file. Sets action to `override`

---

**Note:** This option cannot be used if `format` is "set".

---

**replace**

[False] Specify whether the configuration file uses `replace:` statements. If `True`, only those statements under the `replace` tag will be changed.

**merge**

[False] If set to `True` will set the load-config action to `merge`. the default load-config action is 'replace' for xml/json/text config

**update**

[False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1.

**format**

Determines the format of the contents

**template\_vars**

Variables to be passed into the template processing engine in addition to those present in pillar, the minion configuration, grains, etc. You may reference these variables in your template like so:

```
{{ template_vars["var_name"] }}
```

CLI Examples:

```
salt 'device_name' junos.load 'salt://production/network/routers/config.  
→set'  
  
salt 'device_name' junos.load 'salt://templates/replace_config.conf'␣  
→replace=True  
  
salt 'device_name' junos.load 'salt://my_new_configuration.conf'␣  
→overwrite=True  
  
salt 'device_name' junos.load 'salt://syslog_template.conf' template_vars=  
→ '{"syslog_host": "10.180.222.7"}'
```

### `salt.modules.junos.lock()`

Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

---

**Note:** When locking, it is important to remember to call `junos.unlock` once finished. If locking during orchestration, remember to include a step in the orchestration job to unlock.

---

CLI Example:

```
salt 'device_name' junos.lock
```

### `salt.modules.junos.ping(dest_ip=None, **kwargs)`

Send a ping RPC to a device

#### **dest\_ip**

The IP of the device to ping

#### **dev\_timeout**

[30] The NETCONF RPC timeout (in seconds)

#### **rapid**

[False] When True, executes ping at 100pps instead of 1pps

#### **ttl**

Maximum number of IP routers (IP hops) allowed between source and destination

#### **routing\_instance**

Name of the routing instance to use to send the ping

#### **interface**

Interface used to send traffic

#### **count**

[5] Number of packets to send

CLI Examples:

```
salt 'device_name' junos.ping '8.8.8.8' count=5  
salt 'device_name' junos.ping '8.8.8.8' ttl=1 rapid=True
```

### `salt.modules.junos.rollback(**kwargs)`

Roll back the last committed configuration changes and commit

#### **id**

[0] The rollback ID value (0-49)

**d\_id**

[0] The rollback ID value (0-49)

**dev\_timeout**

[30] The NETCONF RPC timeout (in seconds)

**comment**

Provide a comment for the commit

**confirm**

Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

**diffs\_file**

Path to the file where the diff (difference in old configuration and the committed configuration) will be stored. Note that the file will be stored on the proxy minion. To push the files to the master use `cp.push`.

CLI Example:

```
salt 'device_name' junos.rollback 10
```

NOTE: Because of historical reasons and the internals of the Salt state compiler, there are three possible sources of the rollback ID--the positional argument, and the `id` and `d_id` kwargs. The precedence of the arguments are `id` (positional), `id` (kwargs), `d_id` (kwargs). In other words, if all three are passed, only the positional argument will be used. A warning is logged if more than one is passed.

`salt.modules.junos.routing_engine(**kwargs)`

Returns a dictionary containing the routing engines on the device and their status (Master, Disabled, Backup).

Under the hood parses the result of `show chassis routing-engine`

New in version 3003.

CLI Example:

```
salt junos-router junos.routing_engine

junos-router:
  backup:
    - re1:
  master:
    re0:
  success:
    True
```

Returns `success: False` if the device does not appear to have multiple routing engines.

`salt.modules.junos.rpc(cmd=None, dest=None, **kwargs)`

This function executes the RPC provided as arguments on the junos device. The returned data can be stored in a file.

**cmd**

The RPC to be executed

**dest**

Destination file where the RPC output is stored. Note that the file will be stored on the proxy minion. To push the files to the master use `cp.push`.

**format**

[xml] The format in which the RPC reply is received from the device

**dev\_timeout**

[30] The NETCONF RPC timeout (in seconds)

**filter**

Used with the `get-config` RPC to get specific configuration

**terse**

[False] Amount of information you want

**interface\_name**

Name of the interface to query

CLI Example:

```
salt 'device' junos.rpc get_config dest=/var/log/config.txt format=text
→filter='<configuration><system></configuration>'
salt 'device' junos.rpc get-interface-information dest=/home/user/
→interface.xml interface_name='lo0' terse=True
salt 'device' junos.rpc get-chassis-inventory
```

`salt.modules.junos.rpc_file_list`(*path*, *\*\*kwargs*)

Use the Junos RPC interface to get a list of files and return them as a structure dictionary.

New in version 3003.

CLI Example:

```
salt junos-router junos.rpc_file_list /var/local/salt/etc

junos-router:
  files:
    directory:
      directory-name:
        /var/local/salt/etc
      file-information:
        |
        file-directory:
          file-name:
            pki
        |
        file-name:
          proxy
        |
        file-directory:
          file-name:
            proxy.d
    total-file-blocks:
      10
    total-files:
      1
  success:
    True
```

`salt.modules.junos.set_hostname`(*hostname=None*, *\*\*kwargs*)

Set the device's hostname

**hostname**

The name to be set

**comment**

Provide a comment to the commit

**dev\_timeout**

[30] The NETCONF RPC timeout (in seconds)

**confirm**

Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

CLI Example:

```
salt 'device_name' junos.set_hostname salt-device
```

`salt.modules.junos.shutdown(**kwargs)`

Shut down (power off) or reboot a device running Junos OS. This includes all Routing Engines in a Virtual Chassis or a dual Routing Engine system.

---

**Note:** One of `shutdown` or `reboot` must be set to `True` or no action will be taken.

---

**shutdown**

[False] Set this to `True` if you want to shutdown the machine. This is a safety mechanism so that the user does not accidentally shutdown the junos device.

**reboot**

[False] If `True`, reboot instead of shutting down

**at**

Used when rebooting, to specify the date and time the reboot should take place. The value of this option must match the JunOS CLI reboot syntax.

**in\_min**

Used when shutting down. Specify the delay (in minutes) before the device will be shut down.

CLI Examples:

```
salt 'device_name' junos.shutdown reboot=True
salt 'device_name' junos.shutdown shutdown=True in_min=10
salt 'device_name' junos.shutdown shutdown=True
```

`salt.modules.junos.unlock()`

Unlocks the candidate configuration.

CLI Example:

```
salt 'device_name' junos.unlock
```

`salt.modules.junos.zeroize()`

Resets the device to default factory settings

---

**Note:** In case of non-root user, `proxy_reconnect` will not be able to re-connect to the device as `zeroize` will delete the local user's configuration. For more details on `zeroize` functionality, please refer [https://www.juniper.net/documentation/en\\_US/junos/topics/reference/command-summary/request-system-zeroize.html](https://www.juniper.net/documentation/en_US/junos/topics/reference/command-summary/request-system-zeroize.html)

---

CLI Example:

```
salt 'device_name' junos.zeroize
```

### 26.6.199 salt.modules.k8s

**Warning:** This module will be removed from Salt in version 3009 in favor of the [kubernetes Salt Extension](#).

Salt module to manage Kubernetes cluster

New in version 2016.3.0.

Roadmap:

- Add creation of K8S objects (pod, rc, service, ...)
- Add replace of K8S objects (pod, rc, service, ...)
- Add deletion of K8S objects (pod, rc, service, ...)
- Add rolling update
- Add (auto)scaling

`salt.modules.k8s.create_namespace` (*name, apiserver\_url=None*)

New in version 2016.3.0.

Create kubernetes namespace from the name, similar to the functionality added to kubectl since v.1.2.0: ..  
code-block:: bash

```
kubectl create namespaces namespace-name
```

CLI Example:

```
salt '*' k8s.create_namespace namespace_name
salt '*' k8s.create_namespace namespace_name http://kube-master.cluster.
↪ local
```

`salt.modules.k8s.create_secret` (*namespace, name, sources, apiserver\_url=None, force=False, update=False, saltenv='base'*)

New in version 2016.3.0.

Create k8s secrets in the defined namespace from the list of files

CLI Example:

```
salt '*' k8s.create_secret namespace_name secret_name sources
salt '*' k8s.create_secret namespace_name secret_name sources
http://kube-master.cluster.local
```

sources are either dictionary of {name: path, name1: path} pairs or array of strings defining paths.

Example of paths array:

```
['/full/path/filename', 'file:///full/path/filename', 'salt://secret/storage/file.txt',
'http://user:password@securesite.com/secret-file.json']
```

Example of dictionaries:

```
{'nameit': '/full/path/filename', name2: 'salt://secret/storage/file.txt'}
```

optional parameters accepted:

update=[false] default value is false if set to false, and secret is already present on the cluster - warning will be returned and no changes to the secret will be done. In case it is set to "true" and secret is present but data is differ - secret will be updated.

force=[true] default value is true if the to False, secret will not be created in case one of the files is not valid kubernetes secret. e.g. capital letters in secret name or \_ in case force is set to True, wrong files will be skipped but secret will be created any way.

saltenv=['base'] default value is base in case 'salt://' path is used, this parameter can change the visibility of files

`salt.modules.k8s.delete_secret` (*namespace, name, apiserver\_url=None, force=True*)

New in version 2016.3.0.

Delete kubernetes secret in the defined namespace. Namespace is the mandatory parameter as well as name.

CLI Example:

```
salt '*' k8s.delete_secret namespace_name secret_name
salt '*' k8s.delete_secret namespace_name secret_name http://kube-master.
↳cluster.local
```

`salt.modules.k8s.get_labels` (*node=None, apiserver\_url=None*)

New in version 2016.3.0.

Get labels from the current node

CLI Example:

```
salt '*' k8s.get_labels
salt '*' k8s.get_labels kube-node.cluster.local http://kube-master.
↳cluster.local
```

`salt.modules.k8s.get_namespaces` (*namespace="", apiserver\_url=None*)

New in version 2016.3.0.

Get one or all kubernetes namespaces.

If namespace parameter is omitted, all namespaces will be returned back to user, similar to following kubectl example:

```
kubectl get namespaces -o json
```

In case namespace is set by user, the output will be similar to the one from kubectl:

```
kubectl get namespaces namespace_name -o json
```

CLI Example:

```
salt '*' k8s.get_namespaces
salt '*' k8s.get_namespaces namespace_name http://kube-master.cluster.
→local
```

`salt.modules.k8s.get_secrets(namespace, name="", apiserver_url=None, decode=False, brief=False)`  
Get k8s namespaces

CLI Example:

```
salt '*' k8s.get_secrets namespace_name
salt '*' k8s.get_secrets namespace_name secret_name http://kube-master.
→cluster.local
```

`salt.modules.k8s.label_absent(name, node=None, apiserver_url=None)`

New in version 2016.3.0.

Delete label to the current node

CLI Example:

```
salt '*' k8s.label_absent hw/disktype
salt '*' k8s.label_absent hw/disktype kube-node.cluster.local http://kube-
→master.cluster.local
```

`salt.modules.k8s.label_folder_absent(name, node=None, apiserver_url=None)`

New in version 2016.3.0.

Delete label folder to the current node

CLI Example:

```
salt '*' k8s.label_folder_absent hw
salt '*' k8s.label_folder_absent hw/ kube-node.cluster.local http://kube-
→master.cluster.local
```

`salt.modules.k8s.label_present(name, value, node=None, apiserver_url=None)`

New in version 2016.3.0.

Set label to the current node

CLI Example:

```
salt '*' k8s.label_present hw/disktype ssd
salt '*' k8s.label_present hw/disktype ssd kube-node.cluster.local http://
→kube-master.cluster.local
```

`salt.modules.k8s.update_secret(namespace, name, sources, apiserver_url=None, force=True, saltenv='base')`

New in version 2016.3.0.

alias to `k8s.create_secret` with `update=true`

CLI Example:

```
salt '*' k8s.update_secret namespace_name secret_name sources [apiserver_
→url] [force=true] [update=false] [saltenv='base']
```

sources are either dictionary of {name: path, name1: path} pairs or array of strings defining paths.

Example of paths array:

```
['/full/path/filename', 'file:///full/path/filename', 'salt://secret/storage/file.txt',
'http://user:password@securesite.com/secret-file.json']
```

Example of dictionaries:

```
{"nameit": '/full/path/filename', name2: "salt://secret/storage/file.txt"}
```

optional parameters accepted:

force=[true] default value is true if the to False, secret will not be created in case one of the files is not valid kubernetes secret. e.g. capital letters in secret name or \_ in case force is set to True, wrong files will be skipped but secret will be created any way.

saltenv=['base'] default value is base in case 'salt://' path is used, this parameter can change the visibility of files

## 26.6.200 salt.modules.kapacitor

Kapacitor execution module.

### configuration

This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

New in version 2016.11.0.

Also protocol and SSL settings could be configured:

```
kapacitor.unsafe_ssl: 'false'
kapacitor.protocol: 'http'
```

New in version 2019.2.0.

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

```
salt.modules.kapacitor.define_task(name, tick_script, task_type='stream', database=None,
retention_policy='default', dbrps=None)
```

Define a task. Serves as both create/update.

#### name

Name of the task.

#### tick\_script

Path to the TICK script for the task. Can be a salt:// source.

#### task\_type

Task type. Defaults to 'stream'

**dbrps**

A list of databases and retention policies in "dbname"."rpname" format to fetch data from. For backward compatibility, the value of 'database' and 'retention\_policy' will be merged as part of dbrps.

New in version 2019.2.0.

**database**

Which database to fetch data from.

**retention\_policy**

Which retention policy to fetch data from. Defaults to 'default'.

CLI Example:

```
salt '*' kapacitor.define_task cpu salt://kapacitor/cpu.tick  
↳database=telegraf
```

`salt.modules.kapacitor.delete_task(name)`

Delete a kapacitor task.

**name**

Name of the task to delete.

CLI Example:

```
salt '*' kapacitor.delete_task cpu
```

`salt.modules.kapacitor.disable_task(name)`

Disable a kapacitor task.

**name**

Name of the task to disable.

CLI Example:

```
salt '*' kapacitor.disable_task cpu
```

`salt.modules.kapacitor.enable_task(name)`

Enable a kapacitor task.

**name**

Name of the task to enable.

CLI Example:

```
salt '*' kapacitor.enable_task cpu
```

`salt.modules.kapacitor.get_task(name)`

Get a dict of data on a task.

**name**

Name of the task to get information about.

CLI Example:

```
salt '*' kapacitor.get_task cpu
```

`salt.modules.kapacitor.version()`

Get the kapacitor version.

## 26.6.201 salt.modules.kerberos

Manage Kerberos KDC

### configuration

In order to manage your KDC you will need to generate a keytab that can authenticate without requiring a password.

```
# ktadd -k /root/secure.keytab kadmin/admin kadmin/changepw
```

On the KDC minion you will need to add the following to the minion configuration file so Salt knows what keytab to use and what principal to authenticate as.

```
auth_keytab: /root/auth.keytab
auth_principal: kadmin/admin
```

**salt.modules.kerberos.create\_keytab**(*name*, *keytab*, *etypes=None*)

Create keytab

CLI Example:

```
salt 'kdc.example.com' kerberos.create_keytab host/host1.example.com
→ host1.example.com.keytab
```

**salt.modules.kerberos.create\_principal**(*name*, *etypes=None*)

Create Principal

CLI Example:

```
salt 'kdc.example.com' kerberos.create_principal host/example.com
```

**salt.modules.kerberos.delete\_principal**(*name*)

Delete Principal

CLI Example:

```
salt 'kdc.example.com' kerberos.delete_principal host/example.com@EXAMPLE.
→ COM
```

**salt.modules.kerberos.get\_policy**(*name*)

Get policy details

CLI Example:

```
salt 'kdc.example.com' kerberos.get_policy my_policy
```

**salt.modules.kerberos.get\_principal**(*name*)

Get princial details

CLI Example:

```
salt 'kdc.example.com' kerberos.get_principal root/admin
```

**salt.modules.kerberos.get\_privs**()

Current privileges

CLI Example:

```
salt 'kdc.example.com' kerberos.get_privs
```

`salt.modules.kerberos.list_policies()`

List policies

CLI Example:

```
salt 'kdc.example.com' kerberos.list_policies
```

`salt.modules.kerberos.list_principals()`

Get all principals

CLI Example:

```
salt 'kde.example.com' kerberos.list_principals
```

### 26.6.202 salt.modules.kernelpkg\_linux\_apt

Manage Linux kernel packages on APT-based systems

`salt.modules.kernelpkg_linux_apt.active()`

Return the version of the running kernel.

CLI Example:

```
salt '*' kernelpkg.active
```

`salt.modules.kernelpkg_linux_apt.cleanup(keep_latest=True)`

Remove all unused kernel packages from the system.

**keep\_latest**

[True] In the event that the active kernel is not the latest one installed, setting this to True will retain the latest kernel package, in addition to the active one. If False, all kernel packages other than the active one will be removed.

CLI Example:

```
salt '*' kernelpkg.cleanup
```

`salt.modules.kernelpkg_linux_apt.latest_available()`

Return the version of the latest kernel from the package repositories.

CLI Example:

```
salt '*' kernelpkg.latest_available
```

`salt.modules.kernelpkg_linux_apt.latest_installed()`

Return the version of the latest installed kernel.

CLI Example:

```
salt '*' kernelpkg.latest_installed
```

---

**Note:** This function may not return the same value as `active()` if a new kernel has been installed and the system has not yet been rebooted. The `needs_reboot()` function exists to detect this condition.

---

`salt.modules.kernelpkg_linux_apt.list_installed()`

Return a list of all installed kernels.

CLI Example:

```
salt '*' kernelpkg.list_installed
```

`salt.modules.kernelpkg_linux_apt.needs_reboot()`

Detect if a new kernel version has been installed but is not running. Returns True if a new kernel is installed, False otherwise.

CLI Example:

```
salt '*' kernelpkg.needs_reboot
```

`salt.modules.kernelpkg_linux_apt.remove(release)`

Remove a specific version of the kernel.

**release**

The release number of an installed kernel. This must be the entire release number as returned by `list_installed()`, not the package name.

CLI Example:

```
salt '*' kernelpkg.remove 4.4.0-70-generic
```

`salt.modules.kernelpkg_linux_apt.upgrade(reboot=False, at_time=None)`

Upgrade the kernel and optionally reboot the system.

**reboot**

[False] Request a reboot if a new kernel is available.

**at\_time**

[immediate] Schedule the reboot at some point in the future. This argument is ignored if `reboot=False`. See `reboot()` for more details on this argument.

CLI Example:

```
salt '*' kernelpkg.upgrade
salt '*' kernelpkg.upgrade reboot=True at_time=1
```

---

**Note:** An immediate reboot often shuts down the system before the minion has a chance to return, resulting in errors. A minimal delay (1 minute) is useful to ensure the result is delivered to the master.

---

`salt.modules.kernelpkg_linux_apt.upgrade_available()`

Detect if a new kernel version is available in the repositories. Returns True if a new kernel is available, False otherwise.

CLI Example:

```
salt '*' kernelpkg.upgrade_available
```

### 26.6.203 salt.modules.kernelpkg\_linux\_yum

Manage Linux kernel packages on YUM-based systems

**salt.modules.kernelpkg\_linux\_yum.active()**

Return the version of the running kernel.

CLI Example:

```
salt '*' kernelpkg.active
```

**salt.modules.kernelpkg\_linux\_yum.cleanup(keep\_latest=True)**

Remove all unused kernel packages from the system.

**keep\_latest**

[True] In the event that the active kernel is not the latest one installed, setting this to True will retain the latest kernel package, in addition to the active one. If False, all kernel packages other than the active one will be removed.

CLI Example:

```
salt '*' kernelpkg.cleanup
```

**salt.modules.kernelpkg\_linux\_yum.latest\_available()**

Return the version of the latest kernel from the package repositories.

CLI Example:

```
salt '*' kernelpkg.latest_available
```

**salt.modules.kernelpkg\_linux\_yum.latest\_installed()**

Return the version of the latest installed kernel.

CLI Example:

```
salt '*' kernelpkg.latest_installed
```

---

**Note:** This function may not return the same value as *active()* if a new kernel has been installed and the system has not yet been rebooted. The *needs\_reboot()* function exists to detect this condition.

---

**salt.modules.kernelpkg\_linux\_yum.list\_installed()**

Return a list of all installed kernels.

CLI Example:

```
salt '*' kernelpkg.list_installed
```

**salt.modules.kernelpkg\_linux\_yum.needs\_reboot()**

Detect if a new kernel version has been installed but is not running. Returns True if a new kernel is installed, False otherwise.

CLI Example:

```
salt '*' kernelpkg.needs_reboot
```

`salt.modules.kernelpkg_linux_yum.remove`(*release*)

Remove a specific version of the kernel.

**release**

The release number of an installed kernel. This must be the entire release number as returned by `list_installed()`, not the package name.

CLI Example:

```
salt '*' kernelpkg.remove 3.10.0-327.el7
```

`salt.modules.kernelpkg_linux_yum.upgrade`(*reboot=False*, *at\_time=None*)

Upgrade the kernel and optionally reboot the system.

**reboot**

[False] Request a reboot if a new kernel is available.

**at\_time**

[immediate] Schedule the reboot at some point in the future. This argument is ignored if `reboot=False`. See `reboot()` for more details on this argument.

CLI Example:

```
salt '*' kernelpkg.upgrade
salt '*' kernelpkg.upgrade reboot=True at_time=1
```

---

**Note:** An immediate reboot often shuts down the system before the minion has a chance to return, resulting in errors. A minimal delay (1 minute) is useful to ensure the result is delivered to the master.

---

`salt.modules.kernelpkg_linux_yum.upgrade_available`()

Detect if a new kernel version is available in the repositories. Returns True if a new kernel is available, False otherwise.

CLI Example:

```
salt '*' kernelpkg.upgrade_available
```

### 26.6.204 salt.modules.key

Functions to view the minion's public key information

`salt.modules.key.finger`(*hash\_type=None*)

Return the minion's public key fingerprint

**hash\_type**

The hash algorithm used to calculate the fingerprint

CLI Example:

```
salt '*' key.finger
```

`salt.modules.key.finger_master`(*hash\_type=None*)

Return the fingerprint of the master's public key on the minion.

**hash\_type**

The hash algorithm used to calculate the fingerprint

CLI Example:

```
salt '*' key.finger_master
```

### 26.6.205 salt.modules.keyboard

Module for managing keyboards on supported POSIX-like systems using systemd, or such as Redhat, Debian and Gentoo.

**salt.modules.keyboard.get\_sys()**

Get current system keyboard setting

CLI Example:

```
salt '*' keyboard.get_sys
```

**salt.modules.keyboard.get\_x()**

Get current X keyboard setting

CLI Example:

```
salt '*' keyboard.get_x
```

**salt.modules.keyboard.set\_sys(layout)**

Set current system keyboard setting

CLI Example:

```
salt '*' keyboard.set_sys dvorak
```

**salt.modules.keyboard.set\_x(layout)**

Set current X keyboard setting

CLI Example:

```
salt '*' keyboard.set_x dvorak
```

### 26.6.206 salt.modules.keystone

Module for handling openstack keystone calls.

**optdepends**

- keystoneclient Python adapter

**configuration**

This module is not usable until the following are specified either in a pillar or in the minion's config file:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.tenant_id: f80919baedab48ec8931f200c65a50df
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
keystone.verify_ssl: True
```

OR (for token based authentication)

```
keystone.token: 'ADMIN'
keystone.endpoint: 'http://127.0.0.1:35357/v2.0'
```

If configuration for multiple openstack accounts is required, they can be set up as different configuration profiles. For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.tenant_id: f80919baedab48ec8931f200c65a50df
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
  keystone.verify_ssl: True

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.tenant_id: f80919baedab48ec8931f200c65a50df
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
  keystone.verify_ssl: True
```

With this configuration in place, any of the keystone functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' keystone.tenant_list profile=openstack1
```

`salt.modules.keystone.api_version` (*profile=None*, *\*\*connection\_args*)

Returns the API version derived from endpoint's response.

CLI Example:

```
salt '*' keystone.api_version
```

`salt.modules.keystone.auth` (*profile=None*, *\*\*connection\_args*)

Set up keystone credentials. Only intended to be used within Keystone-enabled modules.

CLI Example:

```
salt '*' keystone.auth
```

`salt.modules.keystone.ec2_credentials_create` (*user\_id=None*, *name=None*, *tenant\_id=None*, *tenant=None*, *profile=None*, *\*\*connection\_args*)

Create EC2-compatible credentials for user per tenant

CLI Examples:

```
salt '*' keystone.ec2_credentials_create name=admin tenant=admin

salt '*' keystone.ec2_credentials_create user_
→ id=c965f79c4f864eaaa9c3b41904e67082 tenant_
→ id=722787eb540849158668370dc627ec5f
```

`salt.modules.keystone.ec2_credentials_delete` (*user\_id=None, name=None, access\_key=None, profile=None, \*\*connection\_args*)

Delete EC2-compatible credentials

CLI Examples:

```
salt '*' keystone.ec2_credentials_delete ❌
→860f8c2c38ca4fab989f9bc56a061a64 access_
→key=5f66d2f24f604b8bb9cd28886106f442

salt '*' keystone.ec2_credentials_delete name=admin access_
→key=5f66d2f24f604b8bb9cd28886106f442
```

`salt.modules.keystone.ec2_credentials_get` (*user\_id=None, name=None, access=None, profile=None, \*\*connection\_args*)

Return ec2\_credentials for a user (keystone ec2-credentials-get)

CLI Examples:

```
salt '*' keystone.ec2_credentials_get c965f79c4f864eaaa9c3b41904e67082❌
→access=722787eb540849158668370
salt '*' keystone.ec2_credentials_get user_
→id=c965f79c4f864eaaa9c3b41904e67082 access=722787eb540849158668370
salt '*' keystone.ec2_credentials_get name=nova❌
→access=722787eb540849158668370dc627ec5f
```

`salt.modules.keystone.ec2_credentials_list` (*user\_id=None, name=None, profile=None, \*\*connection\_args*)

Return a list of ec2\_credentials for a specific user (keystone ec2-credentials-list)

CLI Examples:

```
salt '*' keystone.ec2_credentials_list 298ce377245c4ec9b70e1c639c89e654
salt '*' keystone.ec2_credentials_list user_
→id=298ce377245c4ec9b70e1c639c89e654
salt '*' keystone.ec2_credentials_list name=jack
```

`salt.modules.keystone.endpoint_create` (*service, publicurl=None, internalurl=None, adminurl=None, region=None, profile=None, url=None, interface=None, \*\*connection\_args*)

Create an endpoint for an Openstack service

CLI Examples:

```
salt 'v2' keystone.endpoint_create nova 'http://public/url' 'http://
→internal/url' 'http://adminurl/url' region

salt 'v3' keystone.endpoint_create nova url='http://public/url' interface=
→'public' region='RegionOne'
```

`salt.modules.keystone.endpoint_delete` (*service, region=None, profile=None, interface=None, \*\*connection\_args*)

Delete endpoints of an Openstack service

CLI Examples:

```
salt 'v2' keystone.endpoint_delete nova [region=RegionOne]
salt 'v3' keystone.endpoint_delete nova interface=admin [region=RegionOne]
```

`salt.modules.keystone.endpoint_get`(*service*, *region=None*, *profile=None*, *interface=None*, *\*\*connection\_args*)

Return a specific endpoint (keystone endpoint-get)

CLI Example:

```
salt 'v2' keystone.endpoint_get nova [region=RegionOne]
salt 'v3' keystone.endpoint_get nova interface=admin [region=RegionOne]
```

`salt.modules.keystone.endpoint_list`(*profile=None*, *\*\*connection\_args*)

Return a list of available endpoints (keystone endpoints-list)

CLI Example:

```
salt '*' keystone.endpoint_list
```

`salt.modules.keystone.project_create`(*name*, *domain*, *description=None*, *enabled=True*, *profile=None*, *\*\*connection\_args*)

Create a keystone project. Overrides keystone tenant\_create form api V2. For keystone api V3.

New in version 2016.11.0.

**name**

The project name, which must be unique within the owning domain.

**domain**

The domain name.

**description**

The project description.

**enabled**

Enables or disables the project.

**profile**

Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_create nova default description='Nova Compute
↳Project'
salt '*' keystone.project_create test default enabled=False
```

`salt.modules.keystone.project_delete`(*project\_id=None*, *name=None*, *profile=None*, *\*\*connection\_args*)

Delete a project (keystone project-delete). Overrides keystone tenant-delete form api V2. For keystone api V3 only.

New in version 2016.11.0.

**project\_id**

The project id.

**name**

The project name.

**profile**

Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete project_
↳ id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete name=demo
```

`salt.modules.keystone.project_get` (*project\_id=None, name=None, profile=None, \*\*connection\_args*)

Return a specific projects (keystone project-get) Overrides keystone tenant-get form api V2. For keystone api V3 only.

New in version 2016.11.0.

**project\_id**

The project id.

**name**

The project name.

**profile**

Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get project_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get name=nova
```

`salt.modules.keystone.project_list` (*profile=None, \*\*connection\_args*)

Return a list of available projects (keystone projects-list). Overrides keystone tenants-list form api V2. For keystone api V3 only.

New in version 2016.11.0.

**profile**

Configuration profile - if configuration for multiple openstack accounts required.

CLI Example:

```
salt '*' keystone.project_list
```

`salt.modules.keystone.project_update` (*project\_id=None, name=None, description=None, enabled=None, profile=None, \*\*connection\_args*)

Update a tenant's information (keystone project-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID

Overrides keystone tenant\_update form api V2. For keystone api V3 only.

New in version 2016.11.0.

**project\_id**

The project id.

**name**

The project name, which must be unique within the owning domain.

**description**

The project description.

**enabled**

Enables or disables the project.

**profile**

Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_update name=admin enabled=True
salt '*' keystone.project_update c965f79c4f864eaaa9c3b41904e67082
↳ name=admin email=admin@domain.com
```

`salt.modules.keystone.role_create` (*name*, *profile=None*, *\*\*connection\_args*)

Create a named role.

CLI Example:

```
salt '*' keystone.role_create admin
```

`salt.modules.keystone.role_delete` (*role\_id=None*, *name=None*, *profile=None*, *\*\*connection\_args*)

Delete a role (keystone role-delete)

CLI Examples:

```
salt '*' keystone.role_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_delete role_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_delete name=admin
```

`salt.modules.keystone.role_get` (*role\_id=None*, *name=None*, *profile=None*, *\*\*connection\_args*)

Return a specific roles (keystone role-get)

CLI Examples:

```
salt '*' keystone.role_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_get role_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_get name=nova
```

`salt.modules.keystone.role_list` (*profile=None*, *\*\*connection\_args*)

Return a list of available roles (keystone role-list)

CLI Example:

```
salt '*' keystone.role_list
```

`salt.modules.keystone.service_create` (*name*, *service\_type*, *description=None*, *profile=None*, *\*\*connection\_args*)

Add service to Keystone service catalog

CLI Examples:

```
salt '*' keystone.service_create nova compute 'OpenStack Compute Service'
```

`salt.modules.keystone.service_delete` (*service\_id=None*, *name=None*, *profile=None*, *\*\*connection\_args*)

Delete a service from Keystone service catalog

CLI Examples:

```
salt '*' keystone.service_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_delete name=nova
```

`salt.modules.keystone.service_get`(*service\_id=None, name=None, profile=None, \*\*connection\_args*)  
Return a specific services (keystone service-get)

CLI Examples:

```
salt '*' keystone.service_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_get service_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_get name=nova
```

`salt.modules.keystone.service_list`(*profile=None, \*\*connection\_args*)

Return a list of available services (keystone services-list)

CLI Example:

```
salt '*' keystone.service_list
```

`salt.modules.keystone.tenant_create`(*name, description=None, enabled=True, profile=None, \*\*connection\_args*)

Create a keystone tenant

CLI Examples:

```
salt '*' keystone.tenant_create nova description='nova tenant'
salt '*' keystone.tenant_create test enabled=False
```

`salt.modules.keystone.tenant_delete`(*tenant\_id=None, name=None, profile=None, \*\*connection\_args*)  
Delete a tenant (keystone tenant-delete)

CLI Examples:

```
salt '*' keystone.tenant_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_delete tenant_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_delete name=demo
```

`salt.modules.keystone.tenant_get`(*tenant\_id=None, name=None, profile=None, \*\*connection\_args*)  
Return a specific tenants (keystone tenant-get)

CLI Examples:

```
salt '*' keystone.tenant_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_get tenant_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_get name=nova
```

`salt.modules.keystone.tenant_list`(*profile=None, \*\*connection\_args*)

Return a list of available tenants (keystone tenants-list)

CLI Example:

```
salt '*' keystone.tenant_list
```

`salt.modules.keystone.tenant_update` (*tenant\_id=None, name=None, description=None, enabled=None, profile=None, \*\*connection\_args*)

Update a tenant's information (keystone tenant-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID

CLI Examples:

```
salt '*' keystone.tenant_update name=admin enabled=True
salt '*' keystone.tenant_update c965f79c4f864eaaa9c3b41904e67082
  → name=admin email=admin@domain.com
```

`salt.modules.keystone.token_get` (*profile=None, \*\*connection\_args*)

Return the configured tokens (keystone token-get)

CLI Example:

```
salt '*' keystone.token_get c965f79c4f864eaaa9c3b41904e67082
```

`salt.modules.keystone.user_create` (*name, password, email, tenant\_id=None, enabled=True, profile=None, project\_id=None, description=None, \*\*connection\_args*)

Create a user (keystone user-create)

CLI Examples:

```
salt '*' keystone.user_create name=jack password=zero
  → email=jack@halloweentown.org          tenant_
  → id=a28a7b5a999a455f84b1f5210264375e  enabled=True
```

`salt.modules.keystone.user_delete` (*user\_id=None, name=None, profile=None, \*\*connection\_args*)

Delete a user (keystone user-delete)

CLI Examples:

```
salt '*' keystone.user_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_delete user_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_delete name=nova
```

`salt.modules.keystone.user_get` (*user\_id=None, name=None, profile=None, \*\*connection\_args*)

Return a specific users (keystone user-get)

CLI Examples:

```
salt '*' keystone.user_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_get user_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_get name=nova
```

`salt.modules.keystone.user_list` (*profile=None, \*\*connection\_args*)

Return a list of available users (keystone user-list)

CLI Example:

```
salt '*' keystone.user_list
```

`salt.modules.keystone.user_password_update` (*user\_id=None, name=None, password=None, profile=None, \*\*connection\_args*)

Update a user's password (keystone user-password-update)

CLI Examples:

```
salt '*' keystone.user_password_update c965f79c4f864eaaa9c3b41904e67082
→password=12345
salt '*' keystone.user_password_update user_
→id=c965f79c4f864eaaa9c3b41904e67082 password=12345
salt '*' keystone.user_password_update name=nova password=12345
```

`salt.modules.keystone.user_role_add` (*user\_id=None, user=None, tenant\_id=None, tenant=None, role\_id=None, role=None, profile=None, project\_id=None, project\_name=None, \*\*connection\_args*)

Add role for user in tenant (keystone user-role-add)

CLI Examples:

```
salt '*' keystone.user_role_add user_id=298ce377245c4ec9b70e1c639c89e654
→tenant_id=7167a092ece84bae8cead4bf9d15bb3b role_
→id=ce377245c4ec9b70e1c639c89e8cead4
salt '*' keystone.user_role_add user=admin tenant=admin role=admin
```

`salt.modules.keystone.user_role_list` (*user\_id=None, tenant\_id=None, user\_name=None, tenant\_name=None, profile=None, project\_id=None, project\_name=None, \*\*connection\_args*)

Return a list of available user\_roles (keystone user-roles-list)

CLI Examples:

```
salt '*' keystone.user_role_list user_id=298ce377245c4ec9b70e1c639c89e654
→tenant_id=7167a092ece84bae8cead4bf9d15bb3b
salt '*' keystone.user_role_list user_name=admin tenant_name=admin
```

`salt.modules.keystone.user_role_remove` (*user\_id=None, user=None, tenant\_id=None, tenant=None, role\_id=None, role=None, profile=None, project\_id=None, project\_name=None, \*\*connection\_args*)

Remove role for user in tenant (keystone user-role-remove)

CLI Examples:

```
salt '*' keystone.user_role_remove user_
→id=298ce377245c4ec9b70e1c639c89e654 tenant_
→id=7167a092ece84bae8cead4bf9d15bb3b role_
→id=ce377245c4ec9b70e1c639c89e8cead4
salt '*' keystone.user_role_remove user=admin tenant=admin role=admin
```

`salt.modules.keystone.user_update` (*user\_id=None, name=None, email=None, enabled=None, tenant=None, profile=None, project=None, description=None, \*\*connection\_args*)

Update a user's information (keystone user-update) The following fields may be updated: name, email, enabled, tenant. Because the name is one of the fields, a valid user id is required.

CLI Examples:

```

salt '*' keystone.user_update user_id=c965f79c4f864eaaa9c3b41904e67082
→name=newname
salt '*' keystone.user_update c965f79c4f864eaaa9c3b41904e67082
→name=newname email=newemail@domain.com

```

`salt.modules.keystone.user_verify_password`(*user\_id=None, name=None, password=None, profile=None, \*\*connection\_args*)

Verify a user's password

CLI Examples:

```

salt '*' keystone.user_verify_password name=test password=foobar
salt '*' keystone.user_verify_password user_
→id=c965f79c4f864eaaa9c3b41904e67082 password=foobar

```

### 26.6.207 salt.modules.keystoneng

Keystone module for interacting with OpenStack Keystone

New in version 2018.3.0.

:depends:shade

Example configuration

```

keystone:
  cloud: default

```

```

keystone:
  auth:
    username: admin
    password: password123
    user_domain_name: mydomain
    project_name: myproject
    project_domain_name: myproject
    auth_url: https://example.org:5000/v3
    identity_api_version: 3

```

`salt.modules.keystoneng.compare_changes`(*obj, \*\*kwargs*)

Compare two dicts returning only keys that exist in the first dict and are different in the second one

`salt.modules.keystoneng.domain_create`(*auth=None, \*\*kwargs*)

Create a domain

CLI Example:

```

salt '*' keystoneng.domain_create name=domain1

```

`salt.modules.keystoneng.domain_delete`(*auth=None, \*\*kwargs*)

Delete a domain

CLI Example:

```

salt '*' keystoneng.domain_delete name=domain1
salt '*' keystoneng.domain_delete name=b62e76fbee4e8fb77073f591cf211e

```

`salt.modules.keystoneng.domain_get(auth=None, **kwargs)`

Get a single domain

CLI Example:

```
salt '*' keystoneng.domain_get name=domain1
salt '*' keystoneng.domain_get name=b62e76fbee4e8fb77073f591cf211e
```

`salt.modules.keystoneng.domain_list(auth=None, **kwargs)`

List domains

CLI Example:

```
salt '*' keystoneng.domain_list
```

`salt.modules.keystoneng.domain_search(auth=None, **kwargs)`

Search domains

CLI Example:

```
salt '*' keystoneng.domain_search
salt '*' keystoneng.domain_search name=domain1
```

`salt.modules.keystoneng.domain_update(auth=None, **kwargs)`

Update a domain

CLI Example:

```
salt '*' keystoneng.domain_update name=domain1 new_name=newdomain
salt '*' keystoneng.domain_update name=domain1 enabled=True description=
→'new description'
```

`salt.modules.keystoneng.endpoint_create(auth=None, **kwargs)`

Create an endpoint

CLI Example:

```
salt '*' keystoneng.endpoint_create interface=admin service=glance❌
→url=https://example.org:9292
salt '*' keystoneng.endpoint_create interface=public service=glance❌
→region=RegionOne url=https://example.org:9292
salt '*' keystoneng.endpoint_create interface=admin service=glance❌
→url=https://example.org:9292 enabled=True
```

`salt.modules.keystoneng.endpoint_delete(auth=None, **kwargs)`

Delete an endpoint

CLI Example:

```
salt '*' keystoneng.endpoint_delete id=3bee4bd8c2b040ee966adfd1f0bfca9
```

`salt.modules.keystoneng.endpoint_get(auth=None, **kwargs)`

Get a single endpoint

CLI Example:

```
salt '*' keystone.endpoint_get id=02cffaa173b2460f98e40eda3748dae5
```

`salt.modules.keystone.endpoint_list` (*auth=None, \*\*kwargs*)

List endpoints

CLI Example:

```
salt '*' keystone.endpoint_list
```

`salt.modules.keystone.endpoint_search` (*auth=None, \*\*kwargs*)

Search endpoints

CLI Example:

```
salt '*' keystone.endpoint_search
salt '*' keystone.endpoint_search id=02cffaa173b2460f98e40eda3748dae5
```

`salt.modules.keystone.endpoint_update` (*auth=None, \*\*kwargs*)

Update an endpoint

CLI Example:

```
salt '*' keystone.endpoint_update endpoint_
  ↳ id=4f961ad09d2d48948896bbe7c6a79717 interface=public enabled=False
salt '*' keystone.endpoint_update endpoint_
  ↳ id=4f961ad09d2d48948896bbe7c6a79717 region=newregion
salt '*' keystone.endpoint_update endpoint_
  ↳ id=4f961ad09d2d48948896bbe7c6a79717 service_name_or_id=glance
  ↳ url=https://example.org:9292
```

`salt.modules.keystone.get_entity` (*ent\_type, \*\*kwargs*)

Attempt to query Keystone for more information about an entity

`salt.modules.keystone.get_openstack_cloud` (*auth=None*)

Return an openstack\_cloud

`salt.modules.keystone.get_operator_cloud` (*auth=None*)

Return an operator\_cloud

`salt.modules.keystone.group_create` (*auth=None, \*\*kwargs*)

Create a group

CLI Example:

```
salt '*' keystone.group_create name=group1
salt '*' keystone.group_create name=group2 domain=domain1 description=
  ↳ 'my group2'
```

`salt.modules.keystone.group_delete` (*auth=None, \*\*kwargs*)

Delete a group

CLI Example:

```
salt '*' keystone.group_delete name=group1
salt '*' keystone.group_delete name=group2 domain_
  ↳ id=b62e76fbef4e8fb77073f591cf211e
salt '*' keystone.group_delete name=0e4feb2a5ab4f2c8f374b054162506d
```

`salt.modules.keystoneng.group_get(auth=None, **kwargs)`

Get a single group

CLI Example:

```
salt '*' keystoneng.group_get name=group1
salt '*' keystoneng.group_get name=group2 domain_
→id=b62e76fbee4e8fb77073f591cf211e
salt '*' keystoneng.group_get name=0e4febc2a5ab4f2c8f374b054162506d
```

`salt.modules.keystoneng.group_list(auth=None, **kwargs)`

List groups

CLI Example:

```
salt '*' keystoneng.group_list
salt '*' keystoneng.group_list domain_id=b62e76fbee4e8fb77073f591cf211e
```

`salt.modules.keystoneng.group_search(auth=None, **kwargs)`

Search for groups

CLI Example:

```
salt '*' keystoneng.group_search name=group1
salt '*' keystoneng.group_search domain_
→id=b62e76fbee4e8fb77073f591cf211e
```

`salt.modules.keystoneng.group_update(auth=None, **kwargs)`

Update a group

CLI Example:

```
salt '*' keystoneng.group_update name=group1 description='new description'
salt '*' keystoneng.group_create name=group2 domain_
→id=b62e76fbee4e8fb77073f591cf211e new_name=newgroupname
salt '*' keystoneng.group_create name=0e4febc2a5ab4f2c8f374b054162506d
→new_name=newgroupname
```

`salt.modules.keystoneng.project_create(auth=None, **kwargs)`

Create a project

CLI Example:

```
salt '*' keystoneng.project_create name=project1
salt '*' keystoneng.project_create name=project2 domain_
→id=b62e76fbee4e8fb77073f591cf211e
salt '*' keystoneng.project_create name=project3 enabled=False
→description='my project3'
```

`salt.modules.keystoneng.project_delete(auth=None, **kwargs)`

Delete a project

CLI Example:

```

salt '*' keystoneeng.project_delete name=project1
salt '*' keystoneeng.project_delete name=project2 domain_
→id=b62e76fbee4e8fb77073f591cf211e
salt '*' keystoneeng.project_delete name=f315afcf12f24ad88c92b936c38f2d5a

```

`salt.modules.keystoneeng.project_get(auth=None, **kwargs)`

Get a single project

CLI Example:

```

salt '*' keystoneeng.project_get name=project1
salt '*' keystoneeng.project_get name=project2 domain_
→id=b62e76fbee4e8fb77073f591cf211e
salt '*' keystoneeng.project_get name=f315afcf12f24ad88c92b936c38f2d5a

```

`salt.modules.keystoneeng.project_list(auth=None, **kwargs)`

List projects

CLI Example:

```

salt '*' keystoneeng.project_list
salt '*' keystoneeng.project_list domain_
→id=b62e76fbee4e8fb77073f591cf211e

```

`salt.modules.keystoneeng.project_search(auth=None, **kwargs)`

Search projects

CLI Example:

```

salt '*' keystoneeng.project_search
salt '*' keystoneeng.project_search name=project1
salt '*' keystoneeng.project_search domain_
→id=b62e76fbee4e8fb77073f591cf211e

```

`salt.modules.keystoneeng.project_update(auth=None, **kwargs)`

Update a project

CLI Example:

```

salt '*' keystoneeng.project_update name=project1 new_name=newproject
salt '*' keystoneeng.project_update name=project2 enabled=False
→description='new description'

```

`salt.modules.keystoneeng.role_assignment_list(auth=None, **kwargs)`

List role assignments

CLI Example:

```

salt '*' keystoneeng.role_assignment_list

```

`salt.modules.keystoneeng.role_create(auth=None, **kwargs)`

Create a role

CLI Example:

```
salt '*' keystoneeng.role_create name=role1
salt '*' keystoneeng.role_create name=role1 domain_
→id=b62e76fbee4e8fb77073f591cf211e
```

`salt.modules.keystoneeng.role_delete` (*auth=None, \*\*kwargs*)

Delete a role

CLI Example:

```
salt '*' keystoneeng.role_delete name=role1 domain_
→id=b62e76fbee4e8fb77073f591cf211e
salt '*' keystoneeng.role_delete name=1eb6edd5525e4ac39af571adee673559
```

`salt.modules.keystoneeng.role_get` (*auth=None, \*\*kwargs*)

Get a single role

CLI Example:

```
salt '*' keystoneeng.role_get name=role1
salt '*' keystoneeng.role_get name=role1 domain_
→id=b62e76fbee4e8fb77073f591cf211e
salt '*' keystoneeng.role_get name=1eb6edd5525e4ac39af571adee673559
```

`salt.modules.keystoneeng.role_grant` (*auth=None, \*\*kwargs*)

Grant a role in a project/domain to a user/group

CLI Example:

```
salt '*' keystoneeng.role_grant name=role1 user=user1 project=project1
salt '*' keystoneeng.role_grant name=ddbe3e0ed74e4c7f8027bad4af03339d
→group=user1 project=project1 domain=domain1
salt '*' keystoneeng.role_grant name=ddbe3e0ed74e4c7f8027bad4af03339d
→group=19573afd5e4241d8b65c42215bae9704
→project=1dcac318a83b4610b7a7f7ba01465548
```

`salt.modules.keystoneeng.role_list` (*auth=None, \*\*kwargs*)

List roles

CLI Example:

```
salt '*' keystoneeng.role_list
salt '*' keystoneeng.role_list domain_id=b62e76fbee4e8fb77073f591cf211e
```

`salt.modules.keystoneeng.role_revoke` (*auth=None, \*\*kwargs*)

Grant a role in a project/domain to a user/group

CLI Example:

```
salt '*' keystoneeng.role_revoke name=role1 user=user1 project=project1
salt '*' keystoneeng.role_revoke name=ddbe3e0ed74e4c7f8027bad4af03339d
→group=user1 project=project1 domain=domain1
salt '*' keystoneeng.role_revoke name=ddbe3e0ed74e4c7f8027bad4af03339d
→group=19573afd5e4241d8b65c42215bae9704
→project=1dcac318a83b4610b7a7f7ba01465548
```

`salt.modules.keystoneng.role_search(auth=None, **kwargs)`

Search roles

CLI Example:

```
salt '*' keystoneng.role_search
salt '*' keystoneng.role_search name=role1
salt '*' keystoneng.role_search domain_id=b62e76fbee4e8fb77073f591cf211e
```

`salt.modules.keystoneng.role_update(auth=None, **kwargs)`

Update a role

CLI Example:

```
salt '*' keystoneng.role_update name=role1 new_name=newrole
salt '*' keystoneng.role_update name=1eb6edd5525e4ac39af571adee673559 new_
→name=newrole
```

`salt.modules.keystoneng.service_create(auth=None, **kwargs)`

Create a service

CLI Example:

```
salt '*' keystoneng.service_create name=glance type=image
salt '*' keystoneng.service_create name=glance type=image description=
→"Image"
```

`salt.modules.keystoneng.service_delete(auth=None, **kwargs)`

Delete a service

CLI Example:

```
salt '*' keystoneng.service_delete name=glance
salt '*' keystoneng.service_delete name=39cc1327cdf744ab815331554430e8ec
```

`salt.modules.keystoneng.service_get(auth=None, **kwargs)`

Get a single service

CLI Example:

```
salt '*' keystoneng.service_get name=glance
salt '*' keystoneng.service_get name=75a5804638944b3ab54f7fbfcec2305a
```

`salt.modules.keystoneng.service_list(auth=None, **kwargs)`

List services

CLI Example:

```
salt '*' keystoneng.service_list
```

`salt.modules.keystoneng.service_search(auth=None, **kwargs)`

Search services

CLI Example:

```
salt '*' keystoneeng.service_search
salt '*' keystoneeng.service_search name=glance
salt '*' keystoneeng.service_search name=135f0403f8e544dc9008c6739ecda860
```

`salt.modules.keystoneeng.service_update` (*auth=None, \*\*kwargs*)

Update a service

CLI Example:

```
salt '*' keystoneeng.service_update name=cinder type=volumev2
salt '*' keystoneeng.service_update name=cinder description='new'
→description'
salt '*' keystoneeng.service_update name=ab4d35e269f147b3ae2d849f77f5c88f
→enabled=False
```

`salt.modules.keystoneeng.setup_clouds` (*auth=None*)

Call functions to create Shade cloud objects in `__context__` to take advantage of Shade's in-memory caching across several states

`salt.modules.keystoneeng.user_create` (*auth=None, \*\*kwargs*)

Create a user

CLI Example:

```
salt '*' keystoneeng.user_create name=user1
salt '*' keystoneeng.user_create name=user2 password=1234 enabled=False
salt '*' keystoneeng.user_create name=user3 domain_
→id=b62e76fbee4e8fb77073f591cf211e
```

`salt.modules.keystoneeng.user_delete` (*auth=None, \*\*kwargs*)

Delete a user

CLI Example:

```
salt '*' keystoneeng.user_delete name=user1
salt '*' keystoneeng.user_delete name=user2 domain_
→id=b62e76fbee4e8fb77073f591cf211e
salt '*' keystoneeng.user_delete name=a42cbbfa1e894e839fd0f584d22e321f
```

`salt.modules.keystoneeng.user_get` (*auth=None, \*\*kwargs*)

Get a single user

CLI Example:

```
salt '*' keystoneeng.user_get name=user1
salt '*' keystoneeng.user_get name=user1 domain_
→id=b62e76fbee4e8fb77073f591cf211e
salt '*' keystoneeng.user_get name=02cffaa173b2460f98e40eda3748dae5
```

`salt.modules.keystoneeng.user_list` (*auth=None, \*\*kwargs*)

List users

CLI Example:

```
salt '*' keystoneeng.user_list
salt '*' keystoneeng.user_list domain_id=b62e76fbee4e8fb77073f591cf211e
```

`salt.modules.keystoneng.user_search(auth=None, **kwargs)`

List users

CLI Example:

```
salt '*' keystoneng.user_list
salt '*' keystoneng.user_list domain_id=b62e76fbee4e8fb77073f591cf211e
```

`salt.modules.keystoneng.user_update(auth=None, **kwargs)`

Update a user

CLI Example:

```
salt '*' keystoneng.user_update name=user1 enabled=False description='new'
→description'
salt '*' keystoneng.user_update name=user1 new_name=newuser
```

### 26.6.208 salt.modules.keystore

Module to interact with keystores

`salt.modules.keystore.add(name, keystore, passphrase, certificate, private_key=None)`

Adds certificates to an existing keystore or creates a new one if necessary.

#### Parameters

- **name** -- alias for the certificate
- **keystore** -- The path to the keystore file to query
- **passphrase** -- The passphrase to use to decode the keystore
- **certificate** -- The PEM public certificate to add to keystore. Can be a string for file.
- **private\_key** -- (Optional for TrustedCert) The PEM private key to add to the keystore

CLI Example:

```
salt '*' keystore.add aliasname /tmp/test.store changeit /tmp/testcert.crt
salt '*' keystore.add aliasname /tmp/test.store changeit certificate="-----
→-BEGIN CERTIFICATE-----Sib...BM-----END CERTIFICATE-----"
salt '*' keystore.add keyname /tmp/test.store changeit /tmp/512.cert
→private_key=/tmp/512.key
```

`salt.modules.keystore.get_sha1(certificate)`

Returns the SHA1 sum of a ASN1/PEM certificate

#### Parameters

- **name** -- ASN1/PEM certificate

CLI Example:

```
salt '*' keystore.get_sha1 "(certificate_content_string)"
```

`salt.modules.keystore.list(keystore, passphrase, alias=None, return_cert=False)`

Lists certificates in a keytool managed keystore.

#### Parameters

- **keystore** -- The path to the keystore file to query
- **passphrase** -- The passphrase to use to decode the keystore
- **alias** -- (Optional) If found, displays details on only this key
- **return\_certs** -- (Optional) Also return certificate PEM.

**Warning:** There are security implications for using `return_cert` to return decrypted certificates.

CLI Example:

```
salt '*' keystore.list /usr/lib/jvm/java-8/jre/lib/security/cacerts
→changeit
salt '*' keystore.list /usr/lib/jvm/java-8/jre/lib/security/cacerts
→changeit debian:verisign_-_g5.pem
```

`salt.modules.keystore.remove`(*name*, *keystore*, *passphrase*)

Removes a certificate from an existing keystore. Returns True if remove was successful, otherwise False

#### Parameters

- **name** -- alias for the certificate
- **keystore** -- The path to the keystore file to query
- **passphrase** -- The passphrase to use to decode the keystore

CLI Example:

```
salt '*' keystore.remove aliasname /tmp/test.store changeit
```

## 26.6.209 salt.modules.kmod

Module to manage Linux kernel modules

`salt.modules.kmod.available`()

Return a list of all available kernel modules

CLI Example:

```
salt '*' kmod.available
```

`salt.modules.kmod.check_available`(*mod*)

Check to see if the specified kernel module is available

CLI Example:

```
salt '*' kmod.check_available kvm
```

`salt.modules.kmod.is_loaded`(*mod*)

Check to see if the specified kernel module is loaded

CLI Example:

```
salt '*' kmod.is_loaded kvm
```

`salt.modules.kmod.load(mod, persist=False)`

Load the specified kernel module

**mod**

Name of module to add

**persist**

Write module to /etc/modules to make it load on system reboot

CLI Example:

```
salt '*' kmod.load kvm
```

`salt.modules.kmod.lsmod()`

Return a dict containing information about currently loaded modules

CLI Example:

```
salt '*' kmod.lsmod
```

`salt.modules.kmod.mod_list(only_persist=False)`

Return a list of the loaded module names

**only\_persist**

Only return the list of loaded persistent modules

CLI Example:

```
salt '*' kmod.mod_list
```

`salt.modules.kmod.remove(mod, persist=False, comment=True)`

Remove the specified kernel module

**mod**

Name of module to remove

**persist**

Also remove module from /etc/modules

**comment**

If persist is set don't remove line from /etc/modules but only comment it

CLI Example:

```
salt '*' kmod.remove kvm
```

### 26.6.210 salt.modules.kubeadm

**Warning:** This module will be removed from Salt in version 3009 in favor of the [kubernetes Salt Extension](#).

Module for kubeadm :maintainer: Alberto Planas <[aplanas@suse.com](mailto:aplanas@suse.com)> :maturity: new :depends: None :platform: Linux

`salt.modules.kubeadm.alpha_certs_renew(rootfs=None)`

New in version 3001.

Renews certificates for a Kubernetes cluster

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.alpha_certs_renew
```

`salt.modules.kubeadm.alpha_kubeconfig_user` (*client\_name*, *apiserver\_advertise\_address=None*, *apiserver\_bind\_port=None*, *cert\_dir=None*, *org=None*, *token=None*, *rootfs=None*)

New in version 3001.

Outputs a kubeconfig file for an additional user

**client\_name**

The name of the user. It will be used as the CN if client certificates are created

**apiserver\_advertise\_address**

The IP address the API server is accessible on

**apiserver\_bind\_port**

The port the API server is accessible on (default 6443)

**cert\_dir**

The path where certificates are stored (default `"/etc/kubernetes/pki"`)

**org**

The organization of the client certificate

**token**

The token that show be used as the authentication mechanism for this kubeconfig, instead of client certificates

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.alpha_kubeconfig_user client_name=user
```

`salt.modules.kubeadm.alpha_kubelet_config_download` (*kubeconfig=None*, *kubelet\_version=None*, *rootfs=None*)

New in version 3001.

Downloads the kubelet configuration from the cluster ConfigMap kubelet-config-1.X

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in `/etc/kubernetes/admin.conf`

**kubelet\_version**

The desired version for the kubelet

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.alpha_kubelet_config_download
salt '*' kubeadm.alpha_kubelet_config_download kubelet_version='1.14.0'
```

`salt.modules.kubeadm.alpha_kubelet_config_enable_dynamic` (*node\_name*, *kubeconfig=None*,  
*kubelet\_version=None*,  
*rootfs=None*)

New in version 3001.

Enables or updates dynamic kubelet configuration for a node

**node\_name**

Name of the node that should enable the dynamic kubelet configuration

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in `/etc/kubernetes/admin.conf`

**kubelet\_version**

The desired version for the kubelet

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.alpha_kubelet_config_enable_dynamic node-1
```

`salt.modules.kubeadm.alpha_selfhosting_pivot` (*cert\_dir=None*, *config=None*, *kubeconfig=None*,  
*store\_certs\_in\_secrets=False*, *rootfs=None*)

New in version 3001.

Converts a static Pod-hosted control plane into a self-hosted one

**cert\_dir**

The path where certificates are stored (default `"/etc/kubernetes/pki"`)

**config**

Path to kubeadm configuration file

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in `/etc/kubernetes/admin.conf`

**store\_certs\_in\_secrets**

Enable storing certs in secrets

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.alpha_selfhost_pivot
```

`salt.modules.kubeadm.config_images_list` (*config=None*, *feature\_gates=None*,  
*kubernetes\_version=None*, *kubeconfig=None*,  
*rootfs=None*)

New in version 3001.

Print a list of images kubeadm will use

**config**

Path to kubeadm configuration file

**feature\_gates**

A set of key=value pairs that describe feature gates for various features

**kubernetes\_version**

Choose a specific Kubernetes version for the control plane (default "stable-1")

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.config_images_list
```

```
salt.modules.kubeadm.config_images_pull(config=None, cri_socket=None, feature_gates=None,
kubernetes_version=None, kubeconfig=None,
rootfs=None)
```

New in version 3001.

Pull images used by kubeadm

**config**

Path to kubeadm configuration file

**cri\_socket**

Path to the CRI socket to connect

**feature\_gates**

A set of key=value pairs that describe feature gates for various features

**kubernetes\_version**

Choose a specific Kubernetes version for the control plane (default "stable-1")

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.config_images_pull
```

```
salt.modules.kubeadm.config_migrate(old_config, new_config=None, kubeconfig=None, rootfs=None)
```

New in version 3001.

Read an older version of the kubeadm configuration API types from a file, and output the similar config object for the newer version

**old\_config**

Path to the kubeadm config file that is using the old API version and should be converted

**new\_config**

Path to the resulting equivalent kubeadm config file using the new API version. If not specified the output will be returned

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.config_migrate /oldconfig.cfg
```

`salt.modules.kubeadm.config_print_init_defaults` (*component\_configs=None, kubeconfig=None, rootfs=None*)

New in version 3001.

Return default init configuration, that can be used for 'kubeadm init'

**component\_config**

A comma-separated list for component config API object to print the default values for (valid values: KubeProxyConfiguration, KubeletConfiguration)

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.config_print_init_defaults
```

`salt.modules.kubeadm.config_print_join_defaults` (*component\_configs=None, kubeconfig=None, rootfs=None*)

New in version 3001.

Return default join configuration, that can be used for 'kubeadm join'

**component\_config**

A comma-separated list for component config API object to print the default values for (valid values: KubeProxyConfiguration, KubeletConfiguration)

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.config_print_join_defaults
```

`salt.modules.kubeadm.config_upload_from_file` (*config, kubeconfig=None, rootfs=None*)

New in version 3001.

Upload a configuration file to the in-cluster ConfigMap for kubeadm configuration

**config**

Path to a kubeadm configuration file

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.config_upload_from_file /config.cfg
```

`salt.modules.kubeadm.config_upload_from_flags` (*apiserver\_advertise\_address=None, apiserver\_bind\_port=None, apiserver\_cert\_extra\_sans=None, cert\_dir=None, cri\_socket=None, feature\_gates=None, kubernetes\_version=None, node\_name=None, pod\_network\_cidr=None, service\_cidr=None, service\_dns\_domain=None, kubeconfig=None, rootfs=None*)

New in version 3001.

Create the in-cluster configuration file for the first time using flags

**apiserver\_advertise\_address**

The IP address the API server will advertise it's listening on

**apiserver\_bind\_port**

The port the API server is accessible on (default 6443)

**apiserver\_cert\_extra\_sans**

Optional extra Subject Alternative Names (SANs) to use for the API Server serving certificate

**cert\_dir**

The path where to save and store the certificates (default `"/etc/kubernetes/pki"`)

**cri\_socket**

Path to the CRI socket to connect

**feature\_gates**

A set of key=value pairs that describe feature gates for various features

**kubernetes\_version**

Choose a specific Kubernetes version for the control plane (default `"stable-1"`)

**node\_name**

Specify the node name

**pod\_network\_cidr**

Specify range of IP addresses for the pod network

**service\_cidr**

Use alternative range of IP address for service VIPs (default `"10.96.0.0/12"`)

**service\_dns\_domain**

Use alternative domain for services (default `"cluster.local"`)

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in `/etc/kubernetes/admin.conf`

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.config_upload_from_flags
```

`salt.modules.kubeadm.config_view` (*kubeconfig=None, rootfs=None*)

New in version 3001.

View the kubeadm configuration stored inside the cluster

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in `/etc/kubernetes/admin.conf`

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.config_view
```

```
salt.modules.kubeadm.init(apiserver_advertise_address=None, apiserver_bind_port=None,
                             apiserver_cert_extra_sans=None, cert_dir=None, certificate_key=None,
                             control_plane_endpoint=None, config=None, cri_socket=None,
                             experimental_upload_certs=False, upload_certs=False, feature_gates=None,
                             ignore_preflight_errors=None, image_repository=None,
                             kubernetes_version=None, node_name=None, pod_network_cidr=None,
                             service_cidr=None, service_dns_domain=None,
                             skip_certificate_key_print=False, skip_phases=None, skip_token_print=False,
                             token=None, token_ttl=None, rootfs=None)
```

New in version 3001.

Command to set up the Kubernetes control plane

**apiserver\_advertise\_address**

The IP address the API server will advertise it's listening on

**apiserver\_bind\_port**

The port the API server is accessible on (default 6443)

**apiserver\_cert\_extra\_sans**

Optional extra Subject Alternative Names (SANs) to use for the API Server serving certificate

**cert\_dir**

The path where to save and store the certificates (default "/etc/kubernetes/pki")

**certificate\_key**

Key used to encrypt the control-plane certificates in the kubeadm-certs Secret

**config**

Path to a kubeadm configuration file

**control\_plane\_endpoint**

Specify a stable IP address or DNS name for the control plane

**cri\_socket**

Path to the CRI socket to connect

**experimental\_upload\_certs**

Upload control-plane certificate to the kubeadm-certs Secret. ( kubeadm version =< 1.16 )

**upload\_certs**

Upload control-plane certificate to the kubeadm-certs Secret. ( kubeadm version > 1.16 )

**feature\_gates**

A set of key=value pairs that describe feature gates for various features

**ignore\_preflight\_errors**

A list of checks whose errors will be shown as warnings

**image\_repository**

Choose a container registry to pull control plane images from

**kubernetes\_version**

Choose a specific Kubernetes version for the control plane (default "stable-1")

**node\_name**

Specify the node name

**pod\_network\_cidr**

Specify range of IP addresses for the pod network

**service\_cidr**

Use alternative range of IP address for service VIPs (default "10.96.0.0/12")

**service\_dns\_domain**

Use alternative domain for services (default "cluster.local")

**skip\_certificate\_key\_print**

Don't print the key used to encrypt the control-plane certificates

**skip\_phases**

List of phases to be skipped

**skip\_token\_print**

Skip printing of the default bootstrap token generated by 'kubeadm init'

**token**

The token to use for establishing bidirectional trust between nodes and control-plane nodes. The token must match a regular expression, that by default is `[a-z0-9]{6}.[a-z0-9]{16}`

**token\_ttl**

The duration before the token is automatically deleted (1s, 2m, 3h). If set to '0' the token will never expire. Default value is 24h0m0s

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.init pod_network_cidr='10.244.0.0/16'
```

```
salt.modules.kubeadm.join(api_server_endpoint=None, apiserver_advertise_address=None,
    apiserver_bind_port=None, certificate_key=None, config=None,
    cri_socket=None, discovery_file=None, discovery_token=None,
    discovery_token_ca_cert_hash=None,
    discovery_token_unsafe_skip_ca_verification=False,
    experimental_control_plane=False, control_plane=False,
    ignore_preflight_errors=None, node_name=None, skip_phases=None,
    tls_bootstrap_token=None, token=None, rootfs=None)
```

New in version 3001.

Command to join to an existing cluster

**api\_server\_endpoint**

IP address or domain name and port of the API Server

**apiserver\_advertise\_address**

If the node should host a new control plane instance, the IP address the API Server will advertise it's listening on

**apiserver\_bind\_port**

If the node should host a new control plane instance, the port the API Server to bind to (default 6443)

**certificate\_key**

Use this key to decrypt the certificate secrets uploaded by init

**config**

Path to a kubeadm configuration file

**cri\_socket**

Path to the CRI socket to connect

**discovery\_file**

For file-based discovery, a file or URL from which to load cluster information

**discovery\_token**

For token-based discovery, the token used to validate cluster information fetched from the API Server

**discovery\_token\_ca\_cert\_hash**

For token-based discovery, validate that the root CA public key matches this hash (format: "`<type>:<value>`")

**discovery\_token\_unsafe\_skip\_ca\_verification**

For token-based discovery, allow joining without 'discovery-token-ca-cert-hash' pinning

**experimental\_control\_plane**

Create a new control plane instance on this node (kubeadm version =< 1.16)

**control\_plane**

Create a new control plane instance on this node (kubeadm version > 1.16)

**ignore\_preflight\_errors**

A list of checks whose errors will be shown as warnings

**node\_name**

Specify the node name

**skip\_phases**

List of phases to be skipped

**tls\_bootstrap\_token**

Specify the token used to temporarily authenticate with the Kubernetes Control Plane while joining the node

**token**

Use this token for both discovery-token and tls-bootstrap-token when those values are not provided

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.join 10.160.65.165:6443 token='token'
```

`salt.modules.kubeadm.join_params` (*create\_if\_needed=False*)

New in version 3001.

Return the parameters required for joining into the cluster

**create\_if\_needed**

If the token bucket is empty and this parameter is True, a new token will be created.

CLI Example:

```
salt '*' kubeadm.join_params
salt '*' kubeadm.join_params create_if_needed=True
```

`salt.modules.kubeadm.reset` (*cert\_dir=None, cri\_socket=None, ignore\_preflight\_errors=None, kubeconfig=None, rootfs=None*)

New in version 3001.

Revert any changes made to this host by 'kubeadm init' or 'kubeadm join'

**cert\_dir**

The path to the directory where the certificates are stored (default `"/etc/kubernetes/pki"`)

**cri\_socket**

Path to the CRI socket to connect

**ignore\_preflight\_errors**

A list of checks whose errors will be shown as warnings

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in `/etc/kubernetes/admin.conf`

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.join 10.160.65.165:6443 token='token'
```

`salt.modules.kubeadm.token_create` (*token=None, config=None, description=None, groups=None, ttl=None, usages=None, kubeconfig=None, rootfs=None*)

New in version 3001.

Create bootstrap tokens on the server

**token**

Token to write, if None one will be generated. The token must match a regular expression, that by default is `[a-z0-9]{6}.[a-z0-9]{16}`

**config**

Path to kubeadm configuration file

**description**

A human friendly description of how this token is used

**groups**

List of extra groups that this token will authenticate, default to `['system:bootstrappers:kubeadm:default-node-token']`

**ttl**

The duration before the token is automatically deleted (1s, 2m, 3h). If set to '0' the token will never expire. Default value is `24h0m0s`

**usages**

Describes the ways in which this token can be used. The default value is `['signing', 'authentication']`

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in `/etc/kubernetes/admin.conf`

**rootfs**

The path to the real host root filesystem

CLI Example:

```

salt '*' kubeadm.token_create
salt '*' kubeadm.token_create a1b2c.0123456789abcdef
salt '*' kubeadm.token_create ttl='6h'
salt '*' kubeadm.token_create usages="['signing']"

```

`salt.modules.kubeadm.token_delete` (*token*, *kubeconfig=None*, *rootfs=None*)

New in version 3001.

Delete bootstrap tokens on the server

**token**

Token to write, if None one will be generated. The token must match a regular expression, that by default is `[a-z0-9]{6}.[a-z0-9]{16}`

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in `/etc/kubernetes/admin.conf`

**rootfs**

The path to the real host root filesystem

CLI Example:

```

salt '*' kubeadm.token_delete a1b2c
salt '*' kubeadm.token_create a1b2c.0123456789abcdef

```

`salt.modules.kubeadm.token_generate` (*kubeconfig=None*, *rootfs=None*)

New in version 3001.

Generate and return a bootstrap token, but do not create it on the server

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in `/etc/kubernetes/admin.conf`

**rootfs**

The path to the real host root filesystem

CLI Example:

```

salt '*' kubeadm.token_generate

```

`salt.modules.kubeadm.token_list` (*kubeconfig=None*, *rootfs=None*)

New in version 3001.

List bootstrap tokens on the server

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in `/etc/kubernetes/admin.conf`

**rootfs**

The path to the real host root filesystem

CLI Example:

```

salt '*' kubeadm.token_list

```

`salt.modules.kubeadm.version` (*kubeconfig=None*, *rootfs=None*)

New in version 3001.

Return the version of kubeadm

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in `/etc/kubernetes/admin.conf`

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.version
```

**26.6.211 salt.modules.kubernetesmod**

**Warning:** This module will be removed from Salt in version 3009 in favor of the [kubernetes Salt Extension](#).

Module for handling kubernetes calls.

**optdepends**

- kubernetes Python client < 4.0
- PyYAML < 6.0

**configuration**

The k8s API settings are provided either in a pillar, in the minion's config file, or in master's config file:

```
kubernetes.kubeconfig: '/path/to/kubeconfig'
kubernetes.kubeconfig-data: '<base64 encoded kubeconfig content'
kubernetes.context: 'context'
```

These settings can be overridden by adding `context` and `kubeconfig` or `kubeconfig_data` parameters when calling a function.

The data format for `kubernetes.kubeconfig-data` value is the content of `kubeconfig` base64 encoded in one line.

Only `kubeconfig` or `kubeconfig-data` should be provided. In case both are provided `kubeconfig` entry is preferred.

CLI Example:

```
salt '*' kubernetes.nodes kubeconfig=/etc/salt/k8s/kubeconfig context=minikube
```

New in version 2017.7.0.

Changed in version 2019.2.0.

**Warning:** Configuration options changed in 2019.2.0. The following configuration options have been removed:

- kubernetes.user
- kubernetes.password
- kubernetes.api\_url
- kubernetes.certificate-authority-data/file
- kubernetes.client-certificate-data/file
- kubernetes.client-key-data/file

Please use now:

- `kubernetes.kubeconfig` or `kubernetes.kubeconfig-data`
- `kubernetes.context`

`salt.modules.kubernetesmod.configmaps` (*namespace='default', \*\*kwargs*)

Return a list of kubernetes configmaps defined in the namespace

CLI Example:

```
salt '*' kubernetes.configmaps
salt '*' kubernetes.configmaps namespace=default
```

`salt.modules.kubernetesmod.create_configmap` (*name, namespace, data, source=None, template=None, saltenv='base', \*\*kwargs*)

Creates the kubernetes configmap as defined by the user.

CLI Example:

```
salt 'minion1' kubernetes.create_configmap           settings default '{
→"example.conf": "# example file"}'

salt 'minion2' kubernetes.create_configmap           name=settings
→namespace=default data='{"example.conf": "# example file"}'
```

`salt.modules.kubernetesmod.create_deployment` (*name, namespace, metadata, spec, source, template, saltenv, \*\*kwargs*)

Creates the kubernetes deployment as defined by the user.

`salt.modules.kubernetesmod.create_namespace` (*name, \*\*kwargs*)

Creates a namespace with the specified name.

CLI Example:

```
salt '*' kubernetes.create_namespace salt
salt '*' kubernetes.create_namespace name=salt
```

`salt.modules.kubernetesmod.create_pod` (*name, namespace, metadata, spec, source, template, saltenv, \*\*kwargs*)

Creates the kubernetes deployment as defined by the user.

`salt.modules.kubernetesmod.create_secret` (*name, namespace='default', data=None, source=None, template=None, saltenv='base', \*\*kwargs*)

Creates the kubernetes secret as defined by the user.

CLI Example:

```
salt 'minion1' kubernetes.create_secret           passwords default '{
→"db": "letmein"}'

salt 'minion2' kubernetes.create_secret           name=passwords
→namespace=default data='{"db": "letmein"}'
```

`salt.modules.kubernetesmod.create_service`(*name, namespace, metadata, spec, source, template, saltenv, \*\*kwargs*)

Creates the kubernetes service as defined by the user.

`salt.modules.kubernetesmod.delete_configmap`(*name, namespace='default', \*\*kwargs*)

Deletes the kubernetes configmap defined by name and namespace

CLI Example:

```
salt '*' kubernetes.delete_configmap settings default
salt '*' kubernetes.delete_configmap name=settings namespace=default
```

`salt.modules.kubernetesmod.delete_deployment`(*name, namespace='default', \*\*kwargs*)

Deletes the kubernetes deployment defined by name and namespace

CLI Example:

```
salt '*' kubernetes.delete_deployment my-nginx
salt '*' kubernetes.delete_deployment name=my-nginx namespace=default
```

`salt.modules.kubernetesmod.delete_namespace`(*name, \*\*kwargs*)

Deletes the kubernetes namespace defined by name

CLI Example:

```
salt '*' kubernetes.delete_namespace salt
salt '*' kubernetes.delete_namespace name=salt
```

`salt.modules.kubernetesmod.delete_pod`(*name, namespace='default', \*\*kwargs*)

Deletes the kubernetes pod defined by name and namespace

CLI Example:

```
salt '*' kubernetes.delete_pod guestbook-708336848-5nl8c default
salt '*' kubernetes.delete_pod name=guestbook-708336848-5nl8c
→ namespace=default
```

`salt.modules.kubernetesmod.delete_secret`(*name, namespace='default', \*\*kwargs*)

Deletes the kubernetes secret defined by name and namespace

CLI Example:

```
salt '*' kubernetes.delete_secret confidential default
salt '*' kubernetes.delete_secret name=confidential namespace=default
```

`salt.modules.kubernetesmod.delete_service`(*name, namespace='default', \*\*kwargs*)

Deletes the kubernetes service defined by name and namespace

CLI Example:

```
salt '*' kubernetes.delete_service my-nginx default
salt '*' kubernetes.delete_service name=my-nginx namespace=default
```

`salt.modules.kubernetesmod.deployments`(*namespace='default', \*\*kwargs*)

Return a list of kubernetes deployments defined in the namespace

CLI Example:

```
salt '*' kubernetes.deployments
salt '*' kubernetes.deployments namespace=default
```

`salt.modules.kubernetesmod.namespaces(**kwargs)`

Return the names of the available namespaces

CLI Example:

```
salt '*' kubernetes.namespaces
salt '*' kubernetes.namespaces kubeconfig=/etc/salt/k8s/kubeconfig
→ context=minikube
```

`salt.modules.kubernetesmod.node(name, **kwargs)`

Return the details of the node identified by the specified name

CLI Example:

```
salt '*' kubernetes.node name='minikube'
```

`salt.modules.kubernetesmod.node_add_label(node_name, label_name, label_value, **kwargs)`

Set the value of the label identified by `label_name` to `label_value` on the node identified by the name `node_name`. Creates the label if not present.

CLI Example:

```
salt '*' kubernetes.node_add_label node_name="minikube" label_
→ name="foo" label_value="bar"
```

`salt.modules.kubernetesmod.node_labels(name, **kwargs)`

Return the labels of the node identified by the specified name

CLI Example:

```
salt '*' kubernetes.node_labels name="minikube"
```

`salt.modules.kubernetesmod.node_remove_label(node_name, label_name, **kwargs)`

Removes the label identified by `label_name` from the node identified by the name `node_name`.

CLI Example:

```
salt '*' kubernetes.node_remove_label node_name="minikube"
→ label_name="foo"
```

`salt.modules.kubernetesmod.nodes(**kwargs)`

Return the names of the nodes composing the kubernetes cluster

CLI Example:

```
salt '*' kubernetes.nodes
salt '*' kubernetes.nodes kubeconfig=/etc/salt/k8s/kubeconfig
→ context=minikube
```

`salt.modules.kubernetesmod.ping(**kwargs)`

Checks connections with the kubernetes API server. Returns True if the connection can be established, False otherwise.

CLI Example:

```
salt '*' kubernetes.ping
```

`salt.modules.kubernetesmod.pods` (*namespace='default', \*\*kwargs*)

Return a list of kubernetes pods defined in the namespace

CLI Example:

```
salt '*' kubernetes.pods
salt '*' kubernetes.pods namespace=default
```

`salt.modules.kubernetesmod.replace_configmap` (*name, data, source=None, template=None, saltenv='base', namespace='default', \*\*kwargs*)

Replaces an existing configmap with a new one defined by name and namespace with the specified data.

CLI Example:

```
salt 'minion1' kubernetes.replace_configmap settings default '
→{"example.conf": "# example file"}'

salt 'minion2' kubernetes.replace_configmap name=settings
→namespace=default data='{"example.conf": "# example file"}'
```

`salt.modules.kubernetesmod.replace_deployment` (*name, metadata, spec, source, template, saltenv, namespace='default', \*\*kwargs*)

Replaces an existing deployment with a new one defined by name and namespace, having the specified metadata and spec.

`salt.modules.kubernetesmod.replace_secret` (*name, data, source=None, template=None, saltenv='base', namespace='default', \*\*kwargs*)

Replaces an existing secret with a new one defined by name and namespace, having the specified data.

CLI Example:

```
salt 'minion1' kubernetes.replace_secret name=passwords data='
→{"db": "letmein"}'

salt 'minion2' kubernetes.replace_secret name=passwords
→namespace=saltstack data='{"db": "passw0rd"}'
```

`salt.modules.kubernetesmod.replace_service` (*name, metadata, spec, source, template, old\_service, saltenv, namespace='default', \*\*kwargs*)

Replaces an existing service with a new one defined by name and namespace, having the specified metadata and spec.

`salt.modules.kubernetesmod.secrets` (*namespace='default', \*\*kwargs*)

Return a list of kubernetes secrets defined in the namespace

CLI Example:

```
salt '*' kubernetes.secrets
salt '*' kubernetes.secrets namespace=default
```

`salt.modules.kubernetesmod.services` (*namespace='default', \*\*kwargs*)

Return a list of kubernetes services defined in the namespace

CLI Example:

```
salt '*' kubernetes.services
salt '*' kubernetes.services namespace=default
```

`salt.modules.kubernetesmod.show_configmap` (*name*, *namespace='default'*, *\*\*kwargs*)

Return the kubernetes configmap defined by name and namespace.

CLI Example:

```
salt '*' kubernetes.show_configmap game-config default
salt '*' kubernetes.show_configmap name=game-config namespace=default
```

`salt.modules.kubernetesmod.show_deployment` (*name*, *namespace='default'*, *\*\*kwargs*)

Return the kubernetes deployment defined by name and namespace

CLI Example:

```
salt '*' kubernetes.show_deployment my-nginx default
salt '*' kubernetes.show_deployment name=my-nginx namespace=default
```

`salt.modules.kubernetesmod.show_namespace` (*name*, *\*\*kwargs*)

Return information for a given namespace defined by the specified name

CLI Example:

```
salt '*' kubernetes.show_namespace kube-system
```

`salt.modules.kubernetesmod.show_pod` (*name*, *namespace='default'*, *\*\*kwargs*)

Return POD information for a given pod name defined in the namespace

CLI Example:

```
salt '*' kubernetes.show_pod guestbook-708336848-fqr2x
salt '*' kubernetes.show_pod guestbook-708336848-fqr2x namespace=default
```

`salt.modules.kubernetesmod.show_secret` (*name*, *namespace='default'*, *decode=False*, *\*\*kwargs*)

Return the kubernetes secret defined by name and namespace. The secrets can be decoded if specified by the user. Warning: this has security implications.

CLI Example:

```
salt '*' kubernetes.show_secret confidential default
salt '*' kubernetes.show_secret name=confidential namespace=default
salt '*' kubernetes.show_secret name=confidential decode=True
```

`salt.modules.kubernetesmod.show_service` (*name*, *namespace='default'*, *\*\*kwargs*)

Return the kubernetes service defined by name and namespace

CLI Example:

```
salt '*' kubernetes.show_service my-nginx default
salt '*' kubernetes.show_service name=my-nginx namespace=default
```

## 26.6.212 salt.modules.launchctl\_service

Module for the management of MacOS systems that use launchd/launchctl

---

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see [here](#).

---

### depends

- plistlib Python module

salt.modules.launchctl\_service.**available**(job\_label)

Check that the given service is available.

CLI Example:

```
salt '*' service.available com.openssh.sshd
```

salt.modules.launchctl\_service.**disabled**(job\_label, runas=None)

Return True if the named service is disabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service label>
```

salt.modules.launchctl\_service.**enabled**(job\_label, runas=None)

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service label>
```

salt.modules.launchctl\_service.**get\_all**()

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.launchctl\_service.**missing**(job\_label)

The inverse of service.available Check that the given service is not available.

CLI Example:

```
salt '*' service.missing com.openssh.sshd
```

salt.modules.launchctl\_service.**restart**(job\_label, runas=None)

Restart the named service

CLI Example:

```
salt '*' service.restart <service label>
```

salt.modules.launchctl\_service.**start**(job\_label, runas=None)

Start the specified service

CLI Example:

```
salt '*' service.start <service label>
salt '*' service.start org.ntp.ntpd
salt '*' service.start /System/Library/LaunchDaemons/org.ntp.ntpd.plist
```

`salt.modules.launchctl_service.status`(*name*, *runas=None*)

Return the status for a service via systemd. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

#### Parameters

- **name** (*str*) -- The name of the service to check
- **runas** (*str*) -- User to run launchctl commands

#### Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

#### Return type

bool

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.launchctl_service.stop`(*job\_label*, *runas=None*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service label>
salt '*' service.stop org.ntp.ntpd
salt '*' service.stop /System/Library/LaunchDaemons/org.ntp.ntpd.plist
```

### 26.6.213 salt.modules.layman

Support for Layman

`salt.modules.layman.add`(*overlay*)

Add the given overlay from the cached remote list to your locally installed overlays. Specify 'ALL' to add all overlays from the remote list.

Return a list of the new overlay(s) added:

CLI Example:

```
salt '*' layman.add <overlay name>
```

`salt.modules.layman.delete`(*overlay*)

Remove the given overlay from the your locally installed overlays. Specify 'ALL' to remove all overlays.

Return a list of the overlays(s) that were removed:

CLI Example:

```
salt '*' layman.delete <overlay name>
```

`salt.modules.layman.list_all()`

List all overlays, including remote ones.

Return a list of available overlays:

CLI Example:

```
salt '*' layman.list_all
```

`salt.modules.layman.list_local()`

List the locally installed overlays.

Return a list of installed overlays:

CLI Example:

```
salt '*' layman.list_local
```

`salt.modules.layman.sync(overlay='ALL')`

Update the specified overlay. Use 'ALL' to synchronize all overlays. This is the default if no overlay is specified.

**overlay**

Name of the overlay to sync. (Defaults to 'ALL')

CLI Example:

```
salt '*' layman.sync
```

### 26.6.214 salt.modules.ldap3

#### Query and modify an LDAP database (alternative interface)

New in version 2016.3.0.

This is an alternative to the `ldap` interface provided by the `ldapmod` execution module.

**depends**

- `ldap` Python module

**exception** `salt.modules.ldap3.LDAPError` (*message*, *cause=None*)

Base class of all LDAP exceptions raised by backends.

This is only used for errors encountered while interacting with the LDAP server; usage errors (e.g., invalid backend name) will have a different type.

**Variables**

**cause** -- backend exception object, if applicable

`salt.modules.ldap3.add` (*connect\_spec*, *dn*, *attributes*)

Add an entry to an LDAP database.

**Parameters**

- **connect\_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **dn** -- Distinguished name of the entry.

- **attributes** -- Non-empty dict mapping each of the new entry's attributes to a non-empty iterable of values.

#### Returns

True if successful, raises an exception otherwise.

CLI Example:

```
salt '*' ldap3.add "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
    'method': 'simple',
    'password': 'secret',
  },
}" "dn='dc=example,dc=com'" "attributes={'example': 'values'}"
```

`salt.modules.ldap3.change`(*connect\_spec*, *dn*, *before*, *after*)

Modify an entry in an LDAP database.

This does the same thing as `modify()`, but with a simpler interface. Instead of taking a list of directives, it takes a before and after view of an entry, determines the differences between the two, computes the directives, and executes them.

Any attribute value present in `before` but missing in `after` is deleted. Any attribute value present in `after` but missing in `before` is added. Any attribute value in the database that is not mentioned in either `before` or `after` is not altered. Any attribute value that is present in both `before` and `after` is ignored, regardless of whether that attribute value exists in the database.

#### Parameters

- **connect\_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **dn** -- Distinguished name of the entry.
- **before** -- The expected state of the entry before modification. This is a dict mapping each attribute name to an iterable of values.
- **after** -- The desired state of the entry after modification. This is a dict mapping each attribute name to an iterable of values.

#### Returns

True if successful, raises an exception otherwise.

CLI Example:

```
salt '*' ldap3.change "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
    'method': 'simple',
    'password': 'secret'
  }
}" dn='cn=admin,dc=example,dc=com'
before="{ 'example_value': 'before_val' }"
after="{ 'example_value': 'after_val' }"
```

`salt.modules.ldap3.connect`(*connect\_spec=None*)

Connect and optionally bind to an LDAP server.

#### Parameters

- **connect\_spec** -- This can be an LDAP connection object returned by a previous call to

`connect()` (in which case the argument is simply returned), `None` (in which case an empty dict is used), or a dict with the following keys:

- **'backend'**  
Optional; default depends on which Python LDAP modules are installed. Name of the Python LDAP module to use. Only `'ldap'` is supported at the moment.
- **'url'**  
Optional; defaults to `'ldapi:///'`. URL to the LDAP server.
- **'bind'**  
Optional; defaults to `None`. Describes how to bind an identity to the LDAP connection. If `None`, an anonymous connection is made. Valid keys:
  - **'method'**  
Optional; defaults to `None`. The authentication method to use. Valid values include but are not necessarily limited to `'simple'`, `'sasl'`, and `None`. If `None`, an anonymous connection is made. Available methods depend on the chosen backend.
  - **'mechanism'**  
Optional; defaults to `'EXTERNAL'`. The SASL mechanism to use. Ignored unless the method is `'sasl'`. Available methods depend on the chosen backend and the server's capabilities.
  - **'credentials'**  
Optional; defaults to `None`. An object specific to the chosen SASL mechanism and backend that represents the authentication credentials. Ignored unless the method is `'sasl'`.  
  
For the `'ldap'` backend, this is a dictionary. If `None`, an empty dict is used. Keys:
    - \* **'args'**  
Optional; defaults to an empty list. A list of arguments to pass to the SASL mechanism constructor. See the SASL mechanism constructor documentation in the `ldap.sasl` Python module.
    - \* **'kwargs'**  
Optional; defaults to an empty dict. A dict of keyword arguments to pass to the SASL mechanism constructor. See the SASL mechanism constructor documentation in the `ldap.sasl` Python module.
  - **'dn'**  
Optional; defaults to an empty string. The distinguished name to bind.
  - **'password'**  
Optional; defaults to an empty string. Password for binding. Ignored if the method is `'sasl'`.
- **'tls'**  
Optional; defaults to `None`. A backend-specific object containing settings to override default TLS behavior.  
  
For the `'ldap'` backend, this is a dictionary. Not all settings in this dictionary are supported by all versions of `python-ldap` or the underlying TLS library. If `None`, an empty dict is used. Possible keys:
  - **'starttls'**  
If present, initiate a TLS connection using StartTLS. (The value associated with this key is ignored.)

- **'cacertdir'**  
Set the path of the directory containing CA certificates.
- **'cacertfile'**  
Set the pathname of the CA certificate file.
- **'certfile'**  
Set the pathname of the certificate file.
- **'cipher\_suite'**  
Set the allowed cipher suite.
- **'crlcheck'**  
Set the CRL evaluation strategy. Valid values are 'none', 'peer', and 'all'.
- **'crlfile'**  
Set the pathname of the CRL file.
- **'dhfile'**  
Set the pathname of the file containing the parameters for Diffie-Hellman ephemeral key exchange.
- **'keyfile'**  
Set the pathname of the certificate key file.
- **'newctx'**  
If present, instruct the underlying TLS library to create a new TLS context. (The value associated with this key is ignored.)
- **'protocol\_min'**  
Set the minimum protocol version.
- **'random\_file'**  
Set the pathname of the random file when /dev/random and /dev/urandom are not available.
- **'require\_cert'**  
Set the certificate validation policy. Valid values are 'never', 'hard', 'demand', 'allow', and 'try'.

- **'opts'**

Optional; defaults to None. A backend-specific object containing options for the backend.

For the 'ldap' backend, this is a dictionary of OpenLDAP options to set. If None, an empty dict is used. Each key is a the name of an OpenLDAP option constant without the 'LDAP\_OPT\_' prefix, then converted to lower case.

### Returns

an object representing an LDAP connection that can be used as the `connect_spec` argument to any of the functions in this module (to avoid the overhead of making and terminating multiple connections).

This object should be used as a context manager. It is safe to nest `with` statements.

CLI Example:

```
salt '*' ldap3.connect "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
```

(continues on next page)

(continued from previous page)

```
'method': 'simple',
'dn': 'cn=admin,dc=example,dc=com',
'password': 'secret'}
}"
```

`salt.modules.ldap3.delete(connect_spec, dn)`

Delete an entry from an LDAP database.

#### Parameters

- **connect\_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **dn** -- Distinguished name of the entry.

#### Returns

True if successful, raises an exception otherwise.

CLI Example:

```
salt '*' ldap3.delete "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
    'method': 'simple',
    'password': 'secret'}
}" dn='cn=admin,dc=example,dc=com'
```

`salt.modules.ldap3.modify(connect_spec, dn, directives)`

Modify an entry in an LDAP database.

#### Parameters

- **connect\_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **dn** -- Distinguished name of the entry.
- **directives** -- Iterable of directives that indicate how to modify the entry. Each directive is a tuple of the form `(op, attr, vals)`, where:
  - `op` identifies the modification operation to perform. One of:
    - \* `'add'` to add one or more values to the attribute
    - \* `'delete'` to delete some or all of the values from the attribute. If no values are specified with this operation, all of the attribute's values are deleted. Otherwise, only the named values are deleted.
    - \* `'replace'` to replace all of the attribute's values with zero or more new values
  - `attr` names the attribute to modify
  - `vals` is an iterable of values to add or delete

#### Returns

True if successful, raises an exception otherwise.

CLI Example:

```
salt '*' ldap3.modify "{
  'url': 'ldaps://ldap.example.com/',
  'bind': {
```

(continues on next page)

(continued from previous page)

```
'method': 'simple',
'password': 'secret'}
}" dn='cn=admin,dc=example,dc=com'
directives=('add', 'example', ['example_val'])"
```

```
salt.modules.ldap3.search(connect_spec, base, scope='subtree', filterstr='(objectClass=*)', attrlist=None,
attrsonly=0)
```

Search an LDAP database.

#### Parameters

- **connect\_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **base** -- Distinguished name of the entry at which to start the search.
- **scope** -- One of the following:
  - **'subtree'**  
Search the base and all of its descendants.
  - **'base'**  
Search only the base itself.
  - **'onelevel'**  
Search only the base's immediate children.
- **filterstr** -- String representation of the filter to apply in the search.
- **attrlist** -- Limit the returned attributes to those in the specified list. If `None`, all attributes of each entry are returned.
- **attrsonly** -- If non-zero, don't return any attribute values.

#### Returns

a dict of results. The dict is empty if there are no results. The dict maps each returned entry's distinguished name to a dict that maps each of the matching attribute names to a list of its values.

CLI Example:

```
salt '*' ldap3.search "{
'url': 'ldaps://ldap.example.com/',
'bind': {
'method': 'simple',
'dn': 'cn=admin,dc=example,dc=com',
'password': 'secret',
},
}" "base='dc=example,dc=com'"
```

## 26.6.215 salt.modules.ldapmod

Salt interface to LDAP commands

### depends

- ldap Python module

### configuration

In order to connect to LDAP, certain configuration is required in the minion config on the LDAP server. The minimum configuration items that must be set are:

```
ldap.basedn: dc=acme,dc=com (example values, adjust to suit)
```

If your LDAP server requires authentication then you must also set:

```
ldap.anonymous: False
ldap.binddn: admin
ldap.bindpw: password
```

In addition, the following optional values may be set:

```
ldap.server: localhost (default=localhost, see warning below)
ldap.port: 389 (default=389, standard port)
ldap.tls: False (default=False, no TLS)
ldap.no_verify: False (default=False, verify TLS)
ldap.anonymous: True (default=True, bind anonymous)
ldap.scope: 2 (default=2, ldap.SCOPE_SUBTREE)
ldap.attrs: [saltAttr] (default=None, return all attributes)
```

**Warning:** At the moment this module only recommends connection to LDAP services listening on localhost. This is deliberate to avoid the potentially dangerous situation of multiple minions sending identical update commands to the same LDAP server. It's easy enough to override this behavior, but badness may ensue - you have been warned.

`salt.modules.ldapmod.search` (*filter*, *dn=None*, *scope=None*, *attrs=None*, *\*\*kwargs*)

Run an arbitrary LDAP query and return the results.

CLI Example:

```
salt 'ldaphost' ldap.search "filter=cn=myhost"
```

Return data:

```
{'myhost': {'count': 1,
            'results': [['cn=myhost,ou=hosts,o=acme,c=gb',
                        {'saltKeyValue': ['ntpserver=ntp.acme.local',
                                           'foo=myfoo'],
                         'saltState': ['foo', 'bar']}]]],
            'time': {'human': '1.2ms', 'raw': '0.00123'}}}
```

Search and connection options can be overridden by specifying the relevant option as key=value pairs, for example:

```
salt 'ldaphost' ldap.search filter=cn=myhost dn=ou=hosts,o=acme,c=gb
scope=1 attrs='' server='localhost' port='7393' tls=True bindpw='ssh'
```

## 26.6.216 salt.modules.libcloud\_compute

### Apache Libcloud Compute Management

Connection module for Apache Libcloud Compute management for a full list of supported clouds, see [http://libcloud.readthedocs.io/en/latest/compute/supported\\_providers.html](http://libcloud.readthedocs.io/en/latest/compute/supported_providers.html)

Clouds include Amazon EC2, Azure, Google GCE, VMware, OpenStack Nova

New in version 2018.3.0.

#### configuration

This module uses a configuration profile for one or multiple cloud providers

```
libcloud_compute:
  profile_test1:
    driver: google
    key: service-account@googlecloud.net
    secret: /path/to.key.json
  profile_test2:
    driver: arm
    key: 12345
    secret: mysecret
```

#### depends

apache-libcloud

`salt.modules.libcloud_compute.attach_volume` (*node\_id*, *volume\_id*, *profile*, *device=None*, *\*\*libcloud\_kwargs*)

Attaches volume to node.

#### Parameters

- **node\_id** (str) -- Node ID to target
- **volume\_id** (str) -- Volume ID from which to attach
- **profile** (str) -- The profile key
- **device** (str) -- Where the device is exposed, e.g. '/dev/sdb'
- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's `attach_volume` method

CLI Example:

```
salt myminion libcloud_compute.detach_volume vol1 profile1
```

`salt.modules.libcloud_compute.copy_image` (*source\_region*, *image\_id*, *name*, *profile*, *description=None*, *\*\*libcloud\_kwargs*)

Copies an image from a source region to the current region.

#### Parameters

- **source\_region** (str) -- Region to copy the node from.
- **image\_id** (str) -- Image to copy.

- **name** (str) -- name for new image.
- **profile** (str) -- The profile key
- **description** -- description for new image.
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's copy\_image method

CLI Example:

```
salt myminion libcloud_compute.copy_image us-east1 image1 'new image'
↳profile1
```

`salt.modules.libcloud_compute.create_image`(*node\_id*, *name*, *profile*, *description=None*,  
*\*\*libcloud\_kwarg*s)

Create an image from a node

#### Parameters

- **node\_id** (str) -- Node to run the task on.
- **name** (str) -- name for new image.
- **profile** (str) -- The profile key
- **description** (*description*) -- description for new image.
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's create\_image method

CLI Example:

```
salt myminion libcloud_compute.create_image server1 my_image profile1
salt myminion libcloud_compute.create_image server1 my_image profile1
↳description='test image'
```

`salt.modules.libcloud_compute.create_key_pair`(*name*, *profile*, *\*\*libcloud\_kwarg*s)

Create a single key pair by name

#### Parameters

- **name** (str) -- Name of the key pair to create.
- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's create\_key\_pair method

CLI Example:

```
salt myminion libcloud_compute.create_key_pair pair1 profile1
```

`salt.modules.libcloud_compute.create_volume`(*size*, *name*, *profile*, *location\_id=None*,  
*\*\*libcloud\_kwarg*s)

Create a storage volume

#### Parameters

- **size** (int) -- Size of volume in gigabytes (required)
- **name** (str) -- Name of the volume to be created
- **location\_id** (str) -- Which data center to create a volume in. If empty, undefined behavior will be selected. (optional)
- **profile** (str) -- The profile key

- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's list\_volumes method

CLI Example:

```
salt myminion libcloud_compute.create_volume 1000 vol1 profile1
```

`salt.modules.libcloud_compute.create_volume_snapshot`(*volume\_id*, *profile*, *name=None*, *\*\*libcloud\_kwargs*)

Create a storage volume snapshot

#### Parameters

- **volume\_id** (str) -- Volume ID from which to create the new snapshot.
- **profile** (str) -- The profile key
- **name** (str) -- Name of the snapshot to be created (optional)
- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's create\_volume\_snapshot method

CLI Example:

```
salt myminion libcloud_compute.create_volume_snapshot vol1 profile1
```

`salt.modules.libcloud_compute.delete_image`(*image\_id*, *profile*, *\*\*libcloud\_kwargs*)

Delete an image of a node

#### Parameters

- **image\_id** (str) -- Image to delete
- **profile** (str) -- The profile key
- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's delete\_image method

CLI Example:

```
salt myminion libcloud_compute.delete_image image1 profile1
```

`salt.modules.libcloud_compute.delete_key_pair`(*name*, *profile*, *\*\*libcloud\_kwargs*)

Delete a key pair

#### Parameters

- **name** (str) -- Key pair name.
- **profile** (str) -- The profile key
- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's import\_key\_pair\_from\_xxx method

CLI Example:

```
salt myminion libcloud_compute.delete_key_pair pair1 profile1
```

`salt.modules.libcloud_compute.destroy_node`(*node\_id*, *profile*, *\*\*libcloud\_kwargs*)

Destroy a node in the cloud

#### Parameters

- **node\_id** (str) -- Unique ID of the node to destroy
- **profile** (str) -- The profile key

- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's `destroy_node` method

CLI Example:

```
salt myminion libcloud_compute.destroy_node as-2346 profile1
```

`salt.modules.libcloud_compute.destroy_volume`(*volume\_id*, *profile*, *\*\*libcloud\_kwarg*s)

Destroy a volume.

Parameters

- **volume\_id** (str) -- Volume ID from which to destroy
- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's `destroy_volume` method

CLI Example:

```
salt myminion libcloud_compute.destroy_volume vol1 profile1
```

`salt.modules.libcloud_compute.destroy_volume_snapshot`(*volume\_id*, *snapshot\_id*, *profile*, *\*\*libcloud\_kwarg*s)

Destroy a volume snapshot.

Parameters

- **volume\_id** (str) -- Volume ID from which the snapshot belongs
- **snapshot\_id** (str) -- Volume Snapshot ID from which to destroy
- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's `destroy_volume_snapshot` method

CLI Example:

```
salt myminion libcloud_compute.destroy_volume_snapshot snap1 profile1
```

`salt.modules.libcloud_compute.detach_volume`(*volume\_id*, *profile*, *\*\*libcloud\_kwarg*s)

Detaches a volume from a node.

Parameters

- **volume\_id** (str) -- Volume ID from which to detach
- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's `detach_volume` method

CLI Example:

```
salt myminion libcloud_compute.detach_volume vol1 profile1
```

`salt.modules.libcloud_compute.extra`(*method*, *profile*, *\*\*libcloud\_kwarg*s)

Call an extended method on the driver

Parameters

- **method** (str) -- Driver's method name
- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's method

CLI Example:

```
salt myminion libcloud_compute.extra ex_get_permissions google container_
↳name=my_container object_name=me.jpg --out=yaml
```

`salt.modules.libcloud_compute.get_image`(*image\_id*, *profile*, *\*\*libcloud\_kwargs*)

Get an image of a node

#### Parameters

- **image\_id** (str) -- Image to fetch
- **profile** (str) -- The profile key
- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's `delete_image` method

CLI Example:

```
salt myminion libcloud_compute.get_image image1 profile1
```

`salt.modules.libcloud_compute.get_key_pair`(*name*, *profile*, *\*\*libcloud\_kwargs*)

Get a single key pair by name

#### Parameters

- **name** (str) -- Name of the key pair to retrieve.
- **profile** (str) -- The profile key
- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's `get_key_pair` method

CLI Example:

```
salt myminion libcloud_compute.get_key_pair pair1 profile1
```

`salt.modules.libcloud_compute.import_key_pair`(*name*, *key*, *profile*, *key\_type=None*, *\*\*libcloud\_kwargs*)

Import a new public key from string or a file path

#### Parameters

- **name** (str) -- Key pair name.
- **key** (str or path str) -- Public key material, the string or a path to a file
- **profile** (str) -- The profile key
- **key\_type** (str) -- The key pair type, either *FILE* or *STRING*. Will detect if not provided and assume that if the string is a path to an existing path it is a *FILE*, else *STRING*.
- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's `import_key_pair_from_xxx` method

CLI Example:

```
salt myminion libcloud_compute.import_key_pair pair1 key_value_data123
↳profile1
salt myminion libcloud_compute.import_key_pair pair1 /path/to/key profile1
```

`salt.modules.libcloud_compute.list_images`(*profile*, *location\_id=None*, *\*\*libcloud\_kwargs*)

Return a list of images for this cloud

#### Parameters

- **profile** (str) -- The profile key
- **location\_id** (str) -- The location key, from list\_locations
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's list\_images method

CLI Example:

```
salt myminion libcloud_compute.list_images profile1
```

`salt.modules.libcloud_compute.list_key_pairs(profile, **libcloud_kwarg`s)

List all the available key pair objects.

**Parameters**

- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's list\_key\_pairs method

CLI Example:

```
salt myminion libcloud_compute.list_key_pairs profile1
```

`salt.modules.libcloud_compute.list_locations(profile, **libcloud_kwarg`s)

Return a list of locations for this cloud

**Parameters**

- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's list\_locations method

CLI Example:

```
salt myminion libcloud_compute.list_locations profile1
```

`salt.modules.libcloud_compute.list_nodes(profile, **libcloud_kwarg`s)

Return a list of nodes

**Parameters**

- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's list\_nodes method

CLI Example:

```
salt myminion libcloud_compute.list_nodes profile1
```

`salt.modules.libcloud_compute.list_sizes(profile, location_id=None, **libcloud_kwarg`s)

Return a list of node sizes

**Parameters**

- **profile** (str) -- The profile key
- **location\_id** (str) -- The location key, from list\_locations
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's list\_sizes method

CLI Example:

```
salt myminion libcloud_compute.list_sizes profile1
salt myminion libcloud_compute.list_sizes profile1 us-east1
```

`salt.modules.libcloud_compute.list_volume_snapshots`(*volume\_id*, *profile*, *\*\*libcloud\_kwargs*)

Return a list of storage volumes snapshots for this cloud

**Parameters**

- **volume\_id** (str) -- The volume identifier
- **profile** (str) -- The profile key
- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's `list_volume_snapshots` method

CLI Example:

```
salt myminion libcloud_compute.list_volume_snapshots vol1 profile1
```

`salt.modules.libcloud_compute.list_volumes`(*profile*, *\*\*libcloud\_kwargs*)

Return a list of storage volumes for this cloud

**Parameters**

- **profile** (str) -- The profile key
- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's `list_volumes` method

CLI Example:

```
salt myminion libcloud_compute.list_volumes profile1
```

`salt.modules.libcloud_compute.reboot_node`(*node\_id*, *profile*, *\*\*libcloud\_kwargs*)

Reboot a node in the cloud

**Parameters**

- **node\_id** (str) -- Unique ID of the node to reboot
- **profile** (str) -- The profile key
- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's `reboot_node` method

CLI Example:

```
salt myminion libcloud_compute.reboot_node as-2346 profile1
```

## 26.6.217 salt.modules.libcloud\_dns

### Apache Libcloud DNS Management

Connection module for Apache Libcloud DNS management

New in version 2016.11.0.

**configuration**

This module uses a configuration profile for one or multiple DNS providers

```
libcloud_dns:
  profile_test1:
    driver: cloudflare
    key: 12345
    secret: mysecret
  profile_test2:
```

(continues on next page)

(continued from previous page)

```

driver: godaddy
key: 12345
secret: mysecret
shopper_id: 12345

```

**depends**

```
apache-libcloud
```

```
salt.modules.libcloud_dns.create_record(name, zone_id, type, data, profile)
```

Create a new record.

**Parameters**

- **name** (str) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string (") for this argument.
- **zone\_id** (str) -- Zone where the requested record is created.
- **type** (str) -- DNS record type (A, AAAA, ...).
- **data** (str) -- Data for the record (depends on the record type).
- **profile** (str) -- The profile key

CLI Example:

```

salt myminion libcloud_dns.create_record www google.com A 12.32.12.2
→profile1

```

```
salt.modules.libcloud_dns.create_zone(domain, profile, type='master', ttl=None)
```

Create a new zone.

**Parameters**

- **domain** (str) -- Zone domain name (e.g. example.com)
- **profile** (str) -- The profile key
- **type** (str) -- Zone type (master / slave).
- **ttl** (int) -- TTL for new records. (optional)

CLI Example:

```

salt myminion libcloud_dns.create_zone google.com profile1

```

```
salt.modules.libcloud_dns.delete_record(zone_id, record_id, profile)
```

Delete a record.

**Parameters**

- **zone\_id** (str) -- Zone to delete.
- **record\_id** (str) -- Record to delete.
- **profile** (str) -- The profile key

**Return type**

```
bool
```

CLI Example:

```

salt myminion libcloud_dns.delete_record google.com www profile1

```

`salt.modules.libcloud_dns.delete_zone(zone_id, profile)`

Delete a zone.

Parameters

- **zone\_id** (str) -- Zone to delete.
- **profile** (str) -- The profile key

Return type

bool

CLI Example:

```
salt myminion libcloud_dns.delete_zone google.com profile1
```

`salt.modules.libcloud_dns.extra(method, profile, **libcloud_kwargs)`

Call an extended method on the driver

Parameters

- **method** (str) -- Driver's method name
- **profile** (str) -- The profile key
- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's delete\_container method

CLI Example:

```
salt myminion libcloud_dns.extra ex_get_permissions google container_
→name=my_container object_name=me.jpg --out=yaml
```

`salt.modules.libcloud_dns.get_bind_data(zone_id, profile)`

Export Zone to the BIND compatible format.

Parameters

- **zone\_id** (str) -- Zone to export.
- **profile** (str) -- The profile key

Returns

Zone data in BIND compatible format.

Return type

str

CLI Example:

```
salt myminion libcloud_dns.get_bind_data google.com profile1
```

`salt.modules.libcloud_dns.get_record(zone_id, record_id, profile)`

Get record information for the given zone\_id on the given profile

Parameters

- **zone\_id** (str) -- Zone to export.
- **record\_id** (str) -- Record to delete.
- **profile** (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.get_record google.com www profile1
```

`salt.modules.libcloud_dns.get_zone(zone_id, profile)`

Get zone information for the given zone\_id on the given profile

Parameters

- **zone\_id** (str) -- Zone to export.
- **profile** (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.get_zone google.com profile1
```

`salt.modules.libcloud_dns.list_record_types(profile)`

List available record types for the given profile, e.g. A, AAAA

**Parameters**

- **profile** (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.list_record_types profile1
```

`salt.modules.libcloud_dns.list_records(zone_id, profile, type=None)`

List records for the given zone\_id on the given profile

**Parameters**

- **zone\_id** (str) -- Zone to export.
- **profile** (str) -- The profile key
- **type** (str) -- The record type, e.g. A, NS

CLI Example:

```
salt myminion libcloud_dns.list_records google.com profile1
```

`salt.modules.libcloud_dns.list_zones(profile)`

List zones for the given profile

**Parameters**

- **profile** (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.list_zones profile1
```

`salt.modules.libcloud_dns.update_zone(zone_id, domain, profile, type='master', ttl=None)`

Update an existing zone.

**Parameters**

- **zone\_id** (str) -- Zone ID to update.
- **domain** (str) -- Zone domain name (e.g. example.com)
- **profile** (str) -- The profile key
- **type** (str) -- Zone type (master / slave).
- **ttl** (int) -- TTL for new records. (optional)

CLI Example:

```
salt myminion libcloud_dns.update_zone google.com google.com profile1 ↵
↪ type=slave
```

## 26.6.218 salt.modules.libcloud\_loadbalancer

### Apache Libcloud Load Balancer Management

Connection module for Apache Libcloud Storage load balancer management for a full list of supported clouds, see [http://libcloud.readthedocs.io/en/latest/loadbalancer/supported\\_providers.html](http://libcloud.readthedocs.io/en/latest/loadbalancer/supported_providers.html)

Clouds include Amazon ELB, ALB, Google, Aliyun, CloudStack, Softlayer

New in version 2018.3.0.

#### configuration

This module uses a configuration profile for one or multiple Storage providers

```
libcloud_loadbalancer:
  profile_test1:
    driver: gce
    key: G00G0123456789ABCXYZ
    secret: mysecret
  profile_test2:
    driver: alb
    key: 12345
    secret: mysecret
```

#### depends

apache-libcloud

`salt.modules.libcloud_loadbalancer.balancer_attach_member` (*balancer\_id, ip, port, profile, extra=None, \*\*libcloud\_kwargs*)

Add a new member to the load balancer

#### Parameters

- **balancer\_id** (str) -- id of a load balancer you want to fetch
- **ip** (str) -- IP address for the new member
- **port** (int) -- Port for the new member
- **profile** (str) -- The profile key
- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's `balancer_attach_member` method

CLI Example:

```
salt myminion libcloud_storage.balancer_attach_member balancer123 1.2.3.4 80 profile1
```

`salt.modules.libcloud_loadbalancer.balancer_detach_member` (*balancer\_id, member\_id, profile, \*\*libcloud\_kwargs*)

Add a new member to the load balancer

#### Parameters

- **balancer\_id** (str) -- id of a load balancer you want to fetch
- **ip** (str) -- IP address for the new member
- **port** (int) -- Port for the new member
- **profile** (str) -- The profile key

- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's balancer\_detach\_member method

CLI Example:

```
salt myminion libcloud_storage.balancer_detach_member balancer123
→member123 profile1
```

`salt.modules.libcloud_loadbalancer.create_balancer` (*name, port, protocol, profile, algorithm=None, members=None, \*\*libcloud\_kwarg*s)

Create a new load balancer instance

#### Parameters

- **name** (str) -- Name of the new load balancer (required)
- **port** (str) -- Port the load balancer should listen on, defaults to 80
- **protocol** (str) -- Loadbalancer protocol, defaults to http.
- **algorithm** (str) -- Load balancing algorithm, defaults to ROUND\_ROBIN. See Algorithm type in Libcloud documentation for a full listing.
- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's create\_balancer method

#### Returns

The details of the new balancer

CLI Example:

```
salt myminion libcloud_storage.create_balancer my_balancer 80 http
→profile1
```

`salt.modules.libcloud_loadbalancer.destroy_balancer` (*balancer\_id, profile, \*\*libcloud\_kwarg*s)

Destroy a load balancer

#### Parameters

- **balancer\_id** (str) -- LoadBalancer ID which should be used
- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's destroy\_balancer method

#### Returns

True if the destroy was successful, otherwise False.

#### Return type

bool

CLI Example:

```
salt myminion libcloud_storage.destroy_balancer balancer_1 profile1
```

`salt.modules.libcloud_loadbalancer.extra` (*method, profile, \*\*libcloud\_kwarg*s)

Call an extended method on the driver

#### Parameters

- **method** (str) -- Driver's method name
- **profile** (str) -- The profile key

- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's method

CLI Example:

```
salt myminion libcloud_loadbalancer.extra ex_get_permissions google
→container_name=my_container object_name=me.jpg --out=yaml
```

`salt.modules.libcloud_loadbalancer.get_balancer` (*balancer\_id*, *profile*, *\*\*libcloud\_kwarg*s)

Get the details for a load balancer by ID

#### Parameters

- **balancer\_id** (str) -- id of a load balancer you want to fetch
- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's `get_balancer` method

#### Returns

the load balancer details

CLI Example:

```
salt myminion libcloud_storage.get_balancer balancer123 profile1
```

`salt.modules.libcloud_loadbalancer.get_balancer_by_name` (*name*, *profile*, *\*\*libcloud\_kwarg*s)

Get the details for a load balancer by name

#### Parameters

- **name** (str) -- Name of a load balancer you want to fetch
- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's `list_balancers` method

#### Returns

the load balancer details

CLI Example:

```
salt myminion libcloud_storage.get_balancer_by_name my_balancer profile1
```

`salt.modules.libcloud_loadbalancer.list_balancer_members` (*balancer\_id*, *profile*, *\*\*libcloud\_kwarg*s)

List the members of a load balancer

#### Parameters

- **balancer\_id** (str) -- id of a load balancer you want to fetch
- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's `list_balancer_members` method

CLI Example:

```
salt myminion libcloud_storage.list_balancer_members balancer123 profile1
```

`salt.modules.libcloud_loadbalancer.list_balancers` (*profile*, *\*\*libcloud\_kwarg*s)

Return a list of load balancers.

#### Parameters

- **profile** (str) -- The profile key

- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's list\_balancers method

CLI Example:

```
salt myminion libcloud_storage.list_balancers profile1
```

`salt.modules.libcloud_loadbalancer.list_protocols(profile, **libcloud_kwarg`s)

Return a list of supported protocols.

**Parameters**

- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's list\_protocols method

**Returns**

a list of supported protocols

**Return type**

list of str

CLI Example:

```
salt myminion libcloud_storage.list_protocols profile1
```

`salt.modules.libcloud_loadbalancer.list_supported_algorithms(profile, **libcloud_kwarg`s)

Get the supported algorithms for a profile

**Parameters**

- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's list\_supported\_algorithms method

**Returns**

The supported algorithms

CLI Example:

```
salt myminion libcloud_storage.list_supported_algorithms profile1
```

## 26.6.219 salt.modules.libcloud\_storage

### Apache Libcloud Storage Management

Connection module for Apache Libcloud Storage (object/blob) management for a full list of supported clouds, see [http://libcloud.readthedocs.io/en/latest/storage/supported\\_providers.html](http://libcloud.readthedocs.io/en/latest/storage/supported_providers.html)

Clouds include Amazon S3, Google Storage, Aliyun, Azure Blobs, Ceph, OpenStack swift

New in version 2018.3.0.

**configuration**

This module uses a configuration profile for one or multiple Storage providers

```
libcloud_storage:
  profile_test1:
    driver: google_storage
    key: G00G0123456789ABCXYZ
```

(continues on next page)

(continued from previous page)

```

secret: mysecret
profile_test2:
driver: s3
key: 12345
secret: mysecret

```

**depends**

apache-libcloud

`salt.modules.libcloud_storage.create_container` (*container\_name*, *profile*, *\*\*libcloud\_kwargs*)

Create a container in the cloud

**Parameters**

- **container\_name** (str) -- Container name
- **profile** (str) -- The profile key
- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's `create_container` method

CLI Example:

```
salt myminion libcloud_storage.create_container MyFolder profile1
```

`salt.modules.libcloud_storage.delete_container` (*container\_name*, *profile*, *\*\*libcloud\_kwargs*)

Delete an object container in the cloud

**Parameters**

- **container\_name** (str) -- Container name
- **profile** (str) -- The profile key
- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's `delete_container` method

**Returns**

True if an object container has been successfully deleted, False otherwise.

**Return type**

bool

CLI Example:

```
salt myminion libcloud_storage.delete_container MyFolder profile1
```

`salt.modules.libcloud_storage.delete_object` (*container\_name*, *object\_name*, *profile*, *\*\*libcloud\_kwargs*)

Delete an object in the cloud

**Parameters**

- **container\_name** (str) -- Container name
- **object\_name** (str) -- Object name
- **profile** (str) -- The profile key
- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's `delete_object` method

**Returns**

True if an object has been successfully deleted, False otherwise.

**Return type**

bool

CLI Example:

```
salt myminion libcloud_storage.delete_object MyFolder me.jpg profile1
```

```
salt.modules.libcloud_storage.download_object(container_name, object_name, destination_path,
profile, overwrite_existing=False,
delete_on_failure=True, **libcloud_kwargs)
```

Download an object to the specified destination path.

#### Parameters

- **container\_name** (str) -- Container name
- **object\_name** (str) -- Object name
- **destination\_path** (str) -- Full path to a file or a directory where the incoming file will be saved.
- **profile** (str) -- The profile key
- **overwrite\_existing** (bool) -- True to overwrite an existing file, defaults to False.
- **delete\_on\_failure** (bool) -- True to delete a partially downloaded file if the download was not successful (hash mismatch / file size).
- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's download\_object method

#### Returns

True if an object has been successfully downloaded, False otherwise.

#### Return type

bool

CLI Example:

```
salt myminion libcloud_storage.download_object MyFolder me.jpg /tmp/me.
→jpg profile1
```

```
salt.modules.libcloud_storage.extra(method, profile, **libcloud_kwargs)
```

Call an extended method on the driver

#### Parameters

- **method** (str) -- Driver's method name
- **profile** (str) -- The profile key
- **libcloud\_kwargs** (dict) -- Extra arguments for the driver's delete\_container method

CLI Example:

```
salt myminion libcloud_storage.extra ex_get_permissions google container_
→name=my_container object_name=me.jpg --out=yaml
```

```
salt.modules.libcloud_storage.get_container(container_name, profile, **libcloud_kwargs)
```

List container details for the given container\_name on the given profile

#### Parameters

- **container\_name** (str) -- Container name
- **profile** (str) -- The profile key

- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's `get_container` method

CLI Example:

```
salt myminion libcloud_storage.get_container MyFolder profile1
```

`salt.modules.libcloud_storage.get_container_object` (*container\_name*, *object\_name*, *profile*, *\*\*libcloud\_kwarg*s)

Get the details for a container object (file or object in the cloud)

Parameters

- **container\_name** (str) -- Container name
- **object\_name** (str) -- Object name
- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's `get_container_object` method

CLI Example:

```
salt myminion libcloud_storage.get_container_object MyFolder MyFile.xyz
↳ profile1
```

`salt.modules.libcloud_storage.list_container_objects` (*container\_name*, *profile*, *\*\*libcloud\_kwarg*s)

List container objects (e.g. files) for the given `container_id` on the given profile

Parameters

- **container\_name** (str) -- Container name
- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's `list_container_objects` method

CLI Example:

```
salt myminion libcloud_storage.list_container_objects MyFolder profile1
```

`salt.modules.libcloud_storage.list_containers` (*profile*, *\*\*libcloud\_kwarg*s)

Return a list of containers.

Parameters

- **profile** (str) -- The profile key
- **libcloud\_kwarg**s (dict) -- Extra arguments for the driver's `list_containers` method

CLI Example:

```
salt myminion libcloud_storage.list_containers profile1
```

`salt.modules.libcloud_storage.upload_object` (*file\_path*, *container\_name*, *object\_name*, *profile*, *extra=None*, *verify\_hash=True*, *headers=None*, *\*\*libcloud\_kwarg*s)

Upload an object currently located on a disk.

Parameters

- **file\_path** (str) -- Path to the object on disk.

- **container\_name** (str) -- Destination container.
- **object\_name** (str) -- Object name.
- **profile** (str) -- The profile key
- **verify\_hash** (bool) -- Verify hash
- **extra** (dict) -- Extra attributes (driver specific). (optional)
- **headers** (dict) -- (optional) Additional request headers, such as CORS headers. For example: headers = {'Access-Control-Allow-Origin': 'http://mozilla.com'}
- **libcloud\_kwarg** (dict) -- Extra arguments for the driver's upload\_object method

**Returns**

The object name in the cloud

**Return type**

str

CLI Example:

```
salt myminion libcloud_storage.upload_object /file/to/me.jpg MyFolder me.
→jpg profile1
```

### 26.6.220 salt.modules.linux\_acl

Support for Linux File Access Control Lists

The Linux ACL module requires the *getfacl* and *setfacl* binaries.

**salt.modules.linux\_acl.delfacl**(*acl\_type*, *acl\_name*=", \*args, \*\*kwargs)

Remove specific FAACL from the specified file(s)

CLI Examples:

```
salt '*' acl.delfacl user myuser /tmp/house/kitchen
salt '*' acl.delfacl default:group mygroup /tmp/house/kitchen
salt '*' acl.delfacl d:u myuser /tmp/house/kitchen
salt '*' acl.delfacl g myuser /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.delfacl user myuser /tmp/house/kitchen recursive=True
```

**salt.modules.linux\_acl.getfacl**(*\*args*, *\*\*kwargs*)

Return (extremely verbose) map of FAACLs on specified file(s)

CLI Examples:

```
salt '*' acl.getfacl /tmp/house/kitchen
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom
→recursive=True
```

**salt.modules.linux\_acl.modfacl**(*acl\_type*, *acl\_name*=", *perms*=", \*args, \*\*kwargs)

Add or modify a FAACL for the specified file(s)

CLI Examples:

```

salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen
salt '*' acl.modfacl default:group mygroup rx /tmp/house/kitchen
salt '*' acl.modfacl d:u myuser 7 /tmp/house/kitchen
salt '*' acl.modfacl g mygroup 0 /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen recursive=True
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen raise_err=True

```

`salt.modules.linux_acl.version()`

Return facl version from getfacl --version

CLI Example:

```
salt '*' acl.version
```

`salt.modules.linux_acl.wipefacls(*args, **kwargs)`

Remove all ACLs from the specified file(s)

CLI Examples:

```

salt '*' acl.wipefacls /tmp/house/kitchen
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom
→ recursive=True

```

### 26.6.221 salt.modules.linux\_ip

The networking module for Non-RH/Deb Linux distros

`salt.modules.linux_ip.down(iface, iface_type=None)`

Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

`salt.modules.linux_ip.get_interface(iface)`

Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.linux_ip.get_routes(iface=None)`

Return the current routing table

CLI Examples:

```

salt '*' ip.get_routes
salt '*' ip.get_routes eth0

```

`salt.modules.linux_ip.up(iface, iface_type=None)`

Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```

## 26.6.222 salt.modules.linux\_lvm

Support for Linux LVM2

`salt.modules.linux_lvm.fullversion()`

Return all version info from lvm version

CLI Example:

```
salt '*' lvm.fullversion
```

`salt.modules.linux_lvm.lvcreate` (*lvname*, *vgname*, *size=None*, *extents=None*, *snapshot=None*, *pv=None*, *thinvolume=False*, *thinpool=False*, *force=False*, *\*\*kwargs*)

Create a new logical volume, with option for which physical volume to be used

CLI Examples:

```
salt '*' lvm.lvcreate new_volume_name      vg_name size=10G
salt '*' lvm.lvcreate new_volume_name      vg_name extents=100 pv=/dev/sdb
salt '*' lvm.lvcreate new_snapshot         vg_name snapshot=volume_name
→size=3G
```

New in version 0.12.0.

Support for thin pools and thin volumes

CLI Examples:

```
salt '*' lvm.lvcreate new_thinpool_name    vg_name size=20G
→thinpool=True
salt '*' lvm.lvcreate new_thinvolume_name  vg_name/thinpool_name size=10G
→thinvolume=True
```

`salt.modules.linux_lvm.lvdisplay` (*lvname=""*, *quiet=False*)

Return information about the logical volume(s)

**lvname**

logical device name

**quiet**

if the logical volume is not present, do not show any error

CLI Examples:

```
salt '*' lvm.lvdisplay
salt '*' lvm.lvdisplay /dev/vg_myserver/root
```

`salt.modules.linux_lvm.lvextend` (*size=None*, *lvpath=None*, *extents=None*, *force=False*, *resizefs=False*)

Increase a logical volume to specific size.

CLI Examples:

```
salt '*' lvm.lvextend +12M /dev/mapper/vg1-test
salt '*' lvm.lvextend lvpath=/dev/mapper/vg1-test extents=+100%FREE
```

`salt.modules.linux_lvm.lvremove` (*lvname*, *vgname*, *force=True*)

Remove a given existing logical volume from a named existing volume group

CLI Example:

```
salt '*' lvm.lvremove lvname vgname force=True
```

`salt.modules.linux_lvm.lvresize` (*size=None*, *lvm\_path=None*, *extents=None*, *force=False*, *resizefs=False*)

Resize a logical volume to specific size.

CLI Examples:

```
salt '*' lvm.lvresize +12M /dev/mapper/vg1-test
salt '*' lvm.lvresize lvm_path=/dev/mapper/vg1-test extents=+100%FREE
```

`salt.modules.linux_lvm.pvcreate` (*devices*, *override=True*, *force=True*, *\*\*kwargs*)

Set a physical device to be used as an LVM physical volume

**override**

Skip devices, if they are already LVM physical volumes

CLI Examples:

```
salt mymachine lvm.pvcreate /dev/sdb1,/dev/sdb2
salt mymachine lvm.pvcreate /dev/sdb1 dataalignmentoffset=7s
```

`salt.modules.linux_lvm.pvdisplay` (*pvname=""*, *real=False*, *quiet=False*)

Return information about the physical volume(s)

**pvname**

physical device name

**real**

dereference any symlinks and report the real device

New in version 2015.8.7.

**quiet**

if the physical volume is not present, do not show any error

CLI Examples:

```
salt '*' lvm.pvdisplay
salt '*' lvm.pvdisplay /dev/md0
```

`salt.modules.linux_lvm.pvremove` (*devices*, *override=True*, *force=True*)

Remove a physical device being used as an LVM physical volume

**override**

Skip devices, if they are already not used as LVM physical volumes

CLI Examples:

```
salt mymachine lvm.pvremove /dev/sdb1,/dev/sdb2
```

`salt.modules.linux_lvm.pvresize` (*devices*, *override=True*, *force=True*)

Resize a LVM physical volume to the physical device size

**override**

Skip devices, if they are already not used as LVM physical volumes

CLI Examples:

```
salt mymachine lvm.pvresize /dev/sdb1,/dev/sdb2
```

`salt.modules.linux_lvm.version()`

Return LVM version from lvm version

CLI Example:

```
salt '*' lvm.version
```

`salt.modules.linux_lvm.vgcreate(vgname, devices, force=False, **kwargs)`

Create an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgcreate my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgcreate my_vg /dev/sdb1 clustered=y
```

`salt.modules.linux_lvm.vgdisplay(vgname="", quiet=False)`

Return information about the volume group(s)

**vgname**

volume group name

**quiet**

if the volume group is not present, do not show any error

CLI Examples:

```
salt '*' lvm.vgdisplay
salt '*' lvm.vgdisplay nova-volumes
```

`salt.modules.linux_lvm.vgextend(vgname, devices, force=False)`

Add physical volumes to an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgextend my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgextend my_vg /dev/sdb1
```

`salt.modules.linux_lvm.vgremove(vgname, force=True)`

Remove an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgremove vgname
salt mymachine lvm.vgremove vgname force=True
```

### 26.6.223 salt.modules.linux\_service

If Salt's OS detection does not identify a different virtual service module, the minion will fall back to using this basic module, which simply wraps sysvinit scripts.

`salt.modules.linux_service.available(name)`

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.linux_service.get_all()`

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.linux_service.missing(name)`

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.linux_service.reload_(name)`

Refreshes config files by calling service reload. Does not perform a full restart.

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.linux_service.restart(name)`

Restart the specified service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.linux_service.run(name, action)`

Run the specified service with an action.

New in version 2015.8.1.

**name**

Service name.

**action**

Action name (like start, stop, reload, restart).

CLI Example:

```
salt '*' service.run apache2 reload
salt '*' service.run postgresql initdb
```

`salt.modules.linux_service.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.linux_service.status(name, sig=None)`

Return the status for a service. If the name contains globbing, a dict mapping service name to PID or empty string is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

**Parameters**

- **name** (*str*) -- The name of the service to check

- **sig**(*str*) -- Signature to use to find the service via ps

**Returns**

PID if running, empty otherwise dict: Maps service name to PID if running, empty string otherwise

**Return type**

string

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

**salt.modules.linux\_service.stop**(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

### 26.6.224 salt.modules.linux\_shadow

Manage the shadow file on Linux systems

---

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to '*shadow.info*' is not available), see [here](#).

---

**salt.modules.linux\_shadow.default\_hash**()

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

**salt.modules.linux\_shadow.del\_password**(*name*, *root=None*)

New in version 2014.7.0.

Delete the password from name user

**name**

User to delete

**root**

Directory to chroot into

CLI Example:

```
salt '*' shadow.del_password username
```

**salt.modules.linux\_shadow.gen\_password**(*password*, *crypt\_salt=None*, *algorithm='sha512'*)

New in version 2014.7.0.

Generate hashed password

---

**Note:** When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

---

**password**

Plaintext password to be hashed.

**crypt\_salt**

Cryptographic salt. If not given, a random 8-character salt will be generated.

**algorithm**

The following hash algorithms are supported:

- md5
- blowfish (not in mainline glibc, only available in distros that add it)
- sha256
- sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
→algorithm=sha256
```

`salt.modules.linux_shadow.info`(*name*, *root=None*)

Return information for the specified user

**name**

User to get the information for

**root**

Directory to chroot into

CLI Example:

```
salt '*' shadow.info root
```

`salt.modules.linux_shadow.list_users`(*root=None*)

New in version 2018.3.0.

Return a list of all shadow users

**root**

Directory to chroot into

CLI Example:

```
salt '*' shadow.list_users
```

`salt.modules.linux_shadow.lock_password`(*name*, *root=None*)

New in version 2016.11.0.

Lock the password from specified user

**name**

User to lock

**root**

Directory to chroot into

CLI Example:

```
salt '*' shadow.lock_password username
```

`salt.modules.linux_shadow.set_date`(*name*, *date*, *root=None*)

Sets the value for the date the password was last changed to days since the epoch (January 1, 1970). See man chage.

**name**

User to modify

**date**

Date the password was last changed

**root**

Directory to chroot into

CLI Example:

```
salt '*' shadow.set_date username 0
```

`salt.modules.linux_shadow.set_expire` (*name*, *expire*, *root=None*)

Changed in version 2014.7.0.

Sets the value for the date the account expires as days since the epoch (January 1, 1970). Using a value of -1 will clear expiration. See man chage.

**name**

User to modify

**date**

Date the account expires

**root**

Directory to chroot into

CLI Example:

```
salt '*' shadow.set_expire username -1
```

`salt.modules.linux_shadow.set_inactdays` (*name*, *inactdays*, *root=None*)

Set the number of days of inactivity after a password has expired before the account is locked. See man chage.

**name**

User to modify

**inactdays**

Set password inactive after this number of days

**root**

Directory to chroot into

CLI Example:

```
salt '*' shadow.set_inactdays username 7
```

`salt.modules.linux_shadow.set_maxdays` (*name*, *maxdays*, *root=None*)

Set the maximum number of days during which a password is valid. See man chage.

**name**

User to modify

**maxdays**

Maximum number of days during which a password is valid

**root**

Directory to chroot into

CLI Example:

```
salt '*' shadow.set_maxdays username 90
```

`salt.modules.linux_shadow.set_mindays` (*name*, *mindays*, *root=None*)

Set the minimum number of days between password changes. See man chage.

**name**

User to modify

**mindays**

Minimum number of days between password changes

**root**

Directory to chroot into

CLI Example:

```
salt '*' shadow.set_mindays username 7
```

`salt.modules.linux_shadow.set_password(name, password, use_usermod=False, root=None)`

Set the password for a named user. The password must be a properly defined hash. A password hash can be generated with `gen_password()`.

**name**

User to set the password

**password**

Password already hashed

**use\_usermod**

Use usermod command to better compatibility

**root**

Directory to chroot into

CLI Example:

```
salt '*' shadow.set_password root '$1$UYCIxa628.9qXjpQCjM4a..'
```

`salt.modules.linux_shadow.set_warndays(name, warndays, root=None)`

Set the number of days of warning before a password change is required. See man chage.

**name**

User to modify

**warndays**

Number of days of warning before a password change is required

**root**

Directory to chroot into

CLI Example:

```
salt '*' shadow.set_warndays username 7
```

`salt.modules.linux_shadow.unlock_password(name, root=None)`

New in version 2016.11.0.

Unlock the password from name user

**name**

User to unlock

**root**

Directory to chroot into

CLI Example:

```
salt '*' shadow.unlock_password username
```

### 26.6.225 salt.modules.linux\_sysctl

Module for viewing and modifying sysctl parameters

`salt.modules.linux_sysctl.assign(name, value)`

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.ipv4.ip_forward 1
```

**salt.modules.linux\_sysctl.default\_config()**

Linux hosts using systemd 207 or later ignore `/etc/sysctl.conf` and only load from `/etc/sysctl.d/* .conf`. This function will do the proper checks and return a default config file which will be valid for the Minion. Hosts running systemd  $\geq$  207 will use `/etc/sysctl.d/99-salt.conf`.

CLI Example:

```
salt -G 'kernel:Linux' sysctl.default_config
```

**salt.modules.linux\_sysctl.get(name)**

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get net.ipv4.ip_forward
```

**salt.modules.linux\_sysctl.persist(name, value, config=None)**

Assign and persist a simple sysctl parameter for this minion. If `config` is not specified, a sensible default will be chosen using `sysctl.default_config`.

CLI Example:

```
salt '*' sysctl.persist net.ipv4.ip_forward 1
```

**salt.modules.linux\_sysctl.show(config\_file=False)**

Return a list of sysctl parameters for this minion

**config:** Pull the data from the system configuration file instead of the live data.

CLI Example:

```
salt '*' sysctl.show
```

## 26.6.226 salt.modules.localemod

Module for managing locales on POSIX-like systems.

**salt.modules.localemod.avail(locale)**

Check if a locale is available.

New in version 2014.7.0.

CLI Example:

```
salt '*' locale.avail 'en_US.UTF-8'
```

**salt.modules.localemod.gen\_locale(locale, \*\*kwargs)**

Generate a locale. Options:

New in version 2014.7.0.

**Parameters**

**locale** -- Any locale listed in `/usr/share/i18n/locales` or `/usr/share/i18n/SUPPORTED` for Debian and Gentoo based distributions, which require the charmap to be specified as part of the locale when generating it.

**verbose**

Show extra warnings about errors that are normally ignored.

CLI Example:

```
salt '*' locale.gen_locale en_US.UTF-8
salt '*' locale.gen_locale 'en_IE.UTF-8 UTF-8' # Debian/Gentoo only
```

`salt.modules.localemod.get_locale()`

Get the current system locale

CLI Example:

```
salt '*' locale.get_locale
```

`salt.modules.localemod.list_avail()`

Lists available (compiled) locales

CLI Example:

```
salt '*' locale.list_avail
```

`salt.modules.localemod.set_locale(locale)`

Sets the current system locale

CLI Example:

```
salt '*' locale.set_locale 'en_US.UTF-8'
```

### 26.6.227 salt.modules.locate

Module for using the locate utilities

`salt.modules.locate.locate(pattern, database="", limit=0, **kwargs)`

Performs a file lookup. Valid options (and their defaults) are:

```
basename=False
count=False
existing=False
follow=True
ignore=False
nofollow=False
wholename=True
regex=False
database=<locate's default database>
limit=<integer, not set by default>
```

See the manpage for `locate(1)` for further explanation of these options.

CLI Example:

```
salt '*' locate.locate
```

`salt.modules.locate.stats()`

Returns statistics about the locate database

CLI Example:

```
salt '*' locate.stats
```

`salt.modules.locate.updatedb()`

Updates the locate database

CLI Example:

```
salt '*' locate.updatedb
```

`salt.modules.locate.version()`

Returns the version of locate

CLI Example:

```
salt '*' locate.version
```

### 26.6.228 salt.modules.logadm

Module for managing Solaris logadm based log rotations.

`salt.modules.logadm.list_conf(conf_file='/etc/logadm.conf, log_file=None, include_unset=False)`

Show parsed configuration

New in version 2018.3.0.

**conf\_file**

[string] path to logadm.conf, defaults to /etc/logadm.conf

**log\_file**

[string] optional show only one log file

**include\_unset**

[boolean] include unset flags in output

CLI Example:

```
salt '*' logadm.list_conf
salt '*' logadm.list_conf log=/var/log/syslog
salt '*' logadm.list_conf include_unset=False
```

`salt.modules.logadm.remove(name, conf_file='/etc/logadm.conf)`

Remove log pattern from logadm

CLI Example:

```
salt '*' logadm.remove myapplog
```

`salt.modules.logadm.rotate(name, pattern=None, conf_file='/etc/logadm.conf, **kwargs)`

Set up pattern for logging.

**name**

[string] alias for entryname

**pattern**

[string] alias for log\_file

**conf\_file**

[string] optional path to alternative configuration file

**kwargs**

[boolean|string|int] optional additional flags and parameters

**Note:** name and pattern were kept for backwards compatibility reasons.

name is an alias for the entryname argument, pattern is an alias for log\_file. These aliases will only be used if the entryname and log\_file arguments are not passed.

For a full list of arguments see ``logadm.show_args``.

CLI Example:

```
salt '*' logadm.rotate myapplog pattern='/var/log/myapp/*.log' count=7
salt '*' logadm.rotate myapplog log_file='/var/log/myapp/*.log' count=4
  ↳owner=myappd mode='0700'
```

`salt.modules.logadm.show_args()`

Show which arguments map to which flags and options.

New in version 2018.3.0.

CLI Example:

```
salt '*' logadm.show_args
```

`salt.modules.logadm.show_conf(conf_file='/etc/logadm.conf', name=None)`

Show configuration

**conf\_file**

[string] path to logadm.conf, defaults to /etc/logadm.conf

**name**

[string] optional show only a single entry

CLI Example:

```
salt '*' logadm.show_conf
salt '*' logadm.show_conf name=/var/log/syslog
```

## 26.6.229 salt.modules.logmod

### On-demand logging

New in version 2017.7.0.

The sole purpose of this module is logging messages in the (proxy) minion. It comes very handy when debugging complex Jinja templates, for example:

```
{%- for var in range(10) %}
  {%- do salt["log.info"](var) -%}
{%- endfor %}
```

CLI Example:

```
salt '*' log.error "Please don't do that, this module is not for CLI use!"
```

`salt.modules.logmod.critical(message)`

Log message at level CRITICAL.

`salt.modules.logmod.debug(message)`

Log message at level DEBUG.

`salt.modules.logmod.error(message)`

Log message at level ERROR.

`salt.modules.logmod.exception(message)`

Log message at level EXCEPTION.

`salt.modules.logmod.info(message)`

Log message at level INFO.

`salt.modules.logmod.warning(message)`

Log message at level WARNING.

### 26.6.230 salt.modules.logrotate

Module for managing logrotate.

`salt.modules.logrotate.get(key, value=None, conf_file='/etc/logrotate.conf')`

Get the value for a specific configuration line.

#### Parameters

- **key** (*str*) -- The command or stanza block to configure.
- **value** (*str*) -- The command value or command of the block specified by the key parameter.
- **conf\_file** (*str*) -- The logrotate configuration file.

#### Returns

The value for a specific configuration line.

#### Return type

`bool|int|str`

CLI Example:

```
salt '*' logrotate.get rotate
salt '*' logrotate.get /var/log/wtmp rotate /etc/logrotate.conf
```

`salt.modules.logrotate.set_(key, value, setting=None, conf_file='/etc/logrotate.conf')`

Set a new value for a specific configuration line.

#### Parameters

- **key** (*str*) -- The command or block to configure.
- **value** (*str*) -- The command value or command of the block specified by the key parameter.
- **setting** (*str*) -- The command value for the command specified by the value parameter.
- **conf\_file** (*str*) -- The logrotate configuration file.

#### Returns

A boolean representing whether all changes succeeded.

#### Return type

`bool`

CLI Example:

```
salt '*' logrotate.set rotate 2
```

Can also be used to set a single value inside a multiline configuration block. For instance, to change rotate in the following block:

```
/var/log/wtmp {
  monthly
  create 0664 root root
  rotate 1
}
```

Use the following command:

```
salt '*' logrotate.set /var/log/wtmp rotate 2
```

This module also has the ability to scan files inside an include directory, and make changes in the appropriate file.

`salt.modules.logrotate.show_conf` (*conf\_file*='/etc/logrotate.conf')

Show parsed configuration

**Parameters**

**conf\_file** (*str*) -- The logrotate configuration file.

**Returns**

The parsed configuration.

**Return type**

dict

CLI Example:

```
salt '*' logrotate.show_conf
```

### 26.6.231 salt.modules.lvs

Support for LVS (Linux Virtual Server)

`salt.modules.lvs.add_server` (*protocol*=None, *service\_address*=None, *server\_address*=None, *packet\_forward\_method*='dr', *weight*=1, *\*\*kwargs*)

Add a real server to a virtual service.

**protocol**

The service protocol(only support tcp, udp and fwmark service).

**service\_address**

The LVS service address.

**server\_address**

The real server address.

**packet\_forward\_method**

The LVS packet forwarding method(dr for direct routing, tunnel for tunneling, nat for network access translation).

**weight**

The capacity of a server relative to the others in the pool.

CLI Example:

```
salt '*' lvs.add_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

`salt.modules.lvs.add_service`(*protocol=None, service\_address=None, scheduler='wlc'*)

Add a virtual service.

**protocol**

The service protocol(only support tcp, udp and fwmark service).

**service\_address**

The LVS service address.

**scheduler**

Algorithm for allocating TCP connections and UDP datagrams to real servers.

CLI Example:

```
salt '*' lvs.add_service tcp 1.1.1.1:80 rr
```

`salt.modules.lvs.check_server`(*protocol=None, service\_address=None, server\_address=None, \*\*kwargs*)

Check the real server exists in the specified service.

CLI Example:

```
salt '*' lvs.check_server tcp 1.1.1.1:80 192.168.0.11:8080
```

`salt.modules.lvs.check_service`(*protocol=None, service\_address=None, \*\*kwargs*)

Check the virtual service exists.

CLI Example:

```
salt '*' lvs.check_service tcp 1.1.1.1:80
```

`salt.modules.lvs.clear`()

Clear the virtual server table

CLI Example:

```
salt '*' lvs.clear
```

`salt.modules.lvs.delete_server`(*protocol=None, service\_address=None, server\_address=None*)

Delete the realserver from the virtual service.

**protocol**

The service protocol(only support tcp, udp and fwmark service).

**service\_address**

The LVS service address.

**server\_address**

The real server address.

CLI Example:

```
salt '*' lvs.delete_server tcp 1.1.1.1:80 192.168.0.11:8080
```

`salt.modules.lvs.delete_service`(*protocol=None, service\_address=None*)

Delete the virtual service.

**protocol**

The service protocol(only support tcp, udp and fwmark service).

**service\_address**

The LVS service address.

CLI Example:

```
salt '*' lvs.delete_service tcp 1.1.1.1:80
```

`salt.modules.lvs.edit_server` (*protocol=None, service\_address=None, server\_address=None, packet\_forward\_method=None, weight=None, \*\*kwargs*)

Edit a real server to a virtual service.

**protocol**

The service protocol(only support tcp, udp and fwmark service).

**service\_address**

The LVS service address.

**server\_address**

The real server address.

**packet\_forward\_method**

The LVS packet forwarding method(dr for direct routing, tunnel for tunneling, nat for network access translation).

**weight**

The capacity of a server relative to the others in the pool.

CLI Example:

```
salt '*' lvs.edit_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

`salt.modules.lvs.edit_service` (*protocol=None, service\_address=None, scheduler=None*)

Edit the virtual service.

**protocol**

The service protocol(only support tcp, udp and fwmark service).

**service\_address**

The LVS service address.

**scheduler**

Algorithm for allocating TCP connections and UDP datagrams to real servers.

CLI Example:

```
salt '*' lvs.edit_service tcp 1.1.1.1:80 rr
```

`salt.modules.lvs.get_rules`()

Get the virtual server rules

CLI Example:

```
salt '*' lvs.get_rules
```

`salt.modules.lvs.list_` (*protocol=None, service\_address=None*)

List the virtual server table if `service_address` is not specified. If a `service_address` is selected, list this service only.

CLI Example:

```
salt '*' lvs.list
```

`salt.modules.lvs.zero` (*protocol=None, service\_address=None*)

Zero the packet, byte and rate counters in a service or all services.

CLI Example:

```
salt '*' lvs.zero
```

## 26.6.232 salt.modules.lxc

Control Linux Containers via Salt

### depends

lxc package for distribution

lxc >= 1.0 (even beta alpha) is required

**salt.modules.lxc.add\_veth**(*name*, *interface\_name*, *bridge=None*, *path=None*)

Add a veth to a container. Note : this function doesn't update the container config, just add the interface at runtime

### name

Name of the container

### interface\_name

Name of the interface in the container

### bridge

Name of the bridge to attach the interface to (facultative)

CLI Examples:

```
salt '*' lxc.add_veth container_name eth1 br1
salt '*' lxc.add_veth container_name eth1
```

**salt.modules.lxc.apply\_network\_profile**(*name*, *network\_profile*, *nic\_opts=None*, *path=None*)

New in version 2015.5.0.

Apply a network profile to a container

### network\_profile

profile name or default values (dict)

### nic\_opts

values to override in defaults (dict) indexed by nic card names

### path

path to the container parent

New in version 2015.8.0.

CLI Examples:

```
salt 'minion' lxc.apply_network_profile web1 centos
salt 'minion' lxc.apply_network_profile web1 centos \
    nic_opts="{ 'eth0': { 'mac': 'xx:xx:xx:xx:xx:xx' } }"
salt 'minion' lxc.apply_network_profile web1 \
    "{ 'eth0': { 'mac': 'xx:xx:xx:xx:xx:yy' } }"
    nic_opts="{ 'eth0': { 'mac': 'xx:xx:xx:xx:xx:xx' } }"
```

The special case to disable use of ethernet nics:

```
salt 'minion' lxc.apply_network_profile web1 centos \
    "{eth0: {disable: true}}"
```

**salt.modules.lxc.attachable**(*name*, *path=None*)

Return True if the named container can be attached to via the lxc-attach command

### path

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt 'minion' lxc.attachable ubuntu
```

```
salt.modules.lxc.bootstrap(name, config=None, approve_key=True, install=True, pub_key=None,
                           priv_key=None, bootstrap_url=None, force_install=False,
                           unconditional_install=False, path=None, bootstrap_delay=None,
                           bootstrap_args=None, bootstrap_shell=None)
```

Install and configure salt in a container.

**config**

Minion configuration options. By default, the `master` option is set to the target host's master.

**approve\_key**

Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: `True`

**path**

path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**pub\_key**

Explicit public key to pressed the minion with (optional). This can be either a filepath or a string representing the key

**priv\_key**

Explicit private key to pressed the minion with (optional). This can be either a filepath or a string representing the key

**bootstrap\_delay**

Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.

**bootstrap\_url**

url, content or filepath to the salt bootstrap script

**bootstrap\_args**

salt bootstrap script arguments

**bootstrap\_shell**

shell to execute the script into

**install**

Whether to attempt a full installation of salt-minion if needed.

**force\_install**

Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container

**unconditional\_install**

Run the script even if the container seems seeded

CLI Examples:

```
salt 'minion' lxc.bootstrap container_name [config=config_data] \
    [approve_key=(True|False)] [install=(True|False)]
```

```
salt.modules.lxc.clone(name, orig, profile=None, network_profile=None, nic_opts=None, **kwargs)
```

Create a new container as a clone of another container

**name**

Name of the container

**orig**

Name of the original container to be cloned

**profile**

Profile to use in container cloning (see `lxc.get_container_profile`). Values in a profile will be overridden by the **Container Cloning Arguments** listed below.

**path**

path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**Container Cloning Arguments****snapshot**

Use Copy On Write snapshots (LVM)

**size**

[1G] Size of the volume to create. Only applicable if `backing=lvm`.

**backing**

The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within /var/lib/lxc.

**network\_profile**

Network profile to use for container

New in version 2015.8.0.

**nic\_opts**

give extra opts overriding network profile values

New in version 2015.8.0.

CLI Examples:

```
salt '*' lxc.clone myclone orig=orig_container
salt '*' lxc.clone myclone orig=orig_container snapshot=True
```

`salt.modules.lxc.cloud_init`(*name*, *vm\_*=None, *\*\*kwargs*)

Thin wrapper to `lxc.init` to be used from the saltcloud `lxc` driver

**name**

Name of the container may be None and then guessed from saltcloud mapping

**vm\_**

saltcloud mapping defaults for the vm

CLI Example:

```
salt '*' lxc.cloud_init foo
```

`salt.modules.lxc.cloud_init_interface`(*name*, *vm\_*=None, *\*\*kwargs*)

Interface between `salt.cloud.lxc` driver and `lxc.init` `vm_` is a mapping of `vm` opts in the `salt.cloud` format as documented for the `lxc` driver.

This can be used either:

- from the salt cloud driver
- because you find the argument to give easier here than using directly `lxc.init`

**Warning:** BE REALLY CAREFUL CHANGING DEFAULTS !!! IT'S A RETRO COMPATIBLE INTERFACE WITH THE SALT CLOUD DRIVER (ask kiorke).

**name**

name of the lxc container to create

**pub\_key**

public key to preseed the minion with. Can be the keycontent or a filepath

**priv\_key**

private key to preseed the minion with. Can be the keycontent or a filepath

**path**

path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

**profile***profile* selection**network\_profile***network profile* selection**nic\_opts**

per interface settings compatibles with network profile (ipv4/ipv6/link/gateway/mac/netmask)

eg:

```
- {'eth0': {'mac': '00:16:3e:01:29:40',
           'gateway': None, (default)
           'link': 'br0', (default)
           'gateway': None, (default)
           'netmask': '', (default)
           'ip': '22.1.4.25'}}}
```

**unconditional\_install**

given to lxc.bootstrap (see relative doc)

**force\_install**

given to lxc.bootstrap (see relative doc)

**config**

any extra argument for the salt minion config

**dnsservers**

list of DNS servers to set inside the container

**dns\_via\_dhcp**

do not set the dns servers, let them be set by the dhcp.

**autostart**

autostart the container at boot time

**password**

administrative password for the container

**bootstrap\_delay**

delay before launching bootstrap script at Container init

**Warning:** Legacy but still supported options:**from\_container**

which container we use as a template when running lxc.clone

**image**

which template do we use when we are using lxc.create. This is the default mode unless you specify something in from\_container

**backing**

which backing store to use. Values can be: overlayfs, dir(default), lvm, zfs, btrfs

**fstype**

When using a blockdevice level backing store, which filesystem to use on

**size**

When using a blockdevice level backing store, which size for the filesystem to use on

**snapshot**

Use snapshot when cloning the container source

**vgname**

if using LVM: vgname

<b>lvname</b>	if using LVM: lvname
<b>thinpool:</b>	if using LVM: thinpool
<b>ip</b>	ip for the primary nic
<b>mac</b>	mac address for the primary nic
<b>netmask</b>	netmask for the primary nic (24) = <code>vm_.get('netmask', '24')</code>
<b>bridge</b>	bridge for the primary nic (lxcbr0)
<b>gateway</b>	network gateway for the container
<b>additional_ips</b>	additional ips which will be wired on the main bridge (br0) which is connected to internet. Be aware that you may use manual virtual mac addresses provided by your provider (online, ovh, etc). This is a list of mappings {ip: ", mac: ", netmask:"} Set gateway to None and an interface with a gateway to escape from another interface that eth0. eg:
	<pre>- {'mac': '00:16:3e:01:29:40',   'gateway': None, (default)   'link': 'br0', (default)   'netmask': '', (default)   'ip': '22.1.4.25'}</pre>
<b>users</b>	administrative users for the container default: [root] and [root, ubuntu] on ubuntu
<b>default_nic</b>	name of the first interface, you should really not override this

CLI Example:

```
salt '*' lxc.cloud_init_interface foo
```

`salt.modules.lxc.copy_to`(*name*, *source*, *dest*, *overwrite=False*, *makedirs=False*, *path=None*)

Changed in version 2015.8.0: Function renamed from `lxc.cp` to `lxc.copy_to` for consistency with other container types. `lxc.cp` will continue to work, however. For versions 2015.2.x and earlier, use `lxc.cp`.

Copy a file or directory from the host into a container

**name**

Container name

**source**

File to be copied to the container

**path**

path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**dest**

Destination on the container. Must be an absolute path.

Changed in version 2015.5.0: If the destination is a directory, the file will be copied into that directory.

**overwrite**

[False] Unless this option is set to `True`, then if a file exists at the location specified by the `dest` argument, an error will be raised.

New in version 2015.8.0.

`makedirs` : False

Create the parent directory on the container if it does not already exist.

New in version 2015.5.0.

CLI Example:

```
salt 'minion' lxc.copy_to /tmp/foo /root/foo
salt 'minion' lxc.cp /tmp/foo /root/foo
```

`salt.modules.lxc.cp`(*name, source, dest, overwrite=False, makedirs=False, path=None*)

This function is an alias of `copy_to`.

Changed in version 2015.8.0: Function renamed from `lxc.cp` to `lxc.copy_to` for consistency with other container types. `lxc.cp` will continue to work, however. For versions 2015.2.x and earlier, use `lxc.cp`.

Copy a file or directory from the host into a container

**name**

Container name

**source**

File to be copied to the container

**path**

path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**dest**

Destination on the container. Must be an absolute path.

Changed in version 2015.5.0: If the destination is a directory, the file will be copied into that directory.

**overwrite**

[False] Unless this option is set to `True`, then if a file exists at the location specified by the `dest` argument, an error will be raised.

New in version 2015.8.0.

`makedirs` : False

Create the parent directory on the container if it does not already exist.

New in version 2015.5.0.

CLI Example:

```
salt 'minion' lxc.copy_to /tmp/foo /root/foo
salt 'minion' lxc.cp /tmp/foo /root/foo
```

`salt.modules.lxc.create`(*name, config=None, profile=None, network\_profile=None, nic\_opts=None, \*\*kwargs*)

Create a new container.

**name**

Name of the container

**config**

The config file to use for the container. Defaults to system-wide config (usually in `/etc/lxc/lxc.conf`).

**profile**

Profile to use in container creation (see `lxc.get_container_profile`). Values in a profile will be overridden by the **Container Creation Arguments** listed below.

**network\_profile**

Network profile to use for container

New in version 2015.5.0.

**Container Creation Arguments****template**

The template to use. For example, `ubuntu` or `fedora`. For a full list of available templates, check out the `lxc.templates` function.

Conflicts with the `image` argument.

---

**Note:** The `download` template requires the following three parameters to be defined in `options`:

- `dist` - The name of the distribution
- `release` - Release name/version
- `arch` - Architecture of the container

The available images can be listed using the `lxc.images` function.

---

**options**

Template-specific options to pass to the `lxc-create` command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
options='{ "dist": "centos", "release": "6", "arch": "amd64" }'
```

For available template options, refer to the `lxc` template scripts which are usually located under `/usr/share/lxc/templates`, or run `lxc-create -t <template> -h`.

**image**

A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

**backing**

The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within `/var/lib/lxc`.

**fstype**

Filesystem type to use on LVM logical volume

**size**

[1G] Size of the volume to create. Only applicable if `backing=lvm`.

**vgname**

[lxc] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing=lvm`.

**lvname**

Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing=lvm`.

**thinpool**

Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing=lvm`.

**nic\_opts**

give extra opts overriding network profile values

**path**

parent path for the container creation (default: `/var/lib/lxc`)

**zfsroot**

Name of the ZFS root in which to create the volume for this container. Only applicable if `backing=zfs`. (default: `tank/lxc`)

New in version 2015.8.0.

`salt.modules.lxc.destroy` (*name*, *stop=False*, *path=None*)

Destroy the named container.

**Warning:** Destroys all data associated with the container.

**path**

path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

**stop**

[False] If True, the container will be destroyed even if it is running/frozen.

Changed in version 2015.5.0: Default value changed to `False`. This more closely matches the behavior of `lxc-destroy(1)`, and also makes it less likely that an accidental command will destroy a running container that was being used for important things.

CLI Examples:

```
salt '*' lxc.destroy foo
salt '*' lxc.destroy foo stop=True
```

`salt.modules.lxc.edit_conf(conf_file, out_format='simple', read_only=False, lxc_config=None, **kwargs)`

Edit an LXC configuration file. If a setting is already present inside the file, its value will be replaced. If it does not exist, it will be appended to the end of the file. Comments and blank lines will be kept in-tact if they already exist in the file.

**out\_format:**

Set to simple if you need backward compatibility (multiple items for a simple key is not supported)

**read\_only:**

return only the edited configuration without applying it to the underlying lxc configuration file

**lxc\_config:**

List of dict containning lxc configuration items For network configuration, you also need to add the device it belongs to, otherwise it will default to eth0. Also, any change to a network parameter will result in the whole network reconfiguration to avoid mismatches, be aware of that !

After the file is edited, its contents will be returned. By default, it will be returned in `simple` format, meaning an unordered dict (which may not represent the actual file order). Passing in an `out_format` of `commented` will return a data structure which accurately represents the order and content of the file.

CLI Example:

```
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf \
  out_format=commented lxc.network.type=veth
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf \
  out_format=commented \
  lxc_config="[{'lxc.network.name': 'eth0', \
                'lxc.network.ipv4': '1.2.3.4'}, \
               {'lxc.network.name': 'eth2', \
                'lxc.network.ipv4': '1.2.3.5', \
                'lxc.network.gateway': '1.2.3.1'}]"
```

`salt.modules.lxc.exists(name, path=None)`

Returns whether the named container exists.

**path**

path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.exists name
```

`salt.modules.lxc.freeze`(*name*, *\*\*kwargs*)

Freeze the named container

**path**

path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

**start**

[False] If True and the container is stopped, the container will be started before attempting to freeze.

New in version 2015.5.0.

**use\_vt**

run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.freeze name
```

`salt.modules.lxc.get_container_profile`(*name=None*, *\*\*kwargs*)

New in version 2015.5.0.

Gather a pre-configured set of container configuration parameters. If no arguments are passed, an empty profile is returned.

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using `config.get`. The key under which LXC profiles must be configured is `lxc.container_profile.profile_name`. An example container profile would be as follows:

```
lxc.container_profile:
```

```
ubuntu:
```

```
template: ubuntu
```

```
backing: lvm
```

```
vgname: lxc
```

```
size: 1G
```

Parameters set in a profile can be overridden by passing additional container creation arguments (such as the ones passed to `lxc.create`) to this function.

A profile can be defined either as the name of the profile, or a dictionary of variable names and values. See the [LXC Tutorial](#) for more information on how to use LXC profiles.

CLI Example:

```
salt-call lxc.get_container_profile centos
salt-call lxc.get_container_profile ubuntu template=ubuntu
→backing=overlayfs
```

`salt.modules.lxc.get_network_profile`(*name=None*, *\*\*kwargs*)

New in version 2015.5.0.

Gather a pre-configured set of network configuration parameters. If no arguments are passed, the following default profile is returned:

```
{'eth0': {'link': 'br0', 'type': 'veth', 'flags': 'up'}}
```

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using `config.get`. The key under which LXC profiles must be configured is `lxc.network_profile`. An example network profile would be as follows:

```
lxc.network_profile.centos:
eth0:
  link: br0
  type: veth
  flags: up
```

To disable networking entirely:

```
lxc.network_profile.centos:
eth0:
  disable: true
```

Parameters set in a profile can be overridden by passing additional arguments to this function.

A profile can be passed either as the name of the profile, or a dictionary of variable names and values. See the *LXC Tutorial* for more information on how to use network profiles.

**Warning:** The `ipv4`, `ipv6`, `gateway`, and `link` (bridge) settings in network profiles will only work if the container doesn't redefine the network configuration (for example in `/etc/sysconfig/network-scripts/ifcfg-<interface_name>` on RHEL/CentOS, or `/etc/network/interfaces` on Debian/Ubuntu/etc.)

CLI Example:

```
salt-call lxc.get_network_profile default
```

`salt.modules.lxc.get_parameter` (*name*, *parameter*, *path=None*)

Returns the value of a cgroup parameter for a container

**path**

path to the container parent directory default: `/var/lib/lxc` (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.get_parameter container_name memory.limit_in_bytes
```

`salt.modules.lxc.get_pid` (*name*, *path=None*)

Returns a container pid. Throw an exception if the container isn't running.

CLI Example:

```
salt '*' lxc.get_pid name
```

`salt.modules.lxc.get_root_path` (*path*)

Get the configured lxc root for containers

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.get_root_path
```

`salt.modules.lxc.images` (*dist=None*)

New in version 2015.5.0.

List the available images for LXC's download template.

**dist**

[None] Filter results to a single Linux distribution

CLI Examples:

```
salt myminion lxc.images
salt myminion lxc.images dist=centos
```

`salt.modules.lxc.info` (*name, path=None*)

Returns information about a container

**path**

path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.info name
```

`salt.modules.lxc.init` (*name, config=None, cpuset=None, cpushare=None, memory=None, profile=None, network\_profile=None, nic\_opts=None, cpu=None, autostart=True, password=None, password\_encrypted=None, users=None, dnsservers=None, searchdomains=None, bridge=None, gateway=None, pub\_key=None, priv\_key=None, force\_install=False, unconditional\_install=False, bootstrap\_delay=None, bootstrap\_args=None, bootstrap\_shell=None, bootstrap\_url=None, \*\*kwargs*)

Initialize a new container.

This is a partial idempotent function as if it is already provisioned, we will reset a bit the lxc configuration file but much of the hard work will be escaped as markers will prevent re-execution of harmful tasks.

**name**

Name of the container

**image**

A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

**cpus**

Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored

**cpuset**

Explicitly define the cpus this container will be bound to

**cpushare**

cgroups cpu shares

**autostart**

autostart container on reboot

**memory**

cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass `memory=0` to set no limit.

**gateway**

the ipv4 gateway to use the default does nothing more than lxcutils does

**bridge**

the bridge to use the default does nothing more than lxcutils does

**network\_profile**

Network profile to use for the container

New in version 2015.5.0.

**nic\_opts**

Extra options for network interfaces, will override

```
{ "eth0": { "hwaddr": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6":
"2001:db8::ff00:42:8329" }}
```

or

```
{ "eth0": { "hwaddr": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1/24",
"ipv6": "2001:db8::ff00:42:8329" }}
```

**users**

Users for which the password defined in the `password` param should be set. Can be passed as a comma separated list or a python list. Defaults to just the `root` user.

**password**

Set the initial password for the users defined in the `users` parameter

**password\_encrypted**

[False] Set to `True` to denote a password hash instead of a plaintext password

New in version 2015.5.0.

**profile**

A LXC profile (defined in config or pillar). This can be either a real profile mapping or a string to retrieve it in configuration

**start**

Start the newly-created container

**dnsservers**

list of dns servers to set in the container, default [] (no setting)

**seed**

Seed the container with the minion config. Default: `True`

**install**

If salt-minion is not already installed, install it. Default: `True`

**config**

Optional config parameters. By default, the `id` is set to the name of the container.

**master**

salt master (default to minion's master)

**master\_port**

salt master port (default to minion's master port)

**pub\_key**

Explicit public key to preseed the minion with (optional). This can be either a filepath or a string representing the key

**priv\_key**

Explicit private key to preseed the minion with (optional). This can be either a filepath or a string representing the key

**approve\_key**

If explicit preseeding is not used; Attempt to request key approval from the master. Default: `True`

**path**

path to the container parent directory default: `/var/lib/lxc` (system)

New in version 2015.8.0.

**clone\_from**

Original from which to use a clone operation to create the container. Default: `None`

**bootstrap\_delay**

Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.

**bootstrap\_url**

See lxc.bootstrap

**bootstrap\_shell**

See lxc.bootstrap

**bootstrap\_args**

See lxc.bootstrap

**force\_install**

Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container

**unconditional\_install**

Run the script even if the container seems seeded

CLI Example:

```
salt 'minion' lxc.init name [cpuset=cgroups_cpuset] \
    [cpushare=cgroups_cpushare] [memory=cgroups_memory] \
