Since this module uses the same virtualname as the previous x509 modules, but is incompatible with them, it needs to be explicitly activated on each minion by including the following line in the minion configuration:

```
# /etc/salt/minion.d/x509.conf
```

```
features:  
  x509_v2: true
```

#### Peer communication

To be able to remotely sign certificates, it is required to configure the Salt master to allow *Peer Communication*:

```
# /etc/salt/master.d/peer.conf
```

```
peer:  
  .*:  
    - x509.sign_remote_certificate
```

In order for the *Compound Matcher* to work with restricting signing policies to a subset of minions, in addition calls to *match.compound\_matches* by the minion acting as the CA must be permitted:

```
# /etc/salt/master.d/peer.conf
```

```
peer:  
  .*:  
    - x509.sign_remote_certificate  
  
peer_run:  
  ca_server:  
    - match.compound_matches
```

---

**Note:** When compound match expressions are employed, pillar values can only be matched literally. This is a barrier to enumeration attacks by the CA server.

Also note that compound matching requires a minion data cache on the master. Any certificate signing request will be denied if `minion_data_cache` is disabled (it is enabled by default).

---

**Note:** Since grain values are controlled by minions, you should avoid using them to restrict certificate issuance.

See *Is Targeting using Grain Data Secure?*.

---

Changed in version 3007.0: Previously, a compound expression match was validated by the requesting minion itself via peer publishing, which did not protect from compromised minions. The new match validation takes place on the master using peer running.

## Signing policies

In addition, the minion representing the CA needs to have at least one signing policy configured, remote calls not referencing one are always rejected.

The parameters specified in this signing policy override any parameters passed from the minion requesting the certificate. It can be configured in the CA minion's pillar, which takes precedence, or any location `config.get` looks up in. Signing policies are defined under `x509_signing_policies`.

You can restrict which minions can request a certificate under a configured signing policy by specifying a matcher in `minions`. This can be a glob or compound matcher (for the latter, see the notes above).

### `x509_signing_policies:`

#### `www:`

- `minions:` 'www\*'
- `signing_private_key:` /etc/pki/ca.key
- `signing_cert:` /etc/pki/ca.crt
- `C:` US
- `ST:` Utah
- `L:` Salt Lake City
- `basicConstraints:` "critical, CA:false"
- `keyUsage:` "critical, cRLSign, keyCertSign"
- `subjectKeyIdentifier:` hash
- `authorityKeyIdentifier:` keyid, issuer:always
- `days_valid:` 90
- `copypath:` /etc/pki/issued\_certs/

---

**Note:** The following semantics are applied regarding the order of preference for specifying the subject name:

- If neither `subject` nor any name attributes (like CN) are part of the policy, issued certificates can contain any requested ones.
  - If any name attributes are specified in the signing policy, `subject` contained in requests is ignored.
  - If `subject` is specified in the signing policy, any name attributes are ignored. If the request contains the same data type for `subject` as the signing policy (for dicts and lists, and only then), merging is performed, otherwise `subject` is taken from the signing policy. Dicts are merged and list items are appended, with the items taken from the signing policy having priority.
-

## Breaking changes versus the previous x509 modules

- The output format has changed for all `read_*` functions as well as the state return dict.
- The formatting of some extension definitions might have changed, but should be stable for most basic use cases.
- The default ordering of RDNs/Name Attributes in the subject's Distinguished Name has been adapted to industry standards. This might cause a reissuance during the first state run.
- For `x509.private_key_managed`, the file mode defaults to `0400`. This should be considered a bug fix because writing private keys with world-readable permissions by default is a security issue.
- Restricting signing policies using compound match expressions requires peer run permissions instead of peer publishing permissions:

```
# x509, x509_v2 in 3006.*
peer:
  ca_server:
    - match.compound

# x509_v2 from 3007.0 onwards
peer_run:
  ca_server:
    - match.compound_matches
```

Note that when a `ca_server` is involved, both peers must use the updated module version.

```
salt.modules.x509_v2.create_certificate(ca_server=None, signing_policy=None, encoding='pem',
                                       append_certs=None, pkcs12_passphrase=None,
                                       pkcs12_encryption_compat=False,
                                       pkcs12_friendlyname=None, path=None, overwrite=True,
                                       raw=False, **kwargs)
```

Create an X.509 certificate and return an encoded version of it.

---

**Note:** All parameters that take a public key, private key or certificate can be specified either as a PEM/hex/base64 string or a path to a local file encoded in all supported formats for the type.

---

CLI Example:

```
salt '*' x509.create_certificate signing_private_key='/etc/pki/myca.key'
→csr='/etc/pki/my.csr'
```

### ca\_server

Request a remotely signed certificate from `ca_server`. For this to work, a `signing_policy` must be specified, and that same policy must be configured on the `ca_server`. See [Signing policies](#) for details. Also, the Salt master must permit peers to call the `sign_remote_certificate` function, see [Peer communication](#).

### signing\_policy

The name of a configured signing policy. Parameters specified in there are hardcoded and cannot be overridden. This is required for remote signing, otherwise optional. See [Signing policies](#) for details.

### encoding

Specify the encoding of the resulting certificate. It can be returned as a `pem` (or `pkcs7_pem`) string or several (base64-encoded) binary formats (`der`, `pkcs7_der`, `pkcs12`). Defaults to `pem`.

**append\_certs**

A list of additional certificates to append to the new one, e.g. to create a CA chain.

---

**Note:** Mind that when `der` encoding is in use, appending certificatees is prohibited.

---

**copypath**

Create a copy of the issued certificate in PEM format in this directory. The file will be named `<serial_number>.crt` if `prepend_cn` is `False`.

**prepend\_cn**

When `copypath` is set, prepend the common name of the certificate to the file name like so: `<CN>-<serial_number>.crt`. Defaults to `false`.

**pkcs12\_passphrase**

When encoding a certificate as `pkcs12`, encrypt it with this passphrase.

---

**Note:** PKCS12 encryption is very weak and [should not be relied on for security](#).

---

**pkcs12\_encryption\_compat**

OpenSSL 3 and cryptography v37 switched to a much more secure default encryption for PKCS12, which might be incompatible with some systems. This forces the legacy encryption. Defaults to `False`.

**pkcs12\_friendlyname**

When encoding a certificate as `pkcs12`, a name for the certificate can be included.

**path**

Instead of returning the certificate, write it to this file path.

**overwrite**

If `path` is specified and the file exists, overwrite it. Defaults to `true`.

**raw**

Return the encoded raw bytes instead of a string. Defaults to `false`.

**digest**

The hashing algorithm to use for the signature. Valid values are: `sha1`, `sha224`, `sha256`, `sha384`, `sha512`, `sha512_224`, `sha512_256`, `sha3_224`, `sha3_256`, `sha3_384`, `sha3_512`. Defaults to `sha256`. This will be ignored for `ed25519` and `ed448` key types.

**private\_key**

The private key corresponding to the public key the certificate should be issued for. This is one way of specifying the public key that will be included in the certificate, the other ones being `public_key` and `csr`.

**private\_key\_passphrase**

If `private_key` is specified and encrypted, the passphrase to decrypt it.

**public\_key**

The public key the certificate should be issued for. Other ways of passing the required information are `private_key` and `csr`. If neither are set, the public key of the `signing_private_key` will be included, i.e. a self-signed certificate is generated.

**csr**

A certificate signing request to use as a base for generating the certificate. The following information will be respected, depending on configuration: `* public key *` extensions, if not otherwise specified (arguments, `signing_policy`)

**signing\_cert**

The CA certificate to be used for signing the issued certificate.

**signing\_private\_key**

The private key corresponding to the public key in `signing_cert`. Required.

**signing\_private\_key\_passphrase**

If `signing_private_key` is encrypted, the passphrase to decrypt it.

**serial\_number**

A serial number to be embedded in the certificate. If unspecified, will autogenerate one. This should be

an integer, either in decimal or hexadecimal notation.

**not\_before**

Set a specific date the certificate should not be valid before. The format should follow %Y-%m-%d %H:%M:%S and will be interpreted as GMT/UTC. Defaults to the time of issuance.

**not\_after**

Set a specific date the certificate should not be valid after. The format should follow %Y-%m-%d %H:%M:%S and will be interpreted as GMT/UTC. If unspecified, defaults to the current time plus `days_valid` days.

**days\_valid**

If `not_after` is unspecified, the number of days from the time of issuance the certificate should be valid for. Defaults to 30.

**subject**

The subject's distinguished name embedded in the certificate. This is one way of passing this information (see `kwargs` below for the other). This argument will be preferred and allows to control the order of RDNs in the DN as well as to embed RDNs with multiple attributes. This can be specified as an RFC4514-encoded string (`CN=example.com,O=Example Inc,C=US`, mind that the rendered order is reversed from what is embedded), a list of RDNs encoded as in RFC4514 (`["C=US", "O=Example Inc", "CN=example.com"]`) or a dictionary (`{"CN": "example.com", "C": "US", "O": "Example Inc"}`, default ordering). Multiple name attributes per RDN are concatenated with a `+`.

---

**Note:** Parsing of RFC4514 strings requires at least cryptography release 37.

---

**kwargs**

Embedded X.509v3 extensions and the subject's distinguished name can be controlled via supplemental keyword arguments. See the following for an overview.

**Subject properties in kwargs**

C, ST, L, STREET, O, OU, CN, MAIL, SN, GN, UID, SERIALNUMBER

**X.509v3 extensions in kwargs**

Most extensions can be configured using the same string format as OpenSSL, while some require adjustments. In general, since the strings are parsed to dicts/lists, you can always use the latter formats directly. Marking an extension as critical is done by including it at the beginning of the configuration string, in the list or as a key in the dictionary with the value `true`.

Examples (some showcase dict/list correspondance):

**basicConstraints**

`critical, CA:TRUE, pathlen:1` or

```
- basicConstraints:  
  critical: true  
  ca: true  
  pathlen: 1
```

**keyUsage**

`critical, cRLSign, keyCertSign` or

```
- keyUsage:  
  - critical  
  - cRLSign  
  - keyCertSign
```

**subjectKeyIdentifier**

This can be an explicit value or hash, in which case the value will be set to the SHA1 hash of some encoding of the associated public key, depending on the underlying algorithm (RSA/ECDSA/EdDSA).

**authorityKeyIdentifier**

keyid:always, issuer

**subjectAltName**

There is support for all OpenSSL-defined types except otherName.

email:me@example.com,DNS:example.com or

```
# mind this being a list, not a dict
- subjectAltName:
  - email:me@example.com
  - DNS:example.com
```

**issuerAltName**

The syntax is the same as for subjectAltName, except that the additional value issuer:copy is supported, which will copy the values of subjectAltName in the issuer's certificate.

**authorityInfoAccess**

OCSP;URI:http://ocsp.example.com/,caIssuers;URI:http://myca.example.com/ca.cer

**crlDistributionPoints**

When set to a string value, items are interpreted as fullnames:

URI:http://example.com/myca.crl, URI:http://example.org/my.crl

There is also support for more attributes using the full form:

```
- crlDistributionPoints:
  - fullname: URI:http://example.com/myca.crl
  - crlissuer: DNS:example.org
  - reasons:
    - keyCompromise
  - URI:http://example.org/my.crl
```

**certificatePolicies**

critical, 1.2.4.5, 1.1.3.4

Again, there is support for more attributes using the full form:

```
- certificatePolicies:
  - critical: true
  - 1.2.3.4.5: https://my.ca.com/pratice_statement
  - 1.2.4.5.6:
    - https://my.ca.com/pratice_statement
    - organization: myorg
  - noticeNumbers: [1, 2, 3]
  - text: mytext
```

**policyConstraints**

requireExplicitPolicy:3,inhibitPolicyMapping:1

**inhibitAnyPolicy**

The value is just an integer: - inhibitAnyPolicy: 1

**nameConstraints**

critical,permitted;IP:192.168.0.0/255.255.0.0,permitted;email:.example.com,excluded;email:.com

```
- nameConstraints:
  - critical: true
  - permitted:
```

(continues on next page)

(continued from previous page)

```

- IP:192.168.0.0/24
- email:.example.com
excluded:
- email:.com

```

**noCheck**

This extension does not take any values, except `critical`. Just the presence in the keyword args will include it.

**tlsfeature**

`status_request`

For more information, visit the [OpenSSL docs](#).

```

salt.modules.x509_v2.create_crl(signing_private_key, revoked, signing_cert=None,
                                signing_private_key_passphrase=None, include_expired=False,
                                days_valid=None, digest='sha256', encoding='pem', extensions=None,
                                path=None, raw=False, **kwargs)

```

Create a certificate revocation list.

CLI Example:

```

salt '*' x509.create_crl signing_cert=/etc/pki/ca.crt
→ signing_private_key=/etc/pki/ca.key revoked="[{"
→ 'certificate': '/etc/pki/certs/www1.crt', 'revocation_date': '2015-03-
→ 01 00:00:00'}]"

```

**signing\_private\_key**

Your certificate authority's private key. It will be used to sign the CRL. Required.

**revoked**

A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A dict must contain either the key `serial_number` with the value of the serial number to revoke, or `certificate` with some reference to the certificate to revoke.

The dict can optionally contain the `revocation_date` key. If this key is omitted, the revocation date will be set to now. It should be a string in the format `"%Y-%m-%d %H:%M:%S"`.

The dict can also optionally contain the `not_after` key. This is redundant if the `certificate` key is included, since it will be sourced from the certificate. If the `certificate` key is not included, this can be used for the logic behind the `include_expired` parameter. It should be a string in the format `"%Y-%m-%d %H:%M:%S"`.

The dict can also optionally contain the `extensions` key, which allows to set CRL entry-specific extensions. The following extensions are supported:

**certificateIssuer**

Identifies the certificate issuer associated with an entry in an indirect CRL. The format is the same as for `subjectAltName`.

**CRLReason**

Identifies the reason for certificate revocation. Available choices are `unspecified`, `keyCompromise`, `CACompromise`, `affiliationChanged`, `superseded`, `cessationOfOperation`, `certificateHold`, `privilegeWithdrawn`, `aACompromise` and `removeFromCRL`.

**invalidityDate**

Provides the date on which the certificate likely became invalid. The value should be a string in the same format as `revocation_date`.

**signing\_cert**

The CA certificate to be used for signing the CRL.

**signing\_private\_key\_passphrase**

If `signing_private_key` is encrypted, the passphrase to decrypt it.

**include\_expired**

Also include already expired certificates in the CRL. Defaults to false.

**days\_valid**

The number of days the CRL should be valid for. This sets the `Next Update` field. Defaults to 100 (until v3009) or 7 (from v3009 onwards).

**digest**

The hashing algorithm to use for the signature. Valid values are: `sha1`, `sha224`, `sha256`, `sha384`, `sha512`, `sha512_224`, `sha512_256`, `sha3_224`, `sha3_256`, `sha3_384`, `sha3_512`. Defaults to `sha256`. This will be ignored for `ed25519` and `ed448` key types.

**encoding**

Specify the encoding of the resulting certificate revocation list. It can be returned as a `pem` string or base64-encoded `der`. Defaults to `pem`.

**extensions**

Add CRL extensions. The following are available:

**authorityKeyIdentifier**

See `x509.create_certificate`.

**authorityInfoAccess**

See `x509.create_certificate`.

**cRLNumber**

Specifies a sequential number for each CRL issued by a CA. Values must be integers.

**deltaCRLIndicator**

If the CRL is a delta CRL, this value points to the `cRLNumber` of the base CRL. Values must be integers.

**freshestCRL**

Identifies how delta CRL information is obtained. The format is the same as `crlDistributionPoints`.

**issuerAltName**

See `x509.create_certificate`.

**issuingDistributionPoint**

Identifies the CRL distribution point for a particular CRL and indicates what kinds of revocation it covers. The format is comparable to `crlDistributionPoints`. Specify as follows:

```
issuingDistributionPoint:
  fullname: # or relativename with RDN
    - URI:http://example.com/myca.crl
  onlysomereasons:
    - keyCompromise
  onlyuser: true
  onlyCA: true
  onlyAA: true
  indirectCRL: false
```

**path**

Instead of returning the CRL, write it to this file path.

**raw**

Return the encoded raw bytes instead of a string. Defaults to false.

```
salt.modules.x509_v2.create_csr(private_key, private_key_passphrase=None, digest='sha256',
                                encoding='pem', path=None, raw=False, **kwargs)
```

Create a certificate signing request.

CLI Example:

```
salt '*' x509.create_csr private_key='/etc/pki/myca.key' CN='My Cert'
```

**private\_key**

The private key corresponding to the public key the certificate should be issued for. The CSR will be signed by it. Required.

**private\_key\_passphrase**

If `private_key` is encrypted, the passphrase to decrypt it.

**digest**

The hashing algorithm to use for the signature. Valid values are: `sha1`, `sha224`, `sha256`, `sha384`, `sha512`, `sha512_224`, `sha512_256`, `sha3_224`, `sha3_256`, `sha3_384`, `sha3_512`. Defaults to `sha256`. This will be ignored for `ed25519` and `ed448` key types.

**encoding**

Specify the encoding of the resulting certificate signing request. It can be returned as a `pem` string or base64-encoded `der`. Defaults to `pem`.

**path**

Instead of returning the CSR, write it to this file path.

**raw**

Return the encoded raw bytes instead of a string. Defaults to `false`.

**kwargs**

Embedded X.509v3 extensions and the subject's distinguished name can be controlled via supplemental keyword arguments. See [x509.create\\_certificate](#) for an overview. Mind that some extensions are not available for CSR (`authorityInfoAccess`, `authorityKeyIdentifier`, `issuerAltName`, `crlDistributionPoints`).

```
salt.modules.x509_v2.create_private_key(algo='rsa', keysize=None, passphrase=None,
                                       encoding='pem', pkcs12_encryption_compat=False,
                                       path=None, raw=False, **kwargs)
```

Create a private key.

CLI Example:

```
salt '*' x509.create_private_key algo=ec keysize=384
```

**algo**

The digital signature scheme the private key should be based on. Available: `rsa`, `ec`, `ed25519`, `ed448`. Defaults to `rsa`.

**keysize**

For `rsa`, specifies the bitlength of the private key (2048, 3072, 4096). For `ec`, specifies the NIST curve to use (256, 384, 521). Irrelevant for Edwards-curve schemes (`ed25519`, `ed448`). Defaults to 2048 for RSA and 256 for EC.

**passphrase**

If this is specified, the private key will be encrypted using this passphrase. The encryption algorithm cannot be selected, it will be determined automatically as the best available one.

**encoding**

Specify the encoding of the resulting private key. It can be returned as a `pem` string, base64-encoded `der` or base64-encoded `pkcs12`. Defaults to `pem`.

**pkcs12\_encryption\_compat**

Some operating systems are incompatible with the encryption defaults for PKCS12 used since OpenSSL v3. This switch triggers a fallback to `PBESv1SHA1And3KeyTripleDESCBC`. Please consider the [notes on PKCS12 encryption](#).

**path**

Instead of returning the private key, write it to this file path. Note that this does not use safe permissions and should be avoided.

**raw**

Return the encoded raw bytes instead of a string. Defaults to false.

```
salt.modules.x509_v2.encode_certificate(certificate, encoding='pem', append_certs=None,
                                       private_key=None, private_key_passphrase=None,
                                       pkcs12_passphrase=None,
                                       pkcs12_encryption_compat=False,
                                       pkcs12_friendlyname=None, raw=False)
```

Create an encoded representation of a certificate, optionally including other structures. This can be used to create certificate chains, convert a certificate into a different encoding or embed the corresponding private key (for pkcs12).

CLI Example:

```
salt '*' x509.encode_certificate /etc/pki/my.crt pem /etc/pki/ca.crt
```

#### certificate

The certificate to encode.

#### encoding

Specify the encoding of the resulting certificate. It can be returned as a pem (or pkcs7\_pem) string or several (base64-encoded) binary formats (der, pkcs7\_der, pkcs12). Defaults to pem.

#### append\_certs

A list of additional certificates to encode with the new one, e.g. to create a CA chain.

---

**Note:** Mind that when der encoding is in use, appending certificatees is prohibited.

---

#### private\_key

For pkcs12, the private key corresponding to the public key of the certificate to be embedded.

#### private\_key\_passphrase

For pkcs12, if the private key to embed is encrypted, specify the corresponding passphrase.

#### pkcs12\_passphrase

For pkcs12, the container can be encrypted. Specify the passphrase to use here. Mind that PKCS12 encryption should not be relied on for security purposes, see note above in [x509.create\\_certificate](#).

#### pkcs12\_encryption\_compat

OpenSSL 3 and cryptography v37 switched to a much more secure default encryption for PKCS12, which might be incompatible with some systems. This forces the legacy encryption. Defaults to False.

#### pkcs12\_friendlyname

When encoding a certificate as pkcs12, a name for the certificate can be included.

#### raw

Return the encoded raw bytes instead of a string. Defaults to false.

```
salt.modules.x509_v2.encode_crl(crl, encoding='pem', raw=False)
```

Create an encoded representation of a certificate revocation list.

CLI Example:

```
salt '*' x509.encode_crl /etc/pki/my.crl der
```

#### crl

The certificate revocation list to encode.

#### encoding

Specify the encoding of the resulting certificate revocation list. It can be returned as a pem string or base64-encoded der. Defaults to pem.

#### raw

Return the encoded raw bytes instead of a string. Defaults to false.

`salt.modules.x509_v2.encode_csr(csr, encoding='pem', raw=False)`

Create an encoded representation of a certificate signing request.

CLI Example:

```
salt '*' x509.encode_csr /etc/pki/my.csr der
```

**csr**

The certificate signing request to encode.

**encoding**

Specify the encoding of the resulting certificate signing request. It can be returned as a pem string or base64-encoded der. Defaults to pem.

**raw**

Return the encoded raw bytes instead of a string. Defaults to false.

`salt.modules.x509_v2.encode_private_key(private_key, encoding='pem', passphrase=None, private_key_passphrase=None, pkcs12_encryption_compat=False, raw=False)`

Create an encoded representation of a private key.

CLI Example:

```
salt '*' x509.encode_private_key /etc/pki/my.key der
```

**private\_key**

The private key to encode.

**encoding**

Specify the encoding of the resulting private key. It can be returned as a pem string, base64-encoded der and base64-encoded pkcs12. Defaults to pem.

**passphrase**

If this is specified, the private key will be encrypted using this passphrase. The encryption algorithm cannot be selected, it will be determined automatically as the best available one.

**private\_key\_passphrase**

New in version 3006.2.

If the current `private_key` is encrypted, the passphrase to decrypt it.

**pkcs12\_encryption\_compat**

Some operating systems are incompatible with the encryption defaults for PKCS12 used since OpenSSL v3. This switch triggers a fallback to PBESv1SHA1And3KeyTripleDESCBC. Please consider the [notes on PKCS12 encryption](#).

**raw**

Return the encoded raw bytes instead of a string. Defaults to false.

`salt.modules.x509_v2.expired(certificate)`

Returns a dict containing limited details of a certificate and whether the certificate has expired.

CLI Example:

```
salt '*' x509.expired /etc/pki/mycert.crt
```

**certificate**

The certificate to check.

`salt.modules.x509_v2.expires(certificate, days=0)`

Determine whether a certificate will expire or has expired already. Returns a boolean only.

CLI Example:

```
salt '*' x509.expires /etc/pki/my.crt days=7
```

**certificate**

The certificate to check.

**days**

If specified, determine expiration x days in the future. Defaults to 0, which checks for the current time.

`salt.modules.x509_v2.get_pem_entries(glob_path)`

Returns a dict containing PEM entries in files matching a glob.

CLI Example:

```
salt '*' x509.get_pem_entries "/etc/pki/*.crt"
```

**glob\_path**

A path representing certificates to be read and returned.

`salt.modules.x509_v2.get_pem_entry(text, pem_type=None)`

Returns a properly formatted PEM string from the input text, fixing any whitespace or line-break issues.

CLI Example:

```
salt '*' x509.get_pem_entry "-----BEGIN CERTIFICATE REQUEST-----MIICyzCCⓧ
→Ar8CAQI...-----END CERTIFICATE REQUEST"
```

**text**

Text containing the X509 PEM entry to be returned or path to a file containing the text.

**pem\_type**

If specified, this function will only return a pem of a certain type, for example 'CERTIFICATE' or 'CERTIFICATE REQUEST'.

`salt.modules.x509_v2.get_private_key_size(private_key, passphrase=None)`

Return information about the keysize of a private key (RSA/EC).

CLI Example:

```
salt '*' x509.get_private_key_size /etc/pki/my.key
```

**private\_key**

The private key to check.

**passphrase**

If private\_key is encrypted, the passphrase to decrypt it.

`salt.modules.x509_v2.get_public_key(key, passphrase=None, asObj=None)`

Returns a PEM-encoded public key derived from some reference. The reference should be a public key, certificate, private key or CSR.

CLI Example:

```
salt '*' x509.get_public_key /etc/pki/my.key
```

**key**

A reference to the structure to look the public key up for.

**passphrase**

If key is encrypted, the passphrase to decrypt it.

`salt.modules.x509_v2.get_signing_policy`(*signing\_policy*, *ca\_server=None*)

Returns the specified named signing policy.

CLI Example:

```
salt '*' x509.get_signing_policy www
```

**signing\_policy**

The name of the signing policy to return.

**ca\_server**

If this is set, the CA server will be queried for the signing policy instead of looking it up locally.

`salt.modules.x509_v2.read_certificate`(*certificate*)

Returns a dict containing details of a certificate.

CLI Example:

```
salt '*' x509.read_certificate /etc/pki/mycert.crt
```

**certificate**

The certificate to read.

`salt.modules.x509_v2.read_certificates`(*glob\_path*)

Returns a dict containing details of all certificates matching a glob.

CLI Example:

```
salt '*' x509.read_certificates "/etc/pki/*.crt"
```

**glob\_path**

A path to certificates to be read and returned.

`salt.modules.x509_v2.read_crl`(*crl*)

Returns a dict containing details of a certificate revocation list.

CLI Example:

```
salt '*' x509.read_crl /etc/pki/my.crl
```

**crl**

The certificate revocation list to read.

`salt.modules.x509_v2.read_csr`(*csr*)

Returns a dict containing details of a certificate signing request.

CLI Example:

```
salt '*' x509.read_csr /etc/pki/mycert.csr
```

**csr**

The certificate signing request to read.

`salt.modules.x509_v2.sign_remote_certificate`(*signing\_policy*, *kwargs*,  
*get\_signing\_policy\_only=False*, *\*\*more\_kwargs*)

Request a certificate to be remotely signed according to a signing policy. This is mostly for internal use and does not make much sense on the CLI.

CLI Example:

```
salt '*' x509.sign_remote_certificate www kwarg="{public_key: '/etc/
→pki/www.key'}"
```

**signing\_policy**

The name of the signing policy to use. Required.

**kwargs**

A dict containing all the arguments to be passed into the `x509.create_certificate` function.

**get\_signing\_policy\_only**

Only return the named signing policy. Defaults to false.

`salt.modules.x509_v2.verify_crl(crl, cert)`

Verify that a signature on a certificate revocation list was made by the private key corresponding to the public key associated with the specified certificate.

CLI Example:

```
salt '*' x509.verify_crl /etc/pki/my.crl /etc/pki/my.crt
```

**crl**

The certificate revocation list to check the signature on.

**cert**

The certificate (or any reference that can be passed to `get_public_key`) to retrieve the public key from.

`salt.modules.x509_v2.verify_private_key(private_key, public_key, passphrase=None)`

Verify that a private key belongs to the specified public key.

CLI Example:

```
salt '*' x509.verify_private_key /etc/pki/my.key /etc/pki/my.crt
```

**private\_key**

The private key to check.

**public\_key**

The certificate (or any reference that can be passed to `get_public_key`) to retrieve the public key from.

**passphrase**

If `private_key` is encrypted, the passphrase to decrypt it.

`salt.modules.x509_v2.verify_signature(certificate, signing_pub_key=None,
signing_pub_key_passphrase=None)`

Verify that a signature on a certificate was made by the private key corresponding to the public key associated with the specified certificate.

CLI Example:

```
salt '*' x509.verify_signature /etc/pki/my.key /etc/pki/my.crt
```

**certificate**

The certificate to check the signature on.

**signing\_pub\_key**

Any reference that can be passed to `get_public_key` to retrieve the public key of the signing entity from. If unspecified, will take the public key of `certificate`, i.e. verify a self-signed certificate.

**signing\_pub\_key\_passphrase**

If `signing_pub_key` is encrypted, the passphrase to decrypt it.

`salt.modules.x509_v2.will_expire`(*certificate*, *days*)

Returns a dict containing details of a certificate and whether the certificate will expire in the specified number of days.

CLI Example:

```
salt '*' x509.will_expire "/etc/pki/mycert.crt" days=30
```

**certificate**

The certificate to check.

**days**

The number of days in the future to check the validity for.

`salt.modules.x509_v2.write_pem`(*text*, *path*, *overwrite=True*, *pem\_type=None*)

Writes out a PEM string, fixing any formatting or whitespace issues before writing.

CLI Example:

```
salt '*' x509.write_pem "-----BEGIN CERTIFICATE-----MIIGMzCCBugA..."  
→path=/etc/pki/mycert.crt
```

**text**

PEM string input to be written out.

**path**

Path of the file to write the PEM out to.

**overwrite**

If `True` (default), `write_pem` will overwrite the entire PEM file. Set to `False` to preserve existing private keys and DH params that may exist in the PEM file.

**pem\_type**

The PEM type to be saved, for example `CERTIFICATE` or `PUBLIC KEY`. Adding this will allow the function to take input that may contain multiple PEM types.

## 26.6.521 salt.modules.xapi\_virt

This module (mostly) uses the XenAPI to manage Xen virtual machines.

Big fat warning: the XenAPI used in this file is the one bundled with Xen Source, NOT XenServer nor Xen Cloud Platform. As a matter of fact it *will* fail under those platforms. From what I've read, little work is needed to adapt this code to XS/XCP, mostly playing with XenAPI version, but as XCP is not taking precedence on Xen Source on many platforms, please keep compatibility in mind.

Useful documentation:

. <http://downloads.xen.org/Wiki/XenAPI/xenapi-1.0.6.pdf> . [http://docs.vmd.citrix.com/XenServer/6.0.0/1.0/en\\_gb/api/](http://docs.vmd.citrix.com/XenServer/6.0.0/1.0/en_gb/api/) . <https://github.com/xapi-project/xen-api/tree/master/scripts/examples/python> . <http://xenbits.xen.org/gitweb/?p=xen.git;a=tree;f=tools/python/xen/xm;hb=HEAD>

`salt.modules.xapi_virt.freecpu`()

Return an int representing the number of unallocated cpus on this hypervisor

CLI Example:

```
salt '*' virt.freecpu
```

`salt.modules.xapi_virt.freemem`()

Return an int representing the amount of memory that has not been given to virtual machines on this node

CLI Example:

```
salt '*' virt.freemem
```

`salt.modules.xapi_virt.full_info()`

Return the node\_info, vm\_info and freemem

CLI Example:

```
salt '*' virt.full_info
```

`salt.modules.xapi_virt.get_disks(vm_)`

Return the disks of a named vm

CLI Example:

```
salt '*' virt.get_disks <vm name>
```

`salt.modules.xapi_virt.get_macs(vm_)`

Return a list off MAC addresses from the named vm

CLI Example:

```
salt '*' virt.get_macs <vm name>
```

`salt.modules.xapi_virt.get_nics(vm_)`

Return info about the network interfaces of a named vm

CLI Example:

```
salt '*' virt.get_nics <vm name>
```

`salt.modules.xapi_virt.is_hyper()`

Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:

```
salt '*' virt.is_hyper
```

`salt.modules.xapi_virt.list_domains()`

Return a list of virtual machine names on the minion

CLI Example:

```
salt '*' virt.list_domains
```

`salt.modules.xapi_virt.migrate(vm_, target, live=1, port=0, node=-1, ssl=None, change_home_server=0)`

Migrates the virtual machine to another hypervisor

CLI Example:

```
salt '*' virt.migrate <vm name> <target hypervisor> [live] [port] [node]
→ [ssl] [change_home_server]
```

Optional values:

**live**

Use live migration

**port**

Use a specified port

**node**

Use specified NUMA node on target

**ssl**

use ssl connection for migration

**change\_home\_server**

change home server for managed domains

`salt.modules.xapi_virt.node_info()`

Return a dict with information about this node

CLI Example:

```
salt '*' virt.node_info
```

`salt.modules.xapi_virt.pause(vm_)`

Pause the named vm

CLI Example:

```
salt '*' virt.pause <vm name>
```

`salt.modules.xapi_virt.reboot(vm_)`

Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <vm name>
```

`salt.modules.xapi_virt.reset(vm_)`

Reset a VM by emulating the reset button on a physical machine

CLI Example:

```
salt '*' virt.reset <vm name>
```

`salt.modules.xapi_virt.resume(vm_)`

Resume the named vm

CLI Example:

```
salt '*' virt.resume <vm name>
```

`salt.modules.xapi_virt.setmem(vm_, memory)`

Changes the amount of memory allocated to VM.

Memory is to be specified in MB

CLI Example:

```
salt '*' virt.setmem myvm 768
```

`salt.modules.xapi_virt.setvcpus(vm_, vcpus)`

Changes the amount of vcpus allocated to VM.

vcpus is an int representing the number to be assigned

CLI Example:

```
salt '*' virt.setvcpus myvm 2
```

`salt.modules.xapi_virt.shutdown(vm_)`

Send a soft shutdown signal to the named vm

CLI Example:

```
salt '*' virt.shutdown <vm name>
```

`salt.modules.xapi_virt.start(config_)`

Start a defined domain

CLI Example:

```
salt '*' virt.start <path to Xen cfg file>
```

`salt.modules.xapi_virt.stop(vm_)`

Hard power down the virtual machine, this is equivalent to pulling the power

CLI Example:

```
salt '*' virt.stop <vm name>
```

`salt.modules.xapi_virt.vcpu_pin(vm_, vcpu, cpus)`

Set which CPUs a VCPU can use.

CLI Example:

```
salt 'foo' virt.vcpu_pin domU-id 2 1
salt 'foo' virt.vcpu_pin domU-id 2 2-6
```

`salt.modules.xapi_virt.vm_cputime(vm_=None)`

Return cputime used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'cputime' <int>
    'cputime_percent' <int>
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_cputime
```

`salt.modules.xapi_virt.vm_diskstats(vm_=None)`

Return disk usage counters used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'io_read_kbs' : 0,
```

(continues on next page)

(continued from previous page)

```

    'io_write_kbs' : 0
  },
  ...
]

```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_diskstats
```

`salt.modules.xapi_virt.vm_info(vm_=None)`

Return detailed information about the vms.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

`salt.modules.xapi_virt.vm_netstats(vm_=None)`

Return combined network counters used by the vms on this hyper in a list of dicts:

```

[
  'your-vm': {
    'io_read_kbs'           : 0,
    'io_total_read_kbs'    : 0,
    'io_total_write_kbs'   : 0,
    'io_write_kbs'         : 0
  },
  ...
]

```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

`salt.modules.xapi_virt.vm_state(vm_=None)`

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_state <vm name>
```

## 26.6.522 salt.modules.xbpspkg

Package support for XBPS package manager (used by VoidLinux)

New in version 2016.11.0.

**salt.modules.xbpspkg.add\_repo**(*repo*, *conffile*='/usr/share/xbps.d/15-saltstack.conf')

Add an XBPS repository to the system.

**repo**

url of repo to add (persistent).

**conffile**

path to xbps conf file to add this repo default: /usr/share/xbps.d/15-saltstack.conf

CLI Examples:

```
salt '*' pkg.add_repo <repo url> [conffile=/path/to/xbps/repo.conf]
```

**salt.modules.xbpspkg.available\_version**(*\*names*, *\*\*kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

**salt.modules.xbpspkg.del\_repo**(*repo*, *\*\*kwargs*)

Remove an XBPS repository from the system.

**repo**

url of repo to remove (persistent).

CLI Examples:

```
salt '*' pkg.del_repo <repo url>
```

**salt.modules.xbpspkg.get\_repo**(*repo*, *\*\*kwargs*)

Display information about the repo.

CLI Examples:

```
salt '*' pkg.get_repo 'repo-url'
```

**salt.modules.xbpspkg.install**(*name=None*, *refresh=False*, *fromrepo=None*, *pkgs=None*, *sources=None*, *\*\*kwargs*)

Install the passed package

**name**

The name of the package to be installed.

**refresh**

Whether or not to refresh the package database before installing.

**fromrepo**

Specify a package repository (url) to install from.

Multiple Package Installation Options:

**pkgs**

A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

**sources**

A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"}, {"bar":  
↪ "salt://bar.deb"}]'
```

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',  
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

`salt.modules.xbpspkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>  
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.xbpspkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.xbpspkg.list_repos(**kwargs)`

List all repos known by XBPS

CLI Example:

```
salt '*' pkg.list_repos
```

`salt.modules.xbpspkg.list_upgrades(refresh=True, **kwargs)`

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.xbpspkg.refresh_db(**kwargs)`

Update list of available packages from installed repos

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.xbpspkg.remove`(*name=None, pkgs=None, recursive=True, \*\*kwargs*)

**name**

The name of the package to be deleted.

**recursive**

Also remove dependent packages (not required elsewhere). Default mode: enabled.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name> [recursive=False]
salt '*' pkg.remove <package1>,<package2>,<package3> [recursive=False]
salt '*' pkg.remove pkgs='["foo", "bar"]' [recursive=False]
```

`salt.modules.xbpspkg.upgrade`(*refresh=True, \*\*kwargs*)

Run a full system upgrade

**refresh**

Whether or not to refresh the package database before installing. Default is *True*.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.xbpspkg.upgrade_available`(*name, \*\*kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.xbpspkg.version`(*\*names, \*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 26.6.523 salt.modules.xfs

Module for managing XFS file systems.

**salt.modules.xfs.defragment** (*device*)

Defragment mounted XFS filesystem. In order to mount a filesystem, device should be properly mounted and writable.

CLI Example:

```
salt '*' xfs.defragment /dev/sda1
```

**salt.modules.xfs.devices** ()

Get known XFS formatted devices on the system.

CLI Example:

```
salt '*' xfs.devices
```

**salt.modules.xfs.dump** (*device, destination, level=0, label=None, noerase=None*)

Dump filesystem device to the media (file, tape etc).

Required parameters:

- **device**: XFS device, content of which to be dumped.
- **destination**: Specifies a dump destination.

Valid options are:

- **label**: Label of the dump. Otherwise automatically generated label is used.
- **level**: Specifies a dump level of 0 to 9.
- **noerase**: Pre-erase media.

Other options are not used in order to let `xfsdump` use its default values, as they are most optimal. See the `xfsdump(8)` manpage for a more complete description of these options.

CLI Example:

```
salt '*' xfs.dump /dev/sda1 /detination/on/the/client
salt '*' xfs.dump /dev/sda1 /detination/on/the/client label='Company
→accountancy'
salt '*' xfs.dump /dev/sda1 /detination/on/the/client noerase=True
```

**salt.modules.xfs.estimate** (*path*)

Estimate the space that an XFS filesystem will take. For each directory estimate the space that directory would take if it were copied to an XFS filesystem. Estimation does not cross mount points.

CLI Example:

```
salt '*' xfs.estimate /path/to/file
salt '*' xfs.estimate /path/to/dir/*
```

**salt.modules.xfs.info** (*device*)

Get filesystem geometry information.

CLI Example:

```
salt '*' xfs.info /dev/sda1
```

**salt.modules.xfs.inventory()**

Display XFS dump inventory without restoration.

CLI Example:

```
salt '*' xfs.inventory
```

**salt.modules.xfs.mkfs** (*device, label=None, ssize=None, noforce=None, bso=None, gmo=None, ino=None, lso=None, rso=None, nmo=None, dso=None*)

Create a file system on the specified device. By default wipes out with force.

General options:

- **label**: Specify volume label.
- **ssize**: Specify the fundamental sector size of the filesystem.
- **noforce**: Do not force create filesystem, if disk is already formatted.

Filesystem geometry options:

- **bso**: Block size options.
- **gmo**: Global metadata options.
- **dso**: **Data section options. These options specify the location, size, and other parameters of the data section of the filesystem.**
- **ino**: Inode options to specify the inode size of the filesystem, and other inode allocation parameters.
- **lso**: Log section options.
- **nmo**: Naming options.
- **rso**: Realtime section options.

See the `mkfs.xfs(8)` manpage for a more complete description of corresponding options description.

CLI Example:

```
salt '*' xfs.mkfs /dev/sda1
salt '*' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' noforce=True
salt '*' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' lso='logdev=/dev/sda2,
→size=10000b'
```

**salt.modules.xfs.modify** (*device, label=None, lazy\_counting=None, uuid=None*)

Modify parameters of an XFS filesystem.

CLI Example:

```
salt '*' xfs.modify /dev/sda1 label='My backup' lazy_counting=False
salt '*' xfs.modify /dev/sda1 uuid=False
salt '*' xfs.modify /dev/sda1 uuid=True
```

**salt.modules.xfs.prune\_dump** (*sessionid*)

Prunes the dump session identified by the given session id.

CLI Example:

```
salt '*' xfs.prune_dump b74a3586-e52e-4a4a-8775-c3334fa8ea2c
```

### 26.6.524 salt.modules.xml

XML file manager

New in version 3000.

`salt.modules.xml.get_attribute` (*file, element*)

Return the attributes of the matched xpath element.

CLI Example:

```
salt '*' xml.get_attribute /tmp/test.xml "../element[@id='3']"
```

`salt.modules.xml.get_value` (*file, element*)

Returns the value of the matched xpath element

CLI Example:

```
salt '*' xml.get_value /tmp/test.xml "../element"
```

`salt.modules.xml.set_attribute` (*file, element, key, value*)

Set the requested attribute key and value for matched xpath element.

CLI Example:

```
salt '*' xml.set_attribute /tmp/test.xml "../element[@id='3']" editedby  
↪ "gal"
```

`salt.modules.xml.set_value` (*file, element, value*)

Sets the value of the matched xpath element

CLI Example:

```
salt '*' xml.set_value /tmp/test.xml "../element" "new value"
```

### 26.6.525 salt.modules.xmpp

Module for Sending Messages via XMPP (a.k.a. Jabber)

New in version 2014.1.0.

#### depends

- `sleekxmpp` >= 1.3.1
- `pyasn1`
- `pyasn1-modules`
- `dnspython`

#### configuration

This module can be used by either passing a jid and password directly to `send_message`, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-xmpp-login:  
  xmpp.jid: myuser@jabber.example.org/resourcename  
  xmpp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org/salt
  xmpp.password: verybadpass

my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org
  xmpp.password: verybadpass
```

**class** salt.modules.xmpp.**SendMsgBot**(jid, password, recipient, msg)

**classmethod** **create\_multi**(jid, password, msg, recipients=None, rooms=None, nick='SaltStack Bot')

Alternate constructor that accept multiple recipients and rooms

**start**(event)

**class** salt.modules.xmpp.**SleekXMPPMUC**(name="")

**filter**(record)

Determine if the specified record is to be logged.

Is the specified record to be logged? Returns 0 for no, nonzero for yes. If deemed appropriate, the record may be modified in-place.

salt.modules.xmpp.**send\_msg**(recipient, message, jid=None, password=None, profile=None)

Send a message to an XMPP recipient. Designed for use in states.

CLI Examples:

```
xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test'
→ profile='my-xmpp-account'
xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test'
→ jid='myuser@xmpp.example.com/salt' password='verybadpass'
```

salt.modules.xmpp.**send\_msg\_multi**(message, recipients=None, rooms=None, jid=None, password=None, nick='SaltStack Bot', profile=None)

Send a message to an XMPP recipient, support send message to multiple recipients or chat room.

CLI Examples:

```
xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=[
→ 'secret@conference.xmpp.example.com'] 'This is a salt
→ module test' profile='my-xmpp-account'
xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=[
→ 'secret@conference.xmpp.example.com'] 'This is a salt module
→ test' jid='myuser@xmpp.example.com/salt' password=
→ 'verybadpass'
```

### 26.6.526 salt.modules.yaml

Yaml helper module for troubleshooting yaml

New in version 3005.

#### depends

yamllint >= 1.20.0

`salt.modules.yaml.lint`(*source*, *saltenv*=None, *pre\_render*=None, *\*\*kwargs*)

lint the output after detecting a successful render.

#### Parameters

- **source** (*str*) -- managed source file
- **saltenv** (*str*) -- the saltenv to use, defaults to minions environment or base if not set
- **pre\_render** (*str*) -- The render options passed to `slsutil.renderer` otherwise file is cached and loaded as stream

CLI Example:

```
salt '*' yaml.lint salt://example/bad_yaml.sls
```

### 26.6.527 salt.modules.yumpkg

Support for YUM/DNF

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

---

**Note:** DNF is fully supported as of version 2015.5.10 and 2015.8.4 (partial support for DNF was initially added in 2015.8.0), and DNF is used automatically in place of YUM in Fedora 22 and newer.

---

New in version 3003: Support for `tdnf` on Photon OS.

New in version 3007.0: Support for `dnf5`` on Fedora 39

**class** `salt.modules.yumpkg.AvailablePackages`(*\*args*, *\*\*kwargs*)

`salt.modules.yumpkg.available_version`(*\*names*, *\*\*kwargs*)

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the `fromrepo` keyword argument, and the `disableexcludes` option is also supported.

New in version 2014.7.0: Support for the `disableexcludes` option

CLI Example:

```

salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=epel-testing
salt '*' pkg.latest_version <package name> disableexcludes=main
salt '*' pkg.latest_version <package1> <package2> <package3> ...

```

`salt.modules.yumpkg.clean_metadata(**kwargs)`

New in version 2014.1.0.

Cleans local yum metadata. Functionally identical to `refresh_db()`.

CLI Example:

```
salt '*' pkg.clean_metadata
```

`salt.modules.yumpkg.del_repo(repo, basedir=None, **kwargs)`

Delete a repo from <basedir> (default basedir: all dirs in `reposdir` yum option).

If the `.repo` file in which the repo exists does not contain any other repo configuration, the file itself will be deleted.

Strict parsing of configuration files is the default, this can be disabled using the `strict_config` keyword argument set to `False`

CLI Examples:

```

salt '*' pkg.del_repo myrepo
salt '*' pkg.del_repo myrepo basedir=/path/to/dir strict_config=False
salt '*' pkg.del_repo myrepo basedir=/path/to/dir,/path/to/another/dir

```

`salt.modules.yumpkg.diff(*paths, **kwargs)`

Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

**Parameters**

**path** -- Full path to the installed file

**Returns**

Difference string or raises an exception if examined file is binary.

CLI Example:

```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

`salt.modules.yumpkg.download(*packages, **kwargs)`

New in version 2015.5.0.

Download packages to the local disk. Requires `yumdownloader` from `yum-utils` package.

---

**Note:** `yum-utils` will already be installed on the minion if the package was installed from the Fedora / EPEL repositories.

---

CLI Example:

```

salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix

```

`salt.modules.yumpkg.file_dict(*packages, **kwargs)`

New in version 2014.1.0.

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.yumpkg.file_list(*packages, **kwargs)`

New in version 2014.1.0.

List the files that belong to a package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.yumpkg.get_locked_packages(pattern='[\\w+]+(?:[.-][^-]+)*', full=True)`

This function is an alias of `list_holds`.

Changed in version 2015.5.10,2015.8.4,2016.3.0: Function renamed from `pkg.get_locked_pkgs` to `pkg.list_holds`.

List information on locked packages

---

**Note:** Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
  - On RHEL 6 & 7: `yum-plugin-versionlock`
  - On Fedora: `python-dnf-plugins-extras-versionlock`
- 

**pattern**

`[w+(?:[.-][^-]+)*]` Regular expression used to match the package name

**full**

`[True]` Show the full hold definition including version and epoch. Set to `False` to return just the name of the package(s) being held.

CLI Example:

```
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

`salt.modules.yumpkg.get_repo(repo, basedir=None, **kwargs)`

Display a repo from `<basedir>` (default `basedir`: all dirs in `reposdir` yum option).

CLI Examples:

```
salt '*' pkg.get_repo myrepo
salt '*' pkg.get_repo myrepo basedir=/path/to/dir
salt '*' pkg.get_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

`salt.modules.yumpkg.group_diff(name, **kwargs)`

New in version 2014.1.0.

Changed in version 2015.5.10,2015.8.4,2016.3.0: Environment groups are now supported. The key names have been renamed, similar to the changes made in *pkg.group\_info*.

Changed in version 3006.2: Support for `fromrepo`, `enablerepo`, and `disablerepo` (as used in *pkg.install*) has been added.

Lists which of a group's packages are installed and which are not installed

**name**

The name of the group to check

**fromrepo**

Restrict `yum groupinfo` to the specified repo(s). (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

New in version 3006.2.

**enablerepo (ignored if `fromrepo` is specified)**

Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

New in version 3006.2.

**disablerepo (ignored if `fromrepo` is specified)**

Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

New in version 3006.2.

CLI Example:

```
salt '*' pkg.group_diff 'Perl Support'
salt '*' pkg.group_diff 'Perl Support' fromrepo=base,updates
salt '*' pkg.group_diff 'Perl Support' enablerepo=somerepo
```

`salt.modules.yumpkg.group_info(name, expand=False, ignore_groups=None, **kwargs)`

New in version 2014.1.0.

Changed in version 2015.5.10,2015.8.4,2016.3.0,3001: The return data has changed. A new key `type` has been added to distinguish environment groups from package groups. Also, keys for the group name and group ID have been added. The mandatory `packages`, `optional packages`, and `default packages` keys have been renamed to `mandatory`, `optional`, and `default` for accuracy, as environment groups include other groups, and not packages. Finally, this function now properly identifies conditional packages.

Changed in version 3006.2: Support for `fromrepo`, `enablerepo`, and `disablerepo` (as used in *pkg.install*) has been added.

Lists packages belonging to a certain group

**name**

Name of the group to query

**expand**

[False] If the specified group is an environment group, then the group will be expanded and the return data will include package names instead of group names.

New in version 2016.3.0.

**ignore\_groups**

[None] This parameter can be used to pass a list of groups to ignore when expanding subgroups. It is used during recursion in order to prevent expanding the same group multiple times.

New in version 3001.

**fromrepo**

Restrict yum groupinfo to the specified repo(s). (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

New in version 3006.2.

**enablerepo (ignored if **fromrepo** is specified)**

Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

New in version 3006.2.

**disablerepo (ignored if **fromrepo** is specified)**

Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

New in version 3006.2.

CLI Example:

```
salt '*' pkg.group_info 'Perl Support'
salt '*' pkg.group_info 'Perl Support' fromrepo=base,updates
salt '*' pkg.group_info 'Perl Support' enablerepo=somerepo
```

`salt.modules.yumpkg.group_install` (*name*, *skip*=(), *include*=(), *\*\*kwargs*)

New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around `pkg.install`, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

**name**

Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

CLI Examples:

```
salt '*' pkg.group_install 'Group 1'
salt '*' pkg.group_install 'Group 1,Group 2'
salt '*' pkg.group_install '["Group 1", "Group 2"]'
```

**skip**

Packages that would normally be installed by the package group ("default" packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip='["foo", "bar"]'
```

**include**

Packages which are included in a group, which would not normally be installed by a yum groupinstall ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include='["foo", "bar"]'
```

**Note:** Because this is essentially a wrapper around `pkg.install`, any argument which can be passed to

`pkg.install` may also be included here, and it will be passed along wholesale.

### `salt.modules.yumpkg.group_list()`

New in version 2014.1.0.

Lists all groups known by yum on this system

CLI Example:

```
salt '*' pkg.group_list
```

### `salt.modules.yumpkg.groupinstall(name, skip=(), include=(), **kwargs)`

This function is an alias of `group_install`.

New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around `pkg.install`, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

#### **name**

Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

CLI Examples:

```
salt '*' pkg.group_install 'Group 1'
salt '*' pkg.group_install 'Group 1,Group 2'
salt '*' pkg.group_install ['"Group 1", "Group 2"]'
```

#### **skip**

Packages that would normally be installed by the package group ("default" packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip=['"foo", "bar"]'
```

#### **include**

Packages which are included in a group, which would not normally be installed by a yum `groupinstall` ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include=['"foo", "bar"]
↪'
```

**Note:** Because this is essentially a wrapper around `pkg.install`, any argument which can be passed to `pkg.install` may also be included here, and it will be passed along wholesale.

### `salt.modules.yumpkg.hold(name=None, pkgs=None, sources=None, normalize=True, **kwargs)`

New in version 2014.7.0.

Version-lock packages

---

**Note:** Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
  - On RHEL 6 & 7: `yum-plugin-versionlock`
  - On Fedora: `python-dnf-plugins-extras-versionlock`
- 

**name**

The name of the package to be held.

Multiple Package Options:

**pkgs**

A list of packages to hold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

`salt.modules.yumpkg.info_installed(*names, **kwargs)`

New in version 2015.8.1.

Return the information of the named package(s), installed on the system.

**Parameters**

**all\_versions** -- Include information for all versions of the packages installed on the minion.

CLI Example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2> <package3> all_
↳versions=True
```

`salt.modules.yumpkg.install(name=None, refresh=False, skip_verify=False, pkgs=None, sources=None, downloadonly=False, reinstall=False, normalize=True, update_holds=False, saltenv='base', ignore_epoch=False, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `yum/dnf` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add `refresh=True` to clean the yum database before package is installed.

**name**

The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (`.i686`, `.i586`, etc.) to the end of the package name.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh**

Whether or not to update the yum database before executing.

**reinstall**

Specifying `reinstall=True` will use `yum reinstall` rather than `yum install` for requested packages that are already installed.

If a version is specified with the requested package, then `yum reinstall` will only be used if the installed version matches the requested version.

Works with `sources` when the package header of the source can be matched to the name and version of an installed package.

New in version 2014.7.0.

**skip\_verify**

Skip the GPG verification check (e.g., `--nogpgcheck`)

**downloadonly**

Only download the packages, do not install.

**version**

Install a specific version of the package, e.g. `1.2.3-4.el5`. Ignored if `"pkgs"` or `"sources"` is passed.

Changed in version 2018.3.0: `version` can now contain comparison operators (e.g. `>1.2.3`, `<=2.0`, etc.)

**update\_holds**

[False] If `True`, and this function would update the package version, any packages held using the yum/dnf `"versionlock"` plugin will be unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and an error will be raised.

New in version 2016.11.0.

**setopt**

A comma-separated or Python list of `key=value` options. This list will be expanded and `--setopt` prepended to each in the yum/dnf command that is run.

CLI Example:

```
salt '*' pkg.install foo setopt='obsoletes=0,plugins=0'
```

New in version 2019.2.0.

Repository Options:

**fromrepo**

Specify a package repository (or repositories) from which to install. (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

**enablerepo (ignored if **fromrepo** is specified)**

Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

**disablerepo (ignored if **fromrepo** is specified)**

Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

**disableexcludes**

Disable exclude from main, for a repo or for everything. (e.g., `yum --disableexcludes='main'`)

New in version 2014.7.0.

**ignore\_epoch**

[False] Only used when the version of a package is specified using a comparison operator (e.g. `>4.1`). If set to `True`, then the epoch will be ignored when comparing the currently-installed version to the desired version.

New in version 2018.3.0.

Multiple Package Installation Options:

#### pkgs

A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version.

CLI Examples:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-4.el5"}]'
```

#### sources

A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.rpm"}, {"bar":
↪ "salt://bar.rpm"}]'
```

#### normalize

[True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.install gdfs.gplbin-2.6.32-279.31.1.el6.x86_64
↪ normalize=False
```

New in version 2014.7.0.

#### split\_arch

[True] If set to False it prevents package name normalization more strict way than `normalize` set to False does.

New in version 3006.0.

#### diff\_attr:

If a list of package attributes is specified, returned value will contain them, eg.:

```
{ '<package>': {
  'old': {
    'version': '<old-version>',
    'arch': '<old-arch>'},

  'new': {
    'version': '<new-version>',
    'arch': '<new-arch>'}}
```

Valid attributes are: `epoch`, `version`, `release`, `arch`, `install_date`, `install_date_time_t`.

If `all` is specified, all valid attributes will be returned.

New in version 2018.3.0.

Returns a dict containing the new package names and versions:

```
{ '<package>': {'old': '<old-version>',
                'new': '<new-version>'}}
```

If an attribute list in `diff_attr` is specified, the dict will also contain any specified attribute, eg.:

```
{'<package>': {
  'old': {
    'version': '<old-version>',
    'arch': '<old-arch>'},

  'new': {
    'version': '<new-version>',
    'arch': '<new-arch>'}}
```

`salt.modules.yumpkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the `fromrepo` keyword argument, and the `disableexcludes` option is also supported.

New in version 2014.7.0: Support for the `disableexcludes` option

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=epel-testing
salt '*' pkg.latest_version <package name> disableexcludes=main
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.yumpkg.list_downloaded(**kwargs)`

New in version 2017.7.0.

List prefetched packages downloaded by Yum in the local disk.

CLI Example:

```
salt '*' pkg.list_downloaded
```

`salt.modules.yumpkg.list_holds(pattern='[\\w+](?:[.-][^-]+)*', full=True)`

Changed in version 2015.5.10,2015.8.4,2016.3.0: Function renamed from `pkg.get_locked_pkgs` to `pkg.list_holds`.

List information on locked packages

---

**Note:** Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
  - On RHEL 6 & 7: `yum-plugin-versionlock`
  - On Fedora: `python-dnf-plugins-extras-versionlock`
- 

**pattern**

`[w+(?:[.-][^-]+)*]` Regular expression used to match the package name

**full**

[True] Show the full hold definition including version and epoch. Set to `False` to return just the name of the package(s) being held.

CLI Example:

```
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

`salt.modules.yumpkg.list_installed_patches` (\*\*kwargs)

New in version 2017.7.0.

List installed advisory patches on the system.

CLI Examples:

```
salt '*' pkg.list_installed_patches
```

`salt.modules.yumpkg.list_patches` (refresh=False, \*\*kwargs)

New in version 2017.7.0.

List all known advisory patches from available repos.

**refresh**

force a refresh if set to True. If set to False (default) it depends on yum if a refresh is executed.

CLI Examples:

```
salt '*' pkg.list_patches
```

`salt.modules.yumpkg.list_pkgs` (versions\_as\_list=False, \*\*kwargs)

List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

```
{'<package_name>': '<version>[,<version>...']}
```

**versions\_as\_list:**

If set to true, the versions are provided as a list

```
{'<package_name>': ['<version>', '<version>']}
```

**attr:**

If a list of package attributes is specified, returned value will contain them in addition to version, eg.:

```
{'<package_name>': [{'version' : 'version', 'arch' : 'arch'}]}
```

Valid attributes are: epoch, version, release, arch, install\_date, install\_date\_time\_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs attr=version,arch
salt '*' pkg.list_pkgs attr=['"version"', "arch"]'
```

`salt.modules.yumpkg.list_repo_pkgs` (\*args, \*\*kwargs)

New in version 2014.1.0.

Changed in version 2014.7.0: All available versions of each package are now returned. This required a slight modification to the structure of the return dict. The return data shown below reflects the updated return dict structure. Note that packages which are version-locked using `pkg.hold` will only show the currently installed version, as locking a package will make other versions appear unavailable to yum/dnf.

Changed in version 2017.7.0: By default, the versions for each package are no longer organized by repository. To get results organized by repository, use `byrepo=True`.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

**Warning:** Running this function on RHEL/CentOS 6 and earlier will be more resource-intensive, as the version of yum that ships with older RHEL/CentOS has no yum subcommand for listing packages from a repository. Thus, a `yum list installed` and `yum list available` are run, which generates a lot of output, which must then be analyzed to determine which package information to include in the return data.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
  'bash': ['4.1.2-15.el6_5.2',
           '4.1.2-15.el6_5.1',
           '4.1.2-15.el6_4'],
  'kernel': ['2.6.32-431.29.2.el6',
             '2.6.32-431.23.3.el6',
             '2.6.32-431.20.5.el6',
             '2.6.32-431.20.3.el6',
             '2.6.32-431.17.1.el6',
             '2.6.32-431.11.2.el6',
             '2.6.32-431.5.1.el6',
             '2.6.32-431.3.1.el6',
             '2.6.32-431.1.2.0.1.el6',
             '2.6.32-431.el6']
}

# With byrepo=True
{
  'base': {
    'bash': ['4.1.2-15.el6_4'],
    'kernel': ['2.6.32-431.el6']
  },
  'updates': {
    'bash': ['4.1.2-15.el6_5.2', '4.1.2-15.el6_5.1'],
    'kernel': ['2.6.32-431.29.2.el6',
              '2.6.32-431.23.3.el6',
              '2.6.32-431.20.5.el6',
              '2.6.32-431.20.3.el6',
              '2.6.32-431.17.1.el6',
              '2.6.32-431.11.2.el6',
              '2.6.32-431.5.1.el6',
              '2.6.32-431.3.1.el6',
              '2.6.32-431.1.2.0.1.el6']
  }
}
```

**fromrepo**

[None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

**enablerepo (ignored if **fromrepo** is specified)**

Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

New in version 2017.7.0.

**disablerepo (ignored if **fromrepo** is specified)**

Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

New in version 2017.7.0.

**byrepo**

[False] When True, the return data for each package will be organized by repository.

New in version 2017.7.0.

**cacheonly**

[False] When True, the repo information will be retrieved from the cached repo metadata. This is equivalent to passing the `-C` option to yum/dnf.

New in version 2017.7.0.

**setopt**

A comma-separated or Python list of key=value options. This list will be expanded and `--setopt` prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

`salt.modules.yumpkg.list_repos` (*basedir=None, \*\*kwargs*)

Lists all repos in `<basedir>` (default: all dirs in `reposdir` yum option).

Strict parsing of configuration files is the default, this can be disabled using the `strict_config` keyword argument set to False

CLI Example:

```
salt '*' pkg.list_repos
salt '*' pkg.list_repos basedir=/path/to/dir
salt '*' pkg.list_repos basedir=/path/to/dir,/path/to/another/dir strict_
↳config=False
```

`salt.modules.yumpkg.list_updates` (*refresh=True, \*\*kwargs*)

This function is an alias of `list_upgrades`.

Check whether or not an upgrade is available for all packages

The `fromrepo`, `enablerepo`, and `disablerepo` arguments are supported, as used in `pkg` states, and the `disableexcludes` option is also supported.

New in version 2014.7.0: Support for the `disableexcludes` option

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.yumpkg.list_upgrades` (*refresh=True, \*\*kwargs*)

Check whether or not an upgrade is available for all packages

The `fromrepo`, `enablerepo`, and `disablerepo` arguments are supported, as used in `pkg` states, and the `disableexcludes` option is also supported.

New in version 2014.7.0: Support for the `disableexcludes` option

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.yumpkg.mod_repo` (*repo, basedir=None, \*\*kwargs*)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:

**repo**

name by which the yum refers to the repo

**name**

a human-readable name for the repo

**baseurl**

the URL for yum to reference

**mirrorlist**

the URL for yum to reference

Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a baseurl can only be deleted if a mirrorlist is specified (or vice versa).

Strict parsing of configuration files is the default, this can be disabled using the `strict_config` keyword argument set to `False`

CLI Examples:

```
salt '*' pkg.mod_repo reponame enabled=1 gpgcheck=1
salt '*' pkg.mod_repo reponame basedir=/path/to/dir enabled=1 strict_
→config=False
salt '*' pkg.mod_repo reponame baseurl= mirrorlist=http://host.com/
```

`salt.modules.yumpkg.modified` (*\*packages, \*\*flags*)

List the modified files that belong to a package. Not specifying any packages will return a list of `_all_` modified files on the system's RPM database.

New in version 2015.5.0.

Filtering by flags (True or False):

**size**

Include only files where size changed.

**mode**

Include only files which file's mode has been changed.

**checksum**

Include only files which MD5 checksum has been changed.

**device**

Include only files which major and minor numbers has been changed.

**symlink**

Include only files which are symbolic link contents.

**owner**

Include only files where owner has been changed.

**group**

Include only files where group has been changed.

**time**

Include only files where modification time of the file has been changed.

**capabilities**

Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

**salt.modules.yumpkg.normalize\_name**(*name*)

Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:

- If the arch is 32 bit and the package name ends in a 32-bit arch.
- If the arch matches the OS arch, or is noarch.

CLI Example:

```
salt '*' pkg.normalize_name zsh.x86_64
```

**salt.modules.yumpkg.owner**(*\*paths*, *\*\*kwargs*)

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like *pkg.version*, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

**salt.modules.yumpkg.parse\_arch**(*name*)

Parse name and architecture from the specified package name.

CLI Example:

```
salt '*' pkg.parse_arch zsh.x86_64
```

**salt.modules.yumpkg.purge**(*name=None*, *pkgs=None*, *\*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `yum/dnf` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Package purges are not supported by yum, this function is identical to *pkg.remove*.

**name**

The name of the package to be purged

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.yumpkg.refresh_db(**kwargs)`

Check the yum repos for updated packages

Returns:

- True: Updates are available
- False: An error occurred
- None: No updates are available

**repo**

Refresh just the specified repo

**disablerepo**

Do not refresh the specified repo

**enablerepo**

Refresh a disabled repo using this option

**branch**

Add the specified branch when refreshing

**disableexcludes**

Disable the excludes defined in your config files. Takes one of three options: - all - disable all excludes - main - disable excludes defined in [main] in yum.conf - repo id - disable excludes defined for that repo

**setopt**

A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.yumpkg.remove(name=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages

**name**

The name of the package to be removed

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

**split\_arch**

[True] If set to False it prevents package name normalization by removing arch.

New in version 3006.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.yumpkg.services_need_restart(**kwargs)`

New in version 3003.

List services that use files which have been changed by the package manager. It might be needed to restart them.

Requires systemd.

CLI Examples:

```
salt '*' pkg.services_need_restart
```

`salt.modules.yumpkg.unhold(name=None, pkgs=None, sources=None, **kwargs)`

New in version 2014.7.0.

Remove version locks

---

**Note:** Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
  - On RHEL 6 & 7: `yum-plugin-versionlock`
  - On Fedora: `python-dnf-plugins-extras-versionlock`
- 

**name**

The name of the package to be unheld

Multiple Package Options:

**pkgs**

A list of packages to unhold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.yumpkg.update(name=None, pkgs=None, refresh=True, skip_verify=False, normalize=True, minimal=False, obsoletes=False, **kwargs)`

New in version 2019.2.0.

Calls `pkg.upgrade` with `obsoletes=False`. Mirrors the CLI behavior of `yum update`. See `pkg.upgrade` for further documentation.

CLI Example:

```
salt '*' pkg.update
```

`salt.modules.yumpkg.upgrade` (*name=None, pkgs=None, refresh=True, skip\_verify=False, normalize=True, minimal=False, obsoletes=True, diff\_attr=None, \*\*kwargs*)

Run a full system upgrade (a `yum upgrade` or `dnf upgrade`), or upgrade specified packages. If the packages aren't installed, they will not be installed.

Changed in version 2014.7.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `yum/dnf` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Changed in version 2019.2.0: Added `obsoletes` and `minimal` arguments

Returns a dictionary containing the changes:

```
{ '<package>': {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade name=openssl
```

Repository Options:

**fromrepo**

Specify a package repository (or repositories) from which to install. (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

**enablerepo** (ignored if **fromrepo** is specified)

Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

**disablerepo** (ignored if **fromrepo** is specified)

Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

**disableexcludes**

Disable exclude from main, for a repo or for everything. (e.g., `yum --disableexcludes='main'`)

New in version 2014.7.0.

**name**

The name of the package to be upgraded. Note that this parameter is ignored if "pkgs" is passed.

32-bit packages can be upgraded on 64-bit systems by appending the architecture designation (`.i686`, `.i586`, etc.) to the end of the package name.

Warning: if you forget 'name=' and run `pkg.upgrade openssl`, ALL packages are upgraded. This will be addressed in next releases.

CLI Example:

```
salt '*' pkg.upgrade name=openssl
```

New in version 2016.3.0.

**pkgs**

A list of packages to upgrade from a software repository. Must be passed as a python list. A specific

version number can be specified by using a single-element dict representing the package and its version. If the package was not already installed on the system, it will not be installed.

CLI Examples:

```
salt '*' pkg.upgrade pkgs='["foo", "bar"]'
salt '*' pkg.upgrade pkgs='["foo", {"bar": "1.2.3-4.el5"}]'
```

New in version 2016.3.0.

#### normalize

[True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.upgrade gpfs.gplbin-2.6.32-279.31.1.el6.x86_64
↳ normalize=False
```

New in version 2016.3.0.

#### minimal

[False] Use upgrade-minimal instead of upgrade (e.g., yum upgrade-minimal) Goes to the 'newest' package match which fixes a problem that affects your system.

```
salt '*' pkg.upgrade minimal=True
```

New in version 2019.2.0.

#### obsoletes

[True] Controls whether yum/dnf should take obsoletes into account and remove them. If set to False yum will use update instead of upgrade and dnf will be run with --obsoletes=False

```
salt '*' pkg.upgrade obsoletes=False
```

New in version 2019.2.0.

#### setopt

A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

#### diff\_attr:

If a list of package attributes is specified, returned value will contain them, eg.:

```
{ '<package>': {
  'old': {
    'version': '<old-version>',
    'arch': '<old-arch>'},
  'new': {
    'version': '<new-version>',
    'arch': '<new-arch>'}}}
```

Valid attributes are: epoch, version, release, arch, install\_date, install\_date\_time\_t.

If all is specified, all valid attributes will be returned.

New in version 3006.0.

---

**Note:** To add extra arguments to the `yum upgrade` command, pass them as key word arguments. For arguments without assignments, pass `True`

---

```
salt '*' pkg.upgrade security=True exclude='kernel*'
```

`salt.modules.yumpkg.upgrade_available`(*name*, *\*\*kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.yumpkg.verify`(*\*names*, *\*\*kwargs*)

New in version 2014.1.0.

Runs an `rpm -Va` on a system, and returns the results in a dict

Pass options to modify rpm verify behavior using the `verify_options` keyword argument

Files with an attribute of `config`, `doc`, `ghost`, `license` or `readme` in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix'
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
salt '*' pkg.verify 'httpd postfix' verify_options=['nodeps','nosize']
```

`salt.modules.yumpkg.version`(*\*names*, *\*\*kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.yumpkg.version_cmp`(*pkg1*, *pkg2*, *ignore\_epoch=False*, *\*\*kwargs*)

New in version 2015.5.4.

Do a cmp-style comparison on two packages. Return -1 if `pkg1 < pkg2`, 0 if `pkg1 == pkg2`, and 1 if `pkg1 > pkg2`. Return `None` if there was a problem making the comparison.

**ignore\_epoch**

[False] Set to `True` to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

## 26.6.528 salt.modules.zabbix

**Warning:** This module will be removed from Salt in version 3009 in favor of the [zabbix Salt Extension](#).

Support for Zabbix

#### optdepends

- zabbix server

#### configuration

This module is not usable until the zabbix user and zabbix password are specified either in a pillar or in the minion's config file. Zabbix url should be also specified.

```
zabbix.user: Admin
zabbix.password: mypassword
zabbix.url: http://127.0.0.1/zabbix/api_jsonrpc.php
```

Connection arguments from the minion config file can be overridden on the CLI by using arguments with `_connection_` prefix.

```
zabbix.apiinfo_version _connection_user=Admin _connection_
password=zabbix _connection_url=http://host/zabbix/
```

#### codeauthor

Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.modules.zabbix.apiinfo_version(**connection_args)`

Retrieve the version of the Zabbix API.

New in version 2016.3.0.

#### Parameters

- **`_connection_user`** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **`_connection_password`** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **`_connection_url`** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### Returns

On success string with Zabbix API version, False on failure.

CLI Example:

```
salt '*' zabbix.apiinfo_version
```

`salt.modules.zabbix.compare_params(defined, existing, return_old_value=False)`

New in version 2017.7.0.

Compares Zabbix object definition against existing Zabbix object.

#### Parameters

- **`defined`** -- Zabbix object definition taken from sls file.
- **`existing`** -- Existing Zabbix object taken from result of an API call.
- **`return_old_value`** -- Default False. If True, returns dict("old"=old\_val, "new"=new\_val) for rollback purpose.

**Returns**

Params that are different from existing object. Result extended by object ID can be passed directly to Zabbix API update method.

CLI Example:

```
salt '*' zabbix.compare_params new_zabbix_object_dict existing_zabbix_
→object_dict
```

`salt.modules.zabbix.configuration_import` (*config\_file*, *rules=None*, *file\_format='xml'*, *\*\*connection\_args*)

New in version 2017.7.0.

Imports Zabbix configuration specified in file to Zabbix server.

**Parameters**

- **config\_file** -- File with Zabbix config (local or remote)
- **rules** -- Optional - Rules that have to be different from default (defaults are the same as in Zabbix web UI.)
- **file\_format** -- Config file format (default: xml)
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

CLI Example:

```
salt '*' zabbix.configuration_import salt://zabbix/config/zabbix_
→templates.xml      '{"screens': {'createMissing': True,
→'updateExisting': True}}"
```

`salt.modules.zabbix.get_object_id_by_params` (*obj*, *params=None*, *\*\*connection\_args*)

New in version 2017.7.0.

Get ID of single Zabbix object specified by its name.

**Parameters**

- **obj** -- Zabbix object type
- **params** -- Parameters by which object is uniquely identified
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

object ID

CLI Example:

```
salt '*' zabbix.get_object_id_by_params object_type params=zabbix_api_
→query_parameters_dict
```

`salt.modules.zabbix.get_zabbix_id_mapper` ()

New in version 2017.7.0.

Make ZABBIX\_ID\_MAPPER constant available to state modules.

**Returns**

ZABBIX\_ID\_MAPPER

CLI Example:

```
salt '*' zabbix.get_zabbix_id_mapper
```

`salt.modules.zabbix.host_create` (*host, groups, interfaces, \*\*connection\_args*)

New in version 2016.3.0.

Create new host

---

**Note:** This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **host** -- technical name of the host
- **groups** -- groupids of host groups to add the host to
- **interfaces** -- interfaces to be created for the host
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible\_name** -- string with visible name of the host, use 'visible\_name' instead of 'name' parameter to not mess with value supplied from Salt sls file.

return: ID of the created host.

CLI Example:

```
salt '*' zabbix.host_create technicalname 4
interfaces='{type: 1, main: 1, useip: 1, ip: "192.168.3.1", dns: "",
↳port: 10050}'
visible_name='Host Visible Name' inventory_mode=0 inventory='{ "alias":
↳"something" }'
```

`salt.modules.zabbix.host_delete` (*hostids, \*\*connection\_args*)

Delete hosts.

New in version 2016.3.0.

#### Parameters

- **hostids** -- Hosts (hostids) to delete.
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### Returns

IDs of the deleted hosts.

CLI Example:

```
salt '*' zabbix.host_delete 10106
```

`salt.modules.zabbix.host_exists` (*host=None, hostid=None, name=None, node=None, nodeids=None, \*\*connection\_args*)

Checks if at least one host that matches the given filter criteria exists.

New in version 2016.3.0.

#### Parameters

- **host** -- technical name of the host
- **hostids** -- Hosts (hostids) to delete.
- **name** -- visible name of the host
- **node** -- name of the node the hosts must belong to (zabbix API < 2.4)
- **nodeids** -- IDs of the node the hosts must belong to (zabbix API < 2.4)
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### Returns

IDs of the deleted hosts, False on failure.

CLI Example:

```
salt '*' zabbix.host_exists 'Zabbix server'
```

`salt.modules.zabbix.host_get(host=None, name=None, hostids=None, **connection_args)`

New in version 2016.3.0.

Retrieve hosts according to the given parameters

---

**Note:** This function accepts all optional `host.get` parameters: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **host** -- technical name of the host
- **name** -- visible name of the host
- **hostids** -- ids of the hosts
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### Returns

Array with convenient hosts details, False if no host found or on failure.

CLI Example:

```
salt '*' zabbix.host_get 'Zabbix server'
```

`salt.modules.zabbix.host_inventory_get(hostids, **connection_args)`

Retrieve host inventory according to the given parameters. See: [https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host\\_inventory](https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory)

New in version 2019.2.0.

#### Parameters

- **hostids** -- ID of the host to query

- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

Array with host inventory fields, populated or not, False if host inventory is disabled or on failure.

CLI Example:

```
salt '*' zabbix.host_inventory_get 101054
```

`salt.modules.zabbix.host_inventory_set` (*hostid*, *\*\*connection\_args*)

Update host inventory items NOTE: This function accepts all standard host: keyword argument names for inventory see: [https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host\\_inventory](https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory)

New in version 2019.2.0.

**Parameters**

- **hostid** -- ID of the host to update
- **clear\_old** -- Set to True in order to remove all existing inventory items before setting the specified items
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

ID of the updated host, False on failure.

CLI Example:

```
salt '*' zabbix.host_inventory_set 101054 asset_tag=jml3322 type=vm clear_
→old=True
```

`salt.modules.zabbix.host_list` (*\*\*connection\_args*)

Retrieve all hosts.

New in version 2016.3.0.

**Parameters**

- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

Array with details about hosts, False on failure.

CLI Example:

```
salt '*' zabbix.host_list
```

`salt.modules.zabbix.host_update` (*hostid*, *\*\*connection\_args*)

New in version 2016.3.0.

Update existing hosts

---

**Note:** This function accepts all standard host and host.update properties: keyword argument names differ depending on your zabbix version, see the documentation for [host objects](#) and the documentation for [updating hosts](#).

---

#### Parameters

- **hostid** -- ID of the host to update
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible\_name** -- string with visible name of the host, use 'visible\_name' instead of 'name' parameter to not mess with value supplied from Salt sls file.

#### Returns

ID of the updated host.

CLI Example:

```
salt '*' zabbix.host_update 10084 name='Zabbix server2'
```

`salt.modules.zabbix.hostgroup_create`(*name*, *\*\*connection\_args*)

New in version 2016.3.0.

Create a host group

---

**Note:** This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **name** -- name of the host group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### Returns

ID of the created host group.

CLI Example:

```
salt '*' zabbix.hostgroup_create MyNewGroup
```

`salt.modules.zabbix.hostgroup_delete`(*hostgroupids*, *\*\*connection\_args*)

Delete the host group.

New in version 2016.3.0.

#### Parameters

- **hostgroupids** -- IDs of the host groups to delete
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)

- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

ID of the deleted host groups, False on failure.

CLI Example:

```
salt '*' zabbix.hostgroup_delete 23
```

`salt.modules.zabbix.hostgroup_exists` (*name=None, groupid=None, node=None, nodeids=None, \*\*connection\_args*)

Checks if at least one host group that matches the given filter criteria exists.

New in version 2016.3.0.

**Parameters**

- **name** -- names of the host groups
- **groupid** -- host group IDs
- **node** -- name of the node the host groups must belong to (zabbix API < 2.4)
- **nodeids** -- IDs of the nodes the host groups must belong to (zabbix API < 2.4)
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

True if at least one host group exists, False if not or on failure.

CLI Example:

```
salt '*' zabbix.hostgroup_exists MyNewGroup
```

`salt.modules.zabbix.hostgroup_get` (*name=None, groupids=None, hostids=None, \*\*connection\_args*)

New in version 2016.3.0.

Retrieve host groups according to the given parameters

---

**Note:** This function accepts all standard `hostgroup.get` properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

**Parameters**

- **name** -- names of the host groups
- **groupid** -- host group IDs
- **node** -- name of the node the host groups must belong to
- **nodeids** -- IDs of the nodes the host groups must belong to
- **hostids** -- return only host groups that contain the given hosts
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

Array with host groups details, False if no convenient host group found or on failure.

CLI Example:

```
salt '*' zabbix.hostgroup_get MyNewGroup
```

`salt.modules.zabbix.hostgroup_list(**connection_args)`

Retrieve all host groups.

New in version 2016.3.0.

#### Parameters

- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### Returns

Array with details about host groups, False on failure.

CLI Example:

```
salt '*' zabbix.hostgroup_list
```

`salt.modules.zabbix.hostgroup_update(groupid, name=None, **connection_args)`

New in version 2016.3.0.

Update existing hosts group

---

**Note:** This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **groupid** -- ID of the host group to update
- **name** -- name of the host group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### Returns

IDs of updated host groups.

CLI Example:

```
salt '*' zabbix.hostgroup_update 24 name='Renamed Name'
```

`salt.modules.zabbix.hostinterface_create(hostid, ip_, dns="", main=1, if_type=1, useip=1, port=None, **connection_args)`

New in version 2016.3.0.

Create new host interface

---

**Note:** This function accepts all standard host group interface: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **hostid** -- ID of the host the interface belongs to
- **ip** -- IP address used by the interface
- **dns** -- DNS name used by the interface
- **main** -- whether the interface is used as default on the host (0 - not default, 1 - default)
- **port** -- port number used by the interface
- **type** -- Interface type (1 - agent; 2 - SNMP; 3 - IPMI; 4 - JMX)
- **useip** -- Whether the connection should be made via IP (0 - connect using host DNS name; 1 - connect using host IP address for this host interface)
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

ID of the created host interface, False on failure.

CLI Example:

```
salt '*' zabbix.hostinterface_create 10105 192.193.194.197
```

`salt.modules.zabbix.hostinterface_delete`(*interfaceids*, *\*\*connection\_args*)

Delete host interface

New in version 2016.3.0.

**Parameters**

- **interfaceids** -- IDs of the host interfaces to delete
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

ID of deleted host interfaces, False on failure.

CLI Example:

```
salt '*' zabbix.hostinterface_delete 50
```

`salt.modules.zabbix.hostinterface_get`(*hostids*, *\*\*connection\_args*)

New in version 2016.3.0.

Retrieve host groups according to the given parameters

---

**Note:** This function accepts all standard `hostinterface.get` properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

**Parameters**

- **hostids** -- Return only host interfaces used by the given hosts.
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

Array with host interfaces details, False if no convenient host interfaces found or on failure.

CLI Example:

```
salt '*' zabbix.hostinterface_get 101054
```

`salt.modules.zabbix.hostinterface_update`(*interfaceid*, *\*\*connection\_args*)

New in version 2016.3.0.

Update host interface

---

**Note:** This function accepts all standard hostinterface: keyword argument names differ depending on your zabbix version, see [here](#).

---

**Parameters**

- **interfaceid** -- ID of the hostinterface to update
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

ID of the updated host interface, False on failure.

CLI Example:

```
salt '*' zabbix.hostinterface_update 6 ip_=0.0.0.2
```

`salt.modules.zabbix.mediatype_create`(*name*, *mediatype*, *\*\*connection\_args*)

Create new mediatype

---

**Note:** This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

**Parameters**

- **mediatype** -- media type - 0: email, 1: script, 2: sms, 3: Jabber, 100: Ez Texting
- **exec\_path** -- exec path - Required for script and Ez Texting types, see Zabbix API docs
- **gsm\_modem** -- exec path - Required for sms type, see Zabbix API docs
- **smtp\_email** -- email address from which notifications will be sent, required for email type
- **smtp\_helo** -- SMTP HELO, required for email type
- **smtp\_server** -- SMTP server, required for email type
- **status** -- whether the media type is enabled - 0: enabled, 1: disabled
- **username** -- authentication user, required for Jabber and Ez Texting types
- **passwd** -- authentication password, required for Jabber and Ez Texting types
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the created mediatype.

CLI Example:

```
salt '*' zabbix.mediatype_create 'Email' 0 smtp_email='noreply@example.com'
→ '
smtp_server='mailserver.example.com' smtp_helo='zabbix.example.com'
```

`salt.modules.zabbix.mediatype_delete`(*mediatypeids*, *\*\*connection\_args*)

Delete mediatype

Parameters

- **interfaceids** -- IDs of the mediatypes to delete
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns

ID of deleted mediatype, False on failure.

CLI Example:

```
salt '*' zabbix.mediatype_delete 3
```

`salt.modules.zabbix.mediatype_get`(*name=None*, *mediatypeids=None*, *\*\*connection\_args*)

Retrieve mediatypes according to the given parameters.

Parameters

- **name** -- Name or description of the mediatype
- **mediatypeids** -- ids of the mediatypes
- **connection\_args** (*optional*) -- `_connection_user`: zabbix user (can also be set in opts or pillar, see module's docstring) `_connection_password`: zabbix password (can also be set in opts or pillar, see module's docstring) `_connection_url`: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

all optional mediatype.get parameters: keyword argument names depends on your zabbix version, see:

<https://www.zabbix.com/documentation/2.2/manual/api/reference/mediatype/get>

Returns

Array with mediatype details, False if no mediatype found or on failure.

CLI Example:

```
salt '*' zabbix.mediatype_get name='Email'
salt '*' zabbix.mediatype_get mediatypeids="['1', '2', '3']"
```

`salt.modules.zabbix.mediatype_update`(*mediatypeid*, *name=False*, *mediatype=False*, *\*\*connection\_args*)

Update existing mediatype

---

**Note:** This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

Parameters

- **mediatypeid** -- ID of the mediatype to update

- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

IDs of the updated mediatypes, False on failure.

CLI Example:

```
salt '*' zabbix.usergroup_update 8 name="Email update"
```

`salt.modules.zabbix.run_query`(*method*, *params*, *\*\*connection\_args*)

Send Zabbix API call

**Parameters**

- **method** -- actual operation to perform via the API
- **params** -- parameters required for specific method
- **connection\_args** (*optional*) -- **\_connection\_user**: zabbix user (can also be set in opts or pillar, see module's docstring) **\_connection\_password**: zabbix password (can also be set in opts or pillar, see module's docstring) **\_connection\_url**: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

all optional template.get parameters: keyword argument names depends on your zabbix version, see:

<https://www.zabbix.com/documentation/2.4/manual/api/reference/>

**Returns**

Response from Zabbix API

CLI Example:

```
salt '*' zabbix.run_query proxy.create '{"host": "zabbixproxy.domain.com",
→ "status": "5"}'
```

`salt.modules.zabbix.substitute_params`(*input\_object*, *extend\_params=None*, *filter\_key='name'*, *\*\*kwargs*)

New in version 2017.7.0.

Go through Zabbix object params specification and if needed get given object ID from Zabbix API and put it back as a value. Definition of the object is done via dict with keys "query\_object" and "query\_name".

**Parameters**

- **input\_object** -- Zabbix object type specified in state file
- **extend\_params** -- Specify query with params
- **filter\_key** -- Custom filtering key (default: name)
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

Params structure with values converted to string for further comparison purposes

CLI Example:

```
salt '*' zabbix.substitute_params '{"query_object": "object_name", "query_
→ name": "specific_object_name"}'
```

`salt.modules.zabbix.template_get` (*name=None, host=None, templateids=None, \*\*connection\_args*)

Retrieve templates according to the given parameters.

#### Parameters

- **host** -- technical name of the template
- **name** -- visible name of the template
- **hostids** -- ids of the templates
- **connection\_args** (*optional*) -- `_connection_user`: zabbix user (can also be set in opts or pillar, see module's docstring) `_connection_password`: zabbix password (can also be set in opts or pillar, see module's docstring) `_connection_url`: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

all optional `template.get` parameters: keyword argument names depends on your zabbix version, see:

<https://www.zabbix.com/documentation/2.4/manual/api/reference/template/get>

#### Returns

Array with convenient template details, False if no template found or on failure.

CLI Example:

```
salt '*' zabbix.template_get name='Template OS Linux'
salt '*' zabbix.template_get templateids="['10050', '10001']"
```

`salt.modules.zabbix.user_addmedia` (*userid, active, mediatypeid, period, sendto, severity, \*\*connection\_args*)

Add new media to multiple users. Available only for Zabbix version 3.4 or older.

New in version 2016.3.0.

#### Parameters

- **userid** -- ID of the user that uses the media
- **active** -- Whether the media is enabled (0 enabled, 1 disabled)
- **mediatypeid** -- ID of the media type used by the media
- **period** -- Time when the notifications can be sent as a time period
- **sendto** -- Address, user name or other identifier of the recipient
- **severity** -- Trigger severities to send notifications about
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### Returns

IDs of the created media.

CLI Example:

```
salt '*' zabbix.user_addmedia 4 active=0 mediatypeid=1 period='1-7,00:00-
→24:00' sendto='support2@example.com'
severity=63
```

`salt.modules.zabbix.user_create` (*alias, passwd, usrgrps, \*\*connection\_args*)

New in version 2016.3.0.

Create new zabbix user

---

**Note:** This function accepts all standard user properties: keyword argument names differ depending on your

zabbix version, see [here](#).

#### Parameters

- **alias** -- user alias
- **passwd** -- user's password
- **usrgrps** -- user groups to add the user to
- **\_connection\_user** -- zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- url of zabbix frontend (can also be set in opts or pillar, see module's docstring)
- **firstname** -- string with firstname of the user, use 'firstname' instead of 'name' parameter to not mess with value supplied from Salt sls file.

#### Returns

On success string with id of the created user.

CLI Example:

```
salt '*' zabbix.user_create james password007 '[7, 12]' firstname='James
→Bond'
```

`salt.modules.zabbix.user_delete`(*users*, *\*\*connection\_args*)

Delete zabbix users.

New in version 2016.3.0.

#### Parameters

- **users** -- array of users (userids) to delete
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### Returns

On success array with userids of deleted users.

CLI Example:

```
salt '*' zabbix.user_delete 15
```

`salt.modules.zabbix.user_deletemedia`(*mediaids*, *\*\*connection\_args*)

Delete media by id. Available only for Zabbix version 3.4 or older.

New in version 2016.3.0.

#### Parameters

- **mediaids** -- IDs of the media to delete
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### Returns

IDs of the deleted media, False on failure.

CLI Example:

```
salt '*' zabbix.user_deletemedia 27
```

`salt.modules.zabbix.user_exists`(*alias*, *\*\*connection\_args*)

Checks if user with given alias exists.

New in version 2016.3.0.

#### Parameters

- **alias** -- user alias
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### Returns

True if user exists, else False.

CLI Example:

```
salt '*' zabbix.user_exists james
```

`salt.modules.zabbix.user_get`(*alias=None*, *userids=None*, *\*\*connection\_args*)

Retrieve users according to the given parameters.

New in version 2016.3.0.

#### Parameters

- **alias** -- user alias
- **userids** -- return only users with the given IDs
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### Returns

Array with details of convenient users, False on failure of if no user found.

CLI Example:

```
salt '*' zabbix.user_get james
```

`salt.modules.zabbix.user_getmedia`(*userids=None*, *\*\*connection\_args*)

New in version 2016.3.0.

Retrieve media according to the given parameters

---

**Note:** This function accepts all standard `usermedia.get` properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **userids** -- return only media that are used by the given users
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)

- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

List of retrieved media, False on failure.

CLI Example:

```
salt '*' zabbix.user_getmedia
```

`salt.modules.zabbix.user_list(**connection_args)`

Retrieve all of the configured users.

New in version 2016.3.0.

**Parameters**

- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

Array with user details.

CLI Example:

```
salt '*' zabbix.user_list
```

`salt.modules.zabbix.user_update(userid, **connection_args)`

New in version 2016.3.0.

Update existing users

---

**Note:** This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

**Parameters**

- **userid** -- id of the user to update
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

Id of the updated user on success.

CLI Example:

```
salt '*' zabbix.user_update 16 visible_name='James Brown'
```

`salt.modules.zabbix.usergroup_create(name, **connection_args)`

New in version 2016.3.0.

Create new user group

---

**Note:** This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **name** -- name of the user group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### Returns

IDs of the created user groups.

CLI Example:

```
salt '*' zabbix.usergroup_create GroupName
```

`salt.modules.zabbix.usergroup_delete` (*usergroupids*, *\*\*connection\_args*)

New in version 2016.3.0.

#### Parameters

- **usergroupids** -- IDs of the user groups to delete
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### Returns

IDs of the deleted user groups.

CLI Example:

```
salt '*' zabbix.usergroup_delete 28
```

`salt.modules.zabbix.usergroup_exists` (*name=None*, *node=None*, *nodeids=None*, *\*\*connection\_args*)

Checks if at least one user group that matches the given filter criteria exists

New in version 2016.3.0.

#### Parameters

- **name** -- names of the user groups
- **node** -- name of the node the user groups must belong to (This will override the `nodeids` parameter.)
- **nodeids** -- IDs of the nodes the user groups must belong to
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### Returns

True if at least one user group that matches the given filter criteria exists, else False.

CLI Example:

```
salt '*' zabbix.usergroup_exists Guests
```

`salt.modules.zabbix.usergroup_get`(*name=None, usrgrpids=None, userids=None, \*\*connection\_args*)

New in version 2016.3.0.

Retrieve user groups according to the given parameters

---

**Note:** This function accepts all `usergroup_get` properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **name** -- names of the user groups
- **usrgrpids** -- return only user groups with the given IDs
- **userids** -- return only user groups that contain the given users
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### Returns

Array with convenient user groups details, False if no user group found or on failure.

CLI Example:

```
salt '*' zabbix.usergroup_get Guests
```

`salt.modules.zabbix.usergroup_list`(*\*\*connection\_args*)

Retrieve all enabled user groups.

New in version 2016.3.0.

#### Parameters

- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

#### Returns

Array with enabled user groups details, False on failure.

CLI Example:

```
salt '*' zabbix.usergroup_list
```

`salt.modules.zabbix.usergroup_update`(*usrgrpuid, \*\*connection\_args*)

New in version 2016.3.0.

Update existing user group

---

**Note:** This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see [here](#).

---

#### Parameters

- **usrgrpid** -- ID of the user group to update.
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

IDs of the updated user group, False on failure.

CLI Example:

```
salt '*' zabbix.usergroup_update 8 name=guestsRenamed
```

`salt.modules.zabbix.usermacro_create`(*macro*, *value*, *hostid*, *\*\*connection\_args*)

Create new host usermacro.

**Parameters**

- **macro** -- name of the host usermacro
- **value** -- value of the host usermacro
- **hostid** -- hostid or templateid
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the created host usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_create '{$SNMP_COMMUNITY}' 'public' 1
```

`salt.modules.zabbix.usermacro_createglobal`(*macro*, *value*, *\*\*connection\_args*)

Create new global usermacro.

**Parameters**

- **macro** -- name of the global usermacro
- **value** -- value of the global usermacro
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the created global usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_createglobal '{$SNMP_COMMUNITY}' 'public'
```

`salt.modules.zabbix.usermacro_delete`(*macroids*, *\*\*connection\_args*)

Delete host usermacros.

**Parameters**

- **macroids** -- macroids of the host usermacros
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: IDs of the deleted host usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_delete 21
```

`salt.modules.zabbix.usermacro_deleteglobal` (*macroids*, *\*\*connection\_args*)

Delete global usermacros.

#### Parameters

- **macroids** -- macroids of the global usermacros
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: IDs of the deleted global usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_deleteglobal 21
```

`salt.modules.zabbix.usermacro_get` (*macro=None*, *hostids=None*, *templateids=None*, *hostmacroids=None*, *globalmacroids=None*, *globalmacro=False*, *\*\*connection\_args*)

Retrieve user macros according to the given parameters.

#### Parameters

- **macro** -- name of the usermacro
- **hostids** -- Return macros for the given hostids
- **templateids** -- Return macros for the given templateids
- **hostmacroids** -- Return macros with the given hostmacroids
- **globalmacroids** -- Return macros with the given globalmacroids (implies globalmacro=True)
- **globalmacro** -- if True, returns only global macros
- **connection\_args** (*optional*) -- **\_connection\_user**: zabbix user (can also be set in opts or pillar, see module's docstring) **\_connection\_password**: zabbix password (can also be set in opts or pillar, see module's docstring) **\_connection\_url**: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

#### Returns

Array with usermacro details, False if no usermacro found or on failure.

CLI Example:

```
salt '*' zabbix.usermacro_get macro='{${SNMP_COMMUNITY}}'
```

`salt.modules.zabbix.usermacro_update` (*hostmacroid*, *value*, *\*\*connection\_args*)

Update existing host usermacro.

#### Parameters

- **hostmacroid** -- id of the host usermacro
- **value** -- new value of the host usermacro
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the update host usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_update 1 'public'
```

`salt.modules.zabbix.usermacro_updateglobal`(*globalmacroid*, *value*, *\*\*connection\_args*)

Update existing global usermacro.

#### Parameters

- **globalmacroid** -- id of the host usermacro
- **value** -- new value of the host usermacro
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the update global usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_updateglobal 1 'public'
```

## 26.6.529 salt.modules.zcbuildout

Management of `zc.buildout`

New in version 2014.1.0.

This module is inspired by [minitage's buildout maker](#)

---

**Note:** The `zc.buildout` integration is still in beta; the API is subject to change

---

### General notes

You have those following methods:

- `upgrade_bootstrap`
- `bootstrap`
- `run_buildout`
- `buildout`

`salt.modules.zcbuildout.bootstrap`(*\*a*, *\*\*kw*)

Run the buildout bootstrap dance (python bootstrap.py).

**directory**

directory to execute in

**config**

alternative buildout configuration file to use

**runas**  
User used to run buildout as

**env**  
environment variables to set when running

**buildout\_ver**  
force a specific buildout version (1 | 2)

**test\_release**  
buildout accept test release

**offline**  
are we executing buildout in offline mode

**distribute**  
Forcing use of distribute

**new\_st**  
Forcing use of setuptools >= 0.7

**python**  
path to a python executable to use in place of default (salt one)

**onlyif**  
Only execute cmd if statement on the host return 0

**unless**  
Do not execute cmd if statement on the host return 0

**use\_vt**  
Use the new salt VT to stream output [experimental]

CLI Example:

```
salt '*' buildout.bootstrap /srv/mybuildout
```

`salt.modules.zcbuildout.buildout(*a, **kw)`

Run buildout in a directory.

**directory**  
directory to execute in

**config**  
buildout config to use

**parts**  
specific buildout parts to run

**runas**  
user used to run buildout as

**env**  
environment variables to set when running

**buildout\_ver**  
force a specific buildout version (1 | 2)

**test\_release**  
buildout accept test release

**new\_st**  
Forcing use of setuptools >= 0.7

**distribute**  
use distribute over setuptools if possible

**offline**  
does buildout run offline

**python**  
python to use

**debug**  
run buildout with -D debug flag

**onlyif**  
Only execute cmd if statement on the host return 0

**unless**  
Do not execute cmd if statement on the host return 0

**newest**  
run buildout in newest mode

**verbose**  
run buildout in verbose mode (-vvvvv)

**use\_vt**  
Use the new salt VT to stream output [experimental]

CLI Example:

```
salt '*' buildout.buildout /srv/mybuildout
```

`salt.modules.zcbuildout.run_buildout(*a, **kw)`

Run a buildout in a directory.

**directory**  
directory to execute in

**config**  
alternative buildout configuration file to use

**offline**  
are we executing buildout in offline mode

**runas**  
user used to run buildout as

**env**  
environment variables to set when running

**onlyif**  
Only execute cmd if statement on the host return 0

**unless**  
Do not execute cmd if statement on the host return 0

**newest**  
run buildout in newest mode

**force**  
run buildout unconditionally

**verbose**  
run buildout in verbose mode (-vvvvv)

**use\_vt**  
Use the new salt VT to stream output [experimental]

CLI Example:

```
salt '*' buildout.run_buildout /srv/mybuildout
```

`salt.modules.zcbuildout.upgrade_bootstrap(*a, **kw)`

Upgrade current bootstrap.py with the last released one.

Indeed, when we first run a buildout, a common source of problem is to have a locally stale bootstrap, we just try to grab a new copy

**directory**  
directory to execute in

**offline**  
are we executing buildout in offline mode

**buildout\_ver**  
forcing to use a specific buildout version (1 | 2)

**onlyif**  
Only execute cmd if statement on the host return 0

**unless**  
Do not execute cmd if statement on the host return 0

CLI Example:

```
salt '*' buildout.upgrade_bootstrap /srv/mybuildout
```

### 26.6.530 salt.modules.zenoss

Module for working with the Zenoss API

New in version 2016.3.0.

#### configuration

This module requires a 'zenoss' entry in the master/minion config.

For example:

```
zenoss:
  hostname: https://zenoss.example.com
  username: admin
  password: admin123
  verify_ssl: True
  ca_bundle: /etc/ssl/certs/ca-certificates.crt
```

`salt.modules.zenoss.add_device` (*device=None, device\_class=None, collector='localhost', prod\_state=1000*)

A function to connect to a zenoss server and add a new device entry.

#### Parameters

- **device** -- (Optional) Will use the grain 'fqdn' by default.
- **device\_class** -- (Optional) The device class to use. If none, will determine based on kernel grain.
- **collector** -- (Optional) The collector to use for this device. Defaults to 'localhost'.
- **prod\_state** -- (Optional) The prodState to set on the device. If none, defaults to 1000 ( production )

CLI Example:

```
salt '*' zenoss.add_device
```

`salt.modules.zenoss.device_exists` (*device=None*)

Check to see if a device already exists in Zenoss.

#### Parameters

- **device** -- (Optional) Will use the grain 'fqdn' by default

CLI Example:

```
salt '*' zenoss.device_exists
```

`salt.modules.zenoss.find_device` (*device=None*)

Find a device in Zenoss. If device not found, returns None.

#### Parameters

- **device** -- (Optional) Will use the grain 'fqdn' by default

CLI Example:

```
salt '*' zenoss.find_device
```

`salt.modules.zenoss.set_prod_state` (*prod\_state, device=None*)

A function to set the prod\_state in zenoss.

#### Parameters

- **prod\_state** -- (Required) Integer value of the state
- **device** -- (Optional) Will use the grain 'fqdn' by default.

CLI Example:

```
salt zenoss.set_prod_state 1000 hostname
```

### 26.6.531 salt.modules.zfs

Module for running ZFS command

**codeauthor**

Nitin Madhok <nmadhok@g.clemson.edu>, Jorge Schrauwen <sjorge@blackdot.be>

**maintainer**

Jorge Schrauwen <sjorge@blackdot.be>

**maturity**

new

**depends**

salt.utils.zfs

**platform**

illumos,freebsd,linux

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

`salt.modules.zfs.bookmark` (*snapshot, bookmark*)

Creates a bookmark of the given snapshot

---

**Note:** Bookmarks mark the point in time when the snapshot was created, and can be used as the incremental source for a `zfs send` command.

This feature must be enabled to be used. See `zpool-features(5)` for details on ZFS feature flags and the bookmarks feature.

---

**snapshot**

[string] name of snapshot to bookmark

**bookmark**

[string] name of bookmark

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.bookmark myzpool/mydataset@yesterday myzpool/mydataset
→#complete
```

`salt.modules.zfs.clone` (*name\_a, name\_b, \*\*kwargs*)

Creates a clone of the given snapshot.

**name\_a**

[string] name of snapshot

**name\_b**

[string] name of filesystem or volume

**create\_parent**

[boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.

**properties**

[dict] additional zfs properties (-o)

**Note:** ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.clone myzpool/mydataset@yesterday myzpool/mydataset_yesterday
```

`salt.modules.zfs.create`(*name*, *\*\*kwargs*)

Create a ZFS File System.

**name**

[string] name of dataset or volume

**volume\_size**

[string] if specified, a zvol will be created instead of a dataset

**sparse**

[boolean] create sparse volume

**create\_parent**

[boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.

**properties**

[dict] additional zfs properties (-o)

**Note:** ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.create myzpool/mydataset [create_parent=True|False]
salt '*' zfs.create myzpool/mydataset properties="{ 'mountpoint': '/export/
→zfs', 'sharenfs': 'on' }"
salt '*' zfs.create myzpool/volume volume_size=1G [sparse=True|False]`
salt '*' zfs.create myzpool/volume volume_size=1G properties="{
→'volblocksize': '512'}" [sparse=True|False]
```

`salt.modules.zfs.destroy`(*name*, *\*\*kwargs*)

Destroy a ZFS File System.

**name**

[string] name of dataset, volume, or snapshot

**force**

[boolean] force an unmount of any file systems using the unmount -f command.

**recursive**

[boolean] recursively destroy all children. (-r)

**recursive\_all**

[boolean] recursively destroy all dependents, including cloned file systems outside the target hierarchy. (-R)

**Warning:** watch out when using recursive and recursive\_all

New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.destroy myzpool/mydataset [force=True|False]
```

`salt.modules.zfs.diff`(*name\_a*, *name\_b=None*, *\*\*kwargs*)

Display the difference between a snapshot of a given filesystem and another snapshot of that filesystem from a later time or the current contents of the filesystem.

**name\_a**

[string] name of snapshot

**name\_b**

[string] (optional) name of snapshot or filesystem

**show\_changetime**

[boolean] display the path's inode change time as the first column of output. (default = True)

**show\_indication**

[boolean] display an indication of the type of file. (default = True)

**parsable**

[boolean] if true we don't parse the timestamp to a more readable date (default = True)

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.diff myzpool/mydataset@yesterday myzpool/mydataset
```

`salt.modules.zfs.exists`(*name*, *\*\*kwargs*)

Check if a ZFS filesystem or volume or snapshot exists.

**name**

[string] name of dataset

**type**

[string] also check if dataset is of a certain type, valid choices are: filesystem, snapshot, volume, bookmark, or all.

New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.exists myzpool/mydataset
salt '*' zfs.exists myzpool/myvolume type=volume
```

`salt.modules.zfs.get`(*\*dataset*, *\*\*kwargs*)

Displays properties for the given datasets.

**dataset**

[string] name of snapshot(s), filesystem(s), or volume(s)

**properties**

[string] comma-separated list of properties to list, defaults to all

**recursive**

[boolean] recursively list children

**depth**

[int] recursively list children to depth

**fields**

[string] comma-separated list of fields to include, the name and property field will always be added

**type**

[string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.

Changed in version 3004.

type is ignored on Solaris 10 and 11 since not a valid parameter on those platforms

**source**

[string] comma-separated list of sources to display. Must be one of the following: local, default, inherited, temporary, and none. The default value is all sources.

**parsable**

[boolean] display numbers in parsable (exact) values (default = True) .. versionadded:: 2018.3.0

---

**Note:** If no datasets are specified, then the command displays properties for all datasets on the system.

---

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.get
salt '*' zfs.get myzpool/mydataset [recursive=True|False]
salt '*' zfs.get myzpool/mydataset properties="sharenfs,mountpoint"
→ [recursive=True|False]
salt '*' zfs.get myzpool/mydataset myzpool/myotherdataset
→ properties=available fields=value depth=1
```

`salt.modules.zfs.hold(tag, *snapshot, **kwargs)`

Adds a single reference, named with the tag argument, to the specified snapshot or snapshots.

---

**Note:** Each snapshot has its own tag namespace, and tags must be unique within that space.

If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

---

**tag**

[string] name of tag

**snapshot**

[string] name of snapshot(s)

**recursive**

[boolean] specifies that a hold with the given tag is applied recursively to the snapshots of all descendent file systems.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It's now possible to create a tag that contains a comma, this was impossible before.

CLI Example:

```
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot myzpool/
↳mydataset@myothersnapshot
```

`salt.modules.zfs.holds`(*snapshot*, *\*\*kwargs*)

Lists all existing user references for the given snapshot or snapshots.

**snapshot**

[string] name of snapshot

**recursive**

[boolean] lists the holds that are set on the named descendent snapshots also.

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.holds myzpool/mydataset@baseline
```

`salt.modules.zfs.inherit`(*prop*, *name*, *\*\*kwargs*)

Clears the specified property

**prop**

[string] name of property

**name**

[string] name of the filesystem, volume, or snapshot

**recursive**

[boolean] recursively inherit the given property for all children.

**revert**

[boolean] revert the property to the received value if one exists; otherwise operate as if the -S option was not specified.

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.inherit canmount myzpool/mydataset [recursive=True|False]
```

`salt.modules.zfs.list_`(*name=None*, *\*\*kwargs*)

Return a list of all datasets or a specified dataset on the system and the values of their used, available, referenced, and mountpoint properties.

**name**

[string] name of dataset, volume, or snapshot

**recursive**

[boolean] recursively list children

**depth**

[int] limit recursion to depth

**properties**

[string] comma-separated list of properties to list, the name property will always be added

**type**

[string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.

**sort**

[string] property to sort on (default = name)

**order**

[string [ascending|descending]] sort order (default = ascending)

**parsable**

[boolean] display numbers in parsable (exact) values .. versionadded:: 2018.3.0

New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.list
salt '*' zfs.list myzpool/mydataset [recursive=True|False]
salt '*' zfs.list myzpool/mydataset properties="sharenfs,mountpoint"
```

`salt.modules.zfs.list_mount()`

List mounted zfs filesystems

New in version 2018.3.1.

CLI Example:

```
salt '*' zfs.list_mount
```

`salt.modules.zfs.mount(name=None, **kwargs)`

Mounts ZFS file systems

**name**

[string] name of the filesystem, having this set to None will mount all filesystems. (this is the default)

**overlay**

[boolean] perform an overlay mount.

**options**

[string] optional comma-separated list of mount options to use temporarily for the duration of the mount.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** Passing '-a' as name is deprecated and will be removed in 3001.

CLI Example:

```
salt '*' zfs.mount
salt '*' zfs.mount myzpool/mydataset
salt '*' zfs.mount myzpool/mydataset options=ro
```

`salt.modules.zfs.promote(name)`

Promotes a clone file system to no longer be dependent on its "origin" snapshot.

---

**Note:** This makes it possible to destroy the file system that the clone was created from. The clone parent-child dependency relationship is reversed, so that the origin file system becomes a clone of the specified file system.

The snapshot that was cloned, and any snapshots previous to this snapshot, are now owned by the promoted clone. The space they use moves from the origin file system to the promoted clone, so enough space must be available to accommodate these snapshots. No new space is consumed by this operation, but the space accounting is adjusted. The promoted clone must not have any conflicting snapshot names of its own. The rename subcommand can be used to rename any conflicting snapshots.

---

**name**

[string] name of clone-file system

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.promote myzpool/myclone
```

`salt.modules.zfs.release`(*tag*, *\*snapshot*, *\*\*kwargs*)

Removes a single reference, named with the tag argument, from the specified snapshot or snapshots.

---

**Note:** The tag must already exist for each snapshot. If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

---

**tag**

[string] name of tag

**snapshot**

[string] name of snapshot(s)

**recursive**

[boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It's is now possible to create a tag that contains a comma, this was impossible before.

CLI Example:

```
salt '*' zfs.release mytag myzpool/mydataset@mynsnapshot [recursive=True]
salt '*' zfs.release mytag myzpool/mydataset@mynsnapshot myzpool/
→mydataset@myothersnapshot
```

`salt.modules.zfs.rename`(*name*, *new\_name*, *\*\*kwargs*)

Rename or Relocate a ZFS File System.

**name**

[string] name of dataset, volume, or snapshot

**new\_name**

[string] new name of dataset, volume, or snapshot

**force**

[boolean] force unmount any filesystems that need to be unmounted in the process.

**create\_parent**

[boolean] creates all the nonexistent parent datasets. Datasets created in this manner are automatically mounted according to the mountpoint property inherited from their parent.

**recursive**

[boolean] recursively rename the snapshots of all descendent datasets. snapshots are the only dataset that can be renamed recursively.

New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.rename myzpool/mydataset myzpool/renameddataset
```

`salt.modules.zfs.rollback`(*name*, *\*\*kwargs*)

Roll back the given dataset to a previous snapshot.

**name**  
[string] name of snapshot

**recursive**  
[boolean] destroy any snapshots and bookmarks more recent than the one specified.

**recursive\_all**  
[boolean] destroy any more recent snapshots and bookmarks, as well as any clones of those snapshots.

**force**  
[boolean] used with the -R option to force an unmount of any clone file systems that are to be destroyed.

**Warning:** When a dataset is rolled back, all data that has changed since the snapshot is discarded, and the dataset reverts to the state at the time of the snapshot. By default, the command refuses to roll back to a snapshot other than the most recent one.

In order to do so, all intermediate snapshots and bookmarks must be destroyed by specifying the -r option.

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.rollback myzpool/mydataset@yesterday
```

`salt.modules.zfs.set` (\*dataset, \*\*kwargs)

Sets the property or list of properties to the given value(s) for each dataset.

**dataset**

[string] name of snapshot(s), filesystem(s), or volume(s)

**properties**

[string] additional zfs properties pairs

**Note:** properties are passed as key-value pairs. e.g.  
compression=off

**Note:** Only some properties can be edited.

See the Properties section for more information on what properties can be set and acceptable values.

Numeric values can be specified as exact values, or in a human-readable form with a suffix of B, K, M, G, T, P, E (for bytes, kilobytes, megabytes, gigabytes, terabytes, petabytes, or exabytes respectively).

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.set myzpool/mydataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=lz4
→ canmount=off
```

`salt.modules.zfs.snapshot` (\*snapshot, \*\*kwargs)

Creates snapshots with the given names.

**snapshot**

[string] name of snapshot(s)

**recursive**

[boolean] recursively create snapshots of all descendent datasets.

**properties**

[dict] additional zfs properties (-o)

**Note:** ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.snapshot myzpool/mydataset@yesterday [recursive=True]
salt '*' zfs.snapshot myzpool/mydataset@yesterday myzpool/
→myotherdataset@yesterday [recursive=True]
```

**salt.modules.zfs.unmount** (*name*, *\*\*kwargs*)

Unmounts ZFS file systems

**name**

[string] name of the filesystem, you can use None to unmount all mounted filesystems.

**force**

[boolean] forcefully unmount the file system, even if it is currently in use.

**Warning:** Using `-a` for the name parameter will probably break your system, unless your rootfs is not on zfs.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** Passing `-a` as name is deprecated and will be removed in 3001.

CLI Example:

```
salt '*' zfs.unmount myzpool/mydataset [force=True|False]
```

## 26.6.532 salt.modules.zk\_concurrency

### Concurrency controls in zookeeper

**depends**

kazoo

**configuration**

See `salt.modules.zookeeper` for setup instructions.

This module allows you to acquire and release a slot. This is primarily useful for ensuring that no more than N hosts take a specific action at once. This can also be used to coordinate between masters.

`salt.modules.zk_concurrency.lock`(*path, zk\_hosts=None, identifier=None, max\_concurrency=1, timeout=None, ephemeral\_lease=False, force=False, profile=None, scheme=None, username=None, password=None, default\_acl=None*)

Get lock (with optional timeout)

**path**

The path in zookeeper where the lock is

**zk\_hosts**

zookeeper connect string

**identifier**

Name to identify this minion, if unspecified defaults to the hostname

**max\_concurrency**

Maximum number of lock holders

**timeout**

timeout to wait for the lock. A None timeout will block forever

**ephemeral\_lease**

Whether the locks in zookeeper should be ephemeral

**force**

Forcibly acquire the lock regardless of available slots

Example:

```
salt minion zk_concurrency.lock /lock/path host1:1234,host2:1234
```

`salt.modules.zk_concurrency.lock_holders`(*path, zk\_hosts=None, identifier=None, max\_concurrency=1, timeout=None, ephemeral\_lease=False, profile=None, scheme=None, username=None, password=None, default\_acl=None*)

Return an un-ordered list of lock holders

**path**

The path in zookeeper where the lock is

**zk\_hosts**

zookeeper connect string

**identifier**

Name to identify this minion, if unspecified defaults to hostname

**max\_concurrency**

Maximum number of lock holders

**timeout**

timeout to wait for the lock. A None timeout will block forever

**ephemeral\_lease**

Whether the locks in zookeeper should be ephemeral

Example:

```
salt minion zk_concurrency.lock_holders /lock/path host1:1234,host2:1234
```

`salt.modules.zk_concurrency.party_members`(*path, zk\_hosts=None, min\_nodes=1, blocking=False, profile=None, scheme=None, username=None, password=None, default\_acl=None*)

Get the List of identifiers in a particular party, optionally waiting for the specified minimum number of nodes (*min\_nodes*) to appear

**path**

The path in zookeeper where the lock is

**zk\_hosts**

zookeeper connect string

**min\_nodes**

The minimum number of nodes expected to be present in the party

**blocking**

The boolean indicating if we need to block until `min_nodes` are available

Example:

```
salt minion zk_concurrency.party_members /lock/path host1:1234,host2:1234
salt minion zk_concurrency.party_members /lock/path host1:1234,host2:1234
↳ min_nodes=3 blocking=True
```

`salt.modules.zk_concurrency.unlock`(*path*, *zk\_hosts*=None, *identifier*=None, *max\_concurrency*=1, *ephemeral\_lease*=False, *scheme*=None, *profile*=None, *username*=None, *password*=None, *default\_acl*=None)

Remove lease from semaphore

**path**

The path in zookeeper where the lock is

**zk\_hosts**

zookeeper connect string

**identifier**

Name to identify this minion, if unspecified defaults to hostname

**max\_concurrency**

Maximum number of lock holders

**timeout**

timeout to wait for the lock. A None timeout will block forever

**ephemeral\_lease**

Whether the locks in zookeeper should be ephemeral

Example:

```
salt minion zk_concurrency.unlock /lock/path host1:1234,host2:1234
```

### 26.6.533 salt.modules.znc

`znc` - An advanced IRC bouncer

New in version 2014.7.0.

Provides an interface to basic ZNC functionality

`salt.modules.znc.buildmod`(\*modules)

Build module using `znc-buildmod`

CLI Example:

```
salt '*' znc.buildmod module.cpp [...]
```

`salt.modules.znc.dumpconf`()

Write the active configuration state to config file

CLI Example:

```
salt '*' znc.dumpconf
```

`salt.modules.znc.rehashconf`()

Rehash the active configuration state from config file

CLI Example:

```
salt '*' znc.rehashconf
```

`salt.modules.znc.version()`

Return server version from `znc --version`

CLI Example:

```
salt '*' znc.version
```

### 26.6.534 salt.modules.zoneadm

Module for Solaris 10's zoneadm

**maintainer**

Jorge Schrauwen <[sjorge@blackdot.be](mailto:sjorge@blackdot.be)>

**maturity**

new

**platform**

OmniOS,OpenIndiana,SmartOS,OpenSolaris,Solaris 10

New in version 2017.7.0.

**Warning:** Oracle Solaris 11's zoneadm is not supported by this module!

`salt.modules.zoneadm.attach(zone, force=False, brand_opts=None)`

Attach the specified zone.

**zone**

[string] name of the zone

**force**

[boolean] force the zone into the "installed" state with no validation

**brand\_opts**

[string] brand specific options to pass

CLI Example:

```
salt '*' zoneadm.attach lawrence
salt '*' zoneadm.attach lawrence True
```

`salt.modules.zoneadm.boot(zone, single=False, altinit=None, smf_options=None)`

Boot (or activate) the specified zone.

**zone**

[string] name or uuid of the zone

**single**

[boolean] boots only to milestone svc:/milestone/single-user:default.

**altinit**

[string] valid path to an alternative executable to be the primordial process.

**smf\_options**

[string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.boot clementine
salt '*' zoneadm.boot maeve single=True
salt '*' zoneadm.boot teddy single=True smf_options=verbose
```

`salt.modules.zoneadm.clone`(*zone*, *source*, *snapshot=None*)

Install a zone by copying an existing installed zone.

**zone**

[string] name of the zone

**source**

[string] zone to clone from

**snapshot**

[string] optional name of snapshot to use as source

CLI Example:

```
salt '*' zoneadm.clone clementine dolores
```

`salt.modules.zoneadm.detach`(*zone*)

Detach the specified zone.

**zone**

[string] name or uuid of the zone

CLI Example:

```
salt '*' zoneadm.detach kissy
```

`salt.modules.zoneadm.halt`(*zone*)

Halt the specified zone.

**zone**

[string] name or uuid of the zone

---

**Note:** To cleanly shutdown the zone use the shutdown function.

---

CLI Example:

```
salt '*' zoneadm.halt hector
```

`salt.modules.zoneadm.install`(*zone*, *nodataset=False*, *brand\_opts=None*)

Install the specified zone from the system.

**zone**

[string] name of the zone

**nodataset**

[boolean] do not create a ZFS file system

**brand\_opts**

[string] brand specific options to pass

CLI Example:

```
salt '*' zoneadm.install dolores
salt '*' zoneadm.install teddy True
```

`salt.modules.zoneadm.list_zones`(*verbose=True*, *installed=False*, *configured=False*, *hide\_global=True*)

List all zones

**verbose**

[boolean] display additional zone information

**installed**

[boolean] include installed zones in output

**configured**

[boolean] include configured zones in output

**hide\_global**

[boolean] do not include global zone

CLI Example:

```
salt '*' zoneadm.list
```

`salt.modules.zoneadm.move`(*zone*, *zonepath*)

Move zone to new zonepath.

**zone**

[string] name or uuid of the zone

**zonepath**

[string] new zonepath

CLI Example:

```
salt '*' zoneadm.move meave /sweetwater/meave
```

`salt.modules.zoneadm.ready`(*zone*)

Prepares a zone for running applications.

**zone**

[string] name or uuid of the zone

CLI Example:

```
salt '*' zoneadm.ready clementine
```

`salt.modules.zoneadm.reboot`(*zone*, *single=False*, *altinit=None*, *smf\_options=None*)

Restart the zone. This is equivalent to a halt boot sequence.

**zone**

[string] name or uuid of the zone

**single**

[boolean] boots only to milestone svc:/milestone/single-user:default.

**altinit**

[string] valid path to an alternative executable to be the primordial process.

**smf\_options**

[string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.reboot dolores
salt '*' zoneadm.reboot teddy single=True
```

`salt.modules.zoneadm.shutdown`(*zone*, *reboot=False*, *single=False*, *altinit=None*, *smf\_options=None*)

Gracefully shutdown the specified zone.

**zone**

[string] name or uuid of the zone

**reboot**

[boolean] reboot zone after shutdown (equivalent of shutdown -i6 -g0 -y)

**single**

[boolean] boots only to milestone svc:/milestone/single-user:default.

**altinit**

[string] valid path to an alternative executable to be the primordial process.

**smf\_options**

[string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.shutdown peter
salt '*' zoneadm.shutdown armistice reboot=True
```

**salt.modules.zoneadm.uninstall**(zone)

Uninstall the specified zone from the system.

**zone**

[string] name or uuid of the zone

**Warning:** The -F flag is always used to avoid the prompts when uninstalling.

CLI Example:

```
salt '*' zoneadm.uninstall teddy
```

**salt.modules.zoneadm.verify**(zone)

Check to make sure the configuration of the specified zone can safely be installed on the machine.

**zone**

[string] name of the zone

CLI Example:

```
salt '*' zoneadm.verify dolores
```

## 26.6.535 salt.modules.zonecfg

Module for Solaris 10's zonecfg

**maintainer**

Jorge Schrauwen <sjorge@blackdot.be>

**maturity**

new

**platform**

OmniOS,OpenIndiana,SmartOS,OpenSolaris,Solaris 10

**depend**

salt.modules.file

New in version 2017.7.0.

**Warning:** Oracle Solaris 11's zonecfg is not supported by this module!

**salt.modules.zonecfg.add\_resource**(zone, resource\_type, \*\*kwargs)

Add a resource

**zone**

[string] name of zone

**resource\_type**

[string] type of resource

**kwargs**

[string|int|...] resource properties

CLI Example:

```
salt '*' zonecfg.add_resource tallgeese rctl name=zone.max-locked-memory
→value='(priv=privileged,limit=33554432,action=deny)'
```

**salt.modules.zonecfg.clear\_property**(*zone, key*)

Clear a property

**zone**

[string] name of zone

**key**

[string] name of property

CLI Example:

```
salt '*' zonecfg.clear_property deathscythe cpu-shares
```

**salt.modules.zonecfg.create**(*zone, brand, zonepath, force=False*)

Create an in-memory configuration for the specified zone.

**zone**

[string] name of zone

**brand**

[string] brand name

**zonepath**

[string] path of zone

**force**

[boolean] overwrite configuration

CLI Example:

```
salt '*' zonecfg.create deathscythe ipkg /zones/deathscythe
```

**salt.modules.zonecfg.create\_from\_template**(*zone, template*)

Create an in-memory configuration from a template for the specified zone.

**zone**

[string] name of zone

**template**

[string] name of template

**Warning:** existing config will be overwritten!

CLI Example:

```
salt '*' zonecfg.create_from_template leo tallgeese
```

**salt.modules.zonecfg.delete**(*zone*)

Delete the specified configuration from memory and stable storage.

**zone**

[string] name of zone

CLI Example:

```
salt '*' zonecfg.delete epyon
```

`salt.modules.zonecfg.export(zone, path=None)`

Export the configuration from memory to stable storage.

**zone**

[string] name of zone

**path**

[string] path of file to export to

CLI Example:

```
salt '*' zonecfg.export epyon
salt '*' zonecfg.export epyon /zones/epyon.cfg
```

`salt.modules.zonecfg.import_(zone, path)`

Import the configuration to memory from stable storage.

**zone**

[string] name of zone

**path**

[string] path of file to export to

CLI Example:

```
salt '*' zonecfg.import epyon /zones/epyon.cfg
```

`salt.modules.zonecfg.info(zone, show_all=False)`

Display the configuration from memory

**zone**

[string] name of zone

**show\_all**

[boolean] also include calculated values like capped-cpu, cpu-shares, ...

CLI Example:

```
salt '*' zonecfg.info tallgeese
```

`salt.modules.zonecfg.remove_resource(zone, resource_type, resource_key, resource_value)`

Remove a resource

**zone**

[string] name of zone

**resource\_type**

[string] type of resource

**resource\_key**

[string] key for resource selection

**resource\_value**

[string] value for resource selection

---

**Note:** Set `resource_selector` to `None` for resource that do not require one.

---

CLI Example:

```
salt '*' zonecfg.remove_resource tallgeese rctl name zone.max-locked-
→memory
```

`salt.modules.zonecfg.set_property(zone, key, value)`

Set a property

**zone**

[string] name of zone

**key**  
     [string] name of property  
**value**  
     [string] value of property  
 CLI Example:

```
salt '*' zonecfg.set_property deathscythe cpu-shares 100
```

`salt.modules.zonecfg.update_resource`(*zone*, *resource\_type*, *resource\_selector*, *\*\*kwargs*)

Add a resource

**zone**  
     [string] name of zone  
**resource\_type**  
     [string] type of resource  
**resource\_selector**  
     [string] unique resource identifier  
**kwargs**  
     [string|int|...] resource properties

---

**Note:** Set `resource_selector` to `None` for resource that do not require one.

---

CLI Example:

```
salt '*' zonecfg.update_resource tallgeese rctl name name=zone.max-locked-
↳memory value='(priv=privileged,limit=33554432,action=deny)'
```

## 26.6.536 salt.modules.zookeeper

### Zookeeper Module

**maintainer**  
     SaltStack  
**maturity**  
     new  
**platform**  
     all  
**depends**  
     kazoo

New in version 2018.3.0.

## Configuration

### configuration

This module is not usable until the following are specified either in a pillar or in the minion's config file:

```
zookeeper:  
  hosts: zoo1,zoo2,zoo3  
  default_acl:  
    - username: daniel  
      password: test  
      read: true  
      write: true  
      create: true  
      delete: true  
      admin: true  
  username: daniel  
  password: test
```

If configuration for multiple zookeeper environments is required, they can be set up as different configuration profiles. For example:

```
zookeeper:  
  prod:  
    hosts: zoo1,zoo2,zoo3  
    default_acl:  
      - username: daniel  
        password: test  
        read: true  
        write: true  
        create: true  
        delete: true  
        admin: true  
    username: daniel  
    password: test  
  dev:  
    hosts:  
      - dev1  
      - dev2  
      - dev3  
    default_acl:  
      - username: daniel  
        password: test  
        read: true  
        write: true  
        create: true  
        delete: true  
        admin: true  
    username: daniel  
    password: test
```

`salt.modules.zookeeper.create` (*path, value="", acls=None, ephemeral=False, sequence=False, makepath=False, profile=None, hosts=None, scheme=None, username=None, password=None, default\_acl=None*)

Create Znode

**path**

path of znode to create

**value**

value to assign to znode (Default: "")

**acls**

list of acl dictionaries to be assigned (Default: None)

**ephemeral**

indicate node is ephemeral (Default: False)

**sequence**

indicate node is suffixed with a unique index (Default: False)

**makepath**

Create parent paths if they do not exist (Default: False)

**profile**

Configured Zookeeper profile to authenticate with (Default: None)

**hosts**

Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

**scheme**

Scheme to authenticate with (Default: 'digest')

**username**

Username to authenticate (Default: None)

**password**

Password to authenticate (Default: None)

**default\_acl**

Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.create /test/name daniel profile=prod
```

`salt.modules.zookeeper.delete` (*path*, *version=-1*, *recursive=False*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default\_acl=None*)

Delete znode

**path**

path to znode

**version**

only delete if version matches (Default: -1 (always matches))

**profile**

Configured Zookeeper profile to authenticate with (Default: None)

**hosts**

Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

**scheme**

Scheme to authenticate with (Default: 'digest')

**username**

Username to authenticate (Default: None)

**password**

Password to authenticate (Default: None)

**default\_acl**

Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.delete /test/name profile=prod
```

`salt.modules.zookeeper.ensure_path` (*path*, *acls=None*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default\_acl=None*)

Ensure Znode path exists

**path**

Parent path to create

**acls**

list of acls dictionaries to be assigned (Default: None)

**profile**

Configured Zookeeper profile to authenticate with (Default: None)

**hosts**

Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

**scheme**

Scheme to authenticate with (Default: 'digest')

**username**

Username to authenticate (Default: None)

**password**

Password to authenticate (Default: None)

**default\_acl**

Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.ensure_path /test/name profile=prod
```

`salt.modules.zookeeper.exists` (*path*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default\_acl=None*)

Check if path exists

**path**

path to check

**profile**

Configured Zookeeper profile to authenticate with (Default: None)

**hosts**

Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

**scheme**

Scheme to authenticate with (Default: 'digest')

**username**

Username to authenticate (Default: None)

**password**

Password to authenticate (Default: None)

**default\_acl**

Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.exists /test/name profile=prod
```

`salt.modules.zookeeper.get` (*path*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default\_acl=None*)

Get value saved in znode

**path**

path to check

**profile**

Configured Zookeeper profile to authenticate with (Default: None)

**hosts**

Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

**scheme**

Scheme to authenticate with (Default: 'digest')

**username**

Username to authenticate (Default: None)  
**password**  
 Password to authenticate (Default: None)  
**default\_acl**  
 Default acls to assign if a node is created in this connection (Default: None)  
 CLI Example:

```
salt minion1 zookeeper.get /test/name profile=prod
```

`salt.modules.zookeeper.get_acls`(*path, profile=None, hosts=None, scheme=None, username=None, password=None, default\_acl=None*)

Get acls on a znode  
**path**  
 path to znode  
**profile**  
 Configured Zookeeper profile to authenticate with (Default: None)  
**hosts**  
 Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')  
**scheme**  
 Scheme to authenticate with (Default: 'digest')  
**username**  
 Username to authenticate (Default: None)  
**password**  
 Password to authenticate (Default: None)  
**default\_acl**  
 Default acls to assign if a node is created in this connection (Default: None)  
 CLI Example:

```
salt minion1 zookeeper.get_acls /test/name profile=prod
```

`salt.modules.zookeeper.get_children`(*path, profile=None, hosts=None, scheme=None, username=None, password=None, default\_acl=None*)

Get children in znode path  
**path**  
 path to check  
**profile**  
 Configured Zookeeper profile to authenticate with (Default: None)  
**hosts**  
 Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')  
**scheme**  
 Scheme to authenticate with (Default: 'digest')  
**username**  
 Username to authenticate (Default: None)  
**password**  
 Password to authenticate (Default: None)  
**default\_acl**  
 Default acls to assign if a node is created in this connection (Default: None)  
 CLI Example:

```
salt minion1 zookeeper.get_children /test profile=prod
```

`salt.modules.zookeeper.make_digest_acl`(*username, password, read=False, write=False, create=False, delete=False, admin=False, allperms=False*)

Generate acl object

---

**Note:** This is heavily used in the zookeeper state and probably is not useful as a cli module

---

**username**  
username of acl

**password**  
plain text password of acl

**read**  
read acl

**write**  
write acl

**create**  
create acl

**delete**  
delete acl

**admin**  
admin acl

**allperms**  
set all other acls to True

CLI Example:

```
salt minion1 zookeeper.make_digest_acl username=daniel password=myspass
→allperms=True
```

`salt.modules.zookeeper.set`(*path, value, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default\_acl=None*)

Update znode with new value

**path**  
znode to update

**value**  
value to set in znode

**version**  
only update znode if version matches (Default: -1 (always matches))

**profile**  
Configured Zookeeper profile to authenticate with (Default: None)

**hosts**  
Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

**scheme**  
Scheme to authenticate with (Default: 'digest')

**username**  
Username to authenticate (Default: None)

**password**  
Password to authenticate (Default: None)

**default\_acl**  
Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.set /test/name gtmanfred profile=prod
```

`salt.modules.zookeeper.set_acls`(*path, acls, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default\_acl=None*)

Set acls on a znode

**path**  
path to znode

**acls**  
list of acl dictionaries to set on the znode

**version**  
only set acls if version matches (Default: -1 (always matches))

**profile**  
Configured Zookeeper profile to authenticate with (Default: None)

**hosts**  
Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

**scheme**  
Scheme to authenticate with (Default: 'digest')

**username**  
Username to authenticate (Default: None)

**password**  
Password to authenticate (Default: None)

**default\_acl**  
Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.set_acls /test/name acls='[{"username": "gtmanfred
↪", "password": "test", "all": True}]' profile=prod
```

### 26.6.537 salt.modules.zpool

Module for running ZFS zpool command

**codeauthor**  
Nitin Madhok <nmadhok@g.clemson.edu>, Jorge Schrauwen <sjorge@blackdot.be>

**maintainer**  
Jorge Schrauwen <sjorge@blackdot.be>

**maturity**  
new

**depends**  
salt.utils.zfs

**platform**  
illumos,freebsd,linux

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

`salt.modules.zpool.add(zpool, *vdevs, **kwargs)`

Add the specified vdev's to the given storage pool

**zpool**  
[string] Name of storage pool

**vdevs**  
[string] One or more devices

**force**  
[boolean] Forces use of device

CLI Example:

```
salt '*' zpool.add myzpool /path/to/vdev1 /path/to/vdev2 [...]
```

`salt.modules.zpool.attach`(*zpool*, *device*, *new\_device*, *force=False*)

Attach specified device to zpool

**zpool**

[string] Name of storage pool

**device**

[string] Existing device name too

**new\_device**

[string] New device name (to be attached to device)

**force**

[boolean] Forces use of device

CLI Example:

```
salt '*' zpool.attach myzpool /path/to/vdev1 /path/to/vdev2 [...]
```

`salt.modules.zpool.clear`(*zpool*, *device=None*)

Clears device errors in a pool.

**Warning:** The device must not be part of an active pool configuration.

**zpool**

[string] name of storage pool

**device**

[string] (optional) specific device to clear

New in version 2018.3.1.

CLI Example:

```
salt '*' zpool.clear mypool
salt '*' zpool.clear mypool /path/to/dev
```

`salt.modules.zpool.create`(*zpool*, *\*vdevs*, *\*\*kwargs*)

New in version 2015.5.0.

Create a simple zpool, a mirrored zpool, a zpool having nested VDEVs, a hybrid zpool with cache, spare and log drives or a zpool with RAIDZ-1, RAIDZ-2 or RAIDZ-3

**zpool**

[string] Name of storage pool

**vdevs**

[string] One or more devices

**force**

[boolean] Forces use of vdevs, even if they appear in use or specify a conflicting replication level.

**mountpoint**

[string] Sets the mount point for the root dataset

**altroot**

[string] Equivalent to "-o cachefile=none,altroot=root"

**properties**

[dict] Additional pool properties

**filesystem\_properties**

[dict] Additional filesystem properties

**createboot**

[boolean] create a boot partition

New in version 2018.3.0.

CLI Examples:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...] [force=True|False]
salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 /path/to/vdev3 /path/to/vdev4 /path/to/vdev5 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 [...] mirror /path/to/vdev2 /path/to/vdev3 [...] [force=True|False]
salt '*' zpool.create myhybridzpool mirror /tmp/file1 [...] log mirror /path/to/vdev1 [...] cache /path/to/vdev2 [...] spare /path/to/vdev3 [...] [force=True|False]
```

**Note:** Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

Filesystem properties can be specified at the time of creation of the pool by passing an additional argument called "filesystem\_properties" and specifying the properties with their respective values in the form of a python dictionary:

```
filesystem_properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

Example:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

CLI Example:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...] [force=True|False]
salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 /path/to/vdev3 /path/to/vdev4 /path/to/vdev5 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 [...] mirror /path/to/vdev2 /path/to/vdev3 [...] [force=True|False]
salt '*' zpool.create myhybridzpool mirror /tmp/file1 [...] log mirror /path/to/vdev1 [...] cache /path/to/vdev2 [...] spare /path/to/vdev3 [...] [force=True|False]
```

`salt.modules.zpool.create_file_vdev`(*size*, \**vdevs*)

Creates file based virtual devices for a zpool

CLI Example:

```
salt '*' zpool.create_file_vdev 7G /path/to/vdev1 [/path/to/vdev2] [...]
```

**Note:** Depending on file size, the above command may take a while to return.

`salt.modules.zpool.destroy` (*zpool*, *force=False*)

Destroys a storage pool

**zpool**

[string] Name of storage pool

**force**

[boolean] Force destroy of pool

CLI Example:

```
salt '*' zpool.destroy myzpool
```

`salt.modules.zpool.detach` (*zpool*, *device*)

Detach specified device to zpool

**zpool**

[string] Name of storage pool

**device**

[string] Device to detach

CLI Example:

```
salt '*' zpool.detach myzpool /path/to/vdev1
```

`salt.modules.zpool.exists` (*zpool*)

Check if a ZFS storage pool is active

**zpool**

[string] Name of storage pool

CLI Example:

```
salt '*' zpool.exists myzpool
```

`salt.modules.zpool.export` (*\*pools*, *\*\*kwargs*)

New in version 2015.5.0.

Export storage pools

**pools**

[string] One or more storage pools to export

**force**

[boolean] Force export of storage pools

CLI Example:

```
salt '*' zpool.export myzpool ... [force=True|False]
salt '*' zpool.export myzpool2 myzpool2 ... [force=True|False]
```

`salt.modules.zpool.get` (*zpool*, *prop=None*, *show\_source=False*, *parsable=True*)

New in version 2016.3.0.

Retrieves the given list of properties

**zpool**

[string] Name of storage pool

**prop**

[string] Optional name of property to retrieve

**show\_source**

[boolean] Show source of property

**parsable**

[boolean] Display numbers in parsable (exact) values

New in version 2018.3.0.

CLI Example:

```
salt '*' zpool.get myzpool
```

`salt.modules.zpool.healthy()`

Check if all zpools are healthy

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.healthy
```

`salt.modules.zpool.history(zpool=None, internal=False, verbose=False)`

New in version 2016.3.0.

Displays the command history of the specified pools, or all pools if no pool is specified

**zpool**

[string] Optional storage pool

**internal**

[boolean] Toggle display of internally logged ZFS events

**verbose**

[boolean] Toggle display of the user name, the hostname, and the zone in which the operation was performed

CLI Example:

```
salt '*' zpool.upgrade myzpool
```

`salt.modules.zpool.import_(zpool=None, new_name=None, **kwargs)`

New in version 2015.5.0.

Import storage pools or list pools available for import

**zpool**

[string] Optional name of storage pool

**new\_name**

[string] Optional new name for the storage pool

**mntopts**

[string] Comma-separated list of mount options to use when mounting datasets within the pool.

**force**

[boolean] Forces import, even if the pool appears to be potentially active.

**altroot**

[string] Equivalent to "-o cachefile=none,altroot=root"

**dir**

[string] Searches for devices or files in dir, multiple dirs can be specified as follows: dir="dir1, dir2"

**no\_mount**

[boolean] Import the pool without mounting any file systems.

**only\_destroyed**

[boolean] Imports destroyed pools only. This also sets force=True.

**recovery**

[bool|str] false: do not try to recovery broken pools true: try to recovery the pool by rolling back the latest transactions test: check if a pool can be recovered, but don't import it nolog: allow import without log device, recent transactions might be lost

---

**Note:** If feature flags are not support this forced to the default of 'false'

---

**Warning:** When recovery is set to 'test' the result will be have imported set to True if the pool can be imported. The pool might also be imported if the pool was not broken to begin with.

**properties**

[dict] Additional pool properties

**Note:** Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

CLI Example:

```
salt '*' zpool.import [force=True|False]
salt '*' zpool.import myzpool [mynewzpool] [force=True|False]
salt '*' zpool.import myzpool dir='/tmp'
```

**salt.modules.zpool.iostat** (*zpool=None, sample\_time=5, parsable=True*)

Display I/O statistics for the given pools

**zpool**

[string] optional name of storage pool

**sample\_time**

[int] seconds to capture data before output default a sample of 5 seconds is used

**parsable**

[boolean] display data in pythonc values (True, False, Bytes,...)

New in version 2016.3.0.

Changed in version 2018.3.1: Added `parsable` parameter that defaults to True

CLI Example:

```
salt '*' zpool.iostat myzpool
```

**salt.modules.zpool.labelclear** (*device, force=False*)

New in version 2018.3.0.

Removes ZFS label information from the specified device

**device**

[string] Device name; must not be part of an active pool configuration.

**force**

[boolean] Treat exported or foreign devices as inactive

CLI Example:

```
salt '*' zpool.labelclear /path/to/dev
```

**salt.modules.zpool.list\_** (*properties='size,alloc,free,cap,frag,health', zpool=None, parsable=True*)

New in version 2015.5.0.

Return information about (all) storage pools

**zpool**

[string] optional name of storage pool

**properties**

[string] comma-separated list of properties to list

**parsable**

[boolean] display numbers in parsable (exact) values

New in version 2018.3.0.

---

**Note:** The name property will always be included, while the frag property will get removed if not available

---

**zpool**

[string] optional zpool

---

**Note:** Multiple storage pool can be provided as a space separated list

---

CLI Example:

```
salt '*' zpool.list
salt '*' zpool.list zpool=tank
salt '*' zpool.list 'size,free'
salt '*' zpool.list 'size,free' tank
```

`salt.modules.zpool.offline`(*zpool*, \**vdevs*, \*\**kwargs*)

New in version 2015.5.0.

Ensure that the specified devices are offline

**Warning:** By default, the OFFLINE state is persistent. The device remains offline when the system is rebooted. To temporarily take a device offline, use `temporary=True`.

**zpool**

[string] name of storage pool

**vdevs**

[string] One or more devices

**temporary**

[boolean] Enable temporarily offline

CLI Example:

```
salt '*' zpool.offline myzpool /path/to/vdev1 [...] [temporary=True|False]
```

`salt.modules.zpool.online`(*zpool*, \**vdevs*, \*\**kwargs*)

New in version 2015.5.0.

Ensure that the specified devices are online

**zpool**

[string] name of storage pool

**vdevs**

[string] one or more devices

**expand**

[boolean] Expand the device to use all available space.

---

**Note:** If the device is part of a mirror or raidz then all devices must be expanded before the new space will become available to the pool.

---

CLI Example:

```
salt '*' zpool.online myzpool /path/to/vdev1 [...]
```

`salt.modules.zpool.reguid(zpool)`

Generates a new unique identifier for the pool

**Warning:** You must ensure that all devices in this pool are online and healthy before performing this action.

**zpool**

[string] name of storage pool

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.reguid myzpool
```

`salt.modules.zpool.reopen(zpool)`

Reopen all the vdevs associated with the pool

**zpool**

[string] name of storage pool

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.reopen myzpool
```

`salt.modules.zpool.replace(zpool, old_device, new_device=None, force=False)`

Replaces `old_device` with `new_device`

---

**Note:** This is equivalent to attaching `new_device`, waiting for it to resilver, and then detaching `old_device`.

The size of `new_device` must be greater than or equal to the minimum size of all the devices in a mirror or raidz configuration.

---

**zpool**

[string] Name of storage pool

**old\_device**

[string] Old device to replace

**new\_device**

[string] Optional new device

**force**

[boolean] Forces use of `new_device`, even if its appears to be in use.

CLI Example:

```
salt '*' zpool.replace myzpool /path/to/vdev1 /path/to/vdev2
```

`salt.modules.zpool.scrub(zpool, stop=False, pause=False)`

Scrub a storage pool

**zpool**

[string] Name of storage pool

**stop**  
[boolean] If True, cancel ongoing scrub

**pause**  
[boolean] If True, pause ongoing scrub

New in version 2018.3.0.

---

**Note:** Pause is only available on recent versions of ZFS.

If both `pause` and `stop` are True, then `stop` will win.

---

CLI Example:

```
salt '*' zpool.scrub myzpool
```

`salt.modules.zpool.set`(*zpool*, *prop*, *value*)

Sets the given property on the specified pool

**zpool**  
[string] Name of storage pool

**prop**  
[string] Name of property to set

**value**  
[string] Value to set for the specified property

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.set myzpool readonly yes
```

`salt.modules.zpool.split`(*zpool*, *newzpool*, *\*\*kwargs*)

New in version 2018.3.0.

Splits devices off pool creating newpool.

---

**Note:** All vdevs in pool must be mirrors. At the time of the split, `newzpool` will be a replica of `zpool`.

After splitting, do not forget to import the new pool!

---

**zpool**  
[string] Name of storage pool

**newzpool**  
[string] Name of new storage pool

**mountpoint**  
[string] Sets the mount point for the root dataset

**altroot**  
[string] Sets altroot for newzpool

**properties**  
[dict] Additional pool properties for newzpool

CLI Examples:

```
salt '*' zpool.split datamirror databackup
salt '*' zpool.split datamirror databackup altroot=/backup
```

**Note:** Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

Example:

```
salt '*' zpool.split datamirror databackup properties="{ 'readonly': 'on' }"
```

CLI Example:

```
salt '*' zpool.split datamirror databackup
salt '*' zpool.split datamirror databackup altroot=/backup
```

`salt.modules.zpool.status` (*zpool=None*)

Return the status of the named zpool

**zpool**

[string] optional name of storage pool

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.status myzpool
```

`salt.modules.zpool.upgrade` (*zpool=None, version=None*)

New in version 2016.3.0.

Enables all supported features on the given pool

**zpool**

[string] Optional storage pool, applies to all otherwise

**version**

[int] Version to upgrade to, if unspecified upgrade to the highest possible

**Warning:** Once this is done, the pool will no longer be accessible on systems that do not support feature flags. See `zpool-features(5)` for details on compatibility with systems that support feature flags, but do not support all features enabled on the pool.

CLI Example:

```
salt '*' zpool.upgrade myzpool
```

## 26.6.538 salt.modules.zypperpkg

Package support for openSUSE via the zypper package manager

**depends**

- rpm Python module. Install with `zypper install rpm-python`

---

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

---

**class** salt.modules.zypperpkg.**Wildcard**(zypper)

New in version 2017.7.0.

Converts string wildcard to a zypper query. .. rubric:: Example

'1.2.3.4\*' is '1.2.3.4.whatever.is.here' and is equal to: '1.2.3.4 >= and < 1.2.3.5'

**Parameters**

**ptn** -- Pattern

**Returns**

Query range

**Z\_OP** = ['<', '<=', '=', '>=', '>']

salt.modules.zypperpkg.**available\_version**(\*names, \*\*kwargs)

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty dict will be returned for that package.

**refresh**

force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

**root**

operate on a different root directory.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.zypperpkg.**clean\_locks**(root=None)

Remove unused locks that do not currently (with regard to repositories used) lock any package.

**root**

Operate on a different root directory.

CLI Example:

```
salt '*' pkg.clean_locks
```

salt.modules.zypperpkg.**del\_repo**(repo, root=None)

Delete a repo.

**root**

operate on a different root directory.

CLI Examples:

```
salt '*' pkg.del_repo alias
```

salt.modules.zypperpkg.**diff**(\*paths, \*\*kwargs)

Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

The root parameter can also be passed via the keyword argument.

**Parameters**

**path** -- Full path to the installed file

**Returns**

Difference string or raises an exception if examined file is binary.

CLI Example:

```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

`salt.modules.zypperpkg.download(*packages, **kwargs)`

Download packages to the local disk.

**refresh**

force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

**root**

operate on a different root directory.

CLI Example:

```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

`salt.modules.zypperpkg.file_dict(*packages, **kwargs)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of *every* file on the system's rpm database (not generally recommended).

The root parameter can also be passed via the keyword argument.

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.zypperpkg.file_list(*packages, **kwargs)`

List the files that belong to a package. Not specifying any packages will return a list of *every* file on the system's rpm database (not generally recommended).

The root parameter can also be passed via the keyword argument.

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.zypperpkg.get_repo(repo, root=None, **kwargs)`

Display a repo.

**root**

operate on a different root directory.

CLI Example:

```
salt '*' pkg.get_repo alias
```

`salt.modules.zypperpkg.hold(name=None, pkgs=None, root=None, **kwargs)`

New in version 3003.

Add a package hold. Specify one of name and pkgs.

**name**

A package name to hold, or a comma-separated list of package names to hold.

**pkgs**

A list of packages to hold. The name parameter will be ignored if this option is passed.

**root**

operate on a different root directory.

CLI Example:

```
salt '*' pkg.hold <package name>
salt '*' pkg.hold <package1>, <package2>, <package3>
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

`salt.modules.zypperpkg.info_available(*names, **kwargs)`

Return the information of the named package available for the system.

**refresh**

force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

**root**

operate on a different root directory.

CLI Example:

```
salt '*' pkg.info_available <package1>
salt '*' pkg.info_available <package1> <package2> <package3> ...
```

`salt.modules.zypperpkg.info_installed(*names, **kwargs)`

Return the information of the named package(s), installed on the system.

**Parameters**

- **names** -- Names of the packages to get information about.
- **attr** -- Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.  
**Valid attributes are:**  
 version, vendor, release, build\_date, build\_date\_time\_t, install\_date, install\_date\_time\_t, build\_host, group, source\_rpm, arch, epoch, size, license, signature, packager, url, summary, description.
- **errors** -- Handle RPM field errors. If 'ignore' is chosen, then various mistakes are simply ignored and omitted from the texts or strings. If 'report' is chosen, then a field with a mistake is not returned, instead a 'N/A (broken)' (not available, broken) text is placed.  
**Valid attributes are:**  
 ignore, report
- **all\_versions** -- Include information for all versions of the packages installed on the minion.
- **root** -- Operate on a different root directory.

CLI Example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2> <package3> all_
→versions=True
salt '*' pkg.info_installed <package1> attr=version,vendor all_
→versions=True
salt '*' pkg.info_installed <package1> <package2> <package3> ...✘
→attr=version,vendor
salt '*' pkg.info_installed <package1> <package2> <package3> ...✘
→attr=version,vendor errors=ignore
salt '*' pkg.info_installed <package1> <package2> <package3> ...✘
→attr=version,vendor errors=report
```

`salt.modules.zypperpkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, downloadonly=None, skip_verify=False, version=None, ignore_repo_failure=False, no_recommends=False, root=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `zypper` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add `refresh=True` to force a 'zypper refresh' before package is installed.

#### name

The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

#### refresh

force a refresh if set to `True`. If set to `False` (default) it depends on `zypper` if a refresh is executed.

#### fromrepo

Specify a package repository to install from.

#### downloadonly

Only download the packages, do not install.

#### skip\_verify

Skip the GPG verification check (e.g., `--no-gpg-checks`)

#### version

Can be either a version number, or the combination of a comparison operator (`<`, `>`, `<=`, `>=`, `=`) and a version number (ex. `>1.2.3-4`). This parameter is ignored if `pkgs` or `sources` is passed.

#### resolve\_capabilities

If this option is set to `True` `zypper` will take capabilities into account. In this case names which are just provided by a package will get installed. Default is `False`.

Multiple Package Installation Options:

#### pkgs

A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the `version` parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-4"}]'
salt '*' pkg.install pkgs='["foo", {"bar": "<1.2.3-4"}]'
```

#### sources

A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.rpm"}, {"bar":
↳ "salt://bar.rpm"}]'
```

#### ignore\_repo\_failure

`Zypper` returns error code 106 if one of the repositories are not available for various reasons. In case to set strict check, this parameter needs to be set to `True`. Default: `False`.

#### no\_recommends

Do not install recommended packages, only required ones.

**root**

operate on a different root directory.

**diff\_attr:**

If a list of package attributes is specified, returned value will contain them, eg.:

```
{'<package>': {
  'old': {
    'version': '<old-version>',
    'arch': '<old-arch>'},

  'new': {
    'version': '<new-version>',
    'arch': '<new-arch>'}}}
```

Valid attributes are: epoch, version, release, arch, install\_date, install\_date\_time\_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

If an attribute list is specified in `diff_attr`, the dict will also contain any specified attribute, eg.:

```
{'<package>': {
  'old': {
    'version': '<old-version>',
    'arch': '<old-arch>'},

  'new': {
    'version': '<new-version>',
    'arch': '<new-arch>'}}}
```

`salt.modules.zypperpkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty dict will be returned for that package.

**refresh**

force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

**root**

operate on a different root directory.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.zypperpkg.list_downloaded(root=None, **kwargs)`

New in version 2017.7.0.

List prefetched packages downloaded by Zypper in the local disk.

**root**

operate on a different root directory.

CLI Example:

```
salt '*' pkg.list_downloaded
```

`salt.modules.zypperpkg.list_holds` (*pattern=None, full=True, root=None, \*\*kwargs*)

New in version 3005.

List information on locked packages.

---

**Note:** This function returns the computed output of `list_locks` to show exact locked packages.

---

**pattern**

Regular expression used to match the package name

**full**

[True] Show the full hold definition including version and epoch. Set to `False` to return just the name of the package(s) being held.

**root**

Operate on a different root directory.

CLI Example:

```
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

`salt.modules.zypperpkg.list_installed_patches` (*root=None, \*\*kwargs*)

New in version 2017.7.0.

List installed advisory patches on the system.

**root**

operate on a different root directory.

CLI Examples:

```
salt '*' pkg.list_installed_patches
```

`salt.modules.zypperpkg.list_installed_patterns` (*root=None*)

List installed patterns on the system.

**root**

operate on a different root directory.

CLI Examples:

```
salt '*' pkg.list_installed_patterns
```

`salt.modules.zypperpkg.list_locks` (*root=None*)

List current package locks.

**root**

operate on a different root directory.

Return a dict containing the locked package with attributes:

```
{ '<package>': {'case_sensitive': '<case_sensitive>',
               'match_type': '<match_type>'
               'type': '<type>'}}
```

CLI Example:

```
salt '*' pkg.list_locks
```

`salt.modules.zypperpkg.list_patches` (*refresh=False, root=None, \*\*kwargs*)

New in version 2017.7.0.

List all known advisory patches from available repos.

**refresh**

force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

**root**

operate on a different root directory.

CLI Examples:

```
salt '*' pkg.list_patches
```

`salt.modules.zypperpkg.list_patterns` (*refresh=False, root=None*)

List all known patterns from available repos.

**refresh**

force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

**root**

operate on a different root directory.

CLI Examples:

```
salt '*' pkg.list_patterns
```

`salt.modules.zypperpkg.list_pkgs` (*versions\_as\_list=False, root=None, includes=None, \*\*kwargs*)

List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

```
{'<package_name>': '<version>[,<version>...]'}
```

**versions\_as\_list:**

If set to true, the versions are provided as a list

```
{'<package_name>': ['<version>', '<version>']}
```

**root:**

operate on a different root directory.

**includes:**

List of types of packages to include (package, patch, pattern, product) By default packages are always included

**attr:**

If a list of package attributes is specified, returned value will contain them in addition to version, eg.:

```
{'<package_name>': [{'version' : 'version', 'arch' : 'arch'}]}
```

Valid attributes are: epoch, version, release, arch, install\_date, install\_date\_time\_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

**removed:**

not supported

**purge\_desired:**

not supported

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs attr=version,arch
salt '*' pkg.list_pkgs attr=['version', 'arch']
```

`salt.modules.zypperpkg.list_products` (*all=False, refresh=False, root=None*)

List all available or installed SUSE products.

**all**

List all products available or only installed. Default is False.

**refresh**

force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

**root**

operate on a different root directory.

Includes handling for OEM products, which read the OEM productline file and overwrite the release value.

CLI Examples:

```
salt '*' pkg.list_products
salt '*' pkg.list_products all=True
```

`salt.modules.zypperpkg.list_provides` (*root=None, \*\*kwargs*)

New in version 2018.3.0.

List package provides of installed packages as a dict. {<provided\_name>: [<package\_name>, '<package\_name>', ...]}

**root**

operate on a different root directory.

CLI Examples:

```
salt '*' pkg.list_provides
```

`salt.modules.zypperpkg.list_repo_pkgs` (*\*args, \*\*kwargs*)

New in version 2017.7.5,2018.3.1.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

This function can be helpful in discovering the version or repo to specify in a *pkg.installed* state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If *byrepo* is set to True, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
  'bash': ['4.3-83.3.1',
           '4.3-82.6'],
  'vim': ['7.4.326-12.1']
}
{
  'OSS': {
    'bash': ['4.3-82.6'],
    'vim': ['7.4.326-12.1']
  },
  'OSS Update': {
    'bash': ['4.3-83.3.1']
  }
}
```

(continues on next page)

(continued from previous page)

```
}
}
```

**fromrepo**

[None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

**byrepo**

[False] When True, the return data for each package will be organized by repository.

**root**

operate on a different root directory.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
salt '*' pkg.list_repo_pkgs 'python2-*' fromrepo='OSS Updates'
```

`salt.modules.zypperpkg.list_repos` (*root=None, \*\*kwargs*)

Lists all repos.

**root**

operate on a different root directory.

CLI Example:

```
salt '*' pkg.list_repos
```

`salt.modules.zypperpkg.list_updates` (*refresh=True, root=None, \*\*kwargs*)

This function is an alias of `list_upgrades`.

List all available package upgrades on this system

**refresh**

force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.

**root**

operate on a different root directory.

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.zypperpkg.list_upgrades` (*refresh=True, root=None, \*\*kwargs*)

List all available package upgrades on this system

**refresh**

force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.

**root**

operate on a different root directory.

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.zypperpkg.mod_repo` (*repo, \*\*kwargs*)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:

**repo or alias**

alias by which Zypper refers to the repo

**url, mirrorlist or baseurl**

the URL for Zypper to reference

**enabled**

Enable or disable (True or False) repository, but do not remove if disabled.

**name**

This is used as the descriptive name value in the repo file.

**refresh**

Enable or disable (True or False) auto-refresh of the repository.

**cache**

Enable or disable (True or False) RPM files caching.

**gpgcheck**

Enable or disable (True or False) GPG check for this repository.

**gpgautoimport**

[False] If set to True, automatically trust and import public GPG key for the repository.

**root**

operate on a different root directory.

Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a URL can only be deleted if a `mirrorlist` is specified (or vice versa).

CLI Examples:

```
salt '*' pkg.mod_repo alias alias=new_alias
salt '*' pkg.mod_repo alias url=mirrorlist=http://host.com/
```

**salt.modules.zypperpkg.modified(\*packages, \*\*flags)**

List the modified files that belong to a package. Not specifying any packages will return a list of `_all_` modified files on the system's RPM database.

New in version 2015.5.0.

Filtering by flags (True or False):

**size**

Include only files where size changed.

**mode**

Include only files which file's mode has been changed.

**checksum**

Include only files which MD5 checksum has been changed.

**device**

Include only files which major and minor numbers has been changed.

**symlink**

Include only files which are symbolic link contents.

**owner**

Include only files where owner has been changed.

**group**

Include only files where group has been changed.

**time**

Include only files where modification time of the file has been changed.

**capabilities**

Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

**root**

operate on a different root directory.

CLI Examples:

```

salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False

```

### `salt.modules.zypperpkg.normalize_name(name)`

Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:

- If the arch is 32 bit and the package name ends in a 32-bit arch.
- If the arch matches the OS arch, or is noarch.

CLI Example:

```

salt '*' pkg.normalize_name zsh.x86_64

```

### `salt.modules.zypperpkg.owner(*paths, **kwargs)`

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

The root parameter can also be passed via the keyword argument.

CLI Examples:

```

salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf

```

### `salt.modules.zypperpkg.parse_arch(name)`

Parse name and architecture from the specified package name.

CLI Example:

```

salt '*' pkg.parse_arch zsh.x86_64

```

### `salt.modules.zypperpkg.purge(name=None, pkgs=None, root=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a `zypper -n remove -u`

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

**root**

Operate on a different root directory.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.zypperpkg.refresh_db` (*force=None, root=None, gpgautoimport=False, \*\*kwargs*)

Trigger a repository refresh by calling `zypper refresh`. Refresh will run with `--force` if the "force=True" flag is passed on the CLI or `refreshdb_force` is set to `true` in the pillar. The CLI option overrides the pillar setting.

It will return a dict:

```
{'<database name>': Bool}
```

#### **gpgautoimport**

[False] If set to True, automatically trust and import public GPG key for the repository.

New in version 3007.0.

#### **repos**

Refresh just the specified repos

New in version 3007.0.

#### **root**

operate on a different root directory.

CLI Example:

```
salt '*' pkg.refresh_db [force=true|false]
```

Pillar Example:

```
zypper:
  refreshdb_force: false
```

`salt.modules.zypperpkg.remove` (*name=None, pkgs=None, root=None, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `zypper` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages with `zypper -n remove name`

The name of the package to be deleted.

Multiple Package Options:

#### **pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

#### **root**

Operate on a different root directory.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```

salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'

```

Changed in version 3007.0: Can now remove also PTF packages which require a different handling in the backend.

Can now remove also PTF packages which require a different handling in the backend.

`salt.modules.zypperpkg.resolve_capabilities` (*pkgs*, *refresh=False*, *root=None*, *\*\*kwargs*)

New in version 2018.3.0.

Convert name provides in *pkgs* into real package names if `resolve_capabilities` parameter is set to True. In case of `resolve_capabilities` is set to False the package list is returned unchanged.

**refresh**

force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

**root**

operate on a different root directory.

**resolve\_capabilities**

If this option is set to True the input will be checked if a package with this name exists. If not, this function will search for a package which provides this name. If one is found the output is exchanged with the real package name. In case this option is set to False (Default) the input will be returned unchanged.

CLI Examples:

```

salt '*' pkg.resolve_capabilities resolve_capabilities=True w3m_ssl

```

`salt.modules.zypperpkg.search` (*criteria*, *refresh=False*, *\*\*kwargs*)

List known packages, available to the system.

**refresh**

force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

**match (str)**

One of *exact*, *words*, *substrings*. Search for an *exact* match or for the whole *words* only. Default to *substrings* to patch partial words.

**provides (bool)**

Search for packages which provide the search strings.

**recommends (bool)**

Search for packages which recommend the search strings.

**requires (bool)**

Search for packages which require the search strings.

**suggests (bool)**

Search for packages which suggest the search strings.

**conflicts (bool)**

Search packages conflicting with search strings.

**obsoletes (bool)**

Search for packages which obsolete the search strings.

**file\_list (bool)**

Search for a match in the file list of packages.

**search\_descriptions (bool)**

Search also in package summaries and descriptions.

**case\_sensitive (bool)**

Perform case-sensitive search.

**installed\_only (bool)**

Show only installed packages.

**not\_installed\_only (bool)**

Show only packages which are not installed.

**details (bool)**

Show version and repository

**root**

operate on a different root directory.

CLI Examples:

```
salt '*' pkg.search <criteria>
```

`salt.modules.zypperpkg.services_need_restart` (*root=None, \*\*kwargs*)

New in version 3003.

List services that use files which have been changed by the package manager. It might be needed to restart them.

**root**

operate on a different root directory.

CLI Examples:

```
salt '*' pkg.services_need_restart
```

`salt.modules.zypperpkg.unhold` (*name=None, pkgs=None, root=None, \*\*kwargs*)

New in version 3003.

Remove a package hold.

**name**

A package name to unhold, or a comma-separated list of package names to unhold.

**pkgs**

A list of packages to unhold. The name parameter will be ignored if this option is passed.

**root**

operate on a different root directory.

CLI Example:

```
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold <package1>,<package2>,<package3>
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.zypperpkg.upgrade` (*name=None, pkgs=None, refresh=True, dryrun=False, dist\_upgrade=False, fromrepo=None, novendorchange=False, skip\_verify=False, no\_recommends=False, root=None, diff\_attr=None, \*\*kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `zypper` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a zypper upgrade

**name**

The name of the package to be installed. Note that this parameter is ignored if `pkgs` is passed or if `dryrun` is set to `True`.

CLI Example:

```
salt '*' pkg.install name=<package name>
```

**pkgs**

A list of packages to install from a software repository. Must be passed as a python list. Note that this parameter is ignored if `dryrun` is set to `True`.

CLI Examples:

```
salt '*' pkg.install pkgs=['"foo", "bar"]'
```

**refresh**

force a refresh if set to `True` (default). If set to `False` it depends on `zypper` if a refresh is executed.

**dryrun**

If set to `True`, it creates a debug solver log file and then perform a dry-run upgrade (no changes are made). Default: `False`

**dist\_upgrade**

Perform a system dist-upgrade. Default: `False`

**fromrepo**

Specify a list of package repositories to upgrade from. Default: `None`

**novendorchange**

If set to `True`, no allow vendor changes. Default: `False`

**skip\_verify**

Skip the GPG verification check (e.g., `--no-gpg-checks`)

**no\_recommends**

Do not install recommended packages, only required ones.

**root**

Operate on a different root directory.

**diff\_attr:**

If a list of package attributes is specified, returned value will contain them, eg.:

```
{ '<package>': {
  'old': {
    'version': '<old-version>',
    'arch': '<old-arch>' },
  'new': {
    'version': '<new-version>',
    'arch': '<new-arch>' } }
```

Valid attributes are: `epoch`, `version`, `release`, `arch`, `install_date`, `install_date_time_t`.

If `all` is specified, all valid attributes will be returned.

New in version 3006.0.

Returns a dictionary containing the changes:

```
{ '<package>': { 'old': '<old-version>',
                'new': '<new-version>' } }
```

If an attribute list is specified in `diff_attr`, the dict will also contain any specified attribute, eg.:

```
.. code-block:: python
```

```
{ '<package>': {
  'old': {
    'version': '<old-version>', 'arch': '<old-arch>' },
```

```
'new': {
    'version': '<new-version>', 'arch': '<new-arch>'}}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade name=mypackage
salt '*' pkg.upgrade pkgs='["package1", "package2"]'
salt '*' pkg.upgrade dist_upgrade=True fromrepo='["MyRepoName"]'
↳ novendorchange=True
salt '*' pkg.upgrade dist_upgrade=True dryrun=True
```

`salt.modules.zypperpkg.upgrade_available(name, **kwargs)`

Check whether or not an upgrade is available for a given package

**refresh**

force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

**root**

operate on a different root directory.

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.zypperpkg.verify(*names, **kwargs)`

Runs an rpm -Va on a system, and returns the results in a dict

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument.

The root parameter can also be passed via the keyword argument.

CLI Example:

```
salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix'
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
```

`salt.modules.zypperpkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty dict if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**root**

operate on a different root directory.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.zypperpkg.version_cmp(ver1, ver2, ignore_epoch=False, **kwargs)`

New in version 2015.5.4.

Do a cmp-style comparison on two packages. Return -1 if `ver1 < ver2`, 0 if `ver1 == ver2`, and 1 if `ver1 > ver2`. Return None if there was a problem making the comparison.

**ignore\_epoch**

[False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

## 26.7 executors modules

<code>direct_call</code>	Direct call executor module
<code>docker</code>	
<code>splay</code>	Splay function calls across targeted minions
<code>sudo</code>	Sudo executor module
<code>transactional_update</code>	Transactional executor module

### 26.7.1 salt.executors.direct\_call

Direct call executor module

`salt.executors.direct_call.execute`(*opts, data, func, args, kwargs*)

Directly calls the given function with arguments

### 26.7.2 salt.executors.docker

**Warning:** This module will be removed from Salt in version 3009 in favor of the [docker Salt Extension](#).

Docker executor module

New in version 2019.2.0.

Used with the docker proxy minion.

`salt.executors.docker.allow_missing_func`(*function*)

Allow all calls to be passed through to docker container.

The docker call will use `direct_call`, which will return back if the module was unable to be run.

`salt.executors.docker.execute`(*opts, data, func, args, kwargs*)

Directly calls the given function with arguments

### 26.7.3 salt.executors.splay

Splay function calls across targeted minions

`salt.executors.splay.execute`(*opts, data, func, args, kwargs*)

Splay a salt function call execution time across minions over a number of seconds (default: 300)

---

**Note:** You *probably* want to use `--async` here and look up the job results later. If you're dead set on getting the output from the CLI command, then make sure to set the timeout (with the `-t` flag) to something greater than the splaytime (max splaytime + time to execute job). Otherwise, it's very likely that the cli will time out before the job returns.

---

CLI Example:

```
# With default splaytime
salt --async --module-executors='[splay, direct_call]' '*' pkg.install
→ cowsay version=3.03-8.el6
```

```
# With specified splaytime (5 minutes) and timeout with 10 second buffer
salt -t 310 --module-executors='[splay, direct_call]' --executor-opts='
→ {splaytime: 300}' '*' pkg.version cowsay
```

## 26.7.4 salt.executors.sudo

Sudo executor module

`salt.executors.sudo.execute` (*opts, data, func, args, kwargs*)

Allow for the calling of execution modules via sudo.

This module is invoked by the minion if the `sudo_user` minion config is present.

Example minion config:

```
sudo_user: saltdev
```

Once this setting is made, any execution module call done by the minion will be run under `sudo -u <sudo_user> salt-call`. For example, with the above minion config,

```
salt sudo_minion cmd.run 'cat /etc/sudoers'
```

is equivalent to

```
sudo -u saltdev salt-call cmd.run 'cat /etc/sudoers'
```

being run on `sudo_minion`.

## 26.7.5 salt.executors.transactional\_update module

Transactional executor module

New in version 3004.

`salt.executors.transactional_update.execute` (*opts, data, func, args, kwargs*)

Delegate into `transactional_update` module

The `transactional_update` module support the execution of functions inside a transaction, as support apply a state (via `apply`, `sls`, `single` or `highstate`).

This execution module can be used to route some Salt modules and functions to be executed inside the transaction snapshot.

Add this executor in the minion configuration file:

```
module_executors:
- transactional_update
- direct_call
```

Or use the command line parameter:

```
salt-call --module-executors='[transactional_update, direct_call]' test.
→version
```

You can also schedule a reboot if needed:

```
salt-call --module-executors='[transactional_update]' state.sls stuff
→activate_transaction=True
```

There are some configuration parameters supported:

```
# Replace the list of default modules that all the functions
# are delegated to `transactional_update.call()`
delegated_modules: [cmd, pkg]

# Replace the list of default functions that are delegated to
# `transactional_update.call()`
delegated_functions: [pip.install]

# Expand the default list of modules
add_delegated_modules: [ansible]

# Expand the default list of functions
add_delegated_functions: [file.copy]
```

## 26.8 fileserver modules

<i>gitfs</i>	Git Fileserver Backend
<i>hgfs</i>	Mercurial Fileserver Backend
<i>minionfs</i>	Fileserver backend which serves files pushed to the Master
<i>roots</i>	The default file server backend
<i>s3fs</i>	Amazon S3 Fileserver Backend
<i>svnfs</i>	Subversion Fileserver Backend

### 26.8.1 salt.filesserver.gitfs

Git Fileserver Backend

With this backend, branches and tags in a remote git repository are exposed to salt as different environments.

To enable, add `gitfs` to the `fileserver_backend` option in the Master config file.

```
fileserver_backend:
- gitfs
```

**Note:** `git` also works here. Prior to the 2018.3.0 release, *only* `git` would work.

The Git fileserver backend supports both `pygit2` and `GitPython`, to provide the Python interface to git. If both are present, the order of preference for which one will be chosen is the same as the order in which they were listed: `pygit2`, then `GitPython`.

An optional master config parameter (`gitfs_provider`) can be used to specify which provider should be used, in the event that compatible versions of both `pygit2` and `GitPython` are installed.

More detailed information on how to use GitFS can be found in the [GitFS Walkthrough](#).

---

**Note:** Minimum requirements

To use `pygit2` for GitFS requires a minimum `pygit2` version of 0.20.3. `pygit2` 0.20.3 requires `libgit2` 0.20.0. `pygit2` and `libgit2` are developed alongside one another, so it is recommended to keep them both at the same major release to avoid unexpected behavior. For example, `pygit2` 0.21.x requires `libgit2` 0.21.x, `pygit2` 0.22.x will require `libgit2` 0.22.x, etc.

To use `GitPython` for GitFS requires a minimum `GitPython` version of 0.3.0, as well as the git CLI utility. Instructions for installing `GitPython` can be found [here](#).

To clear stale refs the git CLI utility must also be installed.

---

## 26.8.2 salt.filesserver.hgfs

Mercurial Fileserver Backend

To enable, add `hgfs` to the `fileserver_backend` option in the Master config file.

```
fileserver_backend:  
- hgfs
```

---

**Note:** `hg` also works here. Prior to the 2018.3.0 release, *only* `hg` would work.

---

After enabling this backend, branches, bookmarks, and tags in a remote mercurial repository are exposed to salt as different environments. This feature is managed by the `fileserver_backend` option in the salt master config file.

This fileserver has an additional option `hgfs_branch_method` that will set the desired branch method. Possible values are: `branches`, `bookmarks`, or `mixed`. If using `branches` or `mixed`, the default branch will be mapped to `base`.

Changed in version 2014.1.0: The `hgfs_base` master config parameter was added, allowing for a branch other than `default` to be used for the base environment, and allowing for a base environment to be specified when using an `hgfs_branch_method` of `bookmarks`.

**depends**

- mercurial
- python bindings for mercurial (python-hglib)

### 26.8.3 salt.filesserver.minionfs

Fileserver backend which serves files pushed to the Master

The `cp.push` function allows Minions to push files up to the Master. Using this backend, these pushed files are exposed to other Minions via the Salt fileserver.

To enable minionfs, `file_recv` needs to be set to `True` in the master config file (otherwise `cp.push` will not be allowed to push files to the Master), and `minionfs` must be added to the `fileserver_backends` list.

```
fileserver_backend:
- minionfs
```

---

**Note:** `minion` also works here. Prior to the 2018.3.0 release, *only* `minion` would work.

---

Other `minionfs` settings include: `minionfs_whitelist`, `minionfs_blacklist`, `minionfs_mountpoint`, and `minionfs_env`.

See also:

[MinionFS Backend Walkthrough](#)

### 26.8.4 salt.filesserver.roots

The default file server backend

This fileserver backend serves files from the Master's local filesystem. If `fileserver_backend` is not defined in the Master config file, then this backend is enabled by default. If it is defined then `roots` must be in the `fileserver_backend` list to enable this backend.

```
fileserver_backend:
- roots
```

Fileserver environments are defined using the `file_roots` configuration option.

### 26.8.5 salt.filesserver.s3fs

Amazon S3 Fileserver Backend

New in version 0.16.0.

This backend exposes directories in S3 buckets as Salt environments. To enable this backend, add `s3fs` to the `fileserver_backend` option in the Master config file.

```
fileserver_backend:
- s3fs
```

S3 credentials must also be set in the master config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

Alternatively, if on EC2 these credentials can be automatically loaded from instance metadata.

This fileserver supports two modes of operation for the buckets:

1. A single bucket per environment

```
s3.buckets:
  production:
    - bucket1
    - bucket2
  staging:
    - bucket3
    - bucket4
```

2. Multiple environments per bucket

```
s3.buckets:
  - bucket1
  - bucket2
  - bucket3
  - bucket4
```

Note that bucket names must be all lowercase both in the AWS console and in Salt, otherwise you may encounter `SignatureDoesNotMatch` errors.

A multiple-environment bucket must adhere to the following root directory structure:

```
s3://<bucket name>/<environment>/<files>
```

---

**Note:** This fileserver back-end requires the use of the MD5 hashing algorithm. MD5 may not be compliant with all security policies.

---

**Note:** This fileserver back-end is only compatible with MD5 ETag hashes in the S3 metadata. This means that you must use SSE-S3 or plaintext for bucket encryption, and that you must not use multipart upload when uploading to your bucket. More information here: <https://docs.aws.amazon.com/AmazonS3/latest/API/RESTCommonResponseHeaders.html>

Objects without an MD5 ETag will be fetched on every fileserver update.

If you deal with objects greater than 8MB, then you should use the following AWS CLI config to avoid mutipart upload:

```
s3 =
  multipart_threshold = 1024MB
```

More info here: <https://docs.aws.amazon.com/cli/latest/topic/s3-config.html>

---

**Note:** This fileserver back-end will by default sync all buckets on every fileserver update.

If you want files to be only populated in the cache when requested, you can disable this in the master config:

```
s3.s3_sync_on_update: False
```

---

## 26.8.6 salt.filesserver.svnfs

### Subversion Fileserver Backend

After enabling this backend, branches and tags in a remote subversion repository are exposed to salt as different environments. To enable this backend, add `svnfs` to the `filesserver_backend` option in the Master config file.

```
filesserver_backend:  
- svnfs
```

---

**Note:** `svn` also works here. Prior to the 2018.3.0 release, *only* `svn` would work.

---

This backend assumes a standard `svn` layout with directories for `branches`, `tags`, and `trunk`, at the repository root.

#### depends

- `subversion`
- `pysvn`

Changed in version 2014.7.0: The paths to the `trunk`, `branches`, and `tags` have been made configurable, via the config options `svnfs_trunk`, `svnfs_branches`, and `svnfs_tags`. `svnfs_mountpoint` was also added. Finally, support for per-remote configuration parameters was added. See the *documentation* for more information.

## 26.9 grains modules

<i>chronos</i>	Generate chronos proxy minion grains.
<i>cimc</i>	Generate baseline proxy minion grains for cimc hosts.
<i>core</i>	The static grains, these are the core, or built in grains.
<i>disks</i>	Detect disks
<i>esxi</i>	Generate baseline proxy minion grains for ESXi hosts.
<i>extra</i>	
<i>fibre_channel</i>	Grains for Fibre Channel WWN's.
<i>fx2</i>	Generate baseline proxy minion grains for Dell FX2 chassis.
<i>iscsi</i>	Grains for iSCSI Qualified Names (IQN).
<i>junos</i>	Grains for junos.
<i>lvm</i>	Detect LVM Volumes
<i>marathon</i>	Generate marathon proxy minion grains.
<i>mdadm</i>	Detect MDADM RAIDs
<i>mdata</i>	SmartOS Metadata grain provider
<i>metadata</i>	Grains from cloud metadata servers at 169.254.169.254
<i>metadata_gce</i>	Grains from cloud metadata servers at 169.254.169.254 in google compute engine
<i>minion_process</i>	Set grains describing the minion process.
<i>napalm</i>	NAPALM Grains
<i>nvme</i>	Grains for NVMe Qualified Names (NQN).
<i>nxos</i>	Grains for Cisco NX-OS minions
<i>opts</i>	Simple grain to merge the opts into the grains directly if the grain_opts configuration value is set.
<i>package</i>	Grains for detecting what type of package Salt is using
<i>panos</i>	Generate baseline proxy minion grains for panos hosts.
<i>pending_reboot</i>	Grain that indicates the system is pending a reboot See functions in salt.utils.win_system to see what conditions would indicate a reboot is pending
<i>philips_hue</i>	Static grains for the Philips HUE lamps
<i>rest_sample</i>	Generate baseline proxy minion grains
<i>smartos</i>	SmartOS grain provider
<i>ssh_sample</i>	Generate baseline proxy minion grains
<i>zfs</i>	ZFS grain provider

### 26.9.1 salt.grains.chronos

Generate chronos proxy minion grains.

New in version 2015.8.2.

`salt.grains.chronos.kernel()`

`salt.grains.chronos.os()`

`salt.grains.chronos.os_data()`

`salt.grains.chronos.os_family()`

## 26.9.2 salt.grains.cimc

Generate baseline proxy minion grains for cimc hosts.

```
salt.grains.cimc.cimc(proxy=None)
```

## 26.9.3 salt.grains.core

The static grains, these are the core, or built in grains.

When grains are loaded they are not loaded in the same way that modules are loaded, grain functions are detected and executed, the functions MUST return a dict which will be applied to the main grains dict. This module will always be executed first, so that any grains loaded here in the core module can be overwritten just by returning dict keys with the same value as those returned here

```
salt.grains.core.append_domain()
```

Return append\_domain if set

```
salt.grains.core.cwd()
```

Current working directory

```
salt.grains.core.default_gateway()
```

Populates grains which describe whether a server has a default gateway configured or not. Uses *ip -4 route show* and *ip -6 route show* and greps for a *default* at the beginning of any line. Assuming the standard *default via <ip>* format for default gateways, it will also parse out the ip address of the default gateway, and put it in *ip4\_gw* or *ip6\_gw*.

If the *ip* command is unavailable, no grains will be populated.

Currently does not support multiple default gateways. The grains will be set to the first default gateway found.

List of grains:

```
ip4_gw: True # ip/True/False if default ipv4 gateway ip6_gw: True # ip/True/False if default ipv6
gateway ip_gw: True # True if either of the above is True, False otherwise
```

```
salt.grains.core.dns()
```

Parse the resolver configuration file

New in version 2016.3.0.

```
salt.grains.core.fqdns()
```

Return all known FQDNs for the system by enumerating all interfaces and then trying to reverse resolve them (excluding 'lo' interface). To disable the fqdns grain, set *enable\_fqdns\_grains*: False in the minion configuration file.

```
salt.grains.core.get_machine_id()
```

Provide the machine-id for machine/virtualization combination

```
salt.grains.core.get_master()
```

Provides the minion with the name of its master. This is useful in states to target other services running on the master.

```
salt.grains.core.get_server_id()
```

Provides an integer based on the FQDN of a machine. Useful as server-id in MySQL replication or anywhere else you'll need an ID like this.

`salt.grains.core.hostname()`

Return fqdn, hostname, domainname

---

**Note:** On Windows the domain grain may refer to the dns entry for the host instead of the Windows domain to which the host is joined. It may also be empty if not a part of any domain. Refer to the windowsdomain grain instead

---

`salt.grains.core.hwaddr_interfaces()`

Provide a dict of the connected interfaces and their hw addresses (Mac Address)

`salt.grains.core.id_()`

Return the id

`salt.grains.core.ip4_interfaces()`

Provide a dict of the connected interfaces and their ip4 addresses The addresses will be passed as a list for each interface

`salt.grains.core.ip6_interfaces()`

Provide a dict of the connected interfaces and their ip6 addresses The addresses will be passed as a list for each interface

`salt.grains.core.ip_fqdn()`

Return ip address and FQDN grains

`salt.grains.core.ip_interfaces()`

Provide a dict of the connected interfaces and their ip addresses The addresses will be passed as a list for each interface

`salt.grains.core.kernelparams()`

Return the kernel boot parameters

`salt.grains.core.locale_info()`

**Provides**

defaultlanguage defaultencoding

`salt.grains.core.os_data()`

Return grains pertaining to the operating system

`salt.grains.core.path()`

Return the path

`salt.grains.core.pythonexecutable()`

Return the python executable in use

`salt.grains.core.pythonpath()`

Return the Python path

`salt.grains.core.pythonversion()`

Return the Python version

`salt.grains.core.saltpath()`

Return the path of the salt module

`salt.grains.core.saltversion()`

Return the version of salt

`salt.grains.core.saltversioninfo()`

Return the `version_info` of salt  
New in version 0.17.0.

`salt.grains.core.zmqversion()`

Return the zeromq version

#### 26.9.4 `salt.grains.disks`

Detect disks

`salt.grains.disks.disks()`

Return list of disk devices

#### 26.9.5 `salt.grains.esxi`

Generate baseline proxy minion grains for ESXi hosts.

**Warning:** This module will be deprecated in a future release of Salt. VMware strongly recommends using the [VMware Salt extensions](#) instead of the ESXi module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.

`salt.grains.esxi.esxi()`

`salt.grains.esxi.kernel()`

`salt.grains.esxi.os()`

`salt.grains.esxi.os_family()`

#### 26.9.6 `salt.grains.extra`

`salt.grains.extra.config()`

Return the grains set in the grains file

`salt.grains.extra.shell()`

Return the default shell to use on this system

`salt.grains.extra.transactional()`

Determine if the system is transactional.

`salt.grains.extra.uefi()`

Populate UEFI grains.

### 26.9.7 salt.grains.fibre\_channel

Grains for Fibre Channel WWN's. On Windows this runs a PowerShell command that queries WMI to get the Fibre Channel WWN's available.

New in version 2018.3.0.

To enable these grains set `fibre_channel_grains: True` in the minion config.

```
fibre_channel_grains: True
```

```
salt.grains.fibre_channel.fibre_channel_wwns()
```

Return list of fiber channel HBA WWNs

### 26.9.8 salt.grains.fx2

Generate baseline proxy minion grains for Dell FX2 chassis. The challenge is that most of Salt isn't bootstrapped yet, so we need to repeat a bunch of things that would normally happen in `proxy/fx2.py`--just enough to get data from the chassis to include in grains.

```
salt.grains.fx2.fx2()
```

```
salt.grains.fx2.kernel()
```

```
salt.grains.fx2.location()
```

```
salt.grains.fx2.os_data()
```

```
salt.grains.fx2.os_family()
```

### 26.9.9 salt.grains.iscsi

Grains for iSCSI Qualified Names (IQN).

New in version 2018.3.0.

To enable these grains set `iscsi_grains: True` in the minion config.

```
iscsi_grains: True
```

```
salt.grains.iscsi.iscsi_iqn()
```

Return iSCSI IQN

### 26.9.10 salt.grains.junos

Grains for junos. NOTE this is a little complicated--junos can only be accessed via salt-proxy-minion. Thus, some grains make sense to get them from the minion (PYTHONPATH), but others don't (`ip_interfaces`)

```
salt.grains.junos.defaults()
```

```
salt.grains.junos.facts(proxy=None)
```

```
salt.grains.junos.os_family()
```

### 26.9.11 salt.grains.lvm

Detect LVM Volumes

`salt.grains.lvm.lvm()`

Return list of LVM devices

### 26.9.12 salt.grains.marathon

Generate marathon proxy minion grains.

New in version 2015.8.2.

`salt.grains.marathon.kernel()`

`salt.grains.marathon.marathon()`

`salt.grains.marathon.os()`

`salt.grains.marathon.os_data()`

`salt.grains.marathon.os_family()`

### 26.9.13 salt.grains.mdadm

Detect MDADM RAIDs

`salt.grains.mdadm.mdadm()`

Return list of mdadm devices

### 26.9.14 salt.grains.mdata

SmartOS Metadata grain provider

**maintainer**

Jorge Schrauwen <[sjorge@blackdot.be](mailto:sjorge@blackdot.be)>

**maturity**

new

**depends**

salt.utils, salt.module.cmdmod

**platform**

SmartOS

New in version 2017.7.0.

`salt.grains.mdata.mdata()`

Provide grains from the SmartOS metadata

### 26.9.15 salt.grains.metadata

Grains from cloud metadata servers at 169.254.169.254

New in version 2017.7.0.

**depends**  
requests

To enable these grains that pull from the <http://169.254.169.254/latest> metadata server set `metadata_server_grains: True` in the minion config.

```
metadata_server_grains: True
```

```
salt.grains.metadata.metadata()
```

### 26.9.16 salt.grains.metadata\_gce

Grains from cloud metadata servers at 169.254.169.254 in google compute engine

New in version 3005.

**depends**  
requests

To enable these grains that pull from the <http://169.254.169.254/computeMetadata/v1/> metadata server set `metadata_server_grains: True` in the minion config.

```
metadata_server_grains: True
```

```
salt.grains.metadata_gce.metadata()
```

Takes no arguments, returns a dictionary of metadata values from Google.

### 26.9.17 salt.grains.minion\_process

Set grains describing the minion process.

```
salt.grains.minion_process.grains()
```

Return the grains dictionary

### 26.9.18 salt.grains.napalm

#### NAPALM Grains

**codeauthor**  
Mircea Ulinic <ping@mirceaulinic.net>

**maturity**  
new

**depends**  
napalm

**platform**  
unix

## Dependencies

- NAPALM proxy module

New in version 2016.11.0.

`salt.grains.napalm.getos` (*proxy=None*)

Returns the Operating System name running on the network device.

Example: junos, iosxr, eos, ios etc.

CLI Example - select all network devices running JunOS:

```
salt -G 'os:junos' test.ping
```

`salt.grains.napalm.host` (*proxy=None*)

This grain is set by the NAPALM grain module only when running in a proxy minion. When Salt is installed directly on the network device, thus running a regular minion, the `host` grain provides the physical hostname of the network device, as it would be on an ordinary minion server. When running in a proxy minion, `host` points to the value configured in the pillar: *NAPALM proxy module*.

---

**Note:** The difference between `host` and `hostname` is that `host` provides the physical location - either domain name or IP address, while `hostname` provides the hostname as configured on the device. They are not necessarily the same.

---

New in version 2017.7.0.

CLI Example:

```
salt 'device*' grains.get host
```

Output:

```
device1:
  ip-172-31-13-136.us-east-2.compute.internal
device2:
  ip-172-31-11-193.us-east-2.compute.internal
device3:
  ip-172-31-2-181.us-east-2.compute.internal
```

`salt.grains.napalm.host_dns` (*proxy=None*)

Return the DNS information of the host. This grain is a dictionary having two keys:

- A
- AAAA

---

**Note:** This grain is disabled by default, as the proxy startup may be slower when the lookup fails. The user can enable it using the `napalm_host_dns_grain` option (in the pillar or proxy configuration file):

```
napalm_host_dns_grain: true
```

New in version 2017.7.0.

CLI Example:

```
salt 'device*' grains.get host_dns
```

Output:

```
device1:
  A:
    - 172.31.9.153
  AAAA:
    - fd52:188c:c068::1
device2:
  A:
    - 172.31.46.249
  AAAA:
    - fdca:3b17:31ab::17
device3:
  A:
    - 172.31.8.167
  AAAA:
    - fd0f:9fd6:5fab::1
```

`salt.grains.napalm.hostname` (*proxy=None*)

Return the hostname as configured on the network device.

CLI Example:

```
salt 'device*' grains.get hostname
```

Output:

```
device1:
  edge01.yyz01
device2:
  edge01.bjm01
device3:
  edge01.flw01
```

`salt.grains.napalm.interfaces` (*proxy=None*)

Returns the complete interfaces list of the network device.

Example: ['lc-0/0/0', 'pfe-0/0/0', 'xe-1/3/0', 'lo0', 'irb', 'demux0', 'fxp0']

CLI Example - select all devices that have a certain interface, e.g.: xe-1/1/1:

```
salt -G 'interfaces:xe-1/1/1' test.ping
```

Output:

```
edge01.yyz01:
  True
edge01.maa01:
  True
edge01.syd01:
  True
edge01.del01:
  True
```

(continues on next page)

(continued from previous page)

```

edge01.dus01:
  True
edge01.kix01:
  True

```

`salt.grains.napalm.model` (*proxy=None*)

Returns the network device chassis model.

Example: MX480, ASR-9904-AC etc.

CLI Example - select all Juniper MX480 routers and execute traceroute to 8.8.8.8:

```
salt -G 'model:MX480' net.traceroute 8.8.8.8
```

`salt.grains.napalm.optional_args` (*proxy=None*)

Return the connection optional args.

---

**Note:** Sensible data will not be returned.

---

New in version 2017.7.0.

CLI Example - select all devices connecting via port 1234:

```
salt -G 'optional_args:port:1234' test.ping
```

Output:

```

device1:
  True
device2:
  True

```

`salt.grains.napalm.serial` (*proxy=None*)

Returns the chassis serial number.

Example: FOX1234W00F

CLI Example - select all devices whose serial number begins with *FOX* and display the serial number value:

```
salt -G 'serial:FOX*' grains.get serial
```

Output:

```

edge01.icn01:
  FOXW00F001
edge01.del01:
  FOXW00F002
edge01.yyz01:
  FOXW00F003
edge01.mrs01:
  FOXW00F004

```

`salt.grains.napalm.uptime` (*proxy=None*)

Returns the uptime in seconds.

CLI Example - select all devices started/restarted within the last hour:

```
salt -G 'uptime<3600' test.ping
```

`salt.grains.napalm.username` (*proxy=None*)

Return the username.

New in version 2017.7.0.

CLI Example - select all devices using *foobar* as username for connection:

```
salt -G 'username:foobar' test.ping
```

Output:

```
device1:
  True
device2:
  True
```

`salt.grains.napalm.vendor` (*proxy=None*)

Returns the network device vendor.

Example: juniper, cisco, arista etc.

CLI Example - select all devices produced by Cisco and shutdown:

```
salt -G 'vendor:cisco' net.cli "shut"
```

`salt.grains.napalm.version` (*proxy=None*)

Returns the OS version.

Example: 13.3R6.5, 6.0.2 etc.

CLI Example - select all network devices running JunOS 13.3R6.5 and return the model:

```
salt -G 'os:junos and version:13.3R6.5' grains.get model
```

Output:

```
edge01.bjm01:
  MX2000
edge01.sjc01:
  MX960
edge01.mrs01:
  MX480
edge01.muc01:
  MX240
```

### 26.9.19 salt.grains.nvme

Grains for NVMe Qualified Names (NQN).

New in version 3000.

To enable these grains set `nvme_grains: True` in the minion config.

```
nvme_grains: True
```

`salt.grains.nvme.nvme_nqn()`

Return NVMe NQN

### 26.9.20 salt.grains.nxos

Grains for Cisco NX-OS minions

New in version 2016.11.0.

For documentation on setting up the nxos proxy minion look in the documentation for `salt.proxy.nxos`.

`salt.grains.nxos.system_information(proxy=None)`

### 26.9.21 salt.grains.opts

Simple grain to merge the opts into the grains directly if the `grain_opts` configuration value is set.

`salt.grains.opts.opts()`

Return the minion configuration settings

### 26.9.22 salt.grains.package

Grains for detecting what type of package Salt is using

New in version 3007.0.

`salt.grains.package.package()`

Function to determine if the user is currently using onedir, pip or system level package of Salt.

### 26.9.23 salt.grains.panos

Generate baseline proxy minion grains for panos hosts.

`salt.grains.panos.panos(proxy=None)`

### 26.9.24 salt.grains.pending\_reboot

Grain that indicates the system is pending a reboot See functions in salt.utils.win\_system to see what conditions would indicate a reboot is pending

salt.grains.pending\_reboot.**pending\_reboot**()

A grain that indicates that a Windows system is pending a reboot.

### 26.9.25 salt.grains.philips\_hue

Static grains for the Philips HUE lamps

New in version 2015.8.3.

salt.grains.philips\_hue.**kernel**()

salt.grains.philips\_hue.**os**()

salt.grains.philips\_hue.**os\_family**()

salt.grains.philips\_hue.**product**()

salt.grains.philips\_hue.**vendor**()

### 26.9.26 salt.grains.rest\_sample

Generate baseline proxy minion grains

salt.grains.rest\_sample.**kernel**()

salt.grains.rest\_sample.**location**()

salt.grains.rest\_sample.**os**()

salt.grains.rest\_sample.**os\_data**()

salt.grains.rest\_sample.**os\_family**()

salt.grains.rest\_sample.**proxy\_functions**(*proxy*)

The loader will execute functions with one argument and pass a reference to the proxymodules LazyLoader object. However, grains sometimes get called before the LazyLoader object is setup so *proxy* might be None.

### 26.9.27 salt.grains.smartos

SmartOS grain provider

**maintainer**

Jorge Schrauwen <sjorge@blackdot.be>

**maturity**

new

**depends**

salt.utils, salt.module.cmdmod

**platform**

SmartOS

New in version 2017.7.0.

`salt.grains.smartos.smartos()`

Provide grains for SmartOS

### 26.9.28 salt.grains.ssh\_sample

Generate baseline proxy minion grains

`salt.grains.ssh_sample.kernel()`

`salt.grains.ssh_sample.location()`

`salt.grains.ssh_sample.os_data()`

`salt.grains.ssh_sample.proxy_functions(proxy)`

The loader will execute functions with one argument and pass a reference to the proxymodules LazyLoader object. However, grains sometimes get called before the LazyLoader object is setup so *proxy* might be None.

### 26.9.29 salt.grains.zfs

ZFS grain provider

**maintainer**

Jorge Schrauwen <[sjorge@blackdot.be](mailto:sjorge@blackdot.be)>

**maturity**

new

**depends**

salt.module.cmdmod

**platform**

illumos,freebsd,linux

New in version 2018.3.0.

`salt.grains.zfs.zfs()`

Provide grains for zfs/zpool

## 26.10 netapi modules

<code>rest_cherrypy</code>	A script to start the CherryPy WSGI server
<code>rest_tornado</code>	
<code>rest_wsgi</code>	A minimalist REST API for Salt

## 26.10.1 rest\_cherryppy

- *A REST API for Salt*
  - *Authentication*
  - *Usage*
  - *Content negotiation*
- *Performance Expectations and Recommended Usage*
  - *Long-Running HTTP Connections*
  - *Timeouts*
  - *Best Practices*
  - *Performance Tuning*
  - *Future Plans*
- *Deployment*
  - **salt-api** using the CherryPy server
  - Using a WSGI-compliant web server

A script to start the CherryPy WSGI server

This is run by `salt-api` and started in a multiprocess.

### A REST API for Salt

---

**Note:** This module is Experimental on Windows platforms and supports limited configurations:

- doesn't support PAM authentication (i.e. `external_auth: auto`)
  - doesn't support SSL (i.e. `disable_ssl: True`)
- 

#### depends

- CherryPy Python module.

Note: there is a known SSL traceback for CherryPy versions 3.2.5 through 3.7.x. Please use version 3.2.3 or the latest 10.x version instead.

#### optdepends

- ws4py Python module for websockets support.

#### client\_libraries

- Java: <https://github.com/SUSE/salt-netapi-client>
- Python: <https://github.com/saltstack/pepper>

#### setup

All steps below are performed on the machine running the Salt Master daemon. Configuration goes into the Master configuration file.

1. Install `salt-api`. (This step varies between OS and Linux distros. Some package systems have a split package, others include `salt-api` in the main Salt package. Ensure the `salt-api --version` output matches the `salt --version` output.)
2. Install CherryPy. (Read the version caveat in the section above.)
3. Optional: generate self-signed SSL certificates.

Using a secure HTTPS connection is strongly recommended since Salt eauth authentication credentials will be sent over the wire.

1. Install the PyOpenSSL package.
2. Generate a self-signed certificate using the `create_self_signed_cert()` execution function.

```
salt-call --local tls.create_self_signed_cert
```

4. Edit the master config to create at least one external auth user or group following the *full external auth instructions*.
5. Edit the master config with the following production-ready example to enable the `rest_cherrypy` module. (Adjust cert paths as needed, or disable SSL (not recommended!))

```
rest_cherrypy:
  port: 8000
  ssl_cert: /etc/pki/tls/certs/localhost.crt
  ssl_key: /etc/pki/tls/certs/localhost.key
```

6. Restart the `salt-master` daemon.
7. Start the `salt-api` daemon.

### configuration

All available configuration options are detailed below. These settings configure the CherryPy HTTP server and do not apply when using an external server such as Apache or Nginx.

#### port

##### Required

The port for the webserver to listen on.

#### host

[0.0.0.0] The socket interface for the HTTP server to listen on.

#### debug

[False] Starts the web server in development mode. It will reload itself when the underlying code is changed and will output more debugging info.

#### log\_access\_file

Path to a file to write HTTP access logs.

New in version 2016.11.0.

#### log\_error\_file

Path to a file to write HTTP error logs.

New in version 2016.11.0.

#### ssl\_cert

The path to a SSL certificate. (See below)

**ssl\_key**

The path to the private key for your SSL certificate. (See below)

**ssl\_chain**

(Optional when using PyOpenSSL) the certificate chain to pass to `Context.load_verify_locations`.

**disable\_ssl**

A flag to disable SSL. Warning: your Salt authentication credentials will be sent in the clear!

**webhook\_disable\_auth**

[False] The *Webhook* URL requires authentication by default but external services cannot always be configured to send authentication. See the Webhook documentation for suggestions on securing this interface.

**webhook\_url**

[/hook] Configure the URL endpoint for the *Webhook* entry point.

**thread\_pool**

[100] The number of worker threads to start up in the pool.

**socket\_queue\_size**

[30] Specify the maximum number of HTTP connections to queue.

**expire\_responses**

[True] Whether to check for and kill HTTP responses that have exceeded the default timeout.

Deprecated since version 2016.11.9,2017.7.3,2018.3.0: The "expire\_responses" configuration setting, which corresponds to the `timeout_monitor` setting in CherryPy, is no longer supported in CherryPy versions  $\geq 12.0.0$ .

**max\_request\_body\_size**

[1048576] Maximum size for the HTTP request body.

**collect\_stats**

[False] Collect and report statistics about the CherryPy server

Reports are available via the *Stats* URL.

**stats\_disable\_auth**

[False] Do not require authentication to access the `/stats` endpoint.

New in version 2018.3.0.

**static**

A filesystem path to static HTML/JavaScript/CSS/image assets.

**static\_path**

[/static] The URL prefix to use when serving static assets out of the directory specified in the `static` setting.

**enable\_sessions**

[True] Enable or disable all endpoints that rely on session cookies. This can be useful to enforce only header-based authentication.

New in version 2017.7.0.

**app**

[index.html] A filesystem path to an HTML file that will be served as a static file. This is useful for bootstrapping a single-page JavaScript app.

Warning! If you set this option to a custom web application, anything that uses cookie-based authentication is vulnerable to XSRF attacks. Send the custom `X-Auth-Token` header instead and consider disabling the `enable_sessions` setting.

Changed in version 2017.7.0: Add a proof-of-concept JavaScript single-page app.

#### **app\_path**

[/app] The URL prefix to use for serving the HTML file specified in the `app` setting. This should be a simple name containing no slashes.

Any path information after the specified path is ignored; this is useful for apps that utilize the HTML5 history API.

#### **root\_prefix**

[/] A URL path to the main entry point for the application. This is useful for serving multiple applications from the same URL.

## Authentication

Authentication is performed by passing a session token with each request. Tokens are generated via the *Login* URL.

The token may be sent in one of two ways: as a custom header or as a session cookie. The latter is far more convenient for clients that support cookies.

- Include a custom header named *X-Auth-Token*.

For example, using curl:

```
curl -sSk https://localhost:8000/login \
-H 'Accept: application/x-yaml' \
-d username=saltdev \
-d password=saltdev \
-d eauth=pam
```

Copy the token value from the output and include it in subsequent requests:

```
curl -sSk https://localhost:8000 \
-H 'Accept: application/x-yaml' \
-H 'X-Auth-Token: 697adbdc8fe971d09ae4c2a3add7248859c87079' \
-d client=local \
-d tgt='*' \
-d fun=test.ping
```

- Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

For example, using curl:

```
# Write the cookie file:
curl -sSk https://localhost:8000/login \
-c ~/cookies.txt \
-H 'Accept: application/x-yaml' \
-d username=saltdev \
-d password=saltdev \
-d eauth=auto
```

(continues on next page)

(continued from previous page)

```
# Read the cookie file:
curl -sSk https://localhost:8000 \
  -b ~/cookies.txt \
  -H 'Accept: application/x-yaml' \
  -d client=local \
  -d tgt='*' \
  -d fun=test.ping
```

Another example using the **requests** library in Python:

```
>>> import requests
>>> session = requests.Session()
>>> session.post('http://localhost:8000/login', json={
    'username': 'saltdev',
    'password': 'saltdev',
    'eauth': 'auto',
})
<Response [200]>
>>> resp = session.post('http://localhost:8000', json=[{
    'client': 'local',
    'tgt': '*',
    'fun': 'test.arg',
    'arg': ['foo', 'bar'],
    'kwarg': {'baz': 'Baz!'}},
])
>>> resp.json()
{u'return': [{
    ...snip...
}]}
```

#### See also:

You can bypass the session handling via the *Run* URL.

#### Usage

This interface directly exposes Salt's *Python API*. Everything possible at the CLI is possible through the Python API. Commands are executed on the Salt Master.

The root URL (/) is RPC-like in that it accepts instructions in the request body for what Salt functions to execute, and the response contains the result of those function calls.

For example:

```
% curl -sSi https://localhost:8000 -H 'Content-type: application/json
→ ' -d '[{
    "client": "local",
    "tgt": "*",
    "fun": "test.ping"
}]'
HTTP/1.1 200 OK
Content-Type: application/json
[...snip...]
```

(continues on next page)

(continued from previous page)

```
{"return": [{"jerry": true}]}
```

The request body must be an array of commands. Use this workflow to build a command:

1. Choose a client interface.
2. Choose a function.
3. Fill out the remaining parameters needed for the chosen client.

The `client` field is a reference to the main Python classes used in Salt's Python API. Read the full [Client APIs](#) documentation, but in short:

- "local" uses [LocalClient](#) which sends commands to Minions. Equivalent to the `salt` CLI command.
- "runner" uses [RunnerClient](#) which invokes runner modules on the Master. Equivalent to the `salt-run` CLI command.
- "wheel" uses [WheelClient](#) which invokes wheel modules on the Master. Wheel modules do not have a direct CLI equivalent but they typically manage Master-side resources such as state files, pillar files, the Salt config files, and the [key wheel module](#) exposes similar functionality as the `salt-key` CLI command.

Most clients have variants like synchronous or asynchronous execution as well as others like batch execution. See the [full list of client interfaces](#).

Each client requires different arguments and sometimes has different syntax. For example, `LocalClient` requires the `tgt` argument because it forwards the command to Minions and the other client interfaces do not. `LocalClient` also takes `arg` (array) and `kwarg` (dictionary) arguments because these values are sent to the Minions and used to execute the requested function there. `RunnerClient` and `WheelClient` are executed directly on the Master and thus do not need or accept those arguments.

Read the method signatures in the client documentation linked above, but hopefully an example will help illustrate the concept. This example causes Salt to execute two functions -- the [test.arg execution function](#) using `LocalClient` and the [test.arg runner function](#) using `RunnerClient`; note the different structure for each command. The results for both are combined and returned as one response.

```
% curl -b ~/cookies.txt -sSi localhost:8000 -H 'Content-type: application/json' -d '[
  {
    "client": "local",
    "tgt": "*",
    "fun": "test.arg",
    "arg": ["positional arg one", "positional arg two"],
    "kwarg": {
      "keyword arg one": "Hello from a minion",
      "keyword arg two": "Hello again from a minion"
    }
  },
  {
    "client": "runner",
    "fun": "test.arg",
    "keyword arg one": "Hello from a master",
    "keyword arg two": "Runners do not support positional args"
  }
]
```

(continues on next page)

(continued from previous page)

```
'
HTTP/1.1 200 OK
[...snip...]
{
  "return": [
    {
      "jerry": {
        "args": [
          "positional arg one",
          "positional arg two"
        ],
        "kwargs": {
          "keyword arg one": "Hello from a minion",
          "keyword arg two": "Hello again from a minion",
          [...snip...]
        }
      },
      [...snip; other minion returns here...]
    },
    {
      "args": [],
      "kwargs": {
        "keyword arg two": "Runners do not support positional args",
        "keyword arg one": "Hello from a master"
      }
    }
  ]
}
```

One more example, this time with more commonly used functions:

```
curl -b /tmp/cookies.txt -sSi localhost:8000 -H 'Content-type: application/json' -d '[
  {
    "client": "local",
    "tgt": "*",
    "fun": "state.sls",
    "kwarg": {
      "mods": "apache",
      "pillar": {
        "lookup": {
          "wwwdir": "/srv/httpd/htdocs"
        }
      }
    }
  },
  {
    "client": "runner",
    "fun": "cloud.create",
    "provider": "my-ec2-provider",
    "instances": "my-centos-6",
```

(continues on next page)

(continued from previous page)

```

        "image": "ami-1624987f",
        "delvol_on_destroy", true
    }
]
',
HTTP/1.1 200 OK
[...snip...]
{
  "return": [
    {
      "jerry": {
        "pkg_|-install_apache_|-httpd_|-installed": {
          [...snip full state return here...]
        }
      }
    }
    [...snip other minion returns here...]
  ],
  {
    [...snip full salt-cloud output here...]
  }
]
}

```

## Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, urlencoded).

- Specify the format of data in the request body by including the *Content-Type* header.
- Specify the desired data format for the response body with the *Accept* header.

We recommend the JSON format for most HTTP requests. urlencoded data is simple and cannot express complex data structures -- and that is often required for some Salt commands, such as starting a state run that uses Pillar data. Salt's CLI tool can reformat strings passed in at the CLI into complex data structures, and that behavior also works via salt-api, but that can be brittle and since salt-api can accept JSON it is best just to send JSON.

Here is an example of sending urlencoded data:

```

curl -sSik https://localhost:8000 \
  -b ~/cookies.txt \
  -d client=runner \
  -d fun='jobs.lookup_jid' \
  -d jid='20150129182456704682'

```

## urlencoded data caveats

- Only a single command may be sent per HTTP request.
- Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.

Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated query string parameters. E.g., `?foo[]=fooone&foo[]=footwo`. This is **not** supported; send `?foo=fooone&foo=footwo` instead, or send JSON or YAML.

A note about `curl`

The `-d` flag to `curl` does *not* automatically urlencode data which can affect passwords and other data that contains characters that must be encoded. Use the `--data-urlencode` flag instead. E.g.:

```
curl -ksi http://localhost:8000/login \  
-H "Accept: application/json" \  
-d username='myapiuser' \  
--data-urlencode password='1234+' \  
-d eauth='pam'
```

## Performance Expectations and Recommended Usage

This module provides a thin wrapper around *Salt's Python API*. Executing a Salt command via `rest_cherry.py` is directly analogous to executing a Salt command via Salt's CLI (which also uses the Python API) -- they share the same semantics, performance characteristics, and 98% of the same code. As a rule-of-thumb: if you wouldn't do it at the CLI don't do it via this API.

## Long-Running HTTP Connections

The CherryPy server is a production-ready, threading HTTP server written in Python. Because it makes use of a thread pool to process HTTP requests it is not ideally suited to maintaining large numbers of concurrent, synchronous connections. On moderate hardware with default settings it should top-out at around 30 to 50 concurrent connections.

That number of long-running, synchronous Salt processes is also not ideal. Like at the CLI, each Salt command run will start a process that instantiates its own `LocalClient`, which instantiates its own listener to the Salt event bus, and sends out its own periodic `saltutil.find_job` queries to determine if a Minion is still running the command. Not exactly a lightweight operation.

## Timeouts

In addition to the above resource overhead for long-running connections, there are the usual HTTP timeout semantics for the CherryPy server, any HTTP client being used, as well as any hardware in between such as proxies, gateways, or load balancers. `rest_cherry.py` can be configured not to time-out long responses via the `expire_responses` setting, and both `LocalClient` and `RunnerClient` have their own timeout parameters that may be passed as top-level keywords:

```
curl -b /tmp/cookies.txt -sSi localhost:8000 -H 'Content-type: application/json' -d '[  
  {  
    "client": "local",  
    "tgt": "*",  
    "fun": "test.sleep",  
    "kwarg": {"length": 30},  
    "timeout": 60  
  },  
  {  
    "client": "runner",
```

(continues on next page)

(continued from previous page)

```
"fun": "test.sleep",
"kwarg": {"s_time": 30},
"timeout": 60
}
]
```

## Best Practices

Given the performance overhead and HTTP timeouts for long-running operations described above, the most effective and most scalable way to use both Salt and salt-api is to run commands asynchronously using the `local_async`, `runner_async`, and `wheel_async` clients.

Running asynchronous jobs results in being able to process 3x more commands per second for `LocalClient` and 17x more commands per second for `RunnerClient`, in addition to much less network traffic and memory requirements. Job returns can be fetched from Salt's job cache via the `/jobs/<jid>` endpoint, or they can be collected into a data store using Salt's *Returner system*.

The `/events` endpoint is specifically designed to handle long-running HTTP connections and it exposes Salt's event bus which includes job returns. Watching this endpoint first, then executing asynchronous Salt commands second, is the most lightweight and scalable way to use `rest_cherry.py` while still receiving job returns in real-time. But this requires clients that can properly handle the inherent asynchronicity of that workflow.

## Performance Tuning

The `thread_pool` and `socket_queue_size` settings can be used to increase the capacity of `rest_cherry.py` to handle incoming requests. Keep an eye on RAM usage as well as available file handles while testing changes to these settings. As salt-api is a thin wrapper around Salt's Python API, also keep an eye on the performance of Salt when testing.

## Future Plans

Now that Salt uses the Tornado concurrency library internally, we plan to improve performance in the API by taking advantage of existing processes and event listeners and to use lightweight coroutines to facilitate more simultaneous HTTP connections and better support for synchronous operations. That effort can be tracked in [issue 26505](#), but until that issue is closed `rest_cherry.py` will remain the officially recommended REST API.

## Deployment

The `rest_cherry.py netapi` module is a standard Python WSGI app. It can be deployed one of two ways.

## salt-api using the CherryPy server

The default configuration is to run this module using **salt-api** to start the Python-based CherryPy server. This server is lightweight, multi-threaded, encrypted with SSL, and should be considered production-ready. See the section above for performance expectations.

### Using a WSGI-compliant web server

This module may be deployed on any WSGI-compliant server such as Apache with mod\_wsgi or Nginx with FastCGI, to name just two (there are many).

Note, external WSGI servers handle URLs, paths, and SSL certs directly. The `rest_cherry` configuration options are ignored and the `salt-api` daemon does not need to be running at all. Remember Salt authentication credentials are sent in the clear unless SSL is being enforced!

An example Apache virtual host configuration:

```
<VirtualHost *:80>
  ServerName example.com
  ServerAlias *.example.com

  ServerAdmin webmaster@example.com

  LogLevel warn
  ErrorLog /var/www/example.com/logs/error.log
  CustomLog /var/www/example.com/logs/access.log combined

  DocumentRoot /var/www/example.com/htdocs

  WSGIScriptAlias / /path/to/salt/netapi/rest_cherry/wsgi.py
</VirtualHost>
```

## 26.10.2 REST URI Reference

/

### **class** salt.netapi.rest\_cherry.py.app.LowDataAdapter

The primary entry point to Salt's REST API

#### **GET** ()

An explanation of the API with links of where to go next

#### **GET** /

##### Request Headers

- `Accept` -- the desired response format.

##### Status Codes

- `200 OK` -- success
- `401 Unauthorized` -- authentication required
- `406 Not Acceptable` -- requested Content-Type not available

Example request:

```
curl -i localhost:8000
```

```
GET / HTTP/1.1
Host: localhost:8000
Accept: application/json
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: application/json
```

## POST (\*\*kwargs)

Send one or more Salt commands in the request body

### POST /

#### Request Headers

- *X-Auth-Token* -- a session token from *Login*.
- *Accept* -- the desired response format.
- *Content-Type* -- the format of the request body.

#### Response Headers

- *Content-Type* -- the format of the response body; depends on the *Accept* request header.

#### Status Codes

- 200 OK -- success
- 400 Bad Request -- bad or malformed request
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

*lowstate* data describing Salt commands must be sent in the request body.

Example request:

```
curl -sSik https://localhost:8000 \
  -b ~/cookies.txt \
  -H "Accept: application/x-yaml" \
  -H "Content-type: application/json" \
  -d '[{"client": "local", "tgt": "*", "fun": "test.ping"}]'
```

```
POST / HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
X-Auth-Token: d40d1e1e
Content-Type: application/json

[{"client": "local", "tgt": "*", "fun": "test.ping"}]
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 200
Allow: GET, HEAD, POST
Content-Type: application/x-yaml

return:
```

Destroy the currently active session and expire the session cookie

## /minions

### class salt.netapi.rest\_cherry.py.app.Minions

Convenience URLs for working with minions

#### GET (*mid=None*)

A convenience URL for getting lists of minions or getting minion details

#### GET /minions/ (*mid*)

##### Request Headers

- *X-Auth-Token* -- a session token from *Login*.
- *Accept* -- the desired response format.

##### Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/minions/ms-3
```

```
GET /minions/ms-3 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 129005
Content-Type: application/x-yaml

return:
- ms-3:
  grains.items:
    ...
```

#### POST (*\*\*kwargs*)

Start an execution command and immediately return the job id

#### POST /minions

##### Request Headers

- *X-Auth-Token* -- a session token from *Login*.
- *Accept* -- the desired response format.
- *Content-Type* -- the format of the request body.

##### Response Headers

- *Content-Type* -- the format of the response body; depends on the *Accept* request header.

##### Status Codes

- 200 OK -- success
- 400 Bad Request -- bad or malformed request
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Lowstate data describing Salt commands must be sent in the request body. The `client` option will be set to `local_async()`.

Example request:

```
curl -sSi localhost:8000/minions \
  -b ~/cookies.txt \
  -H "Accept: application/x-yaml" \
  -d '{"tgt": "*", "fun": "status.diskusage"}'
```

```
POST /minions HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Type: application/x-www-form-urlencoded

tgt=*&fun=status.diskusage
```

Example response:

```
HTTP/1.1 202 Accepted
Content-Length: 86
Content-Type: application/x-yaml

return:
- jid: '20130603122505459265'
  minions: [ms-4, ms-3, ms-2, ms-1, ms-0]
  _links:
    jobs:
      - href: /jobs/20130603122505459265
```

## /jobs

**class** salt.netapi.rest\_cherry.py.app.**Jobs**

**GET** (*jid=None, timeout=""*)

A convenience URL for getting lists of previously run jobs or getting the return from a single job

**GET** /jobs/*(jid)*

List jobs or show a single job from the job cache.

### Request Headers

- *X-Auth-Token* -- a session token from *Login*.
- *Accept* -- the desired response format.

### Status Codes

- *200 OK* -- success
- *401 Unauthorized* -- authentication required
- *406 Not Acceptable* -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/jobs
```

```
GET /jobs HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
- '20121130104633606931':
  Arguments:
  - '3'
  Function: test.fib
  Start Time: 2012, Nov 30 10:46:33.606931
  Target: jerry
  Target-type: glob
```

**Example request:**

```
curl -i localhost:8000/jobs/20121130104633606931
```

```
GET /jobs/20121130104633606931 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

info:
- Arguments:
  - '3'
  Function: test.fib
  Minions:
  - jerry
  Start Time: 2012, Nov 30 10:46:33.606931
  Target: '*'
  Target-type: glob
  User: saltdev
  jid: '20121130104633606931'
return:
- jerry:
  - - 0
  - 1
  - 1
  - 2
  - 6.9141387939453125e-06
```

## /run

### class salt.netapi.rest\_cherry.py.app.Run

Run commands bypassing the *normal session handling*.

salt-api does not enforce authorization, Salt's eauth system does that. Local/Runner/WheelClient all accept username/password/eauth or token kwargs that are then checked by the eauth system. The session mechanism in rest\_cherry.py simply pairs a session with a Salt eauth token and then passes the token kwarg in automatically.

If you already have a Salt eauth token, perhaps generated by the *mk\_token* function in the Auth Runner module, then there is no reason to use sessions.

This endpoint accepts either a username, password, eauth trio, or a token kwarg and does not make use of sessions at all.

#### POST (\*\*kwargs)

Run commands bypassing the *normal session handling*. Otherwise, this URL is identical to the *root URL (/)*.

#### POST /run

An array of lowstate data describing Salt commands must be sent in the request body.

##### Status Codes

- 200 OK -- success
- 400 Bad Request -- bad or malformed request
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

#### Example request:

```
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \
-H 'Content-type: application/json' \
-d '[{
  "client": "local",
  "tgt": "*",
  "fun": "test.ping",
  "username": "saltdev",
  "password": "saltdev",
  "eauth": "auto"
}]'
```

Or using a Salt Eauth token:

```
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \
-H 'Content-type: application/json' \
-d '[{
  "client": "local",
  "tgt": "*",
  "fun": "test.ping",
  "token": "<salt eauth token here>"
}]'
```

```
POST /run HTTP/1.1
Host: localhost:8000
```

(continues on next page)

(continued from previous page)

```
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/json

[{"client": "local", "tgt": "*", "fun": "test.ping", "username":
  ↪ "saltdev", "password": "saltdev", "eauth": "auto"}]
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
- ms-0: true
  ms-1: true
  ms-2: true
  ms-3: true
  ms-4: true
```

The `/run` endpoint can also be used to issue commands using the `salt-ssh` subsystem. When using `salt-ssh`, `eauth` credentials must also be supplied, and are subject to *eauth access-control lists*.

All SSH client requests are synchronous.

**Example SSH client request:**

```
curl -sS localhost:8000/run \
  -H 'Accept: application/x-yaml' \
  -d client='ssh' \
  -d tgt='*' \
  -d username='saltdev' \
  -d password='saltdev' \
  -d eauth='auto' \
  -d fun='test.ping'
```

```
POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/x-www-form-urlencoded
```

**Example SSH response:**

```
return:
- silver:
  _stamp: '2020-09-08T23:04:28.912609'
  fun: test.ping
  fun_args: []
  id: silver
  jid: '20200908230427905565'
  retcode: 0
  return: true
```

## /events

### class salt.netapi.rest\_cherry.py.app.Events

Expose the Salt event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure.

See also:

[Events & Reactor](#)

**GET** (*token=None, salt\_token=None*)

An HTTP stream of the Salt master event bus

This stream is formatted per the Server Sent Events (SSE) spec. Each event is formatted as JSON.

#### GET /events

##### Status Codes

- [200 OK](#) -- success
- [401 Unauthorized](#) -- authentication required
- [406 Not Acceptable](#) -- requested Content-Type not available

##### Query Parameters

- **token** -- optional parameter containing the token ordinarily supplied via the X-Auth-Token header in order to allow cross-domain requests in browsers that do not include CORS support in the EventSource API. E.g., `curl -NsS localhost:8000/events?token=308650d`
- **salt\_token** -- optional parameter containing a raw Salt *eaauth token* (not to be confused with the token returned from the /login URL). E.g., `curl -NsS localhost:8000/events?salt_token=30742765`

Example request:

```
curl -NsS localhost:8000/events
```

```
GET /events HTTP/1.1
Host: localhost:8000
```

Example response:

Note, the `tag` field is not part of the spec. SSE compliant clients should ignore unknown fields. This addition allows non-compliant clients to only watch for certain tags without having to deserialize the JSON object each time.

```
HTTP/1.1 200 OK
Connection: keep-alive
Cache-Control: no-cache
Content-Type: text/event-stream;charset=utf-8

retry: 400

tag: salt/job/20130802115730568475/new
data: {'tag': 'salt/job/20130802115730568475/new', 'data': {'minions
→ ': ['ms-4', 'ms-3', 'ms-2', 'ms-1', 'ms-0']}}
```

(continues on next page)

(continued from previous page)

```
tag: salt/job/20130802115730568475/ret/jerry
data: {'tag': 'salt/job/20130802115730568475/ret/jerry', 'data': {
  ↳ 'jid': '20130802115730568475', 'return': True, 'retcode': 0,
  ↳ 'success': True, 'cmd': '_return', 'fun': 'test.ping', 'id': 'ms-1
  ↳ '}}
```

The event stream can be easily consumed via JavaScript:

```
var source = new EventSource('/events');
source.onopen = function() { console.info('Listening ...') };
source.onerror = function(err) { console.error(err) };
source.onmessage = function(message) {
  var saltEvent = JSON.parse(message.data);
  console.log(saltEvent.tag, saltEvent.data);
};
```

Note, the SSE stream is fast and completely asynchronous and Salt is very fast. If a job is created using a regular POST request, it is possible that the job return will be available on the SSE stream before the response for the POST request arrives. It is important to take that asynchronicity into account when designing an application. Below are some general guidelines.

- Subscribe to the SSE stream *before* creating any events.
- Process SSE events directly as they arrive and don't wait for any other process to "complete" first (like an ajax request).
- Keep a buffer of events if the event stream must be used for synchronous lookups.
- Be cautious in writing Salt's event stream directly to the DOM. It is very busy and can quickly overwhelm the memory allocated to a browser tab.

A full, working proof-of-concept JavaScript application is available [adjacent to this file](#). It can be viewed by pointing a browser at the /app endpoint in a running `rest_cherry` instance.

Or using CORS:

```
var source = new EventSource('/events?
  ↳ token=ecd589e4e01912cf3c4035afad73426dbb8dba75', {withCredentials:
  ↳ true});
```

It is also possible to consume the stream via the shell.

Records are separated by blank lines; the `data:` and `tag:` prefixes will need to be removed manually before attempting to unserialize the JSON.

curl's `-N` flag turns off input buffering which is required to process the stream incrementally.

Here is a basic example of printing each event as it comes in:

```
curl -NsS localhost:8000/events | \
  while IFS= read -r line ; do
    echo $line
  done
```

Here is an example of using `awk` to filter events based on tag:

```
curl -NsS localhost:8000/events | \
  awk '
    BEGIN { RS=""; FS="\n" }
```

(continues on next page)

(continued from previous page)

```

    $1 ~ /^tag: salt\/job\/[0-9]+\\/new$/ { print $0 }
,
tag: salt/job/20140112010149808995/new
data: {"tag": "salt/job/20140112010149808995/new", "data": {"tgt_type
↳": "glob", "jid": "20140112010149808995", "tgt": "jerry", "_stamp
↳": "2014-01-12_01:01:49.809617", "user": "shouse", "arg": [], "fun
↳": "test.ping", "minions": ["jerry"]}}
tag: 20140112010149808995
data: {"tag": "20140112010149808995", "data": {"fun_args": [], "jid
↳": "20140112010149808995", "return": true, "retcode": 0, "success
↳": true, "cmd": "_return", "_stamp": "2014-01-12_01:01:49.819316",
↳"fun": "test.ping", "id": "jerry"}}

```

## /hook

### class salt.netapi.rest\_cherry.py.app.Webhook

A generic web hook entry point that fires an event on Salt's event bus

External services can POST data to this URL to trigger an event in Salt. For example, Amazon SNS, Jenkins-CI or Travis-CI, or GitHub web hooks.

**Note:** Be mindful of security

Salt's Reactor can run any code. A Reactor SLS that responds to a hook event is responsible for validating that the event came from a trusted source and contains valid data.

**This is a generic interface and securing it is up to you!**

This URL requires authentication however not all external services can be configured to authenticate. For this reason authentication can be selectively disabled for this URL. Follow best practices -- always use SSL, pass a secret key, configure the firewall to only allow traffic from a known source, etc.

The event data is taken from the request body. The *Content-Type* header is respected for the payload.

The event tag is prefixed with `salt/netapi/hook` and the URL path is appended to the end. For example, a POST request sent to `/hook/mycompany/myapp/mydata` will produce a Salt event with the tag `salt/netapi/hook/mycompany/myapp/mydata`.

The following is an example `.travis.yml` file to send notifications to Salt of successful test runs:

```

language: python
script: python -m unittest tests
after_success:
  - |
    curl -sSk https://saltapi-url.example.com:8000/hook/travis/build/
↳success                               -d branch="${TRAVIS_BRANCH}"
↳                                       -d commit="${TRAVIS_COMMIT}"

```

See also:

*Events & Reactor, reactor*

**POST** (*\*args*, *\*\*kwargs*)

Fire an event in Salt with a custom event tag and data

**POST /hook**

## Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available
- 413 Request Entity Too Large -- request body is too large

## Example request:

```
curl -sS localhost:8000/hook \
  -H 'Content-type: application/json' \
  -d '{"foo": "Foo!", "bar": "Bar!"}'
```

```
POST /hook HTTP/1.1
Host: localhost:8000
Content-Length: 16
Content-Type: application/json

{"foo": "Foo!", "bar": "Bar!"}
```

## Example response:

```
HTTP/1.1 200 OK
Content-Length: 14
Content-Type: application/json

{"success": true}
```

As a practical example, an internal continuous-integration build server could send an HTTP POST request to the URL `https://localhost:8000/hook/mycompany/build/success` which contains the result of a build and the SHA of the version that was built as JSON. That would then produce the following event in Salt that could be used to kick off a deployment via Salt's Reactor:

```
Event fired at Fri Feb 14 17:40:11 2014
*****
Tag: salt/netapi/hook/mycompany/build/success
Data:
{'_stamp': '2014-02-14_17:40:11.440996',
  'headers': {
    'X-My-Secret-Key': 'F0fAgoQjIT@W',
    'Content-Length': '37',
    'Content-Type': 'application/json',
    'Host': 'localhost:8000',
    'Remote-Addr': '127.0.0.1'},
  'post': {'revision': 'aa22a3c4b2e7', 'result': True}}
```

Salt's Reactor could listen for the event:

```
reactor:
- 'salt/netapi/hook/mycompany/build/*':
- /srv/reactor/react_ci_builds.sls
```

And finally deploy the new build:

```
{% set secret_key = data.get('headers', {}).get('X-My-Secret-Key') %}
{% set build = data.get('post', {}) %}

{% if secret_key == 'F0fAgoQjIT@W' and build.result == True %}
deploy_my_app:
  cmd.state.sls:
    - tgt: 'application*'
    - arg:
      - myapp.deploy
    - kwarg:
      pillar:
        revision: {{ revision }}
{% endif %}
```

## /keys

### class salt.netapi.rest\_cherry.py.app.Keys

Convenience URLs for working with minion keys

New in version 2014.7.0.

These URLs wrap the functionality provided by the *key wheel module* functions.

#### GET (*mid=None*)

Show the list of minion keys or detail on a specific key

New in version 2014.7.0.

#### GET /keys/ (*mid*)

List all keys or show a specific key

##### Request Headers

- *X-Auth-Token* -- a session token from *Login*.
- *Accept* -- the desired response format.

##### Status Codes

- *200 OK* -- success
- *401 Unauthorized* -- authentication required
- *406 Not Acceptable* -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/keys
```

```
GET /keys HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
  local:
```

(continues on next page)

(continued from previous page)

```

- master.pem
- master.pub
minions:
- jerry
minions_pre: []
minions_rejected: []

```

**Example request:**

```
curl -i localhost:8000/keys/jerry
```

```

GET /keys/jerry HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

```

**Example response:**

```

HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
  minions:
    jerry: 51:93:b3:d0:9f:3a:6d:e5:28:67:c2:4b:27:d6:cd:2b

```

**POST** (*\*\*kwargs*)

Easily generate keys for a minion and auto-accept the new key

Accepts all the same parameters as the [key.gen\\_accept](#).

---

**Note:** A note about curl Avoid using the `-i` flag or HTTP headers will be written and produce an invalid tar file.

---

Example partial kickstart script to bootstrap a new minion:

```

%post
mkdir -p /etc/salt/pki/minion
curl -sSk https://localhost:8000/keys \
  -d mid=jerry \
  -d username=kickstart \
  -d password=kickstart \
  -d eauth=pam \
  | tar -C /etc/salt/pki/minion -xf -

mkdir -p /etc/salt/minion.d
printf 'master: 10.0.0.5\nid: jerry' > /etc/salt/minion.d/id.conf
%end

```

**POST /keys**

Generate a public and private key and return both as a tarball

Authentication credentials must be passed in the request.

Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -sSk https://localhost:8000/keys \  
  -d mid=jerry \  
  -d username=kickstart \  
  -d password=kickstart \  
  -d eauth=pam \  
  -o jerry-salt-keys.tar
```

```
POST /keys HTTP/1.1  
Host: localhost:8000
```

Example response:

```
HTTP/1.1 200 OK  
Content-Length: 10240  
Content-Disposition: attachment; filename="saltkeys-jerry.tar"  
Content-Type: application/x-tar  
  
jerry.pub00000644000000000000000000000000000000000070300000000000010730 0ustar X  
↩000000000000000
```

## /ws

### class salt.netapi.rest\_cherry.py.app.WebsocketEndpoint

Open a WebSocket connection to Salt's event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

See also:

*Events & Reactor*

**GET** (*token=None, \*\*kwargs*)

Return a websocket connection of Salt's event stream

**GET** /ws/ (*token*)

#### Query `format_events`

The event stream will undergo server-side formatting if the `format_events` URL parameter is included in the request. This can be useful to avoid formatting on the client-side:

```
curl -NsS <...snip...> localhost:8000/ws?format_events
```

#### Reqheader `X-Auth-Token`

an authentication token from *Login*.

#### Status 101

switching to the websockets protocol

#### Status 401

authentication required

**Status 406**

requested Content-Type not available

**Example request:**

```
curl -NsSk \
  -H 'X-Auth-Token: ffedf49d' \
  -H 'Host: localhost:8000' \
  -H 'Connection: Upgrade' \
  -H 'Upgrade: websocket' \
  -H 'Origin: https://localhost:8000' \
  -H 'Sec-WebSocket-Version: 13' \
  -H 'Sec-WebSocket-Key: "$(echo -n $RANDOM | base64)" \
  localhost:8000/ws
```

```
GET /ws HTTP/1.1
Connection: Upgrade
Upgrade: websocket
Host: localhost:8000
Origin: https://localhost:8000
Sec-WebSocket-Version: 13
Sec-WebSocket-Key: s65VsgHigh7v/Jcf4nXHnA==
X-Auth-Token: ffedf49d
```

**Example response:**

```
HTTP/1.1 101 Switching Protocols
Upgrade: websocket
Connection: Upgrade
Sec-WebSocket-Accept: mWZjBV9FCglzn1rIKJAxrTFlnJE=
Sec-WebSocket-Version: 13
```

An authentication token **may optionally** be passed as part of the URL for browsers that cannot be configured to send the authentication header or cookie:

```
curl -NsS <...snip...> localhost:8000/ws/ffedf49d
```

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!
var source = new WebSocket('ws://localhost:8000/ws/d0ce6c1a');
source.onerror = function(e) { console.debug('error!', e); };
source.onmessage = function(e) { console.debug(e.data); };

source.send('websocket client ready')

source.close();
```

Or via Python, using the Python module `websocket-client` for example.

```
# Note, you must be authenticated!
from websocket import create_connection
```

(continues on next page)

(continued from previous page)

```
ws = create_connection('ws://localhost:8000/ws/d0ce6c1a')
ws.send('websocket client ready')

# Look at https://pypi.python.org/pypi/websocket-client/ for more
# examples.
while listening_to_events:
    print ws.recv()

ws.close()
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

## /stats

### class salt.netapi.rest\_cherrypy.app.Stats

Expose statistics on the running CherryPy server

#### GET()

Return a dump of statistics collected from the CherryPy server

#### GET /stats

##### Request Headers

- *X-Auth-Token* -- a session token from *Login*.
- *Accept* -- the desired response format.

##### Response Headers

- *Content-Type* -- the format of the response body; depends on the *Accept* request header.

##### Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

## 26.10.3 rest\_tornado

### A non-blocking REST API for Salt

#### depends

- tornado Python module

#### configuration

All authentication is done through Salt's *external auth* system which requires additional configuration not described here.

In order to run `rest_tornado` with the salt-master add the following to the Salt master config file.

```
rest_tornado:
# can be any port
port: 8000
# address to bind to (defaults to 0.0.0.0)
address: 0.0.0.0
```

(continues on next page)

(continued from previous page)

```
# socket backlog
backlog: 128
ssl_cert: /etc/pki/api/certs/server.crt
# no need to specify ssl_key if cert and key
# are in one single file
ssl_key: /etc/pki/api/certs/server.key
debug: False
disable_ssl: False
webhook_disable_auth: False
cors_origin: null
```

## Authentication

Authentication is performed by passing a session token with each request. Tokens are generated via the *SaltAuthHandler* URL.

The token may be sent in one of two ways:

- Include a custom header named *X-Auth-Token*.
- Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

See also:

You can bypass the session handling via the *RunSaltAPIHandler* URL.

## CORS

*rest\_tornado* supports Cross-site HTTP requests out of the box. It is by default deactivated and controlled by the *cors\_origin* config key.

You can allow all origins by settings *cors\_origin* to *\**.

You can allow only one origin with this configuration:

```
rest_tornado:
  cors_origin: http://salt.yourcompany.com
```

You can also be more specific and select only a few allowed origins by using a list. For example:

```
rest_tornado:
  cors_origin:
    - http://salt.yourcompany.com
    - http://salt-preprod.yourcompany.com
```

The format for origin are full URL, with both scheme and port if not standard.

In this case, *rest\_tornado* will check if the Origin header is in the allowed list if it's the case allow the origin. Else it will returns nothing, effectively preventing the origin to make request.

For reference, CORS is a mechanism used by browser to allow (or disallow) requests made from browser from a different origin than salt-api. It's complementary to Authentication and mandatory only if you plan to use a salt client developed as a Javascript browser application.

## Usage

Commands are sent to a running Salt master via this module by sending HTTP requests to the URLs detailed below.

### Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, x-www-form-urlencoded).

- Specify the format of data in the request body by including the *Content-Type* header.
- Specify the desired data format for the response body with the *Accept* header.

Data sent in **POST** and **PUT** requests must be in the format of a list of lowstate dictionaries. This allows multiple commands to be executed in a single HTTP request.

### lowstate

A dictionary containing various keys that instruct Salt which command to run, where that command lives, any parameters for that command, any authentication credentials, what returner to use, etc.

Salt uses the lowstate data format internally in many places to pass command data between functions. Salt also uses lowstate for the *LocalClient()* Python API interface.

The following example (in JSON format) causes Salt to execute two commands:

```
[{
  "client": "local",
  "tgt": "*",
  "fun": "test.fib",
  "arg": ["10"]
},
{
  "client": "runner",
  "fun": "jobs.lookup_jid",
  "jid": "20130603122505459265"
}]
```

Multiple commands in a Salt API request will be executed in serial and makes no guarantees that all commands will run. Meaning that if test.fib (from the example above) had an exception, the API would still execute "jobs.lookup\_jid".

Responses to these lowstates are an in-order list of dicts containing the return data, a yaml response could look like:

```
- ms-1: true
  ms-2: true
- ms-1: foo
  ms-2: bar
```

In the event of an exception while executing a command the return for that lowstate will be a string, for example if no minions matched the first lowstate we would get a return like:

```
- No minions matched the target. No command was sent, no jid was assigned.
- ms-1: true
  ms-2: true
```

### x-www-form-urlencoded

Sending JSON or YAML in the request body is simple and most flexible, however sending data in urlencoded format is also supported with the caveats below. It is the default format for HTML forms, many JavaScript libraries, and the **curl** command.

For example, the equivalent to running `salt '*' test.ping` is sending `fun=test.ping&arg&client=local&tgt=*` in the HTTP request body.

Caveats:

- Only a single command may be sent per HTTP request.
- Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.

Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated parameters. E.g., `arg=one`, `arg=two` will be sent as `arg[]=one`, `arg[]=two`. This is not supported; send JSON or YAML instead.

---

## A Websockets add-on to saltnado

**depends**

- tornado Python module

In order to enable `saltnado_websockets` you must add `websockets: True` to your saltnado config block.

```
rest_tornado:  
# can be any port  
port: 8000  
ssl_cert: /etc/pki/api/certs/server.crt  
# no need to specify ssl_key if cert and key  
# are in one single file  
ssl_key: /etc/pki/api/certs/server.key  
debug: False  
disable_ssl: False  
websockets: True
```

## All Events

Exposes all "real-time" events from Salt's event bus on a websocket connection. It should be noted that "Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the `/events` end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain authentication tokens is shown below.

```
% curl -si localhost:8000/login \  
-H "Accept: application/json" \  
-d username='salt' \  
-d password='salt' \  
-d eauth='pam'
```

Which results in the response

```
{
  "return": [{
    "perms": [".*", "@runner", "@wheel"],
    "start": 1400556492.277421,
    "token": "d0ce6c1a37e99dcc0374392f272fe19c0090cca7",
    "expire": 1400599692.277422,
    "user": "salt",
    "eauth": "pam"
  }]
}
```

In this example the token returned is `d0ce6c1a37e99dcc0374392f272fe19c0090cca7` and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new WebSocket('wss://localhost:8000/all_events/
↳d0ce6c1a37e99dcc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.
source.onopen = function() { source.send('websocket client ready'); };

// Other handlers
source.onerror = function(e) { console.debug('error!', e); };

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); };

// Terminates websocket connection and Salt's "real time" event stream on the
↳server.
source.close();
```

Or via Python, using the Python module `websocket-client` for example. Or the `tornado` client.

```
# Note, you must be authenticated!

from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/all_events/
↳d0ce6c1a37e99dcc0374392f272fe19c0090cca7')

# Get Salt's "real time" event stream.
ws.send('websocket client ready')

# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
```

(continues on next page)

(continued from previous page)

```

print ws.recv()          # Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the
→server.
ws.close()

# Please refer to https://github.com/liris/websocket-client/issues/81 when
→using a self signed cert

```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

### Formatted Events

Exposes formatted "real-time" events from Salt's event bus on a websocket connection. It should be noted that "Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the `/events` end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Formatted events parses the raw "real time" event stream and maintains a current view of the following:

- minions
- jobs

A change to the minions (such as addition, removal of keys or connection drops) or jobs is processed and clients are updated. Since we use salt's presence events to track minions, please enable `presence_events` and set a small value for the `loop_interval` in the salt master config file.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain authentication tokens is shown below.

```

% curl -si localhost:8000/login \
-H "Accept: application/json" \
-d username='salt' \
-d password='salt' \
-d eauth='pam'

```

Which results in the response

```

{
  "return": [{
    "perms": [".*", "@runner", "@wheel"],
    "start": 1400556492.277421,
    "token": "d0ce6c1a37e99dcc0374392f272fe19c0090cca7",
    "expire": 1400599692.277422,
    "user": "salt",
    "eauth": "pam"
  }]
}

```

In this example the token returned is `d0ce6c1a37e99dcc0374392f272fe19c0090cca7` and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new WebSocket('wss://localhost:8000/formatted_events/
↳d0ce6c1a37e99dcc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.
source.onopen = function() { source.send('websocket client ready'); };

// Other handlers
source.onerror = function(e) { console.debug('error!', e); };

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); };

// Terminates websocket connection and Salt's "real time" event stream on the
↳server.
source.close();
```

Or via Python, using the Python module `websocket-client` for example. Or the `tornado` client.

```
# Note, you must be authenticated!

from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/formatted_events/
↳d0ce6c1a37e99dcc0374392f272fe19c0090cca7')

# Get Salt's "real time" event stream.
ws.send('websocket client ready')

# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
    print ws.recv()          # Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the
↳server.
ws.close()

# Please refer to https://github.com/liris/websocket-client/issues/81 when
↳using a self signed cert
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

## Example responses

Minion information is a dictionary keyed by each connected minion's `id` (`mid`), grains information for each minion is also included.

Minion information is sent in response to the following minion events:

- **connection drops**
  - requires running `manage.present` periodically every `loop_interval` seconds
- minion addition
- minion removal

```
# Not all grains are shown
data: {
  "minions": {
    "minion1": {
      "id": "minion1",
      "grains": {
        "kernel": "Darwin",
        "domain": "local",
        "zmqversion": "4.0.3",
        "kernelrelease": "13.2.0"
      }
    }
  }
}
```

Job information is also tracked and delivered.

Job information is also a dictionary in which each job's information is keyed by salt's `jid`.

```
data: {
  "jobs": {
    "20140609153646699137": {
      "tgt_type": "glob",
      "jid": "20140609153646699137",
      "tgt": "*",
      "start_time": "2014-06-09T15:36:46.700315",
      "state": "complete",
      "fun": "test.ping",
      "minions": {
        "minion1": {
          "return": true,
          "retcode": 0,
          "success": true
        }
      }
    }
  }
}
```

## Setup

## 26.10.4 REST URI Reference

- /
- /login
- /minions
- /jobs
- /run
- /events
- /hook

/

**class** salt.netapi.rest\_tornado.saltnado.**SaltAPIHandler**(\*args, \*\*kwargs)

Main API handler for base "/"

**disbatch**()

Disbatch all lowstates to the appropriate clients

**get**()

An endpoint to determine salt-api capabilities

**GET /**

**Request Headers**

- **Accept** -- the desired response format.

**Status Codes**

- **200 OK** -- success
- **401 Unauthorized** -- authentication required
- **406 Not Acceptable** -- requested Content-Type not available

**Example request:**

```
curl -i localhost:8000
```

```
GET / HTTP/1.1
Host: localhost:8000
Accept: application/json
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 83

{"clients": ["local", "local_async", "runner", "runner_async"],
  ↪ "return": "Welcome"}
```

**post()**

Send one or more Salt commands (lowstates) in the request body

**POST /****Request Headers**

- *X-Auth-Token* -- a session token from *SaltAuthHandler*.
- *Accept* -- the desired response format.
- *Content-Type* -- the format of the request body.

**Response Headers**

- *Content-Type* -- the format of the response body; depends on the *Accept* request header.

**Status Codes**

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

*lowstate* data describing Salt commands must be sent in the request body.

**Example request:**

```
curl -si https://localhost:8000 \
  -H "Accept: application/x-yaml" \
  -H "X-Auth-Token: d40d1e1e" \
  -d client=local \
  -d tgt='*' \
  -d fun='test.ping' \
  -d arg
```

```
POST / HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
X-Auth-Token: d40d1e1e
Content-Length: 36
Content-Type: application/x-www-form-urlencoded

fun=test.ping&arg&client=local&tgt=*
```

**Example response:**

Responses are an in-order list of the lowstate's return data. In the event of an exception running a command the return will be a string instead of a mapping.

```
HTTP/1.1 200 OK
Content-Length: 200
Allow: GET, HEAD, POST
Content-Type: application/x-yaml

return:
- ms-0: true
  ms-1: true
  ms-2: true
  ms-3: true
  ms-4: true
```

**multiple commands**

Note that if multiple *lowstate* structures are sent, the Salt API will execute them in serial, and will not stop execution upon failure of a previous job. If you need to have commands executed in order and stop on failure please use `compound-command-execution`.

## /login

**class** salt.netapi.rest\_tornado.saltnado.SaltAuthHandler(\*args, \*\*kwargs)

Handler for login requests

### get()

All logins are done over post, this is a parked endpoint

### GET /login

#### Status Codes

- [401 Unauthorized](#) -- authentication required
- [406 Not Acceptable](#) -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/login
```

```
GET /login HTTP/1.1
Host: localhost:8000
Accept: application/json
```

Example response:

```
HTTP/1.1 401 Unauthorized
Content-Type: application/json
Content-Length: 58

{"status": "401 Unauthorized", "return": "Please log in"}
```

### post()

*Authenticate* against Salt's eauth system

### POST /login

#### Request Headers

- *X-Auth-Token* -- a session token from *SaltAuthHandler*.
- *Accept* -- the desired response format.
- *Content-Type* -- the format of the request body.

#### Form Parameters

- **eauth** -- the eauth backend configured for the user
- **username** -- username
- **password** -- password

#### Status Codes

- [200 OK](#) -- success
- [400 Bad Request](#) -- bad request
- [401 Unauthorized](#) -- authentication required
- [406 Not Acceptable](#) -- requested Content-Type not available
- [500 Internal Server Error](#) -- internal server error

Example request:

```
curl -si localhost:8000/login \
  -H "Accept: application/json" \
  -d username='saltuser' \
  -d password='saltpass' \
  -d eauth='pam'
```

```
POST / HTTP/1.1
Host: localhost:8000
Content-Length: 42
Content-Type: application/x-www-form-urlencoded
Accept: application/json
```

```
username=saltuser&password=saltpass&eauth=pam
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 206
X-Auth-Token: 6d1b722e
Set-Cookie: session_id=6d1b722e; expires=Sat, 17 Nov 2012 03:23:52 GMT; Path=/

{"return": {
  "token": "6d1b722e",
  "start": 1363805943.776223,
  "expire": 1363849143.776224,
  "user": "saltuser",
  "eauth": "pam",
  "perms": [
    "grains.*",
    "status.*",
    "sys.*",
    "test.*"
  ]
}}
```

## /minions

**class** salt.netapi.rest\_tornado.saltnado.MinionSaltAPIHandler (\*args, \*\*kwargs)

A convenience endpoint for minion related functions

**get** (mid=None)

A convenience URL for getting lists of minions or getting minion details

**GET** /minions/ (mid)

**Request Headers**

- *X-Auth-Token* -- a session token from *SaltAuthHandler*.
- *Accept* -- the desired response format.

**Status Codes**

- 200 OK -- success
- 401 Unauthorized -- authentication required

- `406 Not Acceptable` -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/minions/ms-3
```

```
GET /minions/ms-3 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 129005
Content-Type: application/x-yaml

return:
- ms-3:
  grains.items:
    ...
```

## post()

Start an execution command and immediately return the job id

### POST /minions

#### Request Headers

- `X-Auth-Token` -- a session token from `SaltAuthHandler`.
- `Accept` -- the desired response format.
- `Content-Type` -- the format of the request body.

#### Response Headers

- `Content-Type` -- the format of the response body; depends on the `Accept` request header.

#### Status Codes

- `200 OK` -- success
- `401 Unauthorized` -- authentication required
- `406 Not Acceptable` -- requested Content-Type not available

`lowstate` data describing Salt commands must be sent in the request body. The `client` option will be set to `local_async()`.

Example request:

```
curl -sSi localhost:8000/minions \
-H "Accept: application/x-yaml" \
-d tgt='*' \
-d fun='status.diskusage'
```

```
POST /minions HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 26
Content-Type: application/x-www-form-urlencoded

tgt=*&fun=status.diskusage
```

Example response:

```

HTTP/1.1 202 Accepted
Content-Length: 86
Content-Type: application/x-yaml

return:
- jid: '20130603122505459265'
  minions: [ms-4, ms-3, ms-2, ms-1, ms-0]

```

## /jobs

**class** salt.netapi.rest\_tornado.saltnado.**JobsSaltAPIHandler** (\*args, \*\*kwargs)

A convenience endpoint for job cache data

**get** (jid=None)

A convenience URL for getting lists of previously run jobs or getting the return from a single job

**GET /jobs/ (jid)**

List jobs or show a single job from the job cache.

### Status Codes

- [200 OK](#) -- success
- [401 Unauthorized](#) -- authentication required
- [406 Not Acceptable](#) -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/jobs
```

```

GET /jobs HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

```

Example response:

```

HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
- '20121130104633606931':
  Arguments:
  - '3'
  Function: test.fib
  Start Time: 2012, Nov 30 10:46:33.606931
  Target: jerry
  Target-type: glob

```

Example request:

```
curl -i localhost:8000/jobs/20121130104633606931
```

```

GET /jobs/20121130104633606931 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

info:
- Arguments:
  - '3'
  Function: test.fib
  Minions:
  - jerry
  Start Time: 2012, Nov 30 10:46:33.606931
  Target: '*'
  Target-type: glob
  User: saltdev
  jid: '20121130104633606931'
return:
- jerry:
  - - 0
  - 1
  - 1
  - 2
  - 6.9141387939453125e-06
```

## /run

**class** salt.netapi.rest\_tornado.saltornado.**RunSaltAPIHandler** (\*args, \*\*kwargs)

Endpoint to run commands without normal session handling

**post()**

Run commands bypassing the *normal session handling*

**POST /run**

This entry point is primarily for "one-off" commands. Each request must pass full Salt authentication credentials. Otherwise this URL is identical to the `root URL (/)`.

*lowstate* data describing Salt commands must be sent in the request body.

**Status Codes**

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \
-d client='local' \
-d tgt='*' \
-d fun='test.ping' \
-d username='saltdev' \
-d password='saltdev' \
-d eauth='pam'
```

```
POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/x-www-form-urlencoded

client=local&tgt=*&fun=test.ping&username=saltdev&password=saltdev&
↪eauth=pam
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
- ms-0: true
  ms-1: true
  ms-2: true
  ms-3: true
  ms-4: true
```

## /events

**class** `salt.netapi.rest_tornado.saltornado.EventsSaltAPIHandler` (*\*args*, *\*\*kwargs*)

Expose the Salt event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure.

See also:

*Events & Reactor*

**get()**

An HTTP stream of the Salt master event bus

This stream is formatted per the Server Sent Events (SSE) spec. Each event is formatted as JSON.

**GET /events**

Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -NsS localhost:8000/events
```

```
GET /events HTTP/1.1
Host: localhost:8000
```

Example response:

```

HTTP/1.1 200 OK
Connection: keep-alive
Cache-Control: no-cache
Content-Type: text/event-stream;charset=utf-8

retry: 400
data: {'tag': '', 'data': {'minions': ['ms-4', 'ms-3', 'ms-2', 'ms-1
→', 'ms-0']}}

data: {'tag': '20130802115730568475', 'data': {'jid':
→ '20130802115730568475', 'return': True, 'retcode': 0, 'success':
→ True, 'cmd': '_return', 'fun': 'test.ping', 'id': 'ms-1'}}

```

The event stream can be easily consumed via JavaScript:

```

<!-- Note, you must be authenticated! -->
var source = new EventSource('/events');
source.onopen = function() { console.debug('opening') };
source.onerror = function(e) { console.debug('error!', e) };
source.onmessage = function(e) { console.debug(e.data) };

```

Or using CORS:

```

var source = new EventSource('/events', {withCredentials: true});

```

Some browser clients lack CORS support for the EventSource() API. Such clients may instead pass the *X-Auth-Token* value as an URL parameter:

```

curl -NsS localhost:8000/events/6d1b722e

```

It is also possible to consume the stream via the shell.

Records are separated by blank lines; the `data:` and `tag:` prefixes will need to be removed manually before attempting to unserialize the JSON.

curl's `-N` flag turns off input buffering which is required to process the stream incrementally.

Here is a basic example of printing each event as it comes in:

```

curl -NsS localhost:8000/events | \
    while IFS= read -r line ; do
        echo $line
    done

```

Here is an example of using `awk` to filter events based on tag:

```

curl -NsS localhost:8000/events | \
    awk '
        BEGIN { RS=""; FS="\n\n" }
        $1 ~ /^tag: salt\/job\/[0-9]+\\/new$/ { print $0 }
    '
tag: salt/job/20140112010149808995/new
data: {"tag": "salt/job/20140112010149808995/new", "data": {"tgt_type
→": "glob", "jid": "20140112010149808995", "tgt": "jerry", "_stamp
→": "2014-01-12_01:01:49.809617", "user": "shouse", "arg": [], "fun

```

(continues on next page)

(continued from previous page)

```

↳: "test.ping", "minions": ["jerry"]}]}}
tag: 20140112010149808995
data: {"tag": "20140112010149808995", "data": {"fun_args": [], "jid
↳: "20140112010149808995", "return": true, "retcode": 0, "success
↳: true, "cmd": "_return", "_stamp": "2014-01-12_01:01:49.819316",
↳"fun": "test.ping", "id": "jerry"}]}

```

## /hook

**class** salt.netapi.rest\_tornado.saltnado.WebhookSaltAPIHandler (\*args, \*\*kwargs)

A generic web hook entry point that fires an event on Salt's event bus

External services can POST data to this URL to trigger an event in Salt. For example, Amazon SNS, Jenkins-CI or Travis-CI, or GitHub web hooks.

**Note:** Be mindful of security

Salt's Reactor can run any code. A Reactor SLS that responds to a hook event is responsible for validating that the event came from a trusted source and contains valid data.

**This is a generic interface and securing it is up to you!**

This URL requires authentication however not all external services can be configured to authenticate. For this reason authentication can be selectively disabled for this URL. Follow best practices -- always use SSL, pass a secret key, configure the firewall to only allow traffic from a known source, etc.

The event data is taken from the request body. The *Content-Type* header is respected for the payload.

The event tag is prefixed with `salt/netapi/hook` and the URL path is appended to the end. For example, a POST request sent to `/hook/mycompany/myapp/mydata` will produce a Salt event with the tag `salt/netapi/hook/mycompany/myapp/mydata`.

The following is an example `.travis.yml` file to send notifications to Salt of successful test runs:

```

language: python
script: python -m unittest tests
after_success:
  - 'curl -sS http://saltapi-url.example.com:8000/hook/travis/build/
↳success -d branch="${TRAVIS_BRANCH}" -d commit="${TRAVIS_COMMIT}"'

```

See also:

*Events, Reactor*

**post** (*tag\_suffix=None*)

Fire an event in Salt with a custom event tag and data

### POST /hook

#### Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available
- 413 Request Entity Too Large -- request body is too large

Example request:

```
curl -sS localhost:8000/hook -d foo='Foo!' -d bar='Bar!'
```

```
POST /hook HTTP/1.1
Host: localhost:8000
Content-Length: 16
Content-Type: application/x-www-form-urlencoded

foo=Foo&bar=Bar!
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 14
Content-Type: application/json

{"success": true}
```

As a practical example, an internal continuous-integration build server could send an HTTP POST request to the URL `http://localhost:8000/hook/mycompany/build/success` which contains the result of a build and the SHA of the version that was built as JSON. That would then produce the following event in Salt that could be used to kick off a deployment via Salt's Reactor:

```
Event fired at Fri Feb 14 17:40:11 2014
*****
Tag: salt/netapi/hook/mycompany/build/success
Data:
{'_stamp': '2014-02-14_17:40:11.440996',
  'headers': {
    'X-My-Secret-Key': 'F0fAgoQjIT@W',
    'Content-Length': '37',
    'Content-Type': 'application/json',
    'Host': 'localhost:8000',
    'Remote-Addr': '127.0.0.1'},
  'post': {'revision': 'aa22a3c4b2e7', 'result': True}}
```

Salt's Reactor could listen for the event:

```
reactor:
- 'salt/netapi/hook/mycompany/build/*':
- /srv/reactor/react_ci_builds.sls
```

And finally deploy the new build:

```
{% set secret_key = data.get('headers', {}).get('X-My-Secret-Key') %}
{% set build = data.get('post', {}) %}

{% if secret_key == 'F0fAgoQjIT@W' and build.result == True %}
deploy_my_app:
  cmd.state.sls:
    - tgt: 'application*'
    - arg:
      - myapp.deploy
    - kwarg:
```

(continues on next page)

```
pillar:
  revision: {{ revision }}
{% endif %}
```

## 26.10.5 rest\_wsgi

### A minimalist REST API for Salt

This `rest_wsgi` module provides a no-frills REST interface for sending commands to the Salt master. There are no dependencies.

Extra care must be taken when deploying this module into production. Please read this documentation in entirety.

All authentication is done through Salt's *external auth* system.

### Usage

- All requests must be sent to the root URL (/).
- All requests must be sent as a POST request with JSON content in the request body.
- All responses are in JSON.

See also:

[rest\\_cherry.py](#)

The `rest_cherry.py` module is more full-featured, production-ready, and has builtin security features.

### Deployment

The `rest_wsgi` netapi module is a standard Python WSGI app. It can be deployed one of two ways.

#### Using a WSGI-compliant web server

This module may be run via any WSGI-compliant production server such as Apache with `mod_wsgi` or Nginx with `FastCGI`.

It is strongly recommended that this app be used with a server that supports HTTPS encryption since raw Salt authentication credentials must be sent with every request. Any apps that access Salt through this interface will need to manually manage authentication credentials (either username and password or a Salt token). Tread carefully.

#### salt-api using a development-only server

If run directly via the `salt-api` daemon it uses the `wsgiref.simple_server()` that ships in the Python standard library. This is a single-threaded server that is intended for testing and development. **This server does not use encryption;** please note that raw Salt authentication credentials must be sent with every HTTP request.

**Running this module via `salt-api` is not recommended!**

In order to start this module via the `salt-api` daemon the following must be put into the Salt master config:

```
rest_wsgi:
  port: 8001
```

## Usage examples

### POST /

Example request for a basic test.ping:

```
% curl -sS -i \
  -H 'Content-Type: application/json' \
  -d '[{"eauth":"pam","username":"saltdev","password":"saltdev",
  →"client":"local","tgt":"*","fun":"test.ping"}]' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true,
  →"ms--0": true}]}
```

Example request for an asynchronous test.ping:

```
% curl -sS -i \
  -H 'Content-Type: application/json' \
  -d '[{"eauth":"pam","username":"saltdev","password":"saltdev",
  →"client":"local_async","tgt":"*","fun":"test.ping"}]' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 103
Content-Type: application/json

{"return": [{"jid": "20130412192112593739", "minions": ["ms--4", "ms--3",
  →"ms--2", "ms--1", "ms--0"]}]}]
```

Example request for looking up a job ID:

```
% curl -sS -i \
  -H 'Content-Type: application/json' \
  -d '[{"eauth":"pam","username":"saltdev","password":"saltdev",
  →"client":"runner","fun":"jobs.lookup_jid","jid":"20130412192112593739"}]
  →' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json
```

(continues on next page)

(continued from previous page)

```

{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true,
→ "ms--0": true}]}

```

**form lowstate**

A list of lowstate data appropriate for the *client* interface you are calling.

**status 200**

success

**status 401**

authentication required

## 26.11 output modules

Follow one of the below links for further information and examples

<i>dson</i>	Display return data in DSON format
<i>highstate</i>	Outputter for displaying results of state runs
<i>json_out</i>	Display return data in JSON format
<i>key</i>	Display salt-key output
<i>nested</i>	Recursively display nested data
<i>newline_values_only</i>	Display values only, separated by newlines
<i>no_out_quiet</i>	Display no output
<i>no_return</i>	Display output for minions that did not return
<i>overstatestage</i>	Display clean output of an overstate stage
<i>pony</i>	Display Pony output data structure
<i>pprint_out</i>	Python pretty-print (pprint)
<i>profile</i>	Display profiling data in a table format
<i>progress</i>	Display return data as a progress bar
<i>raw</i>	Display raw output data structure
<i>table_out</i>	Display output in a table format
<i>txt</i>	Simple text outputter
<i>virt_query</i>	virt.query outputter
<i>yaml_out</i>	Display return data in YAML format

### 26.11.1 salt.output.dson

#### Display return data in DSON format

This outputter is intended for demonstration purposes. Information on the DSON spec can be found [here](#).

This outputter requires [Dogeon](#) (installable via pip)

```

salt.output.dson.output(data, **kwargs)

```

Print the output data in JSON

## 26.11.2 salt.output.highstate

### Outputter for displaying results of state runs

The return data from the Highstate command is a standard data structure which is parsed by the highstate outputter to deliver a clean and readable set of information about the HighState run on minions.

Two configurations can be set to modify the highstate outputter. These values can be set in the master config to change the output of the `salt` command or set in the minion config to change the output of the `salt-call` command.

#### state\_verbose:

By default `state_verbose` is set to `True`, setting this to `False` will instruct the highstate outputter to omit displaying anything in green, this means that nothing with a result of `True` and no changes will not be printed

#### state\_output:

The highstate outputter has six output modes, `full`, `terse`, `mixed`, `changes` and `filter`

- The default is set to `full`, which will display many lines of detailed information for each executed chunk.
- If `terse` is used, then the output is greatly simplified and shown in only one line.
- If `mixed` is used, then terse output will be used unless a state failed, in which case full output will be used.
- If `changes` is used, then terse output will be used if there was no error and no changes, otherwise full output will be used.
- If `filter` is used, then either or both of two different filters can be used: `exclude` or `terse`.
  - for `exclude`, `state.highstate` expects a list of states to be excluded (or `None`) followed by `True` for terse output or `False` for regular output. Because of parsing nuances, if only one of these is used, it must still contain a comma. For instance: `exclude=True,`.
  - for `terse`, `state.highstate` expects simply `True` or `False`.

These can be set as such from the command line, or in the Salt config as `state_output_exclude` or `state_output_terse`, respectively.

The output modes have one modifier:

`full_id`, `terse_id`, `mixed_id`, `changes_id` and `filter_id` If `_id` is used, then the corresponding form will be used, but the value for name will be drawn from the state ID. This is useful for cases where the name value might be very long and hard to read.

#### state\_tabular:

If `state_output` uses the terse output, set this to `True` for an aligned output format. If you wish to use a custom format, this can be set to a string.

#### state\_output\_pct:

Set `state_output_pct` to `True` in order to add "Success %" and "Failure %" to the "Summary" section at the end of the highstate output.

#### state\_compress\_ids:

Set `state_compress_ids` to `True` to aggregate information about states which have multiple "names" under the same state ID in the highstate output. This is useful in combination with the `terse_id` value set in the `state_output` option when states are using the `names` state parameter.

Example usage:

If `state_output: filter` is set in the configuration file:

```
salt '*' state.highstate exclude=None,True
```

means to exclude no states from the highstate and turn on terse output.

```
salt twd state.highstate exclude=problemstate1,problemstate2,False
```

means to exclude states `problemstate1` and `problemstate2` from the highstate, and use regular output.

Example output for the above highstate call when `top.sls` defines only one other state to apply to minion `twd`:

```
twd:

Summary for twd
-----
Succeeded: 1 (changed=1)
Failed:    0
-----
Total states run:    1
```

Example output with no special settings in configuration files:

```
myminion:
-----
      ID: test.ping
      Function: module.run
      Result: True
      Comment: Module function test.ping executed
      Changes:
             -----
             ret:
             True

Summary for myminion
-----
Succeeded: 1
Failed:    0
-----
Total:     0
```

`salt.output.highstate.output(data, **kwargs)`

The HighState Outputter is only meant to be used with the `state.highstate` function, or a function that returns highstate return data.

### 26.11.3 salt.output.json\_out

#### Display return data in JSON format

##### configuration

The output format can be configured in two ways: Using the `--out-indent` CLI flag and specifying a positive integer or a negative integer to group JSON from each minion to a single line.

Or setting the `output_indent` setting in the Master or Minion configuration file with one of the following values:

- `Null`: put each minion return on a single line.
- `pretty`: use four-space indents and sort the keys.
- An integer: specify the indentation level.

Salt's outputters operate on a per-minion basis. Each minion return will be output as a single JSON object once it comes in to the master.

Some JSON parsers can guess when an object ends and a new one begins but many can not. A good way to differentiate between each minion return is to use the single-line output format and to parse each line individually. Example output (truncated):

```
{ "dave": { "en0": { "hwaddr": "02:b0:26:32:4c:69", ... } } }
{ "jerry": { "en0": { "hwaddr": "02:26:ab:0d:b9:0d", ... } } }
{ "kevin": { "en0": { "hwaddr": "02:6d:7f:ce:9f:ee", ... } } }
{ "mike": { "en0": { "hwaddr": "02:48:a2:4b:70:a0", ... } } }
{ "phill": { "en0": { "hwaddr": "02:1d:cc:a2:33:55", ... } } }
{ "stuart": { "en0": { "hwaddr": "02:9a:e0:ea:9e:3c", ... } } }
```

CLI Example:

```
salt '*' foo.bar --out=json
```

```
salt.output.json_out.output(data, **kwargs)
```

Print the output data in JSON

## 26.11.4 salt.output.key

### Display salt-key output

The `salt-key` command makes use of this outputter to format its output.

```
salt.output.key.output(data, **kwargs)
```

Read in the dict structure generated by the salt key API methods and print the structure.

## 26.11.5 salt.output.nested

### Recursively display nested data

This is the default outputter for most execution functions.

Example output:

```
myminion:
  -----
  foo:
    -----
    bar:
      baz
    dictionary:
      -----
      abc:
        123
```

(continues on next page)

(continued from previous page)

```

    def:
        456
    list:
        - Hello
        - World

```

**class** salt.output.nested.**NestDisplay**(*retcode=0*)

Manage the nested display contents

**display**(*ret, indent, prefix, out*)

Recursively iterate down through data structures to determine output

**ustring**(*indent, color, msg, prefix=", suffix=", endc=None*)

salt.output.nested.**output**(*ret, \*\*kwargs*)

Display ret data

### 26.11.6 salt.output.newline\_values\_only

#### Display values only, separated by newlines

New in version 2015.5.0.

This outputter is designed for Salt CLI return data. It will do the following to the return dict:

1. Get just the values (ignoring the minion IDs).
2. Each value, if it is iterable, is split a separate line.
3. Each minion's values are separated by newlines.

This results in a single string of return data containing all the values from the various minions.

**Warning:** As noted above, this outputter will discard the minion ID. If the minion ID is important, then an outputter that returns the full return dictionary in a parsable format (such as `json`, `pprint`, or `yaml`) may be more suitable.

#### Example 1

```

salt '*' foo.bar --out=newline_values_only

```

#### Input

```

{
  'myminion': ['127.0.0.1', '10.0.0.1'],
  'second-minion': ['127.0.0.1', '10.0.0.2']
}

```

## Output

```
127.0.0.1
10.0.0.1
127.0.0.1
10.0.0.2
```

## Example 2

```
salt '*' foo.bar --out=newline_values_only
```

## Input

```
{
  'myminion': 8,
  'second-minion': 10
}
```

## Output

```
8
10
```

```
salt.output.newline_values_only.output(data, **kwargs)
```

Display modified ret data

### 26.11.7 salt.output.no\_out\_quiet

#### Display no output

No output is produced when this outputter is selected

CLI Example:

```
salt '*' foo.bar --out=quiet
```

```
salt.output.no_out_quiet.output(ret, **kwargs)
```

Don't display data. Used when you only are interested in the return.

### 26.11.8 salt.output.no\_return

#### Display output for minions that did not return

This outputter is used to display notices about which minions failed to return when a salt function is run with `-v` or `--verbose`. It should not be called directly from the CLI.

Example output:

```
virtucentos:
  Minion did not return
```

#### **class** salt.output.no\_return.NestDisplay

Create generator for nested output

**display**(ret, indent, prefix, out)

Recursively iterate down through data structures to determine output

salt.output.no\_return.output(ret, \*\*kwargs)

Display ret data

### 26.11.9 salt.output.overstatestage

#### Display clean output of an overstate stage

This outputter is used to display *Orchestrate Runner* stages, and should not be called directly.

salt.output.overstatestage.output(data, \*\*kwargs)

Format the data for printing stage information from the overstate system

### 26.11.10 salt.output.pony

#### Display Pony output data structure

**depends**

- ponysay CLI program

Display output from a pony. Ponies are better than cows because everybody wants a pony.

Example output:

```
< {'local': True} >
```

(continues on next page)

(continued from previous page)

CLI Example:

```
salt '*' foo.bar --out=pony
```

```
salt.output.pony.output(data, **kwargs)  
    Mane function
```

### 26.11.11 salt.output.pprint\_out

#### Python pretty-print (pprint)

The python pretty-print system was once the default outputter. It simply passes the return data through to `pprint`, `pformat` and prints the results.

CLI Example:

```
salt '*' foo.bar --out=pprint
```

Example output:

```
{'saltmine': {'foo': {'bar': 'baz',  
                    'dictionary': {'abc': 123, 'def': 456},  
                    'list': ['Hello', 'World']}}}}
```

```
salt.output.pprint_out.output(data, **kwargs)  
    Print out via pretty print
```

### 26.11.12 salt.output.profile

#### Display profiling data in a table format

Show profile data for returners that would normally show a highstate output.

CLI Example:

```
salt '*' state.apply something --out=profile
```

Attempt to output the returns of state.sls and state.highstate as a table of names, modules and durations that looks somewhat like the following:

name	mod. fun	duration (ms)
I-fail-unless-stmt	other.function	-1.0000
old-minion-config	grains.list_present	1.1200
salt-data	group.present	48.3800
/etc/salt/minion	file.managed	63.1450

To get the above appearance, use settings something like these:

```
out.table.separate_rows: False
out.table.justify: left
out.table.delim: ' '
out.table.prefix: ''
out.table.suffix: ''
```

`salt.output.profile.output`(*data*, *\*\*kwargs*)

Display the profiling data in a table format.

### 26.11.13 salt.output.progress

Display return data as a progress bar

`salt.output.progress.output`(*ret*, *bar*, *\*\*kwargs*)

Update the progress bar

`salt.output.progress.progress_iter`(*progress*)

Initialize and return a progress bar iter

### 26.11.14 salt.output.raw

#### Display raw output data structure

This outputter simply displays the output as a python data structure, by printing a string representation of it. It is similar to the `pprint` outputter, only the data is not nicely formatted/indented.

This was the original outputter used by Salt before the outputter system was developed.

CLI Example:

```
salt '*' foo.bar --out=raw
```

Example output:

```
salt '*' foo.bar --out=raw
{'myminion': {'foo': {'list': ['Hello', 'World'], 'bar': 'baz', 'dictionary':
→{'abc': 123, 'def': 456}}}}
```

```
salt.output.raw.output(data, **kwargs)
```

Rather basic....

### 26.11.15 salt.output.table\_out

#### Display output in a table format

New in version 2017.7.0.

The `table` outputter displays a sequence of rows as table.

Example output:

```
edge01.bjm01:
-----
comment:
-----
out:
-----
-----
→ | Active | Interface | Last Move | Mac | Moves | Static |
→ | Vlan |
-----
→ | True | ae1.900 | 0.0 | 40:A6:77:5A:50:01 | 0 | False |
→ | 111 |
-----
→ | True | ae1.111 | 0.0 | 64:16:8D:32:26:58 | 0 | False |
→ | 111 |
-----
→ | True | ae1.111 | 0.0 | 8C:60:4F:73:2D:57 | 0 | False |
→ | 111 |
-----
→ | True | ae1.111 | 0.0 | 8C:60:4F:73:2D:7C | 0 | False |
→ | 111 |
-----
→ | True | ae1.222 | 0.0 | 8C:60:4F:73:2D:57 | 0 | False |
→ | 222 |
-----
→ | True | ae1.222 | 0.0 | F4:0F:1B:76:9D:97 | 0 | False |
→ | 222 |
```

(continues on next page)

(continued from previous page)

```

-----
→ -----
   result:
   -----

```

CLI Example:

```
salt '*' foo.bar --out=table
```

```
class salt.output.table_out.TableDisplay(has_header=True, row_delimiter='-', delim='|',
                                           justify='center', separate_rows=True, prefix='|', suffix='|',
                                           width=50, wrapfunc=None)
```

Manage the table display content.

**display**(ret, indent, out, rows\_key=None, labels\_key=None)

Display table(s).

**display\_rows**(rows, labels, indent)

Prepares row content and displays.

**prepare\_rows**(rows, indent, has\_header)

Prepare rows content to be displayed.

**ustring**(indent, color, msg, prefix="", suffix="", endc=None)

Build the unicode string to be displayed.

**wrap\_onspace**(text)

When the text inside the column is longer then the width, will split by space and continue on the next line.

salt.output.table\_out.**output**(ret, \*\*kwargs)

Display the output as table.

Parameters

- **nested\_indent**(\*) -- integer, specify the left alignment.
- **has\_header**(\*) -- boolean specifying if header should be displayed. Default: True.
- **row\_delimiter**(\*) -- character to separate rows. Default: \_.
- **delim**(\*) -- character to separate columns. Default: " | ".
- **justify**(\*) -- text alignment. Default: center.
- **separate\_rows**(\*) -- boolean specifying if row separator will be displayed between consecutive rows. Default: True.
- **prefix**(\*) -- character at the beginning of the row. Default: " | ".
- **suffix**(\*) -- character at the end of the row. Default: " | ".
- **width**(\*) -- column max width. Default: 50.
- **rows\_key**(\*) -- display the rows under a specific key.
- **labels\_key**(\*) -- use the labels under a certain key. Otherwise will try to use the dictionary keys (if any).
- **title**(\*) -- display title when only one table is selected (using the rows\_key argument).

### 26.11.16 salt.output.txt

#### Simple text outputter

The txt outputter has been developed to make the output from shell commands on minions appear as they do when the command is executed on the minion.

CLI Example:

```
salt '*' foo.bar --out=txt
```

`salt.output.txt.output(data, **kwargs)`

Output the data in lines, very nice for running commands

### 26.11.17 salt.output.virt\_query

#### virt.query outputter

Used to display the output from the `virt.query` runner.

`salt.output.virt_query.output(data, **kwargs)`

Display output for the salt-run virt.query function

### 26.11.18 salt.output.yaml\_out

#### Display return data in YAML format

This outputter defaults to printing in YAML block mode for better readability.

CLI Example:

```
salt '*' foo.bar --out=yaml
```

Example output:

CLI Example:

```
saltmine:
  foo:
    bar: baz
    dictionary:
      abc: 123
      def: 456
    list:
      - Hello
      - World
```

`salt.output.yaml_out.output(data, **kwargs)`

Print out YAML using the block mode

## 26.12 pillar modules

<code>cmd_json</code>	Execute a command and read the output as JSON.
<code>cmd_yaml</code>	Execute a command and read the output as YAML.
<code>cmd_yamllex</code>	Execute a command and read the output as YAMLEX.
<code>cobbler</code>	A module to pull data from Cobbler via its API into the Pillar dictionary
<code>confidant</code>	An external pillar module for getting credentials from confidant.
<code>consul_pillar</code>	Use Consul K/V as a Pillar source with values parsed as YAML
<code>csvpillar</code>	Store key/value pairs in a CSV file
<code>digicert</code>	Digicert Pillar Certificates
<code>django_orm</code>	Generate Pillar data from Django models through the Django ORM
<code>ec2_pillar</code>	Retrieve EC2 instance data for minions for <code>ec2_tags</code> and <code>ec2_tags_list</code>
<code>etcd_pillar</code>	Use etcd data as a Pillar source
<code>extra_minion_data_in_pillar</code>	Add all extra minion data to the pillar.
<code>file_tree</code>	The <code>file_tree</code> external pillar allows values from all files in a directory tree to be imported as Pillar data.
<code>foreman</code>	A module to pull data from Foreman via its API into the Pillar dictionary
<code>git_pillar</code>	Use a git repository as a Pillar source
<code>gpg</code>	Decrypt pillar data through the builtin GPG renderer
<code>hg_pillar</code>	Use remote Mercurial repository as a Pillar source.
<code>hiera</code>	Use hiera data as a Pillar source
<code>http_json</code>	A module that adds data to the Pillar structure retrieved by an http request
<code>http_yaml</code>	A module that adds data to the Pillar structure retrieved by an http request
<code>libvirt</code>	Load up the libvirt keys into Pillar for a given minion if said keys have been generated using the libvirt key runner
<code>makostack</code>	Simple and flexible YAML <code>ext_pillar</code> which can read pillar from within pillar.
<code>mongo</code>	Read Pillar data from a mongodb collection
<code>mysql</code>	Retrieve Pillar data by doing a MySQL query
<code>nacl</code>	Decrypt pillar data through the builtin NAACL renderer
<code>netbox</code>	A module that adds data to the Pillar structure from a NetBox API.
<code>neutron</code>	Use Openstack Neutron data as a Pillar source.
<code>nodegroups</code>	Nodegroups Pillar
<code>pepa</code>	Pepa
<code>pillar_ldap</code>	Use LDAP data as a Pillar source
<code>postgres</code>	Retrieve Pillar data by doing a postgres query
<code>puppet</code>	Execute an unmodified <code>puppet_node_classifier</code> and read the output as YAML.
<code>reclass_adapter</code>	Use the "reclass" database as a Pillar source
<code>redismod</code>	Read pillar data from a Redis backend
<code>rethinkdb_pillar</code>	Provide external pillar data from RethinkDB

continues on next page

Table 5 – continued from previous page

<code>s3</code>	Copy pillar data from a bucket in Amazon S3
<code>saltclass</code>	SaltClass Pillar Module
<code>sql_base</code>	Retrieve Pillar data by doing a SQL query
<code>sqlcipher</code>	Retrieve Pillar data by running a SQLCipher query
<code>sqlite3</code>	Retrieve Pillar data by doing a SQLite3 query
<code>stack</code>	Simple and flexible YAML <code>ext_pillar</code> which can read pillar from within pillar.
<code>svn_pillar</code>	Clone a remote SVN repository and use the filesystem as a Pillar source
<code>varstack_pillar</code>	Use <code>Varstack</code> data as a Pillar source
<code>vault</code>	Vault Pillar Module
<code>venafi</code>	Venafi Pillar Certificates
<code>virtkey</code>	Accept a key from a hypervisor if the virt runner has already submitted an authorization request
<code>vmware_pillar</code>	Pillar data from vCenter or an ESXi host

### 26.12.1 salt.pillar.cmd\_json

Execute a command and read the output as JSON. The JSON data is then directly overlaid onto the minion's Pillar data.

#### Configuring the CMD\_JSON ext\_pillar

Set the following Salt config to setup cmd json result as external pillar source:

```
ext_pillar:
- cmd_json: 'echo {"arg":"value"}'
```

This will run the command `echo {arg: value}` on the master.

#### Module Documentation

`salt.pillar.cmd_json.ext_pillar` (*minion\_id*, *pillar*, *command*)

Execute a command and read the output as JSON

### 26.12.2 salt.pillar.cmd\_yaml

Execute a command and read the output as YAML. The YAML data is then directly overlaid onto the minion's Pillar data

`salt.pillar.cmd_yaml.ext_pillar` (*minion\_id*, *pillar*, *command*)

Execute a command and read the output as YAML

### 26.12.3 salt.pillar.cmd\_yamlex

Execute a command and read the output as YAMLEX.

The YAMLEX data is then directly overlaid onto the minion's Pillar data

`salt.pillar.cmd_yamlex.ext_pillar` (*minion\_id, pillar, command*)

Execute a command and read the output as YAMLEX

### 26.12.4 salt.pillar.cobbler

A module to pull data from Cobbler via its API into the Pillar dictionary

#### Configuring the Cobbler `ext_pillar`

The same `cobbler.*` parameters are used for both the Cobbler tops and Cobbler pillar modules.

```
ext_pillar:
- cobbler:
    key: cobbler # Nest results within this key. By default, values are not
    ↪nested.
    only: [parameters] # Add only these keys to pillar.

cobbler.url: https://example.com/cobbler_api #default is http://localhost/
    ↪cobbler_api
cobbler.user: username # default is no username
cobbler.password: password # default is no password
```

#### Module Documentation

`salt.pillar.cobbler.ext_pillar` (*minion\_id, pillar, key=None, only=()*)

Read pillar data from Cobbler via its API.

### 26.12.5 salt.pillar.confidant

An external pillar module for getting credentials from confidant.

#### Configuring the Confidant module

The module can be configured via `ext_pillar` in the minion config:

```
ext_pillar:
```

- `confidant:`

- `profile:`

- `# The URL of the confidant web service url: 'https://confidant-production.example.com'`
    - `# The context to use for KMS authentication auth_context: from: example-production-`
    - `iad to: confidant-production-iad user_type: service # The KMS master key to use for au-`
    - `thentication auth_key: "alias/authnz" # Cache file for KMS auth token token_cache_file:`

```
/run/confidant/confidant_token # The duration of the validity of a token, in minutes
token_duration: 60 # key, keyid and region can be defined in the profile, but it's # generally
best to use IAM roles or environment variables for AWS # auth. keyid: 98nh9h9h908h09kjjk
key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0 region: us-east-1
```

**depends**

confidant-common, confidant-client

**Module Documentation**

`salt.pillar.confidant.ext_pillar` (*minion\_id, pillar, profile=None*)

Read pillar data from Confidant via its API.

**26.12.6 salt.pillar.consul\_pillar**

Use Consul K/V as a Pillar source with values parsed as YAML

**depends**

- python-consul

In order to use an consul server, a profile must be created in the master configuration file:

```
my_consul_config:
  consul.host: 127.0.0.1
  consul.port: 8500
  consul.token: b6376760-a8bb-edd5-fcda-33bc13bfc556
  consul.scheme: http
  consul.consistency: default
  consul.dc: dev
  consul.verify: True
```

All parameters are optional.

The `consul.token` requires `python-consul >= 0.4.7`.

If you have a multi-datacenter Consul cluster you can map your `pillarenv` entries to your data centers by providing a dictionary of mappings in `consul.dc` field:

```
my_consul_config:
  consul.dc:
    dev: us-east-1
    prod: us-west-1
```

In the example above we specifying static mapping between Pillar environments and data centers: the data for `dev` and `prod` Pillar environments will be fetched from `us-east-1` and `us-west-1` datacenter respectively.

In fact when `consul.dc` is set to dictionary keys are processed as regular expressions (that can capture named parameters) and values are processed as string templates as per PEP 3101.

```
my_consul_config:
  consul.dc:
    ^dev-.*$: dev-datacenter
    ^(?:P<region>.*)-prod$: prod-datacenter-{region}
```

This example maps all Pillar environments starting with dev- to dev-datacenter whereas Pillar environment like eu-prod will be mapped to prod-datacenter-eu.

Before evaluation patterns are sorted by length in descending order.

If Pillar environment names correspond to data center names a single pattern can be used:

```
my_consul_config:
  consul.dc:
    ^(?P<env>.*)*$: '{env}'
```

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

```
ext_pillar:
  - consul: my_consul_config

ext_pillar:
  - consul: my_consul_config root=salt
```

Using these configuration profiles, multiple consul sources may also be used:

```
ext_pillar:
  - consul: my_consul_config
  - consul: my_other_consul_config
```

Either the `minion_id`, or the `role`, or the `environment` grain may be used in the `root` path to expose minion-specific information stored in consul.

```
ext_pillar:
  - consul: my_consul_config root=salt/%(minion_id)s
  - consul: my_consul_config root=salt/%(role)s
  - consul: my_consul_config root=salt/%(environment)s
```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

```
ext_pillar:
  - consul: my_consul_config root=salt-shared
  - consul: my_other_consul_config root=salt-private/%(minion_id)s
```

If using the `role` or `environment` grain in the consul key path, be sure to define it using `/etc/salt/grains`, or similar:

```
role: my-minion-role
environment: dev
```

It's possible to lock down where the pillar values are shared through minion targeting. Note that double quotes " are required around the target value and cannot be used inside the matching statement. See the section on Compound Matchers for more examples.

```
ext_pillar:
  - consul: my_consul_config root=salt target="L@salt.example.com and
↪G@osarch:x86_64"
```

The data from Consul can be merged into a nested key in Pillar.

```
ext_pillar:
  - consul: my_consul_config pillar_root=consul_data
```

By default, keys containing YAML data will be deserialized before being merged into Pillar. This behavior can be disabled by setting `expand_keys` to `false`.

```
ext_pillar:
- consul: my_consul_config expand_keys=false
```

`salt.pillar.consul_pillar.consul_fetch(client, path)`

Query consul for all keys/values within base path

`salt.pillar.consul_pillar.ext_pillar(minion_id, pillar, conf)`

Check consul for all data

`salt.pillar.consul_pillar.fetch_tree(client, path, expand_keys)`

Grab data from consul, trim base path and remove any keys which are folders. Take the remaining data and send it to be formatted in such a way as to be used as pillar data.

`salt.pillar.consul_pillar.get_conn(opts, profile)`

Return a client object for accessing consul

`salt.pillar.consul_pillar.pillar_format(ret, keys, value, expand_keys)`

Perform data formatting to be used as pillar data and merge it with the current pillar data

### 26.12.7 salt.pillar.csvpillar

Store key/value pairs in a CSV file

New in version 2016.11.0.

Example configuration:

```
ext_pillar:
- csv: /path/to/file.csv

# or

ext_pillar:
- csv:
  path: /path/to/file.csv
  namespace: 'subkey'
  fieldnames:
  - col1
  - col2
  - col2
```

The first column must be minion IDs and the first row must be dictionary keys. E.g.:

id	role	env
jerry	web	prod
stuart	web	stage
dave	web	qa
phil	db	prod
kevin	db	stage
mike	db	qa

Will produce the following Pillar values for a minion named "jerry":

```
{
  'role': 'web',
  'env': 'prod',
}
```

`salt.pillar.csvpillar.ext_pillar` (*mid*, *pillar*, *path*, *idkey='id'*, *namespace=None*, *fieldnames=None*, *restkey=None*, *restval=None*, *dialect='excel'*)

Read a CSV into Pillar

#### Parameters

- **path** (*str*) -- Absolute path to a CSV file.
- **idkey** (*str*) -- (Optional) The column name of minion IDs.
- **namespace** (*str*) -- (Optional) A pillar key to namespace the values under.
- **fieldnames** (*list*) -- (Optional) if the first row of the CSV is not column names they may be specified here instead.

### 26.12.8 salt.pillar.digicert

Digicert Pillar Certificates

This module will only return pillar data if the `digicert` runner module has already been used to create certificates.

To configure this module, set `digicert` to `True` in the `ext_pillar` section of your master configuration file:

```
ext_pillar:
- digicert: True
```

`salt.pillar.digicert.ext_pillar` (*minion\_id*, *pillar*, *conf*)

Return an existing set of certificates

### 26.12.9 salt.pillar.django\_orm

Generate Pillar data from Django models through the Django ORM

**maintainer**

Micah Hausler <micah.hausler@gmail.com>

**maturity**

new

#### Configuring the `django_orm` `ext_pillar`

To use this module, your Django project must be on the salt master server with database access. This assumes you are using `virtualenv` with all the project's requirements installed.

```
ext_pillar:
- django_orm:
  pillar_name: my_application
  project_path: /path/to/project/
  settings_module: my_application.settings
  env_file: /path/to/env/file.sh
  # Optional: If your project is not using the system python,
```

(continues on next page)

(continued from previous page)

```

# add your virtualenv path below.
env: /path/to/virtualenv/

django_app:

# Required: the app that is included in INSTALLED_APPS
my_application.clients:

# Required: the model name
Client:

# Required: model field to use as the key in the rendered
# Pillar. Must be unique; must also be included in the
# ``fields`` list below.
name: shortname

# Optional:
# See Django's QuerySet documentation for how to use .filter()
filter: {'kw': 'args'}

# Required: a list of field names
# List items will be used as arguments to the .values() method.
# See Django's QuerySet documentation for how to use .values()
fields:
  - field_1
  - field_2

```

This would return pillar data that would look like

```

my_application:
  my_application.clients:
    Client:
      client_1:
        field_1: data_from_field_1
        field_2: data_from_field_2
      client_2:
        field_1: data_from_field_1
        field_2: data_from_field_2

```

As another example, data from multiple database tables can be fetched using Django's regular lookup syntax. Note, using ManyToManyFields will not currently work since the return from values() changes if a ManyToMany is present.

```

ext_pillar:
  - django_orm:
      pillar_name: djangotutorial
      project_path: /path/to/mysite
      settings_module: mysite.settings

      django_app:
        mysite.polls:
          Choices:
            name: poll__question

```

(continues on next page)

(continued from previous page)

```

fields:
- poll__question
- poll__id
- choice_text
- votes

```

## Module Documentation

`salt.pillar.django_orm.ext_pillar` (*minion\_id, pillar, pillar\_name, project\_path, settings\_module, django\_app, env=None, env\_file=None, \*args, \*\*kwargs*)

Connect to a Django database through the ORM and retrieve model fields

### Parameters

- **pillar\_name** (*str*) -- The name of the pillar to be returned
- **project\_path** (*str*) -- The full path to your Django project (the directory `manage.py` is in)
- **settings\_module** (*str*) -- The settings module for your project. This can be found in your `manage.py` file
- **django\_app** (*str*) -- A dictionary containing your apps, models, and fields
- **env** (*str*) -- The full path to the virtualenv for your Django project
- **env\_file** (*str*) -- An optional bash file that sets up your environment. The file is run in a subprocess and the changed variables are then added

### 26.12.10 salt.pillar.ec2\_pillar

Retrieve EC2 instance data for minions for `ec2_tags` and `ec2_tags_list`

The minion id must be the AWS instance-id or value in `tag_match_key`. For example set `tag_match_key` to `Name` to have the minion-id matched against the tag 'Name'. The tag contents must be unique. The value of `tag_match_value` can be 'uqdn' or 'asis'. if 'uqdn', then the domain will be stripped before comparison.

Additionally, the `use_grain` option can be set to `True`. This allows the use of an instance-id grain instead of the minion-id. Since this is a potential security risk, the configuration can be further expanded to include a list of minions that are trusted to only allow the alternate id of the instances to specific hosts. There is no glob matching at this time.

---

**Note:** If you are using `use_grain: True` in the configuration for this external pillar module, the minion must have `metadata_server_grains` enabled in the minion config file (see also [here](#)).

It is important to also note that enabling the `use_grain` option allows the minion to manipulate the pillar data returned, as described above.

---

The optional `tag_list_key` indicates which keys should be added to `ec2_tags_list` and be split by `tag_list_sep` (by default `;`). If a tag key is included in `tag_list_key` it is removed from `ec2_tags`. If a tag does not exist it is still included as an empty list.

---

**Note:** As with any master configuration change, restart the salt-master daemon for changes to take effect.

---

```

ext_pillar:
- ec2_pillar:

```

(continues on next page)

(continued from previous page)

```

tag_match_key: 'Name'
tag_match_value: 'asis'
tag_list_key:
  - Role
tag_list_sep: ';'
use_grain: True
minion_ids:
  - trusted-minion-1
  - trusted-minion-2
  - trusted-minion-3

```

This is a very simple pillar configuration that simply retrieves the instance data from AWS. Currently the only portion implemented are EC2 tags, which returns a list of key/value pairs for all of the EC2 tags assigned to the instance.

```

salt.pillar.ec2_pillar.ext_pillar(minion_id, pillar, use_grain=False, minion_ids=None,
                                  tag_match_key=None, tag_match_value='asis', tag_list_key=None,
                                  tag_list_sep=';')

```

Execute a command and read the output as YAML

### 26.12.11 salt.pillar.etcd\_pillar

Use etcd data as a Pillar source

New in version 2014.7.0.

#### depends

- python-etcd or etcd3-py

In order to use an etcd server, a profile must be created in the master configuration file:

```

my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001

```

In order to choose whether to use etcd API v2 or v3, you can put the following configuration option in the same place as your etcd configuration. This option defaults to true, meaning you will use v2 unless you specify otherwise.

```

etcd.require_v2: True

```

When using API v3, there are some specific options available to be configured within your etcd profile. They are defaulted to the following...

```

etcd.encode_keys: False
etcd.encode_values: True
etcd.raw_keys: False
etcd.raw_values: False
etcd.unicode_errors: "surrogateescape"

```

`etcd.encode_keys` indicates whether you want to pre-encode keys using msgpack before adding them to etcd.

**Note:** If you set `etcd.encode_keys` to True, all recursive functionality will no longer work. This includes `tree` and `ls` and all other methods if you set `recurse/recursive` to True. This is due to the fact that when

encoding with msgpack, keys like `/salt` and `/salt/stack` will have differing byte prefixes, and etcd v3 searches recursively using prefixes.

---

`etcd.encode_values` indicates whether you want to pre-encode values using msgpack before adding them to etcd. This defaults to `True` to avoid data loss on non-string values wherever possible.

`etcd.raw_keys` determines whether you want the raw key or a string returned.

`etcd.raw_values` determines whether you want the raw value or a string returned.

`etcd.unicode_errors` determines what you policy to follow when there are encoding/decoding errors.

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

```
ext_pillar:
  - etcd: my_etcd_config

ext_pillar:
  - etcd: my_etcd_config root=/salt
```

Using these configuration profiles, multiple etcd sources may also be used:

```
ext_pillar:
  - etcd: my_etcd_config
  - etcd: my_other_etcd_config
```

The `minion_id` may be used in the `root` path to expose minion-specific information stored in etcd.

```
ext_pillar:
  - etcd: my_etcd_config root=/salt/%(minion_id)s
```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

```
ext_pillar:
  - etcd: my_etcd_config root=/salt-shared
  - etcd: my_other_etcd_config root=/salt-private/%(minion_id)s
```

Using the configuration above, the following commands could be used to share a key with all minions but override its value for a specific minion:

```
etcdctl set /salt-shared/mykey my_value
etcdctl set /salt-private/special_minion_id/mykey my_other_value
```

```
salt.pillar.etcd_pillar.ext_pillar(minion_id, pillar, conf)
    Check etcd for all data
```

### 26.12.12 salt.pillar.extra\_minion\_data\_in\_pillar

Add all extra minion data to the pillar.

```
codeauthor
    Alexandru.Bleotu@morganstanley.ms.com
```

One can filter on the keys to include in the pillar by using the `include` parameter. For subkeys the `'!'` notation is supported (i.e. `'key:subkey'`) The keyword `<all>` includes all keys.

### Complete example in etc/salt/master

```

ext_pillar:
  - extra_minion_data_in_pillar:
      include: *

ext_pillar:
  - extra_minion_data_in_pillar:
      include:
        - key1
        - key2:subkey2

ext_pillar:
  - extra_minion_data_in_pillar:
      include: <all>

```

`salt.pillar.extra_minion_data_in_pillar.ext_pillar` (*minion\_id*, *pillar*, *include*, *extra\_minion\_data=None*)

### 26.12.13 salt.pillar.file\_tree

The `file_tree` external pillar allows values from all files in a directory tree to be imported as Pillar data.

---

**Note:** This is an external pillar and is subject to the *rules and constraints* governing external pillars.

---

New in version 2015.5.0.

In this pillar, data is organized by either Minion ID or Nodegroup name. To setup pillar data for a specific Minion, place it in `<root_dir>/hosts/<minion_id>`. To setup pillar data for an entire Nodegroup, place it in `<root_dir>/nodegroups/<node_group>` where `<node_group>` is the Nodegroup's name.

#### Example file\_tree Pillar

##### Master Configuration

```

ext_pillar:
  - file_tree:
      root_dir: /srv/ext_pillar
      follow_dir_links: False
      keep_newline: True

```

The `root_dir` parameter is required and points to the directory where files for each host are stored. The `follow_dir_links` parameter is optional and defaults to False. If `follow_dir_links` is set to True, this external pillar will follow symbolic links to other directories.

**Warning:** Be careful when using `follow_dir_links`, as a recursive symlink chain will result in unexpected results.

Changed in version 2018.3.0: If `root_dir` is a relative path, it will be treated as relative to the `pillar_roots` of the environment specified by `pillarenv`. If an environment specifies multiple roots, this module will search for files relative to all of them, in order, merging the results.

If `keep_newline` is set to `True`, then the pillar values for files ending in newlines will keep that newline. The default behavior is to remove the end-of-file newline. `keep_newline` should be turned on if the pillar data is intended to be used to deploy a file using `contents_pillar` with a `file.managed` state.

Changed in version 2015.8.4: The `raw_data` parameter has been renamed to `keep_newline`. In earlier releases, `raw_data` must be used. Also, this parameter can now be a list of globs, allowing for more granular control over which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for minion IDs and nodegroups underneath the `root_dir` (see the layout examples in the below sections).

```
ext_pillar:
- file_tree:
  root_dir: /path/to/root/directory
  keep_newline:
  - files/testdir/*
```

---

**Note:** In earlier releases, this documentation incorrectly stated that binary files would not be affected by the `keep_newline` configuration. However, this module does not actually distinguish between binary and text files.

---

Changed in version 2017.7.0: Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

`template` must be set to `True` for templating to happen.

```
ext_pillar:
- file_tree:
  root_dir: /path/to/root/directory
  render_default: jinja|yaml
  renderer_blacklist:
  - gpg
  renderer_whitelist:
  - jinja
  - yaml
  template: True
```

### Assigning Pillar Data to Individual Hosts

To configure pillar data for each host, this external pillar will recursively iterate over `root_dir/hosts/id` (where `id` is a minion ID), and compile pillar data with each subdirectory as a dictionary key and each file as a value.

For example, the following `root_dir` tree:

```
./hosts/
./hosts/test-host/
./hosts/test-host/files/
./hosts/test-host/files/testdir/
./hosts/test-host/files/testdir/file1.txt
./hosts/test-host/files/testdir/file2.txt
./hosts/test-host/files/another-testdir/
./hosts/test-host/files/another-testdir/symlink-to-file1.txt
```

will result in the following pillar tree for minion with ID test-host:

```
test-host:
  -----
  apache:
    -----
    config.d:
      -----
      00_important.conf:
        <important_config important_setting="yes" />
      20_bob_extra.conf:
        <bob_specific_cfg has_freeze_ray="yes" />
  corporate_app:
    -----
    settings:
      -----
      common_settings:
        // This is the main settings file for the corporate
        // internal web app
        main_setting: probably
      bob_settings:
        role: bob
```

**Note:** The leaf data in the example shown is the contents of the pillar files.

`salt.pillar.file_tree.ext_pillar` (*minion\_id*, *pillar*, *root\_dir=None*, *follow\_dir\_links=False*, *debug=False*, *keep\_newline=False*, *render\_default=None*, *renderer\_blacklist=None*, *renderer\_whitelist=None*, *template=False*)

Compile pillar data from the given `root_dir` specific to Nodegroup names and Minion IDs.

If a Minion's ID is not found at `<root_dir>/host/<minion_id>` or if it is not included in any Nodegroups named at `<root_dir>/nodegroups/<node_group>`, no pillar data provided by this pillar module will be available for that Minion.

Changed in version 2017.7.0: Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

`template` must be set to `True` for templating to happen.

```
ext_pillar:
- file_tree:
  root_dir: /path/to/root/directory
  render_default: jinja|yaml
  renderer_blacklist:
  - gpg
  renderer_whitelist:
  - jinja
  - yaml
  template: True
```

#### Parameters

- **minion\_id** -- The ID of the Minion whose pillar data is to be collected
- **pillar** -- Unused by the `file_tree` pillar module

- **root\_dir** -- Filesystem directory used as the root for pillar data (e.g. `/srv/ext_pillar`)

Changed in version 2018.3.0: If `root_dir` is a relative path, it will be treated as relative to the `pillar_roots` of the environment specified by `pillarenv`. If an environment specifies multiple roots, this module will search for files relative to all of them, in order, merging the results.

- **follow\_dir\_links** -- Follow symbolic links to directories while collecting pillar files. Defaults to `False`.

**Warning:** Care should be exercised when enabling this option as it will follow links that point outside of `root_dir`.

**Warning:** Symbolic links that lead to infinite recursion are not filtered.

- **debug** -- Enable debug information at log level `debug`. Defaults to `False`. This option may be useful to help debug errors when setting up the `file_tree` pillar module.
- **keep\_newline** -- Preserve the end-of-file newline in files. Defaults to `False`. This option may either be a boolean or a list of file globs (as defined by the `Python fnmatch package`) for which end-of-file newlines are to be kept.

`keep_newline` should be turned on if the pillar data is intended to be used to deploy a file using `contents_pillar` with a `file.managed` state.

Changed in version 2015.8.4: The `raw_data` parameter has been renamed to `keep_newline`. In earlier releases, `raw_data` must be used. Also, this parameter can now be a list of globs, allowing for more granular control over which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for Minion IDs and Nodegroup names underneath the `root_dir`.

```
ext_pillar:
- file_tree:
  root_dir: /srv/ext_pillar
  keep_newline:
  - apache/config.d/*
  - corporate_app/settings/*
```

**Note:** In earlier releases, this documentation incorrectly stated that binary files would not be affected by the `keep_newline`. However, this module does not actually distinguish between binary and text files.

- **render\_default** -- Override Salt's `default global renderer` for the `file_tree` pillar.

```
render_default: jinja
```

- **renderer\_blacklist** -- Disallow renderers for pillar files.

```
renderer_blacklist:
- json
```

- **renderer\_whitelist** -- Allow renderers for pillar files.

**renderer\_whitelist:**

- yaml
- jinja

- **template** -- Enable templating of pillar files. Defaults to `False`.

### 26.12.14 salt.pillar.foreman

A module to pull data from Foreman via its API into the Pillar dictionary

#### Configuring the Foreman ext\_pillar

Set the following Salt config to setup Foreman as external pillar source:

```

ext_pillar:
- foreman:
    key: foreman # Nest results within this key
    only: ['hostgroup_name', 'parameters'] # Add only these keys to pillar

foreman.url: https://example.com/foreman_api
foreman.user: username # default is admin
foreman.password: password # default is changeme

```

The following options are optional:

```

foreman.api: apiversion # default is 2 (1 is not supported yet)
foreman.verifyssl: False # default is True
foreman.certfile: /etc/ssl/certs/mycert.pem # default is None
foreman.keyfile: /etc/ssl/private/mykey.pem # default is None
foreman.cafile: /etc/ssl/certs/mycert.ca.pem # default is None
foreman.lookup_parameters: True # default is True

```

An alternative would be to use the Foreman modules integrating Salt features in the Smart Proxy and the webinterface.

Further information can be found on [GitHub](#).

#### Module Documentation

`salt.pillar.foreman.ext_pillar` (*minion\_id*, *pillar*, *key=None*, *only=()*)

Read pillar data from Foreman via its API.

## 26.12.15 salt.pillar.git\_pillar

### Use a git repository as a Pillar source

This external pillar allows for a Pillar top file and Pillar SLS files to be sourced from a git repository.

However, since `git_pillar` does not have an equivalent to the `pillar_roots` parameter, configuration is slightly different. A Pillar top file is required to be in the git repository and must still contain the relevant environment, like so:

```
base:
  '*':
    - foo
```

The branch/tag which maps to that environment must then be specified along with the repo's URL. Configuration details can be found below.

---

**Important:** Each branch/tag used for `git_pillar` must have its own top file. This is different from how the top file works when configuring `States`. The reason for this is that each `git_pillar` branch/tag is processed separately from the rest. Therefore, if the `qa` branch is to be used for `git_pillar`, it would need to have its own top file, with the `qa` environment defined within it, like this:

```
qa:
  'dev-*':
    - bar
```

Additionally, while `git_pillar` allows for the branch/tag to be overridden (see [here](#)), keep in mind that the top file must reference the actual environment name. It is common practice to make the environment in a `git_pillar` top file match the branch/tag name, but when remapping, the environment of course no longer matches the branch/tag, and the top file needs to be adjusted accordingly. When expected Pillar values configured in `git_pillar` are missing, this is a common misconfiguration that may be to blame, and is a good first step in troubleshooting.

---

### Configuring git\_pillar for Salt

Beginning with Salt version 2015.8.0, `pygit2` is now supported in addition to `GitPython`. The requirements for `GitPython` and `pygit2` are the same as for `GitFS`, as described [here](#).

---

**Important:** `git_pillar` has its own set of global configuration parameters. While it may seem intuitive to use the global `gitfs` configuration parameters (`gitfs_base`, etc.) to manage `git_pillar`, this will not work. The main difference for this is the fact that the different components which use Salt's git backend code do not all function identically. For instance, in `git_pillar` it is necessary to specify which branch/tag to be used for `git_pillar` remotes. This is the reverse behavior from `gitfs`, where branches/tags make up your environments.

See [here](#) for documentation on the `git_pillar` configuration options and their usage.

---

Here is an example `git_pillar` configuration:

```
ext_pillar:
  - git:
    # Use 'prod' instead of the branch name 'production' as the environment
    - production https://gitserver/git-pillar.git:
```

(continues on next page)

(continued from previous page)

```

- env: prod
# Use 'dev' instead of the branch name 'develop' as the environment
- develop https://gitserver/git-pillar.git:
  - env: dev
# No per-remote config parameters (and no trailing colon), 'qa' will
# be used as the environment
- qa https://gitserver/git-pillar.git
# SSH key authentication
- master git@other-git-server:pillardata-ssh.git:
  # Pillar SLS files will be read from the 'pillar' subdirectory in
  # this repository
  - root: pillar
  - privkey: /path/to/key
  - pubkey: /path/to/key.pub
  - passphrase: CorrectHorseBatteryStaple
# HTTPS authentication
- master https://other-git-server/pillardata-https.git:
  - user: git
  - password: CorrectHorseBatteryStaple

```

The main difference between this and the old way of configuring `git_pillar` is that multiple remotes can be configured under one `git` section under `ext_pillar`. More than one `git` section can be used, but it is not necessary. Remotes will be evaluated sequentially.

Per-remote configuration parameters are supported (similar to `gitfs`), and global versions of the `git_pillar` configuration parameters can also be set.

To remap a specific branch to a specific Pillar environment, use the `env` per-remote parameter:

```

ext_pillar:
- git:
  - production https://gitserver/git-pillar.git:
    - env: prod

```

If `__env__` is specified as the branch name, then `git_pillar` will decide which branch to use based on the following criteria:

- If the minion has a `pillarenv` configured, it will use that pillar environment. (2016.11.2 and later)
- Otherwise, if the minion has an `environment` configured, it will use that environment.
- Otherwise, the master's `git_pillar_base` will be used.

---

**Note:** The use of `environment` to choose the pillar environment dates from a time before the `pillarenv` parameter was added. In a future release, it will be ignored and either the minion's `pillarenv` or the master's `git_pillar_base` will be used.

---

Here's an example of using `__env__` as the `git_pillar` environment:

```

ext_pillar:
- git:
  - __env__ https://gitserver/git-pillar.git:
    - root: pillar

```

The corresponding Pillar top file would look like this:

```
"{{saltenv}}":  
  '*':  
    - bar
```

With the addition of `pygit2` support, `git_pillar` can now interact with authenticated remotes. Authentication works just like in `gitfs` (as outlined in the *Git Fileserver Backend Walkthrough*), only with the global authentication parameter names prefixed with `git_pillar` instead of `gitfs` (e.g. `git_pillar_pubkey`, `git_pillar_privkey`, `git_pillar_passphrase`, etc.).

---

**Note:** The `name` parameter can be used to further differentiate between two remotes with the same URL and branch. When using two remotes with the same URL, the `name` option is required.

---

### How Multiple Remotes Are Handled

As noted above, multiple remotes can be included in the same `git ext_pillar` configuration. Consider the following:

```
my_etcd_config:  
  etcd.host: 127.0.0.1  
  etcd.port: 4001  
  
ext_pillar:  
  - etcd: my_etcd_config  
  - git:  
    - master https://mydomain.tld/foo.git:  
      - root: pillar  
    - master https://mydomain.tld/bar.git  
    - master https://mydomain.tld/baz.git  
    - dev https://mydomain.tld/qux.git  
  - git:  
    - master https://mydomain.tld/abc.git  
    - dev https://mydomain.tld/123.git
```

To understand how pillar data from these repos will be compiled, it's important to know how Salt will process them. The following points should be kept in mind:

1. Each `ext_pillar` is called separately from the others. So, in the above example, the `etcd` `ext_pillar` will be evaluated first, with the first group of `git_pillar` remotes evaluated next (and merged into the `etcd` pillar data). Lastly, the second group of `git_pillar` remotes will be evaluated, and then merged into the `ext_pillar` data evaluated before it.
2. Within a single group of `git_pillar` remotes, each remote will be evaluated in order, with results merged together as each remote is evaluated.

---

**Note:** Prior to the 2017.7.0 release, remotes would be evaluated in a non-deterministic order.

---

3. By default, when a repo is evaluated, other remotes' which share its pillar environment will have their files made available to the remote being processed.

The first point should be straightforward enough, but the second and third could use some additional clarification.

First, point #2. In the first group of `git_pillar` remotes, the `foo` file and pillar SLS files in the `foo` remote will be evaluated first. The `bar` remote will be evaluated next, and its results will be merged into the pillar data compiled

when the `foo` remote was evaluated. As the subsequent remotes are evaluated, their data will be merged in the same fashion.

But wait, don't these repositories belong to more than one pillar environments? Well, yes. The default method of generating pillar data compiles pillar data from all environments. This behavior can be overridden using a `pillarenv`. Setting a `pillarenv` in the minion config file will make that minion tell the master to ignore any pillar data from environments which don't match that `pillarenv`. A `pillarenv` can also be specified for a given minion or set of minions when `running states`, by using the `pillarenv` argument. The CLI `pillarenv` will override one set in the minion config file. So, assuming that a `pillarenv` of `base` was set for a minion, it would not get any of the pillar variables configured in the `qux` remote, since that remote is assigned to the `dev` environment. The only way to get its pillar data would be to specify a `pillarenv` of `dev`, which would mean that it would then ignore any items from the `base` `pillarenv`. A more detailed explanation of pillar environments can be found [here](#).

Moving on to point #3, and looking at the example `ext_pillar` configuration, as the `foo` remote is evaluated, it will also have access to the files from the `bar` and `baz` remotes, since all three are assigned to the `base` pillar environment. So, if an SLS file referenced by the `foo` remotes's top file does not exist in the `foo` remote, it will be searched for in the `bar` remote, followed by the `baz` remote. When it comes time to evaluate the `bar` remote, SLS files referenced by the `bar` remote's top file will first be looked for in the `bar` remote, followed by `foo`, and `baz`, and when the `baz` remote is processed, SLS files will be looked for in `baz`, followed by `foo` and `bar`. This "failover" logic is called a *directory overlay*, and it is also used by `file_roots` and `:conf_minion`pillar_roots``. The ordering of which remote is checked for SLS files is determined by the order they are listed. First the remote being processed is checked, then the others that share the same environment are checked. However, before the 2017.7.0 release, since evaluation was unordered, the remote being processed would be checked, followed in no specific order by the other repos which share the same environment.

Beginning with the 2017.7.0 release, this behavior of `git_pillar` remotes having access to files in other repos which share the same environment can be disabled by setting `git_pillar_includes` to `False`. If this is done, then all `git_pillar` remotes will only have access to their own SLS files. Another way of ensuring that a `git_pillar` remote will not have access to SLS files from other `git_pillar` remotes which share the same pillar environment is to put them in a separate `git` section under `ext_pillar`. Look again at the example configuration above. In the second group of `git_pillar` remotes, the `abc` remote would not have access to the SLS files from the `foo`, `bar`, and `baz` remotes, and vice-versa.

## Mountpoints

New in version 2017.7.0.

Assume the following pillar top file:

```
base:
  'web*':
    - common
    - web.server.nginx
    - web.server.appdata
```

Now, assume that you would like to configure the `web.server.nginx` and `web.server.appdata` SLS files in separate repos. This could be done using the following `ext_pillar` configuration (assuming that `git_pillar_includes` has not been set to `False`):

```
ext_pillar:
  - git:
    - master https://mydomain.tld/pillar-common.git
    - master https://mydomain.tld/pillar-nginx.git
    - master https://mydomain.tld/pillar-appdata.git
```

However, in order to get the files in the second and third `git_pillar` remotes to work, you would need to first create the directory structure underneath it (i.e. place them underneath `web/server/` in the repository). This also makes it tedious to reorganize the configuration, as changing `web.server.nginx` to `web.nginx` in the top file would require you to also move the SLS files in the `pillar-nginx` up a directory level.

For these reasons, much like `gitfs`, `git_pillar` now supports a "mountpoint" feature. Using the following `ext_pillar` configuration, the SLS files in the second and third `git_pillar` remotes can be placed in the root of the git repository:

```
ext_pillar:
- git:
  - master https://mydomain.tld/pillar-common.git
  - master https://mydomain.tld/pillar-nginx.git:
    - mountpoint: web/server/
  - master https://mydomain.tld/pillar-appdata.git:
    - mountpoint: web/server/
```

Now, if the top file changed the SLS target from `web.server.nginx`, instead of reorganizing the git repository, you would just need to adjust the mountpoint to `web/` (and restart the `salt-master` daemon).

---

**Note:**

- Leading and trailing slashes on the mountpoints are optional.
  - Use of the `mountpoint` feature requires that `git_pillar_includes` is not disabled.
  - Content from mounted `git_pillar` repos can only be referenced by a top file in the same pillar environment.
  - Salt versions prior to 2018.3.4 ignore the `root` parameter when `mountpoint` is set.
- 

## `all_saltenvs`

New in version 2018.3.4.

When `__env__` is specified as the branch name, `all_saltenvs` per-remote configuration parameter overrides the logic Salt uses to map branches/tags to pillar environments (i.e. `pillarenvs`). This allows a single branch/tag to appear in all `saltenvs`. Example:

```
ext_pillar:
- git:
  - __env__ https://mydomain.tld/top.git
    - all_saltenvs: master
  - __env__ https://mydomain.tld/pillar-nginx.git:
    - mountpoint: web/server/
  - __env__ https://mydomain.tld/pillar-appdata.git:
    - mountpoint: web/server/
```

## git\_pillar\_update\_interval

New in version 3000.

This option defines the default update interval (in seconds) for git\_pillar remotes. The update is handled within the global loop, hence git\_pillar\_update\_interval should be a multiple of loop\_interval.

```
git_pillar_update_interval: 120
```

## fallback

New in version 3001.

Setting fallback per-remote or global configuration parameter will map non-existing environments to a default branch. Example:

```
ext_pillar:
- git:
  - __env__ https://mydomain.tld/top.git
  - all_saltenvs: master
- __env__ https://mydomain.tld/pillar-nginx.git:
  - mountpoint: web/server/
  - fallback: master
- __env__ https://mydomain.tld/pillar-appdata.git:
  - mountpoint: web/server/
  - fallback: master
```

salt.pillar.git\_pillar.**ext\_pillar**(*minion\_id*, *pillar*, *\*repos*)

Checkout the ext\_pillar sources and compile the resulting pillar SLS

### 26.12.16 salt.pillar.gpg

Decrypt pillar data through the builtin GPG renderer

In most cases, you'll want to make this the last external pillar used. For example, to pair with the builtin stack pillar you could do something like this:

```
ext_pillar:
- stack: /path/to/stack.cfg
- gpg: {}
```

Set gpg\_keydir in your config to adjust the homedir the renderer uses.

salt.pillar.gpg.**ext\_pillar**(*minion\_id*, *pillar*, *\*args*, *\*\*kwargs*)

### 26.12.17 salt.pillar.hg\_pillar

Use remote Mercurial repository as a Pillar source.

New in version 2015.8.0.

The module depends on the `hglib` python module being available. This is the same requirement as for `hgfs_` so should not pose any extra hurdles.

This external Pillar source can be configured in the master config file as such:

```
ext_pillar:  
- hg: ssh://hg@example.co/user/repo
```

**class** salt.pillar.hg\_pillar.Repo(repo\_uri)

Deal with remote hg (mercurial) repository for Pillar

**close()**

Cleanup mercurial command server

**pull()**

**update**(branch='default')

Ensure we are using the latest revision in the hg repository

salt.pillar.hg\_pillar.ext\_pillar(minion\_id, pillar, repo, branch='default', root=None)

Extract pillar from an hg repository

salt.pillar.hg\_pillar.update(repo\_uri)

Execute an hg pull on all the repos

### 26.12.18 salt.pillar.hiera

Use hiera data as a Pillar source

salt.pillar.hiera.ext\_pillar(minion\_id, pillar, conf)

Execute hiera and return the data

### 26.12.19 salt.pillar.http\_json

A module that adds data to the Pillar structure retrieved by an http request

#### Configuring the HTTP\_JSON ext\_pillar

Set the following Salt config to setup http json result as external pillar source:

```
ext_pillar:  
- http_json:  
  url: http://example.com/api/minion_id  
  namespace: 'subkey'  
  username: username  
  password: password  
  header_dict: None  
  auth: None
```

You can pass additional parameters, they will be added to the `http.query` call *utils.http.query function*:

Changed in version 3006.0: If namespace is defined, the data will be added under the specified subkeys in the Pillar structure.

If the `with_grains` parameter is set, grain keys wrapped in `<>` can be provided (wrapped in `<>` brackets) in the url in order to populate pillar data based on the grain value.

```
ext_pillar:
- http_json:
  url: http://example.com/api/<nodename>
  with_grains: True
```

Changed in version 2018.3.0: If `%s` is present in the url, it will be automatically replaced by the `minion_id`:

```
ext_pillar:
- http_json:
  url: http://example.com/api/%s
```

## Module Documentation

`salt.pillar.http_json.ext_pillar` (*minion\_id, pillar, url, with\_grains=False, header\_dict=None, auth=None, username=None, password=None, namespace=None*)

Read pillar data from HTTP response.

### Parameters

- **url** (*str*) -- Url to request.
- **with\_grains** (*bool*) -- Whether to substitute strings in the url with their grain values.
- **header\_dict** (*dict*) -- Extra headers to send
- **auth** -- special auth if needed
- **username** (*str*) -- username for auth
- **password** (*str*) -- password for auth
- **namespace** (*str*) -- (Optional) A pillar key to namespace the values under. .. versionadded:: 3006.0

### Returns

A dictionary of the pillar data to add.

### Return type

dict

## 26.12.20 salt.pillar.http\_yaml

A module that adds data to the Pillar structure retrieved by an http request

### Configuring the HTTP\_YAML ext\_pillar

Set the following Salt config to setup an http endpoint as the external pillar source:

```
ext_pillar:
- http_yaml:
  url: http://example.com/api/minion_id
  username: username
  password: password
  header_dict: None
  auth: None
```

You can pass additional parameters, they will be added to the http.query call *utils.http.query function*:

If the with\_grains parameter is set, grain keys wrapped in can be provided (wrapped in <> brackets) in the url in order to populate pillar data based on the grain value.

```
ext_pillar:
- http_yaml:
  url: http://example.com/api/<nodename>
  with_grains: True
```

Changed in version 2018.3.0: If %s is present in the url, it will be automatically replaced by the minion\_id:

```
ext_pillar:
- http_json:
  url: http://example.com/api/%s
```

### Module Documentation

salt.pillar.http\_yaml.**ext\_pillar** (*minion\_id, pillar, url, with\_grains=False, header\_dict=None, auth=None, username=None, password=None*)

Read pillar data from HTTP response.

#### Parameters

- **url** (*str*) -- Url to request.
- **with\_grains** (*bool*) -- Whether to substitute strings in the url with their grain values.
- **header\_dict** (*dict*) -- Extra headers to send
- **username** (*str*) -- username for auth
- **password** (*str*) -- password for auth
- **auth** -- special auth if needed

#### Returns

A dictionary of the pillar data to add.

#### Return type

dict

### 26.12.21 salt.pillar.libvirt

Load up the libvirt keys into Pillar for a given minion if said keys have been generated using the libvirt key runner

```
depends
  certtool
```

```
salt.pillar.libvirt.ext_pillar(minion_id, pillar, command)
```

Read in the generated libvirt keys

```
salt.pillar.libvirt.gen_hyper_keys(minion_id, country='US', state='Utah', locality='Salt Lake City',
                                   organization='Salted', expiration_days='365')
```

Generate the keys to be used by libvirt hypervisors, this routine gens the keys and applies them to the pillar for the hypervisor minions

### 26.12.22 salt.pillar.makostack

Simple and flexible YAML `ext_pillar` which can read pillar from within pillar.

New in version 2016.3.0.

This custom saltstack `ext_pillar` is a direct ripoff of the 'stack' `ext_pillar`, simply ported to use mako instead of jinja2 for templating.

It supports the following features:

- multiple config files that are mako templates with support for `pillar`, `__grains__`, `__salt__`, `__opts__` objects.
- a config file renders as an ordered list of files. Unless absolute, the paths of these files are relative to the current config file - if absolute, they will be treated literally.
- this list of files are read in order as mako templates with support for `stack`, `pillar`, `__grains__`, `__salt__`, `__opts__` objects.
- all these rendered files are then parsed as `yaml`.
- then all `yaml` dicts are merged in order, with support for the following. merging strategies: `merge-first`, `merge-last`, `remove`, and `overwrite`.
- stack config files can be matched based on `pillar`, `grains`, or `opts` values, which make it possible to support kind of self-contained environments.

#### Configuration in Salt

Like any other external pillar, its configuration takes place through the `ext_pillar` key in the master config file.

However, you can configure MakoStack in 3 different ways:

### Single config file

This is the simplest option, you just need to set the path to your single MakoStack config file like below:

```
ext_pillar:
- makostack: /path/to/stack.cfg
```

### List of config files

You can also provide a list of config files:

```
ext_pillar:
- makostack:
  - /path/to/stack1.cfg
  - /path/to/stack2.cfg
```

### Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: MakoStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```
ext_pillar:
- makostack:
  pillar:environment:
    dev: /path/to/dev/stack.cfg
    prod: /path/to/prod/stack.cfg
  grains:custom:grain:
    value:
      - /path/to/stack1.cfg
      - /path/to/stack2.cfg
  opts:custom:opt:
    value: /path/to/stack0.cfg
```

### Grafting data from files to arbitrary namespaces

An extended syntax for config files permits defining "graft points" on a per-config-file basis. As an example, if the file foo.cfg would produce the following:

```
foo:
- bar
- baz
```

and you specified the cfg file as /path/to/foo.cfg:yummy:fur, the following would actually end up in pillar after all merging was complete:

```
yummy:
  fur:
    foo:
```

(continues on next page)

(continued from previous page)

- bar
- baz

### MakoStack configuration files

The config files that are referenced in the above `ext_pillar` configuration are mako templates which must render as a simple ordered list of `yaml` files that will then be merged to build pillar data.

Unless an absolute path name is specified, the path of these `yaml` files is assumed to be relative to the directory containing the MakoStack config file. If a path begins with '/', however, it will be treated literally and can be anywhere on the filesystem.

The following variables are available in mako templating of makostack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your list of `yaml` files that will be merged in pillar data.

For example, you could have a MakoStack config file which looks like:

```
$ cat /path/to/stack/config.cfg
core.yml
osarchs/%{ __grains__[ 'osarch' ] }.yml
oscodenames/%{ __grains__[ 'oscodename' ] }.yml
% for role in pillar.get('roles', []):
roles/%{ role }.yml
% endfor
minions/%{ minion_id }.yml
```

And the whole directory structure could look like:

```
$ tree /path/to/stack/
/path/to/stack/
├── config.cfg
├── core.yml
├── osarchs/
│   ├── amd64.yml
│   └── armhf.yml
├── oscodenames/
│   ├── wheezy.yml
│   └── jessie.yml
├── roles/
│   ├── web.yml
│   └── db.yml
└── minions/
```

(continues on next page)

```
├─ test-1-dev.yml
└─ test-2-dev.yml
```

## Overall process

In the above MakoStack configuration, given that test-1-dev minion is an amd64 platform running Debian Jessie, and which pillar roles is ["db"], the following yaml files would be merged in order:

- core.yml
- osarchs/amd64.yml
- oscodenames/jessie.yml
- roles/db.yml
- minions/test-1-dev.yml

Before merging, every files above will be preprocessed as mako templates. The following variables are available in mako templating of yaml files:

- `stack`: the MakoStack pillar data object that has currently been merged (data from previous yaml files in MakoStack configuration)
- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your pillar data, and even use other pillar values that has already been merged by MakoStack (from previous yaml files in MakoStack configuration) through the `stack` variable.

Once a yaml file has been preprocessed by mako, we obtain a Python dict - let's call it `yaml_data` - then, MakoStack will merge this `yaml_data` dict in the main `stack` dict (which contains already merged MakoStack pillar data). By default, MakoStack will deeply merge `yaml_data` in `stack` (similarly to the `recurse` salt `pillar_source_merging_strategy`), but 3 merging strategies are currently available for you to choose (see next section).

Once every yaml files have been processed, the `stack` dict will contain your whole own pillar data, merged in order by MakoStack. So MakoStack `ext_pillar` returns the `stack` dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

## Merging strategies

The way the data from a new `yaml_data` dict is merged with the existing `stack` data can be controlled by specifying a merging strategy. Right now this strategy can either be `merge-last` (the default), `merge-first`, `remove`, or `overwrite`.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the `overwrite` strategy (other strategies don't make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
__: <merging strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

### merge-last (default) strategy

If the `merge-last` strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the `recurse salt pillar_source_merging_strategy`). This allows for extending previously defined data.

### merge-first strategy

If the `merge-first` strategy is selected, then the content of dict or list variables are swapped between the `yaml_data` and `stack` objects before being merged recursively with the `merge-last` previous strategy.

### remove strategy

If the `remove` strategy is selected, then content of dict or list variables in `stack` are removed only if the corresponding item is present in the `yaml_data` dict. This allows for removing items from previously defined data.

### overwrite strategy

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

### Merging examples

Let's go through small examples that should clarify what's going on when a `yaml_data` dict is merged in the `stack` dict.

When you don't specify any strategy, the default `merge-last` strategy is selected:

stack	yaml_data	stack (after merge)
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 1000     roles:       - sysadmin       - developer   mat:     uid: 1001   root:     uid: 0</pre>

Then you can select a custom merging strategy using the `__` key in a dict:

stack	yaml_data	stack (after merge)
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   __: merge-last   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 1000     roles:       - sysadmin       - developer   mat:     uid: 1001   root:     uid: 0</pre>
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   __: merge-first   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 500     roles:       - developer       - sysadmin   mat:     uid: 1001   root:     uid: 0</pre>
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   __: remove   tom:   mat:</pre>	<pre>users:   root:     uid: 0</pre>
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   __: overwrite   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>

You can also select a custom merging strategy using a `__` object in a list:

stack	yaml_data	stack (after merge)
<b>users:</b> - tom - root	<b>users:</b> - __: merge-last - mat	<b>users:</b> - tom - root - mat
<b>users:</b> - tom - root	<b>users:</b> - __: merge-first - mat	<b>users:</b> - mat - tom - root
<b>users:</b> - tom - root	<b>users:</b> - __: remove - mat - tom	<b>users:</b> - root
<b>users:</b> - tom - root	<b>users:</b> - __: overwrite - mat	<b>users:</b> - mat

`salt.pillar.makostack.ext_pillar` (*minion\_id*, *pillar*, *\*args*, *\*\*kwargs*)

### 26.12.23 salt.pillar.mongo

Read Pillar data from a mongodb collection

#### depends

pymongo (for salt-master)

This module will load a node-specific pillar dictionary from a mongo collection. It uses the node's id for lookups and can load either the whole document, or just a specific field from that document as the pillar dictionary.

#### Salt Master Mongo Configuration

The module shares the same base mongo connection variables as `salt.returners.mongo_future_return`. These variables go in your master config file.

```
mongo.db: <database name>
mongo.host: <server ip address>
mongo.user: <MongoDB username>
mongo.password: <MongoDB user password>
mongo.port: 27017
```

Or single URI:

```
mongo.uri: URI
```

where uri is in the format:

```
mongodb://[username:password@]host1[:port1][,host2[:port2],...[,
↪hostN[:portN]]][/[database][?options]]
```

Example:

```
mongodb://db1.example.net:27017/mydatabase
mongodb://db1.example.net:27017,db2.example.net:2500/?replicaSet=test
mongodb://db1.example.net:27017,db2.example.net:2500/?replicaSet=test&
↪connectTimeoutMS=300000
```

More information on URI format can be found in <https://docs.mongodb.com/manual/reference/connection-string/>

### Configuring the Mongo ext\_pillar

The Mongo ext\_pillar takes advantage of the fact that the Salt Master configuration file is yaml. It uses a sub-dictionary of values to adjust specific features of the pillar. This is the explicit single-line dictionary notation for yaml. One may be able to get the easier-to-read multi-line dict to work correctly with some experimentation.

```
ext_pillar:
  - mongo: {collection: vm, id_field: name, re_pattern: \.example\.com,
↪fields: [customer_id, software, apache_vhosts]}
```

In the example above, we've decided to use the `vm` collection in the database to store the data. Minion ids are stored in the `name` field on documents in that collection. And, since minion ids are FQDNs in most cases, we'll need to trim the domain name in order to find the minion by hostname in the collection. When we find a minion, return only the `customer_id`, `software`, and `apache_vhosts` fields, as that will contain the data we want for a given node. They will be available directly inside the `pillar` dict in your SLS templates.

### Module Documentation

```
salt.pillar.mongo.ext_pillar(minion_id, pillar, collection='pillar', id_field='_id', re_pattern=None,
↪re_replace='', fields=None)
```

Connect to a mongo database and read per-node pillar information.

#### Parameters

- **collection** (\*) -- The mongodb collection to read data from. Defaults to 'pillar'.
- **id\_field** (\*) -- The field in the collection that represents an individual minion id. Defaults to '\_id'.
- **re\_pattern** (\*) -- If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. *re\_pattern* will be used to match the name, and *re\_replace* will be used to replace it. Backrefs are supported as they are in the Python standard library. If `None`, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to `None`.
- **re\_replace** (\*) -- Use as the replacement value in node ids matched with *re\_pattern*. Defaults to `"`. Feel free to use backreferences here.
- **fields** (\*) -- The specific fields in the document to use for the pillar data. If `None`, will use the entire document. If using the entire document, the `_id` field will be converted to string. Be careful with other fields in the document as they must be string serializable. Defaults to `None`.

## 26.12.24 salt.pillar.mysql

Retrieve Pillar data by doing a MySQL query

MariaDB provides Python support through the MySQL Python package. Therefore, you may use this module with both MySQL or MariaDB.

This module is a concrete implementation of the `sql_base` `ext_pillar` for MySQL.

```

maturity
  new

depends
  python-mysqldb

platform
  all

```

### Configuring the `mysql` `ext_pillar`

Use the 'mysql' key under `ext_pillar` for configuration of queries.

MySQL configuration of the MySQL returner is being used (`mysql.db`, `mysql.user`, `mysql.pass`, `mysql.port`, `mysql.host`) for database connection info.

Required python modules: MySQLdb

### Complete example

```

mysql:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'
  port: 3306
  ssl:
    cert: /etc/mysql/client-cert.pem
    key: /etc/mysql/client-key.pem

ext_pillar:
  - mysql:
    fromdb:
      query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE %s'
      depth: 5
      as_list: True
      with_lists: [1,3]

```

### **class** salt.pillar.mysql.MySQLExtPillar

This class receives and processes the database rows from MySQL.

#### **extract\_queries** (*args*, *kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

`salt.pillar.mysql.ext_pillar`(*minion\_id*, *pillar*, \*args, \*\*kwargs)

Execute queries against MySQL, merge and return as a dict

### 26.12.25 salt.pillar.nacl

Decrypt pillar data through the builtin NACL renderer

In most cases, you'll want to make this the last external pillar used. For example, to pair with the builtin stack pillar you could do something like this:

```
nacl.config:
  keyfile: /root/.nacl

ext_pillar:
  - stack: /path/to/stack.cfg
  - nacl: {}
```

Set `nacl.config` in your config.

`salt.pillar.nacl.ext_pillar`(*minion\_id*, *pillar*, \*args, \*\*kwargs)

### 26.12.26 salt.pillar.netbox

A module that adds data to the Pillar structure from a NetBox API.

New in version 2019.2.0.

#### Configuring the NetBox ext\_pillar

To use this pillar, you must first create a token in your NetBox instance at <http://netbox.example.com/user/api-tokens/> (substituting the hostname of your NetBox instance)

The NetBox `api_url` and `api_token` must be set in the master config.

For example `/etc/salt/master.d/netbox.conf`:

```
ext_pillar:
  - netbox:
      api_url: http://netbox.example.com/api/
      api_token: 123abc
```

The following options are optional, and determine whether or not the module will attempt to configure the proxy pillar data for use with the `napalm` proxy-minion:

```
proxy_return: True
proxy_username: admin
```

By default, this module will query the NetBox API for the platform associated with the device, and use the 'NAPALM driver' field to set the `napalm` proxy-minion driver. (Currently only 'napalm' is supported for drivertype.)

This module currently only supports the `napalm` proxy minion and assumes you will use SSH keys to authenticate to the network device. If password authentication is desired, it is recommended to create another `proxy` key in `pillar_roots` (or `git_pillar`) with just the `passwd` key and use `salt.renderers.gpg` to encrypt the value.

If you use more than one username for your devices, leave `proxy_username` unset, and set the `username` key in your pillar as well. If any additional options for the proxy setup are needed, they should also be configured in `pillar_roots`.

Other available configuration options:

**site\_details: True**

Whether should retrieve details of the site the device belongs to.

**site\_prefixes: True**

Whether should retrieve the prefixes of the site the device belongs to.

**devices: True**

New in version 3004.

Whether should retrieve physical devices.

**virtual\_machines: False**

New in version 3004.

Whether should retrieve virtual machines.

**interfaces: False**

New in version 3004.

Whether should retrieve the interfaces of the device.

**interface\_ips: False**

New in version 3004.

Whether should retrieve the IP addresses for interfaces of the device. (interfaces must be set to True as well)

**api\_query\_result\_limit: Use NetBox default**

New in version 3004.

An integer specifying how many results should be returned for each query to the NetBox API. Leaving this unset will use NetBox's default value.

**connected\_devices: False**

New in version 3006.0.

Whether `connected_devices` key should be populated with device objects. If set to True it will force *interfaces* to also be true as a dependency

Note that each option you enable can have a detrimental impact on pillar performance, so use them with caution.

After configuring the pillar, you must restart the Salt master for the changes to take effect.

For example:

```
systemctl restart salt-master
```

To query perform a quick test of the pillar, you should refresh the pillar on the minion with the following:

```
salt minion1 saltutil.refresh_pillar
```

And then query the pillar:

```
salt minion1 pillar.items 'netbox'
```

Example output:

```
minion1:
  netbox:
    -----
    id:
      511
    url:
      https://netbox.example.com/api/dcim/devices/511/

`salt.pillar.netbox.ext_pillar` (*minion\_id, pillar, \*args, \*\*kwargs*)

Query NetBox API for minion data

### 26.12.27 salt.pillar.neutron

Use Openstack Neutron data as a Pillar source. Will list all networks listed inside of Neutron, to all minions.

New in version 2015.5.1.

#### depends

- python-neutronclient

A keystone profile must be used for the pillar to work (no generic keystone configuration here). For example:

```
my openstack_config:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'
```

After the profile is created, configure the external pillar system to use it.

```
ext_pillar:
  - neutron: my_openstack_config
```

Using these configuration profiles, multiple neutron sources may also be used:

```
ext_pillar:
  - neutron: my_openstack_config
  - neutron: my_other_openstack_config
```

By default, these networks will be returned as a pillar item called `networks`. In order to have them returned under a different name, add the name after the Keystone profile name:

```
ext_pillar:
  • neutron: my_openstack_config neutron_networks
```

`salt.pillar.neutron.ext_pillar` (*minion\_id, pillar, conf*)

Check neutron for all data

### 26.12.28 salt.pillar.nodegroups

#### Nodegroups Pillar

Introspection: to which nodegroups does my minion belong? Provides a pillar with the default name of `nodegroups` which contains a list of nodegroups which match for a given minion.

New in version 2016.11.0.

## Command Line

```
salt-call pillar.get nodegroups
local:
  - class_infra
  - colo_sj
  - state_active
  - country_US
  - type_saltmaster
```

## Configuring Nodegroups Pillar

```
extension_modules: /srv/salt/ext
ext_pillar:
  - nodegroups:
      pillar_name: 'nodegroups'
```

`salt.pillar.nodegroups.ext_pillar` (*minion\_id*, *pillar*, *pillar\_name=None*)

A salt external pillar which provides the list of nodegroups of which the minion is a member.

### Parameters

- **minion\_id** -- used for compound matching nodegroups
- **pillar** -- provided by salt, but not used by nodegroups ext\_pillar
- **pillar\_name** -- optional name to use for the pillar, defaults to 'nodegroups'

### Returns

a dictionary which is included by the salt master in the pillars returned to the minion

## 26.12.29 salt.pillar.pepa

### Pepa

Configuration templating for SaltStack using Hierarchical substitution and Jinja.

### Configuring Pepa

```
extension_modules: /srv/salt/ext

ext_pillar:
  - pepa:
      resource: host # Name of resource directory and sub-key
      ↪in pillars
      sequence: # Sequence used for hierarchical
      ↪substitution
        - hostname: # Name of key
            name: input # Alias used for template directory
            base_only: True # Only use templates from Base
      ↪environment, i.e. no staging
        - default:
        - environment:
```

(continues on next page)

(continued from previous page)

```

- location..region:
  name: region
- location..country:
  name: country
- location..datacenter:
  name: datacenter
- roles:
- osfinger:
  name: os
- hostname:
  name: override
  base_only: True
subkey: True # Create a sub-key in pillars, named
↳after the resource in this case [host]
subkey_only: True # Only create a sub-key, and leave the
↳top level untouched

pepa_roots: # Base directory for each environment
base: /srv/pepa/base # Path for base environment
dev: /srv/pepa/base # Associate dev with base
qa: /srv/pepa/qa
prod: /srv/pepa/prod

# Use a different delimiter for nested dictionaries, defaults to '..' since
↳some keys may use '.' in the name
#pepa_delimiter: ..

# Supply Grains for Pepa, this should **ONLY** be used for testing or
↳validation
#pepa_grains:
# environment: dev

# Supply Pillar for Pepa, this should **ONLY** be used for testing or
↳validation
#pepa_pillars:
# saltversion: 0.17.4

# Enable debug for Pepa, and keep Salt on warning
#log_level: debug

#log_granular_levels:
# salt: warning
# salt.loaded.ext.pillar.pepa: debug

```

Pepa can also be used in Master-less SaltStack setup.

## Command line

```
usage: pepa.py [-h] [-c CONFIG] [-d] [-g GRAINS] [-p PILLAR] [-n] [-v]
             hostname

positional arguments:
  hostname             Hostname

optional arguments:
  -h, --help          show this help message and exit
  -c CONFIG, --config CONFIG
                     Configuration file
  -d, --debug         Print debug info
  -g GRAINS, --grains GRAINS
                     Input Grains as YAML
  -p PILLAR, --pillar PILLAR
                     Input Pillar as YAML
  -n, --no-color      No color output
  -v, --validate      Validate output
```

## Templates

Templates is configuration for a host or software, that can use information from Grains or Pillars. These can then be used for hierarchically substitution.

**Example File:** host/input/test\_example\_com.yaml

```
location..region: emea
location..country: nl
location..datacenter: foobar
environment: dev
roles:
  - salt.master
network..gateway: 10.0.0.254
network..interfaces..eth0..hwaddr: 00:20:26:a1:12:12
network..interfaces..eth0..dhcp: False
network..interfaces..eth0..ipv4: 10.0.0.3
network..interfaces..eth0..netmask: 255.255.255.0
network..interfaces..eth0..fqdn: {{ hostname }}
cobbler..profile: fedora-19-x86_64
```

As you see in this example you can use Jinja directly inside the template.

**Example File:** host/region/amer.yaml

```
network..dns..servers:
  - 10.0.0.1
  - 10.0.0.2
time..ntp..servers:
  - ntp1.amer.example.com
  - ntp2.amer.example.com
  - ntp3.amer.example.com
```

(continues on next page)

(continued from previous page)

```
time..timezone: America/Chihuahua
yum..mirror: yum.amer.example.com
```

Each template is named after the value of the key using lowercase and all extended characters are replaced with underscore.

**Example:**

```
osfinger: Fedora-19
```

**Would become:**

```
fedora_19.yaml
```

### Nested dictionaries

In order to create nested dictionaries as output you can use double dot “..” as a delimiter. You can change this using “pepa\_delimiter” we choose double dot since single dot is already used by key names in some modules, and using “:” requires quoting in the YAML.

**Example:**

```
network..dns..servers:
- 10.0.0.1
- 10.0.0.2
network..dns..options:
- timeout:2
- attempts:1
- ndots:1
network..dns..search:
- example.com
```

**Would become:**

```
network:
  dns:
    servers:
      - 10.0.0.1
      - 10.0.0.2
    options:
      - timeout:2
      - attempts:1
      - ndots:1
    search:
      - example.com
```

## Operators

Operators can be used to merge/unset a list/hash or set the key as immutable, so it can't be changed.

Operator	Description
merge()	Merge list or hash
unset()	Unset key
immutable()	Set the key as immutable, so it can't be changed
imerge()	Set immutable and merge
iunset()	Set immutable and unset

Example:

```
network..dns..search..merge():  
  - foobar.com  
  - dummy.nl  
owner..immutable(): Operations  
host..printers..unset():
```

## Validation

Since it's very hard to test Jinja as is, the best approach is to run all the permutations of input and validate the output, i.e. Unit Testing.

To facilitate this in Pepa we use YAML, Jinja and Cerberus <<https://github.com/nicolaiarocci/cerberus>>.

## Schema

So this is a validation schema for network configuration, as you see it can be customized with Jinja just as Pepa templates.

This was designed to be run as a build job in Jenkins or similar tool. You can provide Grains/Pillar input using either the config file or command line arguments.

File Example: host/validation/network.yaml

```
network..dns..search:  
  type: list  
  allowed:  
    - example.com  
  
network..dns..options:  
  type: list  
  allowed: ['timeout:2', 'attempts:1', 'ndots:1']  
  
network..dns..servers:  
  type: list  
  schema:  
    regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$  
  
network..gateway:  
  type: string
```

(continues on next page)

(continued from previous page)

```

    regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

{% if network.interfaces is defined %}
{% for interface in network.interfaces %}

network..interfaces..{{ interface }}..dhcp:
    type: boolean

network..interfaces..{{ interface }}..fqdn:
    type: string
    regex: ^([a-z0-9]([a-z0-9-]{0,61}[a-z0-9])?\.)+[a-zA-Z]{2,6}$

network..interfaces..{{ interface }}..hwaddr:
    type: string
    regex: ^([0-9a-f]{1,2}\:){5}[0-9a-f]{1,2}$

network..interfaces..{{ interface }}..ipv4:
    type: string
    regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

network..interfaces..{{ interface }}..netmask:
    type: string
    regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

{% endfor %}
{% endif %}

```

## Links

`salt.pillar.pepa.key_value_to_tree` (*data*)

Convert key/value to tree

`salt.pillar.pepa.validate` (*output, resource*)

Validate Pepa templates

### 26.12.30 salt.pillar.pillar\_ldap

Use LDAP data as a Pillar source

This pillar module executes a series of LDAP searches. Data returned by these searches are aggregated, whereby data returned by later searches override data by previous searches with the same key.

The final result is merged with existing pillar data.

The configuration of this external pillar module is done via an external file which provides the actual configuration for the LDAP searches.

## Configuring the LDAP ext\_pillar

The basic configuration is part of the `master` configuration.

```
ext_pillar:
- pillar_ldap: /etc/salt/master.d/pillar_ldap.yaml
```

---

**Note:** When placing the file in the `master.d` directory, make sure its name doesn't end in `.conf`, otherwise the `salt-master` process will attempt to parse its content.

---

**Warning:** Make sure this file has very restrictive permissions, as it will contain possibly sensitive LDAP credentials!

The only required key in the master configuration is `pillar_ldap` pointing to a file containing the actual configuration.

## Configuring the LDAP searches

The file is processed using *Salt's Renderers* `<renderers>` which makes it possible to reference grains within the configuration.

**Warning:** When using Jinja in this file, make sure to do it in a way which prevents leaking sensitive information. A rogue minion could send arbitrary grains to trick the master into returning secret data. Use only the `'id'` grain which is verified through the minion's `key/cert`.

## Map Mode

The `it-admins` configuration below returns the Pillar `it-admins` by:

- filtering for: - members of the group `it-admins` - objects with `objectclass=user`
- returning the data of users, where each user is a dictionary containing the configured string or list attributes.

## Configuration

```
salt-users:
server: ldap.company.tld
port: 389
tls: true
dn: 'dc=company,dc=tld'
binddn: 'cn=salt-pillars,ou=users,dc=company,dc=tld'
bindpw: bi7ieBai5Ano
referrals: false
anonymous: false
mode: map
dn: 'ou=users,dc=company,dc=tld'
```

(continues on next page)

(continued from previous page)

```

filter:      '(&(memberof=cn=it-admins,ou=groups,dc=company,
→dc=tld)(objectclass=user))'
attrs:
  - cn
  - displayName
  - givenName
  - sn
lists:
  - memberOf

search_order:
  - salt-users

```

**Result**

```

{
  'salt-users': [
    {
      'cn': 'cn=johndoe,ou=users,dc=company,dc=tld',
      'displayName': 'John Doe'
      'givenName': 'John'
      'sn': 'Doe'
      'memberOf': [
        'cn=it-admins,ou=groups,dc=company,dc=tld',
        'cn=team01,ou=groups,dc=company'
      ]
    },
    {
      'cn': 'cn=janedoe,ou=users,dc=company,dc=tld',
      'displayName': 'Jane Doe',
      'givenName': 'Jane',
      'sn': 'Doe',
      'memberOf': [
        'cn=it-admins,ou=groups,dc=company,dc=tld',
        'cn=team02,ou=groups,dc=company'
      ]
    }
  ]
}

```

`salt.pillar.pillar_ldap.ext_pillar(minion_id, pillar, config_file)`

Execute LDAP searches and return the aggregated data

### 26.12.31 salt.pillar.postgres

Retrieve Pillar data by doing a postgres query

New in version 2017.7.0.

```
maturity
  new

depends
  psycpg2

platform
  all
```

#### Complete Example

```
postgres:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'

ext_pillar:
  - postgres:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE %s'
      depth: 5
      as_list: True
      with_lists: [1,3]
```

#### class salt.pillar.postgres.POSTGRESExtPillar

This class receives and processes the database rows from POSTGRES.

#### extract\_queries(*args*, *kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

salt.pillar.postgres.**ext\_pillar**(*minion\_id*, *pillar*, *\*args*, *\*\*kwargs*)

Execute queries against POSTGRES, merge and return as a dict

### 26.12.32 salt.pillar.puppet

Execute an unmodified puppet\_node\_classifier and read the output as YAML. The YAML data is then directly overlaid onto the minion's Pillar data.

salt.pillar.puppet.**ext\_pillar**(*minion\_id*, *pillar*, *command*)

Execute an unmodified puppet\_node\_classifier and read the output as YAML

### 26.12.33 salt.pillar.reclass\_adapter

Use the "reclass" database as a Pillar source

This `ext_pillar` plugin provides access to the `reclass` database, such that Pillar data for a specific minion are fetched using `reclass`.

You can find more information about `reclass` at <http://reclass.pantsfullofunix.net>.

To use the plugin, add it to the `ext_pillar` list in the Salt master config and tell `reclass` by way of a few options how and where to find the inventory:

```
ext_pillar:
  - reclass:
      storage_type: yaml_fs
      inventory_base_uri: /srv/salt
```

This would cause `reclass` to read the inventory from YAML files in `/srv/salt/nodes` and `/srv/salt/classes`.

If you are also using `reclass` as `master_tops` plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for `ext_pillar` and `master_tops`):

```
reclass: &reclass
  storage_type: yaml_fs
  inventory_base_uri: /srv/salt
  reclass_source_path: ~/code/reclass

ext_pillar:
  - reclass: *reclass

master_tops:
  reclass: *reclass
```

If you want to run `reclass` from source, rather than installing it, you can either let the master know via the `PYTHONPATH` environment variable, or by setting the configuration option, like in the example above.

`salt.pillar.reclass_adapter.ext_pillar(minion_id, pillar, **kwargs)`

Obtain the Pillar data from `reclass` for the given `minion_id`.

### 26.12.34 salt.pillar.redismod

#### Read pillar data from a Redis backend

New in version 2014.7.0.

#### depends

- redis Python module (on master)

## Salt Master Redis Configuration

The module shares the same base Redis connection variables as `salt.returners.redis_return`. These variables go in your master config file.

- `redis.db` - The Redis database to use. Defaults to 0.
- `redis.host` - The Redis host to connect to. Defaults to 'salt'.
- `redis.port` - The port that the Redis database is listening on. Defaults to 6379.
- `redis.password` - The password for authenticating with Redis. Only required if you are using master auth. Defaults to None.

## Configuring the Redis `ext_pillar`

```
ext_pillar:  
- redis: {function: key_value}
```

`salt.pillar.redismod.ext_pillar(minion_id, pillar, function, **kwargs)`

Grabs external pillar data based on configured function

`salt.pillar.redismod.key_json(minion_id, pillar, pillar_key=None)`

Pulls a string from redis and deserializes it from json. Deserialized dictionary data loaded directly into top level if `pillar_key` is not set.

**pillar\_key**

Pillar key to return data into

`salt.pillar.redismod.key_value(minion_id, pillar, pillar_key='redis_pillar')`

Looks for key in redis matching `minion_id`, returns a structure based on the data type of the redis key. String for string type, dict for hash type and lists for lists, sets and sorted sets.

**pillar\_key**

Pillar key to return data into

### 26.12.35 salt.pillar.rethinkdb\_pillar

Provide external pillar data from RethinkDB

New in version 2018.3.0.

**depends**

rethinkdb (on the salt-master)

#### salt master rethinkdb configuration

These variables must be configured in your master configuration file.

- `rethinkdb.host` - The RethinkDB server. Defaults to 'salt'
- `rethinkdb.port` - The port the RethinkDB server listens on. Defaults to '28015'
- `rethinkdb.database` - The database to connect to. Defaults to 'salt'
- `rethinkdb.username` - The username for connecting to RethinkDB. Defaults to ''
- `rethinkdb.password` - The password for connecting to RethinkDB. Defaults to ''

## salt-master ext\_pillar configuration

The ext\_pillar function arguments are given in single line dictionary notation.

```
ext_pillar:
- rethinkdb: {table: ext_pillar, id_field: minion_id, field: pillar_root,
↪pillar_key: external_pillar}
```

In the example above the following happens.

- The salt-master will look for external pillars in the 'ext\_pillar' table on the RethinkDB host
- The minion id will be matched against the 'minion\_id' field
- Pillars will be retrieved from the nested field 'pillar\_root'
- Found pillars will be merged inside a key called 'external\_pillar'

## Module Documentation

`salt.pillar.rethinkdb_pillar.ext_pillar` (*minion\_id*, *pillar*, *table='pillar'*, *id\_field=None*, *field=None*, *pillar\_key=None*)

Collect minion external pillars from a RethinkDB database

Arguments:

- *table*: The RethinkDB table containing external pillar information. Defaults to 'pillar'
- *id\_field*: Field in document containing the minion id. If blank then we assume the table index matches minion ids
- *field*: Specific field in the document used for pillar data, if blank then the entire document will be used
- *pillar\_key*: The salt-master will nest found external pillars under this key before merging into the minion pillars. If blank, external pillars will be merged at top level

### 26.12.36 salt.pillar.s3

Copy pillar data from a bucket in Amazon S3

The S3 pillar can be configured in the master config file with the following options

```
ext_pillar:
- s3:
  bucket: my.fancy.pillar.bucket
  keyid: KASKFJWAKJASJKDAJKSD
  key: ksladfdLKDALSFKSD93q032sdDasdfasdfsadkf
  multiple_env: False
  environment: base
  prefix: somewhere/overthere
  verify_ssl: True
  service_url: s3.amazonaws.com
  kms_keyid: 01234567-89ab-cdef-0123-4567890abcde
  s3_cache_expire: 30
  s3_sync_on_update: True
  path_style: False
  https_enable: True
```

The `bucket` parameter specifies the target S3 bucket. It is required.

The `keyid` parameter specifies the key id to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `key` parameter specifies the key to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `multiple_env` defaults to `False`. It specifies whether the pillar should interpret top level folders as pillar environments (see mode section below).

The `environment` defaults to `'base'`. It specifies which environment the bucket represents when in single environments mode (see mode section below). It is ignored if `multiple_env` is `True`.

The `prefix` defaults to `''`. It specifies a key prefix to use when searching for data in the bucket for the pillar. It works when `multiple_env` is `True` or `False`. Essentially it tells `ext_pillar` to look for your pillar data in a 'subdirectory' of your S3 bucket

The `verify_ssl` parameter defaults to `True`. It specifies whether to check for valid S3 SSL certificates. *NOTE* If you use bucket names with periods, this must be set to `False` else an invalid certificate error will be thrown (issue #12200).

The `service_url` parameter defaults to `'s3.amazonaws.com'`. It specifies the base url to use for accessing S3.

The `kms_keyid` parameter is optional. It specifies the ID of the Key Management Service (KMS) master key that was used to encrypt the object.

The `s3_cache_expire` parameter defaults to 30s. It specifies expiration time of S3 metadata cache file.

The `s3_sync_on_update` parameter defaults to `True`. It specifies if cache is synced on update rather than jit.

The `path_style` parameter defaults to `False`. It specifies whether to use path style requests or dns style requests

The `https_enable` parameter defaults to `True`. It specifies whether to use https protocol or http protocol

This pillar can operate in two modes, single environment per bucket or multiple environments per bucket.

Single environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<files>
```

Multiple environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<environment>/<files>
```

If you wish to define your pillar data entirely within S3 it's recommended that you use the `prefix=` parameter and specify one entry in `ext_pillar` for each environment rather than specifying `multiple_env`. This is due to issue #22471 (<https://github.com/saltstack/salt/issues/22471>)

```
class salt.pillar.s3.S3Credentials(key, keyid, bucket, service_url, verify_ssl=True, kms_keyid=None, location=None, path_style=False, https_enable=True)
```

```
salt.pillar.s3.ext_pillar(minion_id, pillar, bucket, key=None, keyid=None, verify_ssl=True, location=None, multiple_env=False, environment='base', prefix='', service_url=None, kms_keyid=None, s3_cache_expire=30, s3_sync_on_update=True, path_style=False, https_enable=True)
```

Execute a command and read the output as YAML

### 26.12.37 salt.pillar.saltclass

#### SaltClass Pillar Module

```
ext_pillar:
- saltclass:
  - path: /srv/saltclass
```

For additional configuration instructions, see the *saltclass* module

```
salt.pillar.saltclass.ext_pillar(minion_id, pillar, *args, **kwargs)
    Compile pillar data
```

### 26.12.38 salt.pillar.sql\_base

Retrieve Pillar data by doing a SQL query

This module is not meant to be used directly as an `ext_pillar`. It is a place to put code common to PEP 249 compliant SQL database adapters. It exposes a python ABC that can be subclassed for new database providers.

```
maturity
    new

platform
    all
```

#### Theory of `sql_base ext_pillar`

Ok, here's the theory for how this works...

- First, any non-keyword args are processed in order.
- Then, remaining keywords are processed.

We do this so that it's backward compatible with older configs. Keyword arguments are sorted before being appended, so that they're predictable, but they will always be applied last so overall it's moot.

For each of those items we process, it depends on the object type:

- Strings are executed as is and the pillar depth is determined by the number of fields returned.
- A list has the first entry used as the query, the second as the pillar depth.
- A mapping uses the keys "query" and "depth" as the tuple

You can retrieve as many fields as you like, how they get used depends on the exact settings.

#### Configuring a `sql_base ext_pillar`

The `sql_base ext_pillar` cannot be used directly, but shares query configuration with its implementations. These examples use a fake 'sql\_base' adapter, which should be replaced with the name of the adapter you are using.

A list of queries can be passed in

```

ext_pillar:
- sql_base:
  - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
  - "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"

```

Or you can pass in a mapping

```

ext_pillar:
- sql_base:
  main: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
  extras: "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"

```

The query can be provided as a string as we have just shown, but they can be provided as lists

```

ext_pillar:
- sql_base:
  - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
  2

```

Or as a mapping

```

ext_pillar:
- sql_base:
  - query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
  depth: 2

```

The depth defines how the dicts are constructed. Essentially if you query for fields a,b,c,d for each row you'll get:

- With depth 1: {a: {"b": b, "c": c, "d": d}}
- With depth 2: {a: {b: {"c": c, "d": d}}}
- With depth 3: {a: {b: {c: d}}}

Depth greater than 3 wouldn't be different from 3 itself. Depth of 0 translates to the largest depth needed, so 3 in this case. (max depth == key count - 1)

Then they are merged in a similar way to plain pillar data, in the order returned by the SQL database.

Thus subsequent results overwrite previous ones when they collide.

The `ignore_null` option can be used to change the overwrite behavior so that only non-NULL values in subsequent results will overwrite. This can be used to selectively overwrite default values.

```

ext_pillar:
- sql_base:
  - query: "SELECT pillar,value FROM pillars WHERE minion_id = 'default'
  ↪and minion_id != %s"
  depth: 2
  - query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
  depth: 2
  ignore_null: True

```

If you specify `as_list: True` in the mapping expression it will convert collisions to lists.

If you specify `with_lists: '...'` in the mapping expression it will convert the specified depths to list. The string provided is a sequence numbers that are comma separated. The string '1,3' will result in:

```
a,b,c,d,e,1 # field 1 same, field 3 differs
a,b,c,f,g,2 # ^^^^
a,z,h,y,j,3 # field 1 same, field 3 same
a,z,h,y,k,4 # ^^^^
  ^      ^
```

These columns define list grouping

```
{a: [
  {c: [
    {e: 1},
    {g: 2}
  ]},
  {h: [
    {j: 3, k: 4 }
  ]}
]}
```

The range for `with_lists` is 1 to `number_of_fields`, inclusive. Numbers outside this range are ignored.

If you specify `as_json: True` in the mapping expression and query only for single value, returned data are considered in JSON format and will be merged directly.

```
ext_pillar:
- sql_base:
  - query: "SELECT json_pillar FROM pillars WHERE minion_id = %s"
    as_json: True
```

The processed JSON entries are recursively merged in a single dictionary. Additionally if `as_list` is set to `True` the lists will be merged in case of collision.

For instance the following rows:

```
{"a": {"b": [1, 2]}, "c": 3} {"a": {"b": [1, 3]}, "d": 4}
```

will result in the following pillar with `as_list=False`

```
{"a": {"b": [1, 3], "c": 3, "d": 4}
```

and in with `as_list=True`

```
{"a": {"b": [1, 2, 3], "c": 3, "d": 4}
```

Finally, if you pass the queries in via a mapping, the key will be the first level name where as passing them in as a list will place them in the root. This isolates the query results into their own subtrees. This may be a help or hindrance to your aims and can be used as such.

You can basically use any SELECT query that gets you the information, you could even do joins or subqueries in case your `minion_id` is stored elsewhere. It is capable of handling single rows or multiple rows per minion.

Configuration of the connection depends on the adapter in use.

New in version 3005: The `as_json` parameter.

More complete example for MySQL (to also show configuration)

```
mysql:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'

ext_pillar:
  - mysql:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE %s'
      depth: 5
      as_list: True
      with_lists: [1,3]
```

**class** salt.pillar.sql\_base.**SqlBaseExtPillar**

This class receives and processes the database rows in a database agnostic way.

**as\_json** = False

**as\_list** = False

**depth** = 0

**enter\_root**(*root*)

Set self.focus for kwarg queries

**extract\_queries**(*args*, *kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

**fetch**(*minion\_id*, *pillar*, *\*args*, *\*\*kwargs*)

Execute queries, merge and return as a dict.

**field\_names** = None

**focus** = None

**ignore\_null** = False

**num\_fields** = 0

**process\_fields**(*field\_names*, *depth*)

The primary purpose of this function is to store the sql field list and the depth to which we process.

**process\_results**(*rows*)

This function takes a list of database results and iterates over, merging them into a dict form.

**result** = None

**with\_lists** = None

### 26.12.39 salt.pillar.sqlcipher

Retrieve Pillar data by running a SQLCipher query

New in version 2016.3.0.

Python SQLCipher support is provided by the pysqlcipher Python package. You need this module installed to query Pillar data from a SQLCipher database.

This module is a concrete implementation of the sql\_base ext\_pillar for SQLCipher.

```

maturity
    new

depends
    pysqlcipher (for py2) or pysqlcipher3 (for py3)

platform
    all

```

#### Configuring the sqlcipher ext\_pillar

Use the 'sqlcipher' key under ext\_pillar for configuration of queries.

SQLCipher database connection configuration requires the following values configured in the master config:

- `sqlcipher.database` - The SQLCipher database to connect to. Defaults to `'/var/lib/salt/pillar-sqlcipher.db'`.
- `sqlcipher.pass` - The SQLCipher database decryption password.
- `sqlcipher.timeout` - The connection timeout in seconds.

Example configuration

```

sqlcipher:
  database: /var/lib/salt/pillar-sqlcipher.db
  pass: strong_pass_phrase
  timeout: 5.0

```

#### Complete Example

```

sqlcipher:
  database: '/var/lib/salt/pillar-sqlcipher.db'
  pass: strong_pass_phrase
  timeout: 5.0

ext_pillar:
  - sqlcipher:
    fromdb:
      query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE ?'
      depth: 5
      as_list: True
      with_lists: [1,3]

```

**class** salt.pillar.sqlcipher.**SQLCipherExtPillar**

This class receives and processes the database rows from SQLCipher.

salt.pillar.sqlcipher.**ext\_pillar**(*minion\_id*, *pillar*, *\*args*, *\*\*kwargs*)

Execute queries against SQLCipher, merge and return as a dict

### 26.12.40 salt.pillar.sqlite3

Retrieve Pillar data by doing a SQLite3 query

New in version 2015.8.0.

sqlite3 is included in the stdlib since Python 2.5.

This module is a concrete implementation of the sql\_base ext\_pillar for SQLite3.

**platform**  
all

#### Configuring the sqlite3 ext\_pillar

Use the 'sqlite3' key under ext\_pillar for configuration of queries.

SQLite3 database connection configuration requires the following values configured in the master config:

Note, timeout is in seconds.

```
sqlite3.database: /var/lib/salt/pillar.db
sqlite3.timeout: 5.0
```

#### Complete Example

```
sqlite3:
  database: '/var/lib/salt/pillar.db'
  timeout: 5.0

ext_pillar:
  - sqlite3:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE ?'
      depth: 5
      as_list: True
      with_lists: [1,3]
```

**class** salt.pillar.sqlite3.**SQLite3ExtPillar**

This class receives and processes the database rows from SQLite3.

salt.pillar.sqlite3.**ext\_pillar**(*minion\_id*, *pillar*, *\*args*, *\*\*kwargs*)

Execute queries against SQLite3, merge and return as a dict

### 26.12.41 salt.pillar.stack

Simple and flexible YAML `ext_pillar` which can read pillar from within pillar.

New in version 2016.3.0.

`PillarStack` is a custom saltstack `ext_pillar` which was inspired by `varstack` but is heavily based on Jinja2 for maximum flexibility.

It supports the following features:

- multiple config files that are jinja2 templates with support for `pillar`, `__grains__`, `__salt__`, `__opts__` objects and `pillarenv`
- a config file renders as an ordered list of files (paths of these files are relative to the current config file)
- this list of files are read in ordered as jinja2 templates with support for `stack`, `pillar`, `__grains__`, `__salt__`, `__opts__` objects and `pillarenv`
- all these rendered files are then parsed as `yaml`
- then all `yaml` dicts are merged in order with support for the following merging strategies: `merge-first`, `merge-last`, `remove`, and `overwrite`
- stack config files can be matched based on `pillar`, `grains`, or `opts` values, which make it possible to support kind of self-contained environments

#### Installation

`PillarStack` is already bundled with Salt since 2016.3.0 version so there is nothing to install from version 2016.3.0.

If you use an older Salt version or you want to override `PillarStack` with a more recent one, follow the installation procedure below.

Installing the `PillarStack ext_pillar` is as simple as dropping the `stack.py` file in the `<extension_modules>/pillar` directory (no external python module required), given that `extension_modules` is set in your salt-master configuration, see: <https://docs.saltproject.io/en/latest/ref/configuration/master.html#extension-modules>

#### Configuration in Salt

Like any other external pillar, its configuration takes place through the `ext_pillar` key in the master config file.

However, you can configure `PillarStack` in 3 different ways:

##### Single config file

This is the simplest option, you just need to set the path to your single `PillarStack` config file like below:

```
ext_pillar:
- stack: /path/to/stack.cfg
```

## List of config files

You can also provide a list of config files:

```
ext_pillar:
- stack:
  - /path/to/stack1.cfg
  - /path/to/stack2.cfg
```

## Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: PillarStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```
ext_pillar:
- stack:
  pillar:something:
    bar: /path/to/bar/stack.cfg
    foo: /path/to/foo/stack.cfg
  grains:custom:grain:
    value:
      - /path/to/stack1.cfg
      - /path/to/stack2.cfg
  opts:custom:opt:
    value: /path/to/stack0.cfg
  opts:saltenv:
    dev: /path/to/dev/stack.cfg
    __env__: /path/to/__env__/stack.cfg
```

## PillarStack configuration files

The config files that are referenced in the above `ext_pillar` configuration are jinja2 templates which must render as a simple ordered list of `yaml` files that will then be merged to build pillar data.

The path of these `yaml` files must be relative to the directory of the PillarStack config file. These paths support unix style pathname pattern expansion through the *Python glob module* <<https://docs.python.org/2/library/glob.html>>.

The following variables are available in jinja2 templating of PillarStack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your list of `yaml` files that will be merged in pillar data.

For example, you could have a PillarStack config file which looks like:

```
$ cat /path/to/stack/config.cfg
core.yml
common/*.yml
osarchs/{{ __grains__['osarch'] }}.yml
oscodenames/{{ __grains__['oscodename'] }}.yml
{%- for role in pillar.get('roles', []) %}
roles/{{ role }}.yml
{%- endfor %}
minions/{{ minion_id }}.yml
```

And the whole directory structure could look like:

```
$ tree /path/to/stack/
/path/to/stack/
├── config.cfg
├── core.yml
├── common/
│   ├── xxx.yml
│   └── yyy.yml
├── osarchs/
│   ├── amd64.yml
│   └── armhf.yml
├── oscodenames/
│   ├── wheezy.yml
│   └── jessie.yml
├── roles/
│   ├── web.yml
│   └── db.yml
└── minions/
    ├── test-1-dev.yml
    └── test-2-dev.yml
```

## Overall process

In the above PillarStack configuration, given that test-1-dev minion is an amd64 platform running Debian Jessie, and which pillar roles is ["db"], the following yaml files would be merged in order:

- core.yml
- common/xxx.yml
- common/yyy.yml
- osarchs/amd64.yml
- oscodenames/jessie.yml
- roles/db.yml
- minions/test-1-dev.yml

Before merging, every files above will be preprocessed as Jinja2 templates. The following variables are available in Jinja2 templating of yaml files:

- `stack`: the PillarStack pillar data object that has currently been merged (data from previous `yaml` files in PillarStack configuration)
- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of Jinja2 to build your pillar data, and even use other pillar values that has already been merged by PillarStack (from previous `yaml` files in PillarStack configuration) through the `stack` variable.

Once a `yaml` file has been preprocessed by Jinja2, we obtain a Python dict - let's call it `yaml_data` - then, PillarStack will merge this `yaml_data` dict in the main `stack` dict (which contains already merged PillarStack pillar data). By default, PillarStack will deeply merge `yaml_data` in `stack` (similarly to the `recurse salt pillar_source_merging_strategy`), but 3 merging strategies are currently available for you to choose (see next section).

Once every `yaml` files have been processed, the `stack` dict will contain your whole own pillar data, merged in order by PillarStack. So PillarStack `ext_pillar` returns the `stack` dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

### Merging strategies

The way the data from a new `yaml_data` dict is merged with the existing `stack` data can be controlled by specifying a merging strategy. Right now this strategy can either be `merge-last` (the default), `merge-first`, `remove`, or `overwrite`.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the `overwrite` strategy (other strategies don't make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
__ : <merging strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

### `merge-last` (default) strategy

If the `merge-last` strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the `recurse salt pillar_source_merging_strategy`). This allows for extending previously defined data.

### merge-first strategy

If the `merge-first` strategy is selected, then the content of dict or list variables are swapped between the `yaml_data` and `stack` objects before being merged recursively with the `merge-last` previous strategy.

### remove strategy

If the `remove` strategy is selected, then content of dict or list variables in `stack` are removed only if the corresponding item is present in the `yaml_data` dict. This allows for removing items from previously defined data.

### overwrite strategy

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

### Merging examples

Let's go through small examples that should clarify what's going on when a `yaml_data` dict is merged in the `stack` dict.

When you don't specify any strategy, the default `merge-last` strategy is selected:

stack	yaml_data	stack (after merge)
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 1000     roles:       - sysadmin       - developer   mat:     uid: 1001   root:     uid: 0</pre>

Then you can select a custom merging strategy using the `__` key in a dict:

stack	yaml_data	stack (after merge)
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   __: merge-last   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 1000     roles:       - sysadmin       - developer   mat:     uid: 1001   root:     uid: 0</pre>
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   __: merge-first   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 500     roles:       - developer       - sysadmin   mat:     uid: 1001   root:     uid: 0</pre>
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   __: remove   tom:   mat:</pre>	<pre>users:   root:     uid: 0</pre>
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   __: overwrite   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>

You can also select a custom merging strategy using a `__` object in a list:

stack	yaml_data	stack (after merge)
<pre>users: - tom - root</pre>	<pre>users: - __: merge-last - mat</pre>	<pre>users: - tom - root - mat</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: merge-first - mat</pre>	<pre>users: - mat - tom - root</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: remove - mat - tom</pre>	<pre>users: - root</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: overwrite - mat</pre>	<pre>users: - mat</pre>

`salt.pillar.stack.ext_pillar` (*minion\_id*, *pillar*, \*args, \*\*kwargs)

Builds stacked pillar from yaml files listed in file(s).

Parameters

- **minion\_id** (*str*) -- Minion ID
- **pillar** (*dict*) -- pillar
- **args** (*list*) -- (Optional) file(s) that list yaml files
- **kwargs** (*dict*) -- (Optional) conditional file(s) that list yaml files

### 26.12.42 salt.pillar.svn\_pillar

Clone a remote SVN repository and use the filesystem as a Pillar source

This external Pillar source can be configured in the master config file like so:

```
ext_pillar:
- svn: trunk svn://svnserver/repo root=subdirectory
```

The `root=` parameter is optional and used to set the subdirectory from where to look for Pillar files (such as `top.sls`).

Changed in version 2014.7.0: The optional `root` parameter will be added.

Note that this is not the same thing as configuring pillar data using the `pillar_roots` parameter. The branch referenced in the `ext_pillar` entry above (`master`), would evaluate to the base environment, so this branch needs to contain a `top.sls` with a base section in it, like this:

```
base:
  '*':
  - foo
```

To use other environments from the same SVN repo as `svn_pillar` sources, just add additional lines, like so:

```
ext_pillar:
- svn: trunk svn://svnserver/repo
- svn: dev  svn://svnserver/repo
```

In this case, the dev branch would need its own `top.sls` with a dev section in it, like this:

```
dev:
  '*':
  - bar
```

**class** `salt.pillar.svn_pillar.SvnPillar` (*branch, repo\_location, root, opts*)

Deal with the remote SVN repository for Pillar

**pillar\_dir**()

Returns the directory of the pillars (repo cache + branch + root)

**update**()

`salt.pillar.svn_pillar.ext_pillar` (*minion\_id, pillar, repo\_string*)

Execute a command and read the output as YAML

### 26.12.43 salt.pillar.varstack\_pillar

Use `Varstack` data as a Pillar source

#### Configuring Varstack

Using `varstack` in Salt is fairly simple. Just put the following into the config file of your master:

```
ext_pillar:
- varstack: /etc/varstack.yaml
```

`Varstack` will then use `/etc/varstack.yaml` to determine which configuration data to return as pillar information. From there you can take a look at the [README](#) of `varstack` on how this file is evaluated.

`salt.pillar.varstack_pillar.ext_pillar` (*minion\_id, pillar, conf*)

Parse `varstack` data and return the result

### 26.12.44 salt.pillar.vault

Vault Pillar Module

**maintainer**  
SaltStack

**maturity**  
New

**platform**  
all

New in version 2016.11.0.

This module allows pillar data to be stored in Hashicorp Vault.

Base configuration instructions are documented in the [execution module docs](#). Below are noted extra configuration required for the pillar module, but the base configuration must also be completed.

After the base Vault configuration is created, add the configuration below to the `ext_pillar` section in the Salt master configuration.

```
ext_pillar:
- vault: path=secret/salt
```

Each key needs to have all the key-value pairs with the names you require. Avoid naming every key 'password' as they will collide.

If you want to nest results under a `nesting_key` name use the following format:

```
ext_pillar:
- vault:
  conf: path=secret/salt
  nesting_key: vault_key_name
```

```
$ vault write secret/salt auth=my_password master=127.0.0.1
```

The above will result in two pillars being available, `auth` and `master`.

You can then use normal pillar requests to get each key pair directly from pillar root. Example:

```
$ salt-ssh '*' pillar.get auth
```

Multiple Vault sources may also be used:

```
ext_pillar:
- vault: path=secret/salt
- vault: path=secret/root
- vault: path=secret/minions/{minion}/pass
- vault: path=secret/roles/{pillar[roles]}/pass
```

You can also use nesting here as well. Identical nesting keys will get merged.

```
ext_pillar:
- vault:
  conf: path=secret/salt
  nesting_key: keyname1
- vault:
  conf: path=secret/root
  nesting_key: keyname1
- vault:
  conf: path=secret/minions/{minion}/pass
  nesting_key: keyname2
```

The difference between the return with and without the nesting key is shown below. This example takes the key value pairs returned from vault as follows:

```
path=secret/salt
```

(continues on next page)

(continued from previous page)

```

Key          Value
----          -
salt-passwd  badpasswd1

path=secret/root

Key          Value
----          -
root-passwd  rootbadpasswd1

path=secret/minions/{minion}/pass

Key          Value
----          -
minion-passwd  minionbadpasswd1

```

```

#Nesting Key not defined

local:
-----
  salt-passwd:
    badpasswd1
  root-passwd:
    rootbadpasswd1
  minion-passwd:
    minionbadpasswd1

#Nesting Key defined

local:
-----
  keyname1:
    -----
      salt-passwd:
        badpasswd1
      root-passwd:
        rootbadpasswd1
  keyname2:
    -----
      minion-passwd:
        minionbadpasswd1

```

New in version 3006.0: Pillar values from previously rendered pillars can be used to template vault ext\_pillar paths.

Using pillar values to template vault pillar paths requires them to be defined before the vault ext\_pillar is called. Especially consider the significance of *ext\_pillar\_first* master config setting. You cannot use pillar values sourced from Vault in pillar-templated policies.

If a pillar pattern matches multiple paths, the results are merged according to the master configuration values *pillar\_source\_merging\_strategy* and *pillar\_merge\_lists* by default.

If the optional *nesting\_key* was defined, the merged result will be nested below. There is currently no way to nest multiple results under different keys.

You can override the merging behavior per defined `ext_pillar`:

```
ext_pillar:
- vault:
  conf: path=secret/roles/{pillar[roles]}
  merge_strategy: smart
  merge_lists: false
```

```
salt.pillar.vault.ext_pillar(minion_id, pillar, conf, nesting_key=None, merge_strategy=None,
                             merge_lists=None, extra_minion_data=None)
```

Get pillar data from Vault for the configuration `conf`.

### 26.12.45 salt.pillar.venafi

Venafi Pillar Certificates

This module will only return pillar data if the `venafi` runner module has already been used to create certificates.

To configure this module, set `venafi` to `True` in the `ext_pillar` section of your master configuration file:

```
ext_pillar:
- venafi: True
```

```
salt.pillar.venafi.ext_pillar(minion_id, pillar, conf)
```

Return an existing set of certificates

### 26.12.46 salt.pillar.virtkey

Accept a key from a hypervisor if the `virt` runner has already submitted an authorization request

```
salt.pillar.virtkey.ext_pillar(hyper_id, pillar, name, key)
```

Accept the key for the VM on the hyper, if authorized.

### 26.12.47 salt.pillar.vmware\_pillar

Pillar data from vCenter or an ESXi host

New in version 2017.7.0.

**depends**

- `pyVmomi`

This external pillar can pull attributes from objects in vCenter or an ESXi host and provide those attributes as pillar data to minions. This can allow for pillar based targeting of minions on ESXi host, Datastore, VM configuration, etc. This setup requires only the salt master have access to the vCenter server/ESXi hosts.

The pillar will return an empty dict if the 'os' or 'virtual' grain are not 'VMWare', 'ESXi', or 'VMWare ESXi'.

## Defaults

- The external pillar will search for Virtual Machines with the VM name matching the minion id.
- Data will be returned into the 'vmware' pillar key.
- The external pillar has a default set of properties to return for both VirtualMachine and HostSystem types.

## Configuring the VMWare pillar

The required minimal configuration in the salt master ext\_pillar setup:

```
ext_pillar:
- vmware:
  host: <vcenter/esx host>
  username: <user to connect with>
  password: <password>
```

Optionally, the following keyword arguments can be passed to the ext\_pillar for customized configuration:

### pillar\_key

Optionally set the pillar key to return the data into. Default is `vmware`.

### protocol

Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is `https`.

### port

Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is `443`.

### property\_name

Property name to match the minion id against. Defaults to `name`.

### property\_types

Optionally specify a list of pyVmomi vim types to search for the minion id in 'property\_name'. Default is `['VirtualMachine']`.

For example, to search both `vim.VirtualMachine` and `vim.HostSystem` object types:

```
ext_pillar:
- vmware:
  host: myesx
  username: root
  password: complex_password
  property_types:
  - VirtualMachine
  - HostSystem
```

Additionally, the list of property types can be dicts, the item of the dict being a list specifying the attribute to return for that vim object type.

The pillar will attempt to recurse the attribute and return all child attributes.

To explicitly specify deeper attributes without attempting to recurse an attribute, convert the list item to a dict with the item of the dict being the child attributes to return. Follow this pattern to return attributes as deep within the object as necessary.

**Note:** Be careful when specifying custom attributes! Many attributes have objects as attributes which have the parent object as an attribute and which will cause the pillar to fail due to the attempt to convert all sub-objects recursively (i.e. infinite attribute loops). Specifying only the sub-attributes you would like returned will keep the infinite recursion from occurring.

A maximum recursion exception will occur in this case and the pillar will not return as desired.

```

ext_pillar:
  - vmware:
    host: myvcenter
    username: my_user
    password: my_pass
    replace_default_attributes: True
    property_types:
      - VirtualMachine:
        - config:
          - bootOptions:
            - bootDelay
            - bootRetryDelay
        - HostSystem:
          - datastore:
            - name
  
```

The above `ext_pillar` example would return a pillar like the following for a `VirtualMachine` object that's name matched the minion id:

```

vmware:
  config:
    bootOptions:
      bootDelay: 1000
      bootRetryDelay: 1000
  
```

If you were to retrieve these virtual machine attributes via `pyVmomi` directly, this would be the same as

```

vmObject.config.bootOptions.bootDelay
vmObject.config.bootOptions.bootRetryDelay
  
```

The above `ext_pillar` example would return a pillar like the following for a `HostSystem` object that's name matched the minion id:

```

vmware:
  datastore:
    - name: Datastore1
    - name: Datastore2
  
```

The 'datastore' property of a `HostSystem` object is a list of datastores, thus a list is returned.

### `replace_default_attributes`

If custom attributes are specified by the `property_types` parameter, `replace_default_attributes` determines if those will be added to default attributes (False) or replace the default attributes completely (True). The default setting is 'False'.

---

**Note:** vCenter "Custom Attributes" (i.e. Annotations) will always be returned if it exists on the object as part of the pillar regardless of this setting.

---

`salt.pillar.vmware_pillar.ext_pillar` (*minion\_id*, *pillar*, *\*\*kwargs*)

Check vmware/vcenter for all data

## 26.13 proxy modules

<i>arista_pyeapi</i>	Arista pyeapi
<i>chronos</i>	Chronos
<i>cimc</i>	Proxy Minion interface module for managing Cisco Integrated Management Controller devices
<i>cisconso</i>	Proxy Minion interface module for managing (practically) any network device with Cisco Network Services Orchestrator (Cisco NSO).
<i>deltaproxy</i>	This is the "master" deltaproxy minion, known better as the <i>control proxy</i> because it controls all the deltaproxies underneath it.
<i>docker</i>	
<i>dummy</i>	This is the a dummy proxy-minion designed for testing the proxy minion subsystem.
<i>esxcluster</i>	Proxy Minion interface module for managing VMWare ESXi clusters.
<i>esxdatacenter</i>	Proxy Minion interface module for managing VMWare ESXi clusters.
<i>esxi</i>	Proxy Minion interface module for managing VMware ESXi hosts.
<i>esxvm</i>	Proxy Minion interface module for managing VMWare ESXi virtual machines.
<i>fx2</i>	Dell FX2 chassis
<i>junos</i>	Interface with a Junos device via proxy-minion.
<i>marathon</i>	Marathon
<i>napalm</i>	NAPALM: Network Automation and Programmability Abstraction Layer with Multivendor support
<i>netmiko_px</i>	Netmiko
<i>nxos</i>	Proxy Minion for Cisco NX-OS Switches
<i>nxos_api</i>	Proxy Minion to manage Cisco Nexus Switches (NX-OS) over the NX-API
<i>panos</i>	Proxy Minion interface module for managing Palo Alto firewall devices
<i>philips_hue</i>	Philips HUE lamps module for proxy.
<i>rest_sample</i>	This is a simple proxy-minion designed to connect to and communicate with the bottle-based web service contained in <a href="https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example">https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example</a>
<i>restconf</i>	Proxy Minion to manage RESTCONF Devices
<i>ssh_sample</i>	This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH.
<i>vcenter</i>	Proxy Minion interface module for managing VMWare vCenters.

## 26.13.1 salt.proxy.arista\_pyeapi

### Arista pyeapi

New in version 2019.2.0.

Proxy module for managing Arista switches via the eAPI using the `pyeapi` library.

**codeauthor**  
Mircea Ulinic <ping@mirceaulinic.net>

**maturity**  
new

**depends**  
pyeapi

**platform**  
unix

---

**Note:** To understand how to correctly enable the eAPI on your switch, please check <https://eos.arista.com/arista-eapi-101/>.

---

### Dependencies

The `pyeapi` Proxy module requires `pyeapi` to be installed: `pip install pyeapi`.

### Pillar

The `pyeapi` proxy configuration requires the following parameters in order to connect to the network device:

**transport: `https`**

Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

**host: `localhost`**

The IP address or DNS host name of the connection device.

**username: `admin`**

The username to pass to the device to authenticate the eAPI connection.

**password**

The password to pass to the device to authenticate the eAPI connection.

**port**

The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**enablepwd**

The enable mode password if required by the destination node.

All the arguments may be optional, depending on your setup.

## Proxy Pillar Example

```
proxy:
  proxytype: pyeapi
  host: router1.example.com
  username: example
  password: example
```

`salt.proxy.arista_pyeapi.call(method, *args, **kwargs)`

Calls an arbitrary pyeapi method.

`salt.proxy.arista_pyeapi.conn()`

Return the connection object.

`salt.proxy.arista_pyeapi.init(opts)`

Open the connection to the Arista switch over the eAPI.

`salt.proxy.arista_pyeapi.initialized()`

Connection finished initializing?

`salt.proxy.arista_pyeapi.ping()`

Connection open successfully?

`salt.proxy.arista_pyeapi.shutdown(opts)`

Closes connection with the device.

### 26.13.2 salt.proxy.chronos

#### Chronos

Proxy minion for managing a Chronos cluster.

#### Dependencies

- *chronos execution module (salt.modules.chronos)*

#### Pillar

The chronos proxy configuration requires a 'base\_url' property that points to the chronos endpoint:

```
proxy:
  proxytype: chronos
  base_url: http://my-chronos-master.mydomain.com:4400
```

New in version 2015.8.2.

`salt.proxy.chronos.init(opts)`

Perform any needed setup.

`salt.proxy.chronos.ping()`

Is the chronos api responding?

`salt.proxy.chronos.shutdown`(*opts*)

For this proxy shutdown is a no-op

### 26.13.3 salt.proxy.cimc

#### Proxy Minion interface module for managing Cisco Integrated Management Controller devices

New in version 2018.3.0.

```
codeauthor
    Spencer Ervin <spencer_ervin@hotmail.com>

maturity
    new

depends
    none

platform
    unix
```

This proxy minion enables Cisco Integrated Management Controller devices (hereafter referred to as simply 'cimc' devices) to be treated individually like a Salt Minion.

The cimc proxy leverages the XML API functionality on the Cisco Integrated Management Controller. The Salt proxy must have access to the cimc on HTTPS (tcp/443).

More in-depth conceptual reading on Proxy Minions can be found in the *Proxy Minion* section of Salt's documentation.

#### Configuration

To use this integration proxy module, please configure the following:

#### Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID.

```
proxy:
  proxytype: cimc
  host: <ip or dns name of cimc host>
  username: <cimc username>
  password: <cimc password>
  verify_ssl: True
```

## proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this `cimc` Proxy Module, set this to `cimc`.

## host

The location, or ip/dns, of the `cimc` host. Required.

## username

The username used to login to the `cimc` host. Required.

## password

The password used to login to the `cimc` host. Required.

`salt.proxy.cimc.get_config_resolver_class` (*cid=None, hierarchical=False*)

The `configResolveClass` method returns requested managed object in a given class.

`salt.proxy.cimc.grains`()

Get the grains from the proxied device

`salt.proxy.cimc.grains_refresh`()

Refresh the grains from the proxied device

`salt.proxy.cimc.init` (*opts*)

This function gets called when the proxy starts up.

`salt.proxy.cimc.initialized`()

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our `init`() function has been called

`salt.proxy.cimc.logon`()

Logs into the `cimc` device and returns the session cookie.

`salt.proxy.cimc.logout` (*cookie=None*)

Closes the session with the device.

`salt.proxy.cimc.ping`()

Returns true if the device is reachable, else false.

`salt.proxy.cimc.prepare_return` (*x*)

Converts the etree to dict

`salt.proxy.cimc.set_config_modify` (*dn=None, inconfig=None, hierarchical=False*)

The `configConfMo` method configures the specified managed object in a single subtree (for example, DN).

`salt.proxy.cimc.shutdown`()

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 26.13.4 salt.proxy.cisconso

Proxy Minion interface module for managing (practically) any network device with Cisco Network Services Orchestrator (Cisco NSO). Cisco NSO uses a series of remote polling agents, APIs and SSH commands to fetch network configuration and represent it in a data model. PyNSO, the Python module used by this proxy minion does the task of converting native Python dictionaries into NETCONF/YANG syntax that the REST API for Cisco NSO can then use to set the configuration of the target network device.

#### Supported devices:

- A10 AX Series
- Arista 7150 Series
- Ciena 3000, 5000, ESM
- H3c S5800 Series
- Overture 1400, 2200, 5000, 5100, 6000
- Accedian MetroNID
- Avaya ERS 4000, SR8000, VSP 9000
- Cisco: APIC-DC, ASA, IOS, IOS XE, IOS XR, er, ME-4600, NX OS, Prime Network Registrar, Quantum, StarOS, UCS ManagWSA
- Huawei: NE40E, quidway series, Enterprise Network Simulation Framework
- PaloAlto PA-2000, PA-3000, Virtualized Firewalls
- Adtran 900 Series
- Brocade ADX, MLX, Netiron, Vyatta
- Dell Force 10 Networking S-Series
- Infinera DTN-X Multi-Terabit Packet Optical Network Platform
- Pulsecom SuperG
- Adva 150CC Series
- CableLabs Converged Cable Access Platform
- Ericsson EFN324 Series, SE family
- Juniper: Contrail, EX, M, MX, QFX, SRX, Virtual SRX
- Quagga Routing Software
- Affirmed Networks
- Citrix Netscaler
- F5 BIG-IP
- NEC iPasolink
- Riverbed Steelhead Series
- Alcatel-Lucent 7XXX, SAM
- Clavister
- Fortinet
- Nominum DCS

- Sonus SBC 5000 Series
- Allied Telesys
- Open vSwitch

New in version 2016.11.0.

**codeauthor**

*Anthony Shaw <anthony.shaw@dimensiondata.com>*

This proxy minion enables a consistent interface to fetch, control and maintain the configuration of network devices via a NETCONF-compliant control plane. Cisco Network Services Orchestrator.

More in-depth conceptual reading on Proxy Minions can be found in the [Proxy Minion](#) section of Salt's documentation.

### Dependencies

- pynso Python module

### PyNSO

PyNSO can be installed via pip:

```
pip install pynso
```

### Configuration

To use this integration proxy module, please configure the following:

### Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the NSO host, the pillar should look like this:

```
proxy:  
  proxytype: ciskonso  
  host: <ip or dns name of host>  
  port: 8080  
  use_ssl: false  
  username: <username>  
  password: password
```

### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this Cisco NSO Proxy Module, set this to `cisconso`.

### host

The location, or IP/dns, of the Cisco NSO API host. Required.

### username

The username used to login to the Cisco NSO host, such as `admin`. Required.

### passwords

The password for the given user. Required.

### use\_ssl

Whether to use HTTPS messaging to speak to the API.

### port

The port that the Cisco NSO API is running on, 8080 by default

## Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the Cisco NSO host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the cisconso host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the Cisco NSO host to make sure it is responding:

```
salt <id> test.ping
```

**salt.proxy.cisconso.apply\_rollback**(*datastore*, *name*)

Apply a system rollback

**Parameters**

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **name** (str) -- an ID of the rollback to restore

**salt.proxy.cisconso.get\_data**(*datastore*, *path*)

Get the configuration of the device tree at the given path

**Parameters**

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (List of str OR tuple) -- The device path, a list of element names in order, comma separated

**Returns**

The network configuration at that tree

**Return type**

dict

```
salt cisco-nso cisconso.get_data devices
```

**salt.proxy.cisconso.get\_rollback**(*name*)

Get the backup of stored a configuration rollback

**Parameters**

**name** (str) -- Typically an ID of the backup

**Return type**

str

**Returns**

the contents of the rollback snapshot

**salt.proxy.cisconso.get\_rollbacks**()

Get a list of stored configuration rollbacks

**salt.proxy.cisconso.grains**()

Get the grains from the proxy device.

**salt.proxy.cisconso.init**(*opts*)

**salt.proxy.cisconso.ping**()

Check to see if the host is responding. Returns False if the host didn't respond, True otherwise.

CLI Example:

```
salt cisco-nso test.ping
```

**salt.proxy.cisconso.set\_data\_value**(*datastore*, *path*, *data*)

Get a data entry in a datastore

**Parameters**

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (List of str OR tuple) -- The device path to set the value at, a list of element names in order, comma separated
- **data** (dict) -- The new value at the given path

**Return type**

bool

**Returns**

True if successful, otherwise error.

`salt.proxy.cisconso.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 26.13.5 salt.proxy.deltaproxy

This is the "master" deltaproxy minion, known better as the *control proxy* because it controls all the deltaproxies underneath it.

`salt.proxy.deltaproxy.grains()`

Make up some grains

`salt.proxy.deltaproxy.grains_refresh()`

Refresh the grains

`salt.proxy.deltaproxy.init(opts)``salt.proxy.deltaproxy.initialized()`

Since grains are loaded in many different places and some of those ws places occur before the proxy can be initialized, return whether our init() function has been called

`salt.proxy.deltaproxy.ping()`

Degenerate ping

`salt.proxy.deltaproxy.shutdown(opts)`

For this proxy shutdown is a no-op

### 26.13.6 salt.proxy.docker

**Warning:** This module will be removed from Salt in version 3009 in favor of the [docker Salt Extension](#).

Docker Proxy Minion

New in version 2019.2.0.

**depends**

docker

This proxy minion is just a shim to the docker executor, which will use the *docker.call* for everything except state runs.

To configure the proxy minion:

```

proxy:
  proxytype: docker
  name: festive_leakey

```

It is also possible to just name the proxy minion the same name as the container, and use grains to configure the proxy minion:

```

proxy:
  proxytype: docker
  name: {{grains['id']}}

```

name

Name of the docker container

`salt.proxy.docker.init(opts)`

Always initialize

`salt.proxy.docker.initialized()`

This should always be initialized

`salt.proxy.docker.module_executors()`

List of module executors to use for this Proxy Minion

`salt.proxy.docker.shutdown(opts)`

Nothing needs to be done to shutdown

### 26.13.7 salt.proxy.dummy

This is the a dummy proxy-minion designed for testing the proxy minion subsystem.

`salt.proxy.dummy.fns()`

Method called by grains module.

`salt.proxy.dummy.grains()`

Make up some grains

`salt.proxy.dummy.grains_refresh()`

Refresh the grains

`salt.proxy.dummy.init(opts)`

Required. Can be used to initialize the server connection.

`salt.proxy.dummy.initialized()`

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our `init()` function has been called

`salt.proxy.dummy.package_install(name, **kwargs)`

Install a "package" on the REST server

`salt.proxy.dummy.package_list()`

List "packages" installed on the REST server

`salt.proxy.dummy.package_remove(name)`

Remove a "package" on the REST server

`salt.proxy.dummy.package_status(name)`

Check the installation status of a package on the REST server

`salt.proxy.dummy.ping()`

Degenerate ping

`salt.proxy.dummy.service_list()`

List "services" on the REST server

`salt.proxy.dummy.service_restart(name)`

Restart a "service" on the REST server

`salt.proxy.dummy.service_start(name)`

Start a "service" on the dummy server

`salt.proxy.dummy.service_status(name)`

Check if a service is running on the REST server

`salt.proxy.dummy.service_stop(name)`

Stop a "service" on the dummy server

`salt.proxy.dummy.shutdown(opts)`

For this proxy shutdown is a no-op

`salt.proxy.dummy.test_from_state()`

Test function so we have something to call from a state :return:

`salt.proxy.dummy.upgrade()`

"Upgrade" packages

`salt.proxy.dummy.uptodate()`

Call the REST endpoint to see if the packages on the "server" are up to date.

### 26.13.8 salt.proxy.esxcluster

Proxy Minion interface module for managing VMWare ESXi clusters.

#### Dependencies

- pyVmomi
- jsonschema

#### Configuration

To use this integration proxy module, please configure the following:

## Pillar

Proxy minions get their configuration from Salt's Pillar. This can now happen from the proxy's configuration file.

Example pillars:

userpass mechanism:

```
proxy:
  proxytype: esxcluster
  cluster: <cluster name>
  datacenter: <datacenter name>
  vcenter: <ip or dns name of parent vcenter>
  mechanism: userpass
  username: <vCenter username>
  passwords: (required if userpass is used)
    - first_password
    - second_password
    - third_password
```

sspi mechanism:

```
proxy:
  proxytype: esxcluster
  cluster: <cluster name>
  datacenter: <datacenter name>
  vcenter: <ip or dns name of parent vcenter>
  mechanism: sspi
  domain: <user domain>
  principal: <host kerberos principal>
```

### proxytype

To use this Proxy Module, set this to esxdatacenter.

### cluster

Name of the managed cluster. Required.

### datacenter

Name of the datacenter the managed cluster is in. Required.

**vcenter**

The location of the VMware vCenter server (host of ip) where the datacenter should be managed. Required.

**mechanism**

The mechanism used to connect to the vCenter server. Supported values are `userpass` and `sspi`. Required.

---

**Note:** Connections are attempted using all (username, password) combinations on proxy startup.

---

**username**

The username used to login to the host, such as `root`. Required if mechanism is `userpass`.

**passwords**

A list of passwords to be used to try and login to the vCenter server. At least one password in this list is required if mechanism is `userpass`. When the proxy comes up, it will try the passwords listed in order.

**domain**

User domain. Required if mechanism is `sspi`.

**principal**

Kerberos principal. Required if mechanism is `sspi`.

**protocol**

If the ESXi host is not using the default protocol, set this value to an alternate protocol. Default is `https`.

**port**

If the ESXi host is not using the default port, set this value to an alternate port. Default is 443.

## Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the vCenter server in the pillar. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

To start a proxy minion one needs to establish its identity <id>:

```
salt-proxy --proxyid <proxy_id>
```

On the machine that will run the proxy, make sure there is a configuration file present. By default this is `/etc/salt/proxy`. If in a different location, the `<configuration_folder>` has to be specified when running the proxy: file with at least the following in it:

```
salt-proxy --proxyid <proxy_id> -c <configuration_folder>
```

## Commands

Once the proxy is running it will connect back to the specified master and individual commands can be runs against it:

```
# Master - minion communication
salt <cluster_name> test.ping

# Test vcenter connection
salt <cluster_name> vsphere.test_vcenter_connection
```

## States

Associated states are documented in `salt.states.esxcluster`. Look there to find an example structure for Pillar as well as an example `.sls` file for configuring an ESX cluster from scratch.

`salt.proxy.esxcluster.find_credentials()`

Cycle through all the possible credentials and return the first one that works.

`salt.proxy.esxcluster.get_details()`

Function that returns the cached details

`salt.proxy.esxcluster.init(opts)`

This function gets called when the proxy starts up. For login the protocol and port are cached.

`salt.proxy.esxcluster.ping()`

Returns True.

CLI Example:

```
salt esx-cluster test.ping
```

`salt.proxy.esxcluster.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

## 26.13.9 salt.proxy.esxdatacenter

Proxy Minion interface module for managing VMWare ESXi clusters.

### Dependencies

- pyVmomi
- jsonschema

### Configuration

To use this integration proxy module, please configure the following:

### Pillar

Proxy minions get their configuration from Salt's Pillar. This can now happen from the proxy's configuration file.

Example pillars:

userpass mechanism:

```
proxy:
  proxytype: esxdatacenter
  datacenter: <datacenter name>
  vcenter: <ip or dns name of parent vcenter>
  mechanism: userpass
  username: <vCenter username>
  passwords: (required if userpass is used)
    - first_password
    - second_password
    - third_password
```

sspi mechanism:

```
proxy:
  proxytype: esxdatacenter
  datacenter: <datacenter name>
  vcenter: <ip or dns name of parent vcenter>
  mechanism: sspi
  domain: <user domain>
  principal: <host kerberos principal>
```

**proxytype**

To use this Proxy Module, set this to `esxdatacenter`.

**datacenter**

Name of the managed datacenter. Required.

**vcenter**

The location of the VMware vCenter server (host or ip) where the datacenter should be managed. Required.

**mechanism**

The mechanism used to connect to the vCenter server. Supported values are `userpass` and `sspi`. Required.

---

**Note:** Connections are attempted using all (username, password) combinations on proxy startup.

---

**username**

The username used to login to the host, such as `root`. Required if mechanism is `userpass`.

**passwords**

A list of passwords to be used to try and login to the vCenter server. At least one password in this list is required if mechanism is `userpass`. When the proxy comes up, it will try the passwords listed in order.

**domain**

User domain. Required if mechanism is `sspi`.

**principal**

Kerberos principal. Required if mechanism is `sspi`.

## protocol

If the ESXi host is not using the default protocol, set this value to an alternate protocol. Default is `https`.

## port

If the ESXi host is not using the default port, set this value to an alternate port. Default is 443.

## Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the vCenter server in the pillar. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

To start a proxy minion one needs to establish its identity `<id>`:

```
salt-proxy --proxyid <proxy_id>
```

On the machine that will run the proxy, make sure there is a configuration file present. By default this is `/etc/salt/proxy`. If in a different location, the `<configuration_folder>` has to be specified when running the proxy: file with at least the following in it:

```
salt-proxy --proxyid <proxy_id> -c <configuration_folder>
```

## Commands

Once the proxy is running it will connect back to the specified master and individual commands can be runs against it:

```
# Master - minion communication
salt <datacenter_name> test.ping

# Test vcenter connection
salt <datacenter_name> vsphere.test_vcenter_connection
```

## States

Associated states are documented in `salt.states.esxdatacenter`. Look there to find an example structure for Pillar as well as an example `.sls` file for configuring an ESX datacenter from scratch.

`salt.proxy.esxdatacenter.find_credentials()`

Cycle through all the possible credentials and return the first one that works.

`salt.proxy.esxdatacenter.get_details()`

Function that returns the cached details

`salt.proxy.esxdatacenter.init(opts)`

This function gets called when the proxy starts up. All login details are cached.

`salt.proxy.esxdatacenter.ping()`

Returns True.

CLI Example:

```
salt dc_id test.ping
```

`salt.proxy.esxdatacenter.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 26.13.10 salt.proxy.esxi

Proxy Minion interface module for managing VMware ESXi hosts.

**Warning:** This module will be deprecated in a future release of Salt. VMware strongly recommends using the [VMware Salt extensions](#) instead of the ESXi module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.

**Special Note:** SaltStack thanks [Adobe Corporation](#) for their support in creating this Proxy Minion integration.

This proxy minion enables VMware ESXi (hereafter referred to as simply 'ESXi') hosts to be treated individually like a Salt Minion.

Since the ESXi host may not necessarily run on an OS capable of hosting a Python stack, the ESXi host can't run a Salt Minion directly. Salt's "Proxy Minion" functionality enables you to designate another machine to host a minion process that "proxies" communication from the Salt Master. The master does not know nor care that the target is not a "real" Salt Minion.

More in-depth conceptual reading on Proxy Minions can be found in the [Proxy Minion](#) section of Salt's documentation.

#### Dependencies

- pyVmomi Python Module
- ESXCLI

#### pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

## ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

## Configuration

To use this integration proxy module, please configure the following:

## Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the ESXi host, the pillar should look like this:

```
proxy:  
  proxytype: esxi  
  host: <ip or dns name of esxi host>  
  username: <ESXi username>  
  passwords:  
    - first_password  
    - second_password  
    - third_password  
  credstore: <path to credential store>
```

## proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this ESXi Proxy Module, set this to `esxi`.

**host**

The location, or ip/dns, of the ESXi host. Required.

**username**

The username used to login to the ESXi host, such as `root`. Required.

**passwords**

A list of passwords to be used to try and login to the ESXi host. At least one password in this list is required.

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password and the password you may be updating for an ESXi host either via the `vsphere.update_host_password` execution module function or via the `esxi.password_present` state function. This way, after the password is changed, you should not need to restart the proxy minion--it should just pick up the new password provided in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

This also allows you to use any number of potential fallback passwords.

---

**Note:** When a password is changed on the host to one in the list of possible passwords, the further down on the list the password is, the longer individual commands will take to return. This is due to the nature of pyVmomi's login system. We have to wait for the first attempt to fail before trying the next password on the list.

This scenario is especially true, and even slower, when the proxy minion first starts. If the correct password is not the first password on the list, it may take up to a minute for `test.ping` to respond with a `True` result. Once the initial authorization is complete, the responses for commands will be a little faster.

To avoid these longer waiting periods, SaltStack recommends moving the correct password to the top of the list and restarting the proxy minion at your earliest convenience.

---

**protocol**

If the ESXi host is not using the default protocol, set this value to an alternate protocol. Default is `https`.

**port**

If the ESXi host is not using the default port, set this value to an alternate port. Default is `443`.

**credstore**

If the ESXi host is using an untrusted SSL certificate, set this value to the file path where the credential store is located. This file is passed to `esxcli`. Default is `<HOME>/.vmware/credstore/vicredentials.xml` on Linux and `<APPDATA>/VMware/credstore/vicredentials.xml` on Windows.

---

**Note:** `HOME` variable is sometimes not set for processes running as system services. If you want to rely on the default credential store location, make sure `HOME` is set for the proxy process.

---

## Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the ESXi host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the esxi host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the ESXi host to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the host. For example, you can get the ESXi host's system information:

```
salt <id> esxi.cmd system_info
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. `salt.modules.vsphere` is a standard Salt execution module. If you pull up the docs for it you'll see that almost every function in the module takes credentials and a target host. When credentials and a host aren't passed, Salt runs commands through `pyVmomi` against the local machine. If you wanted, you could run functions from this module on any host where an appropriate version of `pyVmomi` is installed, and that host would reach out over the network and communicate with the ESXi host.

`esxi.cmd` acts as a "shim" between the execution module and the proxy. Its first parameter is always the function from `salt.modules.vsphere`. If the function takes more positional or keyword arguments you can append them to the call. It's this shim that speaks to the ESXi host through the proxy, arranging for the credentials and hostname to be pulled from the Pillar section for this Proxy Minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the ESXi host, you'll want to look in `salt.modules.vsphere` instead of `salt.modules.esxi`.

## States

Associated states are thoroughly documented in `salt.states.esxi`. Look there to find an example structure for Pillar as well as an example `.sls` file for standing up an ESXi host from scratch.

`salt.proxy.esxi.ch_config(cmd, *args, **kwargs)`

This function is called by the `salt.modules.esxi.cmd` shim. It then calls whatever is passed in `cmd` inside the `salt.modules.vsphere` module. Passes the return through from the `vsphere` module.

**cmd**

The command to call inside `salt.modules.vsphere`

**args**

Arguments that need to be passed to that command.

**kwargs**

Keyword arguments that need to be passed to that command.

`salt.proxy.esxi.find_credentials(host)`

Cycle through all the possible credentials and return the first one that works.

`salt.proxy.esxi.get_details()`

Return the proxy details

`salt.proxy.esxi.grains()`

Get the grains from the proxy device.

`salt.proxy.esxi.grains_refresh()`

Refresh the grains from the proxy device.

`salt.proxy.esxi.init(opts)`

This function gets called when the proxy starts up. For ESXi devices, the host, login credentials, and, if configured, the protocol and port are cached.

`salt.proxy.esxi.is_connected_via_vcenter()`

`salt.proxy.esxi.ping()`

Returns True if connection is to be done via a vCenter (no connection is attempted). Check to see if the host is responding when connecting directly via an ESXi host.

CLI Example:

```
salt esxi-host test.ping
```

`salt.proxy.esxi.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 26.13.11 salt.proxy.esxvm

Proxy Minion interface module for managing VMWare ESXi virtual machines.

## Dependencies

- pyVmomi
- jsonschema

## Configuration

To use this integration proxy module, please configure the following:

### Pillar

Proxy minions get their configuration from Salt's Pillar. This can now happen from the proxy's configuration file.

Example pillars:

userpass mechanism:

```
proxy:
  proxytype: esxvm
  datacenter: <datacenter name>
  vcenter: <ip or dns name of parent vcenter>
  mechanism: userpass
  username: <vCenter username>
  passwords: (required if userpass is used)
    - first_password
    - second_password
    - third_password
```

sspi mechanism:

```
proxy:
  proxytype: esxvm
  datacenter: <datacenter name>
  vcenter: <ip or dns name of parent vcenter>
  mechanism: sspi
  domain: <user domain>
  principal: <host kerberos principal>
```

### proxytype

To use this Proxy Module, set this to esxvm.

### **datacenter**

Name of the datacenter where the virtual machine should be deployed. Required.

### **vcenter**

The location of the VMware vCenter server (host of ip) where the virtual machine should be managed. Required.

### **mechanism**

The mechanism used to connect to the vCenter server. Supported values are `userpass` and `sspi`. Required.

---

**Note:** Connections are attempted using all (username, password) combinations on proxy startup.

---

### **username**

The username used to login to the host, such as `root`. Required if mechanism is `userpass`.

### **passwords**

A list of passwords to be used to try and login to the vCenter server. At least one password in this list is required if mechanism is `userpass`. When the proxy comes up, it will try the passwords listed in order.

### **domain**

User realm domain. Required if mechanism is `sspi`.

### **principal**

Kerberos principal. Required if mechanism is `sspi`.

### **protocol**

If the ESXi host is not using the default protocol, set this value to an alternate protocol. Default is `https`.

## port

If the ESXi host is not using the default port, set this value to an alternate port. Default is 443.

## Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the vCenter server in the pillar. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

To start a proxy minion one needs to establish its identity <id>:

```
salt-proxy --proxyid <proxy_id>
```

On the machine that will run the proxy, make sure there is a configuration file present. By default this is `/etc/salt/proxy`. If in a different location, the <configuration\_folder> has to be specified when running the proxy: file with at least the following in it:

```
salt-proxy --proxyid <proxy_id> -c <configuration_folder>
```

## Commands

Once the proxy is running it will connect back to the specified master and individual commands can be runs against it:

```
# Master - minion communication
salt <proxy_id> test.ping

# Test vcenter connection
salt <proxy_id> vsphere.test_vcenter_connection
```

## States

Associated states are documented in `salt.states.esxvm`. Look there to find an example structure for Pillar as well as an example `.sls` file for configuring an ESX virtual machine from scratch.

`salt.proxy.esxvm.find_credentials()`

Cycle through all the possible credentials and return the first one that works.

`salt.proxy.esxvm.get_details()`

Function that returns the cached details

`salt.proxy.esxvm.init(opts)`

This function gets called when the proxy starts up. For login the protocol and port are cached.

`salt.proxy.esxvm.ping()`

Returns True.

CLI Example:

```
salt esx-vm test.ping
```

`salt.proxy.esxvm.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

## 26.13.12 salt.proxy.fx2

### Dell FX2 chassis

New in version 2015.8.2.

Proxy minion interface module for managing Dell FX2 chassis (Dell Chassis Management Controller version 1.2 and above, iDRAC8 version 2.00 and above)

### Dependencies

- *iDRAC Remote execution module* (`salt.modules.dracr`)
- *Chassis command shim* (`salt.modules.chassis`)
- *Dell Chassis States* (`salt.states.dellchassis`)
- Dell's `racadm` command line interface to CMC and iDRAC devices.

**Special Note:** SaltStack thanks [Adobe Corporation](#) for their support in creating this proxy minion integration.

This proxy minion enables Dell FX2 and FX2s (hereafter referred to as simply "chassis", "CMC", or "FX2") chassis to be treated individually like a salt-minion.

Since the CMC embedded in the chassis does not run an OS capable of hosting a Python stack, the chassis can't run a minion directly. Salt's "Proxy Minion" functionality enables you to designate another machine to host a minion process that "proxies" communication from the salt-master. The master does not know nor care that the target is not a real minion.

More in-depth conceptual reading on Proxy Minions can be found *in the Proxy Minion section* of Salt's documentation.

To configure this integration, follow these steps:

### Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar, and a reference in the Pillar toplevel that matches the ID. At a minimum for communication with the chassis the pillar should look like this:

```
proxy:
  host: <ip or dns name of chassis controller>
  admin_username: <iDRAC username for the CMC, usually 'root'>
  fallback_admin_username: <username to try if the first fails>
  passwords:
    - first_password
    - second_password
    - third_password
  proxytype: fx2
```

The `proxytype` line above is critical, it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the salt-master (if you have created your own proxy module, for example).

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password, a potential fallback password, and the third password can be the one you intend to change the chassis to use. This way, after it is changed, you should not need to restart the proxy minion--it should just pick up the third password in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

Beware, many Dell CMC and iDRAC units are configured to lockout IP addresses or users after too many failed password attempts. This can generate user panic in the form of "I no longer know what the password is!!!". To mitigate panic try the web interface from a different IP, or setup a emergency administrator user in the CMC before doing a wholesale password rotation.

The automatic lockout can be disabled via Salt with the following:

```
salt <cmc> chassis.cmd set_general cfgRacTuning cfgRacTuneIpBlkEnable 0
```

and then verified with

```
salt <cmc> chassis.cmd get_general cfgRacTuning cfgRacTuneIpBlkEnable
```

### salt-proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your salt-master and to the chassis in question. SaltStack recommends that this machine also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can start the proxy with

```
salt-proxy --proxyid <id you want to give the chassis>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you want to give the chassis>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the chassis to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the chassis. For example, you can get the chassis inventory:

```
salt <id> chassis.cmd inventory
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. `salt.modules.dracr` is a standard Salt execution module. If you pull up the docs for it you'll see that almost every function in the module takes credentials and a target host. When credentials and a host aren't passed, Salt runs `racadm` against the local machine. If you wanted you could run functions from this module on any host where an appropriate version of `racadm` is installed, and that host would reach out over the network and communicate with the chassis.

`Chassis.cmd` acts as a "shim" between the execution module and the proxy. Its first parameter is always the function from `salt.modules.dracr` to execute. If the function takes more positional or keyword arguments you can append them to the call. It's this shim that speaks to the chassis through the proxy, arranging for the credentials and hostname to be pulled from the pillar section for this proxy minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the chassis, you'll want to look in `salt.modules.dracr` instead of `salt.modules.chassis`.

## States

Associated states are thoroughly documented in `salt.states.dellchassis`. Look there to find an example structure for pillar as well as an example `.sls` file for standing up a Dell Chassis from scratch.

`salt.proxy.fx2.admin_password()`

Return the `admin_password` in the `DETAILS` dictionary, or 'calvin' (the Dell default) if there is none present

`salt.proxy.fx2.admin_username()`

Return the `admin_username` in the `DETAILS` dictionary, or root if there is none present

`salt.proxy.fx2.chconfig(cmd, *args, **kwargs)`

This function is called by the `salt.modules.chassis.cmd` shim. It then calls whatever is passed in `cmd` inside the `salt.modules.dracr` module.

### Parameters

- **cmd** -- The command to call inside `salt.modules.dracr`
- **args** -- Arguments that need to be passed to that command
- **kwargs** -- Keyword arguments that need to be passed to that command

### Returns

Passthrough the return from the `dracr` module.

`salt.proxy.fx2.find_credentials()`

Cycle through all the possible credentials and return the first one that works

`salt.proxy.fx2.grains()`

Get the grains from the proxied device

`salt.proxy.fx2.grains_refresh()`

Refresh the grains from the proxied device

`salt.proxy.fx2.host()`

`salt.proxy.fx2.init(opts)`

This function gets called when the proxy starts up. We check `opts` to see if a fallback user and password are supplied. If they are present, and the primary credentials don't work, then we try the backup before failing.

Whichever set of credentials works is placed in the persistent `DETAILS` dictionary and will be used for further communication with the chassis.

`salt.proxy.fx2.ping()`

Is the chassis responding?

### Returns

Returns False if the chassis didn't respond, True otherwise.

`salt.proxy.fx2.shutdown(opts)`

Shutdown the connection to the proxied device. For this proxy shutdown is a no-op.

### 26.13.13 salt.proxy.junos

Interface with a Junos device via proxy-minion. To connect to a junos device via junos proxy, specify the host information in the pillar in `'/srv/pillar/details.sls'`

```
proxy:
  proxytype: junos
  host: <ip or dns name of host>
  username: <username>
  port: 830
  password: <secret>
```

In `'/srv/pillar/top.sls'` map the device details with the proxy name.

```
base:
  'vmx':
    - details
```

After storing the device information in the pillar, configure the proxy in `'/etc/salt/proxy'`

```
master: <ip or hostname of salt-master>
```

Run the salt proxy via the following command:

```
salt-proxy --proxyid=vmx
```

**class** `salt.proxy.junos.RebootActive(**kwargs)`

Class to get static variable, to indicate when a reboot/shutdown is being processed and the `keep_alive` should not probe the connection since it interferes with the shutdown process.

**reboot\_shutdown = False**

`salt.proxy.junos.alive(opts)`

Validate and return the connection status with the remote device.

New in version 2018.3.0.

`salt.proxy.junos.conn()`

`salt.proxy.junos.get_reboot_active()`

`salt.proxy.junos.get_serialized_facts()`

`salt.proxy.junos.init(opts)`

Open the connection to the Junos device, login, and bind to the Resource class

`salt.proxy.junos.initialized()`

`salt.proxy.junos.ping()`

Ping? Pong!

`salt.proxy.junos.proxytype()`

Returns the name of this proxy

`salt.proxy.junos.reboot_active()`

`salt.proxy.junos.reboot_clear()`

`salt.proxy.junos.shutdown(opts)`

This is called when the proxy-minion is exiting to make sure the connection to the device is closed cleanly.

### 26.13.14 salt.proxy.marathon

#### Marathon

Proxy minion for managing a Marathon cluster.

#### Dependencies

- *marathon execution module (salt.modules.marathon)*

#### Pillar

The marathon proxy configuration requires a 'base\_url' property that points to the marathon endpoint:

```
proxy:
  proxytype: marathon
  base_url: http://my-marathon-master.mydomain.com:8080
```

New in version 2015.8.2.

`salt.proxy.marathon.init(opts)`

Perform any needed setup.

`salt.proxy.marathon.ping()`

Is the marathon api responding?

`salt.proxy.marathon.shutdown(opts)`

For this proxy shutdown is a no-op

### 26.13.15 salt.proxy.napalm

#### NAPALM: Network Automation and Programmability Abstraction Layer with Multivendor support

New in version 2016.11.0.

Proxy minion for managing network devices via [NAPALM](#) library.

#### codeauthor

Mircea Ulinic <[ping@mirceaulinic.net](mailto:ping@mirceaulinic.net)> & Jerome Fleury <[jf@cloudflare.com](mailto:jf@cloudflare.com)>

#### maturity

new

#### depends

napalm

platform  
unix

## Dependencies

The `napalm` proxy module requires [NAPALM](#) library to be installed: `pip install napalm` Please check [Installation](#) for complete details.

---

**Note:** Beginning with Salt release 2017.7.3, it is recommended to use `napalm >= 2.0.0`. The library has been unified into a monolithic package, as in opposite to separate packages per driver. For more details you can check [this document](#). While it will still work with the old packages, bear in mind that the NAPALM core team will maintain only the main `napalm` package.

Moreover, for additional capabilities, the users can always define a library that extends NAPALM's base capabilities and configure the `provider` option (see below).

---

## Pillar

The `napalm` proxy configuration requires the following parameters in order to connect to the network device:

### driver

Specifies the network device operating system. For a complete list of the supported operating systems please refer to the [NAPALM Read the Docs page](#).

### host

The IP Address or FQDN to use when connecting to the device. Alternatively, the following field names can be used instead: `hostname`, `fqdn`, `ip`.

### username

The username to be used when connecting to the device.

### passwd

The password needed to establish the connection.

---

**Note:** This field may not be mandatory when working with SSH-based drivers, and the username has a SSH key properly configured on the device targeted to be managed.

---

### optional\_args

Dictionary with the optional arguments. Check the complete list of supported [optional arguments](#).

### always\_alive: **True**

In certain less dynamic environments, maintaining the remote connection permanently open with the network device is not always beneficial. In that case, the user can select to initialize the connection only when needed, by specifying this field to `false`. Default: `true` (maintains the connection with the remote network device).

New in version 2017.7.0.

### provider: **napalm\_base**

The library that provides the `get_network_device` function. This option is useful when the user has more specific needs and requires to extend the NAPALM capabilities using a private library implementation. The only constraint is that the alternative library needs to have the `get_network_device` function available.

New in version 2017.7.1.

**multiprocessing: False**

Overrides the *multiprocessing* option, per proxy minion. The *multiprocessing* option must be turned off for SSH-based proxies. However, some NAPALM drivers (e.g. Arista, NX-OS) are not SSH-based. As multiple proxy minions may share the same configuration file, this option permits the configuration of the *multiprocessing* option more specifically, for some proxy minions.

New in version 2017.7.2.

Proxy pillar file example:

```
proxy:
  proxytype: napalm
  driver: junos
  host: core05.nrt02
  username: my_username
  passwd: my_password
  optional_args:
    port: 12201
```

Example using a user-specific library, extending NAPALM's capabilities, e.g. `custom_napalm_base`:

```
proxy:
  proxytype: napalm
  driver: ios
  fqdn: cr1.th2.par.as1234.net
  username: salt
  password: ''
  provider: custom_napalm_base
```

See also:

- *NAPALM grains: select network devices based on their characteristics*
- *NET module: network basic features*
- *Network config state: Manage the configuration using arbitrary templates*
- *NAPALM YANG state: Manage the configuration according to the YANG models (OpenConfig/IETF)*
- *Network ACL module: Generate and load ACL (firewall) configuration*
- *Network ACL state: Manage the firewall configuration*
- *NTP operational and configuration management module*
- *BGP operational and configuration management module*
- *Routes details*
- *SNMP configuration module*
- *Users configuration management*

**Note:** Beginning with release codename 2019.2.0, any NAPALM command executed when running under a NAPALM Proxy Minion supports the `force_reconnect` magic argument.

Proxy Minions generally establish a connection with the remote network device at the time of the Minion startup and that connection is going to be used forever.

If one would need execute a command on the device but connecting using different parameters (due to various causes, e.g., unable to authenticate the user specified in the Pillar as the authentication system - say TACACS+ is not available, or the DNS resolver is currently down and would like to temporarily use the IP address instead, etc.), it implies updating the Pillar data and restarting the Proxy Minion process restart. In particular cases like that, you can pass the `force_reconnect=True` keyword argument, together with the alternative connection details, to enforce the command to be executed over a separate connection.

For example, if the usual command is `salt '*' net.arp`, you can use the following to connect using a different username instead: `salt '*' net.arp username=my-alt-usr force_reconnect=True`.

---

`salt.proxy.napalm.alive(opts)`

Return the connection status with the remote device.

New in version 2017.7.0.

`salt.proxy.napalm.call(method, *args, **kwargs)`

Calls a specific method from the network driver instance. Please check the [readthedocs](#) page for the updated list of getters.

**Parameters**

- **method** -- specifies the name of the method to be called
- **params** -- contains the mapping between the name and the values of the parameters needed to call the method

**Returns**

A dictionary with three keys:

- **result** (True/False): if the operation succeeded
- **out** (object): returns the object as-is from the call
- **comment** (string): provides more details in case the call failed
- **traceback** (string): complete traceback in case of exception. Please submit an issue including this traceback on the [correct driver repo](#) and make sure to read the [FAQ](#)

Example:

```
__proxy__['napalm.call']('cli'
                        **{
                            'commands': [
                                'show version',
                                'show chassis fan'
                            ]
                        })
```

`salt.proxy.napalm.fns()`

Method called by NAPALM grains module.

`salt.proxy.napalm.get_device()`

Returns the network device object.

`salt.proxy.napalm.get_grains()`

Retrieve facts from the network device.

`salt.proxy.napalm.grains_refresh()`

Refresh the grains.

`salt.proxy.napalm.init(opts)`

Opens the connection with the network device.

`salt.proxy.napalm.initialized()`

Connection finished initializing?

`salt.proxy.napalm.ping()`

Connection open successfully?

`salt.proxy.napalm.shutdown(opts)`

Closes connection with the device.

### 26.13.16 salt.proxy.netmiko\_px

#### Netmiko

New in version 2019.2.0.

Proxy module for managing network devices via Netmiko.

**codeauthor**

Mircea Ulinic <ping@mirceaulinic.net> & Kirk Byers <ktbyers@twb-tech.com>

**maturity**

new

**depends**

netmiko

**platform**

unix

#### Dependencies

The netmiko proxy modules requires Netmiko to be installed: `pip install netmiko`.

#### Pillar

The netmiko proxy configuration requires the following parameters in order to connect to the network device:

- `device_type` - Class selection based on device type. Supported options:
  - `a10`: A10 Networks
  - `accedian`: Accedian Networks
  - `alcatel_aos`: Alcatel AOS
  - `alcatel_sros`: Alcatel SROS
  - `apresia_aeos`: Apresia AEOS
  - `arista_eos`: Arista EOS
  - `aruba_os`: Aruba
  - `avaya_ers`: Avaya ERS
  - `avaya_vsp`: Avaya VSP
  - `brocade_fastiron`: Brocade Fastiron
  - `brocade_netiron`: Brocade Netiron

- brocade\_nos: Brocade NOS
- brocade\_vdx: Brocade NOS
- brocade\_vyos: VyOS
- checkpoint\_gaia: Check Point GAiA
- calix\_b6: Calix B6
- ciena\_saos: Ciena SAOS
- cisco\_asa: Cisco SA
- cisco\_ios: Cisco IOS
- cisco\_nxos: Cisco NX-os
- cisco\_s300: Cisco S300
- cisco\_tp: Cisco TpTcCe
- cisco\_wlc: Cisco WLC
- cisco\_xe: Cisco IOS
- cisco\_xr: Cisco XR
- coriant: Coriant
- dell\_force10: Dell Force10
- dell\_os10: Dell OS10
- dell\_powerconnect: Dell PowerConnect
- eltex: Eltex
- enterasys: Enterasys
- extreme: Extreme
- extreme\_wing: Extreme Wing
- f5\_ltm: F5 LTM
- fortinet: Fortinet
- generic\_termserver: TerminalServer
- hp\_comware: HP Comware
- hp\_procurve: HP Procurve
- huawei: Huawei
- huawei\_vrpv8: Huawei VRPV8
- juniper: Juniper Junos
- juniper\_junos: Juniper Junos
- linux: Linux
- mellanox: Mellanox
- mrv\_optiswitch: MrvOptiswitch
- netapp\_cdot: NetAppcDot
- netscaler: Netscaler

- ovs\_linux: OvsLinux
  - paloalto\_panos: PaloAlto Panos
  - pluribus: Pluribus
  - quanta\_mesh: Quanta Mesh
  - ruckus\_fastiron: Ruckus Fastiron
  - ubiquiti\_edge: Ubiquiti Edge
  - ubiquiti\_edgeswitch: Ubiquiti Edge
  - vyatta\_vyos: VyOS
  - vyos: VyOS
  - brocade\_fastiron\_telnet: Brocade Fastiron over Telnet
  - brocade\_netiron\_telnet: Brocade Netiron over Telnet
  - cisco\_ios\_telnet: Cisco IOS over Telnet
  - apresia\_aeos\_telnet: Apresia AEOS over Telnet
  - arista\_eos\_telnet: Arista EOS over Telnet
  - hp\_procurve\_telnet: HP Procurve over Telnet
  - hp\_comware\_telnet: HP Comware over Telnet
  - juniper\_junos\_telnet: Juniper Junos over Telnet
  - calix\_b6\_telnet: Calix B6 over Telnet
  - dell\_powerconnect\_telnet: Dell PowerConnect over Telnet
  - generic\_termserver\_telnet: TerminalServer over Telnet
  - extreme\_telnet: Extreme Networks over Telnet
  - ruckus\_fastiron\_telnet: Ruckus Fastiron over Telnet
  - cisco\_ios\_serial: Cisco IOS over serial port
- ip - IP address of target device (not required if host is provided)
  - host - Hostname of target device (not required if ip is provided)
  - username - Username to authenticate against target device, if required
  - password - Password to authenticate against target device, if required
  - secret - The enable password if target device requires one
  - port - The destination port used to connect to the target device
  - global\_delay\_factor - Multiplication factor affecting Netmiko delays (default: 1)
  - use\_keys - Connect to target device using SSH keys (default: False)
  - key\_file - Filename path of the SSH key file to use
  - allow\_agent - Enable use of SSH key-agent
  - ssh\_strict - Automatically reject unknown SSH host keys (default: False, which means unknown SSH host keys will be accepted)
  - system\_host\_keys - Load host keys from the user's "known\_hosts" file (default: False)

- `alt_host_keys` - If `True`, host keys will be loaded from the file specified in `alt_key_file` (default: `False`)
- `alt_key_file` - SSH host key file to use (if `alt_host_keys=True`)
- `ssh_config_file` - File name of OpenSSH configuration file
- `timeout` - Connection timeout, in seconds (default: `90`)
- `session_timeout` - Set a timeout for parallel requests, in seconds (default: `60`)
- `keepalive` - Send SSH keepalive packets at a specific interval, in seconds. Currently defaults to `0`, for backwards compatibility (it will not attempt to keep the connection alive using the `KEEPALIVE` packets).
- `default_enter` - Character(s) to send to correspond to enter key (default: `\n`)
- `response_return` - Character(s) to use in normalized return data to represent enter key (default: `\n`)
- `always_alive` - In certain less dynamic environments, maintaining the remote connection permanently open with the network device is not always beneficial. In that case, the user can select to initialize the connection only when needed, by setting this option to `False`. By default this option is set to `True` (maintains the connection with the remote network device)
- `multiprocessing` - Overrides the `multiprocessing` option, per proxy minion, as the Netmiko communication channel is mainly SSH (default: `False`)
- `connection_timeout` - The number of seconds to attempt to connect to the device in seconds. (default: `300`)

### Proxy Pillar Example

```
proxy:
  proxytype: netmiko
  device_type: juniper_junos
  host: router1.example.com
  username: example
  password: example
```

```
proxy:
  proxytype: netmiko
  device_type: cisco_ios
  ip: 1.2.3.4
  username: test
  use_keys: true
  secret: w3@k
```

`salt.proxy.netmiko_px.alive(opts)`

Return the connection status with the network device.

`salt.proxy.netmiko_px.args()`

Return the Netmiko device args.

`salt.proxy.netmiko_px.call(method, *args, **kwargs)`

Calls an arbitrary netmiko method.

`salt.proxy.netmiko_px.conn()`

Return the connection object.

`salt.proxy.netmiko_px.connection(connection_timeout=300)`

`salt.proxy.netmiko_px.init(opts)`

Open the connection to the network device managed through netmiko.

`salt.proxy.netmiko_px.initialized()`

Connection finished initializing?

`salt.proxy.netmiko_px.make_con(connection_timeout=300)`

`salt.proxy.netmiko_px.ping()`

Connection open successfully?

`salt.proxy.netmiko_px.shutdown(opts)`

Closes connection with the device.

### 26.13.17 salt.proxy.nxos

Proxy Minion for Cisco NX-OS Switches

New in version 2016.11.0.

The Cisco NX-OS Proxy Minion is supported on NX-OS devices for the following connection types: 1) Connection Type SSH 2) Connection Type NX-API (If Supported By The Device and Image Version).

**maturity**  
new

**platform**  
nxos

SSH uses the built in SSHConnection module in `salt.utils.vt_helper`

To configure the proxy minion for ssh:

```
proxy:
  proxytype: nxos
  connection: ssh
  host: 192.168.187.100
  username: admin
  password: admin
  prompt_name: nxos-switch
  ssh_args: '-o PubkeyAuthentication=no'
  key_accept: True
```

To configure the proxy minion for nxapi:

```
proxy:
  proxytype: nxos
  connection: nxapi
  host: 192.168.187.100
  username: admin
  password: admin
  transport: http
  port: 80
  verify: False
  save_config: False
```

**proxytype:**

(REQUIRED) Use this proxy minion *nxos*

**connection:**

(REQUIRED) connection transport type. Choices: *ssh*, *nxapi* Default: *ssh*

**host:**

(REQUIRED) login ip address or dns hostname.

**username:**

(REQUIRED) login username.

**password:**

(REQUIRED) login password.

**save\_config:**

If True, 'copy running-config starting-config' is issues for every configuration command. If False, Running config is not saved to startup config Default: True

The recommended approach is to use the *save\_running\_config* function instead of this option to improve performance. The default behavior controlled by this option is preserved for backwards compatibility.

## Connection SSH Args:

**prompt\_name:**

(REQUIRED when *connection* is *ssh*) (REQUIRED, this or *prompt\_regex* below, but not both) The name in the prompt on the switch. Recommended to use your device's hostname.

**prompt\_regex:**

(REQUIRED when *connection* is *ssh*) (REQUIRED, this or *prompt\_name* above, but not both) A regular expression that matches the prompt on the switch and any other possible prompt at which you need the proxy minion to continue sending input. This feature was specifically developed for situations where the switch may ask for confirmation. *prompt\_name* above would not match these, and so the session would timeout.

Example:

```
nxos-switch#.*|\(y\/n\)\/\?.*
```

This should match

```
nxos-switch#
```

or

```
Flash complete. Reboot this switch (y/n)? [n]
```

If neither *prompt\_name* nor *prompt\_regex* is specified the prompt will be defaulted to

```
.*#
```

which should match any number of characters followed by a # at the end of the line. This may be far too liberal for most installations.

**ssh\_args:**

Extra optional arguments used for connecting to switch.

**key\_accept:**

Whether or not to accept the host key of the switch on initial login. Default: *False*

## Connection NXAPI Args:

**transport:**

(REQUIRED) when *connection* is *nxapi*. Choices: *http*, *https* Default: *https*

**port:**

(REQUIRED) when *connection* is *nxapi*. Default: *80*

**verify:**

(REQUIRED) when *connection* is *nxapi*. Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Default: *True*

When there is no certificate configuration on the device and this option is set as *True* (default), the commands will fail with the following error: `SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581)`. In this case, you either need to configure a proper certificate on the device (*recommended*), or bypass the checks setting this argument as *False* with all the security risks considered.

Check [https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus3000/sw/programmability/6\\_x/b\\_Cisco\\_Nexus\\_3000\\_Series\\_NX-OS\\_Programmability\\_Guide/b\\_Cisco\\_Nexus\\_3000\\_Series\\_NX-OS\\_Programmability\\_Guide\\_chapter\\_01.html](https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus3000/sw/programmability/6_x/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide_chapter_01.html) to see how to properly configure the certificate.

The functions from the proxy minion can be run from the salt commandline using the `salt.modules.nxos` execution module.

**salt.proxy.nxos.grains()**

Helper function for nxos execution module functions that need to retrieve nxos grains using the proxy minion.

**salt.proxy.nxos.grains\_refresh()**

Helper function for nxos execution module functions that need to refresh nxos grains using the proxy minion.

**salt.proxy.nxos.init**(*opts=None*)

Required. Initialize device connection using ssh or nxapi connection type.

**salt.proxy.nxos.initialized()**

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether the `init()` function has been called.

**salt.proxy.nxos.ping()**

Helper function for nxos execution module functions that need to ping the nxos device using the proxy minion.

**salt.proxy.nxos.proxy\_config**(*commands*, *save\_config=None*)

Helper function for nxos execution module functions that need to configure an nxos device using the proxy minion.

**salt.proxy.nxos.sendline**(*commands*, *method='cli\_show\_ascii'*, *\*\*kwargs*)

Helper function for nxos execution module functions that need to send commands to an nxos device using the proxy minion.

**salt.proxy.nxos.shutdown()**

Not supported. Only used as a place holder to satisfy shutdown function requirement.

### 26.13.18 salt.proxy.nxos\_api

Proxy Minion to manage Cisco Nexus Switches (NX-OS) over the NX-API

New in version 2019.2.0.

Proxy module for managing Cisco Nexus switches via the NX-API.

**codeauthor**  
Mircea Ulinic <ping@mirceaulinic.net>

**maturity**  
new

**platform**  
any

#### Usage

---

**Note:** To be able to use this module you need to enable to NX-API on your switch, by executing `feature nxapi` in configuration mode.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

---

**Note:** NX-API requires modern NXOS distributions, typically at least 7.0 depending on the hardware. Due to reliability reasons it is recommended to run the most recent version.

Check [https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus7000/sw/programmability/guide/b\\_Cisco\\_Nexus\\_7000\\_Series\\_NX-OS\\_Programmability\\_Guide/b\\_Cisco\\_Nexus\\_7000\\_Series\\_NX-OS\\_Programmability\\_Guide\\_chapter\\_0101.html](https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus7000/sw/programmability/guide/b_Cisco_Nexus_7000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_7000_Series_NX-OS_Programmability_Guide_chapter_0101.html) for more details.

---

#### Pillar

The `nxos_api` proxy configuration requires the following parameters in order to connect to the network switch:

**transport:** `https`

Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

**host:** `localhost`

The IP address or DNS host name of the connection device.

**username:** `admin`

The username to pass to the device to authenticate the NX-API connection.

**password**

The password to pass to the device to authenticate the NX-API connection.

**port**

The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**timeout: 60**

Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify: True**

Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

When there is no certificate configuration on the device and this option is set as `True` (default), the commands will fail with the following error: `SSLError: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581)`. In this case, you either need to configure a proper certificate on the device (*recommended*), or bypass the checks setting this argument as `False` with all the security risks considered.

Check [https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus3000/sw/programmability/6\\_x/b\\_Cisco\\_Nexus\\_3000\\_Series\\_NX-OS\\_Programmability\\_Guide/b\\_Cisco\\_Nexus\\_3000\\_Series\\_NX-OS\\_Programmability\\_Guide\\_chapter\\_01.html](https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus3000/sw/programmability/6_x/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide_chapter_01.html) to see how to properly configure the certificate.

All the arguments may be optional, depending on your setup.

**Proxy Pillar Example**

```
proxy:
  proxytype: nxos_api
  host: switch1.example.com
  username: example
  password: example
```

`salt.proxy.nxos_api.get_conn_args()`

Returns the connection arguments of the Proxy Minion.

`salt.proxy.nxos_api.init(opts)`

Open the connection to the Nexsu switch over the NX-API.

As the communication is HTTP based, there is no connection to maintain, however, in order to test the connectivity and make sure we are able to bring up this Minion, we are executing a very simple command (`show clock`) which doesn't come with much overhead and it's sufficient to confirm we are indeed able to connect to the NX-API endpoint as configured.

`salt.proxy.nxos_api.initialized()`

Connection finished initializing?

`salt.proxy.nxos_api.ping()`

Connection open successfully?

`salt.proxy.nxos_api.rpc(commands, method='cli', **kwargs)`

Executes an RPC request over the NX-API.

`salt.proxy.nxos_api.shutdown(opts)`

Closes connection with the device.

### 26.13.19 salt.proxy.panos

#### Proxy Minion interface module for managing Palo Alto firewall devices

New in version 2018.3.0.

```

platform
    unix
```

This proxy minion enables Palo Alto firewalls (hereafter referred to as simply 'panos') to be treated individually like a Salt Minion.

The panos proxy leverages the XML API functionality on the Palo Alto firewall. The Salt proxy must have access to the Palo Alto firewall on HTTPS (tcp/443).

More in-depth conceptual reading on Proxy Minions can be found in the *Proxy Minion* section of Salt's documentation.

#### Configuration

To use this integration proxy module, please configure the following:

#### Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. There are four connection options available for the panos proxy module.

- Direct Device (Password)
- Direct Device (API Key)
- Panorama Pass-Through (Password)
- Panorama Pass-Through (API Key)

#### Direct Device (Password)

The direct device configuration configures the proxy to connect directly to the device with username and password.

```
proxy:
  proxytype: panos
  host: <ip or dns name of panos host>
  username: <panos username>
  password: <panos password>
  verify_ssl: True
```

### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

### host

The location, or ip/dns, of the panos host. Required.

### username

The username used to login to the panos host. Required.

### password

The password used to login to the panos host. Required.

### Direct Device (API Key)

Palo Alto devices allow for access to the XML API with a generated 'API key'\_ instead of username and password.

```
proxy:
  proxytype: panos
  host: <ip or dns name of panos host>
  apikey: <panos generated api key>
```

### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

### host

The location, or ip/dns, of the panos host. Required.

### apikey

The generated XML API key for the panos host. Required.

### Panorama Pass-Through (Password)

The Panorama pass-through method sends all connections through the Panorama management system. It passes the connections to the appropriate device using the serial number of the Palo Alto firewall.

This option will reduce the number of connections that must be present for the proxy server. It will only require a connection to the Panorama server.

The username and password will be for authentication to the Panorama server, not the panos device.

```
proxy:  
  proxytype: panos  
  serial: <serial number of panos host>  
  host: <ip or dns name of the panorama server>  
  username: <panorama server username>  
  password: <panorama server password>
```

#### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

#### serial

The serial number of the panos host. Required.

#### host

The location, or ip/dns, of the Panorama server. Required.

#### username

The username used to login to the Panorama server. Required.

#### password

The password used to login to the Panorama server. Required.

### Panorama Pass-Through (API Key)

The Panorama server can also utilize a generated 'API key' for authentication.

```
proxy:  
  proxytype: panos  
  serial: <serial number of panos host>  
  host: <ip or dns name of the panorama server>  
  apikey: <panos generated api key>
```

## proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

## serial

The serial number of the panos host. Required.

## host

The location, or ip/dns, of the Panorama server. Required.

## apikey

The generated XML API key for the Panorama server. Required.

`salt.proxy.panos.call(payload=None)`

This function captures the query string and sends it to the Palo Alto device.

`salt.proxy.panos.grains()`

Get the grains from the proxied device

`salt.proxy.panos.grains_refresh()`

Refresh the grains from the proxied device

`salt.proxy.panos.init(opts)`

This function gets called when the proxy starts up. For panos devices, a determination is made on the connection type and the appropriate connection details that must be cached.

`salt.proxy.panos.initialized()`

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our `init()` function has been called

`salt.proxy.panos.is_required_version(required_version='0.0.0')`

Because different versions of Palo Alto support different command sets, this function will return true if the current version of Palo Alto supports the required command.

`salt.proxy.panos.ping()`

Returns true if the device is reachable, else false.

`salt.proxy.panos.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 26.13.20 salt.proxy.philips\_hue

Philips HUE lamps module for proxy.

New in version 2015.8.3.

First create a new user on the Hue bridge by following the [Meet hue](#) instructions.

To configure the proxy minion:

```
proxy:
  proxytype: philips_hue
  host: [hostname or ip]
  user: [username]
```

#### class salt.proxy.philips\_hue.Const

Constants for the lamp operations.

```
COLOR_BLUE = {'hue': 46920, 'sat': 254}
```

```
COLOR_DAYLIGHT = {'xy': [0.3806, 0.3576]}
```

```
COLOR_GREEN = {'hue': 25500, 'sat': 254}
```

```
COLOR_ORANGE = {'hue': 12000, 'sat': 254}
```

```
COLOR_PINK = {'xy': [0.3688, 0.2095]}
```

```
COLOR_PURPLE = {'xy': [0.3787, 0.1724]}
```

```
COLOR_RED = {'hue': 0, 'sat': 254}
```

```
COLOR_WHITE = {'xy': [0.3227, 0.329]}
```

```
COLOR_YELLOW = {'xy': [0.4432, 0.5154]}
```

```
LAMP_OFF = {'on': False, 'transitiontime': 0}
```

```
LAMP_ON = {'on': True, 'transitiontime': 0}
```

salt.proxy.philips\_hue.call\_alert(\*args, \*\*kwargs)

Lamp alert

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **on**: Turns on or off an alert. Default is True.

CLI Example:

```
salt '*' hue.alert
salt '*' hue.alert id=1
salt '*' hue.alert id=1,2,3 on=false
```

salt.proxy.philips\_hue.call\_blink(\*args, \*\*kwargs)

Blink a lamp. If lamp is ON, then blink ON-OFF-ON, otherwise OFF-ON-OFF.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **pause**: Time in seconds. Can be less than 1, i.e. 0.7, 0.5 sec.

CLI Example:

```
salt '*' hue.blink id=1
salt '*' hue.blink id=1,2,3
```

`salt.proxy.philips_hue.call_brightness(*args, **kwargs)`

Set an effect to the lamp.

Arguments:

- **value:** 0~255 brightness of the lamp.

Options:

- **id:** Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **transition:** Transition 0~200. Default 0.

CLI Example:

```
salt '*' hue.brightness value=100
salt '*' hue.brightness id=1 value=150
salt '*' hue.brightness id=1,2,3 value=255
```

`salt.proxy.philips_hue.call_color(*args, **kwargs)`

Set a color to the lamp.

Options:

- **id:** Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **color:** Fixed color. Values are: red, green, blue, orange, pink, white, yellow, daylight, purple. Default white.
- **transition:** Transition 0~200.

Advanced:

- **gamut:** XY coordinates. Use gamut according to the Philips HUE devices documentation. More: <http://www.developers.meethue.com/documentation/hue-xy-values>

CLI Example:

```
salt '*' hue.color
salt '*' hue.color id=1
salt '*' hue.color id=1,2,3 color=red transition=30
salt '*' hue.color id=1 gamut=0.3,0.5
```

`salt.proxy.philips_hue.call_effect(*args, **kwargs)`

Set an effect to the lamp.

Options:

- **id:** Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **type:** Type of the effect. Possible values are "none" or "colorloop". Default "none".

CLI Example:

```
salt '*' hue.effect
salt '*' hue.effect id=1
salt '*' hue.effect id=1,2,3 type=colorloop
```

`salt.proxy.philips_hue.call_lights(*args, **kwargs)`

Get info about all available lamps.

Options:

- **id:** Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.lights
salt '*' hue.lights id=1
salt '*' hue.lights id=1,2,3
```

`salt.proxy.philips_hue.call_ping(*args, **kwargs)`

Ping the lamps by issuing a short inversion blink to all available devices.

CLI Example:

```
salt '*' hue.ping
```

`salt.proxy.philips_hue.call_rename(*args, **kwargs)`

Rename a device.

Options:

- **id**: Specifies a device ID. Only one device at a time.
- **title**: Title of the device.

CLI Example:

```
salt '*' hue.rename id=1 title='WC for cats'
```

`salt.proxy.philips_hue.call_status(*args, **kwargs)`

Return the status of the lamps.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.status
salt '*' hue.status id=1
salt '*' hue.status id=1,2,3
```

`salt.proxy.philips_hue.call_switch(*args, **kwargs)`

Switch lamp ON/OFF.

If no particular state is passed, then lamp will be switched to the opposite state.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **on**: True or False. Inverted current, if omitted

CLI Example:

```
salt '*' hue.switch
salt '*' hue.switch id=1
salt '*' hue.switch id=1,2,3 on=True
```

`salt.proxy.philips_hue.call_temperature(*args, **kwargs)`

Set the mired color temperature. More: <http://en.wikipedia.org/wiki/Mired>

Arguments:

- **value**: 150-500.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```

salt '*' hue.temperature value=150
salt '*' hue.temperature value=150 id=1
salt '*' hue.temperature value=150 id=1,2,3

```

`salt.proxy.philips_hue.init(cnf)`

Initialize the module.

`salt.proxy.philips_hue.ping(*args, **kw)`

Ping the lamps.

`salt.proxy.philips_hue.shutdown(opts, *args, **kw)`

Shuts down the service.

### 26.13.21 salt.proxy.rest\_sample

This is a simple proxy-minion designed to connect to and communicate with the bottle-based web service contained in [https://github.com/saltstack/salt-contrib/tree/master/proxyminion\\_rest\\_example](https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example)

`salt.proxy.rest_sample.alive(opts)`

`salt.proxy.rest_sample.fix_outage()`

`salt.proxy.rest_sample.fns()`

`salt.proxy.rest_sample.grains()`

Get the grains from the proxied device

`salt.proxy.rest_sample.grains_refresh()`

Refresh the grains from the proxied device

`salt.proxy.rest_sample.id(opts)`

Return a unique ID for this proxy minion. This ID MUST NOT CHANGE. If it changes while the proxy is running the salt-master will get really confused and may stop talking to this minion

`salt.proxy.rest_sample.init(opts)`

`salt.proxy.rest_sample.initialized()`

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

`salt.proxy.rest_sample.package_install(name, **kwargs)`

Install a "package" on the REST server

`salt.proxy.rest_sample.package_list()`

List "packages" installed on the REST server

`salt.proxy.rest_sample.package_remove(name)`

Remove a "package" on the REST server

`salt.proxy.rest_sample.package_status(name)`

Check the installation status of a package on the REST server

`salt.proxy.rest_sample.ping()`

Is the REST server up?

`salt.proxy.rest_sample.service_list()`

List "services" on the REST server

`salt.proxy.rest_sample.service_restart(name)`

Restart a "service" on the REST server

`salt.proxy.rest_sample.service_start(name)`

Start a "service" on the REST server

`salt.proxy.rest_sample.service_status(name)`

Check if a service is running on the REST server

`salt.proxy.rest_sample.service_stop(name)`

Stop a "service" on the REST server

`salt.proxy.rest_sample.shutdown(opts)`

For this proxy shutdown is a no-op

`salt.proxy.rest_sample.test_from_state()`

Test function so we have something to call from a state :return:

`salt.proxy.rest_sample.uptodate(name)`

Call the REST endpoint to see if the packages on the "server" are up to date.

### 26.13.22 salt.proxy.restconf

Proxy Minion to manage RESTCONF Devices

**codeauthor**

Jamie (Bear) Murphy <jamiemurphyit@gmail.com>

**maturity**

new

**platform**

any

#### Usage

---

**Note:** To be able to use this module you need to enable RESTCONF on your device and have https enabled.

Cisco Configuration example:

```
switch# conf t
switch(config)# restconf
switch(config)# ip http secure-server
```

---

**Note:** RESTCONF requires modern OS distributions. This plugin has been written specifically to use JSON RESTCONF endpoints

---

## Pillar

The `restconf` proxy configuration requires the following parameters in order to connect to the network switch:

**transport: `https` (str)**

Specifies the type of connection transport to use. Valid values for the connection are `https`, and `http`. The RESTCONF standard explicitly requires `https`, but `http` is included as an option as some manufacturers have ignored this requirement.

**hostname: (str)**

The IP address or DNS host name of the RESTCONF device.

**username: (str)**

The username for the device to authenticate the RESTCONF requests.

**password: (str)**

The password for the device to authenticate the RESTCONF requests.

**verify: `True` or `False` (str, optional, default: `true`)**

Verify the RESTCONF SSL certificate?

When there is no certificate configuration on the device and this option is set as `True` (default), the commands will fail with the following error: `SSLError: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed`.

**Warning:** In this case, you either need to configure a proper certificate on the device (*recommended*), or bypass the checks setting this argument as `False` with all the security risks considered as you may be MITM'd.

## Proxy Pillar Example

**proxy:**

```

proxytype: restconf
host: switch1.example.com
username: example
password: example
verify: false

```

`salt.proxy.restconf.connection_test()`

Runs a connection test via http/https. Returns an array.

`salt.proxy.restconf.init(opts)`

Required. Initialize device config and test an initial connection

`salt.proxy.restconf.initialized()`

Connection finished initializing?

`salt.proxy.restconf.ping()`

Triggers connection test. Returns True or False

`salt.proxy.restconf.request(path, method='GET', dict_payload=None)`

Trigger http request to device

`salt.proxy.restconf.shutdown(opts)`

Closes connection with the device.

### 26.13.23 salt.proxy.ssh\_sample

This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH. This can be used as an option when the device does not provide an api over HTTP and doesn't have the python stack to run a minion.

**salt.proxy.ssh\_sample.fns()**

Method called by grains module.

**salt.proxy.ssh\_sample.grains()**

Get the grains from the proxied device

**salt.proxy.ssh\_sample.grains\_refresh()**

Refresh the grains from the proxied device

**salt.proxy.ssh\_sample.init(*opts*)**

Required. Can be used to initialize the server connection.

**salt.proxy.ssh\_sample.initialized()**

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

**salt.proxy.ssh\_sample.package\_install(*name*, *\*\*kwargs*)**

Install a "package" on the ssh server

**salt.proxy.ssh\_sample.package\_list()**

List "packages" by executing a command via ssh This function is called in response to the salt command

```
salt target_minion pkg.list_pkgs
```

**salt.proxy.ssh\_sample.package\_remove(*name*)**

Remove a "package" on the ssh server

**salt.proxy.ssh\_sample.parse(*out*)**

Extract json from out.

**Parameter**

*out*: Type string. The data returned by the ssh command.

**salt.proxy.ssh\_sample.ping()**

Required. Ping the device on the other end of the connection

**salt.proxy.ssh\_sample.service\_list()**

Start a "service" on the ssh server

New in version 2015.8.2.

**salt.proxy.ssh\_sample.service\_restart(*name*)**

Restart a "service" on the ssh server

New in version 2015.8.2.

**salt.proxy.ssh\_sample.service\_start(*name*)**

Start a "service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.service_stop(name)`

Stop a "service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.shutdown(opts)`

Disconnect

### 26.13.24 salt.proxy.vcenter

Proxy Minion interface module for managing VMWare vCenters.

**codeauthor**

*Rod McKenzie (roderick.mckenzie@morganstanley.com)*

**codeauthor**

*Alexandru Bleotu (alexandru.bleotu@morganstanley.com)*

#### Dependencies

- pyVmomi Python Module

#### pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

---

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

---

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

#### Configuration

To use this proxy module, please use on of the following configurations:

```
proxy:
proxytype: vcenter
vcenter: <ip or dns name of parent vcenter>
username: <vCenter username>
mechanism: userpass
passwords:
```

(continues on next page)

(continued from previous page)

- first\_password
- second\_password
- third\_password

**proxy:**

**proxytype:** vcenter  
**vcenter:** <ip or dns name of parent vcenter>  
**username:** <vCenter username>  
**domain:** <user domain>  
**mechanism:** sspi  
**principal:** <host kerberos principal>

**proxytype**

The **proxytype** key and value pair is critical, as it tells Salt which interface to load from the **proxy** directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this Proxy Module, set this to **vcenter**.

**vcenter**

The location of the VMware vCenter server (host of ip). Required

**username**

The username used to login to the vcenter, such as `root`. Required only for **userpass**.

**mechanism**

The mechanism used to connect to the vCenter server. Supported values are **userpass** and **sspi**. Required.

**passwords**

A list of passwords to be used to try and login to the vCenter server. At least one password in this list is required if **mechanism** is **userpass**

The proxy integration will try the passwords listed in order.

**domain**

User domain. Required if **mechanism** is **sspi**

### principal

Kerberos principal. Required if mechanism is `sspi`

### protocol

If the vCenter is not using the default protocol, set this value to an alternate protocol. Default is `https`.

### port

If the ESXi host is not using the default port, set this value to an alternate port. Default is 443.

## Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the vCenter server in the pillar. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id of the cluster>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the vcenter host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the ESXi host to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the vcenter. For example, you can get if the proxy can actually connect to the vCenter:

```
salt <id> vsphere.test_vcenter_connection
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. `Salt.modules.vsphere` is a standard Salt execution module.

If you pull up the docs for it you'll see that almost every function in the module takes credentials and a targets either a vcenter or a host. When credentials and a host aren't passed, Salt runs commands through `pyVmomi` against the local machine. If you wanted, you could run functions from this module on any host where an appropriate version of `pyVmomi` is installed, and that host would reach out over the network and communicate with the ESXi host.

`salt.proxy.vcenter.find_credentials()`

Cycle through all the possible credentials and return the first one that works.

`salt.proxy.vcenter.get_details()`

Function that returns the cached details

`salt.proxy.vcenter.init(opts)`

This function gets called when the proxy starts up. For login the protocol and port are cached.

`salt.proxy.vcenter.ping()`

Returns True.

CLI Example:

```
salt vcenter test.ping
```

`salt.proxy.vcenter.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

## 26.14 queue modules

---

`pgjsonb_queue`

New in version 2016.3.0.

`sqlite_queue`

New in version 2014.7.0.

---

### 26.14.1 salt.queues.pgjsonb\_queue

New in version 2016.3.0.

This is a queue with postgres as the backend. It uses the jsonb store to store information for queues.

**depends**

python-psycopg2

To enable this queue, the following needs to be configured in your master config. These are the defaults:

```
queue.pgjsonb.host: 'salt'
queue.pgjsonb.user: 'salt'
queue.pgjsonb.password: 'salt'
queue.pgjsonb.dbname: 'salt'
queue.pgjsonb.port: 5432
```

Use the following Pg database schema:

```

CREATE DATABASE salt WITH ENCODING 'utf-8';

--
-- Table structure for table `salt`
--
DROP TABLE IF EXISTS salt;
CREATE OR REPLACE TABLE salt(
  id SERIAL PRIMARY KEY,
  data jsonb NOT NULL
);

```

```

salt-run queue.insert test '{"name": "redis", "host": "172.16.0.8", "port": 6379}' backend=pgjsonb
salt-run queue.process_queue test all backend=pgjsonb

```

`salt.queues.pgjsonb_queue.delete(queue, items)`  
Delete an item or items from a queue

`salt.queues.pgjsonb_queue.handle_queue_creation(queue)`

`salt.queues.pgjsonb_queue.insert(queue, items)`  
Add an item or items to a queue

`salt.queues.pgjsonb_queue.list_items(queue)`  
List contents of a queue

`salt.queues.pgjsonb_queue.list_length(queue)`  
Provide the number of items in a queue

`salt.queues.pgjsonb_queue.list_queues()`  
Return a list of Salt Queues on the Salt Master

`salt.queues.pgjsonb_queue.pop(queue, quantity=1, is_runner=False)`  
Pop one or more or all items from the queue return them.

### 26.14.2 salt.queues.sqlite\_queue

New in version 2014.7.0.

This is the default local master event queue built on sqlite. By default, an sqlite3 database file is created in the `sqlite_queue_dir` which is found at:

```
/var/cache/salt/master/queues
```

It's possible to store the sqlite3 database files by setting `sqlite_queue_dir` to another location:

```
sqlite_queue_dir: /home/myuser/salt/master/queues
```

`salt.queues.sqlite_queue.delete(queue, items)`  
Delete an item or items from a queue

`salt.queues.sqlite_queue.insert(queue, items)`  
Add an item or items to a queue

`salt.queues.sqlite_queue.list_items(queue)`

List contents of a queue

`salt.queues.sqlite_queue.list_length(queue)`

Provide the number of items in a queue

`salt.queues.sqlite_queue.list_queues()`

Return a list of Salt Queues on the Salt Master

`salt.queues.sqlite_queue.pop(queue, quantity=1, is_runner=False)`

Pop one or more or all items from the queue return them.

## 26.15 roster modules

<code>ansible</code>	Read in an Ansible inventory file or script.
<code>cache</code>	The <code>cache</code> roster provides a flexible interface to the Salt Masters' minion cache to access regular minions over <code>salt-ssh</code> .
<code>cloud</code>	Use the cloud cache on the master to derive IPv4 addresses based on minion ID.
<code>clustershell</code>	This roster resolves hostname in a pdsh/clustershell style.
<code>dir</code>	Create a salt roster out of a flat directory of files.
<code>flat</code>	Read in the roster from a flat file using the renderer system
<code>range</code>	This roster resolves targets from a range server.
<code>scan</code>	Scan a netmask or ipaddr for open ssh ports
<code>sshconfig</code>	Parses roster entries out of Host directives from SSH config
<code>sshknownhosts</code>	Parses roster entries out of Host directives from SSH known_hosts
<code>terraform</code>	Dynamic roster from terraform current state

### 26.15.1 salt.roster.ansible

Read in an Ansible inventory file or script.

Flat inventory files should be in the regular ansible inventory format.

```
# /tmp/example_roster
[servers]
salt.gtmanfred.com ansible_ssh_user=gtmanfred ansible_ssh_host=127.0.0.1
→ansible_ssh_port=22 ansible_ssh_pass='password' ansible_sudo_pass='password'

[desktop]
home ansible_ssh_user=gtmanfred ansible_ssh_host=12.34.56.78 ansible_ssh_
→port=23 ansible_ssh_pass='password' ansible_sudo_pass='password'

[computers:children]
desktop
```

(continues on next page)

(continued from previous page)

servers

**[computers:vars]**

http\_port=80

then salt-ssh can be used to hit any of them

```
[~]# salt-ssh --roster=ansible --roster-file=/tmp/example_roster -N all test.
↳ping
salt.gtmanfred.com:
    True
home:
    True
[~]# salt-ssh --roster=ansible --roster-file=/tmp/example_roster -N desktop❌
↳test.ping
home:
    True
[~]# salt-ssh --roster=ansible --roster-file=/tmp/example_roster -N computers❌
↳test.ping
salt.gtmanfred.com:
    True
home:
    True
[~]# salt-ssh --roster=ansible --roster-file=/tmp/example_roster salt.
↳gtmanfred.com test.ping
salt.gtmanfred.com:
    True
```

There is also the option of specifying a dynamic inventory, and generating it on the fly

```
#!/bin/bash
# filename: /etc/salt/hosts
echo '{
  "servers": [
    "salt.gtmanfred.com"
  ],
  "desktop": [
    "home"
  ],
  "computers": {
    "hosts": [],
    "children": [
      "desktop",
      "servers"
    ],
    "vars": {
      "http_port": 80
    }
  },
  "_meta": {
    "hostvars": {
      "salt.gtmanfred.com": {
```

(continues on next page)

(continued from previous page)

```

        "ansible_ssh_user": "gtmanfred",
        "ansible_ssh_host": "127.0.0.1",
        "ansible_sudo_pass": "password",
        "ansible_ssh_pass": "password",
        "ansible_ssh_port": 22
    },
    "home": {
        "ansible_ssh_user": "gtmanfred",
        "ansible_ssh_host": "12.34.56.78",
        "ansible_sudo_pass": "password",
        "ansible_ssh_pass": "password",
        "ansible_ssh_port": 23
    }
}
}'

```

This is the format that an inventory script needs to output to work with ansible, and thus here.

```

[~]# salt-ssh --roster=ansible --roster-file /etc/salt/hosts salt.gtmanfred.
    com test.ping
salt.gtmanfred.com:
    True

```

---

**Note:** A dynamic inventory script must have the executable bit set. In the above example, `chmod +x /etc/salt/hosts`.

---

Any of the [groups] or direct hostnames will return. The 'all' is special, and returns everything.

`salt.roster.ansible.targets` (*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)

Return the targets from the ansible `inventory_file` Default: `/etc/salt/roster`

### 26.15.2 salt.roster.cache

The cache roster provides a flexible interface to the Salt Masters' minion cache to access regular minions over `salt-ssh`.

New in version 2017.7.0:

- grains, pillar, mine data matching
- SDB URLs
- IPv6 support
- roster\_order per config key
- default order changed to industry-wide best practices
- CIDR range selection

## Targeting

This roster supports all matching and targeting of the Salt Master. The matching will be done using only the Salt Master's cache.

## The Roster Order

The roster's composition can be configured using `roster_order`. In the `roster_order` you can define *any* roster key and fill it with a parameter overriding the one in `roster_defaults`:

```
roster_order:
  host: id           # use the minion id as hostname
```

You can define lists of parameters as well, the first result from the list will become the value.

## Selecting a host

```
# default
roster_order:
  host:
    - ipv6-private # IPv6 addresses in private ranges
    - ipv6-global  # IPv6 addresses in global ranges
    - ipv4-private # IPv4 addresses in private ranges
    - ipv4-public  # IPv4 addresses in public ranges
    - ipv4-local   # loopback addresses
```

This is the default `roster_order`. It prefers IPv6 over IPv4 addresses and private addresses over public ones. The relevant data will be fetched from the cache in-order, and the first match will fill the `host` key.

Other address selection parameters are also possible:

```
roster_order:
  host:
    - global|public|private|local # Both IPv6 and IPv4 addresses in that
↪range
    - 2000::/3                    # CIDR networks, both IPv4 and IPv6 are
↪supported
```

## Using cached data

Several cached libraries can be selected using the `library: ``` prefix, followed by the library key. This can be referenced using the same ```` syntax as e.g. `pillar.get`. Lists of references are also supported during the lookup, as are Salt SDB URLs.

This should be especially useful for the other roster keys:

```
roster_order:
  host:
    - grain: fqdn_ip4           # Lookup this grain
    - mine: network.ip_addrs    # Mine data lookup works the same
```

(continues on next page)

(continued from previous page)

```

password: sdb://vault/ssh_pass      # Salt SDB URLs are also supported

user:
- pillar: ssh:auth:user            # Lookup this pillar key
- sdb://osenv/USER                  # Lookup this env var through sdb

priv:
- pillar:                          # Lists are also supported
  - salt:ssh:private_key
  - ssh:auth:private_key

```

`salt.roster.cache.targets` (*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)

Return the targets from the Salt Masters' minion cache. All targets and matchers are supported.

The resulting roster can be configured using `roster_order` and `roster_default`.

### 26.15.3 salt.roster.cloud

Use the cloud cache on the master to derive IPv4 addresses based on minion ID.

This roster requires that the minion in question was created using at least the 2015.5.0 version of Salt Cloud. Starting with the 2015.5.0 release, Salt Cloud maintains an index of minions that it creates and deletes. This index tracks the provider and profile configuration used to provision the minion, including authentication information. So long as this configuration remains current, it can be used by Salt SSH to log into any minion in the index.

To connect as a user other than root, modify the cloud configuration file usually located at `/etc/salt/cloud`. For example, add the following:

```

ssh_username: my_user
sudo: True

```

`salt.roster.cloud.extract_ipv4` (*roster\_order*, *ipv4*)

Extract the preferred IP address from the `ipv4` grain

`salt.roster.cloud.targets` (*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)

Return the targets from the flat yaml file, checks opts for location but defaults to `/etc/salt/roster`

### 26.15.4 salt.roster.clustershell

This roster resolves hostname in a `pdsh/clustershell` style.

**depends**

`clustershell`, <https://github.com/cea-hpc/clustershell>

When you want to use host globs for target matching, use `--roster clustershell`. For example:

```

salt-ssh --roster clustershell 'server_[1-10,21-30],test_server[5,7,9]' test.
↪ping

```

`salt.roster.clustershell.targets` (*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)

Return the targets

### 26.15.5 salt.roster.dir

Create a salt roster out of a flat directory of files.

Each filename in the directory is a minion id. The contents of each file is rendered using the salt renderer system.

Consider the following configuration for example:

config/master:

```
... roster: dir roster_dir: config/roster.d ...
```

Where the directory config/roster.d contains two files:

config/roster.d/minion-x:

```
host: minion-x.example.com port: 22 sudo: true user: ubuntu
```

config/roster.d/minion-y:

```
host: minion-y.example.com port: 22 sudo: true user: gentoo
```

The roster would find two minions: minion-x and minion-y, with the given host, port, sudo and user settings.

The directory roster also extends the concept of roster defaults by supporting a roster\_domain value in config:

```
... roster_domain: example.org ...
```

If that option is set, then any roster without a 'host' setting will have an implicit host of its minion id + '.' + the roster\_domain. (The default roster\_domain is the empty string, so you can also name the files the fully qualified name of each host. However, if you do that, then the fully qualified name of each host is also the minion id.)

This makes it possible to avoid having to specify the hostnames when you always want them to match their minion id plus some domain.

**salt.roster.dir.targets**(tgt, tgt\_type='glob', \*\*kwargs)

Return the targets from the directory of flat yaml files, checks opts for location.

### 26.15.6 salt.roster.flat

Read in the roster from a flat file using the renderer system

**salt.roster.flat.targets**(tgt, tgt\_type='glob', \*\*kwargs)

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

### 26.15.7 salt.roster.range

This roster resolves targets from a range server.

**depends**

seco.range, <https://github.com/ytoolshed/range>

When you want to use a range query for target matching, use `--roster range`. For example:

```
salt-ssh --roster range '%%example.range.cluster' test.ping
```

**salt.roster.range.target\_glob**(tgt, hosts)

**salt.roster.range.target\_range**(tgt, hosts)

`salt.roster.range.targets`(*tgt*, *tgt\_type*='range', *\*\*kwargs*)

Return the targets from a range query

### 26.15.8 salt.roster.scan

Scan a netmask or ipaddr for open ssh ports

**class** `salt.roster.scan.RosterMatcher`(*tgt*, *tgt\_type*)

Matcher for the roster data structure

**targets**()

Return ip addrs based on netmask, sitting in the "glob" spot because it is the default

`salt.roster.scan.targets`(*tgt*, *tgt\_type*='glob', *\*\*kwargs*)

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

### 26.15.9 salt.roster.sshconfig

Parses roster entries out of Host directives from SSH config

```
salt-ssh --roster sshconfig '*' -r "echo hi"
```

**class** `salt.roster.sshconfig.RosterMatcher`(*raw*, *tgt*, *tgt\_type*)

Matcher for the roster data structure

**get\_data**(*minion*)

Return the configured ip

**ret\_glob\_minions**()

Return minions that match via glob

**targets**()

Execute the correct *tgt\_type* routine and return

`salt.roster.sshconfig.parse_ssh_config`(*lines*)

Parses lines from the SSH config to create roster targets.

**Parameters**

**lines** -- Individual lines from the ssh config file

**Returns**

Dictionary of targets in similar style to the flat roster

`salt.roster.sshconfig.targets`(*tgt*, *tgt\_type*='glob', *\*\*kwargs*)

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

### 26.15.10 salt.roster.sshknownhosts

Parses roster entries out of Host directives from SSH known\_hosts

New in version 3006.0.

Sample configuration:

---

**Note:** The `known_hosts` file only contains hostname/IP. To pass other parameters, use `roster_defaults`.

---

```
ssh_known_hosts_file: /Users/user1/.ssh/known_hosts
roster_defaults:
  user: user1
  sudo: True
```

Now you can use the module

```
salt-ssh --roster sshknownhosts '*' -r "echo hi"
```

Or with a Saltfile

```
salt-ssh:
  ssh_known_hosts_file: /Users/user1/.ssh/known_hosts
```

```
salt-ssh --roster sshknownhosts '*' -r "echo hi"
```

```
salt.roster.sshknownhosts.targets(tgt, tgt_type='glob')
```

Return the targets from a known\_hosts file

## 26.15.11 salt.roster.terraform

### Dynamic roster from terraform current state

This roster module allows you dynamically generate the roster from the terraform resources defined with the [Terraform Salt](#) provider.

It exposes all salt\_host resources with the same attributes to the salt-ssh roster, making it completely independent of the type of terraform resource, and providing the integration using terraform constructs with interpolation.

### Basic Example

Given a simple salt-ssh tree with a Saltfile:

```
salt-ssh:
  config_dir: etc/salt
  max_procs: 30
  wipe_ssh: True
```

and etc/salt/master:

```
root_dir: .
file_roots:
  base:
    - srv/salt
pillar_roots:
  base:
    - srv/pillar
roster: terraform
```

In the same folder as your Saltfile, create terraform file with resources like cloud instances, virtual machines, etc. For every single one of those that you want to manage with Salt, create a salt\_host resource:

```
resource "salt_host" "dbminion" {
  salt_id = "dbserver"
  host = "${libvirt_domain.vm-db.network_interface.0.addresses.0}"
  user = "root"
  passwd = "linux"
}
```

You can use the count attribute to create multiple roster entries with a single definition. Please refer to the [Terraform Salt provider](#) for more detailed examples.

`salt.roster.terraform.targets` (*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)

Returns the roster from the terraform state file, checks opts for location, but defaults to terraform.tfstate

## 26.16 runner modules

<i>asam</i>	Novell ASAM Runner
<i>auth</i>	Authentication runner for creating, deleting, and managing eauth tokens.
<i>bgp</i>	BGP Finder
<i>cache</i>	Return cached data from minions
<i>cloud</i>	The Salt Cloud Runner
<i>config</i>	This runner is designed to mirror the execution module <code>config.py</code> , but for master settings
<i>ddns</i>	Dynamic DNS Runner
<i>digicertapi</i>	Support for Digicert.
<i>doc</i>	A runner module to collect and display the inline documentation from the various module types
<i>drac</i>	Manage Dell DRAC from the Master
<i>error</i>	Error generator to enable integration testing of salt runner error handling
<i>event</i>	Module for sending events using the runner system.
<i>f5</i>	Runner to provide F5 Load Balancer functionality
<i>filesERVER</i>	Directly manage the Salt fileserver plugins
<i>git_pillar</i>	Runner module to directly manage the git external pillar
<i>http</i>	Module for making various web calls.
<i>jobs</i>	A convenience system to manage jobs, both active and already run
<i>launchd</i>	Manage launchd plist files
<i>lxc</i>	Control Linux Containers via Salt
<i>manage</i>	General management functions for salt, tools like seeing what hosts are up and what hosts are down
<i>match</i>	Run matchers from the master context.
<i>mattermost</i>	Module for sending messages to Mattermost
<i>mine</i>	A runner to access data from the salt mine
<i>nacl</i>	This module helps include encrypted passwords in pillars, grains and salt state files.
<i>net</i>	NET Finder
<i>network</i>	Network tools to run from the Master
<i>pagerduty</i>	Runner Module for Firing Events via PagerDuty

continues on next page

Table 6 – continued from previous page

<i>pillar</i>	Functions to interact with the pillar compiler on the master
<i>pkg</i>	Package helper functions using <code>salt.modules.pkg</code>
<i>queue</i>	General management and processing of queues.
<i>reactor</i>	A convenience system to manage reactors
<i>salt</i>	This runner makes Salt's execution modules available on the salt master.
<i>saltutil</i>	The Saltutil runner is used to sync custom types to the Master.
<i>sdb</i>	Runner for setting and querying data via the sdb API on the master
<i>smartos_vmadm</i>	Runner for SmartOS minions control vmadm
<i>spacewalk</i>	Spacewalk Runner
<i>ssh</i>	A Runner module interface on top of the salt-ssh Python API.
<i>state</i>	Execute orchestration functions
<i>survey</i>	A general map/reduce style salt runner for aggregating results returned by several different minions.
<i>test</i>	This runner is used only for test purposes and serves no production purpose
<i>thin</i>	The thin runner is used to manage the salt thin systems.
<i>vault</i>	
<i>venafiapi</i>	Support for Venafi
<i>virt</i>	Control virtual machines via Salt
<i>vistara</i>	Vistara Runner
<i>winrepo</i>	Runner to manage Windows software repo

### 26.16.1 salt.runners.asam

#### Novell ASAM Runner

New in version 2015.8.0.

Runner to interact with Novell ASAM Fan-Out Driver

##### codeauthor

Nitin Madhok <nmadhok@g.clemson.edu>

To use this runner, set up the Novell Fan-Out Driver URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/asam.conf`:

```
asam:
  prov1.domain.com
    username: "testuser"
    password: "verybadpass"
    verify_ssl: true
  prov2.domain.com
    username: "testuser"
    password: "verybadpass"
    verify_ssl: true
```

**Note:** Optionally, `protocol` and `port` can be specified if the Fan-Out Driver server is not using the defaults. Default is `protocol: https` and `port: 3451`.

---

### **class** salt.runners.asam.ASAMHTMLParser

**handle\_starttag**(*tag, attrs*)

salt.runners.asam.**add\_platform**(*name, platform\_set, server\_url*)

To add an ASAM platform using the specified ASAM platform set on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.add_platform my-test-vm test-platform-set prov1.domain.com
```

salt.runners.asam.**list\_platform\_sets**(*server\_url*)

To list all ASAM platform sets present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platform_sets prov1.domain.com
```

salt.runners.asam.**list\_platforms**(*server\_url*)

To list all ASAM platforms present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platforms prov1.domain.com
```

salt.runners.asam.**remove\_platform**(*name, server\_url*)

To remove specified ASAM platform from the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.remove_platform my-test-vm prov1.domain.com
```

## 26.16.2 salt.runners.auth

Authentication runner for creating, deleting, and managing eauth tokens.

New in version 2016.11.0.

salt.runners.auth.**del\_token**(*token*)

Delete an eauth token by name

CLI Example:

```
salt-run auth.del_token 6556760736e4077daa601baec2b67c24
```

salt.runners.auth.**mk\_token**(*\*\*load*)

Create an eauth token using provided credentials

Non-root users may specify an expiration date -- if allowed via the `token_expire_user_override` setting -- by passing an additional `token_expire` param. This overrides the `token_expire` setting of the same name in the Master config and is how long a token should live in seconds.

CLI Example:

```

salt-run auth.mk_token username=saltdev password=saltdev eauth=auto

# Create a token valid for three years.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
  token_expire=94670856

# Calculate the number of seconds using expr.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
  token_expire=$(expr \( 365 \* 24 \* 60 \* 60 \) \* 3)

```

### 26.16.3 salt.runners.bgp

#### BGP Finder

New in version 2017.7.0.

Runner to search BGP neighbors details.

#### Configuration

- Minion (proxy) config

The `bgp.neighbors` function must be appended in the list of `mine_functions`:

```

mine_functions:
  bgp.neighbors: []

```

Which instructs Salt to cache the data returned by the `neighbors` function from the *NAPALM BGP module*.

How often the mines are refreshed, can be specified using:

```

mine_interval: <X minutes>

```

- Master config

By default the following options can be configured on the master. They are not mandatory, but available in case the user has different requirements.

**tgt:** \*

From what minions will collect the mine data. Default: \* (collect mine data from all minions)

**tgt\_type:** **glob**

Minion matching expression form. Default: glob.

**return\_fields**

What fields to return in the output. It can display all the fields from the `neighbors` function from the *NAPALM BGP module*.

Some fields cannot be removed:

- `as_number`: the AS number of the neighbor
- `device`: the minion ID
- `neighbor_address`: the neighbor remote IP address

By default, the following extra fields are returned (displayed):

- `connection_stats`: connection stats, as described below
- `import_policy`: the name of the import policy
- `export_policy`: the name of the export policy

Special fields:

- `vrf`: return the name of the VRF.
- `connection_stats`: returning an output of the form `<State> <Active>/<Received>/<Accepted>/<Damped>`, e.g. `Established 398/399/399/0` similar to the usual output from network devices.
- `interface_description`: matches the neighbor details with the corresponding interface and returns its description. This will reuse functionality from the `net runner`, so the user needs to enable the mines as specified in the documentation.
- `interface_name`: matches the neighbor details with the corresponding interface and returns the name. Similar to `interface_description`, this will reuse functionality from the `net runner`, so the user needs to enable the mines as specified in the documentation.

**display: True**

Display on the screen or return structured object? Default: True (return on the CLI).

**outputter: table**

Specify the outputter name when displaying on the CLI. Default: `table`.

Configuration example:

```
runners:
  bgp:
    tgt: 'edge*'
    tgt_type: 'glob'
    return_fields:
      - up
      - connection_state
      - previous_connection_state
      - suppress_4byte_as
      - holdtime
      - flap_count
    outputter: yaml
```

`salt.runners.bgp.neighbors(*asns, **kwargs)`

Search for BGP neighbors details in the mines of the `bgp.neighbors` function.

Arguments:

**asns**

A list of AS numbers to search for. The runner will return only the neighbors of these AS numbers.

**device**

Filter by device name (minion ID).

**ip**

Search BGP neighbor using the IP address. In multi-VRF environments, the same IP address could be used by more than one neighbors, in different routing tables.

**network**

Search neighbors within a certain IP network.

**title**

Custom title.

**display: True**

Display on the screen or return structured object? Default: True (return on the CLI).

**outputter: table**

Specify the outputter name when displaying on the CLI. Default: *table*.

In addition, any field from the output of the `neighbors` function from the *NAPALM BGP module* can be used as a filter.

CLI Example:

```
salt-run bgp.neighbors 13335 15169
salt-run bgp.neighbors 13335 ip=172.17.19.1
salt-run bgp.neighbors multipath=True
salt-run bgp.neighbors up=False export_policy=my-export-policy
→multihop=False
salt-run bgp.neighbors network=192.168.0.0/16
```

Output example:

```
BGP Neighbors for 13335, 15169
-----
→
→
| Device | AS Number | Neighbor Address | State |
→#Active/Received/Accepted/Damped | Policy IN | |
→Policy OUT |

## 26.16.4 salt.runners.cache

Return cached data from minions

`salt.runners.cache.clear_all(tgt=None, tgt_type='glob')`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached pillar, grains, and mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_all
```

`salt.runners.cache.clear_git_lock(role, remote=None, **kwargs)`

New in version 2015.8.2.

Remove the update locks for Salt components (`gitfs`, `git_pillar`, `winrepo`) which use `gitfs` backend code from `salt.utils.gitfs`.

---

**Note:** Running `cache.clear_all` will not include this function as it does for pillar, grains, and mine.

Additionally, executing this function with a `role` of `gitfs` is equivalent to running `salt-run fileserver.clear_lock backend=git`.

---

### role

Which type of lock to remove (`gitfs`, `git_pillar`, or `winrepo`)

### remote

If specified, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of `github` will remove the lock from all `github.com` remotes.

### type

[`update`,`checkout`,`mountpoint`] The types of lock to clear. Can be one or more of `update`, `checkout`, and `mountpoint`, and can be passed either as a comma-separated or Python list.

New in version 2015.8.8.

Changed in version 2018.3.0: mountpoint lock type added

CLI Examples:

```
salt-run cache.clear_git_lock gitfs
salt-run cache.clear_git_lock git_pillar
salt-run cache.clear_git_lock git_pillar type=update
salt-run cache.clear_git_lock git_pillar type=update,checkout
salt-run cache.clear_git_lock git_pillar type='["update", "mountpoint"]'
```

`salt.runners.cache.clear_grains` (*tgt=None, tgt\_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached grains data of the targeted minions

CLI Example:

```
salt-run cache.clear_grains
```

`salt.runners.cache.clear_mine` (*tgt=None, tgt\_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine
```

`salt.runners.cache.clear_mine_func` (*tgt=None, tgt\_type='glob', clear\_mine\_func\_flag=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine function data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine_func tgt='*' clear_mine_func_flag='network.
↳ interfaces'
```

`salt.runners.cache.clear_pillar` (*tgt=None, tgt\_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached pillar data of the targeted minions

CLI Example:

```
salt-run cache.clear_pillar
```

`salt.runners.cache.cloud` (*tgt, provider=None*)

Return cloud cache data for target.

---

**Note:** Only works with glob matching

---

**tgt**

Glob Target to match minion ids

**provider**

Cloud Provider

CLI Example:

```
salt-run cache.cloud 'salt*'
salt-run cache.cloud glance.example.org provider=openstack
```

`salt.runners.cache.fetch`(*bank*, *key*, *cachedir=None*)

Fetch data from a salt.cache bank.

CLI Example:

```
salt-run cache.fetch cloud/active/ec2/myec2 myminion cachedir=/var/cache/
↳salt/
```

`salt.runners.cache.flush`(*bank*, *key=None*, *cachedir=None*)

Remove the key from the cache bank with all the key content. If no key is specified remove the entire bank with all keys and sub-banks inside.

CLI Examples:

```
salt-run cache.flush cloud/active/ec2/myec2 cachedir=/var/cache/salt/
salt-run cache.flush cloud/active/ec2/myec2 myminion cachedir=/var/cache/
↳salt/
```

`salt.runners.cache.grains`(*tgt*, *tgt\_type='glob'*, *\*\*kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached grains of the targeted minions.

**tgt**

Target to match minion ids.

Changed in version 2017.7.5,2018.3.0: The `tgt` argument is now required to display cached grains. If not used, the function will not return grains. This optional argument will become mandatory in the Salt 3001 release.

**tgt\_type**

The type of targeting to use for matching, such as `glob`, `list`, etc.

CLI Example:

```
salt-run cache.grains '*'
```

`salt.runners.cache.list_`(*bank*, *cachedir=None*)

Lists entries stored in the specified bank.

CLI Example:

```
salt-run cache.list cloud/active/ec2/myec2 cachedir=/var/cache/salt/
```

`salt.runners.cache.mine`(*tgt=None*, *tgt\_type='glob'*, *\*\*kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached mine data of the targeted minions

CLI Example:

```
salt-run cache.mine
```

`salt.runners.cache.pillar` (*tgt=None, tgt\_type='glob', \*\*kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached pillars of the targeted minions if `tgt` is set. If `tgt` is not set will return cached pillars for all minions.

CLI Example:

```
salt-run cache.pillar
```

`salt.runners.cache.store` (*bank, key, data, cachedir=None*)

Lists entries stored in the specified bank.

CLI Example:

```
salt-run cache.store mycache mykey 'The time has come the walrus said'
```

## 26.16.5 salt.runners.cloud

### The Salt Cloud Runner

This runner wraps the functionality of salt cloud making salt cloud routines available to all internal apis via the runner system

`salt.runners.cloud.action` (*func=None, cloudmap=None, instances=None, provider=None, instance=None, opts=None, \*\*kwargs*)

Execute a single action on the given map/provider/instance

CLI Example:

```
salt-run cloud.action start my-salt-vm
```

`salt.runners.cloud.create` (*provider, instances, opts=None, \*\*kwargs*)

Create an instance using Salt Cloud

CLI Example:

```
salt-run cloud.create my-ec2-config myinstance \
    image=ami-1624987f size='t1.micro' ssh_username=ec2-user \
    securitygroup=default delvol_on_destroy=True
```

`salt.runners.cloud.destroy` (*instances, opts=None*)

Destroy the named vm(s)

`salt.runners.cloud.full_query` (*query\_type='list\_nodes\_full'*)

List all available cloud provider data

`salt.runners.cloud.list_images` (*provider='all'*)

List cloud provider images for the given providers

`salt.runners.cloud.list_locations(provider='all')`

List cloud provider sizes for the given providers

`salt.runners.cloud.list_sizes(provider='all')`

List cloud provider sizes for the given providers

`salt.runners.cloud.map_run(path=None, opts=None, **kwargs)`

Execute a salt cloud map file

`salt.runners.cloud.profile(profile=None, instances=None, opts=None, **kwargs)`

Create a cloud vm with the given profile and instances, instances can be a list or comma-delimited string

CLI Example:

```
salt-run cloud.profile prof=my-ec2 instances=node1,node2,node3
```

`salt.runners.cloud.query(query_type='list_nodes')`

List cloud provider data for all providers

`salt.runners.cloud.select_query(query_type='list_nodes_select')`

List selected nodes

### 26.16.6 salt.runners.config

This runner is designed to mirror the execution module `config.py`, but for master settings

`salt.runners.config.get(key, default="", delimiter=':')`

Retrieve master config options, with optional nesting via the `delimiter` argument.

#### Arguments

`default`

If the key is not found, the default will be returned instead

`delimiter`

Override the delimiter used to separate nested levels of a data structure.

CLI Example:

```
salt-run config.get gitfs_remotes
salt-run config.get file_roots:base
salt-run config.get file_roots,base delimiter=','
```

### 26.16.7 salt.runners.ddns

#### Dynamic DNS Runner

New in version 2015.8.0.

Runner to interact with DNS server and create/delete/update DNS records

#### codeauthor

Nitin Madhok <nmadhok@g.clemson.edu>

`salt.runners.ddns.add_host` (*zone, name, ttl, ip, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)

Create both A and PTR (reverse) records for a host.

CLI Example:

```
salt-run ddns.add_host domain.com my-test-vm 3600 10.20.30.40 my-tsig-key
→ /etc/salt/tsig.keyring 10.0.0.1 5
```

`salt.runners.ddns.create` (*zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)

Create a DNS record. The nameserver must be an IP address and the master running this runner must have create privileges on that server.

CLI Example:

```
salt-run ddns.create domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key
→ /etc/salt/tsig.keyring 10.0.0.1 5
```

`salt.runners.ddns.delete` (*zone, name, keyname, keyfile, nameserver, timeout, rdtype=None, data=None, port=53, keyalgorithm='hmac-md5'*)

Delete a DNS record.

CLI Example:

```
salt-run ddns.delete domain.com my-test-vm my-tsig-key /etc/salt/tsig.
→ keyring 10.0.0.1 5 A
```

`salt.runners.ddns.delete_host` (*zone, name, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)

Delete both forward (A) and reverse (PTR) records for a host only if the forward (A) record exists.

CLI Example:

```
salt-run ddns.delete_host domain.com my-test-vm my-tsig-key /etc/salt/
→ tsig.keyring 10.0.0.1 5
```

`salt.runners.ddns.update` (*zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout, replace=False, port=53, keyalgorithm='hmac-md5'*)

Replace, or update a DNS record. The nameserver must be an IP address and the master running this runner must have update privileges on that server.

---

**Note:** If `replace` is set to `True`, all records for this name and type will first be deleted and then recreated. Default is `replace=False`.

---

CLI Example:

```
salt-run ddns.update domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key
→ /etc/salt/tsig.keyring 10.0.0.1 5
```

## 26.16.8 salt.runners.digicertapi

Support for Digicert. Heavily based on the Venafi runner by Joseph Hall ([jphall@saltstack.com](mailto:jphall@saltstack.com)).

Before using this module you need to register an account with Digicert's CertCentral.

Login to CertCentral, ensure you have a payment method configured and/or there are adequate funds attached to your account. Click the Account item in the left sidebar, and select Account Access. The right hand pane should show "Account Access" and a link to create an API key. Create a new API key and assign it to the user that should be attached to requests coming from Salt.

NOTE CertCentral will not show the API key again after revealing it the first time. Make sure you copy it right away or you will have to revoke it and generate a new one.

Now open `/etc/salt/master` and add the API key as shown below.

```
digicert:
  api_key: [REDACTED]
  → ABCDEFGHIJKLMNOPQRSTUVWXYZABCDEFGHIJKLMNORSTUVWXYZABCDEFGHIJKLMNORSTUVWXYZABC
```

Restart your Salt Master.

You can also include default values of the following variables to help with creating CSRs:

```
digicert:
  api_key: [REDACTED]
  → ABCDEFGHIJKLMNOPQRSTUVWXYZABCDEFGHIJKLMNORSTUVWXYZABCDEFGHIJKLMNORSTUVWXYZABC
  shatype: sha256
```

This API currently only supports RSA key types. Support for other key types will be added if interest warrants.

`salt.runners.digicertapi.del_cached_domain` (*domains*)

Delete cached domains from the master

CLI Example:

```
salt-run digicert.del_cached_domain domain1.example.com,domain2.example.com
```

`salt.runners.digicertapi.gen_csr` (*minion\_id, dns\_name, organization\_id, ou\_name=None, key\_len=2048, shatype='sha256', password=None*)

CLI Example:

```
salt-run digicert.gen_csr <minion_id> <dns_name>
```

`salt.runners.digicertapi.gen_key` (*minion\_id, dns\_name=None, password=None, key\_len=2048*)

Generate and return a private\_key. If a `dns_name` is passed in, the private\_key will be cached under that name.

CLI Example:

```
salt-run digicert.gen_key <minion_id> [dns_name] [password]
```

`salt.runners.digicertapi.get_certificate` (*order\_id=None, certificate\_id=None, minion\_id=None, cert\_format='pem\_all', filename=None*)

Retrieve a certificate by `order_id` or `certificate_id` and write it to stdout or a filename.

A list of permissible `cert_formats` is here:

<https://www.digicert.com/services/v2/documentation/appendix-certificate-formats>

CLI Example:

```
salt-run digicert.get_certificate order_id=48929454 cert_format=apache
```

Including a 'filename' will write the certificate to the desired file. Note that some cert formats are zipped files, and some are binary.

If the certificate has not been issued, this function will return the order details inside of which will be a status (one of pending, rejected, processing, issued, revoked, canceled, needs\_csr, and needs\_approval)

If for some reason you want to pipe the output of this command to a file or other command you will want to leave off the filename argument and make sure to include `--no-color` so there will be no terminal ANSI escape sequences.

`salt.runners.digicertapi.get_org_details(organization_id)`

Return the details for an organization

CLI Example:

```
salt-run digicert.get_org_details 34
```

Returns a dictionary with the org details, or with 'error' and 'status' keys.

`salt.runners.digicertapi.list_domain_cache()`

List domains that have been cached

CLI Example:

```
salt-run digicert.list_domain_cache
```

`salt.runners.digicertapi.list_domains(container_id=None)`

List domains that CertCentral knows about. You can filter by container\_id (also known as "Division") by passing a container\_id.

CLI Example:

```
salt-run digicert.list_domains
```

`salt.runners.digicertapi.list_orders(status=None)`

List certificate orders made to CertCentral.

CLI Example:

```
salt-run digicert.list_orders
```

`salt.runners.digicertapi.list_organizations(container_id=None, include_validation=True)`

List organizations that CertCentral knows about. You can filter by container\_id (also known as "Division") by passing a container\_id. This function returns validation information by default; pass `include_validation=False` to turn it off.

CLI Example:

```
salt-run digicert.list_organizations
```

`salt.runners.digicertapi.list_requests(status=None)`

List certificate requests made to CertCentral. You can filter by status: pending, approved, rejected

CLI Example:

```
salt-run digicert.list_requests pending
```

`salt.runners.digicertapi.order_certificate`(*minion\_id*, *common\_name*, *organization\_id*, *validity\_years*, *cert\_key\_passphrase*=None, *signature\_hash*=None, *key\_len*=2048, *dns\_names*=None, *organization\_units*=None, *server\_platform*=None, *custom\_expiration\_date*=None, *comments*=None, *disable\_renewal\_notifications*=False, *product\_type\_hint*=None, *renewal\_of\_order\_id*=None)

Order a certificate. Requires that an Organization has been created inside Digicert's CertCentral.

See here for API documentation: <https://www.digicert.com/services/v2/documentation/order/order-ssl-determinator>

CLI Example:

```
salt-run digicert.order_certificate my_minionid my.domain.com 10
→ 3 signature_hash=sha256 dns_names=['this.domain.com',
→ 'that.domain.com'] organization_units='My Domain Org Unit'
→ comments='Comment goes here for the approver'
```

This runner can also be used to renew a certificate by passing *renewal\_of\_order\_id*. Previous order details can be retrieved with `digicertapi.list_orders`.

`salt.runners.digicertapi.show_csrs`()

Show certificate requests for this API key

CLI Example:

```
salt-run digicert.show_csrs
```

`salt.runners.digicertapi.show_organization`(*domain*)

Show organization information, especially the company id

CLI Example:

```
salt-run digicert.show_company example.com
```

`salt.runners.digicertapi.show_rsa`(*minion\_id*, *dns\_name*)

Show a private RSA key

CLI Example:

```
salt-run digicert.show_rsa myminion domain.example.com
```

### 26.16.9 salt.runners.doc

A runner module to collect and display the inline documentation from the various module types

`salt.runners.doc.execution()`

Collect all the sys.doc output from each minion and return the aggregate

CLI Example:

```
salt-run doc.execution
```

`salt.runners.doc.runner()`

Return all inline documentation for runner modules

CLI Example:

```
salt-run doc.runner
```

`salt.runners.doc.wheel()`

Return all inline documentation for wheel modules

CLI Example:

```
salt-run doc.wheel
```

### 26.16.10 salt.runners.drac

Manage Dell DRAC from the Master

The login credentials need to be configured in the Salt master configuration file.

**drac:**

```
username: admin
password: secret
```

`salt.runners.drac.poweroff` (*hostname, timeout=20, username=None, password=None*)

Power server off

CLI Example:

```
salt-run drac.poweroff example.com
```

`salt.runners.drac.poweron` (*hostname, timeout=20, username=None, password=None*)

Power server on

CLI Example:

```
salt-run drac.poweron example.com
```

`salt.runners.drac.pxe` (*hostname, timeout=20, username=None, password=None*)

Connect to the Dell DRAC and have the boot order set to PXE and power cycle the system to PXE boot

CLI Example:

```
salt-run drac.pxe example.com
```

`salt.runners.drac.reboot` (*hostname*, *timeout=20*, *username=None*, *password=None*)

Reboot a server using the Dell DRAC

CLI Example:

```
salt-run drac.reboot example.com
```

`salt.runners.drac.version` (*hostname*, *timeout=20*, *username=None*, *password=None*)

Display the version of DRAC

CLI Example:

```
salt-run drac.version example.com
```

### 26.16.11 salt.runners.error

Error generator to enable integration testing of salt runner error handling

`salt.runners.error.error` (*name=None*, *message=""*)

If name is None Then return empty dict

Otherwise raise an exception with `__name__` from name, message from message

CLI Example:

```
salt-run error
salt-run error.error name="Exception" message="This is an error."
```

### 26.16.12 salt.runners.event

Module for sending events using the runner system.

New in version 2016.11.0.

`salt.runners.event.send` (*tag*, *data=None*)

Send an event with the given tag and data.

This is useful for sending events directly to the master from the shell with salt-run. It is also quite useful for sending events in orchestration states where the `fire_event` requisite isn't sufficient because it does not support sending custom data with the event.

Note that event tags will *not* be namespaced like events sent with the `fire_event` requisite! Whereas events produced from `fire_event` are prefixed with `salt/state_result/<jid>/<minion_id>/<name>`, events sent using this runner module will have no such prefix. Make sure your reactors don't expect a prefix!

#### Parameters

- **tag** -- the tag to send with the event
- **data** -- an optional dictionary of data to send with the event

CLI Example:

```
salt-run event.send my/custom/event '{"foo": "bar"}
```

Orchestration Example:

```
# orch/command.sls

run_a_command:
  salt.function:
    - name: cmd.run
    - tgt: my_minion
    - arg:
      - exit {{ pillar['exit_code'] }}

send_success_event:
  salt.runner:
    - name: event.send
    - tag: my_event/success
    - data:
      foo: bar
    - require:
      - salt: run_a_command

send_failure_event:
  salt.runner:
    - name: event.send
    - tag: my_event/failure
    - data:
      baz: qux
    - onfail:
      - salt: run_a_command
```

```
salt-run state.orchestrate orch.command pillar='{"exit_code": 0}'
salt-run state.orchestrate orch.command pillar='{"exit_code": 1}'
```

### 26.16.13 salt.runners.f5

Runner to provide F5 Load Balancer functionality

#### depends

- pycontrol Python module

#### configuration

In order to connect to a F5 Load Balancer, you must specify in the Salt master configuration the currently available load balancers

```
load_balancers:
  bigip1.example.com:
    username: admin
    password: secret
  bigip2.example.com:
    username: admin
    password: secret
```

**class** salt.runners.f5.F5Mgmt(*lb, username, password*)

**add\_pool\_member** (*name, port, pool\_name*)

Add a node to a pool

**check\_member\_pool** (*member, pool\_name*)

Check a pool member exists in a specific pool

**check\_pool** (*name*)

Check to see if a pool exists

**check\_virtualserver** (*name*)

Check to see if a virtual server exists

**create\_pool** (*name, method='ROUND\_ROBIN'*)

Create a pool on the F5 load balancer

**create\_vs** (*name, ip, port, protocol, profile, pool\_name*)

Create a virtual server

**lbmethods** ()

List all the load balancer methods

`salt.runners.f5.add_pool_member` (*lb, name, port, pool\_name*)

Add a node to a pool

CLI Examples:

```
salt-run f5.add_pool_member load_balancer 10.0.0.1 80 my_pool
```

`salt.runners.f5.check_member_pool` (*lb, member, pool\_name*)

Check a pool member exists in a specific pool

CLI Examples:

```
salt-run f5.check_member_pool load_balancer 10.0.0.1 my_pool
```

`salt.runners.f5.check_pool` (*lb, name*)

Check to see if a pool exists

CLI Examples:

```
salt-run f5.check_pool load_balancer pool_name
```

`salt.runners.f5.check_virtualserver` (*lb, name*)

Check to see if a virtual server exists

CLI Examples:

```
salt-run f5.check_virtualserver load_balancer virtual_server
```

`salt.runners.f5.create_pool` (*lb, name, method='ROUND\_ROBIN'*)

Create a pool on the F5 load balancer

CLI Examples:

```
salt-run f5.create_pool load_balancer pool_name loadbalance_method  
salt-run f5.create_pool load_balancer my_pool ROUND_ROBIN
```

`salt.runners.f5.create_vs` (*lb, name, ip, port, protocol, profile, pool\_name*)

Create a virtual server

CLI Examples:

```
salt-run f5.create_vs lbalancer vs_name 10.0.0.1 80 tcp http poolname
```

### 26.16.14 salt.runners.fileserver

Directly manage the Salt fileserver plugins

`salt.runners.fileserver.clear_cache` (*backend=None*)

New in version 2015.5.0.

Clear the fileserver cache from VCS fileserver backends (*git*, *hg*, *svn*). Executing this runner with no arguments will clear the cache for all enabled VCS fileserver backends, but this can be narrowed using the *backend* argument.

#### backend

Only clear the update lock for the specified backend(s). If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: *backend=-roots,git*) then the ones starting with a minus sign will be disregarded.

CLI Example:

```
salt-run fileserver.clear_cache
salt-run fileserver.clear_cache backend=git,hg
salt-run fileserver.clear_cache hg
salt-run fileserver.clear_cache -roots
```

`salt.runners.fileserver.clear_file_list_cache` (*saltenv=None*, *backend=None*)

New in version 2016.11.0.

The Salt fileserver caches the files/directories/symlinks for each fileserver backend and environment as they are requested. This is done to help the fileserver scale better. Without this caching, when hundreds/thousands of minions simultaneously ask the master what files are available, this would cause the master's CPU load to spike as it obtains the same information separately for each minion.

#### saltenv

By default, this runner will clear the file list caches for all environments. This argument allows for a list of environments to be passed, to clear more selectively. This list can be passed either as a comma-separated string, or a Python list.

#### backend

Similar to the *saltenv* parameter, this argument will restrict the cache clearing to specific fileserver backends (the default behavior is to clear from all enabled fileserver backends). This list can be passed either as a comma-separated string, or a Python list.

Since the ability to clear these caches is often required by users writing custom runners which add/remove files, this runner can easily be called from within a custom runner using any of the following examples:

```
# Clear all file list caches
__salt__['fileserver.clear_file_list_cache']()
# Clear just the 'base' saltenv file list caches
__salt__['fileserver.clear_file_list_cache'](saltenv='base')
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
__salt__['fileserver.clear_file_list_cache'](saltenv='base', backend=
→'roots')
# Clear all file list caches from the 'roots' fileserver backend
__salt__['fileserver.clear_file_list_cache'](backend='roots')
```

**Note:** In runners, the `__salt__` dictionary will likely be renamed to `__runner__` in a future Salt release to distinguish runner functions from remote execution functions. See [this GitHub issue](#) for discussion/updates on this.

If using Salt's Python API (not a runner), the following examples are equivalent to the ones above:

```
import salt.config
import salt.runner

opts = salt.config.master_config('/etc/salt/master')
opts['fun'] = 'filesserver.clear_file_list_cache'

# Clear all file list_caches
opts['arg'] = [] # No arguments
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches
opts['arg'] = ['base', None]
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
opts['arg'] = ['base', 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear all file list caches from the 'roots' fileserver backend
opts['arg'] = [None, 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()
```

This function will return a dictionary showing a list of environments which were cleared for each backend. An empty return dictionary means that no changes were made.

CLI Examples:

```
# Clear all file list caches
salt-run filesserver.clear_file_list_cache
# Clear just the 'base' saltenv file list caches
salt-run filesserver.clear_file_list_cache saltenv=base
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
salt-run filesserver.clear_file_list_cache saltenv=base backend=roots
# Clear all file list caches from the 'roots' fileserver backend
salt-run filesserver.clear_file_list_cache backend=roots
```

`salt.runners.filesserver.clear_lock(backend=None, remote=None)`

New in version 2015.5.0.

Clear the fileserver update lock from VCS fileserver backends (*git*, *hg*, *svn*). This should only need to be done if a fileserver update was interrupted and a remote is not updating (generating a warning in the Master's

log file). Executing this runner with no arguments will remove all update locks from all enabled VCS fileserver backends, but this can be narrowed by using the following arguments:

**backend**

Only clear the update lock for the specified backend(s).

**remote**

If specified, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of `github` will remove the lock from all `github.com` remotes.

CLI Example:

```
salt-run fileserver.clear_lock
salt-run fileserver.clear_lock backend=git,hg
salt-run fileserver.clear_lock backend=git remote=github
salt-run fileserver.clear_lock remote=bitbucket
```

`salt.runners.fileserver.dir_list` (*saltenv='base', backend=None*)

Return a list of directories in the given environment

**saltenv**

[base] The salt fileserver environment to be listed

**backend**

Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.dir_list
salt-run fileserver.dir_list saltenv=prod
salt-run fileserver.dir_list saltenv=dev backend=git
salt-run fileserver.dir_list base hg,roots
salt-run fileserver.dir_list -git
```

`salt.runners.fileserver.empty_dir_list` (*saltenv='base', backend=None*)

New in version 2015.5.0.

Return a list of empty directories in the given environment

**saltenv**

[base] The salt fileserver environment to be listed

**backend**

Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

---

**Note:** Some backends (such as `git` and `hg`) do not support empty directories. So, passing `backend=git` or `backend=hg` will result in an empty list being returned.

---

CLI Example:

```
salt-run fileserver.empty_dir_list
salt-run fileserver.empty_dir_list saltenv=prod
salt-run fileserver.empty_dir_list backend=roots
```

`salt.runners.fileserver.envs` (*backend=None, sources=False*)

Return the available fileserver environments. If no backend is provided, then the environments for all configured backends will be returned.

**backend**

Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend=["'roots', 'git']"`)

CLI Example:

```
salt-run fileserver.envs
salt-run fileserver.envs backend=roots,git
salt-run fileserver.envs git
```

`salt.runners.fileserver.file_list` (*saltenv='base', backend=None*)

Return a list of files from the salt fileserver

**saltenv**

[base] The salt fileserver environment to be listed

**backend**

Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Examples:

```
salt-run fileserver.file_list
salt-run fileserver.file_list saltenv=prod
salt-run fileserver.file_list saltenv=dev backend=git
salt-run fileserver.file_list base hg,roots
salt-run fileserver.file_list -git
```

`salt.runners.fileserver.lock` (*backend=None, remote=None*)

New in version 2015.5.0.

Set a fileserver update lock for VCS fileserver backends (*git, hg, svn*).

---

**Note:** This will only operate on enabled backends (those configured in *fileserver\_backend*).

---

**backend**

Only set the update lock for the specified backend(s).

**remote**

If not None, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of `*github.com*` will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.lock
salt-run fileserver.lock backend=git,hg
```

(continues on next page)

(continued from previous page)

```
salt-run fileserver.lock backend=git remote='*github.com*'
salt-run fileserver.lock remote=bitbucket
```

`salt.runners.fileserver.symlink_list` (*saltenv='base', backend=None*)

Return a list of symlinked files and dirs

**saltenv**

[base] The salt fileserver environment to be listed

**backend**

Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.symlink_list
salt-run fileserver.symlink_list saltenv=prod
salt-run fileserver.symlink_list saltenv=dev backend=git
salt-run fileserver.symlink_list base hg,roots
salt-run fileserver.symlink_list -git
```

`salt.runners.fileserver.update` (*backend=None, \*\*kwargs*)

Update the fileserver cache. If no backend is provided, then the cache for all configured backends will be updated.

**backend**

Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend=["roots', 'git']"`)

**kwargs**

Pass additional arguments to backend. See example below

CLI Example:

```
salt-run fileserver.update
salt-run fileserver.update backend=roots,git
salt-run fileserver.update backend=git remotes=myrepo,yourrepo
```

### 26.16.15 salt.runners.git\_pillar

Runner module to directly manage the git external pillar

`salt.runners.git_pillar.update` (*branch=None, repo=None*)

New in version 2014.1.0.

Changed in version 2015.8.4: This runner function now supports the *git\_pillar configuration schema* introduced in 2015.8.0. Additionally, the branch and repo can now be omitted to update all git\_pillar remotes. The return data has also changed to a dictionary. The values will be True only if new commits were fetched, and False if there were errors or no new commits were fetched.

Changed in version 2018.3.0: The return for a given `git_pillar` remote will now be `None` when no changes were fetched. `False` now is reserved only for instances in which there were errors.

Changed in version 3001: The `repo` parameter also matches against the repo name.

Fetch one or all configured `git_pillar` remotes.

---

**Note:** This will *not* fast-forward the `git_pillar` cachedir on the master. All it does is perform a `git fetch`. If this runner is executed with `-l debug`, you may see a log message that says that the repo is up-to-date. Keep in mind that Salt automatically fetches `git_pillar` repos roughly every 60 seconds (or whatever `loop_interval` is set to). So, it is possible that the repo was fetched automatically in the time between when changes were pushed to the repo, and when this runner was executed. When in doubt, simply refresh pillar data using `saltutil.refresh_pillar` and then use `pillar.item` to check if the pillar data has changed as expected.

---

CLI Example:

```
# Update specific branch and repo
salt-run git_pillar.update branch='branch' repo='https://foo.com/bar.git'
# Update specific repo, by name
salt-run git_pillar.update repo=myrepo
# Update all repos
salt-run git_pillar.update
# Run with debug logging
salt-run git_pillar.update -l debug
```

### 26.16.16 salt.runners.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

`salt.runners.http.query` (*url*, *output=True*, *\*\*kwargs*)

Query a resource, and decode the return data

Passes through all the parameters described in the `utils.http.query` function:

CLI Example:

```
salt-run http.query http://somelink.com/
salt-run http.query http://somelink.com/ method=POST           params=
→ 'key1=val1&key2=val2'
salt-run http.query http://somelink.com/ method=POST           data='
→ <xml>somecontent</xml>'
```

`salt.runners.http.update_ca_bundle` (*target=None*, *source=None*, *merge\_files=None*)

Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```
salt-run http.update_ca_bundle
salt-run http.update_ca_bundle target=/path/to/cacerts.pem
salt-run http.update_ca_bundle source=https://example.com/cacerts.pem
```

If the `target` is not specified, it will be pulled from the `ca_cert` configuration variable available to the master. If it cannot be found there, it will be placed at `<<FILE_ROOTS>>/cacerts.pem`.

If the `source` is not specified, it will be pulled from the `ca_cert_url` configuration variable available to the master. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

`merge_files` may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```
salt-run http.update_ca_bundle merge_files=/path/to/mycert.pem
```

### 26.16.17 salt.runners.jobs

A convenience system to manage jobs, both active and already run

`salt.runners.jobs.active` (*display\_progress=False*)

Return a report on all actively running jobs from a job id centric perspective

CLI Example:

```
salt-run jobs.active
```

`salt.runners.jobs.exit_success` (*jid, ext\_source=None*)

Check if a job has been executed and exit successfully

**jid**

The jid to look up.

**ext\_source**

The external job cache to use. Default: *None*.

CLI Example:

```
salt-run jobs.exit_success 20160520145827701627
```

`salt.runners.jobs.last_run` (*ext\_source=None, outputter=None, metadata=None, function=None, target=None, display\_progress=False*)

New in version 2015.8.0.

List all detectable jobs and associated functions

CLI Example:

```
salt-run jobs.last_run
salt-run jobs.last_run target=nodename
salt-run jobs.last_run function='cmd.run'
salt-run jobs.last_run metadata="{ 'foo': 'bar' }"
```

`salt.runners.jobs.list_job` (*jid, ext\_source=None, display\_progress=False*)

List a specific job given by its jid

**ext\_source**

If provided, specifies which external job cache to use.

**display\_progress**

[False] If True, fire progress events.

New in version 2015.8.8.

CLI Example:

```
salt-run jobs.list_job 20130916125524463507
salt-run jobs.list_job 20130916125524463507 --out=pprint
```

`salt.runners.jobs.list_jobs` (*ext\_source=None, outputter=None, search\_metadata=None, search\_function=None, search\_target=None, start\_time=None, end\_time=None, display\_progress=False*)

List all detectable jobs and associated functions

**ext\_source**

If provided, specifies which external job cache to use.

**FILTER OPTIONS**

---

**Note:** If more than one of the below options are used, only jobs which match *all* of the filters will be returned.

---

**search\_metadata**

Specify a dictionary to match to the job's metadata. If any of the key-value pairs in this dictionary match, the job will be returned. Example:

```
salt-run jobs.list_jobs search_metadata='{"foo": "bar", "baz": "qux"}
↪'
```

**search\_function**

Can be passed as a string or a list. Returns jobs which match the specified function. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_function='test.*'
salt-run jobs.list_jobs search_function='["test.*", "pkg.install"]'
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_function='test.*,pkg.install'
```

**search\_target**

Can be passed as a string or a list. Returns jobs which match the specified minion name. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_target='*.mydomain.tld'
salt-run jobs.list_jobs search_target='["db*", "myminion"]'
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_target='db*,myminion'
```

**start\_time**

Accepts any timestamp supported by the `dateutil` Python module (if this module is not installed, this argument will be ignored). Returns jobs which started after this timestamp.

**end\_time**

Accepts any timestamp supported by the `dateutil` Python module (if this module is not installed, this argument will be ignored). Returns jobs which started before this timestamp.

CLI Example:

```
salt-run jobs.list_jobs
salt-run jobs.list_jobs search_function='test.*' search_target='localhost
↳' search_metadata='{ "bar": "foo" }'
salt-run jobs.list_jobs start_time='2015, Mar 16 19:00' end_time='2015,
↳Mar 18 22:00'
```

`salt.runners.jobs.list_jobs_filter` (*count*, *filter\_find\_job=True*, *ext\_source=None*, *outputter=None*, *display\_progress=False*)

List all detectable jobs and associated functions

**ext\_source**

The external job cache to use. Default: *None*.

CLI Example:

```
salt-run jobs.list_jobs_filter 50
salt-run jobs.list_jobs_filter 100 filter_find_job=False
```

`salt.runners.jobs.lookup_jid` (*jid*, *ext\_source=None*, *returned=True*, *missing=False*, *display\_progress=False*)

Return the printout from a previously executed job

**jid**

The jid to look up.

**ext\_source**

The external job cache to use. Default: *None*.

**returned**

[True] If True, include the minions that did return from the command.

New in version 2015.8.0.

**missing**

[False] If True, include the minions that did *not* return from the command.

**display\_progress**

[False] If True, fire progress events.

New in version 2015.5.0.

CLI Example:

```
salt-run jobs.lookup_jid 20130916125524463507
salt-run jobs.lookup_jid 20130916125524463507 --out=highstate
```

`salt.runners.jobs.master` ()

Return the actively executing runners for the master

CLI Example:

```
salt-run jobs.master
```

`salt.runners.jobs.print_job` (*jid*, *ext\_source=None*)

Print a specific job's detail given by its jid, including the return data.

CLI Example:

```
salt-run jobs.print_job 20130916125524463507
```

### 26.16.18 salt.runners.launchd

Manage launchd plist files

`salt.runners.launchd.write_launchd_plist`(*program*)

Write a launchd plist for managing salt-master or salt-minion

CLI Example:

```
salt-run launchd.write_launchd_plist salt-master
```

### 26.16.19 salt.runners.lxc

Control Linux Containers via Salt

#### **depends**

lxc execution module

`salt.runners.lxc.cloud_init`(*names, host=None, quiet=False, \*\*kwargs*)

Wrapper for using lxc.init in saltcloud compatibility mode

#### **names**

Name of the containers, supports a single name or a comma delimited list of names.

#### **host**

Minion to start the container on. Required.

#### **path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

#### **saltcloud\_mode**

init the container with the saltcloud opts format instead

`salt.runners.lxc.find_guest`(*name, quiet=False, path=None*)

Returns the host for a container.

#### **path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.find_guest name
```

`salt.runners.lxc.find_guests`(*names, path=None*)

Return a dict of hosts and named guests

#### **path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

`salt.runners.lxc.freeze`(*name, quiet=False, path=None*)

Freeze the named container

#### **path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.freeze name
```

`salt.runners.lxc.info`(*name*, *quiet=False*, *path=None*)

Returns information about a container.

**path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.info name
```

`salt.runners.lxc.init`(*names*, *host=None*, *saltcloud\_mode=False*, *quiet=False*, *\*\*kwargs*)

Initialize a new container

```
salt-run lxc.init name host=minion_id [cpuset=cgroups_cpuset] \
    [cpushare=cgroups_cpushare] [memory=cgroups_memory] \
    [template=lxc_template_name] [clone=original name] \
    [profile=lxc_profile] [network_profile=network_profile] \
    [nic=network_profile] [nic_opts=nic_opts] \
    [start=(true|false)] [seed=(true|false)] \
    [install=(true|false)] [config=minion_config] \
    [snapshot=(true|false)]
```

**names**

Name of the containers, supports a single name or a comma delimited list of names.

**host**

Minion on which to initialize the container (**required**)

**path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**saltcloud\_mode**

init the container with the saltcloud opts format instead See `lxc.init_interface` module documentation

**cpuset**

cgroups cpuset.

**cpushare**

cgroups cpu shares.

**memory**

cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass `memory=0` to set no limit.

**template**

Name of LXC template on which to base this container

**clone**

Clone this container from an existing container

**profile**

A LXC profile (defined in config or pillar).

**network\_profile**

Network profile to use for the container

New in version 2015.5.2.

**nic**

Deprecated since version 2015.5.0: Use `network_profile` instead

**nic\_opts**

Extra options for network interfaces. E.g.:

```
{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6": "2001:db8::ff00:42:8329"}}
```

**start**

Start the newly created container.

**seed**

Seed the container with the minion config and autosign its key. Default: true

**install**

If salt-minion is not already installed, install it. Default: true

**config**

Optional config parameters. By default, the id is set to the name of the container.

**salt.runners.lxc.list\_** (*host=None, quiet=False, path=None*)

List defined containers (running, stopped, and frozen) for the named (or all) host(s).

**path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.list [host=minion_id]
```

**salt.runners.lxc.purge** (*name, delete\_key=True, quiet=False, path=None*)

Purge the named container and delete its minion key if present. WARNING: Destroys all data associated with the container.

**path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.purge name
```

**salt.runners.lxc.start** (*name, quiet=False, path=None*)

Start the named container.

**path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.start name
```

**salt.runners.lxc.stop** (*name, quiet=False, path=None*)

Stop the named container.

**path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.stop name
```

**salt.runners.lxc.unfreeze** (*name, quiet=False, path=None*)

Unfreeze the named container

**path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.unfreeze name
```

### 26.16.20 salt.runners.manage

General management functions for salt, tools like seeing what hosts are up and what hosts are down

`salt.runners.manage.alived` (*subset=None, show\_ip=False*)

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset**

[None] Pass in a list of minion ids.

**show\_ip**

[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.alived
```

`salt.runners.manage.allowed` (*subset=None, show\_ip=False*)

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset**

[None] Pass in a list of minion ids.

**show\_ip**

[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.allowed
```

`salt.runners.manage.bootstrap` (*version='develop', script='https://bootstrap.saltproject.io', hosts='', script\_args='', roster='flat', ssh\_user=None, ssh\_password=None, ssh\_priv\_key=None, tmp\_dir='/tmp/.bootstrap', http\_backend='tornado'*)

Bootstrap minions with salt-bootstrap

**version**

[develop] Git tag of version to install

**script**

[https://bootstrap.saltproject.io/] URL containing the script to execute

**hosts**

Comma-separated hosts [example: hosts='host1.local,host2.local']. These hosts need to exist in the specified roster.

**script\_args**

Any additional arguments that you want to pass to the script.

New in version 2016.11.0.

**roster**

[flat] The roster to use for Salt SSH. More information about roster files can be found in *Salt's Roster Documentation*.

A full list of roster types, see the *builtin roster modules* documentation.

New in version 2016.11.0.

**ssh\_user**

If `user` isn't found in the `roster`, a default SSH user can be set here. Keep in mind that `ssh_user` will not override the `roster user` value if it is already defined.

New in version 2016.11.0.

**ssh\_password**

If `passwd` isn't found in the `roster`, a default SSH password can be set here. Keep in mind that `ssh_password` will not override the `roster passwd` value if it is already defined.

New in version 2016.11.0.

**ssh\_privkey**

If `priv` isn't found in the `roster`, a default SSH private key can be set here. Keep in mind that `ssh_password` will not override the `roster passwd` value if it is already defined.

New in version 2016.11.0.

**tmp\_dir**

[`/tmp/.bootstrap`] The temporary directory to download the bootstrap script in. This directory will have `-<uuid4>` appended to it. For example: `/tmp/.bootstrap-a19a728e-d40a-4801-aba9-d00655c143a7/`

New in version 2016.11.0.

**http\_backend**

[`tornado`] The backend library to use to download the script. If you need to use a `file:///` URL, then you should set this to `urllib2`.

New in version 2016.11.0.

CLI Example:

```
salt-run manage.bootstrap hosts='host1,host2'
salt-run manage.bootstrap hosts='host1,host2' version='v3004.2'
salt-run manage.bootstrap hosts='host1,host2' version='v3004.2' script=
→ 'https://bootstrap.saltproject.io/develop'
```

`salt.runners.manage.bootstrap_psexec` (`hosts=""`, `master=None`, `version=None`, `arch='win32'`, `installer_url=None`, `username=None`, `password=None`)

Bootstrap Windows minions via PsExec.

**hosts**

Comma separated list of hosts to deploy the Windows Salt minion.

**master**

Address of the Salt master passed as an argument to the installer.

**version**

Point release of installer to download. Defaults to the most recent.

**arch**

Architecture of installer to download. Defaults to win32.

**installer\_url**

URL of minion installer executable. Defaults to the latest version from <https://repo.saltproject.io/windows/>

**username**

Optional user name for login on remote computer.

**password**

Password for optional username. If omitted, PsExec will prompt for one to be entered for each host.

CLI Example:

```
salt-run manage.bootstrap_psexec hosts='host1,host2'
salt-run manage.bootstrap_psexec hosts='host1,host2' version='0.17'
→username='DOMAIN\Administrator'
salt-run manage.bootstrap_psexec hosts='host1,host2' installer_url='http://
→/exampledomain/salt-installer.exe'
```

`salt.runners.manage.down` (*removekeys=False, tgt='\*', tgt\_type='glob', timeout=None, gather\_job\_timeout=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print a list of all the down or unresponsive salt minions Optionally remove keys of down minions

CLI Example:

```
salt-run manage.down
salt-run manage.down removekeys=True
salt-run manage.down tgt="webservers" tgt_type="nodegroup"
```

`salt.runners.manage.joined` (*subset=None, show\_ip=False*)

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset**

[None] Pass in a list of minion ids.

**show\_ip**

[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.joined
```

`salt.runners.manage.key_regen`()

This routine is used to regenerate all keys in an environment. This is invasive! ALL KEYS IN THE SALT ENVIRONMENT WILL BE REGENERATED!!

The `key_regen` routine sends a command out to minions to revoke the master key and remove all minion keys, it then removes all keys from the master and prompts the user to restart the master. The minions will all reconnect and keys will be placed in pending.

After the master is restarted and minion keys are in the pending directory execute a `salt-key -A` command to accept the regenerated minion keys.

The master *must* be restarted within 60 seconds of running this command or the minions will think there is something wrong with the keys and abort.

Only Execute this runner after upgrading minions and master to 0.15.1 or higher!

CLI Example:

```
salt-run manage.key_regen
```

`salt.runners.manage.list_not_state` (*subset=None, show\_ip=False*)

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent to minions)

**subset**

[None] Pass in a list of minion ids.

**show\_ip**

[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.list_not_state
```

`salt.runners.manage.list_state` (*subset=None, show\_ip=False*)

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset**

[None] Pass in a list of minion ids.

**show\_ip**

[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.list_state
```

`salt.runners.manage.not_alive` (*subset=None, show\_ip=False*)

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset**

[None] Pass in a list of minion ids.

**show\_ip**

[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_alive
```

`salt.runners.manage.not_allowed` (*subset=None, show\_ip=False*)

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset**

[None] Pass in a list of minion ids.

**show\_ip**

[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_allowed
```

`salt.runners.manage.not_joined` (*subset=None, show\_ip=False*)

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset**

[None] Pass in a list of minion ids.

**show\_ip**

[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_joined
```

`salt.runners.manage.not_present` (*subset=None, show\_ip=False*)

New in version 2015.5.0.

Changed in version 2019.2.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset**

[None] Pass in a list of minion ids.

**show\_ip**

[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_present
```

`salt.runners.manage.not_reaped` (*subset=None, show\_ip=False*)

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset**

[None] Pass in a list of minion ids.

**show\_ip**

[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_reaped
```

`salt.runners.manage.present` (*subset=None, show\_ip=False*)

Changed in version 2019.2.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset**

[None] Pass in a list of minion ids.

**show\_ip**

[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.present
```

`salt.runners.manage.reaped` (*subset=None, show\_ip=False*)

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset**

[None] Pass in a list of minion ids.

**show\_ip**

[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.reaped
```

`salt.runners.manage.safe_accept` (*target*, *tgt\_type*='glob')

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Accept a minion's public key after checking the fingerprint over salt-ssh

CLI Example:

```
salt-run manage.safe_accept my_minion
salt-run manage.safe_accept minion1,minion2 tgt_type=list
```

`salt.runners.manage.status` (*output*=True, *tgt*='\*', *tgt\_type*='glob', *timeout*=None, *gather\_job\_timeout*=None)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print the status of all known salt minions

CLI Example:

```
salt-run manage.status
salt-run manage.status tgt="webservers" tgt_type="nodegroup"
salt-run manage.status timeout=5 gather_job_timeout=10
```

`salt.runners.manage.up` (*tgt*='\*', *tgt\_type*='glob', *timeout*=None, *gather\_job\_timeout*=None)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print a list of all of the minions that are up

CLI Example:

```
salt-run manage.up
salt-run manage.up tgt="webservers" tgt_type="nodegroup"
salt-run manage.up timeout=5 gather_job_timeout=10
```

`salt.runners.manage.versions` ()

Check the version of active minions

CLI Example:

```
salt-run manage.versions
```

### 26.16.21 salt.runners.match

Run matchers from the master context.

New in version 3007.0.

`salt.runners.match.compound_matches` (*expr*, *minion\_id*)

Check whether a minion is matched by a given compound match expression. On success, this function will return the minion ID, otherwise False.

---

**Note:** Pillar values will be matched literally only since this function is intended for remote calling. This also applies to node groups defined on the master. Custom matchers are not respected.

---

---

**Note:** If a module calls this runner from a minion, you will need to explicitly allow the remote call. See [peer\\_run](#).

---

CLI Example:

```
salt-run match.compound_matches 'I@foo:bar and G@os:Deb* and not db*'
→myminion
```

**expr**

The *Compound Matcher* expression to validate against.

**minion\_id**

The minion ID of the minion to check the match for.

### 26.16.22 salt.runners.mattermost

**Note for 2017.7 releases!**

Due to the `salt.runners.config` module not being available in this release series, importing the `salt.runners.config` module from the master branch is required to make this module work.

Ref: [Mattermost runner failing to retrieve config values due to unavailable config runner #43479](#)

Module for sending messages to Mattermost

New in version 2017.7.0.

**configuration**

This module can be used by either passing an `api_url` and `hook` directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```
mattermost:
  hook: peWcBiM0S9HrZG15peWcBiM0S9HrZG15
  api_url: https://example.com
```

`salt.runners.mattermost.post_event` (*event*, *channel=None*, *username=None*, *api\_url=None*, *hook=None*)

Send an event to a Mattermost channel. `:param channel:` The channel name, either will work. `:param username:` The username of the poster. `:param event:` The event to send to the Mattermost channel. `:param api_url:` The Mattermost api url, if not specified in the configuration. `:param hook:` The Mattermost hook, if not specified in the configuration. `:return:` Boolean if message was sent successfully.

`salt.runners.mattermost.post_message` (*message*, *channel=None*, *username=None*, *api\_url=None*, *hook=None*)

Send a message to a Mattermost channel. :param channel: The channel name, either will work. :param username: The username of the poster. :param message: The message to send to the Mattermost channel. :param api\_url: The Mattermost api url, if not specified in the configuration. :param hook: The Mattermost hook, if not specified in the configuration. :return: Boolean if message was sent successfully.

CLI Example:

```
salt-run mattermost.post_message message='Build is done'
```

### 26.16.23 salt.runners.mine

A runner to access data from the salt mine

`salt.runners.mine.get` (*tgt*, *fun*, *tgt\_type='glob'*)

Gathers the data from the specified minions' mine, pass in the target, function to look up and the target type

CLI Example:

```
salt-run mine.get '*' network.interfaces
```

`salt.runners.mine.update` (*tgt*, *tgt\_type='glob'*, *clear=False*, *mine\_functions=None*)

New in version 2017.7.0.

Update the mine data on a certain group of minions.

**tgt**

Which minions to target for the execution.

**tgt\_type: glob**

The type of tgt.

**clear: False**

Boolean flag specifying whether updating will clear the existing mines, or will update. Default: False (update).

**mine\_functions**

Update the mine data on certain functions only. This feature can be used when updating the mine for functions that require refresh at different intervals than the rest of the functions specified under `mine_functions` in the minion/master config or pillar.

CLI Example:

```
salt-run mine.update '*'
salt-run mine.update 'juniper-edges' tgt_type='nodegroup'
```

### 26.16.24 salt.runners.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

**depends**

PyNaCl, <https://github.com/pyca/pynacl>

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don't advise making your pillars public regardless if they are encrypted or not.

**configuration**

The following configuration defaults can be define (pillar or config files) Avoid storing private keys in pillars! Ensure master does not have `pillar_opts=True`:

```
# cat /etc/salt/master.d/nacl.conf
nacl.config:
  # NOTE: `key` and `key_file` have been renamed to `sk`, `sk_
  ↪file`
  # also `box_type` default changed from secretbox to
  ↪sealedbox.
  box_type: sealedbox                (default)
  sk_file: /etc/salt/pki/master/nacl  (default)
  pk_file: /etc/salt/pki/master/nacl.pub (default)
  sk: None
  pk: None
```

Usage can override the config defaults:

```
salt-run nacl.enc sk_file=/etc/salt/pki/master/nacl pk_file=/etc/
  ↪salt/pki/master/nacl.pub
```

The nacl lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your *sk\_file* and *pk\_file* use:

```
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl
# or if you want to work without files.
salt-run nacl.keygen
local:
-----
pk:
  /kfGX7PbWeu099702PBbKWLpG/9p06IQRswkdWHCDk0=
sk:
  SVWut5SqNpuPeNzb1b9y6b2eXg2PLIog43GBzp48Sow=
```

Now with your keypair, you can encrypt data:

You have two option, *sealedbox* or *secretbox*.

SecretBox is data encrypted using private key *pk*. Sealedbox is encrypted using public key *pk*.

Recommend using Sealedbox because the one way encryption permits developers to encrypt data for source control but not decrypt. Sealedbox only has one key that is for both encryption and decryption.

```
salt-run nacl.enc asecretpass pk=/kfGX7PbWeu099702PBbKWLpG/9p06IQRswkdWHCDk0=
  tqXzeIJnTAM9Xf0mdLcpEdklMbfBGPj2oTKmlgrm3S1DTVHNNh9h8mU1GKllGq/
  ↪+cYsk6m5WhGdk58=
```

To decrypt the data:

```
salt-run nacl.dec data=
  ↪'tqXzeIJnTAM9Xf0mdLcpEdklMbfBGPj2oTKmlgrm3S1DTVHNNh9h8mU1GKllGq/
  ↪+cYsk6m5WhGdk58=' sk='SVWut5SqNpuPeNzb1b9y6b2eXg2PLIog43GBzp48Sow='
```

When the keys are defined in the master config you can use them from the nacl runner without extra parameters:

```
# cat /etc/salt/master.d/nacl.conf
nacl.config:
  sk_file: /etc/salt/pki/master/nacl
  pk: 'cTIqXwnUiD1ulg4kXsbeCE7/NoeKEzd4nLeYcCFpd9k='
```

```
salt-run nacl.enc 'asecretpass'
salt-run nacl.dec data=
↳ 'tqXzeIJnTAM9Xf0mdLcpEdklMbfBGPj2oTKmlgrm3S1DTVVHNnh9h8mU1GKllGq/
↳ +cYsk6m5WhGdk58='
```

```
# a salt developers minion could have pillar data that includes a nacl public key
↳ key
nacl.config:
  pk: '/kfGX7PbWeu099702PBbKWLpG/9p06IQRswkdWHCDk0='
```

The developer can then use a less-secure system to encrypt data.

```
salt-run nacl.enc apassword
```

Pillar files can include protected data that the salt master decrypts:

```
pillarexample:
  user: root
  password1: {{salt.nacl.dec('DRB7Q6/X5gSRCTpZyxS6h1bwj0llUA+uaVvyou3vJ4=
↳ ')|json}}
  cert_key: {{salt.nacl.dec_file('/srv/salt/certs/example.com/key.nacl
↳ ')|json}}
  cert_key2: {{salt.nacl.dec_file('salt:///certs/example.com/key.nacl
↳ ')|json}}
```

Larger files like certificates can be encrypted with:

```
salt-run nacl.enc_file /tmp/cert.crt out=/tmp/cert.nacl
```

`salt.runners.nacl.dec(data, **kwargs)`

Alias to `{box_type}_decrypt`

`box_type`: secretbox, sealedbox(default)

`salt.runners.nacl.dec_file(name, out=None, **kwargs)`

This is a helper function to decrypt a file and return its contents.

You can provide an optional output file using `out`

`name` can be a local file or when not using `salt-run` can be a url like `salt://`, `https://` etc.

CLI Examples:

```
salt-run nacl.dec_file name=/tmp/id_rsa.nacl
salt-run nacl.dec_file name=/tmp/id_rsa.nacl box_type=secretbox
↳ sk_file=/etc/salt/pki/master/nacl.pub
```

`salt.runners.nacl.enc(data, **kwargs)`

Alias to `{box_type}_encrypt`

`box_type`: secretbox, sealedbox(default)

`salt.runners.nacl.enc_file(name, out=None, **kwargs)`

This is a helper function to encrypt a file and return its contents.

You can provide an optional output file using `out`

`name` can be a local file or when not using `salt-run` can be a url like `salt://`, `https://` etc.

CLI Examples:

```
salt-run nacl.enc_file name=/tmp/id_rsa
salt-run nacl.enc_file name=/tmp/id_rsa box_type=secretbox sk_
↳file=/etc/salt/pki/master/nacl.pub
```

`salt.runners.nacl.keygen`(*sk\_file=None*, *pk\_file=None*, *\*\*kwargs*)

Use PyNaCL to generate a keypair.

If no *sk\_file* is defined return a keypair.

If only the *sk\_file* is defined *pk\_file* will use the same name with a postfix *.pub*.

When the *sk\_file* is already existing, but *pk\_file* is not. The *pk\_file* will be generated using the *sk\_file*.

CLI Examples:

```
salt-run nacl.keygen
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/
↳pki/master/nacl.pub
salt-run nacl.keygen
```

`salt.runners.nacl.sealedbox_decrypt`(*data*, *\*\*kwargs*)

Decrypt data using a secret key that was encrypted using a public key with *nacl.sealedbox\_encrypt*.

CLI Examples:

```
salt-run nacl.sealedbox_decrypt pEXHQm6cuaF7A=
salt-run nacl.sealedbox_decrypt data='pEXHQm6cuaF7A=' sk_file=/etc/salt/
↳pki/master/nacl
salt-run nacl.sealedbox_decrypt data='pEXHQm6cuaF7A=' sk='YmFkcGFzcwo='
```

`salt.runners.nacl.sealedbox_encrypt`(*data*, *\*\*kwargs*)

Encrypt data using a public key generated from *nacl.keygen*. The encrypted data can be decrypted using *nacl.sealedbox\_decrypt* only with the secret key.

CLI Examples:

```
salt-run nacl.sealedbox_encrypt datatoenc
```

`salt.runners.nacl.secretbox_decrypt`(*data*, *\*\*kwargs*)

Decrypt data that was encrypted using *nacl.secretbox\_encrypt* using the secret key that was generated from *nacl.keygen*.

CLI Examples:

```
salt-run nacl.secretbox_decrypt pEXHQm6cuaF7A=
salt-run nacl.secretbox_decrypt data='pEXHQm6cuaF7A=' sk_file=/etc/salt/
↳pki/master/nacl
salt-run nacl.secretbox_decrypt data='pEXHQm6cuaF7A=' sk='YmFkcGFzcwo='
```

`salt.runners.nacl.secretbox_encrypt`(*data*, *\*\*kwargs*)

Encrypt data using a secret key generated from *nacl.keygen*. The same secret key can be used to decrypt the data using *nacl.secretbox\_decrypt*.

CLI Examples:

```
salt-run nacl.secretbox_encrypt datatoenc
salt-run nacl.secretbox_encrypt datatoenc sk_file=/etc/salt/pki/master/
→nacl
salt-run nacl.secretbox_encrypt datatoenc sk='YmFkcGFzcwo='
```

## 26.16.25 salt.runners.net

### NET Finder

New in version 2017.7.0.

A runner to find network details easily and fast. It's smart enough to know what you are looking for.

### Configuration

- Minion (proxy) config

To have the complete features, one needs to add the following mine configuration in the minion (proxy) config file:

```
mine_functions:
net.ipaddrs: []
net.lldp: []
net.mac: []
net.arp: []
net.interfaces: []
```

Which instructs Salt to cache the data returned by the NAPALM-functions. While they are not mandatory, the less functions configured, the less details will be found by the runner.

How often the mines are refreshed, can be specified using:

```
mine_interval: <X minutes>
```

- Master config

By default the following options can be configured on the master. They are not necessary, but available in case the user has different requirements.

**target:** \*

From what minions will collect the mine data. Default: \* (collect from all minions).

**expr\_form:** **glob**

Minion matching expression form. Default: glob.

**ignore\_interfaces**

A list of interfaces name to ignore. By default will consider all interfaces.

**display:** **True**

Display on the screen or return structured object? Default: True (return on the CLI).

**outputter:** **table**

Specify the outputter name when displaying on the CLI. Default: table.

Configuration example:

```

runners:
  net.find:
    target: 'edge*'
    expr_form: 'glob'
    ignore_interfaces:
      - lo0
      - em1
      - jsrv
      - fxp0
    outputter: yaml

```

`salt.runners.net.find(addr, best=True, display=True)`

Search in all possible entities (Interfaces, MAC tables, ARP tables, LLDP neighbors), using the following mine functions:

- net.mac
- net.arp
- net.lldp
- net.ipaddrs
- net.interfaces

This function has the advantage that it knows where to look, but the output might become quite long as returns all possible matches.

Optional arguments:

**best: True**

Return only the best match with the interfaces IP networks when the searching pattern is a valid IP Address or Network.

**display: True**

Display on the screen or return structured object? Default: True (return on the CLI).

CLI Example:

```
$ sudo salt-run net.find 10.10.10.7
```

Output Example:

```

Details for all interfaces that include network 10.10.10.7/32 - only best
↳match returned
-----
↳
| Device | Interface | Interface Description | UP | Enabled |
↳Speed [Mbps] | MAC Address | IP Addresses |
-----
↳
| edge01.flw01 | irb | | True | True |
↳ -1 | 5C:5E:AB:AC:52:B4 | 10.10.10.1/22 |
-----
↳
ARP Entries for IP 10.10.10.7
-----
↳
| Device | Interface | MAC | IP |
↳Age |
-----

```

(continues on next page)

(continued from previous page)

```

→_---
| edge01.flw01 | irb.349 [ae0.349] | 2C:60:0C:2A:4C:0A | 10.10.10.7 | 832.
→0 |
-----
→_---

```

`salt.runners.net.findarp` (*device=None, interface=None, mac=None, ip=None, display=True*)

Search for entries in the ARP tables using the following mine functions:

- net.arp

Optional arguments:

**device**

Return interface data from a certain device only.

**interface**

Return data selecting by interface name.

**mac**

Search using a specific MAC Address.

**ip**

Search using a specific IP Address.

**display: True**

Display on the screen or return structured object? Default: True, will return on the CLI.

CLI Example:

```
$ sudo salt-run net.findarp mac=8C:60:0F:78:EC:41
```

Output Example:

```

ARP Entries for MAC 8C:60:0F:78:EC:41
-----
→_---
|   Device   |   Interface   |   MAC   |   IP   |  ⓧ
→Age |
-----
→_---
| edge01.bjm01 | irb.171 [ae0.171] | 8C:60:0F:78:EC:41 | 172.172.17.19 |  ⓧ
→956.0 |
-----
→_---

```

`salt.runners.net.findmac` (*device=None, mac=None, interface=None, vlan=None, display=True*)

Search in the MAC Address tables, using the following mine functions:

- net.mac

Optional arguments:

**device**

Return interface data from a certain device only.

**interface**

Return data selecting by interface name.

**mac**

Search using a specific MAC Address.

**vlan**

Search using a VLAN ID.

**display: True**

Display on the screen or return structured object? Default: True, will return on the CLI.

CLI Example:

```
$ sudo salt-run net.findmac mac=8C:60:0F:78:EC:41
```

Output Example:

```
MAC Address(es)
-----
→
|   Device   | Interface |      MAC      | VLAN | Static | Active | 
→ Moves | Last move |
-----
→
| edge01.bjm01 | ae0.171 | 8C:60:0F:78:EC:41 | 171 | False | True | 
→ 0 | 0.0 |
-----
→
```

`salt.runners.net.interfaces` (*device=None, interface=None, title=None, pattern=None, ipnet=None, best=True, display=True*)

Search for interfaces details in the following mine functions:

- `net.interfaces`
- `net.ipaddrs`

Optional arguments:

**device**

Return interface data from a certain device only.

**interface**

Return data selecting by interface name.

**pattern**

Return interfaces that contain a certain pattern in their description.

**ipnet**

Return interfaces whose IP networks associated include this IP network.

**best: True**

When `ipnet` is specified, this argument says if the runner should return only the best match (the output will contain at most one row). Default: `True` (return only the best match).

**display: True**

Display on the screen or return structured object? Default: `True` (return on the CLI).

**title**

Display a custom title for the table.

CLI Example:

```
$ sudo salt-run net.interfaces interface=vt-0/0/10
```

Output Example:

```
Details for interface xe-0/0/0
-----
→
|   Device   | Interface | Interface Description | UP | Enabled | 
→ Speed [Mbps] | MAC Address | IP Addresses |
-----
→
| edge01.bjm01 | vt-0/0/10 | | True | True | 
→ 1000 | | |
-----
```

(continues on next page)

(continued from previous page)

```

→ -----
| edge01.flw01 | vt-0/0/10 | | True | True | ☒
→1000 | | |
-----
→ -----
| edge01.pos01 | vt-0/0/10 | | True | True | ☒
→1000 | | |
-----
→ -----
| edge01.oua01 | vt-0/0/10 | | True | True | ☒
→1000 | | |
-----
→ -----

```

`salt.runners.net.lldp` (*device=None, interface=None, title=None, pattern=None, chassis=None, display=True*)

Search in the LLDP neighbors, using the following mine functions:

- `net.lldp`

Optional arguments:

**device**

Return interface data from a certain device only.

**interface**

Return data selecting by interface name.

**pattern**

Return LLDP neighbors that have contain this pattern in one of the following fields:

- Remote Port ID
- Remote Port Description
- Remote System Name
- Remote System Description

**chassis**

Search using a specific Chassis ID.

**display: True**

Display on the screen or return structured object? Default: True (return on the CLI).

**display: True**

Display on the screen or return structured object? Default: True (return on the CLI).

**title**

Display a custom title for the table.

CLI Example:

```
$ sudo salt-run net.lldp pattern=Ethernet1/48
```

Output Example:

```

Pattern "Ethernet1/48" found in one of the following LLDP details
-----
→ -----
→ -----
| Device | Interface | Parent Interface | Remote Chassis ID | ☒
→ Remote Port ID | Remote Port Description | Remote System Name | ☒
→ Remote System Description |
-----
→ -----

```

(continues on next page)

(continued from previous page)

```

→-----
| edge01.bjm01 | xe-2/3/4 | ae0 | 8C:60:4F:3B:52:19 |

```

`salt.runners.net.multi_find(*patterns, **kwargs)`

Execute multiple search tasks. This function is based on the `find` function. Depending on the search items, some information might overlap.

Optional arguments:

**best: True**

Return only the best match with the interfaces IP networks when the searching pattern is a valid IP Address or Network.

**display: True**

Display on the screen or return structured object? Default: *True* (return on the CLI).

CLI Example:

```
$ sudo salt-run net.multi_find Ethernet1/49 xe-0/1/2
```

Output Example:

```
Pattern "Ethernet1/49" found in one of the following LLDP details
-----
->-----
->-----
| Device | Interface | Parent Interface | Remote Chassis ID |
->Remote Port Description | Remote Port ID | Remote System

## 26.16.26 salt.runners.network

Network tools to run from the Master

`salt.runners.network.wol` (*mac*, *bcast*='255.255.255.255', *destport*=9)

Send a "Magic Packet" to wake up a Minion

CLI Example:

```

salt-run network.wol 08-00-27-13-69-77
salt-run network.wol 080027136977 255.255.255.255 7
salt-run network.wol 08:00:27:13:69:77 255.255.255.255 7

```

`salt.runners.network.wolllist` (*maclist*, *bcast*='255.255.255.255', *destport*=9)

Send a "Magic Packet" to wake up a list of Minions. This list must contain one MAC hardware address per line

CLI Example:

```

salt-run network.wolllist '/path/to/maclist'
salt-run network.wolllist '/path/to/maclist' 255.255.255.255 7
salt-run network.wolllist '/path/to/maclist' 255.255.255.255 7

```

`salt.runners.network.wolmatch` (*tgt*, *tgt\_type*='glob', *bcast*='255.255.255.255', *destport*=9)

Send a "Magic Packet" to wake up Minions that are matched in the grains cache

CLI Example:

```

salt-run network.wolmatch minion_id
salt-run network.wolmatch 192.168.0.0/16 tgt_type='ipcidr' bcast=255.255.
→255.255 destport=7

```

## 26.16.27 salt.runners.pagerduty

Runner Module for Firing Events via PagerDuty

New in version 2014.1.0.

### configuration

This module can be used by specifying the name of a configuration profile in the master config.

For example:

```

my-pagerduty-account:
  pagerduty.api_key: F3Rbyjbve43rffWf2214
  pagerduty.subdomain: mysubdomain

```

`salt.runners.pagerduty.create_event` (*service\_key=None, description=None, details=None, incident\_key=None, profile=None*)

Create an event in PagerDuty. Designed for use in states.

CLI Example:

```
salt-run pagerduty.create_event <service_key> <description> <details>
→ profile=my-pagerduty-account
```

The following parameters are required:

**service\_key**

This key can be found by using `pagerduty.list_services`.

**description**

This is a short description of the event.

**details**

This can be a more detailed description of the event.

**profile**

This refers to the configuration profile to use to connect to the PagerDuty service.

`salt.runners.pagerduty.list_escalation_policies` (*profile=None, api\_key=None*)

This function is an alias of `list_policies`.

List escalation policies belonging to this account

CLI Example:

```
salt-run pagerduty.list_policies my-pagerduty-account salt-run pager-
duty.list_escalation_policies my-pagerduty-account
```

`salt.runners.pagerduty.list_incidents` (*profile=None, api\_key=None*)

List incidents belonging to this account

CLI Example:

```
salt-run pagerduty.list_incidents my-pagerduty-account
```

`salt.runners.pagerduty.list_maintenance_windows` (*profile=None, api\_key=None*)

This function is an alias of `list_windows`.

List maintenance windows belonging to this account

CLI Example:

```
salt-run pagerduty.list_windows my-pagerduty-account salt-run pager-
duty.list_maintenance_windows my-pagerduty-account
```

`salt.runners.pagerduty.list_policies` (*profile=None, api\_key=None*)

List escalation policies belonging to this account

CLI Example:

```
salt-run pagerduty.list_policies my-pagerduty-account salt-run pagerduty.list_escalation_policies
my-pagerduty-account
```

`salt.runners.pagerduty.list_schedules` (*profile=None, api\_key=None*)

List schedules belonging to this account

CLI Example:

```
salt-run pagerduty.list_schedules my-pagerduty-account
```

`salt.runners.pagerduty.list_services` (*profile=None, api\_key=None*)

List services belonging to this account

CLI Example:

```
salt-run pagerduty.list_services my-pagerduty-account
```

`salt.runners.pagerduty.list_users` (*profile=None, api\_key=None*)

List users belonging to this account

CLI Example:

```
salt-run pagerduty.list_users my-pagerduty-account
```

`salt.runners.pagerduty.list_windows` (*profile=None, api\_key=None*)

List maintenance windows belonging to this account

CLI Example:

```
salt-run pagerduty.list_windows my-pagerduty-account salt-run pager-
duty.list_maintenance_windows my-pagerduty-account
```

### 26.16.28 salt.runners.pillar

Functions to interact with the pillar compiler on the master

`salt.runners.pillar.clear_pillar_cache` (*minion='\*', \*\*kwargs*)

Clears the cached values when using `pillar_cache`

New in version 3003.

CLI Example:

Clears the pillar cache for a specific minion:

```
salt-run pillar.clear_pillar_cache 'minion'
```

`salt.runners.pillar.show_pillar` (*minion='\*', \*\*kwargs*)

Returns the compiled pillar either of a specific minion or just the global available pillars. This function assumes that no minion has the id \*. Function also accepts `pillarenv` as attribute in order to limit to a specific pillar branch of git

CLI Example:

shows minion specific pillar:

```
salt-run pillar.show_pillar 'www.example.com'
```

shows global pillar:

```
salt-run pillar.show_pillar
```

shows global pillar for 'dev' pillar environment: (note that not specifying `pillarenv` will merge all pillar environments using the master config option `pillar_source_merging_strategy`.)

```
salt-run pillar.show_pillar 'pillarenv=dev'
```

shows global pillar for 'dev' pillar environment and specific `pillarenv = dev`:

```
salt-run pillar.show_pillar 'saltenv=dev' 'pillarenv=dev'
```

API Example:

```
import salt.config
import salt.runner
opts = salt.config.master_config('/etc/salt/master')
```

(continues on next page)

(continued from previous page)

```
runner = salt.runner.RunnerClient(opts)
pillar = runner.cmd('pillar.show_pillar', [])
print(pillar)
```

`salt.runners.pillar.show_pillar_cache` (*minion='\*', \*\*kwargs*)

Shows the cached values in `pillar_cache`

New in version 3003.

CLI Example:

Shows the pillar cache for a specific minion:

```
salt-run pillar.show_pillar_cache 'minion'
```

`salt.runners.pillar.show_top` (*minion=None, saltenv='base'*)

Returns the compiled top data for pillar for a specific minion. If no minion is specified, we use the first minion we find.

CLI Example:

```
salt-run pillar.show_top
```

### 26.16.29 salt.runners.pkg

Package helper functions using `salt.modules.pkg`

New in version 2015.8.0.

`salt.runners.pkg.list_upgrades` (*jid, style='group', outputter='nested', ext\_source=None*)

Show list of available pkg upgrades using a specified format style

CLI Example:

```
salt-run pkg.list_upgrades jid=20141120114114417719 style=group
```

### 26.16.30 salt.runners.queue

#### General management and processing of queues.

This runner facilitates interacting with various queue backends such as the included `sqlite3` queue or the planned `AWS SQS` and `Redis` queues

The queue functions such as `insert`, `delete`, and `pop` can be used for typical management of the queue.

The `process_queue` function pops the requested number of items from the queue and creates a Salt Event that can then be processed by a Reactor. The `process_queue` function can be called manually, or can be configured to run on a schedule with the Salt Scheduler or regular system cron. It is also possible to use the peer system to allow a minion to call the runner.

This runner, as well as the Queues system, is not api stable at this time.

There are many things that could potentially be done with queues within Salt. For the time being the focus will be on queueing infrastructure actions on specific minions. The queues generally will be populated with minion IDs. When the `process_queue` runner function is called events are created on the Salt Event bus that indicate the queue

and a list of one or more minion IDs. The reactor is set up to match on event tags for a specific queue and then take infrastructure actions on those minion IDs. These actions might be to delete the minion's key from the master, use salt-cloud to destroy the vm, or some other custom action.

### Queued runners

Using the Salt Queues, references to the commandline arguments of other runners can be saved to be processed later. The queue runners require a queue backend that can store json data (default: `pgjsonb`).

Once the queue is setup, the `runner_queue` will need to be configured.

```
runner_queue:
  queue: runners
  backend: pgjsonb
```

**Note:** only the queue is required, this defaults to using `pgjsonb`

Once this is set, then the following can be added to the scheduler on the master and it will run the specified amount of commands per time period.

```
schedule:
  runner queue:
    schedule:
      function: queue.process_runner
      minutes: 1
      kwargs:
        quantity: 2
```

The above configuration will pop 2 runner jobs off the runner queue, and then run them. And it will do this every minute, unless there are any jobs that are still running from the last time the `process_runner` task was executed.

`salt.runners.queue.delete(queue, items, backend='sqlite')`

Delete an item or items from a queue

CLI Example:

```
salt-run queue.delete myqueue myitem
salt-run queue.delete myqueue myitem backend=sqlite
salt-run queue.delete myqueue ["'item1', 'item2', 'item3']"
```

`salt.runners.queue.insert(queue, items, backend='sqlite')`

Add an item or items to a queue

CLI Example:

```
salt-run queue.insert myqueue myitem
salt-run queue.insert myqueue ["'item1', 'item2', 'item3']"
salt-run queue.insert myqueue myitem backend=sqlite
salt-run queue.insert myqueue ["'item1', 'item2', 'item3']" backend=sqlite
```

`salt.runners.queue.insert_runner(fun, args=None, kwargs=None, queue=None, backend=None)`

Insert a reference to a runner into the queue so that it can be run later.

**fun**

The runner function that is going to be run

**args**  
list or comma-separated string of args to send to fun

**kwargs**  
dictionary of keyword arguments to send to fun

**queue**  
queue to insert the runner reference into

**backend**  
backend that to use for the queue

CLI Example:

```
salt-run queue.insert_runner test.stdout_print
salt-run queue.insert_runner event.send test_insert_runner kwargs='{"data": {"foo": "bar"}}'
```

`salt.runners.queue.list_items(queue, backend='sqlite')`

List contents of a queue

CLI Example:

```
salt-run queue.list_items myqueue
salt-run queue.list_items myqueue backend=sqlite
```

`salt.runners.queue.list_length(queue, backend='sqlite')`

Provide the number of items in a queue

CLI Example:

```
salt-run queue.list_length myqueue
salt-run queue.list_length myqueue backend=sqlite
```

`salt.runners.queue.list_queues(backend='sqlite')`

Return a list of Salt Queues on the backend

CLI Example:

```
salt-run queue.list_queues
salt-run queue.list_queues backend=sqlite
```

`salt.runners.queue.pop(queue, quantity=1, backend='sqlite', is_runner=False)`

Pop one or more or all items from a queue

CLI Example:

```
salt-run queue.pop myqueue
salt-run queue.pop myqueue 6
salt-run queue.pop myqueue all
salt-run queue.pop myqueue 6 backend=sqlite
salt-run queue.pop myqueue all backend=sqlite
```

`salt.runners.queue.process_queue(queue, quantity=1, backend='sqlite', is_runner=False)`

Pop items off a queue and create an event on the Salt event bus to be processed by a Reactor.

CLI Example:

```
salt-run queue.process_queue myqueue
salt-run queue.process_queue myqueue 6
salt-run queue.process_queue myqueue all backend=sqlite
```

`salt.runners.queue.process_runner` (*quantity=1, queue=None, backend=None*)

Process queued runners

**quantity**

number of runners to process

**queue**

queue to insert the runner reference into

**backend**

backend that to use for the queue

CLI Example:

```
salt-run queue.process_runner
salt-run queue.process_runner 5
```

### 26.16.31 salt.runners.reactor

A convenience system to manage reactors

Beginning in the 2017.7 release, the reactor runner requires that the reactor system is running. This is accomplished one of two ways, either by having reactors configured or by including `reactor` in the engine configuration for the Salt master.

**engines:**

- reactor

`salt.runners.reactor.add` (*event, reactors, saltenv='base', test=None*)

Add a new reactor

CLI Example:

```
salt-run reactor.add 'salt/cloud/*/destroyed' reactors='/srv/reactor/
↳destroy/*.sls'
```

`salt.runners.reactor.delete` (*event, saltenv='base', test=None*)

Delete a reactor

CLI Example:

```
salt-run reactor.delete 'salt/cloud/*/destroyed'
```

`salt.runners.reactor.is_leader` ()

Return whether the running reactor is acting as a leader (responding to events).

CLI Example:

```
salt-run reactor.is_leader
```

`salt.runners.reactor.list_` (*saltenv='base', test=None*)

List currently configured reactors

CLI Example:

```
salt-run reactor.list
```

`salt.runners.reactor.set_leader` (*value=True*)

Set the current reactor to act as a leader (responding to events). Defaults to True

CLI Example:

```
salt-run reactor.set_leader True
```

### 26.16.32 salt.runners.salt

This runner makes Salt's execution modules available on the salt master.

New in version 2016.11.0. Salt's execution modules are normally available on the salt minion. Use this runner to call execution modules on the salt master. Salt *execution modules* are the functions called by the `salt` command.

Execution modules can be called with `salt-run`:

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 key=value a=1
```

Execution modules are also available to salt runners:

```
__salt__['salt.cmd'](fun=fun, args=args, kwargs=kwargs)
```

`salt.runners.salt.cmd` (*fun, \*args, \*\*kwargs*)

Changed in version 2018.3.0: Added `with_pillar` argument

Execute `fun` with the given `args` and `kwargs`. Parameter `fun` should be the string *name* of the execution module to call.

---

**Note:** Execution modules will be loaded *every time* this function is called. Additionally, keep in mind that since runners execute on the master, custom execution modules will need to be synced to the master using `salt-run saltutil.sync_modules`, otherwise they will not be available.

---

`with_pillar`

[False] If True, pillar data will be compiled for the master

---

**Note:** To target the master in the pillar top file, keep in mind that the default `id` for the master is `<hostname>_master`. This can be overridden by setting an `id` configuration parameter in the master config file.

---

CLI Example:

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
```

(continues on next page)

(continued from previous page)

```
salt-run salt.cmd test.arg 1 2 3 a=1
salt-run salt.cmd mymod.myfunc with_pillar=True
```

`salt.runners.salt.execute`(*tgt*, *fun*, *arg=()*, *timeout=None*, *tgt\_type='glob'*, *ret=""*, *jid=""*, *kwarg=None*, *\*\*kwargs*)

New in version 2017.7.0.

Execute *fun* on all minions matched by *tgt* and *tgt\_type*. Parameter *fun* is the name of execution module function to call.

This function should mainly be used as a helper for runner modules, in order to avoid redundant code. For example, when inside a runner one needs to execute a certain function on arbitrary groups of minions, only has to:

```
ret1 = __salt__['salt.execute']('*', 'mod.fun')
ret2 = __salt__['salt.execute']('my_nodegroup', 'mod2.fun2', tgt_type=
→ 'nodegroup')
```

It can also be used to schedule jobs directly on the master, for example:

```
schedule:
  collect_bgp_stats:
    function: salt.execute
    args:
      - edge-routers
      - bgp.neighbors
    kwargs:
      tgt_type: nodegroup
    days: 1
    returner: redis
```

### 26.16.33 salt.runners.saltutil

The Saltutil runner is used to sync custom types to the Master. See the *saltutil module* for documentation on managing updates to minions.

New in version 2016.3.0.

`salt.runners.saltutil.sync_all`(*saltenv='base'*, *extmod\_whitelist=None*, *extmod\_blacklist=None*)

Sync all custom types

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] dictionary of modules to sync based on type

**extmod\_blacklist**

[None] dictionary of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_all
salt-run saltutil.sync_all extmod_whitelist={'runners': ['custom_runner'],
→ 'grains': []}
```

`salt.runners.saltutil.sync_cache` (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2017.7.0.

Sync cache modules from `salt://_cache` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_cache
```

`salt.runners.saltutil.sync_clouds` (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2017.7.0.

Sync cloud modules from `salt://_clouds` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_clouds
```

`salt.runners.saltutil.sync_eauth_tokens` (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2018.3.0.

Sync eauth token modules from `salt://_tokens` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_eauth_tokens
```

`salt.runners.saltutil.sync_engines` (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

Sync engines from `salt://_engines` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_engines
```

`salt.runners.saltutil.sync_executors` (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 3000.

Sync executor modules from `salt://_executors` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_executors
```

`salt.runners.saltutil.sync_fileserver` (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2018.3.0.

Sync fileserver modules from `salt://_fileserver` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_fileserver
```

`salt.runners.saltutil.sync_grains` (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

Sync grains modules from `salt://_grains` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_grains
```

`salt.runners.saltutil.sync_modules` (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

Sync execution modules from `salt://_modules` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_modules
```

**salt.runners.saltutil.sync\_output** (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

Sync output modules from `salt://_output` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_output
```

**salt.runners.saltutil.sync\_pillar** (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

Sync pillar modules from `salt://_pillar` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_pillar
```

**salt.runners.saltutil.sync\_proxymodules** (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

Sync proxy modules from `salt://_proxy` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_proxymodules
```

**salt.runners.saltutil.sync\_queues** (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

Sync queue modules from `salt://_queues` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_queues
```

**salt.runners.saltutil.sync\_renderers** (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

Sync renderer modules from from `salt://_renderers` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_renderers
```

**salt.runners.saltutil.sync\_returners** (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

Sync returner modules from `salt://_returners` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_returners
```

**salt.runners.saltutil.sync\_roster** (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2017.7.0.

Sync roster modules from `salt://_roster` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_roster
```

**salt.runners.saltutil.sync\_runners** (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

Sync runners from `salt://_runners` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_runners
```

**salt.runners.saltutil.sync\_sdb**(*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2017.7.0.

Sync sdb modules from `salt://_sdb` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_sdb
```

**salt.runners.saltutil.sync\_serializers**(*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2019.2.0.

Sync serializer modules from `salt://_serializers` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_utils
```

**salt.runners.saltutil.sync\_states**(*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

Sync state modules from `salt://_states` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_states
```

`salt.runners.saltutil.sync_thorium` (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2018.3.0.

Sync Thorium from `salt://_thorium` to the master

**saltenv: base**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

comma-separated list of modules to sync

**extmod\_blacklist**

comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_thorium
```

`salt.runners.saltutil.sync_tops` (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2016.3.7,2016.11.4,2017.7.0.

Sync master\_tops modules from `salt://_tops` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_tops
```

`salt.runners.saltutil.sync_utils` (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2016.11.0.

Sync utils modules from `salt://_utils` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_utils
```

`salt.runners.saltutil.sync_wheel` (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

Sync wheel modules from `salt://_wheel` to the master

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_wheel
```

`salt.runners.saltutil.sync_wrapper` (*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 3007.0.

Sync salt-ssh wrapper modules from `salt://_wrapper` to the master.

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist**

[None] comma-separated list of modules to sync

**extmod\_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_wrapper
```

### 26.16.34 salt.runners.sdb

Runner for setting and querying data via the sdb API on the master

`salt.runners.sdb.delete` (*uri*)

Delete a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully deleted, return `False`.

CLI Example:

```
salt-run sdb.delete sdb://mymemcached/foo
```

`salt.runners.sdb.get` (*uri*)

Get a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://`, then it will be returned as-is.

CLI Example:

```
salt-run sdb.get sdb://mymemcached/foo
```

`salt.runners.sdb.get_or_set_hash` (*uri, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#\$\$%^&\*(\_=+)*)

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

CLI Example:

```
salt-run sdb.get_or_set_hash 'SECRET_KEY' 50
```

**Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with `%`. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

`salt.runners.sdb.set_(uri, value)`

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt-run sdb.set sdb://mymemcached/foo bar
```

### 26.16.35 salt.runners.smartos\_vmadm

Runner for SmartOS minions control vmadm

`salt.runners.smartos_vmadm.get(search, one=True)`

Return information for vms

**search**

[string] filter vms, see the execution module.

**one**

[boolean] return only one vm

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

CLI Example:

```
salt-run vmadm.get 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.get search='alias=saskia'
```

`salt.runners.smartos_vmadm.is_running(search)`

Return true if vm is running

**search**

[string] filter vms, see the execution module.

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

---

**Note:** If multiple vms are matched, the result will be true of ALL vms are running

---

CLI Example:

```
salt-run vmadm.is_running 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.is_running search='alias=julia'
```

`salt.runners.smartos_vmadm.list_vms(search=None, verbose=False)`

List all vms

**search**

[string] filter vms, see the execution module

**verbose**

[boolean] print additional information about the vm

CLI Example:

```
salt-run vmadm.list
salt-run vmadm.list search='type=KVM'
salt-run vmadm.list verbose=True
```

`salt.runners.smartos_vmadm.nodes` (*verbose=False*)

List all compute nodes

**verbose**

[boolean] print additional information about the node e.g. platform version, hvm capable, ...

CLI Example:

```
salt-run vmadm.nodes
salt-run vmadm.nodes verbose=True
```

`salt.runners.smartos_vmadm.reboot` (*search, one=True, force=False*)

Reboot one or more vms

**search**

[string] filter vms, see the execution module.

**one**

[boolean] reboot only one vm

**force**

[boolean] force reboot, faster but no graceful shutdown

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

CLI Example:

```
salt-run vmadm.reboot 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.reboot search='alias=marije'
salt-run vmadm.reboot search='type=KVM' one=False
```

`salt.runners.smartos_vmadm.start` (*search, one=True*)

Start one or more vms

**search**

[string] filter vms, see the execution module.

**one**

[boolean] start only one vm

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

CLI Example:

```
salt-run vmadm.start 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.start search='alias=jiska'
salt-run vmadm.start search='type=KVM' one=False
```

`salt.runners.smartos_vmadm.stop` (*search, one=True*)

Stop one or more vms

**search**

[string] filter vms, see the execution module.

**one**

[boolean] stop only one vm

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

CLI Example:

```
salt-run vmadm.stop 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.stop search='alias=jody'
salt-run vmadm.stop search='type=KVM' one=False
```

### 26.16.36 salt.runners.spacewalk

#### Spacewalk Runner

New in version 2016.3.0.

Runner to interact with Spacewalk using Spacewalk API

**codeauthor**

Nitin Madhok &lt;nmadhok@g.clemson.edu&gt;, Joachim Werner &lt;joe@suse.com&gt;, Benedikt Werner &lt;1benediktwerner@gmail.com&gt;

**maintainer**

Benedikt Werner &lt;1benediktwerner@gmail.com&gt;

To use this runner, set up the Spacewalk URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/spacewalk.conf`:

```
spacewalk:
spacewalk01.domain.com:
  username: 'testuser'
  password: 'verybadpass'
spacewalk02.domain.com:
  username: 'testuser'
  password: 'verybadpass'
```

---

**Note:** Optionally, `protocol` can be specified if the spacewalk server is not using the defaults. Default is `protocol: https`.

---

**salt.runners.spacewalk.addGroupsToKey** (*server, activation\_key, groups*)

Add server groups to a activation key

CLI Example:

```
salt-run spacewalk.addGroupsToKey spacewalk01.domain.com 1-my-key
→ '[group1, group2]'
```

**salt.runners.spacewalk.api** (*server, command, \*args, \*\*kwargs*)

Call the Spacewalk xmlrpc api.

CLI Example:

```
salt-run spacewalk.api spacewalk01.domain.com systemgroup.create MyGroup
→Description
salt-run spacewalk.api spacewalk01.domain.com systemgroup.create
→arguments='["MyGroup", "Description"]'
```

State Example:

```
create_group:
  salt.runner:
    - name: spacewalk.api
    - server: spacewalk01.domain.com
    - command: systemgroup.create
    - arguments:
      - MyGroup
      - Description
```

`salt.runners.spacewalk.deleteAllActivationKeys` (*server*)

Delete all activation keys from Spacewalk

CLI Example:

```
salt-run spacewalk.deleteAllActivationKeys spacewalk01.domain.com
```

`salt.runners.spacewalk.deleteAllGroups` (*server*)

Delete all server groups from Spacewalk

`salt.runners.spacewalk.deleteAllSystems` (*server*)

Delete all systems from Spacewalk

CLI Example:

```
salt-run spacewalk.deleteAllSystems spacewalk01.domain.com
```

`salt.runners.spacewalk.unregister` (*name, server\_url*)

Unregister specified server from Spacewalk

CLI Example:

```
salt-run spacewalk.unregister my-test-vm spacewalk01.domain.com
```

### 26.16.37 salt.runners.ssh

A Runner module interface on top of the salt-ssh Python API.

This allows for programmatic use from salt-api, the Reactor, Orchestrate, etc.

`salt.runners.ssh.cmd` (*tgt, fun, arg=(), timeout=None, tgt\_type='glob', kwarg=None*)

New in version 2015.5.0.

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Execute a single command via the salt-ssh subsystem and return all routines at once

A wrapper around the `SSHClient.cmd` method.

### 26.16.38 salt.runners.state

Execute orchestration functions

`salt.runners.state.event` (*tagmatch='\**, *count=-1*, *quiet=False*, *sock\_dir=None*, *pretty=False*, *node='master'*)

Watch Salt's event bus and block until the given tag is matched

New in version 2014.7.0.

Changed in version 2019.2.0: `tagmatch` can now be either a glob or regular expression.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

#### Parameters

- **tagmatch** -- the event is written to stdout for each tag that matches this glob or regular expression.
- **count** -- this number is decremented for each event that matches the `tagmatch` parameter; pass `-1` to listen forever.
- **quiet** -- do not print to stdout; just block
- **sock\_dir** -- path to the Salt master's event socket file.
- **pretty** -- Output the JSON all on a single line if `False` (useful for shell tools); pretty-print the JSON output if `True`.
- **node** -- Watch the minion-side or master-side event bus. .. versionadded:: 2016.3.0

CLI Examples:

```
# Reboot a minion and run highstate when it comes back online
salt 'jerry' system.reboot && \
  salt-run state.event 'salt/minion/jerry/start' count=1 quiet=True && \
  → \
  salt 'jerry' state.highstate

# Reboot multiple minions and run highstate when all are back online
salt -L 'kevin,stewart,dave' system.reboot && \
  salt-run state.event 'salt/minion/*/start' count=3 quiet=True && \
  salt -L 'kevin,stewart,dave' state.highstate

# Watch the event bus forever in a shell while-loop.
salt-run state.event | while read -r tag data; do
  echo $tag
  echo $data | jq --color-output .
done
```

See also:

See `tests/eventlisten.sh` for an example of usage within a shell script.

`salt.runners.state.orch` (*mods*, *saltenv='base'*, *test=None*, *exclude=None*, *pillar=None*, *pillarenv=None*, *pillar\_enc=None*, *orchestration\_jid=None*)

This function is an alias of `orchestrate`.

New in version 0.17.0.

Execute a state run from the master, used as a powerful orchestration system.

See also:

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- [Docs for the master-side state module](#)

CLI Examples:

```
salt-run state.orchestrate webserver
salt-run state.orchestrate webserver saltenv=dev test=True
salt-run state.orchestrate webserver saltenv=dev pillarenv=aws
```

Changed in version 2014.1.1: Runner renamed from `state.sls` to `state.orchestrate`

Changed in version 2014.7.0: Runner uses the pillar variable

Changed in version 2017.5.0: Runner uses the `pillar_enc` variable that allows renderers to render the pillar. This is usable when supplying the contents of a file as pillar, and the file contains gpg-encrypted entries.

See also:

GPG renderer documentation

CLI Examples:

```
salt-run state.orchestrate webserver pillar_enc=gpg pillar="
↳$(cat somefile.json)"
```

`salt.runners.state.orch_show_sls` (*mods*, *saltenv*='base', *test*=None, *queue*=False, *pillar*=None, *pillarenv*=None, *pillar\_enc*=None)

This function is an alias of `orchestrate_show_sls`.

Display the state data from a specific sls, or list of sls files, after being render using the master minion.

Note, the master minion adds a "\_master" suffix to its minion id.

See also:

The `state.show_sls` module function

CLI Example:

```
salt-run state.orch_show_sls my-orch-formula.my-orch-state
↳'pillar={ nodegroup: ng1 }'
```

`salt.runners.state.orchestrate` (*mods*, *saltenv*='base', *test*=None, *exclude*=None, *pillar*=None, *pillarenv*=None, *pillar\_enc*=None, *orchestration\_jid*=None)

New in version 0.17.0.

Execute a state run from the master, used as a powerful orchestration system.

See also:

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- [Docs for the master-side state module](#)

CLI Examples:

```
salt-run state.orchestrate webserver
salt-run state.orchestrate webserver saltenv=dev test=True
salt-run state.orchestrate webserver saltenv=dev pillarenv=aws
```

Changed in version 2014.1.1: Runner renamed from `state.sls` to `state.orchestrate`

Changed in version 2014.7.0: Runner uses the pillar variable

Changed in version 2017.5.0: Runner uses the `pillar_enc` variable that allows renderers to render the pillar. This is usable when supplying the contents of a file as pillar, and the file contains gpg-encrypted entries.

See also:

GPG renderer documentation

CLI Examples:

```
salt-run state.orchestrate webserver pillar_enc=gpg pillar="$(cat
↪somefile.json)"
```

`salt.runners.state.orchestrate_high`(*data*, *test=None*, *queue=False*, *pillar=None*, *\*\*kwargs*)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_high '{
  stage_one:
    {salt.state: [{tgt: "db*"}, {sls: postgres_setup}]},
  stage_two:
    {salt.state: [{tgt: "web*"}, {sls: apache_setup}, {
      require: [{salt: stage_one}],
    }]},
}'
```

`salt.runners.state.orchestrate_show_sls`(*mods*, *saltenv='base'*, *test=None*, *queue=False*, *pillar=None*, *pillarenv=None*, *pillar\_enc=None*)

Display the state data from a specific sls, or list of sls files, after being render using the master minion.

Note, the master minion adds a "\_master" suffix to its minion id.

See also:

The `state.show_sls` module function

CLI Example:

```
salt-run state.orch_show_sls my-orch-formula.my-orch-state 'pillar={
↪nodegroup: ng1 }'
```

`salt.runners.state.orchestrate_single`(*fun*, *name*, *test=None*, *queue=False*, *pillar=None*, *\*\*kwargs*)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_single fun=salt.wheel name=key.list_all
```

`salt.runners.state.pause`(*jid*, *state\_id=None*, *duration=None*)

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds.

`salt.runners.state.resume(jid, state_id=None)`

Remove a pause from a jid, allowing it to continue

`salt.runners.state.rm_pause(jid, state_id=None)`

This function is an alias of `resume`.

Remove a pause from a jid, allowing it to continue

`salt.runners.state.set_pause(jid, state_id=None, duration=None)`

This function is an alias of `pause`.

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds.

`salt.runners.state.sls(mods, saltenv='base', test=None, exclude=None, pillar=None, pillarenv=None, pillar_enc=None, orchestration_jid=None)`

This function is an alias of `orchestrate`.

New in version 0.17.0.

Execute a state run from the master, used as a powerful orchestration system.

**See also:**

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- [Docs for the master-side state module](#)

CLI Examples:

```
salt-run state.orchestrate webserver
salt-run state.orchestrate webserver saltenv=dev test=True
salt-run state.orchestrate webserver saltenv=dev pillarenv=aws
```

Changed in version 2014.1.1: Runner renamed from `state.sls` to `state.orchestrate`

Changed in version 2014.7.0: Runner uses the pillar variable

Changed in version 2017.5.0: Runner uses the `pillar_enc` variable that allows renderers to render the pillar. This is usable when supplying the contents of a file as pillar, and the file contains gpg-encrypted entries.

**See also:**

GPG renderer documentation

CLI Examples:

```
salt-run state.orchestrate webserver pillar_enc=gpg pillar="
→$(cat somefile.json)"
```

`salt.runners.state.soft_kill(jid, state_id=None)`

Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given state id. This needs to pass in the jid of the running state. If a `state_id` is not passed then the jid referenced will be safely exited at the beginning of the next state run.

### 26.16.39 salt.runners.survey

A general map/reduce style salt runner for aggregating results returned by several different minions.

New in version 2014.7.0.

Aggregated results are sorted by the size of the minion pools which returned matching results.

Useful for playing the game: *"some of these things are not like the others..."* when identifying discrepancies in a large infrastructure managed by salt.

`salt.runners.survey.diff(*args, **kwargs)`

Return the DIFFERENCE of the result sets returned by each matching minion pool

New in version 2014.7.0.

These pools are determined from the aggregated and sorted results of a salt command.

This command displays the "diffs" as a series of 2-way differences -- namely the difference between the FIRST displayed minion pool (according to sort order) and EACH SUBSEQUENT minion pool result set.

Differences are displayed according to the Python `difflib.unified_diff()` as in the case of the salt execution module `file.get_diff`.

This command is submitted via a salt runner using the general form:

```
salt-run survey.diff [survey_sort=up/down] <target>
                   <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (Example to display the "differences of files")

```
salt-run survey.diff survey_sort=up "*" cp.get_file_str file:///etc/hosts
```

`salt.runners.survey.hash(*args, **kwargs)`

Return the MATCHING minion pools from the aggregated and sorted results of a salt command

New in version 2014.7.0.

This command is submitted via a salt runner using the general form:

```
salt-run survey.hash [survey_sort=up/down] <target>
                   <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (functionally equivalent to `salt-run manage.up`)

```
salt-run survey.hash "*" test.ping
```

CLI Example #2: (find an "outlier" minion config file)

```
salt-run survey.hash "*" file.get_hash /etc/salt/minion survey_sort=up
```

### 26.16.40 salt.runners.test

This runner is used only for test purposes and serves no production purpose

`salt.runners.test.arg(*args, **kwargs)`

Output the given args and kwargs

Kwargs will be filtered for 'private' keynames.

CLI Example:

```
salt-run test.arg foo bar=baz
```

`salt.runners.test.get_opts()`

New in version 2018.3.0.

Return the configuration options of the master.

CLI Example:

```
salt-run test.get_opts
```

`salt.runners.test.metasyntactic(locality='us')`

Return common metasyntactic variables for the given locality

CLI Example:

```
salt-run test.metasyntactic locality=uk
```

`salt.runners.test.raw_arg(*args, **kwargs)`

Output the given args and kwargs

CLI Example:

```
salt-run test.arg foo __bar=baz
```

`salt.runners.test.sleep(s_time=10)`

Sleep t seconds, then return True

CLI Example:

```
salt-run test.sleep s_time=5
```

`salt.runners.test.stdout_print()`

Print 'foo' and return 'bar'

CLI Example:

```
salt-run test.stdout_print
```

`salt.runners.test.stream()`

Fire a stream of 100 test events, then return True

CLI Example:

```
salt-run test.stream
```

### 26.16.41 salt.runners.thin

The thin runner is used to manage the salt thin systems.

Salt Thin is a transport-less version of Salt that can be used to run routines in a standalone way. This runner has tools which generate the standalone salt system for easy consumption.

`salt.runners.thin.generate`(*extra\_mods=""*, *overwrite=False*, *so\_mods=""*, *absonly=True*, *compress='gzip'*)

Generate the salt-thin tarball and print the location of the tarball Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate
salt-run thin.generate mako
salt-run thin.generate mako,wempy 1
salt-run thin.generate overwrite=1
```

`salt.runners.thin.generate_min`(*extra\_mods=""*, *overwrite=False*, *so\_mods=""*)

Generate the salt-thin tarball and print the location of the tarball Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate_min
```

### 26.16.42 salt.runners.vault

**Warning:** This module will be removed from Salt in version 3009 in favor of the [vault Salt Extension](#).

Runner functions supporting the Vault modules. Configuration instructions are documented in the [execution module docs](#).

**maintainer**  
SaltStack

**maturity**  
new

**platform**  
all

**class** `salt.runners.vault.LazyPillar`(*opts*, *grains*, *minion\_id*, *extra\_minion\_data=None*)

Simulates a pillar dictionary. Only compiles the pillar once an item is requested.

`salt.runners.vault.cleanup_auth`()

New in version 3007.0.

Removes AppRoles and entities associated with unknown minion IDs. Can only clean up entities if the AppRole still exists.

**Warning:** Make absolutely sure that the configured minion approle issue mount is exclusively dedicated to the Salt master, otherwise you might lose data by using this function! (config: `vault:issue:approle:mount`)

This detects unknown existing AppRoles by listing all roles on the configured minion AppRole mount and deducting known minions from the returned list.

CLI Example:

```
salt-run vault.cleanup_auth
```

**salt.runners.vault.clear\_cache** (*master=True, minions=True*)

New in version 3007.0.

Clears master cache of Vault-specific data. This can include: - AppRole metadata - rendered policies - cached authentication credentials for impersonated minions - cached KV metadata for impersonated minions

CLI Example:

```
salt-run vault.clear_cache
salt-run vault.clear_cache minions=false
salt-run vault.clear_cache master=false minions='[minion1, minion2]'
```

**master**

Clear cached data for the master context. Includes cached master authentication data and KV metadata. Defaults to true.

**minions**

Clear cached data for minions on the master. Can include cached authentication credentials and KV metadata for pillar compilation as well as AppRole metadata and rendered policies for credential issuance. Defaults to true. Set this to a list of minion IDs to only clear cached data pertaining to these minions.

**salt.runners.vault.generate\_new\_token** (*minion\_id, signature, impersonated\_by\_master=False, issue\_params=None*)

New in version 3007.0.

Generate a Vault token for minion <minion\_id>.

**minion\_id**

The ID of the minion that requests a token.

**signature**

Cryptographic signature which validates that the request is indeed sent by the minion (or the master, see *impersonated\_by\_master*).

**impersonated\_by\_master**

If the master needs to create a token on behalf of the minion, this is True. This happens when the master generates minion pillars.

**issue\_params**

Dictionary of parameters for the generated tokens. See master configuration `vault:issue:token:params` for possible values. Requires `vault:issue:allow_minion_override_params` master configuration setting to be effective.

**salt.runners.vault.generate\_secret\_id** (*minion\_id, signature, impersonated\_by\_master=False, issue\_params=None*)

New in version 3007.0.

Generate a Vault secret ID for minion <minion\_id>. Requires the master to be configured to generate AppRoles for minions (configuration: `vault:issue:type`).

**minion\_id**

The ID of the minion that requests a secret ID.

**signature**

Cryptographic signature which validates that the request is indeed sent by the minion (or the master, see `impersonated_by_master`).

**impersonated\_by\_master**

If the master needs to create a token on behalf of the minion, this is True. This happens when the master generates minion pillars.

**issue\_params**

Dictionary of configuration values for the generated AppRole. See master configuration `vault:issue:approle:params` for possible values. Requires `vault:issue:allow_minion_override_params` master configuration setting to be effective.

`salt.runners.vault.generate_token` (*minion\_id*, *signature*, *impersonated\_by\_master=False*, *ttl=None*, *uses=None*, *upgrade\_request=False*)

Deprecated since version 3007.0.

Generate a Vault token for minion <minion\_id>.

**minion\_id**

The ID of the minion that requests a token.

**signature**

Cryptographic signature which validates that the request is indeed sent by the minion (or the master, see `impersonated_by_master`).

**impersonated\_by\_master**

If the master needs to create a token on behalf of the minion, this is True. This happens when the master generates minion pillars.

**ttl**

Ticket time to live in seconds, 1m minutes, or 2h hrs

**uses**

Number of times a token can be used

**upgrade\_request**

In case the new runner endpoints have not been whitelisted for peer running, this endpoint serves as a gateway to `vault.get_config`. Defaults to False.

`salt.runners.vault.get_config` (*minion\_id*, *signature*, *impersonated\_by\_master=False*, *issue\_params=None*, *config\_only=False*)

New in version 3007.0.

Return Vault configuration for minion <minion\_id>.

**minion\_id**

The ID of the minion that requests the configuration.

**signature**

Cryptographic signature which validates that the request is indeed sent by the minion (or the master, see `impersonated_by_master`).

**impersonated\_by\_master**

If the master needs to contact the Vault server on behalf of the minion, this is True. This happens when the master generates minion pillars.

**issue\_params**

Parameters for credential issuance. Requires `vault:issue:allow_minion_override_params` master configuration setting to be effective.

**config\_only**

In case the master is configured to issue tokens, do not include a new token in the response. This is used for configuration update checks. Defaults to false.

`salt.runners.vault.get_role_id` (*minion\_id*, *signature*, *impersonated\_by\_master=False*, *issue\_params=None*)

New in version 3007.0.

Return the Vault role-id for minion <minion\_id>. Requires the master to be configured to generate AppRoles for minions (configuration: `vault:issue:type`).

**minion\_id**

The ID of the minion that requests a role-id.

**signature**

Cryptographic signature which validates that the request is indeed sent by the minion (or the master, see `impersonated_by_master`).

**impersonated\_by\_master**

If the master needs to create a token on behalf of the minion, this is True. This happens when the master generates minion pillars.

**issue\_params**

Dictionary of configuration values for the generated AppRole. See master configuration `vault:issue:approle:params` for possible values. Requires `vault:issue:allow_minion_override_params` master configuration setting to be effective.

**salt.runners.vault.list\_approles()**

New in version 3007.0.

List all AppRoles that have been created by the Salt master. They are named after the minions.

CLI Example:

```
salt-run vault.list_approles
```

Required policy:

```
path "auth/<mount>/role" {
  capabilities = ["list"]
}
```

**salt.runners.vault.list\_entities()**

New in version 3007.0.

List all entities that have been created by the Salt master. They are named `salt_minion_{minion_id}`.

CLI Example:

```
salt-run vault.list_entities
```

Required policy:

```
path "identity/entity/name" {
  capabilities = ["list"]
}
```

**salt.runners.vault.show\_approle(minion\_id)**

New in version 3007.0.

Show AppRole configuration for <minion\_id>.

CLI Example:

```
salt-run vault.show_approle db1
```

**salt.runners.vault.show\_entity(minion\_id)**

New in version 3007.0.

Show entity metadata for <minion\_id>.

CLI Example:

```
salt-run vault.show_entity db1
```

`salt.runners.vault.show_policies` (*minion\_id*, *refresh\_pillar*=<Constant.NOT\_SET>, *expire*=None)

Show the Vault policies that are applied to tokens for the given minion.

**minion\_id**

The ID of the minion to show policies for.

**refresh\_pillar**

Whether to refresh the pillar data when rendering templated policies. None will only refresh when the cached data is unavailable, boolean values force one behavior always. Defaults to config value `vault:policies:refresh_pillar` or None.

**expire**

Policy computation can be heavy in case pillar data is used in templated policies and it has not been cached. Therefore, a short-lived cache specifically for rendered policies is used. This specifies the expiration timeout in seconds. Defaults to config value `vault:policies:cache_time` or 60.

---

**Note:** When issuing AppRoles to minions, the shown policies are read from Vault configuration for the minion's AppRole and thus `refresh_pillar/expire` will not be honored.

---

CLI Example:

```
salt-run vault.show_policies myminion
```

`salt.runners.vault.sync_approles` (*minions*=None, *up*=False, *down*=False)

New in version 3007.0.

Sync minion AppRole parameters with current settings, including associated token policies.

---

**Note:** Only updates existing AppRoles. They are issued during the first request for one by the minion. Running this will reset minion overrides, which are reapplied automatically during the next request for authentication details.

---

---

**Note:** Unlike when issuing tokens, AppRole-associated policies are not regularly refreshed automatically. It is advised to schedule regular runs of this function.

---

If no parameter is specified, will try to sync AppRoles for all known minions.

CLI Example:

```
salt-run vault.sync_approles
salt-run vault.sync_approles ecorp
```

**minions**

(List of) ID(s) of the minion(s) to update the AppRole for. Defaults to None.

**up**

Find all minions that are up and update their AppRoles. Defaults to False.

**down**

Find all minions that are down and update their AppRoles. Defaults to False.

`salt.runners.vault.sync_entities` (*minions=None, up=False, down=False*)

New in version 3007.0.

Sync minion entities with current settings. Only updates entities for minions with existing AppRoles.

---

**Note:** This updates associated metadata only. Entities are created only when issuing AppRoles to minions (`vault:issue:type == approle`).

---

If no parameter is specified, will try to sync entities for all known minions.

CLI Example:

```
salt-run vault.sync_entities
```

**minions**

(List of) ID(s) of the minion(s) to update the entity for. Defaults to None.

**up**

Find all minions that are up and update their associated entities. Defaults to False.

**down**

Find all minions that are down and update their associated entities. Defaults to False.

`salt.runners.vault.unseal`()

Unseal Vault server

This function uses the 'keys' from the 'vault' configuration to unseal vault server

**vault:**

**keys:**

- n63/TbrQuL3xaIW7ZZpuXj/tlfnK1/MbVxO4vT3wYD2A
- S9OwCvMRhErEA4NVVELYBs6w/Me6+urgUr24xGK44Uy3
- F1j4b7JKq850NS6Kboiy5laJ0xY8dWJvB3fcwA+SraYl
- 1cYtvjKJNDVam9c7HNqJUfInk4PYyAXlpjkn/sIuzPv
- 3pPK5X6vGtwLhNOFv1U2elahECz3HpRUfNXJFYLw6lid

CLI Examples:

```
salt-run vault.unseal
```

### 26.16.43 salt.runners.venafiapi

Support for Venafi

**depends**

- vcert Python module

**configuration**

In order to connect to Venafi services you need to specify it in Salt master configuration. Example for Venafi Cloud (using env variables):

**venafi:**

`api_key: "sdb://osenv/CLOUDAPIKEY"`

Example for Venafi Platform (using env variables):

```

```

**venafi:**

```

base_url:      "https://tpp.example.com/"  tpp_user:      admin  tpp_password:
"sdb://osenv/TPP_PASSWORD" trust_bundle: "/opt/venafi/bundle.pem"

```

**salt.runners.venafiapi.del\_cached\_domain**(*domains*)

Delete cached domains from the master

CLI Example:

```

salt-run venafi.del_cached_domain domain1.example.com, domain2.example.com

```

**salt.runners.venafiapi.list\_domain\_cache**()

List domains that have been cached

CLI Example:

```

salt-run venafi.list_domain_cache

```

**salt.runners.venafiapi.renew**(*minion\_id*, *dns\_name=None*, *zone=None*, *country=None*, *state=None*, *loc=None*, *org=None*, *org\_unit=None*, *key\_password=None*, *csr\_path=None*, *pkey\_path=None*)

Request a new certificate

CLI Example:

```

salt-run venafi.request <minion_id> <dns_name>

```

**salt.runners.venafiapi.request**(*minion\_id*, *dns\_name=None*, *zone=None*, *country=None*, *state=None*, *loc=None*, *org=None*, *org\_unit=None*, *key\_password=None*, *csr\_path=None*, *pkey\_path=None*)

Request a new certificate

CLI Example:

```

salt-run venafi.request <minion_id> <dns_name>

```

**salt.runners.venafiapi.show\_cert**(*dns\_name*)

Show issued certificate for domain

CLI Example:

```

salt-run venafi.show_cert example.com

```

#### 26.16.44 salt.runners.virt

Control virtual machines via Salt

**salt.runners.virt.force\_off**(*name*)

Force power down the named virtual machine

**salt.runners.virt.host\_info**(*host=None*)

Return information about the host connected to this master

`salt.runners.virt.init`(*name, cpu, mem, image, hypervisor='kvm', host=None, seed=True, nic='default', install=True, start=True, disk='default', saltenv='base', enable\_vnc=False, seed\_cmd='seed.apply', enable\_qcow=False, serial\_type=None'*)

This routine is used to create a new virtual machine. This routines takes a number of options to determine what the newly created virtual machine will look like.

**name**

The mandatory name of the new virtual machine. The name option is also the minion id, all minions must have an id.

**cpu**

The number of cpus to allocate to this new virtual machine.

**mem**

The amount of memory to allocate to this virtual machine. The number is interpreted in megabytes.

**image**

The network location of the virtual machine image, commonly a location on the salt fileserver, but http, https and ftp can also be used.

**hypervisor**

The hypervisor to use for the new virtual machine. Default is *kvm*.

**host**

The host to use for the new virtual machine, if this is omitted Salt will automatically detect what host to use.

**seed**

Set to *False* to prevent Salt from seeding the new virtual machine.

**nic**

The nic profile to use, defaults to the "default" nic profile which assumes a single network interface per VM associated with the "br0" bridge on the master.

**install**

Set to *False* to prevent Salt from installing a minion on the new VM before it spins up.

**disk**

The disk profile to use

**saltenv**

The Salt environment to use

**enable\_vnc**

Whether a VNC screen is attached to resulting VM. Default is *False*.

**seed\_cmd**

If seed is *True*, use this execution module function to seed new VM. Default is *seed.apply*.

**enable\_qcow**

Clone disk image as a copy-on-write qcow2 image, using downloaded *image* as backing file.

**serial\_type**

Enable serial console. Set to 'pty' for serial console or 'tcp' for telnet. Default is 'None'

`salt.runners.virt.list`(*host=None, quiet=False, hyper=None*)

List the virtual machines on each host, this is a simplified query, showing only the virtual machine names belonging to each host. A single host can be passed in to specify an individual host to list.

`salt.runners.virt.migrate`(*name, target=""*)

Migrate a VM from one host to another. This routine will just start the migration and display information on how to look up the progress.

`salt.runners.virt.next_host`()

Return the host to use for the next autodeployed VM. This queries the available host and executes some math the determine the most "available" next host.

`salt.runners.virt.pause`(*name*)

Pause the named VM

`salt.runners.virt.purge`(*name*, *delete\_key=True*)

Destroy the named VM

`salt.runners.virt.query`(*host=None*, *quiet=False*)

Query the virtual machines. When called without options all hosts are detected and a full query is returned. A single host can be passed in to specify an individual host to query.

`salt.runners.virt.reset`(*name*)

Force power down and restart an existing VM

`salt.runners.virt.resume`(*name*)

Resume a paused VM

`salt.runners.virt.start`(*name*)

Start a named virtual machine

`salt.runners.virt.vm_info`(*name*, *quiet=False*)

Return the information on the named VM

### 26.16.45 salt.runners.vistara

Vistara Runner

Runner to interact with the Vistara (<http://www.vistarait.com/>) REST API

**codeauthor**

Brad Thurber <[brad.thurber@gmail.com](mailto:brad.thurber@gmail.com)>

To use this runner, the Vistara `client_id` and Vistara `oauth2 client_key` and `client_secret` must be set in the master config.

For example `/etc/salt/master.d/_vistara.conf`:

```
vistara:
  client_id: client_012345
  client_key: N0tReallyaR3alKeyButShouldB12345
  client_secret: ☒
  ↪ ThisI5AreallyLongsecretKeyIwonderwhyTheyMakethemSoBigTheseDays00
```

`salt.runners.vistara.delete_device`(*name*, *safety\_on=True*)

Deletes a device from Vistara based on DNS name or partial name. By default, `delete_device` will only perform the delete if a single host is returned. Set `safety_on=False` to delete all matches (up to default API search page size)

CLI Example:

```
salt-run vistara.delete_device 'hostname-101.mycompany.com'
salt-run vistara.delete_device 'hostname-101'
salt-run vistara.delete_device 'hostname-1' safety_on=False
```

## 26.16.46 salt.runners.winrepo

Runner to manage Windows software repo

`salt.runners.winrepo.genrepo` (*opts=None, fire\_event=True*)

Generate winrepo\_cache file based on sls files in the winrepo\_dir

**opts**

Specify an alternate opts dict. Should not be used unless this function is imported into an execution module.

**fire\_event**

[True] Fire an event on failure. Only supported on the master.

CLI Example:

```
salt-run winrepo.genrepo
```

`salt.runners.winrepo.update_git_repos` (*opts=None, clean=False, masterless=False*)

Checkout git repos containing Windows Software Package Definitions

**opts**

Specify an alternate opts dict. Should not be used unless this function is imported into an execution module.

**clean**

[False] Clean repo cachedirs which are not configured under *winrepo\_remotes*.

**Warning:** This argument should not be set to `True` if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Examples:

```
salt-run winrepo.update_git_repos
salt-run winrepo.update_git_repos clean=True
```

## 26.17 sdb modules

<i>cache</i>	cache Module
<i>confidant</i>	An SDB module for getting credentials from confidant.
<i>consul</i>	Consul sdb Module
<i>couchdb</i>	CouchDB sdb Module
<i>env</i>	Environment sdb Module
<i>etcd_db</i>	etcd Database Module
<i>keyring_db</i>	Keyring Database Module
<i>memcached</i>	Memcached sdb Module
<i>redis_sdb</i>	Redis SDB module
<i>rest</i>	Generic REST API SDB Module
<i>sqlite3</i>	SQLite sdb Module
<i>tism</i>	tISM - the Immutable Secrets Manager SDB Module
<i>vault</i>	Vault SDB Module
<i>yaml</i>	Pull sdb values from a YAML file

## 26.17.1 salt.sdb.cache

cache Module

```

maintainer
    SaltStack

maturity
    New

platform
    all
  
```

New in version 2017.7.0.

This module provides access to Salt's cache subsystem.

Like all sdb modules, the cache module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```

mastercloudcache:
  driver: cache
  bank: cloud/active/ec2/my-ec2-conf/saltmaster
  cachedir: /var/cache/salt
  
```

The `driver` refers to the cache module, `bank` refers to the cache bank that contains the data and `cachedir` (optional), if used, points to an alternate directory for cache data storage.

```

master_ip: sdb://mastercloudcache/public_ips
  
```

It is also possible to override both the `bank` and `cachedir` options inside the SDB URI:

```

master_ip: sdb://mastercloudcache/public_ips?cachedir=/var/cache/salt
  
```

For this reason, both the `bank` and the `cachedir` options can be omitted from the SDB profile. However, if the `bank` option is omitted, it must be specified in the URI:

```

master_ip: sdb://mastercloudcache/public_ips?bank=cloud/active/ec2/my-ec2-
  ↪conf/saltmaster
  
```

`salt.sdb.cache.delete` (*key*, *service=None*, *profile=None*)

Get a value from the cache service

`salt.sdb.cache.get` (*key*, *service=None*, *profile=None*)

Get a value from the cache service

`salt.sdb.cache.set_` (*key*, *value*, *service=None*, *profile=None*)

Set a key/value pair in the cache service

## 26.17.2 salt.sdb.confidant

An SDB module for getting credentials from confidant.

### Configuring the Confidant module

The module can be configured via sdb in the minion config:

```
confidant:
  driver: confidant
  # The URL of the confidant web service
  url: 'https://confidant-production.example.com'
  # The context to use for KMS authentication
  auth_context:
    from: example-production-iad
    to: confidant-production-iad
    user_type: service
  # The KMS master key to use for authentication
  auth_key: "alias/authnz"
  # Cache file for KMS auth token
  token_cache_file: /run/confidant/confidant_token
  # The duration of the validity of a token, in minutes
  token_duration: 60
  # key, keyid and region can be defined in the profile, but it's generally
  # best to use IAM roles or environment variables for AWS auth.
  keyid: 98nh9h9h908h09kjjk
  key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0
  region: us-east-1
```

#### depends

confidant-common, confidant-client

### Module Documentation

`salt.sdb.confidant.get`(*key*, *profile=None*)

Read pillar data from Confidant via its API.

CLI Example:

```
salt myminion sdb.get 'sdb://confidant/credentials'
```

Valid keys are: `credentials`, `credentials_metadata`, `result`. `credentials` returns a dict of joined `credential_pairs`, `credentials_metadata` returns a dict of metadata relevant to the credentials mapped to the confidant service, and `result` returns a bool that can be used to determine if the sdb call succeeded or failed to fetch credentials from confidant (or from local cache). If `result` is false, the data in `credentials` or `credentials_metadata` can't be trusted.

### 26.17.3 salt.sdb.consul

Consul sdb Module

```

maintainer
    SaltStack

maturity
    New

platform
    all
  
```

This module allows access to Consul using an `sdb://` URI

Like all sdb modules, the Consul module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```

myconsul:
driver: consul
host: 127.0.0.1
port: 8500
token: b6376760-a8bb-edd5-fcda-33bc13bfc556
scheme: http
consistency: default
dc: dev
verify: True
  
```

The `driver` refers to the Consul module, all other options are optional. For option details see: <https://python-consul.readthedocs.io/en/latest/#consul>

`salt.sdb.consul.get(key, profile=None)`

`salt.sdb.consul.get_conn(profile)`

Return a client object for accessing consul

`salt.sdb.consul.set_(key, value, profile=None)`

### 26.17.4 salt.sdb.couchdb

CouchDB sdb Module

```

maintainer
    SaltStack

maturity
    New

depends
    python2-couchdb

platform
    all
  
```

This allow interaction between Salt and a CouchDB [couchdb.apache.org] database. It uses salt's `sdb` system to allow for inserts and retrievals using the `sdb://` prefix in salt configuration files.

To use the couchbase sdb module, it must first be configured in the salt master or minion config. The following arguments are required:

```
couchdb_sdb:  
  driver: couchdb  
  host: localhost  
  port: 5984  
  database: salt_sdb
```

One could then query the CouchDB instance via an `sdb://` URI such as the following:

```
password: sdb://couchdb_sdb/mykey
```

To use this interface, you must track IDs on your own or have another source to do the map-reduce logic necessary to calculate the ID you wish to fetch.

Additional contributions to build true map-reduce functionality into this module would be welcome.

```
salt.sdb.couchdb.get(key, profile=None)
```

Get a value from couchdb by id

```
salt.sdb.couchdb.set_(key, value, profile=None)
```

Set a key/value pair in couchdb

## 26.17.5 salt.sdb.env

Environment sdb Module

```
maintainer  
  SaltStack  
  
maturity  
  New  
  
depends  
  None  
  
platform  
  all
```

This module allows access to environment variables using an `sdb://` URI.

Example configuration for this module:

```
osenv:  
  driver: env
```

### WARNING:

OS environment variables will be available to read via SDB. Please make sure you don't have any sensitive data in your environment variables!!

Example usage of sdb env module:

```
set some env var:  
cmd.run:  
  - name: echo {{ salt['sdb.set']('sdb://osenv/foo', 'bar') }}  
  - order: 1
```

(continues on next page)

(continued from previous page)

```
{% if salt['sdb.get']('sdb://osenv/foo') == 'bar' %}
always-changes-and-succeeds:
  test.succeed_with_changes:
    - name: foo
{% else %}
always-changes-and-fails:
  test.fail_with_changes:
    - name: foo
{% endif %}
```

The above example will return success.

The env sdb module can also be used with salt cloud. Assuming you have exported the environment variable named compute (and have osenv defined). The example below will look for the salt cloud config key compute\_name in the environment:

```
my-openstack-config:
  compute_name: sdb://osenv/compute
  ..snip
```

`salt.sdb.env.get(key, profile=None)`

Get a value

`salt.sdb.env.set_(key, value, profile=None)`

Set a key/value pair

### 26.17.6 salt.sdb.etcd\_db

etcd Database Module

**maintainer**

SaltStack

**maturity**

New

**depends**

python-etcd or etcd3-py

**platform**

all

New in version 2015.5.0.

This module allows access to the etcd database using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/python-etcd>.

Like all sdb modules, the etcd module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
myetcd:
  driver: etcd
  etcd.host: 127.0.0.1
  etcd.port: 2379
```

The `driver` refers to the `etcd` module, `etcd.host` refers to the host that is hosting the `etcd` database and `etcd.port` refers to the port on that host.

In order to choose whether to use `etcd` API v2 or v3, you can put the following configuration option in the same place as your `etcd` configuration. This option defaults to `true`, meaning you will use v2 unless you specify otherwise.

```
etcd.require_v2: True
```

```
password: sdb://myetcd/mypassword
```

`salt.sdb.etcd_db.delete` (*key*, *service=None*, *profile=None*)

Get a value from the `etcd` service

`salt.sdb.etcd_db.get` (*key*, *service=None*, *profile=None*)

Get a value from the `etcd` service

`salt.sdb.etcd_db.set_` (*key*, *value*, *service=None*, *profile=None*)

Set a key/value pair in the `etcd` service

### 26.17.7 salt.sdb.keyring\_db

Keyring Database Module

**maintainer**

SaltStack

**maturity**

New

**depends**

keyring

**platform**

all

This module allows access to the `keyring` package using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/keyring>.

Care must be taken when using `keyring`. Not all keyend backends are supported on all operating systems. Also, many backends require an agent to be running in order to work. For instance, the "Secret Service" backend requires a compatible agent such as `gnome-keyring-daemon` or `kwallet` to be running. The `keyczar` backend does not seem to enjoy the benefits of an agent, and so using it will require either that the password is typed in manually (which is unreasonable for the `salt-minion` and `salt-master` daemons, especially in production) or an agent is written for it.

Like all `sdb` modules, the `keyring` module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mykeyring:  
  driver: keyring  
  service: system
```

The `driver` refers to the `keyring` module, `service` refers to the service that will be used inside of `keyring` (which may be likened unto a database table) and `mykeyring` refers to the name that will appear in the URI:

```
password: sdb://mykeyring/mypassword
```

The underlying backend configuration must be configured via keyring itself. For examples and documentation, see keyring:

<https://pypi.python.org/pypi/keyring>

New in version 2014.1.4.

`salt.sdb.keyring_db.get(key, service=None, profile=None)`

Get a value from a keyring service

`salt.sdb.keyring_db.set_(key, value, service=None, profile=None)`

Set a key/value pair in a keyring service

### 26.17.8 salt.sdb.memcached

Memcached sdb Module

**maintainer**

SaltStack

**maturity**

New

**depends**

python-memcached

**platform**

all

This module allows access to memcached using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/python-memcached>.

Like all sdb modules, the memcached module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

**mymemcache:**

**driver:** memcached

**memcached.host:** localhost

**memcached.port:** 11211

The `driver` refers to the memcached module, `host` and `port` the memcached server to connect to (defaults to localhost and 11211, and `mymemcached` refers to the name that will appear in the URI:

**password:** `sdb://mymemcached/mykey`

`salt.sdb.memcached.get(key, profile=None)`

Get a value from memcached

`salt.sdb.memcached.set_(key, value, profile=None)`

Set a key/value pair in memcached

## 26.17.9 salt.sdb.redis\_sdb

### Redis SDB module

New in version 2019.2.0.

This module allows access to Redis using an `sdb://` URI.

Like all SDB modules, the Redis module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
sdb_redis:
  driver: redis
  host: 127.0.0.1
  port: 6379
  password: pass
  db: 1
```

The `driver` refers to the Redis module, all other options are optional. For option details see: <https://redis-py.readthedocs.io/en/latest/>.

`salt.sdb.redis_sdb.delete` (*key*, *profile=None*)

Delete a key from the Redis SDB.

`salt.sdb.redis_sdb.get` (*key*, *profile=None*)

Get a value from the Redis SDB.

`salt.sdb.redis_sdb.set_` (*key*, *value*, *profile=None*)

Set a value into the Redis SDB.

## 26.17.10 salt.sdb.rest

### Generic REST API SDB Module

```
maintainer
  SaltStack

maturity
  New

platform
  all
```

New in version 2015.8.0.

This module allows access to a REST interface using an `sdb://` URI.

Like all REST modules, the REST module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
my-rest-api:
  driver: rest
  urls:
    url: https://api.github.com/
  keys:
    url: https://api.github.com/users/{{user}}/keys
  backend: requests
```

The `driver` refers to the REST module, and must be set to `rest` in order to use this driver. Each of the other items inside this block refers to a separate set of HTTP items, including a URL and any options associated with it. The options used here should match the options available in `salt.utils.http.query()`.

In order to call the `urls` item in the example, the following reference can be made inside a configuration file:

```
github_urls: sdb://my-rest-api/urls
```

Key/Value pairs may also be used with this driver, and merged into the URL using the configured renderer (`jinja`, by default). For instance, in order to use the `keys` item in the example, the following reference can be made:

```
github_urls: sdb://my-rest-api/keys?user=myuser
```

This will cause the following URL to actually be called:

```
https://api.github.com/users/myuser/keys
```

Key/Value pairs will NOT be passed through as GET data. If GET data needs to be sent to the URL, then it should be configured in the SDB configuration block. For instance:

```
another-rest-api:
  driver: rest
  user_data:
    url: https://api.example.com/users/
    params:
      user: myuser
```

`salt.sdb.rest.get(key, service=None, profile=None)`

Get a value from the REST interface

`salt.sdb.rest.query(key, value=None, service=None, profile=None)`

Get a value from the REST interface

`salt.sdb.rest.set_(key, value, service=None, profile=None)`

Set a key/value pair in the REST interface

### 26.17.11 salt.sdb.sqlite3

SQLite sdb Module

**maintainer**  
SaltStack

**maturity**  
New

**platform**  
all

This module allows access to `sqlite3` using an `sdb://` URI

Like all sdb modules, the `sqlite3` module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
mysqlite:
  driver: sqlite3
  database: /tmp/sdb.sqlite
```

(continues on next page)

(continued from previous page)

```
table: sdb
create_table: True
```

The driver refers to the `sqlite3` module, `database` refers to the `sqlite3` database file. `table` is the table within the db that will hold keys and values (defaults to `sdb`). The database and table will be created if they do not exist.

### Advanced Usage:

Instead of a table name, it is possible to provide custom SQL statements to create the table(s) and get and set values.

```
myadvanced
  driver: sqlite3
  database: /tmp/sdb-advanced.sqlite
create_statements:
  - "CREATE TABLE advanced (a text, b text, c blob, d blob)"
  - "CREATE INDEX myidx ON advanced (a)"
get_query: "SELECT d FROM advanced WHERE a=:key"
set_query: "INSERT OR REPLACE INTO advanced (a, d) VALUES (:key, :value)"
```

```
salt.sdb.sqlite3.get(key, profile=None)
```

Get a value from `sqlite3`

```
salt.sdb.sqlite3.set_(key, value, profile=None)
```

Set a key/value pair in `sqlite3`

### 26.17.12 salt.sdb.tism

tISM - the Immutable Secrets Manager SDB Module

**maintainer**

tISM

**maturity**

New

**platform**

all

New in version 2017.7.0.

This module will decrypt PGP encrypted secrets against a tISM server.

```
sdb://<profile>/<encrypted secret>
```

```
sdb://tism/
```

```
→hQEMAzJ+GfdAB3KqAQf9E3cyvrPEWR1sf1tMvH0nrJ0bZa9kDFLPxvtwA0qlRiNp0F7IpiiVRF+h+sw5Mb4ffb1T
→G5ptd6CjmgBfBsuGeajWmvLEi4lC6/
→9v1rYGjjLeOCCcN4Dl5AHlxUUaSrxB8akTDvSANPvGhtRTZqDl1t5UEHsyYXM8RaeCrBw50r1yvC9Ctx2saVp3x
→H30L/r50+CBkuI/u4M2pXDcMYsvvt4ajCbJn91qaQ7BDI=
```

A profile must be setup in the minion configuration or pillar. If you want to use `sdb` in a runner or pillar you must also place a profile in the master configuration.

```

tism:
  driver: tism
  url: https://my.tismd:8080/decrypt
  token: eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.
  ↳eyJhZG1pbIi6MSwiZXhwIjoxNTg1MTExNDYwLCJqdGkiOiI3NnA5cWNiMWdtdmw4Iiwia2V5cyI6WyJBTEwiXX0.
  ↳RtAhG6Uorf5xnSf4Ya_GwJnoHkCsql4r1_hi0eDSLzo

```

`salt.sdb.tism.get(key, service=None, profile=None)`

Get a decrypted secret from the tISMd API

### 26.17.13 salt.sdb.vault

Vault SDB Module

```

maintainer
  SaltStack

maturity
  New

platform
  all

```

New in version 2016.11.0.

This module allows access to Hashicorp Vault using an `sdb://` URI.

Base configuration instructions are documented in the [execution module docs](#). Below are noted extra configuration required for the `sdb` module, but the base configuration must also be completed.

Like all `sdb` modules, the `vault` module requires a configuration profile to be configured in either the minion configuration file or a pillar. This profile requires only setting the `driver` parameter to `vault`:

```

myvault:
  driver: vault

```

Once configured you can access data using a URL such as:

```

password: sdb://myvault/secret/passwords/mypassword

```

In this URL, `myvault` refers to the configuration profile, `secret/passwords` is the path where the data resides, and `mypassword` is the key of the data to return.

The above URI is analogous to running the following vault command:

```

$ vault read -field=mypassword secret/passwords

```

## Further configuration

The following options can be set in the profile:

### patch

When writing data, partially update the secret instead of overwriting it completely. This is usually the expected behavior, since without this option, each secret path can only contain a single mapping key safely. Defaults to `False` for backwards-compatibility reasons.

New in version 3007.0.

`salt.sdb.vault.get(key, profile=None)`

Get a value from the vault service

`salt.sdb.vault.set_(key, value, profile=None)`

Set a key/value pair in the vault service

## 26.17.14 salt.sdb.yaml

Pull sdb values from a YAML file

```
maintainer
  SaltStack

maturity
  New

platform
  all
```

New in version 2017.7.0.

Configuration:

```
my-yaml-file:
  driver: yaml
  files:
    - /path/to/foo.yaml
    - /path/to/bar.yaml
```

The files are merged together and the result is searched using the same mechanism Salt uses for searching Grains and Pillar data structures.

Optional configuration:

```
my-yaml-file:
  driver: yaml
  files:
    - /path/to/foo.yaml
    - /path/to/bar.yaml
  merge:
    strategy: smart
    merge_list: false
  gpg: true
```

New in version 2018.3.0.

Setting the `gpg` option to `true` (default is `false`) will decrypt embedded GPG-encrypted data using the *GPG renderer*.

`salt.sdb.yaml.get(key, profile=None)`

Get a value from the dictionary

`salt.sdb.yaml.set_(*args, **kwargs)`

Setting a value is not supported; edit the YAML files directly

## 26.18 serializer modules

### 26.18.1 salt.serializers

This module implements all the serializers needed by salt. Each serializer offers the same functions and attributes:

**deserialize**

function for deserializing string or stream

**serialize**

function for serializing a Python object

**available**

flag that tells if the serializer is available (all dependencies are met etc.)

**exception** `salt.serializers.DeserializationError` (*message*, *line\_num=None*, *buf=""*, *marker='<====='*, *trace=None*)

Raised when stream of string failed to be deserialized

**exception** `salt.serializers.SerializationError` (*message=""*)

Raised when stream of string failed to be serialized

<code>configparser</code>	<code>salt.serializers.configparser</code>
<code>json</code>	<code>salt.serializers.json</code>
<code>keyvalue</code>	<code>salt.serializers.keyvalue</code> New in version 3006.0.
<code>msgpack</code>	<code>salt.serializers.msgpack</code>
<code>plist</code>	<code>salt.serializers.plist</code> New in version 3001.
<code>python</code>	<code>salt.serializers.python</code>
<code>tomlmod</code>	<code>salt.serializers.tomlmod</code>
<code>yaml</code>	<code>salt.serializers.yaml</code>
<code>yamlex</code>	<code>salt.serializers.yamlex</code>

### 26.18.2 salt.serializers.configparser

`salt.serializers.configparser`

New in version 2016.3.0.

Implements a configparser serializer.

**exception** `salt.serializers.configparser.DeserializationError` (*message*, *line\_num=None*, *buf=""*, *marker='<====='*, *trace=None*)

Raised when stream of string failed to be deserialized

**exception** `salt.serializers.configparser.SerializationError` (*message=""*)

Raised when stream of string failed to be serialized

`salt.serializers.configparser.deserialize` (*stream\_or\_string, \*\*options*)

Deserialize any string or stream like object into a Python data structure.

Parameters

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower configparser module.

`salt.serializers.configparser.serialize` (*obj, \*\*options*)

Serialize Python data to a configparser formatted string or file.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower configparser module.

### 26.18.3 salt.serializers.json

#### `salt.serializers.json`

Implements JSON serializer.

It's just a wrapper around json (or simplejson if available).

**exception** `salt.serializers.json.DeserializationError` (*message, line\_num=None, buf="", marker='<=====', trace=None*)

Raised when stream of string failed to be deserialized

**exception** `salt.serializers.json.SerializationError` (*message=""*)

Raised when stream of string failed to be serialized

`salt.serializers.json.deserialize` (*stream\_or\_string, \*\*options*)

Deserialize any string or stream like object into a Python data structure.

Parameters

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower json/simplejson module.

`salt.serializers.json.serialize` (*obj, \*\*options*)

Serialize Python data to JSON.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower json/simplejson module.

### 26.18.4 salt.serializers.keyvalue

#### `salt.serializers.keyvalue`

New in version 3006.0.

Implements keyvalue serializer which can be used for serializing or deserializing any file which defines keys and values separated by a common set of characters, such environment files, which are in "KEY=value" format.

Options:

**param line\_ending**

String representation of LF or CRLF to be used for serialization to a file. Defaults to `\r\n` on Windows and `\n` on other operating systems.

**param quoting**

Boolean flag to determine if values should be quoted (`True`) during serialization or dequoted (`False`) during deserialization. Defaults to `NONE` (no action).

**param separator**

String representing the character(s) used when concatenating or reading key/value pairs. Defaults to `=`.

A dataset such as:

```
foo: bar
wang: chung
```

or

```
- [foo, bar]
- [wang, chung]
```

can be represented as:

```
foo=bar
wang=chung
```

**exception** `salt.serializers.keyvalue.DeserializationError` (*message*, *line\_num=None*, *buf=""*, *marker='<====='*, *trace=None*)

Raised when stream of string failed to be deserialized

**exception** `salt.serializers.keyvalue.SerializationError` (*message=""*)

Raised when stream of string failed to be serialized

`salt.serializers.keyvalue.dequote` (*value*)

Remove extra quotes around a string.

`salt.serializers.keyvalue.deserialize` (*stream\_or\_string*, *\*\*options*)

Deserialize any string or stream like object into a Python data structure.

**Parameters**

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to the function

`salt.serializers.keyvalue.quote` (*txt*)

Wraps a text around quotes.

```
{% set my_text = 'my_text' %}
{{ my_text | quote }}
```

will be rendered as:

```
'my_text'
```

`salt.serializers.keyvalue.serialize` (*obj*, *\*\*options*)

Serialize Python data to environment file.

**Parameters**

- **obj** -- the data structure to serialize
- **options** -- options given to the function

## 26.18.5 salt.serializers.msgpack

### salt.serializers.msgpack

Implements MsgPack serializer.

**exception** salt.serializers.msgpack.**DeserializationError** (*message*, *line\_num=None*, *buf=""*,  
*marker='<====='*,  
*trace=None*)

Raised when stream of string failed to be deserialized

**exception** salt.serializers.msgpack.**SerializationError** (*message=""*)

Raised when stream of string failed to be serialized

salt.serializers.msgpack.**deserialize** (*stream\_or\_string*, *\*\*options*)

Deserialize any string of stream like object into a Python data structure.

**Parameters**

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower msgpack module.

salt.serializers.msgpack.**serialize** (*obj*, *\*\*options*)

Serialize Python data to MsgPack.

**Parameters**

- **obj** -- the data structure to serialize
- **options** -- options given to lower msgpack module.

## 26.18.6 salt.serializers.plist

### salt.serializers.plist

New in version 3001.

Implements plist serializer.

Wrapper around plistlib.

**exception** salt.serializers.plist.**DeserializationError** (*message*, *line\_num=None*, *buf=""*,  
*marker='<====='*,  
*trace=None*)

Raised when stream of string failed to be deserialized

**exception** salt.serializers.plist.**SerializationError** (*message=""*)

Raised when stream of string failed to be serialized

salt.serializers.plist.**deserialize** (*stream\_or\_string*, *\*\*options*)

Deserialize any string or stream like object into a Python data structure.

**Parameters**

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower plist module.

**Returns**

Deserialized data structure.

`salt.serializers.plist.serialize(value, **options)`

Serialize Python data to plist. To create a binary plist pass `fmt: FMT_BINARY` as an option.

**Parameters**

- **obj** -- the data structure to serialize
- **options** -- options given to lower plist module.

**Returns**

bytes of serialized plist.

## 26.18.7 salt.serializers.python

### salt.serializers.python

New in version 2016.3.0.

Implements a Python serializer (via `pprint.format`)

`salt.serializers.python.serialize(obj, **options)`

Serialize Python data to a Python string representation (via `pprint.format`)

**Parameters**

- **obj** -- the data structure to serialize
- **options** -- options given to `pprint.format`

## 26.18.8 salt.serializers.toml

### salt.serializers.tomlmod

Implements TOML serializer.

It's just a wrapper around the python toml module.

**exception** `salt.serializers.tomlmod.DeserializationError` (*message*, *line\_num=None*, *buf=""*, *marker='<====='*, *trace=None*)

Raised when stream of string failed to be deserialized

**exception** `salt.serializers.tomlmod.SerializationError` (*message=""*)

Raised when stream of string failed to be serialized

`salt.serializers.tomlmod.deserialize(stream_or_string, **options)`

Deserialize from TOML into Python data structure.

**Parameters**

- **stream\_or\_string** -- toml stream or string to deserialize.
- **options** -- options given to the python toml module.

`salt.serializers.tomlmod.serialize(obj, **options)`

Serialize Python data to TOML.

**Parameters**

- **obj** -- the data structure to serialize.
- **options** -- options given to the python toml module.

## 26.18.9 salt.serializers.yaml

### salt.serializers.yaml

Implements YAML serializer.

Underneath, it is based on pyyaml and use the safe dumper and loader. It also use C bindings if they are available.

#### salt.serializers.yaml.BaseDumper

alias of CSafeDumper

#### salt.serializers.yaml.BaseLoader

alias of CSafeLoader

**exception** salt.serializers.yaml.**ConstructorError** (*context=None, context\_mark=None, problem=None, problem\_mark=None, note=None*)

**exception** salt.serializers.yaml.**DeserializationError** (*message, line\_num=None, buf="", marker='<=====', trace=None*)

Raised when stream of string failed to be deserialized

**class** salt.serializers.yaml.**Dumper** (*stream, default\_style=None, default\_flow\_style=False, canonical=None, indent=None, width=None, allow\_unicode=None, line\_break=None, encoding=None, explicit\_start=None, explicit\_end=None, version=None, tags=None, sort\_keys=True*)

Overwrites Dumper as not for pollute legacy Dumper

```
yaml_multi_representers = {<class
'salt.serializers.yaml.EncryptedString': <function
EncryptedString.yaml_dumper>, <class 'NoneType': <function
SafeRepresenter.represent_none>, <class 'str': <function
SafeRepresenter.represent_str>, <class 'bool': <function
SafeRepresenter.represent_bool>, <class 'int': <function
SafeRepresenter.represent_int>, <class 'float': <function
SafeRepresenter.represent_float>, <class 'list': <function
SafeRepresenter.represent_list>, <class 'tuple': <function
SafeRepresenter.represent_list>, <class 'dict': <function
SafeRepresenter.represent_dict>, <class 'set': <function
SafeRepresenter.represent_set>, <class 'datetime.date': <function
SafeRepresenter.represent_date>, <class 'datetime.datetime': <function
SafeRepresenter.represent_datetime>, None: <function
SafeRepresenter.represent_undefined>, <class 'collections.OrderedDict':
<function SafeRepresenter.represent_dict>}
```

**class** salt.serializers.yaml.**EncryptedString**

**static** yaml\_constructor (*loader, tag, node*)

**static** yaml\_dumper (*dumper, data*)

yaml\_tag = '!encrypted'

**class** salt.serializers.yaml.Loader(*stream*)

Overwrites Loader as not for pollute legacy Loader

```
yaml_multi_constructors = {'!encrypted': <function
EncryptedString.yaml_constructor>, 'tag:yaml.org,2002:binary': <function
SafeConstructor.construct_yaml_binary>, 'tag:yaml.org,2002:bool':
<function SafeConstructor.construct_yaml_bool>, 'tag:yaml.org,2002:float':
<function SafeConstructor.construct_yaml_float>, 'tag:yaml.org,2002:int':
<function SafeConstructor.construct_yaml_int>, 'tag:yaml.org,2002:map':
<function SafeConstructor.construct_yaml_map>, 'tag:yaml.org,2002:null':
<function SafeConstructor.construct_yaml_null>, 'tag:yaml.org,2002:omap':
<function SafeConstructor.construct_yaml_omap>, 'tag:yaml.org,2002:pairs':
<function SafeConstructor.construct_yaml_pairs>, 'tag:yaml.org,2002:seq':
<function SafeConstructor.construct_yaml_seq>, 'tag:yaml.org,2002:set':
<function SafeConstructor.construct_yaml_set>, 'tag:yaml.org,2002:str':
<function SafeConstructor.construct_yaml_str>,
'tag:yaml.org,2002:timestamp': <function
SafeConstructor.construct_yaml_timestamp>}
```

**class** salt.serializers.yaml.OrderedDict

Dictionary that remembers insertion order

**clear**() → None. Remove all items from od.

**copy**() → a shallow copy of od

**fromkeys**(*value=None*)

Create a new ordered dictionary with keys from iterable and values set to value.

**items**() → a set-like object providing a view on D's items

**keys**() → a set-like object providing a view on D's keys

**move\_to\_end**(*key, last=True*)

Move an existing element to the end (or beginning if last is false).

Raise KeyError if the element does not exist.

**pop**(*k*[, *d*]) → *v*, remove specified key and return the corresponding

value. If key is not found, *d* is returned if given, otherwise KeyError is raised.

**popitem**(*last=True*)

Remove and return a (key, value) pair from the dictionary.

Pairs are returned in LIFO order if last is true or FIFO order if false.

**setdefault**(*key, default=None*)

Insert key with a value of default if key is not in the dictionary.

Return the value for key if key is in the dictionary, else default.

**update**(*[E]*, *\*\*F*) → None. Update D from dict/iterable E and F.

If E is present and has a .keys() method, then does: for k in E: D[k] = E[k] If E is present and lacks a .keys() method, then does: for k, v in E: D[k] = v In either case, this is followed by: for k in F: D[k] = F[k]

**values**() → an object providing a view on D's values

**exception** `salt.serializers.yaml.ScannerError` (*context=None, context\_mark=None, problem=None, problem\_mark=None, note=None*)

**exception** `salt.serializers.yaml.SerializationError` (*message=""*)

Raised when stream of string failed to be serialized

`salt.serializers.yaml.deserialize` (*stream\_or\_string, \*\*options*)

Deserialize any string of stream like object into a Python data structure.

**Parameters**

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower yaml module.

`salt.serializers.yaml.serialize` (*obj, \*\*options*)

Serialize Python data to YAML.

**Parameters**

- **obj** -- the data structure to serialize
- **options** -- options given to lower yaml module.

## 26.18.10 salt.serializers.yamlex

### `salt.serializers.yamlex`

YAMLEX is a format that allows for things like sls files to be more intuitive.

It's an extension of YAML that implements all the salt magic: - it implies omap for any dict like. - it implies that string like data are str, not unicode - ...

For example, the file `states.sls` has this contents:

```
foo:
  bar: 42
  baz: [1, 2, 3]
```

The file can be parsed into Python like this

```
from salt.serializers import yamlex

with open('state.sls', 'r') as stream:
    obj = yamlex.deserialize(stream)
```

Check that `obj` is an `OrderedDict`

```
from salt.utils.odict import OrderedDict

assert isinstance(obj, dict)
assert isinstance(obj, OrderedDict)
```

`yamlex.__repr__` and `__str__` objects' methods render YAML understandable string. It means that they are template friendly.

```
print '{0}'.format(obj)
```

returns:

```
{foo: {bar: 42, baz: [1, 2, 3]}}
```

and they are still valid YAML:

```
from salt.serializers import yaml
yaml_obj = yaml.deserialize(str(obj))
assert yaml_obj == obj
```

yamlex implements also custom tags:

`!aggregate`

this tag allows structures aggregation.

For example:

```
placeholder: !aggregate foo
placeholder: !aggregate bar
placeholder: !aggregate baz
```

is rendered as

```
placeholder: [foo, bar, baz]
```

`!reset`

this tag flushes the computing value.

```
placeholder: {!aggregate foo: {foo: 42}}
placeholder: {!aggregate foo: {bar: null}}
!reset placeholder: {!aggregate foo: {baz: inga}}
```

is roughly equivalent to

```
placeholder: {!aggregate foo: {baz: inga}}
```

Document is defacto an aggregate mapping.

**class** `salt.serializers.yamlex.AggregatedMap`

**class** `salt.serializers.yamlex.AggregatedSequence` (*iterable=()*, /)

`salt.serializers.yamlex.BaseDumper`

alias of `SafeDumper`

`salt.serializers.yamlex.BaseLoader`

alias of `CSafeLoader`

**exception** `salt.serializers.yamlex.ConstructorError` (*context=None, context\_mark=None, problem=None, problem\_mark=None, note=None*)

**exception** `salt.serializers.yamlex.DeserializationError` (*message, line\_num=None, buf="", marker='<=====', trace=None*)

Raised when stream of string failed to be deserialized

```
class salt.serializers.yamlex.Dumper(stream, default_style=None, default_flow_style=False,  
                                     canonical=None, indent=None, width=None,  
                                     allow_unicode=None, line_break=None, encoding=None,  
                                     explicit_start=None, explicit_end=None, version=None,  
                                     tags=None, sort_keys=True)
```

sls dumper.

```
represent_odict(data)
```

```
yaml_multi_representers = {<class 'NoneType'>: <function  
SafeRepresenter.represent_none>, <class 'bytes'>: <function  
SafeRepresenter.represent_binary>, <class 'str'>: <function  
SafeRepresenter.represent_str>, <class 'bool'>: <function  
SafeRepresenter.represent_bool>, <class 'int'>: <function  
SafeRepresenter.represent_int>, <class 'float'>: <function  
SafeRepresenter.represent_float>, <class 'list'>: <function  
SafeRepresenter.represent_list>, <class 'tuple'>: <function  
SafeRepresenter.represent_list>, <class 'dict'>: <function  
Dumper.represent_odict>, <class 'set'>: <function  
SafeRepresenter.represent_set>, <class 'datetime.date'>: <function  
SafeRepresenter.represent_date>, <class 'datetime.datetime'>: <function  
SafeRepresenter.represent_datetime>, None: <function  
SafeRepresenter.represent_undefined>}
```

```
class salt.serializers.yamlex.Loader(stream)
```

Create a custom YAML loader that uses the custom constructor. This allows for the YAML loading defaults to be manipulated based on needs within salt to make things like sls file more intuitive.

```
DEFAULT_MAPPING_TAG = 'tag:yaml.org,2002:omap'
```

```
DEFAULT_SCALAR_TAG = 'tag:yaml.org,2002:str'
```

```
DEFAULT_SEQUENCE_TAG = 'tag:yaml.org,2002:seq'
```

```
compose_document()
```

```
construct_sls_aggregate(node)
```

```
construct_sls_int(node)
```

Verify integers and pass them in correctly is they are declared as octal

```
construct_sls_reset(node)
```

```
construct_sls_str(node)
```

Build the SLSString.

```
construct_yaml_omap(node)
```

Build the SLSMap

```
resolve_sls_tag(node)
```

```

yaml_constructors = {'tag:yaml.org,2002:null': <function
SafeConstructor.construct_yaml_null>, 'tag:yaml.org,2002:bool': <function
SafeConstructor.construct_yaml_bool>, 'tag:yaml.org,2002:int': <function
Loader.construct_sls_int>, 'tag:yaml.org,2002:float': <function
SafeConstructor.construct_yaml_float>, 'tag:yaml.org,2002:binary':
<function SafeConstructor.construct_yaml_binary>,
'tag:yaml.org,2002:timestamp': <function
SafeConstructor.construct_yaml_timestamp>, 'tag:yaml.org,2002:omap':
<function Loader.construct_yaml_omap>, 'tag:yaml.org,2002:pairs':
<function SafeConstructor.construct_yaml_pairs>, 'tag:yaml.org,2002:set':
<function SafeConstructor.construct_yaml_set>, 'tag:yaml.org,2002:str':
<function Loader.construct_sls_str>, 'tag:yaml.org,2002:seq': <function
SafeConstructor.construct_yaml_seq>, 'tag:yaml.org,2002:map': <function
SafeConstructor.construct_yaml_map>, None: <function
SafeConstructor.construct_undefined>, '!aggregate': <function
Loader.construct_sls_aggregate>, '!reset': <function
Loader.construct_sls_reset>}

```

```

yaml_multi_constructors = {'tag:yaml.org,2002:binary': <function
SafeConstructor.construct_yaml_binary>, 'tag:yaml.org,2002:bool':
<function SafeConstructor.construct_yaml_bool>, 'tag:yaml.org,2002:float':
<function SafeConstructor.construct_yaml_float>, 'tag:yaml.org,2002:map':
<function SafeConstructor.construct_yaml_map>, 'tag:yaml.org,2002:null':
<function SafeConstructor.construct_yaml_null>, 'tag:yaml.org,2002:pairs':
<function SafeConstructor.construct_yaml_pairs>, 'tag:yaml.org,2002:seq':
<function SafeConstructor.construct_yaml_seq>, 'tag:yaml.org,2002:set':

'tag:yaml.org,2002:timestamp': <function
SafeConstructor.construct_yaml_timestamp>}

```

**class** salt.serializers.yamlex.**Map**

Map aggregation.

**class** salt.serializers.yamlex.**MappingNode**(*tag, value, start\_mark=None, end\_mark=None, flow\_style=None*)

**id** = 'mapping'

**class** salt.serializers.yamlex.**OrderedDict**

Dictionary that remembers insertion order

**clear**() → None. Remove all items from od.

**copy**() → a shallow copy of od

**fromkeys**(*value=None*)

Create a new ordered dictionary with keys from iterable and values set to value.

**items**() → a set-like object providing a view on D's items

**keys**() → a set-like object providing a view on D's keys

**move\_to\_end**(*key, last=True*)

Move an existing element to the end (or beginning if last is false).

Raise KeyError if the element does not exist.

**pop**( $k[d]$ )  $\rightarrow v$ , remove specified key and return the corresponding value. If key is not found, d is returned if given, otherwise `KeyError` is raised.

**popitem**(*last=True*)

Remove and return a (key, value) pair from the dictionary.

Pairs are returned in LIFO order if *last* is true or FIFO order if false.

**setdefault**(*key, default=None*)

Insert key with a value of default if key is not in the dictionary.

Return the value for key if key is in the dictionary, else default.

**update**( $[E]$ ,  $**F$ )  $\rightarrow$  None. Update D from dict/iterable E and F.

If E is present and has a `.keys()` method, then does: for k in E:  $D[k] = E[k]$  If E is present and lacks a `.keys()` method, then does: for k, v in E:  $D[k] = v$  In either case, this is followed by: for k in F:  $D[k] = F[k]$

**values**()  $\rightarrow$  an object providing a view on D's values

**class** `salt.serializers.yamlex.SLSMap`

Ensures that `dict str()` and `repr()` are YAML friendly.

```
>>> mapping = OrderedDict([('a', 'b'), ('c', None)])
>>> print mapping
OrderedDict([('a', 'b'), ('c', None)])

>>> sls_map = SLSMap(mapping)
>>> print sls_map.__str__()
{a: b, c: null}
```

**class** `salt.serializers.yamlex.SLSString`

Ensures that `str str()` and `repr()` are YAML friendly.

```
>>> scalar = str('foo')
>>> print 'foo'
foo

>>> sls_scalar = SLSString(scalar)
>>> print sls_scalar
"foo"
```

**exception** `salt.serializers.yamlex.ScannerError` (*context=None, context\_mark=None, problem=None, problem\_mark=None, note=None*)

**class** `salt.serializers.yamlex.Sequence` (*iterable=(, /)*)

Sequence aggregation.

**exception** `salt.serializers.yamlex.SerializationError` (*message=""*)

Raised when stream of string failed to be serialized

`salt.serializers.yamlex.aggregate` (*obj\_a, obj\_b, level=False, map\_class=<class 'salt.utils.aggregation.Map'>, sequence\_class=<class 'salt.utils.aggregation.Sequence'>*)

Merge `obj_b` into `obj_a`.

```
>>> aggregate('first', 'second', True) == ['first', 'second']
True
```

`salt.serializers.yamlex.deserialize(stream_or_string, **options)`

Deserialize any string of stream like object into a Python data structure.

**Parameters**

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower yaml module.

`salt.serializers.yamlex.merge_recursive(obj_a, obj_b, level=False)`

Merge `obj_b` into `obj_a`.

`salt.serializers.yamlex.serialize(obj, **options)`

Serialize Python data to YAML.

**Parameters**

- **obj** -- the data structure to serialize
- **options** -- options given to lower yaml module.

## 26.19 state modules

<code>acme</code>	ACME / Let's Encrypt certificate management state
<code>alias</code>	Configuration of email aliases
<code>alternatives</code>	Configuration of the alternatives system
<code>ansiblegate</code>	Execution of Ansible modules from within states
<code>apache</code>	
<code>apache_conf</code>	
<code>apache_module</code>	
<code>apache_site</code>	
<code>aptpkg</code>	Package management operations specific to APT- and DEB-based systems
<code>archive</code>	Extract an archive
<code>artifactory</code>	This state downloads artifacts from artifactory.
<code>at</code>	Configuration disposable regularly scheduled tasks for at.
<code>augeas</code>	Configuration management using Augeas
<code>aws_sqs</code>	Manage SQS Queues
<code>beacon</code>	Management of the Salt beacons
<code>bigip</code>	A state module designed to enforce load-balancing configurations for F5 Big-IP entities.
<code>blockdev</code>	Management of Block Devices
<code>boto3_elasticache</code>	Manage Elasticache with boto3
<code>boto3_elasticsearch</code>	Manage Elasticsearch Service
<code>boto3_route53</code>	Manage Route53 records with Boto 3
<code>boto3_sns</code>	Manage SNS Topics
<code>boto_apigateway</code>	Manage Apigateway Rest APIs
<code>boto_asg</code>	Manage Autoscale Groups

Table 7 – continued from previous page

<i>boto_cfn</i>	Connection module for Amazon Cloud Formation
<i>boto_cloudfront</i>	Manage CloudFront distributions
<i>boto_cloudtrail</i>	Manage CloudTrail Objects
<i>boto_cloudwatch_alarm</i>	Manage Cloudwatch alarms
<i>boto_cloudwatch_event</i>	Manage CloudTrail Objects
<i>boto_cognitoidentity</i>	Manage CognitoIdentity Functions
<i>boto_datapipeline</i>	Manage Data Pipelines
<i>boto_dynamodb</i>	Manage DynamoDB Tables
<i>boto_ec2</i>	Manage EC2
<i>boto_elasticache</i>	Manage Elasticache
<i>boto_elasticsearch_domain</i>	Manage Elasticsearch Domains
<i>boto_elb</i>	Manage ELBs
<i>boto_elbv2</i>	Manage AWS Application Load Balancer
<i>boto_iam</i>	Manage IAM objects
<i>boto_iam_role</i>	Manage IAM roles
<i>boto_iot</i>	Manage IoT Objects
<i>boto_kinesis</i>	Manage Kinesis Streams
<i>boto_kms</i>	Manage KMS keys, key policies and grants.
<i>boto_lambda</i>	Manage Lambda Functions
<i>boto_lc</i>	Manage Launch Configurations
<i>boto_rds</i>	Manage RDSs
<i>boto_route53</i>	Manage Route53 records
<i>boto_s3</i>	Manage S3 Resources
<i>boto_s3_bucket</i>	Manage S3 Buckets
<i>boto_secgroup</i>	Manage Security Groups
<i>boto_sns</i>	Manage SNS Topics
<i>boto_sqs</i>	Manage SQS Queues
<i>boto_vpc</i>	Manage VPCs
<i>bower</i>	Installation of Bower Packages
<i>btrfs</i>	Manage BTRFS file systems.
<i>cabal</i>	Installation of Cabal Packages
<i>ceph</i>	Manage ceph with salt.
<i>chef</i>	Execute Chef client runs
<i>chocolatey</i>	Manage Windows Packages using Chocolatey .
<i>chronos_job</i>	Configure Chronos jobs via a salt proxy.
<i>cimc</i>	A state module to manage Cisco UCS chassis devices.
<i>cisconso</i>	State module for Cisco NSO Proxy minions
<i>cloud</i>	Using states instead of maps to deploy clouds
<i>cmd</i>	Execution of arbitrary commands
<i>composer</i>	Installation of Composer Packages
<i>consul</i>	Consul Management
<i>cron</i>	Management of cron, the Unix command scheduler
<i>cryptdev</i>	Opening of Encrypted Devices
<i>csf</i>	CSF Ip tables management
<i>cyg</i>	Installation of Cygwin packages.
<i>ddns</i>	Dynamic DNS updates
<i>debconfmod</i>	Management of debconf selections
<i>dellchassis</i>	Manage chassis via Salt Proxies.
<i>disk</i>	Disk monitoring state
<i>docker_container</i>	

continues on next page

Table 7 – continued from previous page

<i>docker_image</i>	
<i>docker_network</i>	
<i>docker_volume</i>	
<i>drac</i>	Management of Dell DRAC
<i>dvs</i>	Manage VMware distributed virtual switches (DVSs) and their distributed virtual portgroups (DVportgroups).
<i>elasticsearch</i>	State module to manage Elasticsearch.
<i>elasticsearch_index</i>	State module to manage Elasticsearch indices
<i>elasticsearch_index_template</i>	State module to manage Elasticsearch index templates
<i>environ</i>	Support for getting and setting the environment variables of the current salt process.
<i>eselect</i>	Management of Gentoo configuration using eselect
<i>esxcluster</i>	Manage VMware ESXi Clusters.
<i>esxdatacenter</i>	Salt states to create and manage VMware vSphere datacenters (datacenters).
<i>esxi</i>	Manage VMware ESXi Hosts.
<i>esxvm</i>	Salt state to create, update VMware ESXi Virtual Machines.
<i>etcd_mod</i>	Manage etcd Keys
<i>ethtool</i>	Configuration of network device
<i>event</i>	Send events through Salt's event system during state runs
<i>file</i>	Operations on regular files, special files, directories, and symlinks
<i>firewall</i>	State to check firewall configurations
<i>firewalld</i>	Management of firewalld
<i>gem</i>	Installation of Ruby modules packaged as gems
<i>git</i>	States to manage git repositories and git configuration
<i>github</i>	Github User State Module
<i>glance_image</i>	Management of OpenStack Glance Images
<i>glassfish</i>	Manage Glassfish/Payara server .
<i>glusterfs</i>	Manage GlusterFS pool.
<i>gnomedesktop</i>	Configuration of the GNOME desktop
<i>gpg</i>	Manage GPG keychains
<i>grafana</i>	Manage Grafana Dashboards
<i>grafana4_dashboard</i>	Manage Grafana v4.0 Dashboards
<i>grafana4_datasource</i>	Manage Grafana v4.0 data sources
<i>grafana4_org</i>	Manage Grafana v4.0 orgs
<i>grafana4_user</i>	Manage Grafana v4.0 users
<i>grafana_dashboard</i>	Manage Grafana v2.0 Dashboards
<i>grafana_datasource</i>	Manage Grafana v2.0 data sources
<i>grains</i>	Manage grains on the minion
<i>group</i>	Management of user groups
<i>heat</i>	Management of Heat
<i>helm</i>	
<i>hg</i>	Interaction with Mercurial repositories
<i>highstate_doc</i>	To be used with processors in module <i>highstate_doc</i> .

Table 7 – continued from previous page

<i>host</i>	Management of addresses and names in hosts file
<i>http</i>	HTTP monitoring states
<i>icinga2</i>	Icinga2 state
<i>idem</i>	Idem Support
<i>ifttt</i>	Trigger an event in IFTTT
<i>incron</i>	Management of incron, the inotify cron
<i>influxdb08_database</i>	Management of Influxdb 0.8 databases
<i>influxdb08_user</i>	Management of InfluxDB 0.8 users
<i>influxdb_continuous_query</i>	Management of Influxdb continuous queries
<i>influxdb_database</i>	Management of Influxdb databases
<i>influxdb_retention_policy</i>	Management of Influxdb retention policies
<i>influxdb_user</i>	Management of InfluxDB users
<i>infoblox_a</i>	Infoblox A record management.
<i>infoblox_cname</i>	Infoblox CNAME management.
<i>infoblox_host_record</i>	Infoblox host record management.
<i>infoblox_range</i>	Infoblox host record management.
<i>ini_manage</i>	Manage ini files
<i>ipmi</i>	Manage IPMI devices over LAN
<i>ipset</i>	Management of ipsets
<i>iptables</i>	Management of iptables
<i>jboss7</i>	Manage JBoss 7 Application Server via CLI interface
<i>jenkins</i>	Management of Jenkins
<i>junos</i>	State modules to interact with Junos devices.
<i>kapacitor</i>	Kapacitor state module.
<i>kernelpkg</i>	Manage kernel packages and active kernel version
<i>keyboard</i>	Management of keyboard layouts
<i>keystone</i>	Management of Keystone users
<i>keystone_domain</i>	Management of OpenStack Keystone Domains
<i>keystone_endpoint</i>	Management of OpenStack Keystone Endpoints
<i>keystone_group</i>	Management of OpenStack Keystone Groups
<i>keystone_project</i>	Management of OpenStack Keystone Projects
<i>keystone_role</i>	Management of OpenStack Keystone Roles
<i>keystone_role_grant</i>	Management of OpenStack Keystone Role Grants
<i>keystone_service</i>	Management of OpenStack Keystone Services
<i>keystone_user</i>	Management of OpenStack Keystone Users
<i>keystore</i>	State management of a java keystore
<i>kmod</i>	Loading and unloading of kernel modules
<i>kubernetes</i>	
<i>layman</i>	Management of Gentoo Overlays using layman
<i>ldap</i>	Manage entries in an LDAP database
<i>libcloud_dns</i>	Manage DNS records and zones using libcloud
<i>libcloud_loadbalancer</i>	Apache Libcloud Load Balancer State
<i>libcloud_storage</i>	Apache Libcloud Storage State
<i>linux_acl</i>	Linux File Access Control Lists
<i>locale</i>	Management of languages/locales
<i>logadm</i>	Management of logs using Solaris logadm.
<i>logrotate</i>	Module for managing logrotate.
<i>loop</i>	Loop state
<i>lvm</i>	Management of Linux logical volumes
<i>lvs_server</i>	Management of LVS (Linux Virtual Server) Real Server
<i>lvs_service</i>	Management of LVS (Linux Virtual Server) Service

continues on next page

Table 7 – continued from previous page

<i>lxc</i>	Manage Linux Containers
<i>lxd</i>	Manage LXD profiles.
<i>lxd_container</i>	Manage LXD containers.
<i>lxd_image</i>	Manage LXD images.
<i>lxd_profile</i>	Manage LXD profiles.
<i>mac_assistive</i>	Allows you to manage assistive access on macOS minions with 10.9+
<i>mac_keychain</i>	Installing of certificates to the keychain
<i>mac_xattr</i>	Allows you to manage extended attributes on files or directories
<i>macdefaults</i>	Writing/reading defaults from a macOS minion
<i>macpackage</i>	Installing of mac pkg files
<i>makeconf</i>	Management of Gentoo make.conf
<i>marathon_app</i>	Configure Marathon apps via a salt proxy.
<i>mdadm RAID</i>	Managing software RAID with mdadm
<i>memcached</i>	States for Management of Memcached Keys
<i>modjk</i>	State to control Apache modjk
<i>modjk_worker</i>	Manage modjk workers
<i>module</i>	Execution of Salt modules from within states
<i>mongodb_database</i>	Management of MongoDB Databases
<i>mongodb_user</i>	Management of MongoDB Users
<i>monit</i>	Monit state
<i>mount</i>	Mounting of filesystems
<i>mssql_database</i>	Management of Microsoft SQLServer Databases
<i>mssql_login</i>	Management of Microsoft SQLServer Logins
<i>mssql_role</i>	Management of Microsoft SQLServer Databases
<i>mssql_user</i>	Management of Microsoft SQLServer Users
<i>msteams</i>	Send a message card to Microsoft Teams
<i>mysql_database</i>	Management of MySQL databases (schemas)
<i>mysql_grants</i>	Management of MySQL grants (user permissions)
<i>mysql_query</i>	Execution of MySQL queries
<i>mysql_user</i>	Management of MySQL users
<i>net_napalm_yang</i>	NAPALM YANG state
<i>netacl</i>	Network ACL
<i>netconfig</i>	Network Config
<i>netntp</i>	Network NTP
<i>netsnmp</i>	Network SNMP
<i>netusers</i>	Network Users
<i>network</i>	Configuration of network interfaces
<i>neutron_network</i>	Management of OpenStack Neutron Networks
<i>neutron_secgroup</i>	Management of OpenStack Neutron Security Groups
<i>neutron_secgroup_rule</i>	Management of OpenStack Neutron Security Group Rules
<i>neutron_subnet</i>	Management of OpenStack Neutron Subnets
<i>nexus</i>	This state downloads artifacts from Nexus 3.x.
<i>nfs_export</i>	Management of NFS exports
<i>nftables</i>	Management of nftables
<i>npm</i>	Installation of NPM Packages
<i>ntp</i>	Management of NTP servers
<i>nxos</i>	State module for Cisco NX-OS Switch Proxy and Native minions
<i>nxos_upgrade</i>	Manage NX-OS System Image Upgrades.

continues on next page

Table 7 – continued from previous page

<i>openstack_config</i>	Manage OpenStack configuration file settings.
<i>openvswitch_bridge</i>	Management of Open vSwitch bridges.
<i>openvswitch_db</i>	Management of Open vSwitch database records.
<i>openvswitch_port</i>	Management of Open vSwitch ports.
<i>opsgenie</i>	Create/Close an alert in OpsGenie
<i>pagerduty</i>	Create an Event in PagerDuty
<i>pagerduty_escalation_policy</i>	Manage PagerDuty escalation policies.
<i>pagerduty_schedule</i>	Manage PagerDuty schedules.
<i>pagerduty_service</i>	Manage PagerDuty services
<i>pagerduty_user</i>	Manage PagerDuty users.
<i>panos</i>	A state module to manage Palo Alto network devices.
<i>pbm</i>	Manages VMware storage policies (called pbm because the vCenter endpoint is /pbm)
<i>pcs</i>	Management of Pacemaker/Corosync clusters with PCS
<i>pdbedit</i>	Manage accounts in Samba's passdb using pdbedit
<i>pecl</i>	Installation of PHP Extensions Using pecl
<i>pip_state</i>	Installation of Python Packages Using pip
<i>pkg</i>	Installation of packages using OS package managers such as yum or apt-get
<i>pkgbuild</i>	The pkgbuild state is the front of Salt package building backend.
<i>pkgng</i>	Manage package remote repo using FreeBSD pkgng
<i>pkgrepo</i>	Management of APT/DNF/YUM/Zypper package repos
<i>portage_config</i>	Management of Portage package configuration on Gentoo
<i>ports</i>	Manage software from FreeBSD ports
<i>postgres_cluster</i>	Management of PostgreSQL clusters
<i>postgres_database</i>	Management of PostgreSQL databases
<i>postgres_extension</i>	Management of PostgreSQL extensions
<i>postgres_group</i>	Management of PostgreSQL groups (roles)
<i>postgres_initdb</i>	Initialization of PostgreSQL data directory
<i>postgres_language</i>	Management of PostgreSQL languages
<i>postgres_privileges</i>	Management of PostgreSQL Privileges
<i>postgres_schema</i>	Management of PostgreSQL schemas
<i>postgres_tablespace</i>	Management of PostgreSQL tablespace
<i>postgres_user</i>	Management of PostgreSQL users (roles)
<i>powerpath</i>	Powerpath configuration support
<i>probes</i>	Network Probes
<i>process</i>	Process Management
<i>proxy</i>	Allows you to manage proxy settings on minions
<i>pushover</i>	
<i>pyenv</i>	Managing python installations with pyenv
<i>pyrax_queues</i>	Manage Rackspace Queues
<i>quota</i>	Management of POSIX Quotas
<i>rabbitmq_cluster</i>	Manage RabbitMQ Clusters
<i>rabbitmq_plugin</i>	Manage RabbitMQ Plugins
<i>rabbitmq_policy</i>	Manage RabbitMQ Policies
<i>rabbitmq_upstream</i>	Manage RabbitMQ Upstreams
<i>rabbitmq_user</i>	Manage RabbitMQ Users
<i>rabbitmq_vhost</i>	Manage RabbitMQ Virtual Hosts

continues on next page

Table 7 – continued from previous page

<i>rbac_solaris</i>	Management of Solaris RBAC
<i>rbenv</i>	Managing Ruby installations with rbenv
<i>rdp</i>	Manage RDP Service on Windows servers
<i>redismod</i>	Management of Redis server
<i>reg</i>	Manage the Windows registry
<i>restconf</i>	RESTCONF State module for Proxy minions
<i>rsync</i>	State to synchronize files and directories with rsync.
<i>rvm</i>	Managing Ruby installations and gemsets with Ruby Version Manager (RVM)
<i>salt_proxy</i>	Salt proxy state
<i>saltmod</i>	Control the Salt command interface
<i>saltutil</i>	Saltutil State
<i>schedule</i>	Management of the Salt scheduler
<i>selinux</i>	Management of SELinux rules
<i>serverdensity_device</i>	Monitor Server with Server Density
<i>service</i>	Starting or restarting of services and daemons
<i>slack</i>	Send a message to Slack
<i>smartos</i>	Management of SmartOS Standalone Compute Nodes
<i>smtp</i>	Sending Messages via SMTP
<i>snapper</i>	Managing implicit state and baselines using snapshots
<i>solrcloud</i>	States for solrcloud alias and collection configuration
<i>splunk</i>	Splunk User State Module
<i>splunk_search</i>	Splunk Search State Module
<i>sqlite3</i>	Management of SQLite3 databases
<i>ssh_auth</i>	Control of entries in SSH authorized_key files
<i>ssh_known_hosts</i>	Control of SSH known_hosts entries
<i>stateconf</i>	Stateconf System
<i>status</i>	Minion status monitoring
<i>statuspage</i>	StatusPage
<i>supervisord</i>	Interaction with the Supervisor daemon
<i>svn</i>	Manage SVN repositories
<i>sysctl</i>	Configuration of the kernel using sysctl
<i>sysfs</i>	Configuration of the kernel using sysfs
<i>syslog_ng</i>	State module for syslog_ng
<i>sysrc</i>	State to work with sysrc
<i>telemetry_alert</i>	Manage Telemetry alert configurations
<i>test</i>	Test States
<i>testinframod</i>	
<i>timezone</i>	Management of timezones
<i>tls</i>	Enforce state for SSL/TLS
<i>tomcat</i>	Manage Apache Tomcat web applications
<i>trafficserver</i>	Control Apache Traffic Server
<i>tuned</i>	Interface to Red Hat tuned-adm module
<i>uptime</i>	Monitor Web Server with Uptime
<i>user</i>	Management of user accounts.
<i>vagrant</i>	Manage Vagrant VMs
<i>vault</i>	
<i>vbox_guest</i>	VirtualBox Guest Additions installer state
<i>victorops</i>	Create an Event in VictorOps
<i>virt</i>	Manage virt

Table 7 – continued from previous page

<i>virtualenv_mod</i>	Setup of Python virtualenv sandboxes.
<i>webutil</i>	Support for httpasswd module.
<i>win_appx</i>	Manage Microsoft Store apps on Windows.
<i>win_certutil</i>	Installing of certificates to the Windows Certificate Manager
<i>win_dacl</i>	Windows Object Access Control Lists
<i>win_dism</i>	Installing of Windows features using DISM
<i>win_dns_client</i>	Module for configuring DNS Client on Windows systems
<i>win_firewall</i>	State for configuring Windows Firewall
<i>win_iis</i>	Microsoft IIS site management
<i>win_lgpo</i>	Manage Windows Local Group Policy
<i>win_lgpo_reg</i>	LGPO - Registry.pol
<i>win_license</i>	Installation and activation of windows licenses
<i>win_network</i>	Configuration of network interfaces on Windows hosts
<i>win_path</i>	Manage the Windows System PATH
<i>win_pki</i>	Microsoft certificate management via the Pki PowerShell module.
<i>win_powercfg</i>	This module allows you to control the power settings of a windows minion via powercfg.
<i>win_servermanager</i>	Manage Windows features via the ServerManager powershell module.
<i>win_shortcut</i>	State module for creating shortcuts on Windows.
<i>win_smtp_server</i>	Module for managing IIS SMTP server configuration on Windows servers.
<i>win_snmp</i>	Module for managing SNMP service settings on Windows servers.
<i>win_system</i>	Management of Windows system information
<i>win_task</i>	State module for adding and removing scheduled tasks using the Windows Task Scheduler.

### 26.19.1 salt.states.acme

#### ACME / Let's Encrypt certificate management state

New in version 2016.3.0.

See also the module documentation

```

reload-gitlab:
  cmd.run:
    - name: gitlab-ctl hup

dev.example.com:
  acme.cert:
    - aliases:
      - gitlab.example.com
    - email: acmemaster@example.com
    - webroot: /opt/gitlab/embedded/service/gitlab-rails/public
    - renew: 14
    - fire_event: acme/dev.example.com
    - onchanges_in:
      - cmd: reload-gitlab

```

`salt.states.acme.cert` (*name, aliases=None, email=None, webroot=None, test\_cert=False, renew=None, keysize=None, server=None, owner='root', group='root', mode='0640', certname=None, preferred\_challenges=None, tls\_sni\_01\_port=None, tls\_sni\_01\_address=None, http\_01\_port=None, http\_01\_address=None, dns\_plugin=None, dns\_plugin\_credentials=None, manual\_auth\_hook=None, manual\_cleanup\_hook=None*)

Obtain/renew a certificate from an ACME CA, probably Let's Encrypt.

#### Parameters

- **name** -- Common Name of the certificate (DNS name of certificate)
- **aliases** -- subjectAltNames (Additional DNS names on certificate)
- **email** -- e-mail address for interaction with ACME provider
- **webroot** -- True or a full path to webroot. Otherwise use standalone mode
- **test\_cert** -- Request a certificate from the Happy Hacker Fake CA (mutually exclusive with 'server')

- **renew** -- True/'force' to force a renewal, or a window of renewal before expiry in days
- **keysize** -- RSA key bits
- **server** -- API endpoint to talk to
- **owner** -- owner of the private key file
- **group** -- group of the private key file
- **mode** -- mode of the private key file
- **certname** -- Name of the certificate to save
- **preferred\_challenges** -- A sorted, comma delimited list of the preferred challenge to use during authorization with the most preferred challenge listed first.
- **tls\_sni\_01\_port** -- Port used during tls-sni-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 443.
- **tls\_sni\_01\_address** -- The address the server listens to during tls-sni-01 challenge.
- **http\_01\_port** -- Port used in the http-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 80.
- **https\_01\_address** -- The address the server listens to during http-01 challenge.
- **dns\_plugin** -- Name of a DNS plugin to use (currently only 'cloudflare')
- **dns\_plugin\_credentials** -- Path to the credentials file if required by the specified DNS plugin
- **manual\_auth\_hook** -- Path to the authentication hook script.
- **manual\_cleanup\_hook** -- Path to the cleanup or post-authentication hook script.

## 26.19.2 salt.states.alias

Configuration of email aliases

The mail aliases file can be managed to contain definitions for specific email aliases:

```
username:
  alias.present:
    - target: user@example.com
```

```
thomas:
  alias.present:
    - target: thomas@example.com
```

The default alias file is set to `/etc/aliases`, as defined in Salt's *config execution module*. To change the alias file from the default location, set the following in your minion config:

```
aliases.file: /my/alias/file
```

`salt.states.alias.absent`(*name*)

Ensure that the named alias is absent

**name**

The alias to remove

`salt.states.alias.present`(*name*, *target*)

Ensures that the named alias is present with the given target or list of targets. If the alias exists but the target differs from the previous entry, the target(s) will be overwritten. If the alias does not exist, the alias will be created.

- name**  
The local user/address to assign an alias to
- target**  
The forwarding address

### 26.19.3 salt.states.alternatives

Configuration of the alternatives system

Control the alternatives system

```
{% set my_hadoop_conf = '/opt/hadoop/conf' %}

{{ my_hadoop_conf }}:
  file.directory

hadoop-0.20-conf:
  alternatives.install:
    - name: hadoop-0.20-conf
    - link: /etc/hadoop-0.20/conf
    - path: {{ my_hadoop_conf }}
    - priority: 30
    - require:
      - file: {{ my_hadoop_conf }}

hadoop-0.20-conf:
  alternatives.remove:
    - name: hadoop-0.20-conf
    - path: {{ my_hadoop_conf }}
```

**salt.states.alternatives.auto**(*name*)

New in version 0.17.0.

Instruct alternatives to use the highest priority path for <name>

**name**  
is the master name for this link group (e.g. pager)

**salt.states.alternatives.install**(*name, link, path, priority*)

Install new alternative for defined <name>

**name**  
is the master name for this link group (e.g. pager)

**link**  
is the symlink pointing to /etc/alternatives/<name>. (e.g. /usr/bin/pager)

**path**  
is the location of the new alternative target. NB: This file / directory must already exist. (e.g. /usr/bin/less)

**priority**  
is an integer; options with higher numbers have higher priority in automatic mode.

**salt.states.alternatives.remove**(*name, path*)

Removes installed alternative for defined <name> and <path> or fallback to default alternative, if some defined before.

**name**  
is the master name for this link group (e.g. pager)

**path**

is the location of one of the alternative target files. (e.g. /usr/bin/less)

`salt.states.alternatives.set_(name, path)`

New in version 0.17.0.

Sets alternative for <name> to <path>, if <path> is defined as an alternative for <name>.

**name**

is the master name for this link group (e.g. pager)

**path**

is the location of one of the alternative target files. (e.g. /usr/bin/less)

```
foo:
  alternatives.set:
    - path: /usr/bin/foo-2.0
```

## 26.19.4 salt.states.ansiblegate

### Execution of Ansible modules from within states

With *ansible.call* these states allow individual Ansible module calls to be made via states. To call an Ansible module function use a `module.run` state:

```
some_set_of_tasks:
  ansible:
    - system.ping
    - packaging.os.zypper
      - name: emacs
      - state: installed
```

### class salt.states.ansiblegate.AnsibleState

Ansible state caller.

**get\_args**(argset)

Get args and kwargs from the argset.

**Parameters**

**argset** --

**Returns**

`salt.states.ansiblegate.playbooks`(name, rundir=None, git\_repo=None, git\_kwargs=None, ansible\_kwargs=None)

Run Ansible Playbooks

**Parameters**

- **name** -- path to playbook. This can be relative to rundir or the git repo
- **rundir** -- location to run ansible-playbook from.
- **git\_repo** -- git repository to clone for ansible playbooks. This is cloned using the *git.latest* state, and is cloned to the *rundir* if specified, otherwise it is clone to the *cache\_dir*
- **git\_kwargs** -- extra kwargs to pass to *git.latest* state module besides the *name* and *target*
- **ansible\_kwargs** -- extra kwargs to pass to *ansible.playbooks* execution module besides the *name* and *target*

**Returns**

Ansible playbook output.

```

run nginx install:
  ansible.playbooks:
    - name: install.yml
    - git_repo: git://github.com/gituser/playbook.git
    - git_kwarg:
      rev: master

```

### 26.19.5 salt.states.apache

**Warning:** This module will be removed from Salt in version 3009 in favor of the [apache Salt Extension](#).

Apache state

New in version 2014.7.0.

Allows for inputting a yaml dictionary into a file for apache configuration files.

The variable `this` is special and signifies what should be included with the above word between angle brackets (<>).

```

/etc/httpd/conf.d/website.com.conf:
  apache.configfile:
    - config:
      - VirtualHost:
          this: '*:80'
          ServerName:
            - website.com
          ServerAlias:
            - www.website.com
            - dev.website.com
          ErrorLog: logs/website.com-error_log
          CustomLog: logs/website.com-access_log combined
          DocumentRoot: /var/www/vhosts/website.com
          Directory:
            this: /var/www/vhosts/website.com
            Order: Deny,Allow
            Deny from: all
            Allow from:
              - 127.0.0.1
              - 192.168.100.0/24
            Options:
              - Indexes
              - FollowSymlinks
            AllowOverride: All

```

Changed in version 2018.3.0.

Allows having the same section container multiple times (e.g. <Directory /path/to/dir>).

YAML structure stays the same only replace dictionary with a list.

When a section container does not have mandatory attribute, such as <Else>, it still needs keyword `this` with empty string (or `""` if nicer output is required - without space).

```

/etc/httpd/conf.d/website.com.conf:
  apache.configfile:
    - config:
      - VirtualHost:
        - this: '*:80'
        - ServerName:
          - website.com
        - DocumentRoot: /var/www/vhosts/website.com
        - Directory:
          this: /var/www/vhosts/website.com
          Order: Deny,Allow
          Deny from: all
          Allow from:
            - 127.0.0.1
            - 192.168.100.0/24
          Options:
            - Indexes
            - FollowSymlinks
          AllowOverride: All
        - Directory:
          - this: /var/www/vhosts/website.com/private
          - Order: Deny,Allow
          - Deny from: all
          - Allow from:
            - 127.0.0.1
            - 192.168.100.0/24
          - If:
            this: some condition
            do: something
          - Else:
            this:
            do: something else
          - Else:
            this: ""
            do: another thing

```

`salt.states.apache.configfile`(*name, config*)

### 26.19.6 salt.states.apache\_conf

**Warning:** This module will be removed from Salt in version 3009 in favor of the [apache Salt Extension](#).

Manage Apache Confs

New in version 2016.3.0.

Enable and disable apache confs.

```

Enable security conf:
  apache_conf.enabled:
    - name: security

```

(continues on next page)

(continued from previous page)

```

Disable security conf:
  apache_conf.disabled:
    - name: security

```

`salt.states.apache_conf.disabled(name)`

Ensure an Apache conf is disabled.

**name**

Name of the Apache conf

`salt.states.apache_conf.enabled(name)`

Ensure an Apache conf is enabled.

**name**

Name of the Apache conf

### 26.19.7 salt.states.apache\_module

**Warning:** This module will be removed from Salt in version 3009 in favor of the [apache Salt Extension](#).

Manage Apache Modules

New in version 2014.7.0.

Enable and disable apache modules.

```

Enable cgi module:
  apache_module.enabled:
    - name: cgi

Disable cgi module:
  apache_module.disabled:
    - name: cgi

```

`salt.states.apache_module.disabled(name)`

Ensure an Apache module is disabled.

New in version 2016.3.0.

**name**

Name of the Apache module

`salt.states.apache_module.enabled(name)`

Ensure an Apache module is enabled.

New in version 2016.3.0.

**name**

Name of the Apache module

## 26.19.8 salt.states.apache\_site

**Warning:** This module will be removed from Salt in version 3009 in favor of the [apache Salt Extension](#).

Manage Apache Sites

New in version 2016.3.0.

Enable and disable apache sites.

**Enable default site:**  
**apache\_site.enabled:**  
- **name:** default

**Disable default site:**  
**apache\_site.disabled:**  
- **name:** default

**salt.states.apache\_site.disabled**(*name*)

Ensure an Apache site is disabled.

**name**

Name of the Apache site

**salt.states.apache\_site.enabled**(*name*)

Ensure an Apache site is enabled.

**name**

Name of the Apache site

## 26.19.9 salt.states.aptpkg

Package management operations specific to APT- and DEB-based systems

**salt.states.aptpkg.held**(*name*)

Set package in 'hold' state, meaning it will not be upgraded.

**name**

The name of the package, e.g., 'tmux'

## 26.19.10 salt.states.archive

Extract an archive

New in version 2014.1.0.

**salt.states.archive.extracted**(*name*, *source*, *source\_hash*=None, *source\_hash\_name*=None, *source\_hash\_update*=False, *skip\_files\_list\_verify*=False, *skip\_verify*=False, *password*=None, *options*=None, *list\_options*=None, *force*=False, *overwrite*=False, *clean*=False, *clean\_parent*=False, *user*=None, *group*=None, *if\_missing*=None, *trim\_output*=False, *use\_cmd\_unzip*=None, *extract\_perms*=True, *enforce\_toplevel*=True, *enforce\_ownership\_on*=None, *archive\_format*=None, *use\_etag*=False, *signature*=None, *source\_hash\_sig*=None, *signed\_by\_any*=None, *signed\_by\_all*=None, *keyring*=None, *gnupghome*=None, **\*\*kwargs**)

New in version 2014.1.0.

Changed in version 2016.11.0,3005: This state has been rewritten. Some arguments are new to this release and will not be available in the 2016.3 release cycle (and earlier). Additionally, the **ZIP Archive Handling** section below applies specifically to the 2016.11.0 release (and newer).

Ensure that an archive is extracted to a specific directory.

---

#### Important: Changes for 2016.11.0

In earlier releases, this state would rely on the `if_missing` argument to determine whether or not the archive needed to be extracted. When this argument was not passed, then the state would just assume `if_missing` is the same as the `name` argument (i.e. the parent directory into which the archive would be extracted).

This caused a number of annoyances. One such annoyance was the need to know beforehand a path that would result from the extraction of the archive, and setting `if_missing` to that directory, like so:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
    - if_missing: /var/www/myapp-16.2.4
```

If `/var/www` already existed, this would effectively make `if_missing` a required argument, just to get Salt to extract the archive.

Some users worked around this by adding the top-level directory of the archive to the end of the `name` argument, and then used `--strip` or `--strip-components` to remove that top-level dir when extracting:

```
extract_myapp:
  archive.extracted:
    - name: /var/www/myapp-16.2.4
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
```

With the rewrite for 2016.11.0, these workarounds are no longer necessary. `if_missing` is still a supported argument, but it is no longer required. The equivalent SLS in 2016.11.0 would be:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
```

Salt now uses a function called `archive.list` to get a list of files/directories in the archive. Using this information, the state can now check the minion to see if any paths are missing, and know whether or not the archive needs to be extracted. This makes the `if_missing` argument unnecessary in most use cases.

---

#### Important: ZIP Archive Handling

*Note: this information applies to 2016.11.0 and later.*

Salt has two different functions for extracting ZIP archives:

1. `archive.unzip`, which uses Python's `zipfile` module to extract ZIP files.
2. `archive.cmd_unzip`, which uses the `unzip` CLI command to extract ZIP files.

Salt will prefer the use of `archive.cmd_unzip` when CLI options are specified (via the `options` argument), and will otherwise prefer the `archive.unzip` function. Use of `archive.cmd_unzip` can be forced however by setting the `use_cmd_unzip` argument to `True`. By contrast, setting this argument to `False` will force usage of `archive.unzip`. For example:

```
/var/www:
  archive.extracted:
    - source: salt://foo/bar/myapp.zip
    - use_cmd_unzip: True
```

When `use_cmd_unzip` is omitted, Salt will choose which extraction function to use based on the source archive and the arguments passed to the state. When in doubt, simply do not set this argument; it is provided as a means of overriding the logic Salt uses to decide which function to use.

There are differences in the features available in both extraction functions. These are detailed below.

- *Command-line options* (only supported by `archive.cmd_unzip`) - When the `options` argument is used, `archive.cmd_unzip` is the only function that can be used to extract the archive. Therefore, if `use_cmd_unzip` is specified and set to `False`, and `options` is also set, the state will not proceed.
- *Permissions* - Due to an [upstream bug in Python](#), permissions are not preserved when the `zipfile` module is used to extract an archive. As of the 2016.11.0 release, `archive.unzip` (as well as this state) has an `extract_perms` argument which, when set to `True` (the default), will attempt to match the permissions of the extracted files/directories to those defined within the archive. To disable this functionality and have the state not attempt to preserve the permissions from the ZIP archive, set `extract_perms` to `False`:

```
/var/www:
  archive.extracted:
    - source: salt://foo/bar/myapp.zip
    - extract_perms: False
```

---

#### name

Directory into which the archive should be extracted

#### source

Archive to be extracted

---

**Note:** This argument uses the same syntax as its counterpart in the `file.managed` state.

---

#### source\_hash

Hash of source file, or file with list of hash-to-file mappings

---

**Note:** This argument uses the same syntax as its counterpart in the `file.managed` state.

---

Changed in version 2016.11.0: If this argument specifies the hash itself, instead of a URI to a file containing hashes, the hash type can now be omitted and Salt will determine the hash type based on the length of the hash. For example, both of the below states are now valid, while before only the second one would be:

```

foo_app:
  archive.extracted:
    - name: /var/www
    - source: https://mydomain.tld/foo.tar.gz
    - source_hash: 3360db35e682f1c5f9c58aa307de16d41361618c

bar_app:
  archive.extracted:
    - name: /var/www
    - source: https://mydomain.tld/bar.tar.gz
    - source_hash: sha1=5edb7d584b82ddcbf76e311601f5d4442974aaa5

```

**source\_hash\_name**

When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename part of the source URI. When managing a file with a source of `salt://files/foo.tar.gz`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.tar.gz
```

This line would also match:

```
acbd18db4cc2f85cedef654fccc4a4d8    ./dir1/foo.tar.gz
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```

/var/www:
  archive.extracted:
    - source: https://mydomain.tld/dir2/foo.tar.gz
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.tar.gz

```

---

**Note:** This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

---

New in version 2016.11.0.

**source\_hash\_update**

[False] Set this to `True` if archive should be extracted if `source_hash` has changed and there is a difference between the archive and the local files. This would extract regardless of the `if_missing` parameter.

Note that this is only checked if the `source` value has not changed. If it has (e.g. to increment a version number in the path) then the archive will not be extracted even if the hash has changed.

---

**Note:** Setting this to `True` along with `keep_source` set to `False` will result the source re-download to do a archive file list check. If it's not desirable please consider the

`skip_files_list_verify` argument.

---

New in version 2016.3.0.

#### `skip_files_list_verify`

[False] Set this to `True` if archive should be extracted if `source_hash` has changed but only check-sums of the archive will be checked to determine if the extraction is required.

It will try to find a local cache of the `source` and check its hash against the `source_hash`. If there is no local cache available, for example if you set the `keep_source` to `False`, it will try to find a cached source hash file in the Minion archives cache directory.

---

**Note:** The current limitation of this logic is that you have to set minions `hash_type` config option to the same one that you're going to pass via `source_hash` argument.

---

**Warning:** With this argument set to `True` Salt will only check for the `source_hash` against the local hash of the `source`. So if you, for example, remove extracted files without clearing the Salt Minion cache next time you execute the state Salt will not notice that extraction is required if the hashes are still match.

New in version 3000.

#### `skip_verify`

[False] If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.4.

#### `keep_source`

[True] For `source` archives not local to the minion (i.e. from the Salt fileserver or a remote source such as `http(s)` or `ftp`), Salt will need to download the archive to the minion cache before they can be extracted. To remove the downloaded archive after extraction, set this argument to `False`.

New in version 2017.7.3.

#### `keep`

[True] Same as `keep_source`, kept for backward-compatibility.

---

**Note:** If both `keep_source` and `keep` are used, `keep` will be ignored.

---

#### `password`

**For ZIP archives only.** Password used for extraction.

New in version 2016.3.0.

Changed in version 2016.11.0: The newly-added `archive.is_encrypted` function will be used to determine if the archive is password-protected. If it is, then the `password` argument will be required for the state to proceed.

#### `options`

**For tar and zip archives only.** This option can be used to specify a string of additional arguments to pass to the tar/zip command.

If this argument is not used, then the minion will attempt to use Python's native `tarfile/zipfile` support to extract it. For zip archives, this argument is mostly used to overwrite existing files with `o`.

Using this argument means that the `tar` or `unzip` command will be used, which is less platform-independent, so keep this in mind when using this option; the CLI options must be valid options for the `tar/unzip` implementation on the minion's OS.

New in version 2016.11.0.

Changed in version 2015.8.11,2016.3.2: XZ-compressed tar archives no longer require `J` to manually be set in the `options`, they are now detected automatically and decompressed using the `xz` CLI command and extracted using `tar xvzf`. This is a more platform-independent solution, as not all tar implementations support the `J` argument for extracting archives.

---

**Note:** For tar archives, main operators like `-x`, `--extract`, `--get`, `-c` and `-f/--file` should *not* be used here.

---

### list\_options

**For tar archives only.** This state uses `archive.list` to discover the contents of the source archive so that it knows which file paths should exist on the minion if the archive has already been extracted. For the vast majority of tar archives, `archive.list` "just works". Archives compressed using `gzip`, `bzip2`, and `xz/lzma` (with the help of the `xz` CLI command) are supported automatically. However, for archives compressed using other compression types, CLI options must be passed to `archive.list`.

This argument will be passed through to `archive.list` as its `options` argument, to allow it to successfully list the archive's contents. For the vast majority of archives, this argument should not need to be used, it should only be needed in cases where the state fails with an error stating that the archive's contents could not be listed.

New in version 2016.11.0.

### force

[False] If a path that should be occupied by a file in the extracted result is instead a directory (or vice-versa), the state will fail. Set this argument to `True` to force these paths to be removed in order to allow the archive to be extracted.

**Warning:** Use this option *very* carefully.

New in version 2016.11.0.

### overwrite

[False] Set this to `True` to force the archive to be extracted. This is useful for cases where the file-names/directories have not changed, but the content of the files have.

New in version 2016.11.1.

### clean

[False] Set this to `True` to remove any top-level files and recursively remove any top-level directory paths before extracting.

---

**Note:** Files will only be cleaned first if extracting the archive is deemed necessary, either by paths missing on the minion, or if `overwrite` is set to `True`.

---

New in version 2016.11.1.

### clean\_parent

[False] If `True`, and the archive is extracted, delete the parent directory (i.e. the directory into which the archive is extracted), and then re-create that directory before extracting. Note that `clean` and `clean_parent` are mutually exclusive.

New in version 3000.

### user

The user to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

#### **group**

The group to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

#### **if\_missing**

If specified, this path will be checked, and if it exists then the archive will not be extracted. This path can be either a directory or a file, so this option can also be used to check for a semaphore file and conditionally skip extraction.

Changed in version 2016.3.0: When used in combination with either `user` or `group`, ownership will only be enforced when `if_missing` is a directory.

Changed in version 2016.11.0: Ownership enforcement is no longer tied to this argument, it is simply checked for existence and extraction will be skipped if it is present.

#### **trim\_output**

[False] Useful for archives with many files in them. This can either be set to `True` (in which case only the first 100 files extracted will be in the state results), or it can be set to an integer for more exact control over the max number of files to include in the state results.

New in version 2016.3.0.

#### **use\_cmd\_unzip**

[False] Set to `True` for zip files to force usage of the `archive.cmd_unzip` function to extract.

New in version 2016.11.0.

#### **extract\_perms**

[True] **For ZIP archives only.** When using `archive.unzip` to extract ZIP archives, Salt works around an [upstream bug in Python](#) to set the permissions on extracted files/directories to match those encoded into the ZIP archive. Set this argument to `False` to skip this workaround.

New in version 2016.11.0.

#### **enforce\_toplevel**

[True] This option will enforce a single directory at the top level of the source archive, to prevent extracting a 'tar-bomb'. Set this argument to `False` to allow archives with files (or multiple directories) at the top level to be extracted.

New in version 2016.11.0.

#### **enforce\_ownership\_on**

When `user` or `group` is specified, Salt will default to enforcing permissions on the file/directory paths detected by running `archive.list` on the source archive. Use this argument to specify an alternate directory on which ownership should be enforced.

---

**Note:** This path must be within the path specified by the `name` argument.

---

New in version 2016.11.0.

**archive\_format**

One of `tar`, `zip`, or `rar`.

Changed in version 2016.11.0: If omitted, the archive format will be guessed based on the value of the `source` argument. If the minion is running a release older than 2016.11.0, this option is required.

**use\_etag**

If `True`, remote `http/https` file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the `source_hash` parameter.

New in version 3005.

**signature**

Ensure a valid GPG signature exists on the selected `source` file. This needs to be a file URI retrievable by `:py:func:`cp.cache_file <salt.modules.cp.cache_file>` which identifies a detached signature.

---

**Note:** A signature is only enforced directly after caching the file, before it is extracted to its final destination. Existing files at the target will never be modified.

It will be enforced regardless of source type.

---

New in version 3007.0.

**source\_hash\_sig**

When `source` is a remote file source, `source_hash` is a file, `skip_verify` is not `true` and `use_etag` is not `true`, ensure a valid GPG signature exists on the source hash file. Set this to `true` for an inline (clearsigned) signature, or to a file URI retrievable by `:py:func:`cp.cache_file <salt.modules.cp.cache_file>` for a detached one.

---

**Note:** A signature on the `source_hash` file is enforced regardless of changes since its contents are used to check if an existing file is in the correct state - but only for remote sources! As for `signature`, existing target files will not be modified, only the cached `source_hash` and `source_hash_sig` files will be removed.

---

New in version 3007.0.

**signed\_by\_any**

When verifying signatures either on the managed file or its source hash file, require at least one valid signature from one of a list of key fingerprints. This is passed to `gpg.verify`.

New in version 3007.0.

**signed\_by\_all**

When verifying signatures either on the managed file or its source hash file, require a valid signature from each of the key fingerprints in this list. This is passed to `gpg.verify`.

New in version 3007.0.

**keyring**

When verifying signatures, use this keyring.

New in version 3007.0.

**gnupghome**

When verifying signatures, use this GnuPG home.

New in version 3007.0.

**Examples**

1. tar with `lmza` (i.e. `xz`) compression:

```

graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/
      ↳graylog2-server-0.9.6p1.tar.lzma
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6

```

2. tar archive with flag for verbose output, and enforcement of user/group ownership:

```

graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/
      ↳graylog2-server-0.9.6p1.tar.gz
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
    - options: v
    - user: foo
    - group: foo

```

3. tar archive, with `source_hash_update` set to `True` to prevent state from attempting extraction unless the `source_hash` differs from the previous time the archive was extracted:

```

graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/
      ↳graylog2-server-0.9.6p1.tar.lzma
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
    - source_hash_update: True

```

### 26.19.11 salt.states.artifactory

This state downloads artifacts from artifactory.

`salt.states.artifactory.downloaded` (*name*, *artifact*, *target\_dir*='/tmp', *target\_file*=None, *use\_literal\_group\_id*=False)

Ensures that the artifact from artifactory exists at given location. If it doesn't exist, then it will be downloaded. If it already exists then the checksum of existing file is checked against checksum in artifactory. If it is different then the step will fail.

#### artifact

Details of the artifact to be downloaded from artifactory. Various options are:

- `artifactory_url`: URL of the artifactory instance
- `repository`: Repository in artifactory
- `artifact_id`: Artifact ID
- `group_id`: Group ID
- `packaging`: Packaging
- `classifier`: Classifier .. `versionadded:: 2015.8.0`
- **version**: **Version**
  - One of the following: - `Version` to download - `latest` - Download the latest release of this artifact - `latest_snapshot` - Download the latest snapshot for this artifact
- `username`: Artifactory username .. `versionadded:: 2015.8.0`
- `password`: Artifactory password .. `versionadded:: 2015.8.0`

#### target\_dir

Directory where the artifact should be downloaded. By default it is downloaded to /tmp directory.

**target\_file**

Target file to download artifact to. By default file name is resolved by artifactory.

An example to download an artifact to a specific file:

```

jboss_module_downloaded:
  artifactory.downloaded:
    - artifact:
      artifactory_url: http://artifactory.intranet.example.com/
      ↪artifactory
      repository: 'libs-release-local'
      artifact_id: 'module'
      group_id: 'com.company.module'
      packaging: 'jar'
      classifier: 'sources'
      version: '1.0'
    - target_file: /opt/jboss7/modules/com/company/lib/module.jar

```

Download artifact to the folder (automatically resolves file name):

```

jboss_module_downloaded:
  artifactory.downloaded:
    - artifact:
      artifactory_url: http://artifactory.intranet.example.com/
      ↪artifactory
      repository: 'libs-release-local'
      artifact_id: 'module'
      group_id: 'com.company.module'
      packaging: 'jar'
      classifier: 'sources'
      version: '1.0'
    - target_dir: /opt/jboss7/modules/com/company/lib

```

### 26.19.12 salt.states.at

#### Configuration disposable regularly scheduled tasks for at.

The at state can be add disposable regularly scheduled tasks for your system.

`salt.states.at.absent` (*name*, *jobid=None*, *\*\*kwargs*)

Changed in version 2017.7.0.

Remove a job from queue

**jobid:** string|int

Specific jobid to remove

**tag**

[string] Job's tag

**runas**

[string] Runs user-specified jobs

**kwargs**

Addition kwargs can be provided to filter jobs. See output of `at.jobcheck` for more.

```

example1:
  at.absent:

```

```
Warning: this will remove all jobs!
```

```
example2:  
at.absent:  
- year: 13
```

```
example3:  
at.absent:  
- tag: rose
```

```
example4:  
at.absent:  
- tag: rose  
- day: 13  
- hour: 16
```

```
example5:  
at.absent:  
- jobid: 4
```

`salt.states.at.mod_watch(name, **kwargs)`

The at watcher, called to invoke the watch command.

---

**Note:** This state exists to support special handling of the `watch requisite`. It should not be called directly. Parameters for this function should be set by the state being triggered.

---

**name**

The name of the atjob

`salt.states.at.present(name, timespec, tag=None, user=None, job=None, unique_tag=False)`

Changed in version 2017.7.0.

Add a job to queue.

**job**

[string] Command to run.

**timespec**

[string] The 'timespec' follows the format documented in the at(1) manpage.

**tag**

[string] Make a tag for the job.

**user**

[string] The user to run the at job .. versionadded:: 2014.1.4

**unique\_tag**

[boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```
rose:  
at.present:  
- job: 'echo "I love saltstack" > love'  
- timespec: '9:09 11/09/13'  
- tag: love  
- user: jam
```

`salt.states.at.watch`(*name*, *timespec*, *tag=None*, *user=None*, *job=None*, *unique\_tag=False*)

New in version 2017.7.0.

Add an at job if trigger by watch

**job**

[string] Command to run.

**timespec**

[string] The 'timespec' follows the format documented in the at(1) manpage.

**tag**

[string] Make a tag for the job.

**user**

[string] The user to run the at job .. versionadded:: 2014.1.4

**unique\_tag**

[boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```
minion_restart:
  at.watch:
    - job: 'salt-call --local service.restart salt-minion'
    - timespec: 'now +1 min'
    - tag: minion_restart
    - unique_tag: trye
    - watch:
      - file: /etc/salt/minion
```

### 26.19.13 salt.states.augeas

Configuration management using Augeas

New in version 0.17.0.

This state requires the `augeas` Python module.

`Augeas` can be used to manage configuration files.

`salt.states.augeas.change`(*name*, *context=None*, *changes=None*, *lens=None*, *load\_path=None*, *\*\*kwargs*)

New in version 2014.7.0.

This state replaces `setvalue()`.

Issue changes to Augeas, optionally for a specific context, with a specific lens.

**name**

State name

**context**

A file path, prefixed by `/files`. Should resolve to an actual file (not an arbitrary augeas path). This is used to avoid duplicating the file name for each item in the changes list (for example, `set bind 0.0.0.0` in the example below operates on the file specified by `context`). If `context` is not specified, a file path prefixed by `/files` should be included with the `set` command.

The file path is examined to determine if the specified changes are already present.

```
redis-conf:
  augeas.change:
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
      - set maxmemory 1G
```

**changes**

List of changes that are issued to Augeas. Available commands are `set`, `setm`, `mv/move`, `ins/insert`, and `rm/remove`.

**lens**

The lens to use, needs to be suffixed with `.lns`, e.g.: `Nginx.lns`. See the [list of stock lenses](#) shipped with Augeas.

New in version 2016.3.0.

**load\_path**

A list of directories that modules should be searched in. This is in addition to the standard load path and the directories in `AUGEAS_LENS_LIB`.

Usage examples:

Set the `bind` parameter in `/etc/redis/redis.conf`:

```
redis-conf:
augeas.change:
- changes:
  - set /files/etc/redis/redis.conf/bind 0.0.0.0
```

---

**Note:** Use the `context` parameter to specify the file you want to manipulate. This way you don't have to include this in the `changes` every time:

```
redis-conf:
augeas.change:
- context: /files/etc/redis/redis.conf
- changes:
  - set bind 0.0.0.0
  - set databases 4
  - set maxmemory 1G
```

---

Augeas is aware of a lot of common configuration files and their syntax. It knows the difference between for example ini and yaml files, but also files with very specific syntax, like the hosts file. This is done with *lenses*, which provide mappings between the Augeas tree and the file.

There are many [preconfigured lenses](#) that come with Augeas by default, and they specify the common locations for configuration files. So most of the time Augeas will know how to manipulate a file. In the event that you need to manipulate a file that Augeas doesn't know about, you can specify the lens to use like this:

```
redis-conf:
augeas.change:
- lens: redis.lns
- context: /files/etc/redis/redis.conf
- changes:
  - set bind 0.0.0.0
```

---

**Note:** Even though Augeas knows that `/etc/redis/redis.conf` is a Redis configuration file and knows how to parse it, it is recommended to specify the lens anyway. This is because by default, Augeas loads all known lenses and their associated file paths. All these files are parsed when Augeas is loaded, which can take some time. When specifying a lens, Augeas is loaded with only that lens, which speeds things up quite a bit.

---

A more complex example, this adds an entry to the services file for Zabbix, and removes an obsolete service:

```

zabbix-service:
  augeas.change:
    - lens: services.lns
    - context: /files/etc/services
    - changes:
      - ins service-name after service-name[last()]
      - set service-name[last()] "zabbix-agent"
      - set "service-name[. = 'zabbix-agent']/port" 10050
      - set "service-name[. = 'zabbix-agent']/protocol" tcp
      - set "service-name[. = 'zabbix-agent']/#comment" "Zabbix Agent"
    →service"
      - rm "service-name[. = 'im-obsolete']"
    - unless: grep '^zabbix-agent\s' /etc/services

```

**Warning:** Don't forget the `unless` here, otherwise it will fail on next runs because the service is already defined. Additionally you have to quote lines containing `service-name[. = 'zabbix-agent']` otherwise `augeas_cfg` execute will fail because it will receive more parameters than expected.

**Note:** Order is important when defining a service with Augeas, in this case it's `port`, `protocol` and `#comment`. For more info about the lens check [services lens documentation](#).

<http://augeas.net/docs/references/lenses/files/services-aug.html#Services.record>

## 26.19.14 salt.states.aws\_sqs

Manage SQS Queues

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses the `awscli` tool provided by Amazon. This can be downloaded from `pip`. Also check the documentation for `awscli` for configuration information.

```

myqueue:
  aws_sqs.exists:
    - region: eu-west-1

```

`salt.states.aws_sqs.absent` (*name*, *region*, *user=None*, *opts=False*)

Remove the named SQS queue if it exists.

**name**

Name of the SQS queue.

**region**

Region to remove the queue from

**user**

Name of the user performing the SQS operations

**opts**

Include additional arguments and options to the `aws` command line

`salt.states.aws_sqs.exists` (*name*, *region*, *user=None*, *opts=False*)

Ensure the SQS queue exists.

- name**  
Name of the SQS queue.
- region**  
Region to create the queue
- user**  
Name of the user performing the SQS operations
- opts**  
Include additional arguments and options to the aws command line

### 26.19.15 salt.states.beacon

#### Management of the Salt beacons

New in version 2015.8.0.

```
ps:
  beacon.present:
    - save: True
    - enable: False
    - services:
      salt-master: running
      apache2: stopped
```

```
sh:
  beacon.present: []
```

```
load:
  beacon.present:
    - averages:
      1m:
        - 0.0
        - 2.0
      5m:
        - 0.0
        - 1.5
      15m:
        - 0.1
        - 1.0
```

```
.. versionadded:: 3000
```

Beginning in the 3000 release, multiple copies of a beacon can be configured using the ``beacon\_module`` parameter.

```
inotify_infs:
  beacon.present:
    - save: True
    - enable: True
    - files:
      /etc/infs.conf:
        mask:
          - create
```

(continues on next page)

(continued from previous page)

```

    - delete
    - modify
    recurse: True
    auto_add: True
  - interval: 10
  - beacon_module: inotify
  - disable_during_state_run: True

```

**inotify\_ntp:****beacon.present:**

```

  - save: True
  - enable: True
  - files:
    /etc/ntp.conf:
    mask:
      - create
      - delete
      - modify
    recurse: True
    auto_add: True
  - interval: 10
  - beacon_module: inotify
  - disable_during_state_run: True

```

`salt.states.beacon.absent`(*name*, *save=False*, *\*\*kwargs*)

Ensure beacon is absent.

**name**

The name of the beacon that is ensured absent.

**save**

True/False, if True the beacons.conf file be updated too. Default is False.

Example:

```

remove_beacon:
  beacon.absent:
    - name: ps
    - save: True

```

`salt.states.beacon.disabled`(*name*, *\*\*kwargs*)

Disable a beacon.

**name**

The name of the beacon to disable.

Example:

```

disable_beacon:
  beacon.disabled:
    - name: psp

```

`salt.states.beacon.enabled`(*name*, *\*\*kwargs*)

Enable a beacon.

**name**

The name of the beacon to enable.

Example:

```
enable_beacon:  
  beacon.enabled:  
    - name: ps
```

`salt.states.beacon.present` (*name*, *save=False*, *\*\*kwargs*)

Ensure beacon is configured with the included beacon data.

**name**

The name of the beacon to ensure is configured.

**save**

True/False, if True the beacons.conf file be updated too. Default is False.

Example:

```
ps_beacon:  
  beacon.present:  
    - name: ps  
    - save: True  
    - enable: False  
    - services:  
      salt-master: running  
      apache2: stopped
```

### 26.19.16 salt.states.bigip

A state module designed to enforce load-balancing configurations for F5 Big-IP entities.

**maturity**

develop

**platform**

f5\_bigip\_11.6

`salt.states.bigip.add_pool_member` (*hostname*, *username*, *password*, *name*, *member*)

A function to connect to a bigip device and add a new member to an existing pool.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the pool to modify

**member**

The member to add to the pool

`salt.states.bigip.create_monitor` (*hostname*, *username*, *password*, *monitor\_type*, *name*, *\*\*kwargs*)

A function to connect to a bigip device and create a monitor.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**monitor\_type**

The type of monitor to create

**name**  
The name of the monitor to create

**kwargs**  
[ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

`salt.states.bigip.create_node`(*hostname, username, password, name, address*)

Create a new node if it does not already exist.

**hostname**  
The host/address of the bigip device

**username**  
The iControl REST username

**password**  
The iControl REST password

**name**  
The name of the node to create

**address**  
The address of the node

`salt.states.bigip.create_pool`(*hostname, username, password, name, members=None, allow\_nat=None, allow\_snat=None, description=None, gateway\_failsafe\_device=None, ignore\_persisted\_weight=None, ip\_tos\_to\_client=None, ip\_tos\_to\_server=None, link\_qos\_to\_client=None, link\_qos\_to\_server=None, load\_balancing\_mode=None, min\_active\_members=None, min\_up\_members=None, min\_up\_members\_action=None, min\_up\_members\_checking=None, monitor=None, profiles=None, queue\_depth\_limit=None, queue\_on\_connection\_limit=None, queue\_time\_limit=None, reselect\_tries=None, service\_down\_action=None, slow\_ramp\_time=None*)

Create a new node if it does not already exist.

**hostname**  
The host/address of the bigip device

**username**  
The iControl REST username

**password**  
The iControl REST password

**name**  
The name of the pool to create

**members**  
List of members to be added to the pool

**allow\_nat**  
[yes | no]

**allow\_snat**  
[yes | no]

**description**  
[string]

**gateway\_failsafe\_device**  
[string]

**ignore\_persisted\_weight**  
[enabled | disabled]

**ip\_tos\_to\_client**  
[pass-through | [integer]]

**ip\_tos\_to\_server**  
[pass-through | [integer]]

**link\_qos\_to\_client**  
[pass-through | [integer]]

**link\_qos\_to\_server**  
[pass-through | [integer]]

**load\_balancing\_mode**

`salt.states.bigip.create_profile`(*hostname, username, password, profile\_type, name, \*\*kwargs*)

A function to connect to a bigip device and create a profile.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**profile\_type**

The type of profile to create

**name**

The name of the profile to create

**kwargs**

[ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

Special Characters |, , and : must be escaped using \ when used within strings.

`salt.states.bigip.create_virtual` (*hostname, username, password, name, destination, pool=None, address\_status=None, auto\_lasthop=None, bwc\_policy=None, cmp\_enabled=None, connection\_limit=None, dhcp\_relay=None, description=None, fallback\_persistence=None, flow\_eviction\_policy=None, gtm\_score=None, ip\_forward=None, ip\_protocol=None, internal=None, twelve\_forward=None, last\_hop\_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate\_class=None, rate\_limit=None, rate\_limit\_mode=None, rate\_limit\_dst=None, rate\_limit\_src=None, rules=None, related\_rules=None, reject=None, source=None, source\_address\_translation=None, source\_port=None, virtual\_state=None, traffic\_classes=None, translate\_address=None, translate\_port=None, vlans=None*)

A function to connect to a bigip device and create a virtual server if it does not already exist.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

`salt.states.bigip.delete_monitor` (*hostname, username, password, monitor\_type, name*)

Modify an existing monitor. If it does exist, only the parameters specified will be enforced.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**monitor\_type**

The type of monitor to create

**name**

The name of the monitor to create

**kwargs**

[ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

`salt.states.bigip.delete_node` (*hostname, username, password, name*)

Delete an existing node.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the node which will be deleted.

`salt.states.bigip.delete_pool` (*hostname, username, password, name*)

Delete an existing pool.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the pool which will be deleted

`salt.states.bigip.delete_pool_member` (*hostname, username, password, name, member*)

Delete an existing pool member.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the pool to be modified

**member**

The name of the member to delete from the pool

`salt.states.bigip.delete_profile` (*hostname, username, password, profile\_type, name*)

Modify an existing profile. If it does exist, only the parameters specified will be enforced.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**profile\_type**

The type of profile to create

**name**

The name of the profile to create

**kwargs**

[ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

**salt.states.bigip.delete\_virtual**(*hostname, username, password, name*)

Delete an existing virtual.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the virtual which will be deleted

**salt.states.bigip.list\_monitor**(*hostname, username, password, monitor\_type, name*)

A function to list an existing monitor.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**monitor\_type**

The type of monitor to list

**name**

The name of the monitor to list

**salt.states.bigip.list\_node**(*hostname, username, password, name*)

A function to connect to a bigip device and list a specific node.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**

The name of the node to list.

**salt.states.bigip.list\_pool**(*hostname, username, password, name*)

A function to connect to a bigip device and list a specific pool.

**hostname**

The host/address of the bigip device

**username**  
The iControl REST username

**password**  
The iControl REST password

**name**  
The name of the pool to list.

`salt.states.bigip.list_profile` (*hostname, username, password, profile\_type, name*)

A function to list an existing profile.

**hostname**  
The host/address of the bigip device

**username**  
The iControl REST username

**password**  
The iControl REST password

**profile\_type**  
The type of profile to list

**name**  
The name of the profile to list

`salt.states.bigip.list_virtual` (*hostname, username, password, name*)

A function to list a specific virtual.

**hostname**  
The host/address of the bigip device

**username**  
The iControl REST username

**password**  
The iControl REST password

**name**  
The name of the virtual to list

`salt.states.bigip.manage_monitor` (*hostname, username, password, monitor\_type, name, \*\*kwargs*)

Create a new monitor if a monitor of this type and name does not already exists. If it does exists, only the parameters specified will be enforced.

**hostname**  
The host/address of the bigip device

**username**  
The iControl REST username

**password**  
The iControl REST password

**monitor\_type**  
The type of monitor to create

**name**  
The name of the monitor to create

**kwargs**  
[ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

`salt.states.bigip.manage_node` (*hostname, username, password, name, address, connection\_limit=None, description=None, dynamic\_ratio=None, logging=None, monitor=None, rate\_limit=None, ratio=None, session=None, node\_state=None*)

Manages a node of a given bigip device. If the node does not exist it will be created, otherwise, only the properties which are different than the existing will be updated.

**hostname**  
The host/address of the bigip device

**username**  
The iControl REST username

**password**  
The iControl REST password

**name**  
The name of the node to manage.

**address**  
The address of the node

**connection\_limit**  
[integer]

**description**  
[string]

**dynam**  
c\_ratio: [integer]

**logging**  
[enabled | disabled]

**monitor**

 [integer]

`salt.states.bigip.manage_pool_members` (*hostname, username, password, name, members*)

Manage the members of an existing pool. This function replaces all current pool members. Only the parameters specified are enforced.

**hostname**

The host/address of the bigip device

**username**

The iControl REST username

**password**

The iControl REST password

**name**  
The name of the pool to modify

**members**  
list of pool members to manage.

`salt.states.bigip.manage_profile`(*hostname, username, password, profile\_type, name, \*\*kwargs*)

Create a new profile if a monitor of this type and name does not already exists. If it does exists, only the parameters specified will be enforced.

**hostname**  
The host/address of the bigip device

**username**  
The iControl REST username

**password**  
The iControl REST password

**profile\_type**  
The type of profile to create

**name**  
The name of the profile to create

**kwargs**  
[ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

`salt.states.bigip.manage_virtual`(*hostname, username, password, name, destination, pool=None, address\_status=None, auto\_lasthop=None, bwc\_policy=None, cmp\_enabled=None, connection\_limit=None, dhcp\_relay=None, description=None, fallback\_persistence=None, flow\_eviction\_policy=None, gtm\_score=None, ip\_forward=None, ip\_protocol=None, internal=None, twelve\_forward=None, last\_hop\_pool=None, mask=None, mirror=None, nat64=None, persist=None, profiles=None, policies=None, rate\_class=None, rate\_limit=None, rate\_limit\_mode=None, rate\_limit\_dst=None, rate\_limit\_src=None, rules=None, related\_rules=None, reject=None, source=None, source\_address\_translation=None, source\_port=None, virtual\_state=None, traffic\_classes=None, translate\_address=None, translate\_port=None, vlans=None*)

Manage a virtual server. If a virtual does not exists it will be created, otherwise only the parameters specified will be enforced.

**hostname**  
The host/address of the bigip device

**username**  
The iControl REST username

**password**  
The iControl REST password

### 26.19.17 salt.states.blockdev

Management of Block Devices

A state module to manage blockdevices

```

/dev/sda:
  blockdev.tuned:
    - read-only: True

master-data:
  blockdev.tuned:
    - name: /dev/vg/master-data
    - read-only: True

```

(continues on next page)

- **read-ahead**: 1024

New in version 2014.7.0.

`salt.states.blockdev.formatted`(*name*, *fs\_type*='ext4', *force*=False, *\*\*kwargs*)

Manage filesystems of partitions.

**name**

The name of the block device

**fs\_type**

The filesystem it should be formatted as

**force**

Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

New in version 2016.11.0.

`salt.states.blockdev.tuned`(*name*, *\*\*kwargs*)

Manage options of block device

**name**

The name of the block device

**opts:**

- **read-ahead**  
Read-ahead buffer size
- **filesystem-read-ahead**  
Filesystem Read-ahead buffer size
- **read-only**  
Set Read-Only
- **read-write**  
Set Read-Write

## 26.19.18 salt.states.boto3\_elasticache

### Manage Elasticache with boto3

New in version 2017.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3 behind the scenes - as a result it inherits any limitations it boto3's implementation of the AWS API. It is also designed to as directly as possible leverage boto3's parameter naming and semantics. This allows one to use <http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html> as an excellent source for details too involved to reiterate here.

Note: This module is designed to be transparent ("intentionally ignorant" is the phrase I used to describe it to my boss) to new AWS / boto options - since all AWS API params are passed directly through both the state and executions modules, any new args to existing functions which become available after this documentation is written should work immediately.

Brand new API calls, of course, would still require new functions to be added :)

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information is available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elasticsearch.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticsearch.key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
region: us-east-1
```

```
Ensure myelasticsearch exists:
boto3_elasticsearch.present:
- name: myelasticsearch
- engine: redis
- cache_node_type: cache.t1.micro
- num_cache_nodes: 1
- notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

*# Using a profile from pillars*

```
Ensure myelasticsearch exists:
boto3_elasticsearch.present:
- name: myelasticsearch
- engine: redis
- cache_node_type: cache.t1.micro
- num_cache_nodes: 1
- notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
- region: us-east-1
- profile: myprofile
```

*# Passing in a profile*

```
Ensure myelasticsearch exists:
boto3_elasticsearch.present:
- name: myelasticsearch
- engine: redis
- cache_node_type: cache.t1.micro
- num_cache_nodes: 1
- notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
- region: us-east-1
- profile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

`salt.states.boto3_elasticsearch.cache_cluster_absent` (*name*, *wait=600*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *\*\*args*)

Ensure a given cache cluster is deleted.

**name**

Name of the cache cluster.

**wait**

Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**CacheClusterId**

The node group (shard) identifier. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

**FinalSnapshotIdentifier**

The user-supplied name of a final cache cluster snapshot. This is the unique name that identifies the snapshot. ElastiCache creates the snapshot, and then deletes the cache cluster immediately afterward.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.cache_cluster_present(name, wait=900, security_groups=None,
                                                    region=None, key=None, keyid=None,
                                                    profile=None, **args)
```

Ensure a given cache cluster exists.

**name**

Name of the cache cluster (cache cluster id).

**wait**

Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**security\_groups**

One or more VPC security groups (names and/or IDs) associated with the cache cluster.

---

**Note:** This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

---

**CacheClusterId**

The node group (shard) identifier. This parameter is stored as a lowercase string.

Constraints:

- A name must contain from 1 to 20 alphanumeric characters or hyphens.
- The first character must be a letter.
- A name cannot end with a hyphen or contain two consecutive hyphens.

---

**Note:** In general this parameter is not needed, as 'name' is used if it's not provided.

---

**ReplicationGroupId**

The ID of the replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster is added to the specified replication group as a read replica; otherwise, the cache cluster is a standalone primary that is not part of any replication group. If the specified replication group is Multi-AZ enabled and the Availability Zone is not specified, the cache cluster is created in Availability Zones that provide the best spread of read replicas across Availability Zones.

**AZMode**

Specifies whether the nodes in this Memcached cluster are created in a single Availability Zone or created across multiple Availability Zones in the cluster's region. If the AZMode and PreferredAvailabilityZones are not specified, ElastiCache assumes single-az mode.

---

**Note:** This parameter is ONLY supported for Memcached cache clusters.

---

**PreferredAvailabilityZone**

The EC2 Availability Zone in which the cache cluster is created. All nodes belonging to this Memcached cache cluster are placed in the preferred Availability Zone. If you want to create your nodes across multiple Availability Zones, use PreferredAvailabilityZones.

Default: System chosen Availability Zone.

**PreferredAvailabilityZones**

A list of the Availability Zones in which cache nodes are created. The order of the zones in the list is not important. The number of Availability Zones listed must equal the value of NumCacheNodes. If you want all the nodes in the same Availability Zone, use PreferredAvailabilityZone instead, or repeat the Availability Zone multiple times in the list.

Default: System chosen Availability Zones.

---

**Note:** This option is ONLY supported on Memcached.

If you are creating your cache cluster in an Amazon VPC (recommended) you can only locate nodes in Availability Zones that are associated with the subnets in the selected subnet group.

---

**NumCacheNodes**

The initial (integer) number of cache nodes that the cache cluster has.

---

**Note:** For clusters running Redis, this value must be 1.

For clusters running Memcached, this value must be between 1 and 20.

---

**CacheNodeType**

The compute and memory capacity of the nodes in the node group (shard). Valid node types (and pricing for them) are exhaustively described at <https://aws.amazon.com/elasticache/pricing/>

---

**Note:**

All T2 instances must be created in a VPC

Redis backup/restore is not supported for Redis (cluster mode disabled) T1 and T2 instances. Backup/restore is supported on Redis (cluster mode enabled) T2 instances.

Redis Append-only files (AOF) functionality is not supported for T1 or T2 instances.

---

**Engine**

The name of the cache engine to be used for this cache cluster. Valid values for this parameter are: memcached | redis

**EngineVersion**

The version number of the cache engine to be used for this cache cluster. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

---

**Note:** You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

---

**CacheParameterGroupName**

The name of the parameter group to associate with this cache cluster. If this argument is omitted, the default parameter group for the specified engine is used. You cannot use any parameter group which has cluster-enabled='yes' when creating a cluster.

**CacheSubnetGroupName**

The name of the Cache Subnet Group to be used for the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

---

**Note:** If you're going to launch your cluster in an Amazon VPC, you need to create a subnet group before you start creating a cluster.

---

**CacheSecurityGroupNames**

A list of Cache Security Group names to associate with this cache cluster. Use this parameter ONLY when you are creating a cache cluster outside of a VPC.

**SecurityGroupIds**

One or more VPC security groups associated with the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

**Tags**

A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for ElastiCache, these can only be set during resource creation - later modification is not (currently) supported.

**SnapshotArns**

A single-element string list containing an Amazon Resource Name (ARN) that uniquely identifies a Redis RDB snapshot file stored in Amazon S3. The snapshot file is used to populate the node group (shard). The Amazon S3 object name in the ARN cannot contain any commas.

---

**Note:** This parameter is ONLY valid if the Engine parameter is redis.

---

**SnapshotName**

The name of a Redis snapshot from which to restore data into the new node group (shard). The snapshot status changes to restoring while the new node group (shard) is being created.

---

**Note:** This parameter is ONLY valid if the Engine parameter is redis.

---

**PreferredMaintenanceWindow**

Specifies the weekly time range during which maintenance on the cache cluster is permitted. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat

Example: sun:23:00-mon:01:30

**Port**

The port number on which each of the cache nodes accepts connections.

Default: 6379

**NotificationTopicArn**

The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications are sent.

---

**Note:** The Amazon SNS topic owner must be the same as the cache cluster owner.

---

**AutoMinorVersionUpgrade**

This (boolean) parameter is currently disabled.

**SnapshotRetentionLimit**

The number of days for which ElastiCache retains automatic snapshots before deleting them.

Default: 0 (i.e., automatic backups are disabled for this cache cluster).

---

**Note:** This parameter is ONLY valid if the Engine parameter is redis.

---

### SnapshotWindow

The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

---

**Note:** This parameter is ONLY valid if the Engine parameter is redis.

---

### AuthToken

The password used to access a password protected server.

Password constraints:

- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: '/', '"', or '@'.

### CacheNodeIdsToRemove

A list of cache node IDs to be removed. A node ID is a numeric identifier (0001, 0002, etc.). This parameter is only valid when NumCacheNodes is less than the existing number of cache nodes. The number of cache node IDs supplied in this parameter must match the difference between the existing number of cache nodes in the cluster or pending cache nodes, whichever is greater, and the value of NumCacheNodes in the request.

### NewAvailabilityZones

The list of Availability Zones where the new Memcached cache nodes are created. This parameter is only valid when NumCacheNodes in the request is greater than the sum of the number of active cache nodes and the number of cache nodes pending creation (which may be zero). The number of Availability Zones supplied in this list must match the cache nodes being added in this request. Note: This option is only supported on Memcached clusters.

### NotificationTopicStatus

The status of the SNS notification topic. Notifications are sent only if the status is active.

Valid values: active | inactive

### region

Region to connect to.

### key

Secret key to be used.

### keyid

Access key to be used.

### profile

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto3_elasticache.cache_subnet_group_absent(name, region=None, key=None,
                                                         keyid=None, profile=None,
                                                         **args)

```

Ensure a given cache subnet group is deleted.

### name

Name of the cache subnet group.

### CacheSubnetGroupName

A name for the cache subnet group. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.cache_subnet_group_present(name, subnets=None,
                                                         region=None, key=None,
                                                         keyid=None, profile=None,
                                                         **args)
```

Ensure cache subnet group exists.

**name**

A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens.

**subnets**

A list of VPC subnets (IDs, Names, or a mix) for the cache subnet group.

**CacheSubnetGroupName**

A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

**CacheSubnetGroupDescription**

A description for the cache subnet group.

**SubnetIds**

A list of VPC subnet IDs for the cache subnet group. This is ADDITIVE with 'subnets' above.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.replication_group_absent(name, wait=600, region=None,
                                                       key=None, keyid=None,
                                                       profile=None, **args)
```

Ensure a given replication group is deleted.

**name**

Name of the replication group.

**wait**

Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**ReplicationGroupId**

The replication group identifier. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

**RetainPrimaryCluster**

If set to true, all of the read replicas are deleted, but the primary node is retained.

**FinalSnapshotIdentifier**

The name of a final node group (shard) snapshot. ElastiCache creates the snapshot from the primary

node in the cluster, rather than one of the replicas; this is to ensure that it captures the freshest data. After the final snapshot is taken, the replication group is immediately deleted.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto3_elasticache.replication_group_present(name, wait=900,
                                                       security_groups=None,
                                                       region=None, key=None,
                                                       keyid=None, profile=None,
                                                       **args)

```

Ensure a replication group exists and is in the given state.

**name**

Name of replication group

**wait**

Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**security\_groups**

One or more VPC security groups (names and/or IDs) associated with the cache cluster.

---

**Note:** This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

---

**ReplicationGroupId**

The replication group identifier. This parameter is stored as a lowercase string.

Constraints:

- A name must contain from 1 to 20 alphanumeric characters or hyphens.
- The first character must be a letter.
- A name cannot end with a hyphen or contain two consecutive hyphens.

---

**Note:** In general this parameter is not needed, as 'name' is used if it's not provided.

---

**ReplicationGroupDescription**

A user-created description for the replication group.

**PrimaryClusterId**

The identifier of the cache cluster that serves as the primary for this replication group. This cache cluster must already exist and have a status of available. This parameter is not required if NumCacheClusters, NumNodeGroups, or ReplicasPerNodeGroup is specified.

**AutomaticFailoverEnabled**

Specifies whether a read-only replica is automatically promoted to read/write primary if the existing primary fails. If true, Multi-AZ is enabled for this replication group. If false, Multi-AZ is disabled for this replication group.

Default: False

---

**Note:** AutomaticFailoverEnabled must be enabled for Redis (cluster mode enabled) replication groups.

---

ElastiCache Multi-AZ replication groups is not supported on:

- Redis versions earlier than 2.8.6.
  - Redis (cluster mode disabled): T1 and T2 node types.
  - Redis (cluster mode enabled): T2 node types.
- 

#### **NumCacheClusters**

The number of clusters this replication group initially has. This parameter is not used if there is more than one node group (shard). You should use `ReplicasPerNodeGroup` instead. If Multi-AZ is enabled, the value of this parameter must be at least 2. The maximum permitted value for `NumCacheClusters` is 6 (primary plus 5 replicas).

#### **PreferredCacheClusterAZs**

A list of EC2 Availability Zones in which the replication group's cache clusters are created. The order of the Availability Zones in the list is the order in which clusters are allocated. The primary cluster is created in the first AZ in the list. This parameter is not used if there is more than one node group (shard). You should use `NodeGroupConfiguration` instead. The number of Availability Zones listed must equal the value of `NumCacheClusters`.

Default: System chosen Availability Zones.

---

**Note:** If you are creating your replication group in an Amazon VPC (recommended), you can only locate cache clusters in Availability Zones associated with the subnets in the selected subnet group.

---

#### **NumNodeGroups**

An optional parameter that specifies the number of node groups (shards) for this Redis (cluster mode enabled) replication group. For Redis (cluster mode disabled) either omit this parameter or set it to 1.

Default: 1

#### **ReplicasPerNodeGroup**

An optional parameter that specifies the number of replica nodes in each node group (shard). Valid values are: 0 to 5

#### **NodeGroupConfiguration**

A list of node group (shard) configuration options. Each node group (shard) configuration has the following: `Slots`, `PrimaryAvailabilityZone`, `ReplicaAvailabilityZones`, `ReplicaCount`. If you're creating a Redis (cluster mode disabled) or a Redis (cluster mode enabled) replication group, you can use this parameter to configure one node group (shard) or you can omit this parameter. For fiddly details of the expected data layout of this param, see [http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create\\_replication\\_group](http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create_replication_group)

#### **CacheNodeType**

The compute and memory capacity of the nodes in the node group (shard). See <https://aws.amazon.com/elasticache/pricing/> for current sizing, prices, and constraints.

#### **Engine**

The name of the cache engine to be used for the cache clusters in this replication group.

#### **EngineVersion**

The version number of the cache engine to be used for the cache clusters in this replication group. To view the supported cache engine versions, use the `DescribeCacheEngineVersions` operation.

---

**Note:** You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

---

#### **CacheParameterGroupName**

The name of the parameter group to associate with this replication group. If this argument is omitted, the default cache parameter group for the specified engine is used.

---

**Note:** If you are running Redis version 3.2.4 or later, only one node group (shard), and want to use a default parameter group, we recommend that you specify the parameter group by name.

To create a Redis (cluster mode disabled) replication group, use `CacheParameterGroupName=default.redis3.2`

To create a Redis (cluster mode enabled) replication group, use `CacheParameterGroupName=default.redis3.2.cluster.on`

---

#### **CacheSubnetGroupName**

The name of the cache subnet group to be used for the replication group.

---

**Note:** If you're going to launch your cluster in an Amazon VPC, you need to create a `s` group before you start creating a cluster. For more information, see [Subnets and Subnet Groups](#).

---

#### **CacheSecurityGroupNames**

A list of cache security group names to associate with this replication group.

#### **SecurityGroupIds**

One or more Amazon VPC security groups associated with this replication group. Use this parameter only when you are creating a replication group in an VPC.

#### **Tags**

A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for ElastiCache, these can only be set during resource creation - later modification is not (currently) supported.

#### **SnapshotArns**

A list of ARNs that uniquely identify the Redis RDB snapshot files stored in Amazon S3. These snapshot files are used to populate the replication group. The Amazon S3 object name in the ARN cannot contain any commas. The list must match the number of node groups (shards) in the replication group, which means you cannot repartition.

---

**Note:** This parameter is only valid if the `Engine` parameter is `redis`.

---

#### **SnapshotName**

The name of a snapshot from which to restore data into the new replication group. The snapshot status changes to `restoring` while the new replication group is being created. **Note:** This parameter is only valid if the `Engine` parameter is `redis`.

#### **PreferredMaintenanceWindow**

Specifies the weekly time range during which maintenance on the cluster is performed. It is specified as a range in the format `ddd:hh24:mi-ddd:hh24:mi` (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for `ddd` are: `sun, mon, tue, wed, thu, fri, sat`

Example: `sun:23:00-mon:01:30`

#### **Port**

The port number on which each member of the replication group accepts connections.

#### **NotificationTopicArn**

The ARN of an SNS topic to which notifications are sent.

---

**Note:** The SNS topic owner must be the same as the cache cluster owner.

---

#### **AutoMinorVersionUpgrade**

This parameter is currently disabled.

#### **SnapshotRetentionLimit**

The number of days for which ElastiCache will retain automatic snapshots before deleting them.

Default: 0 (that is, automatic backups are disabled for this cache cluster).

---

**Note:** This parameter is only valid if the Engine parameter is redis.

---

#### SnapshotWindow

The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

---

**Note:** This parameter is only valid if the Engine parameter is redis.

---

#### AuthToken

The password used to access a password protected server. Password constraints:

- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: '/', '"', or '@'.

#### SnapshottingClusterId

The cache cluster ID that is used as the daily snapshot source for the replication group.

#### NotificationTopicStatus

The status of the SNS notification topic. Notifications are sent only if the status is active. Valid values: active | inactive

#### region

Region to connect to.

#### key

Secret key to be used.

#### keyid

Access key to be used.

#### profile

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 26.19.19 salt.states.boto3\_elasticsearch

### Manage Elasticsearch Service

New in version 3001.

#### configuration

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-  
amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
es.keyid: GKTADJGHEIQSXMKKRBJ08H  
es.key: askdjghsdfjkghWupUjasdflkdfkglgjsdfjajkghs
```

A region may also be specified in the configuration:

```
es.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs
  region: us-east-1
```

#### codeauthor

Herbert Buurman <herbert.buurman@ogd.nl>

#### depends

boto3

`salt.states.boto3_elasticsearch.absent` (*name*, *blocking=True*, *region=None*, *keyid=None*, *key=None*, *profile=None*)

Ensure the Elasticsearch Domain specified does not exist.

#### Parameters

- **name** (*str*) -- The name of the Elasticsearch domain to be made absent.
- **blocking** (*bool*) -- Whether or not the state should wait for the deletion to be completed. Default: True

New in version 3001.

Example:

```
Remove Elasticsearch Domain:
boto3_elasticsearch.absent:
- name: my_domain
- region: eu-west-1
```

`salt.states.boto3_elasticsearch.latest` (*name*, *minor\_only=True*, *region=None*, *keyid=None*, *key=None*, *profile=None*)

Ensures the Elasticsearch domain specifies runs on the latest compatible version of elasticsearch, upgrading it if it is not.

Note that this operation is blocking until the upgrade is complete.

#### Parameters

- **name** (*str*) -- The name of the Elasticsearch domain to upgrade.
- **minor\_only** (*bool*) -- Only upgrade to the latest minor version.

New in version 3001.

Example:

The following example will ensure the elasticsearch domain `my_domain` is upgraded to the latest minor version. So if it is currently 5.1 it will be upgraded to 5.6.

```
Upgrade Elasticsearch Domain:
boto3_elasticsearch.latest:
- name: my_domain
- minor_only: True
- region: eu-west-1
```

`salt.states.boto3_elasticsearch.present` (*name*, *elasticsearch\_version*=None, *elasticsearch\_cluster\_config*=None, *ebs\_options*=None, *access\_policies*=None, *snapshot\_options*=None, *vpc\_options*=None, *cognito\_options*=None, *encryption\_at\_rest\_options*=None, *node\_to\_node\_encryption\_options*=None, *advanced\_options*=None, *log\_publishing\_options*=None, *blocking*=True, *tags*=None, *region*=None, *keyid*=None, *key*=None, *profile*=None)

Ensure an Elasticsearch Domain exists.

#### Parameters

- **name** (*str*) -- The name of the Elasticsearch domain that you are creating. Domain names are unique across the domains owned by an account within an AWS region. Domain names must start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).
- **elasticsearch\_version** (*str*) -- String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".
- **elasticsearch\_cluster\_config** (*dict*) -- Dict specifying the configuration options for an Elasticsearch domain. Keys (case sensitive) in here are:
  - InstanceType (*str*): The instance type for an Elasticsearch cluster.
  - InstanceCount (*int*): The instance type for an Elasticsearch cluster.
  - DedicatedMasterEnabled (*bool*): Indicate whether a dedicated master node is enabled.
  - ZoneAwarenessEnabled (*bool*): Indicate whether zone awareness is enabled.
  - ZoneAwarenessConfig (*dict*): Specifies the zone awareness configuration for a domain when zone awareness is enabled. Keys (case sensitive) in here are:
    - \* AvailabilityZoneCount (*int*): An integer value to indicate the number of availability zones for a domain when zone awareness is enabled. This should be equal to number of subnets if VPC endpoints is enabled.
  - DedicatedMasterType (*str*): The instance type for a dedicated master node.
  - DedicatedMasterCount (*int*): Total number of dedicated master nodes, active and on standby, for the cluster.
- **ebs\_options** (*dict*) -- Dict specifying the options to enable or disable and specifying the type and size of EBS storage volumes. Keys (case sensitive) in here are:
  - EBSEnabled (*bool*): Specifies whether EBS-based storage is enabled.
  - VolumeType (*str*): Specifies the volume type for EBS-based storage.
  - VolumeSize (*int*): Integer to specify the size of an EBS volume.
  - Iops (*int*): Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).
- **access\_policies** (*str or dict*) -- Dict or JSON string with the IAM access policy.
- **snapshot\_options** (*dict*) -- Dict specifying the snapshot options. Keys (case sensitive) in here are:
  - AutomatedSnapshotStartHour (*int*): Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.
- **vpc\_options** (*dict*) -- Dict with the options to specify the subnets and security groups for the VPC endpoint. Keys (case sensitive) in here are:
  - SubnetIds (*list*): The list of subnets for the VPC endpoint.
  - SecurityGroupIds (*list*): The list of security groups for the VPC endpoint.
- **cognito\_options** (*dict*) -- Dict with options to specify the cognito user and identity pools for Kibana authentication. Keys (case sensitive) in here are:
  - Enabled (*bool*): Specifies the option to enable Cognito for Kibana authentication.
  - UserPoolId (*str*): Specifies the Cognito user pool ID for Kibana authentication.

- IdentityPoolId (str): Specifies the Cognito identity pool ID for Kibana authentication.
- RoleArn (str): Specifies the role ARN that provides Elasticsearch permissions for accessing Cognito resources.
- **encryption\_at\_rest\_options** (*dict*) -- Dict specifying the encryption at rest options. This option can only be used for the creation of a new Elasticsearch domain. Keys (case sensitive) in here are:
  - Enabled (bool): Specifies the option to enable Encryption At Rest.
  - KmsKeyId (str): Specifies the KMS Key ID for Encryption At Rest options.
- **node\_to\_node\_encryption\_options** (*dict*) -- Dict specifying the node to node encryption options. This option can only be used for the creation of a new Elasticsearch domain. Keys (case sensitive) in here are:
  - Enabled (bool): Specify True to enable node-to-node encryption.
- **advanced\_options** (*dict*) -- Dict with option to allow references to indices in an HTTP request body. Must be False when configuring access to individual sub-resources. By default, the value is True. See <http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createupdatedomains.html#es-createdomain-configure-advanced-options> for more information.
- **log\_publishing\_options** (*dict*) -- Dict with options for various type of logs. The keys denote the type of log file and can be one of the following:
  - INDEX\_SLOW\_LOGS
  - SEARCH\_SLOW\_LOGS
  - ES\_APPLICATION\_LOGS
 The value assigned to each key is a dict with the following case sensitive keys:
  - CloudWatchLogsLogGroupArn (str): The ARN of the Cloudwatch log group to which the log needs to be published.
  - Enabled (bool): Specifies whether given log publishing option is enabled or not.
- **blocking** (*bool*) -- Whether or not the state should wait for all operations (create/update/upgrade) to be completed. Default: True
- **tags** (*dict*) -- Dict of tags to ensure are present on the Elasticsearch domain.

New in version 3001.

Example:

This will create an elasticsearch domain consisting of a single t2.small instance in the eu-west-1 region (Ireland) and will wait until the instance is available before returning from the state.

```

Create new domain:
boto3_elasticsearch.present:
- name: my_domain
- elasticsearch_version: '5.1'
- elasticsearch_cluster_config:
  InstanceType: t2.small.elasticsearch
  InstanceCount: 1
  DedicatedMasterEnabled: False
  ZoneAwarenessEnabled: False
- ebs_options:
  EBSEnabled: True
  VolumeType: gp2
  VolumeSize: 10
- snapshot_options:
  AutomatedSnapshotStartHour: 3
- vpc_options:

```

(continues on next page)

(continued from previous page)

```

SubnetIds:
- subnet-12345678
SecurityGroupIds:
- sg-12345678
- node_to_node_encryption_options:
  Enabled: False
- region: eu-west-1
- tags:
  foo: bar
  baz: qux

```

`salt.states.boto3_elasticsearch.tagged`(*name*, *tags=None*, *replace=False*, *region=None*, *keyid=None*, *key=None*, *profile=None*)

Ensures the Elasticsearch domain has the tags provided. Adds tags to the domain unless `replace` is set to `True`, in which case all existing tags will be replaced with the tags provided in `tags`. (This will remove all tags if `replace` is `True` and `tags` is empty).

#### Parameters

- **name** (*str*) -- The Elasticsearch domain to work with.
- **tags** (*dict*) -- The tags to add to/replace on the Elasticsearch domain.
- **replace** (*bool*) -- Whether or not to replace (`True`) all existing tags on the Elasticsearch domain, or add (`False`) tags to the ES domain.

New in version 3001.

`salt.states.boto3_elasticsearch.upgraded`(*name*, *elasticsearch\_version*, *blocking=True*, *region=None*, *keyid=None*, *key=None*, *profile=None*)

Ensures the Elasticsearch domain specified runs on the specified version of elasticsearch. Only upgrades are possible as downgrades require a manual snapshot and an S3 bucket to store them in.

Note that this operation is blocking until the upgrade is complete.

#### Parameters

- **name** (*str*) -- The name of the Elasticsearch domain to upgrade.
- **elasticsearch\_version** (*str*) -- String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".

New in version 3001.

Example:

```

Upgrade Elasticsearch Domain:
boto3_elasticsearch.upgraded:
- name: my_domain
- elasticsearch_version: '7.2'
- region: eu-west-1

```

## 26.19.20 salt.states.boto3\_route53

Manage Route53 records with Boto 3

New in version 2017.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
region: us-east-1
```

### An exciting new AWS Route 53 Hosted Zone:

#### **boto\_route53.hosted\_zone\_present:**

- **Name:** example.com.
- **PrivateZone:** true
- **VPCs:**
  - **VPCName:** MyLittleVPC
  - **VPCRegion:** us-east-1
  - **VPCId:** vpc-12345678
- **region:** us-east-1
- **keyid:** GKTADJGHEIQSXMKKRBJ08H
- **key:** askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs

#### **mycnamerecord:**

##### **boto\_route53.rr\_present:**

- **Name:** test.example.com.
- **ResourceRecords:**
  - my-elb.us-east-1.elb.amazonaws.com.
- **DomainName:** example.com.
- **TTL:** 60
- **Type:** CNAME
- **region:** us-east-1
- **keyid:** GKTADJGHEIQSXMKKRBJ08H
- **key:** askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs

`salt.states.boto3_route53.hosted_zone_absent` (*name*, *Name=None*, *PrivateZone=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the Route53 Hostes Zone described is absent

**name**

The name of the state definition.

**Name**

The name of the domain. This should be a fully-specified domain, and should terminate with a period. If not provided, the value of name will be used.

**PrivateZone**

Set True if deleting a private hosted zone.

```
salt.states.boto3_route53.hosted_zone_present(name, Name=None, PrivateZone=False,  
                                              CallerReference=None, Comment=None,  
                                              VPCs=None, region=None, key=None,  
                                              keyid=None, profile=None)
```

Ensure a hosted zone exists with the given attributes.

**name**

The name of the state definition.

**Name**

The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. If not provided, the value of name will be used.

**PrivateZone**

Set True if creating a private hosted zone. If true, then 'VPCs' is also required.

**Comment**

Any comments you want to include about the hosted zone.

**CallerReference**

A unique string that identifies the request and that allows create\_hosted\_zone() calls to be retried without the risk of executing the operation twice. This helps ensure idempotency across state calls, but can cause issues if a zone is deleted and then an attempt is made to recreate it with the same CallerReference. If not provided, a unique UUID will be generated at each state run, which can potentially lead to duplicate zones being created if the state is run again while the previous zone creation is still in PENDING status (which can occasionally take several minutes to clear). Maximum length of 128.

**VPCs**

A list of dicts, each dict composed of a VPCRegion, and either a VPCId or a VPCName. Note that this param is ONLY used if PrivateZone == True

**VPCId**

When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.

**VPCName**

When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.

**VPCRegion**

When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. This will fail if a given VPCName exists in multiple regions visible to the bound account, in which case you'll need to provide an explicit value for VPCRegion.

```
salt.states.boto3_route53.rr_absent(name, HostedZoneId=None, DomainName=None,  
                                   PrivateZone=False, Name=None, Type=None,  
                                   SetIdentifier=None, region=None, key=None, keyid=None,  
                                   profile=None)
```

Ensure the Route53 record is deleted.

**name**

The name of the state definition. This will be used for Name if the latter is not provided.

**HostedZoneId**

The ID of the zone to delete the record from. Exclusive with DomainName.

**DomainName**

The domain name of the zone to delete the record from. Exclusive with HostedZoneId.

**PrivateZone**

Set to True if the RR to be removed is in a private zone, False if public.

**Name**

Name of the resource record.

**Type**

The record type (A, NS, MX, TXT, etc.)

**SetIdentifier**

Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type.

The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.

**region**

The region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

```

salt.states.boto3_route53.rr_present (name, HostedZoneId=None, DomainName=None,
                                     PrivateZone=False, Name=None, Type=None,
                                     SetIdentifier=None, Weight=None, Region=None,
                                     GeoLocation=None, Failover=None, TTL=None,
                                     ResourceRecords=None, AliasTarget=None,
                                     HealthCheckId=None, TrafficPolicyInstanceId=None,
                                     region=None, key=None, keyid=None, profile=None)

```

Ensure the Route53 record is present.

**name**

The name of the state definition. This will be used for Name if the latter is not provided.

**HostedZoneId**

The ID of a zone to create the record in. Exclusive with DomainName.

**DomainName**

The domain name of a zone to create the record in. Exclusive with HostedZoneId.

**PrivateZone**

Set to True if the resource record should be in a private zone, False if public.

**Name**

Name of the Route 53 resource record being managed.

**Type**

The record type (A, NS, MX, TXT, etc.)

**SetIdentifier**

Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type.

The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.

**Weight**

Valid for Weighted resource record sets only. Among resource record sets that have the same combination of DNS name and type, a value that determines the proportion of DNS queries that Amazon Route 53 responds to using the current resource record set. Amazon Route 53 calculates the sum of the weights for the resource record sets that have the same combination of DNS name and type. Amazon Route 53 then responds to queries based on the ratio of a resource's weight to the total.

Note the following:

- You must specify a value for the Weight element for every weighted resource record set.
- You can only specify one ResourceRecord per weighted resource record set.
- You can't create latency, failover, or geolocation resource record sets that have the same values for the Name and Type elements as weighted resource record sets.
- You can create a maximum of 100 weighted resource record sets that have the same values for the Name and Type elements.
- For weighted (but not weighted alias) resource record sets, if you set Weight to 0 for a resource record set, Amazon Route 53 never responds to queries with the applicable value for that resource record set. However, if you set Weight to 0 for all resource record sets that have the same combination of DNS name and type, traffic is routed to all resources with equal probability. The effect of setting Weight to 0 is different when you associate health checks with weighted resource record sets. For more information, see [Options for Configuring Amazon Route 53 Active-Active and Active-Passive Failover](#) in the Amazon Route 53 Developer Guide.

### Region

Valid for Latency-based resource record sets only. The Amazon EC2 Region where the resource that is specified in this resource record set resides. The resource typically is an AWS resource, such as an EC2 instance or an ELB load balancer, and is referred to by an IP address or a DNS domain name, depending on the record type.

### GeoLocation

Geo location resource record sets only. A dict that lets you control how Route 53 responds to DNS queries based on the geographic origin of the query. For example, if you want all queries from Africa to be routed to a web server with an IP address of 192.0.2.111, create a resource record set with a Type of A and a ContinentCode of AF.

```
ContinentCode
    The two-letter code for the continent.
    Valid values: AF | AN | AS | EU | OC | NA | SA
    Constraint: Specifying ContinentCode with either CountryCode or
↳SubdivisionCode
                returns an InvalidInput error.

CountryCode
    The two-letter code for the country.

SubdivisionCode
    The code for the subdivision, for example, a state in the United
↳States or a
    province in Canada.
```

### Notes

- Creating geolocation and geolocation alias resource record sets in private hosted zones is not supported.
- If you create separate resource record sets for overlapping geographic regions (for example, one resource record set for a continent and one for a country on the same continent), priority goes to the smallest geographic region. This allows you to route most queries for a continent to one resource and to route queries for a country on that continent to a different resource.
- You can't create two geolocation resource record sets that specify the same geographic location.
- The value \* in the CountryCode element matches all geographic locations that aren't specified in other geolocation resource record sets that have the same values for the Name and Type elements.
- Geolocation works by mapping IP addresses to locations. However, some IP addresses aren't mapped to geographic locations, so even if you create geolocation resource record sets that cover all seven continents, Amazon Route 53 will receive some DNS queries from locations that it can't identify. We recommend that you create a resource record set for which the value of CountryCode is \*, which handles both queries that come from locations for which you haven't created geolocation resource record sets and queries from IP addresses that aren't mapped to a location. If you

don't create a \* resource record set, Amazon Route 53 returns a "no answer" response for queries from those locations.

- You can't create non-geolocation resource record sets that have the same values for the Name and Type elements as geolocation resource record sets.

## TTL

The resource record cache time to live (TTL), in seconds. Note the following:

- If you're creating an alias resource record set, omit TTL. Amazon Route 53 uses the value of TTL for the alias target.
- If you're associating this resource record set with a health check (if you're adding a HealthCheckId element), we recommend that you specify a TTL of 60 seconds or less so clients respond quickly to changes in health status.
- All of the resource record sets in a group of weighted, latency, geolocation, or failover resource record sets must have the same value for TTL.
- If a group of weighted resource record sets includes one or more weighted alias resource record sets for which the alias target is an ELB load balancer, we recommend that you specify a TTL of 60 seconds for all of the non-alias weighted resource record sets that have the same name and type. Values other than 60 seconds (the TTL for load balancers) will change the effect of the values that you specify for Weight.

## ResourceRecords

A list, containing one or more values for the resource record. No single value can exceed 4,000 characters. For details on how to format values for different record types, see [Supported DNS Resource Record Types](#) in the Amazon Route 53 Developer Guide.

Note: You can specify more than one value for all record types except CNAME and SOA.

It is also possible to pass "magic" strings as resource record values. This functionality can easily be extended, but for the moment supports the following:

```
'magic:ec2_instance_tag:some_tag_name:some_string:some_instance_attr'
```

This tells salt to lookup an EC2 instance with a tag 'some\_tag\_name' which has the value 'some\_string' and substitute the 'some\_instance\_attr' attribute of that instance as the resource record value being evaluated.

This should work generally for any EC2 instance tags, as long as the instance attribute being fetched is available to `getattr(instance, 'attribute')` as seen in the code below. Anything else will most likely require this function to be extended to handle it.

The canonical use-case for this (at least at our site) is to query the Name tag (which we always populate with the host's FQDN) to lookup the public or private IPs bound to the instance, so we can then automatically create Route 53 records for them.

## AliasTarget

The rules governing how to define an AliasTarget for the various supported use-cases are obtuse beyond reason and attempting to paraphrase them (or even worse, cut-and-paste them in their entirety) would be silly and counterproductive. If you need this feature, then Read The Fine Materials at the [Boto 3 Route 53 page](#) and/or the [AWS Route 53 docs](#) and suss them for yourself - I sure won't claim to understand them particularly well.

## region

The region to connect to.

## key

Secret key to be used.

## keyid

Access key to be used.

## profile

Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

## 26.19.21 salt.states.boto3\_sns

### Manage SNS Topics

Create and destroy SNS topics. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsd fjkg hWupUjasdf lkd fklgjsdfjajkg h s
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsd fjkg hWupUjasdf lkd fklgjsdfjajkg h s
  region: us-east-1
```

```
mytopic:
  boto3_sns.topic_present:
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsd fjkg hWupUjasdf lkd fklgjsdfjajkg h s
```

### Using a profile from pillars

```
mytopic:
  boto3_sns.topic_present:
    - region: us-east-1
    - profile: mysnsprofile
```

### Passing in a profile

```
mytopic:
  boto3_sns.topic_present:
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsd fjkg hWupUjasdf lkd fklgjsdfjajkg h s
```

`salt.states.boto3_sns.topic_absent` (*name*, *unsubscribe=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named sns topic is deleted.

**name**

Name of the SNS topic.

**unsubscribe**

If True, unsubscribe all subscriptions to the SNS topic before deleting the SNS topic

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto3_sns.topic_present` (*name, subscriptions=None, attributes=None, region=None, key=None, keyid=None, profile=None*)

Ensure the SNS topic exists.

**name**

Name of the SNS topic.

**subscriptions**

List of SNS subscriptions.

Each subscription is a dictionary with a protocol and endpoint key:

```
subscriptions:
- Protocol: https
  Endpoint: https://www.example.com/sns-endpoint
- Protocol: sqs
  Endpoint: arn:aws:sqs:us-west-2:123456789012:MyQueue
```

**attributes**

Dictionary of attributes to set on the SNS topic Valid attribute keys are:

- **Policy:** the JSON serialization of the topic's access control policy
- **DisplayName:** the human-readable name used in the "From" field for notifications to email and email-json endpoints
- **DeliveryPolicy:** the JSON serialization of the topic's delivery policy

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 26.19.22 salt.states.boto\_apigateway

### Manage Apigateway Rest APIs

New in version 2016.11.0.

**depends**

- boto >= 2.8.0
- boto3 >= 1.2.1
- botocore >= 1.4.49

Create and destroy rest apis depending on a swagger version 2 definition file. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
region: us-east-1
```

```
Ensure Apigateway API exists:
boto_apigateway.present:
- name: myfunction
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

```
salt.states.boto_apigateway.absent(name, api_name, stage_name, nuke_api=False, region=None,
                                     key=None, keyid=None, profile=None)
```

Ensure the stage\_name associated with the given api\_name deployed by boto\_apigateway's present state is removed. If the currently associated deployment to the given stage\_name has no other stages associated with it, the deployment will also be removed.

**name**

Name of the swagger file in YAML format

**api\_name**

Name of the rest api on AWS ApiGateway to ensure is absent.

**stage\_name**

Name of the stage to be removed irrespective of the swagger file content. If the current deployment associated with the stage\_name has no other stages associated with it, the deployment will also be removed.

**nuke\_api**

If True, removes the API itself only if there are no other stages associated with any other deployments once the given stage\_name is removed.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_apigateway.present(name, api_name, swagger_file, stage_name, api_key_required,
                                   lambda_integration_role, lambda_region=None,
                                   stage_variables=None, region=None, key=None, keyid=None,
                                   profile=None,
                                   lambda_funcname_format='{stage}_{api}_{resource}_{method}',
                                   authorization_type='NONE', error_response_template=None,
                                   response_template=None)
```

Ensure the specified `api_name` with the corresponding swaggerfile is deployed to the given `stage_name` in AWS ApiGateway.

this state currently only supports ApiGateway integration with AWS Lambda, and CORS support is handled through a Mock integration.

There may be multiple deployments for the API object, each deployment is tagged with a description (i.e. unique label) in pretty printed json format consisting of the following key/values.

```
{
  "api_name": api_name,
  "swagger_file": basename_of_swagger_file
  "swagger_file_md5sum": md5sum_of_swagger_file,
  "swagger_info_object": info_object_content_in_swagger_file
}
```

Please note that the name of the lambda function to be integrated will be derived via the provided `lambda_funcname_format` parameters:

- the default `lambda_funcname_format` is a string with the following substitutable keys: `"{stage}_{api}_{resource}_{method}"`. The user can choose to reorder the known keys.
- the stage key corresponds to the `stage_name` passed in.
- the api key corresponds to the `api_name` passed in.
- the resource corresponds to the resource path defined in the passed swagger file.
- the method corresponds to the method for a resource path defined in the passed swagger file.

For the default `lambda_funcname_format`, given the following input:

```
api_name = ' Test Service'
stage_name = 'alpha'
basePath = '/api'
path = '/a/{b}/c'
method = 'POST'
```

We will end up with the following Lambda Function Name that will be looked up: `'test_service_alpha_a_b_c_post'`

The canonicalization of these input parameters is done in the following order:

1. `lambda_funcname_format` is formatted with the input parameters as passed,
2. resulting string is stripped for leading/trailing spaces,
3. path parameter's curly braces are removed from the resource path,
4. consecutive spaces and forward slashes in the paths are replaced with `'_'`
5. consecutive `'_'` are replaced with `'_'`

Please note that for error response handling, the swagger file must have an error response model with the following schema. The lambda functions should throw exceptions for any non successful responses. An optional pattern field can be specified in `errorMessage` field to aid the response mapping from Lambda to the proper error return status codes.

```
Error:
  type: object
```

(continues on next page)

(continued from previous page)

```

properties:
  stackTrace:
    type: array
    items:
      type: array
      items:
        type: string
      description: call stack
  errorType:
    type: string
    description: error type
  errorMessage:
    type: string
    description: |
      Error message, will be matched based on pattern.
      If no pattern is specified, the default pattern used for response
      ↪mapping will be +*.

```

**name**

The name of the state definition

**api\_name**

The name of the rest api that we want to ensure exists in AWS API Gateway

**swagger\_file**

Name of the location of the swagger rest api definition file in YAML format.

**stage\_name**

Name of the stage we want to be associated with the given `api_name` and `swagger_file` definition

**api\_key\_required**

True or False - whether the API Key is required to call API methods

**lambda\_integration\_role**

The name or ARN of the IAM role that the AWS ApiGateway assumes when it executes your lambda function to handle incoming requests

**lambda\_region**

The region where we expect to find the lambda functions. This is used to determine the region where we should look for the Lambda Function for integration purposes. The region determination is based on the following priority:

1. `lambda_region` as passed in (is not None)
2. if `lambda_region` is None, use the region as if a `boto_lambda` function were executed without explicitly specifying lambda region.
3. if region determined in (2) is different than the region used by `boto_apigateway` functions, a final lookup will be attempted using the `boto_apigateway` region.

**stage\_variables**

A dict with variables and their values, or a pillar key (string) that contains a dict with variables and their values. key and values in the dict must be strings. `{'string': 'string'}`

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**lambda\_funcname\_format**

Please review the earlier example for the usage. The only substituable keys in the funcname format are

{stage}, {api}, {resource}, {method}. Any other keys or positional substitution parameters will be flagged as an invalid input.

#### authorization\_type

This field can be either 'NONE', or 'AWS\_IAM'. This will be applied to all methods in the given swagger spec file. Default is set to 'NONE'

#### error\_response\_template

String value that defines the response template mapping that should be applied in cases error occurs. Refer to AWS documentation for details: <http://docs.aws.amazon.com/apigateway/latest/developerguide/api-gateway-mapping-template-reference.html>

If set to None, the following default value is used:

```
'#set($inputRoot = $input.path('$'))\n'
'{\n'
'  "errorMessage" : "$inputRoot.errorMessage",\n'
'  "errorType" : "$inputRoot.errorType",\n'
'  "stackTrace" : [\n'
'#foreach($stackTrace in $inputRoot.stackTrace)\n'
'    [\n'
'#foreach($elem in $stackTrace)\n'
'      "$elem"\n'
'#if($foreach.hasNext),#end\n'
'#end\n'
'    ]\n'
'#if($foreach.hasNext),#end\n'
'#end\n'
'  ]\n'
```

New in version 2017.7.0.

#### response\_template

String value that defines the response template mapping applied in case of success (including OPTIONS method) If set to None, empty ({} ) template is assumed, which will transfer response from the lambda function as is.

New in version 2017.7.0.

`salt.states.boto_apigateway.usage_plan_absent` (*name, plan\_name, region=None, key=None, keyid=None, profile=None*)

Ensures usage plan identified by name is no longer present

New in version 2017.7.0.

#### name

name of the state

#### plan\_name

name of the plan to remove

#### usage plan absent:

##### boto\_apigateway.usage\_plan\_absent:

- **plan\_name:** my\_usage\_plan
- **profile:** my\_profile

`salt.states.boto_apigateway.usage_plan_association_absent` (*name, plan\_name, api\_stages, region=None, key=None, keyid=None, profile=None*)

Ensures usage plan identified by name is removed from provided api\_stages If a plan is associated to stages not listed in api\_stages parameter, those associations remain intact.

New in version 2017.7.0.

**name**  
name of the state

**plan\_name**  
name of the plan to use

**api\_stages**  
list of dictionaries, where each dictionary consists of the following keys:

**apiId**  
apiId of the api to detach usage plan from

**stage**  
stage name of the api to detach usage plan from

```
UsagePlanAssociationAbsent:
boto_apigateway.usage_plan_association_absent:
- plan_name: my_plan
- api_stages:
  - apiId: 9kb0404ec0
    stage: my_stage
  - apiId: l9v7o2aj90
    stage: my_stage
- profile: my_profile
```

`salt.states.boto_apigateway.usage_plan_association_present` (*name, plan\_name, api\_stages, region=None, key=None, keyid=None, profile=None*)

Ensures usage plan identified by name is added to provided api\_stages

New in version 2017.7.0.

**name**  
name of the state

**plan\_name**  
name of the plan to use

**api\_stages**  
list of dictionaries, where each dictionary consists of the following keys:

**apiId**  
apiId of the api to attach usage plan to

**stage**  
stage name of the api to attach usage plan to

```
UsagePlanAssociationPresent:
boto_apigateway.usage_plan_association_present:
- plan_name: my_plan
- api_stages:
  - apiId: 9kb0404ec0
    stage: my_stage
  - apiId: l9v7o2aj90
    stage: my_stage
- profile: my_profile
```

`salt.states.boto_apigateway.usage_plan_present` (*name, plan\_name, description=None, throttle=None, quota=None, region=None, key=None, keyid=None, profile=None*)

Ensure the specified usage plan with the corresponding metrics is deployed

New in version 2017.7.0.

**name**  
name of the state

**plan\_name**  
[Required] name of the usage plan

**throttle**  
[Optional] throttling parameters expressed as a dictionary. If provided, at least one of the throttling parameters must be present

**rateLimit**  
rate per second at which capacity bucket is populated

**burstLimit**  
maximum rate allowed

**quota**  
[Optional] quota on the number of api calls permitted by the plan. If provided, limit and period must be present

**limit**  
[Required] number of calls permitted per quota period

**offset**  
[Optional] number of calls to be subtracted from the limit at the beginning of the period

**period**  
[Required] period to which quota applies. Must be DAY, WEEK or MONTH

```
UsagePlanPresent:
  boto_apigateway.usage_plan_present:
    - plan_name: my_usage_plan
    - throttle:
      rateLimit: 70
      burstLimit: 100
    - quota:
      limit: 1000
      offset: 0
      period: DAY
    - profile: my_profile
```

### 26.19.23 salt.states.boto\_asg

#### Manage Autoscale Groups

New in version 2014.7.0.

Create and destroy autoscale groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsd fjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsd fjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure myasg exists:
boto_asg.present:
- name: myasg
- launch_config_name: mylc
- availability_zones:
  - us-east-1a
  - us-east-1b
- min_size: 1
- max_size: 1
- desired_capacity: 1
- load_balancers:
  - myelb
- suspended_processes:
  - AddToLoadBalancer
  - AlarmNotification
- scaling_policies:
  - adjustment_type: ChangeInCapacity
  - as_name: api-production-iad
  - cooldown: 1800
  - min_adjustment_step: None
  - name: ScaleDown
  - scaling_adjustment: -1
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsd fjkghWupUjasdflkdfklgjsdfjajkghs
```

*# Using a profile from pillars.*

```
Ensure myasg exists:
boto_asg.present:
- name: myasg
- launch_config_name: mylc
- availability_zones:
  - us-east-1a
  - us-east-1b
- min_size: 1
- max_size: 1
- desired_capacity: 1
- load_balancers:
  - myelb
- profile: myprofile
```

*# Passing in a profile.*

(continues on next page)

(continued from previous page)

```

Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkdfklgsdfjajkghs
      region: us-east-1

# Deleting an autoscale group with running instances.
Ensure myasg is deleted:
  boto_asg.absent:
    - name: myasg
    # If instances exist, we must force the deletion of the asg.
    - force: True

```

It's possible to specify cloudwatch alarms that will be setup along with the ASG. Note the alarm name will be the name attribute defined, plus the ASG resource name.

```

Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile: myprofile
    - alarms:
      CPU:
        name: 'ASG CPU **MANAGED BY SALT**'
        attributes:
          metric: CPUUtilization
          namespace: AWS/EC2
          statistic: Average
          comparison: '>='
          threshold: 65.0
          period: 60
          evaluation_periods: 30
          unit: null

```

(continues on next page)

(continued from previous page)

```

description: 'ASG CPU'
alarm_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
insufficient_data_actions: []
ok_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]

```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto\_asg\_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for an ASG resource.

Setting the alarms in a pillar:

```

my_asg_alarm:
  CPU:
    name: 'ASG CPU **MANAGED BY SALT**'
    attributes:
      metric: CPUUtilization
      namespace: AWS/EC2
      statistic: Average
      comparison: '>='
      threshold: 65.0
      period: 60
      evaluation_periods: 30
      unit: null
    description: 'ASG CPU'
    alarm_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
    insufficient_data_actions: []
    ok_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]

```

Overriding the alarm values on the resource:

```

Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile: myprofile
    - alarms_from_pillar: my_asg_alarm
    # override CPU:attributes:threshold
    - alarms:
      CPU:
        attributes:
          threshold: 50.0

```

`salt.states.boto_asg.absent` (*name, force=False, region=None, key=None, keyid=None, profile=None, remove\_lc=False*)

Ensure the named autoscale group is deleted.

- name**  
Name of the autoscale group.
- force**  
Force deletion of autoscale group.
- remove\_lc**  
Delete the launch config as well.
- region**  
The region to connect to.
- key**  
Secret key to be used.
- keyid**  
Access key to be used.
- profile**  
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_asg.present(name, launch_config_name, availability_zones, min_size, max_size,
                             launch_config=None, desired_capacity=None, load_balancers=None,
                             default_cooldown=None, health_check_type=None,
                             health_check_period=None, placement_group=None,
                             vpc_zone_identifier=None, subnet_names=None, tags=None,
                             termination_policies=None,
                             termination_policies_from_pillar='boto_asg_termination_policies',
                             suspended_processes=None, scaling_policies=None,
                             scaling_policies_from_pillar='boto_asg_scaling_policies',
                             scheduled_actions=None,
                             scheduled_actions_from_pillar='boto_asg_scheduled_actions',
                             alarms=None, alarms_from_pillar='boto_asg_alarms', region=None,
                             key=None, keyid=None, profile=None, notification_arn=None,
                             notification_arn_from_pillar='boto_asg_notification_arn',
                             notification_types=None,
                             notification_types_from_pillar='boto_asg_notification_types')

```

Ensure the autoscale group exists.

- name**  
Name of the autoscale group.
- launch\_config\_name**  
Name of the launch config to use for the group. Or, if `launch_config` is specified, this will be the launch config name's prefix. (see below)
- launch\_config**  
A dictionary of launch config attributes. If specified, a launch config will be used or created, matching this set of attributes, and the autoscale group will be set to use that launch config. The launch config name will be the `launch_config_name` followed by a hyphen followed by a hash of the `launch_config` dict contents. Example:

```

my_asg:
  boto_asg.present:
    - launch_config:
      - ebs_optimized: false
      - instance_profile_name: my_iam_profile
      - kernel_id: ''
      - ramdisk_id: ''
      - key_name: my_ssh_key
      - image_name: aws2015091-hvm
      - instance_type: c3.xlarge
      - instance_monitoring: false

```

(continues on next page)

(continued from previous page)

- ```

- security_groups:
  - my_sec_group_01
  - my_sec_group_02

```

**availability\_zones**

List of availability zones for the group.

**min\_size**

Minimum size of the group.

**max\_size**

Maximum size of the group.

**desired\_capacity**

The desired capacity of the group.

**load\_balancers**

List of load balancers for the group. Once set this can not be updated (Amazon restriction).

**default\_cooldown**

Number of seconds after a Scaling Activity completes before any further scaling activities can start.

**health\_check\_type**

The service you want the health status from, Amazon EC2 or Elastic Load Balancer (EC2 or ELB).

**health\_check\_period**

Length of time in seconds after a new EC2 instance comes into service that Auto Scaling starts checking its health.

**placement\_group**

Physical location of your cluster placement group created in Amazon EC2. Once set this can not be updated (Amazon restriction).

**vpc\_zone\_identifier**

A list of the subnet identifiers of the Virtual Private Cloud.

**subnet\_names**

For VPC, a list of subnet names (NOT subnet IDs) to deploy into. Exclusive with `vpc_zone_identifier`.

**tags**

A list of tags. Example:

- ```

- key: 'key'
  value: 'value'
  propagate_at_launch: true

```

**termination\_policies**

A list of termination policies. Valid values are:

- OldestInstance
- NewestInstance
- OldestLaunchConfiguration
- ClosestToNextInstanceHour
- Default

If no value is specified, the Default value is used.

**termination\_policies\_from\_pillar:**

name of pillar dict that contains termination policy settings. Termination policies defined for this specific state will override those from pillar.

**suspended\_processes**

List of processes to be suspended. see [http://docs.aws.amazon.com/AutoScaling/latest/DeveloperGuide/US\\_SuspendResume.html](http://docs.aws.amazon.com/AutoScaling/latest/DeveloperGuide/US_SuspendResume.html)

**scaling\_policies**

List of scaling policies. Each policy is a dict of key-values described by <https://boto.readthedocs.io/en/latest/ref/autoscale.html#boto.ec2.autoscale.policy.ScalingPolicy>

**scaling\_policies\_from\_pillar:**

name of pillar dict that contains scaling policy settings. Scaling policies defined for this specific state

will override those from pillar.

**scheduled\_actions:**

a dictionary of scheduled actions. Each key is the name of scheduled action and each value is dictionary of options. For example:

```
- scheduled_actions:
  scale_up_at_10:
    desired_capacity: 4
    min_size: 3
    max_size: 5
    recurrence: "0 9 * * 1-5"
  scale_down_at_7:
    desired_capacity: 1
    min_size: 1
    max_size: 1
    recurrence: "0 19 * * 1-5"
```

**scheduled\_actions\_from\_pillar:**

name of pillar dict that contains `scheduled_actions` settings. Scheduled actions for this specific state will override those from pillar.

**alarms:**

a dictionary of name->boto\_cloudwatch\_alarm sections to be associated with this ASG. All attributes should be specified except for dimension which will be automatically set to this ASG.

See the `salt.states.boto_cloudwatch_alarm` state for information about these attributes.

If any alarm actions include `:self:` this will be replaced with the asg name. For example, alarm\_actions reading `"[scaling_policy:self:ScaleUp]"` will map to the arn for this asg's scaling policy named `"ScaleUp"`. In addition, any alarms that have only `scaling_policy` as actions will be ignored if `min_size` is equal to `max_size` for this ASG.

**alarms\_from\_pillar:**

name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

**region**

The region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**notification\_arn**

The AWS arn that notifications will be sent to

**notification\_arn\_from\_pillar**

name of the pillar dict that contains `notification_arn` settings. A `notification_arn` defined for this specific state will override the one from pillar.

**notification\_types**

A list of event names that will trigger a notification. The list of valid notification types is:

- `autoscaling:EC2_INSTANCE_LAUNCH`
- `autoscaling:EC2_INSTANCE_LAUNCH_ERROR`
- `autoscaling:EC2_INSTANCE_TERMINATE`
- `autoscaling:EC2_INSTANCE_TERMINATE_ERROR`
- `autoscaling:TEST_NOTIFICATION`

**notification\_types\_from\_pillar**

name of the pillar dict that contains `notification_types` settings. `notification_types` defined for this specific state will override those from the pillar.

## 26.19.24 salt.states.boto\_cfn

Connection module for Amazon Cloud Formation

New in version 2015.8.0.

### depends

boto

### configuration

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at <http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkghs
```

```
stack-present:
  boto_cfn.present:
    - name: mystack
    - template_body: salt://base/mytemplate.json
    - disable_rollback: true
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'fdkjsafkljsASSADfalkfjasdf'
```

```
stack-absent:
  boto_cfn.absent:
    - name: mystack
```

`salt.states.boto_cfn.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure cloud formation stack is absent.

*name* (string) - The name of the stack to delete.

*region* (string) - Region to connect to.

*key* (string) - Secret key to be used.

*keyid* (string) - Access key to be used.

*profile* (dict) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cfn.present` (*name*, *template\_body=None*, *template\_url=None*, *parameters=None*, *notification\_arns=None*, *disable\_rollback=None*, *timeout\_in\_minutes=None*, *capabilities=None*, *tags=None*, *on\_failure=None*, *stack\_policy\_body=None*, *stack\_policy\_url=None*, *use\_previous\_template=None*, *stack\_policy\_during\_update\_body=None*, *stack\_policy\_during\_update\_url=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure cloud formation stack is present.

*name* (string) - Name of the stack.

*template\_body* (string) - Structure containing the template body. Can also be loaded from a file by using salt://.

`template_url` (string) – Location of file containing the template body. The URL must point to a template located in an S3 bucket in the same region as the stack.

`parameters` (list) – A list of key/value tuples that specify input parameters for the stack. A 3-tuple (key, value, bool) may be used to specify the `UsePreviousValue` option.

`notification_arns` (list) – The Simple Notification Service (SNS) topic ARNs to publish stack related events. You can find your SNS topic ARNs using the `SNS_console` or your Command Line Interface (CLI).

`disable_rollback` (bool) – Indicates whether or not to rollback on failure.

`timeout_in_minutes` (integer) – The amount of time that can pass before the stack status becomes `CREATE_FAILED`; if `DisableRollback` is not set or is set to `False`, the stack will be rolled back.

`capabilities` (list) – The list of capabilities you want to allow in the stack. Currently, the only valid capability is `'CAPABILITY_IAM'`.

`tags` (dict) – A set of user-defined Tags to associate with this stack, represented by key/value pairs. Tags defined for the stack are propagated to EC2 resources that are created as part of the stack. A maximum number of 10 tags can be specified.

`on_failure` (string) – Determines what action will be taken if stack creation fails. This must be one of: `DO_NOTHING`, `ROLLBACK`, or `DELETE`. You can specify either `OnFailure` or `DisableRollback`, but not both.

`stack_policy_body` (string) – Structure containing the stack policy body. Can also be loaded from a file by using `salt://`.

`stack_policy_url` (string) – Location of a file containing the stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass `StackPolicyBody` and `StackPolicyURL`, only `StackPolicyBody` is used.

`use_previous_template` (boolean) – Used only when templates are not the same. Set to `True` to use the previous template instead of uploading a new one via `TemplateBody` or `TemplateURL`.

`stack_policy_during_update_body` (string) – Used only when templates are not the same. Structure containing the temporary overriding stack policy body. If you pass `StackPolicyDuringUpdateBody` and `StackPolicyDuringUpdateURL`, only `StackPolicyDuringUpdateBody` is used. Can also be loaded from a file by using `salt://`.

`stack_policy_during_update_url` (string) – Used only when templates are not the same. Location of a file containing the temporary overriding stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass `StackPolicyDuringUpdateBody` and `StackPolicyDuringUpdateURL`, only `StackPolicyDuringUpdateBody` is used.

`region` (string) - Region to connect to.

`key` (string) - Secret key to be used.

`keyid` (string) - Access key to be used.

`profile` (dict) - A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

## 26.19.25 salt.states.boto\_cloudfront

Manage CloudFront distributions

New in version 2018.3.0.

Create, update and destroy CloudFront distributions.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them, either in a pillar file or in the minion's config file:

```
cloudfront.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudfront.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid, and region via a profile, either passed in as a dict, or a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
  region: us-east-1
```

```
aws:
  region:
    us-east-1:
      profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
        region: us-east-1
```

**depends**  
boto3

**salt.states.boto\_cloudfront.present** (*name, config, tags, region=None, key=None, keyid=None, profile=None*)

Ensure the CloudFront distribution is present.

**name (string)**

Name of the CloudFront distribution

**config (dict)**

Configuration for the distribution

**tags (dict)**

Tags to associate with the distribution

**region (string)**

Region to connect to

**key (string)**

Secret key to use

**keyid (string)**

Access key to use

**profile (dict or string)**

A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.

Example:

```

Manage my_distribution CloudFront distribution:
  boto_cloudfront.present:
    - name: my_distribution
    - config:
      Comment: 'partial config shown, most parameters elided'
      Enabled: True
    - tags:
      testing_key: testing_value

```

### 26.19.26 salt.states.boto\_cloudtrail

#### Manage CloudTrail Objects

New in version 2016.3.0.

Create and destroy CloudTrail objects. Be aware that this interacts with Amazon's services, and so may incur charges.

#### depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```

vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs

```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
  region: us-east-1

```

```

Ensure trail exists:
  boto_cloudtrail.present:
    - Name: mytrail
    - S3BucketName: mybucket
    - S3KeyPrefix: prefix
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs

```

`salt.states.boto_cloudtrail.absent` (*name, Name, region=None, key=None, keyid=None, profile=None*)

Ensure trail with passed properties is absent.

**name**  
The name of the state definition.

**Name**  
Name of the trail.

**region**  
Region to connect to.

**key**  
Secret key to be used.

**keyid**  
Access key to be used.

**profile**  
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudtrail.present` (*name, Name, S3BucketName, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=True, IsMultiRegionTrail=None, EnableLogFileValidation=False, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, LoggingEnabled=True, Tags=None, region=None, key=None, keyid=None, profile=None*)

Ensure trail exists.

**name**  
The name of the state definition

**Name**  
Name of the trail.

**S3BucketName**  
Specifies the name of the Amazon S3 bucket designated for publishing log files.

**S3KeyPrefix**  
Specifies the Amazon S3 key prefix that comes after the name of the bucket you have designated for log file delivery.

**SnsTopicName**  
Specifies the name of the Amazon SNS topic defined for notification of log file delivery. The maximum length is 256 characters.

**IncludeGlobalServiceEvents**  
Specifies whether the trail is publishing events from global services such as IAM to the log files.

**EnableLogFileValidation**  
Specifies whether log file integrity validation is enabled. The default is false.

**CloudWatchLogsLogGroupArn**  
Specifies a log group name using an Amazon Resource Name (ARN), a unique identifier that represents the log group to which CloudTrail logs will be delivered. Not required unless you specify CloudWatchLogsRoleArn.

**CloudWatchLogsRoleArn**  
Specifies the role for the CloudWatch Logs endpoint to assume to write to a user's log group.

**KmsKeyId**  
Specifies the KMS key ID to use to encrypt the logs delivered by CloudTrail. The value can be an alias name prefixed by "alias/", a fully specified ARN to an alias, a fully specified ARN to a key, or a globally unique identifier.

**LoggingEnabled**  
Whether logging should be enabled for the trail

**Tags**  
A dictionary of tags that should be set on the trail

**region**  
Region to connect to.

**key**

- Secret key to be used.
- keyid**
- Access key to be used.
- profile**
- A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 26.19.27 salt.states.boto\_cloudwatch\_alarm

Manage Cloudwatch alarms

New in version 2014.7.0.

Create and destroy cloudwatch alarms. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

<http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
region: us-east-1
```

```
my test alarm:
boto_cloudwatch_alarm.present:
- name: my test alarm
- attributes:
  metric: ApproximateNumberOfMessagesVisible
  namespace: AWS/SQS
  statistic: Average
  comparison: ">="
  threshold: 20000.0
  period: 60
  evaluation_periods: 1
  description: test alarm via salt
  dimensions:
    QueueName:
      - the-sqs-queue-name
  alarm_actions:
    - arn:aws:sns:us-east-1:11111111:myalerting-action
```

`salt.states.boto_cloudwatch_alarm.absent` (*name, region=None, key=None, keyid=None, profile=None*)

Ensure the named cloudwatch alarm is deleted.

**name**

Name of the alarm.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudwatch_alarm.present` (*name, attributes, region=None, key=None, keyid=None, profile=None*)

Ensure the cloudwatch alarm exists.

**name**

Name of the alarm

**attributes**

A dict of key/value cloudwatch alarm attributes.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 26.19.28 salt.states.boto\_cloudwatch\_event

### Manage CloudTrail Objects

New in version 2016.11.0.

Create and destroy CloudWatch event rules. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via `package`, or `pip`.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
cloudwatch_event.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch_event.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkgsh
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
```

(continues on next page)

(continued from previous page)

```
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
region: us-east-1
```

**Ensure event rule exists:****boto\_cloudwatch\_event.present:**

- **Name:** mytrail
- **ScheduleExpression:** 'rate(120 minutes)'
- **State:** 'DISABLED'
- **Targets:**
  - **Id:** "target1"
  - **Arn:** "arn:aws:lambda:us-west-1:124456715622:function:my\_function"
  - **Input:** '{"arbitrary": "json"}'
- **region:** us-east-1
- **keyid:** GKTADJGHEIQSXMKKRBJ08H
- **key:** askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

`salt.states.boto_cloudwatch_event.absent` (*name*, *Name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure CloudWatch event rule with passed properties is absent.

**name**

The name of the state definition.

**Name**

Name of the event rule. Defaults to the value of the 'name' param if not provided.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudwatch_event.present` (*name*, *Name=None*, *ScheduleExpression=None*, *EventPattern=None*, *Description=None*, *RoleArn=None*, *State=None*, *Targets=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure trail exists.

**name**

The name of the state definition

**Name**

Name of the event rule. Defaults to the value of the 'name' param if not provided.

**ScheduleExpression**

The scheduling expression. For example, `cron(0 20 * * ? *)`, `"rate(5 minutes)"`

**EventPattern**

The event pattern.

**Description**

A description of the rule

**State**

Indicates whether the rule is ENABLED or DISABLED.

**RoleArn**

The Amazon Resource Name (ARN) of the IAM role associated with the rule.

**Targets**

A list of rresources to be invoked when the rule is triggered.

**region**  
Region to connect to.

**key**  
Secret key to be used.

**keyid**  
Access key to be used.

**profile**  
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 26.19.29 salt.states.boto\_cognitoidentity

#### Manage CognitoIdentity Functions

New in version 2016.11.0.

Create and destroy CognitoIdentity identity pools. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
region: us-east-1
```

```
Ensure function exists:
boto_cognitoidentity.pool_present:
- PoolName: my_identity_pool
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

`salt.states.boto_cognitoidentity.pool_absent` (*name*, *IdentityPoolName*,  
*RemoveAllMatched=False*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

Ensure cognito identity pool with passed properties is absent.

**name**

The name of the state definition.

**IdentityPoolName**

Name of the Cognito Identity Pool. Please note that this may match multiple pools with the same given name, in which case, all will be removed.

**RemoveAllMatched**

If True, all identity pools with the matching IdentityPoolName will be removed. If False and there are more than one identity pool with the matching IdentityPoolName, no action will be taken. If False and there is only one identity pool with the matching IdentityPoolName, the identity pool will be removed.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_cognitoidentity.pool_present(name, IdentityPoolName, AuthenticatedRole,
                                             AllowUnauthenticatedIdentities=False,
                                             UnauthenticatedRole=None,
                                             SupportedLoginProviders=None,
                                             DeveloperProviderName=None,
                                             OpenIdConnectProviderARNs=None,
                                             region=None, key=None, keyid=None,
                                             profile=None)

```

Ensure Cognito Identity Pool exists.

**name**

The name of the state definition

**IdentityPoolName**

Name of the Cognito Identity Pool

**AuthenticatedRole**

An IAM role name or ARN that will be associated with temporary AWS credentials for an authenticated cognito identity.

**AllowUnauthenticatedIdentities**

Whether to allow anonymous user identities

**UnauthenticatedRole**

An IAM role name or ARN that will be associated with anonymous user identities

**SupportedLoginProviders**

A dictionary or pillar that contains key:value pairs mapping provider names to provider app IDs.

**DeveloperProviderName**

A string which is the domain by which Cognito will refer to your users. This name acts as a placeholder that allows your backend and the Cognito service to communicate about the developer provider. Once you have set a developer provider name, you cannot change it. Please take care in setting this parameter.

**OpenIdConnectProviderARNs**

A list or pillar name that contains a list of OpenID Connect provider ARNs.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 26.19.30 salt.states.boto\_datapipeline

Manage Data Pipelines

New in version 2016.3.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
datapipeline.keyid: GKTADJGHEIQSXMKKRBJ08H
datapipeline.key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
  region: us-east-1
```

```
Ensure daily data pipeline exists:
boto_datapipeline.present:
- name: my-datapipeline
- pipeline_objects:
  DefaultSchedule:
    name: Every 1 day
    fields:
      period: 1 Day
      type: Schedule
      startAt: FIRST_ACTIVATION_DATE_TIME
- parameter_values:
  myDDBTableName: my-dynamo-table
```

`salt.states.boto_datapipeline.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a pipeline with the service\_name does not exist

**name**

Name of the service to ensure a data pipeline does not exist for.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_datapipeline.present(name, pipeline_objects=None,
                                       pipeline_objects_from_pillars='boto_datapipeline_pipeline_objects',
                                       parameter_objects=None, parameter_objects_from_pillars='boto_datapipeline_parameter_objects',
                                       parameter_values=None, parameter_values_from_pillars='boto_datapipeline_parameter_values',
                                       region=None, key=None, keyid=None, profile=None)

```

Ensure the data pipeline exists with matching definition.

**name**

Name of the service to ensure a data pipeline exists for.

**pipeline\_objects**

Pipeline objects to use. Will override objects read from pillars.

**pipeline\_objects\_from\_pillars**

The pillar key to use for lookup.

**parameter\_objects**

Parameter objects to use. Will override objects read from pillars.

**parameter\_objects\_from\_pillars**

The pillar key to use for lookup.

**parameter\_values**

Parameter values to use. Will override values read from pillars.

**parameter\_values\_from\_pillars**

The pillar key to use for lookup.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 26.19.31 salt.states.boto\_dynamodb

#### Manage DynamoDB Tables

New in version 2015.5.0.

Create and destroy DynamoDB tables. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```

keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkdflkjdfjajkghs
region: us-east-1

```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

**myprofile:**

```

keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs
      region: us-east-1

```

**Ensure DynamoDB table does not exist:****boto\_dynamodb.absent:**

- **table\_name:** new\_table
- **keyid:** GKTADJGHEIQSXMKKRBJ08H
- **key:** askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs
- **region:** us-east-1

**Ensure DynamoDB table exists:****boto\_dynamodb.present:**

- **table\_name:** new\_table
- **read\_capacity\_units:** 1
- **write\_capacity\_units:** 2
- **hash\_key:** primary\_id
- **hash\_key\_data\_type:** N
- **range\_key:** start\_timestamp
- **range\_key\_data\_type:** N
- **keyid:** GKTADJGHEIQSXMKKRBJ08H
- **key:** askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs
- **region:** us-east-1
- **local\_indexes:**
  - **index:**
    - **name:** "primary\_id\_end\_timestamp\_index"
    - **hash\_key:** primary\_id
    - **hash\_key\_data\_type:** N
    - **range\_key:** end\_timestamp
    - **range\_key\_data\_type:** N
- **global\_indexes:**
  - **index:**
    - **name:** "name\_end\_timestamp\_index"
    - **hash\_key:** name
    - **hash\_key\_data\_type:** S
    - **range\_key:** end\_timestamp
    - **range\_key\_data\_type:** N
    - **read\_capacity\_units:** 3
    - **write\_capacity\_units:** 4

It's possible to specify cloudwatch alarms that will be setup along with the DynamoDB table. Note the alarm name will be defined by the name attribute provided, plus the DynamoDB resource name.

**Ensure DynamoDB table exists:****boto\_dynamodb.present:**

- **name:** new\_table
- **read\_capacity\_units:** 1
- **write\_capacity\_units:** 2
- **hash\_key:** primary\_id
- **hash\_key\_data\_type:** N
- **range\_key:** start\_timestamp
- **range\_key\_data\_type:** N

(continues on next page)

(continued from previous page)

```

- alarms:
  ConsumedWriteCapacityUnits:
    name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
    attributes:
      metric: ConsumedWriteCapacityUnits
      namespace: AWS/DynamoDB
      statistic: Sum
      comparison: '>='
      # threshold_percent is used to calculate the actual threshold
      # based on the provisioned capacity for the table.
      threshold_percent: 0.75
      period: 300
      evaluation_periods: 2
      unit: Count
      description: 'DynamoDB ConsumedWriteCapacityUnits'
      alarm_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs
- region: us-east-1

```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto\_dynamodb\_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```

boto_dynamodb_alarms:
  ConsumedWriteCapacityUnits:
    name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
    attributes:
      metric: ConsumedWriteCapacityUnits
      namespace: AWS/DynamoDB
      statistic: Sum
      comparison: '>='
      # threshold_percent is used to calculate the actual threshold
      # based on the provisioned capacity for the table.
      threshold_percent: 0.75
      period: 300
      evaluation_periods: 2
      unit: Count
      description: 'DynamoDB ConsumedWriteCapacityUnits'
      alarm_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]

Ensure DynamoDB table exists:
  boto_dynamodb.present:
    - name: new_table
    - read_capacity_units: 1
    - write_capacity_units: 2
    - hash_key: primary_id

```

(continues on next page)

- **hash\_key\_data\_type**: N
- **range\_key**: start\_timestamp
- **range\_key\_data\_type**: N
- **alarms**:
  - ConsumedWriteCapacityUnits**:
  - attributes**:
  - threshold\_percent**: 0.90
  - period**: 900

**exception** salt.states.boto\_dynamodb.**GsiNotUpdatableError**

Raised when a global secondary index cannot be updated.

salt.states.boto\_dynamodb.**absent** (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the DynamoDB table does not exist.

**name**

Name of the DynamoDB table.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto\_dynamodb.**present** (*name=None*, *table\_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *read\_capacity\_units=None*, *write\_capacity\_units=None*, *alarms=None*, *alarms\_from\_pillar='boto\_dynamodb\_alarms'*, *hash\_key=None*, *hash\_key\_data\_type=None*, *range\_key=None*, *range\_key\_data\_type=None*, *local\_indexes=None*, *global\_indexes=None*, *backup\_configs\_from\_pillars='boto\_dynamodb\_backup\_configs'*)

Ensure the DynamoDB table exists. Table throughput can be updated after table creation.

Global secondary indexes (GSIs) are managed with some exceptions:

- If a GSI deletion is detected, a failure will occur (deletes should be done manually in the AWS console).
- If multiple GSIs are added in a single Salt call, a failure will occur (boto supports one creation at a time). Note that this only applies after table creation; multiple GSIs can be created during table creation.
- Updates to existing GSIs are limited to read/write capacity only (DynamoDB limitation).

**name**

Name of the DynamoDB table

**table\_name**

Name of the DynamoDB table (deprecated)

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

- read\_capacity\_units**  
The read throughput for this table
- write\_capacity\_units**  
The write throughput for this table
- hash\_key**  
The name of the attribute that will be used as the hash key for this table
- hash\_key\_data\_type**  
The DynamoDB datatype of the hash key
- range\_key**  
The name of the attribute that will be used as the range key for this table
- range\_key\_data\_type**  
The DynamoDB datatype of the range key
- local\_indexes**  
The local indexes you would like to create
- global\_indexes**  
The global indexes you would like to create
- backup\_configs\_from\_pillars**  
Pillars to use to configure DataPipeline backups

### 26.19.32 salt.states.boto\_ec2

Manage EC2

New in version 2015.8.0.

This module provides an interface to the Elastic Compute Cloud (EC2) service from AWS.

The below code creates a key pair:

```
create-key-pair:
boto_ec2.key_present:
- name: mykeypair
- save_private: /root/
- region: eu-west-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

```
import-key-pair:
boto_ec2.key_present:
- name: mykeypair
- upload_public: 'ssh-rsa AAAA'
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

You can also use salt:// in order to define the public key.

```
import-key-pair:
boto_ec2.key_present:
- name: mykeypair
- upload_public: salt://mybase/public_key.pub
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

The below code deletes a key pair:

**delete-key-pair:****boto\_ec2.key\_absent:**

- **name:** mykeypair
- **region:** eu-west-1
- **keyid:** GKTADJGHEIQSXMKKRBJ08H
- **key:** askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs

`salt.states.boto_ec2.eni_absent` (*name*, *release\_eip=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the EC2 ENI is absent.

New in version 2016.3.0.

**name**

Name tag associated with the ENI.

**release\_eip**

True/False - release any EIP associated with the ENI

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.eni_present` (*name*, *subnet\_id=None*, *subnet\_name=None*, *private\_ip\_address=None*, *description=None*, *groups=None*, *source\_dest\_check=True*, *allocate\_eip=None*, *arecords=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the EC2 ENI exists.

New in version 2016.3.0.

**name**

Name tag associated with the ENI.

**subnet\_id**

The VPC subnet ID the ENI will exist within.

**subnet\_name**

The VPC subnet name the ENI will exist within.

**private\_ip\_address**

The private ip address to use for this ENI. If this is not specified AWS will automatically assign a private IP address to the ENI. Must be specified at creation time; will be ignored afterward.

**description**

Description of the key.

**groups**

A list of security groups to apply to the ENI.

**source\_dest\_check**

Boolean specifying whether source/destination checking is enabled on the ENI.

**allocate\_eip**

allocate and associate an EIP to the ENI. Could be 'standard' to allocate Elastic IP to EC2 region or 'vpc' to get it for a particular VPC

Changed in version 2016.11.0.

**arecords**

A list of arecord dicts with attributes needed for the DNS add\_record state. By default the boto\_route53.add\_record state will be used, which requires: name, zone, ttl, and identifier. See the

boto\_route53 state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. By default, the private ENI IP address will be used, set 'public: True' in the arecord dict to use the ENI's public IP address

New in version 2016.3.0.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.instance_absent` (*name*, *instance\_name=None*, *instance\_id=None*, *release\_eip=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *filters=None*)

Ensure an EC2 instance does not exist (is stopped and removed).

Changed in version 2016.11.0.

**name**

(string) - The name of the state definition.

**instance\_name**

(string) - The name of the instance.

**instance\_id**

(string) - The ID of the instance.

**release\_eip**

(bool) - Release any associated EIPs during termination.

**region**

(string) - Region to connect to.

**key**

(string) - Secret key to be used.

**keyid**

(string) - Access key to be used.

**profile**

(variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**filters**

(dict) - A dict of additional filters to use in matching the instance to delete.

YAML example fragment:

```
- filters:
  vpc-id: vpc-abcdef12
```

`salt.states.boto_ec2.instance_present` (*name, instance\_name=None, instance\_id=None, image\_id=None, image\_name=None, tags=None, key\_name=None, security\_groups=None, user\_data=None, instance\_type=None, placement=None, kernel\_id=None, ramdisk\_id=None, vpc\_id=None, vpc\_name=None, monitoring\_enabled=None, subnet\_id=None, subnet\_name=None, private\_ip\_address=None, block\_device\_map=None, disable\_api\_termination=None, instance\_initiated\_shutdown\_behavior=None, placement\_group=None, client\_token=None, security\_group\_ids=None, security\_group\_names=None, additional\_info=None, tenancy=None, instance\_profile\_arn=None, instance\_profile\_name=None, ebs\_optimized=None, network\_interfaces=None, network\_interface\_name=None, network\_interface\_id=None, attributes=None, target\_state=None, public\_ip=None, allocation\_id=None, allocate\_eip=False, region=None, key=None, keyid=None, profile=None*)

Ensure an EC2 instance is running with the given attributes and state.

**name**

(string) - The name of the state definition. Recommended that this match the `instance_name` attribute (generally the FQDN of the instance).

**instance\_name**

(string) - The name of the instance, generally its FQDN. Exclusive with 'instance\_id'.

**instance\_id**

(string) - The ID of the instance (if known). Exclusive with 'instance\_name'.

**image\_id**

(string) - The ID of the AMI image to run.

**image\_name**

(string) - The name of the AMI image to run.

**tags**

(dict) - Tags to apply to the instance.

**key\_name**

(string) - The name of the key pair with which to launch instances.

**security\_groups**

(list of strings) - The names of the EC2 classic security groups with which to associate instances

**user\_data**

(string) - The Base64-encoded MIME user data to be made available to the instance(s) in this reservation.

**instance\_type**

(string) - The EC2 instance size/type. Note that only certain types are compatible with HVM based AMIs.

**placement**

(string) - The Availability Zone to launch the instance into.

**kernel\_id**

(string) - The ID of the kernel with which to launch the instances.

**ramdisk\_id**

(string) - The ID of the RAM disk with which to launch the instances.

**vpc\_id**

(string) - The ID of a VPC to attach the instance to.

**vpc\_name**

(string) - The name of a VPC to attach the instance to.

**monitoring\_enabled**

(bool) - Enable detailed CloudWatch monitoring on the instance.

**subnet\_id**

- (string) – The ID of the subnet within which to launch the instances for VPC.
- subnet\_name**  
(string) – The name of the subnet within which to launch the instances for VPC.
- private\_ip\_address**  
(string) – If you’re using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g., 10.0.0.25).
- block\_device\_map**  
(boto.ec2.blockdevicemapping.BlockDeviceMapping) – A BlockDeviceMapping data structure describing the EBS volumes associated with the Image.
- disable\_api\_termination**  
(bool) – If True, the instances will be locked and will not be able to be terminated via the API.
- instance\_initiated\_shutdown\_behavior**  
(string) – Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are:
- 'stop'
  - 'terminate'
- placement\_group**  
(string) – If specified, this is the name of the placement group in which the instance(s) will be launched.
- client\_token**  
(string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.
- security\_group\_ids**  
(list of strings) – The IDs of the VPC security groups with which to associate instances.
- security\_group\_names**  
(list of strings) – The names of the VPC security groups with which to associate instances.
- additional\_info**  
(string) – Specifies additional information to make available to the instance(s).
- tenancy**  
(string) – The tenancy of the instance you want to launch. An instance with a tenancy of ‘dedicated’ runs on single-tenant hardware and can only be launched into a VPC. Valid values are:”default” or “dedicated”.  
NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.
- instance\_profile\_arn**  
(string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.
- instance\_profile\_name**  
(string) – The name of the IAM Instance Profile (IIP) to associate with the instances.
- ebs\_optimized**  
(bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and a tuned configuration stack to provide optimal EBS I/O performance. This optimization isn’t available with all instance types.
- network\_interfaces**  
(boto.ec2.networkinterface.NetworkInterfaceCollection) – A NetworkInterfaceCollection data structure containing the ENI specifications for the instance.
- network\_interface\_name**  
(string) - The name of Elastic Network Interface to attach  
New in version 2016.11.0.
- network\_interface\_id**  
(string) - The id of Elastic Network Interface to attach  
New in version 2016.11.0.
- attributes**  
(dict) - Instance attributes and value to be applied to the instance. Available options are:
- instanceType - A valid instance type (m1.small)
  - kernel - Kernel ID (None)
  - ramdisk - Ramdisk ID (None)

- `userData` - Base64 encoded String (None)
- `disableApiTermination` - Boolean (true)
- `instanceInitiatedShutdownBehavior` - stop|terminate
- `blockDeviceMapping` - List of strings - ie: `['/dev/sda=false']`
- `sourceDestCheck` - Boolean (true)
- `groupSet` - Set of Security Groups or IDs
- `ebsOptimized` - Boolean (false)
- `sriovNetSupport` - String - ie: 'simple'

**target\_state**

(string) - The desired target state of the instance. Available options are:

- `running`
- `stopped`

Note that this option is currently UNIMPLEMENTED.

**public\_ip:**

(string) - The IP of a previously allocated EIP address, which will be attached to the instance. EC2 Classic instances ONLY - for VCP pass in an `allocation_id` instead.

**allocation\_id:**

(string) - The ID of a previously allocated EIP address, which will be attached to the instance. VPC instances ONLY - for Classic pass in a `public_ip` instead.

**allocate\_eip:**

(bool) - Allocate and attach an EIP on-the-fly for this instance. Note you'll want to release this address when terminating the instance, either manually or via the `'release_eip'` flag to `'instance_absent'`.

**region**

(string) - Region to connect to.

**key**

(string) - Secret key to be used.

**keyid**

(string) - Access key to be used.

**profile**

(variable) - A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

New in version 2016.3.0.

`salt.states.boto_ec2.key_absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a key pair

`salt.states.boto_ec2.key_present` (*name*, *save\_private=None*, *upload\_public=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure key pair is present.

`salt.states.boto_ec2.private_ips_absent` (*name*, *network\_interface\_name=None*, *network\_interface\_id=None*, *private\_ip\_addresses=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure an ENI does not have secondary private ip addresses associated with it

**name**

(String) - State definition name

**network\_interface\_id**

(String) - The EC2 network interface id, example `eni-123456789`

**private\_ip\_addresses**

(List or String) - The secondary private ip address(es) that should be absent on the ENI.

**region**

(string) - Region to connect to.

**key**

(string) - Secret key to be used.

**keyid**  
(string) - Access key to be used.

**profile**  
(variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_ec2.private_ips_present(name, network_interface_name=None,
                                         network_interface_id=None,
                                         private_ip_addresses=None, allow_reassignment=False,
                                         region=None, key=None, keyid=None, profile=None)
```

Ensure an ENI has secondary private ip addresses associated with it

**name**  
(String) - State definition name

**network\_interface\_id**  
(String) - The EC2 network interface id, example eni-123456789

**private\_ip\_addresses**  
(List or String) - The secondary private ip address(es) that should be present on the ENI.

**allow\_reassignment**  
(Boolean) - If true, will reassign a secondary private ip address associated with another ENI. If false, state will fail if the secondary private ip address is associated with another ENI.

**region**  
(string) - Region to connect to.

**key**  
(string) - Secret key to be used.

**keyid**  
(string) - Access key to be used.

**profile**  
(variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_ec2.snapshot_created(name, ami_name, instance_name,
                                       wait_until_available=True, wait_timeout_seconds=300,
                                       **kwargs)
```

Create a snapshot from the given instance

New in version 2016.3.0.

```
salt.states.boto_ec2.volume_absent(name, volume_name=None, volume_id=None,
                                    instance_name=None, instance_id=None, device=None,
                                    region=None, key=None, keyid=None, profile=None)
```

Ensure the EC2 volume is detached and absent.

New in version 2016.11.0.

**name**  
State definition name.

**volume\_name**  
Name tag associated with the volume. For safety, if this matches more than one volume, the state will refuse to apply.

**volume\_id**  
Resource ID of the volume.

**instance\_name**  
Only remove volume if it is attached to instance with this Name tag. Exclusive with 'instance\_id'. Requires 'device'.

**instance\_id**  
Only remove volume if it is attached to this instance. Exclusive with 'instance\_name'. Requires 'device'.

**device**

Match by device rather than ID. Requires one of 'instance\_name' or 'instance\_id'.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_ec2.volume_present(name, volume_name=None, volume_id=None,  
                                     instance_name=None, instance_id=None, device=None,  
                                     size=None, snapshot_id=None, volume_type=None, iops=None,  
                                     encrypted=False, kms_key_id=None, region=None, key=None,  
                                     keyid=None, profile=None)
```

Ensure the EC2 volume is present and attached.

**name**

State definition name.

**volume\_name**

The Name tag value for the volume. If no volume with that matching name tag is found, a new volume will be created. If multiple volumes are matched, the state will fail.

**volume\_id**

Resource ID of the volume. Exclusive with 'volume\_name'.

**instance\_name**

Attach volume to instance with this Name tag. Exclusive with 'instance\_id'.

**instance\_id**

Attach volume to instance with this ID. Exclusive with 'instance\_name'.

**device**

The device on the instance through which the volume is exposed (e.g. /dev/sdh)

**size**

The size of the new volume, in GiB. If you're creating the volume from a snapshot and don't specify a volume size, the default is the snapshot size. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'.

**snapshot\_id**

The snapshot ID from which the new Volume will be created. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'.

**volume\_type**

The type of the volume. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'. Valid volume types for AWS can be found here: <http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html>

**iops**

The provisioned IOPS you want to associate with this volume. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'.

**encrypted**

Specifies whether the volume should be encrypted. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'.

**kms\_key\_id**

If encrypted is True, this KMS Key ID may be specified to encrypt volume with this key. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'. e.g.: arn:aws:kms:us-east-1:012345678910:key/abcd1234-a123-456a-a12b-a123b4cd56ef

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.volumes_tagged` (*name*, *tag\_maps*, *authoritative=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure EC2 volume(s) matching the given filters have the defined tags.

New in version 2016.11.0.

**name**

State definition name.

**tag\_maps**

List of dicts of filters and tags, where 'filters' is a dict suitable for passing to the 'filters' argument of `boto_ec2.get_all_volumes()`, and 'tags' is a dict of tags to be set on volumes as matched by the given filters. The filter syntax is extended to permit passing either a list of `volume_ids` or an `instance_name` (with `instance_name` being the Name tag of the instance to which the desired volumes are mapped). Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently with one call to this function.

YAML example fragment:

```
- filters:
  attachment.instance_id: i-abcdef12
  tags:
    Name: dev-int-abcdef12.aws-foo.com
- filters:
  attachment.device: /dev/sdf
  tags:
    ManagedSnapshots: true
    BillingGroup: bubba.hotep@aws-foo.com
- filters:
  instance_name: prd-foo-01.aws-foo.com
  tags:
    Name: prd-foo-01.aws-foo.com
    BillingGroup: infra-team@aws-foo.com
- filters:
  volume_ids: [ vol-12345689, vol-abcdef12 ]
  tags:
    BillingGroup: infra-team@aws-foo.com
```

**authoritative**

Should un-declared tags currently set on matched volumes be deleted? Boolean.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 26.19.33 salt.states.boto\_elasticache

#### Manage Elasticache

New in version 2014.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

Note: This module currently only supports creation and deletion of elasticache resources and will not modify clusters when their configuration changes in your state files.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
  region: us-east-1
```

```
Ensure myelasticache exists:
  boto_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

*# Using a profile from pillars*

```
Ensure myelasticache exists:
  boto_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - profile: myprofile
```

*# Passing in a profile*

```
Ensure myelasticache exists:
  boto_elasticache.present:
```

(continues on next page)

(continued from previous page)

```

- name: myelasticache
- engine: redis
- cache_node_type: cache.t1.micro
- num_cache_nodes: 1
- notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
- region: us-east-1
- profile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkgsh

```

`salt.states.boto_elasticache.absent` (*name, wait=True, region=None, key=None, keyid=None, profile=None*)

Ensure the named elasticache cluster is deleted.

**name**

Name of the cache cluster.

**wait**

Boolean. Wait for confirmation from boto that the cluster is in the deleting state.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticache.cache_cluster_absent` (*\*args, \*\*kwargs*)

`salt.states.boto_elasticache.cache_cluster_present` (*\*args, \*\*kwargs*)

`salt.states.boto_elasticache.creategroup` (*name, primary\_cluster\_id, replication\_group\_description, wait=None, region=None, key=None, keyid=None, profile=None*)

Ensure the a replication group is create.

**name**

Name of replication group

**wait**

Waits for the group to be available

**primary\_cluster\_id**

Name of the master cache node

**replication\_group\_description**

Description for the group

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticache.present` (*name, engine=None, cache\_node\_type=None, num\_cache\_nodes=None, preferred\_availability\_zone=None, port=None, cache\_parameter\_group\_name=None, cache\_security\_group\_names=None, replication\_group\_id=None, auto\_minor\_version\_upgrade=True, security\_group\_ids=None, cache\_subnet\_group\_name=None, engine\_version=None, notification\_topic\_arn=None, preferred\_maintenance\_window=None, wait=None, region=None, key=None, keyid=None, profile=None*)

Ensure the cache cluster exists.

**name**

Name of the cache cluster (cache cluster id).

**engine**

The name of the cache engine to be used for this cache cluster. Valid values are memcached or redis.

**cache\_node\_type**

The compute and memory capacity of the nodes in the cache cluster. `cache.t1.micro`, `cache.m1.small`, etc. See: [https://boto.readthedocs.io/en/latest/ref/elasticache.html#boto.elasticache.layer1.ElastiCacheConnection.create\\_cache\\_cluster](https://boto.readthedocs.io/en/latest/ref/elasticache.html#boto.elasticache.layer1.ElastiCacheConnection.create_cache_cluster)

**num\_cache\_nodes**

The number of cache nodes that the cache cluster will have.

**preferred\_availability\_zone**

The EC2 Availability Zone in which the cache cluster will be created. All cache nodes belonging to a cache cluster are placed in the preferred availability zone.

**port**

The port number on which each of the cache nodes will accept connections.

**cache\_parameter\_group\_name**

The name of the cache parameter group to associate with this cache cluster. If this argument is omitted, the default cache parameter group for the specified engine will be used.

**cache\_security\_group\_names**

A list of cache security group names to associate with this cache cluster. Use this parameter only when you are creating a cluster outside of a VPC.

**replication\_group\_id**

The replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster will be added to the specified replication group as a read replica; otherwise, the cache cluster will be a standalone primary that is not part of any replication group.

**auto\_minor\_version\_upgrade**

Determines whether minor engine upgrades will be applied automatically to the cache cluster during the maintenance window. A value of `True` allows these upgrades to occur; `False` disables automatic upgrades.

**security\_group\_ids**

One or more VPC security groups associated with the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

**cache\_subnet\_group\_name**

The name of the cache subnet group to be used for the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

**engine\_version**

The version number of the cache engine to be used for this cluster.

**notification\_topic\_arn**

The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications will be sent. The Amazon SNS topic owner must be the same as the cache cluster owner.

**preferred\_maintenance\_window**

The weekly time range (in UTC) during which system maintenance can occur. Example: `sun:05:00-sun:09:00`

**wait**  
 Boolean. Wait for confirmation from boto that the cluster is in the available state.

**region**  
 Region to connect to.

**key**  
 Secret key to be used.

**keyid**  
 Access key to be used.

**profile**  
 A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_elasticache.replication_group_absent(name, tags=None, region=None,
                                                    key=None, keyid=None,
                                                    profile=None)
```

```
salt.states.boto_elasticache.replication_group_present(*args, **kwargs)
```

```
salt.states.boto_elasticache.subnet_group_absent(name, tags=None, region=None, key=None,
                                                keyid=None, profile=None)
```

```
salt.states.boto_elasticache.subnet_group_present(name, subnet_ids=None,
                                                  subnet_names=None, description=None,
                                                  tags=None, region=None, key=None,
                                                  keyid=None, profile=None)
```

Ensure ElastiCache subnet group exists.

New in version 2015.8.0.

**name**  
 The name for the ElastiCache subnet group. This value is stored as a lowercase string.

**subnet\_ids**  
 A list of VPC subnet IDs for the cache subnet group. Exclusive with `subnet_names`.

**subnet\_names**  
 A list of VPC subnet names for the cache subnet group. Exclusive with `subnet_ids`.

**description**  
 Subnet group description.

**tags**  
 A list of tags.

**region**  
 Region to connect to.

**key**  
 Secret key to be used.

**keyid**  
 Access key to be used.

**profile**  
 A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 26.19.34 salt.states.boto\_elasticsearch\_domain

### Manage Elasticsearch Domains

New in version 2016.11.0.

Create and destroy Elasticsearch domains. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
region: us-east-1
```

```
Ensure domain exists:
  boto_elasticsearch_domain.present:
    - DomainName: mydomain
    - profile='user-credentials'
    - ElasticsearchVersion: "2.3"
    - ElasticsearchClusterConfig:
      InstanceType": "t2.micro.elasticsearch"
      InstanceCount: 1
      DedicatedMasterEnabled: False
      ZoneAwarenessEnabled: False
    - EBSOptions:
      EBSEnabled: True
      VolumeType: "gp2"
      VolumeSize: 10
      Iops: 0
    - AccessPolicies:
      Version: "2012-10-17"
      Statement:
        - Effect: "Allow"
        - Principal:
          AWS: "*"
        - Action:
          - "es:*"
        - Resource: "arn:aws:es:*:111111111111:domain/mydomain/*"
        - Condition:
          IpAddress:
            "aws:SourceIp":
```

(continues on next page)

(continued from previous page)

```

- "127.0.0.1"
- "127.0.0.2"
- SnapshotOptions:
  AutomatedSnapshotStartHour: 0
- AdvancedOptions:
  rest.action.multi.allow_explicit_index": "true"
- Tags:
  a: "b"
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkgHwupUjasdfklkdfklgjsdfjajkghs

```

`salt.states.boto_elasticsearch_domain.absent` (*name, DomainName, region=None, key=None, keyid=None, profile=None*)

Ensure domain with passed properties is absent.

**name**

The name of the state definition.

**DomainName**

Name of the domain.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticsearch_domain.present` (*name, DomainName, ElasticsearchClusterConfig=None, EBSOptions=None, AccessPolicies=None, SnapshotOptions=None, AdvancedOptions=None, Tags=None, region=None, key=None, keyid=None, profile=None, ElasticsearchVersion='1.5'*)

Ensure domain exists.

**name**

The name of the state definition

**DomainName**

Name of the domain.

**ElasticsearchClusterConfig**

Configuration options for an Elasticsearch domain. Specifies the instance type and number of instances in the domain cluster.

InstanceType (string) -- The instance type for an Elasticsearch cluster.

InstanceCount (integer) -- The number of instances in the specified domain cluster.

DedicatedMasterEnabled (boolean) -- A boolean value to indicate whether a dedicated master node is enabled. See About Dedicated Master Nodes for more information.

ZoneAwarenessEnabled (boolean) -- A boolean value to indicate whether zone awareness is enabled. See About Zone Awareness for more information.

DedicatedMasterType (string) -- The instance type for a dedicated master node.

DedicatedMasterCount (integer) -- Total number of dedicated master nodes, active and on standby, for the cluster.

**EBSOptions**

Options to enable, disable and specify the type and size of EBS storage volumes.

EBSEnabled (boolean) -- Specifies whether EBS-based storage is enabled.

VolumeType (string) -- Specifies the volume type for EBS-based storage.

VolumeSize (integer) -- Integer to specify the size of an EBS volume.

Iops (integer) -- Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).

**AccessPolicies**

IAM access policy

**SnapshotOptions**

Option to set time, in UTC format, of the daily automated snapshot. Default value is 0 hours.

AutomatedSnapshotStartHour (integer) -- Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.

**AdvancedOptions**

Option to allow references to indices in an HTTP request body. Must be false when configuring access to individual sub-resources. By default, the value is true .

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**ElasticsearchVersion**

String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".

### 26.19.35 salt.states.boto\_elb

Manage ELBs

New in version 2014.7.0.

Create and destroy ELBs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjakghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
```

(continues on next page)

(continued from previous page)

```

key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
region: us-east-1

```

**Ensure myelb ELB exists:****boto\_elb.present:**

- **name:** myelb
- **region:** us-east-1
- **availability\_zones:**
  - us-east-1a
  - us-east-1c
  - us-east-1d
- **keyid:** GKTADJGHEIQSXMKKRBJ08H
- **key:** askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
- **listeners:**
  - **elb\_port:** 443
  - instance\_port:** 80
  - elb\_protocol:** HTTPS
  - instance\_protocol:** HTTP
  - certificate:** 'arn:aws:iam::1111111:server-certificate/mycert'
  - policies:**
    - my-ssl-policy
    - cookie-policy
  - **elb\_port:** 8210
  - instance\_port:** 8210
  - elb\_protocol:** TCP
- **backends:**
  - **instance\_port:** 80
  - policies:**
    - enable-proxy-protocol
- **health\_check:**
  - target:** 'HTTP:80/'
- **attributes:**
  - cross\_zone\_load\_balancing:**
    - enabled:** true
  - access\_log:**
    - enabled:** true
    - s3\_bucket\_name:** 'mybucket'
    - s3\_bucket\_prefix:** 'my-logs'
    - emit\_interval:** 5
  - connecting\_settings:**
    - idle\_timeout:** 60
- **cnames:**
  - **name:** mycname.example.com.
  - zone:** example.com.
  - ttl:** 60
  - **name:** myothercname.example.com.
  - zone:** example.com.
- **security\_groups:**
  - my-security-group
- **policies:**
  - **policy\_name:** my-ssl-policy
  - policy\_type:** SSLNegotiationPolicyType

(continues on next page)

(continued from previous page)

```

    policy:
      Protocol-TLSv1.2: true
      Protocol-SSLv3: false
      Server-Defined-Cipher-Order: true
      ECDHE-ECDSA-AES128-GCM-SHA256: true
  - policy_name: cookie-policy
    policy_type: LBCookieStickinessPolicyType
    policy: {} # no policy means this is a session cookie
  - policy_name: enable-proxy-protocol
    policy_type: ProxyProtocolPolicyType
    policy:
      ProxyProtocol: true

# Using a profile from pillars
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile

# Passing in a profile
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdfklkdflkjgjsdfjajkghs

```

It's possible to specify attributes from pillars by specifying a pillar. You can override the values defined in the pillar by setting the attributes on the resource. The module will use the default pillar key 'boto\_elb\_attributes', which allows you to set default attributes for all ELB resources.

Setting the attributes pillar:

```

my_elb_attributes:
  cross_zone_load_balancing:
    enabled: true
  connection_draining:
    enabled: true
    timeout: 20
  access_log:
    enabled: true
    s3_bucket_name: 'mybucket'
    s3_bucket_prefix: 'my-logs'
    emit_interval: 5

```

Overriding the attribute values on the resource:

```

Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1

```

(continues on next page)

(continued from previous page)

```

- attributes_from_pillar: my_elb_attributes
# override cross_zone_load_balancing:enabled
- attributes:
  cross_zone_load_balancing:
    enabled: false
- profile: myelbprofile

```

It's possible to specify cloudwatch alarms that will be setup along with the ELB. Note the alarm name will be defined by the name attribute provided, plus the ELB resource name.

```

Ensure myelb ELB exists:
boto_elb.present:
- name: myelb
- region: us-east-1
- profile: myelbprofile
- alarms:
  UnHealthyHostCount:
    name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
    attributes:
      metric: UnHealthyHostCount
      namespace: AWS/ELB
      statistic: Average
      comparison: '>='
      threshold: 1.0
      period: 600
      evaluation_periods: 6
      unit: null
      description: ELB UnHealthyHostCount
      alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
      insufficient_data_actions: []
      ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']

```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto\_elb\_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```

my_elb_alarm:
UnHealthyHostCount:
  name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
  attributes:
    metric: UnHealthyHostCount
    namespace: AWS/ELB
    statistic: Average
    comparison: '>='
    threshold: 1.0
    period: 600
    evaluation_periods: 6
    unit: null
    description: ELB UnHealthyHostCount
    alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
    insufficient_data_actions: []

```

(continues on next page)

(continued from previous page)

```
ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
```

Overriding the alarm values on the resource:

```
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - alarms_from_pillar: my_elb_alarm
    # override UnHealthyHostCount:attributes:threshold
    - alarms:
      UnHealthyHostCount:
        attributes:
          threshold: 2.0
```

Tags can also be set:

New in version 2016.3.0.

```
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - tags:
      MyTag: 'My Tag Value'
      OtherTag: 'My Other Value'
```

`salt.states.boto_elb.absent` (*name, region=None, key=None, keyid=None, profile=None*)

Ensure an ELB does not exist

**name**

name of the ELB

`salt.states.boto_elb.present` (*name, listeners, availability\_zones=None, subnets=None, subnet\_names=None, security\_groups=None, scheme='internet-facing', health\_check=None, attributes=None, attributes\_from\_pillar='boto\_elb\_attributes', cnames=None, alarms=None, alarms\_from\_pillar='boto\_elb\_alarms', policies=None, policies\_from\_pillar='boto\_elb\_policies', backends=None, region=None, key=None, keyid=None, profile=None, wait\_for\_sync=True, tags=None, instance\_ids=None, instance\_names=None*)

Ensure the ELB exists.

**name**

Name of the ELB.

**availability\_zones**

A list of availability zones for this ELB.

**listeners**

A list of listener lists; example:

```
[
  [ '443', 'HTTPS', 'arn:aws:iam::1111111:server-certificate/mycert'
  ↪ ],
```

(continues on next page)

(continued from previous page)

```
[ '8443', '80', 'HTTPS', 'HTTP', 'arn:aws:iam::1111111:server-
  ↪certificate/mycert' ]
]
```

**subnets**

A list of subnet IDs in your VPC to attach to your LoadBalancer.

**subnet\_names**

A list of subnet names in your VPC to attach to your LoadBalancer.

**security\_groups**

The security groups assigned to your LoadBalancer within your VPC. Must be passed either as a list or a comma-separated string.

For example, a list:

```
- security_groups:
  - secgroup-one
  - secgroup-two
```

Or as a comma-separated string:

```
- security_groups: secgroup-one,secgroup-two
```

**scheme**

The type of a LoadBalancer, `internet-facing` or `internal`. Once set, can not be modified.

**health\_check**

A dict defining the health check for this ELB.

**attributes**

A dict defining the attributes to set on this ELB. Unknown keys will be silently ignored.

See the `salt.modules.boto_elb.set_attributes` function for recognized attributes.

**attributes\_from\_pillar**

name of pillar dict that contains attributes. Attributes defined for this specific state will override those from pillar.

**cnames**

A list of cname dicts with attributes needed for the DNS `add_record` state. By default the `boto_route53.add_record` state will be used, which requires: `name`, `zone`, `ttl`, and `identifier`. See the `boto_route53` state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. the cnames dict will be passed to the state as `kwargs`.

See the `salt.states.boto_route53` state for information about these attributes.

**alarms:**

a dictionary of `name->boto_cloudwatch_alarm` sections to be associated with this ELB. All attributes should be specified except for `dimension` which will be automatically set to this ELB.

See the `salt.states.boto_cloudwatch_alarm` state for information about these attributes.

**alarms\_from\_pillar:**

name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

**wait\_for\_sync**

Wait for an INSYNC change status from Route53.

**tags**

dict of tags

**instance\_ids**

list of instance ids. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with instance\_names.

**instance\_names**

list of instance names. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with instance\_ids.

**salt.states.boto\_elb.register\_instances** (*name, instances, region=None, key=None, keyid=None, profile=None*)

Add EC2 instance(s) to an Elastic Load Balancer. Removing an instance from the `instances` list does not remove it from the ELB.

**name**

The name of the Elastic Load Balancer to add EC2 instances to.

**instances**

A list of EC2 instance IDs that this Elastic Load Balancer should distribute traffic to. This state will only ever append new instances to the ELB. EC2 instances already associated with this ELB will not be removed if they are not in the `instances` list.

New in version 2015.8.0.

```
add-instances:
boto_elb.register_instances:
- name: myloadbalancer
- instances:
  - instance-id1
  - instance-id2
```

### 26.19.36 salt.states.boto\_elbv2

Manage AWS Application Load Balancer

New in version 2017.7.0.

Add and remove targets from an ALB target group.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit alb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elbv2.keyid: GKTADJGHEIQSXMKKRBJ08H
elbv2.key: askdjghsdfjkghWupUjasdfklkdflkjdfjajkghs
elbv2.region: us-west-2
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
```

(continues on next page)

(continued from previous page)

```
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
region: us-east-1
```

```
salt.states.boto_elbv2.create_target_group(name, protocol, port, vpc_id, region=None, key=None,
                                          keyid=None, profile=None,
                                          health_check_protocol='HTTP',
                                          health_check_port='traffic-port',
                                          health_check_path='/',
                                          health_check_interval_seconds=30,
                                          health_check_timeout_seconds=5,
                                          healthy_threshold_count=5,
                                          unhealthy_threshold_count=2, **kwargs)
```

New in version 2017.11.0.

Create target group if not present.

**name**

(string) - The name of the target group.

**protocol**

(string) - The protocol to use for routing traffic to the targets

**port**

(int) - The port on which the targets receive traffic. This port is used unless you specify a port override when registering the traffic.

**vpc\_id**

(string) - The identifier of the virtual private cloud (VPC).

**health\_check\_protocol**

(string) - The protocol the load balancer uses when performing health check on targets. The default is the HTTP protocol.

**health\_check\_port**

(string) - The port the load balancer uses when performing health checks on targets. The default is 'traffic-port', which indicates the port on which each target receives traffic from the load balancer.

**health\_check\_path**

(string) - The ping path that is the destination on the targets for health checks. The default is /.

**health\_check\_interval\_seconds**

(integer) - The approximate amount of time, in seconds, between health checks of an individual target. The default is 30 seconds.

**health\_check\_timeout\_seconds**

(integer) - The amount of time, in seconds, during which no response from a target means a failed health check. The default is 5 seconds.

**healthy\_threshold\_count**

(integer) - The number of consecutive health checks successes required before considering an unhealthy target healthy. The default is 5.

**unhealthy\_threshold\_count**

(integer) - The number of consecutive health check failures required before considering a target unhealthy. The default is 2.

**returns**

(bool) - True on success, False on failure.

CLI Example:

```
create-target:
  boto_elbv2.create_targets_group:
    - name: myALB
    - protocol: https
```

(continues on next page)

(continued from previous page)

- **port**: 443
- **vpc\_id**: myVPC

`salt.states.boto_elbv2.delete_target_group`(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete target group.

**name**

(string) - The Amazon Resource Name (ARN) of the resource.

**returns**

(bool) - True on success, False on failure.

CLI Example:

```
check-target:
  boto_elbv2.delete_targets_group:
    - name: myALB
    - protocol: https
    - port: 443
    - vpc_id: myVPC
```

`salt.states.boto_elbv2.targets_deregistered`(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *\*\*kwargs*)

Remove targets to an Application Load Balancer target group.

**name**

The ARN of the Application Load Balancer Target Group to remove targets from.

**targets**

A list of target IDs or a string of a single target registered to the target group to be removed

New in version 2017.7.0.

```
remove-targets:
  boto_elb.targets_deregistered:
    - name: arn:myloadbalancer
    - targets:
      - instance-id1
      - instance-id2
```

`salt.states.boto_elbv2.targets_registered`(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *\*\*kwargs*)

New in version 2017.7.0.

Add targets to an Application Load Balancer target group. This state will not remove targets.

**name**

The ARN of the Application Load Balancer Target Group to add targets to.

**targets**

A list of target IDs or a string of a single target that this target group should distribute traffic to.

```
add-targets:
  boto_elb.targets_registered:
    - name: arn:myloadbalancer
    - targets:
      - instance-id1
      - instance-id2
```

### 26.19.37 salt.states.boto\_iam

#### Manage IAM objects

New in version 2015.8.0.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
delete-user:
  boto_iam.user_absent:
    - name: myuser
    - delete_keys: true
```

```
delete-keys:
  boto_iam.keys_absent:
    - access_keys:
      - 'AKIAJHTMIQ2ASDFLASDF'
      - 'PQIAJHTMIQ2ASRTLASFR'
    - user_name: myuser
```

```
create-user:
  boto_iam.user_present:
    - name: myuser
    - policies:
      mypolicy: |
        {
          "Version": "2012-10-17",
          "Statement": [{
            "Effect": "Allow",
            "Action": "*",
            "Resource": "*"}]
        }
    - password: NewPassword$$1
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'fdkjsafkljsASSADFalkfjasdf'
```

```
create-group:
  boto_iam.group_present:
    - name: mygroup
    - users:
      - myuser
      - myuser1
    - policies:
      mypolicy: |
        {
          "Version": "2012-10-17",
```

(continues on next page)

(continued from previous page)

```

        "Statement": [{
            "Effect": "Allow",
            "Action": "*",
            "Resource": "*"}]
    }
- region: eu-west-1
- keyid: 'AKIAJHTMIQ2ASDFLASDF'
- key: 'safsdosal;fdkjsafkljsASSADFalkfj'
```

**change-policy:**

```

boto_iam.account_policy:
- change_password: True
- region: eu-west-1
- keyid: 'AKIAJHTMIQ2ASDFLASDF'
- key: 'safsdosal;fdkjsafkljsASSADFalkfj'
```

**create server certificate:**

```

boto_iam.server_cert_present:
- name: mycert
- public_key: salt://base/mycert.crt
- private_key: salt://base/mycert.key
- cert_chain: salt://base/mycert_chain.crt
- region: eu-west-1
- keyid: 'AKIAJHTMIQ2ASDFLASDF'
- key: 'fdkjsafkljsASSADFalkfjasdf'
```

**delete server certificate:**

```

boto_iam.server_cert_absent:
- name: mycert
```

**create keys for user:**

```

boto_iam.keys_present:
- name: myusername
- number: 2
- save_dir: /root
- region: eu-west-1
- keyid: 'AKIAJHTMIQ2ASDFLASDF'
- key: 'fdkjsafkljsASSADFalkfjasdf'
```

**create policy:**

```

boto_iam.policy_present:
- name: myname
- policy_document: '{"MyPolicy": "Statement": [{"Action": ["sqs:*"],
↪ "Effect": "Allow", "Resource": ["arn:aws:sqs:*:*:*"], "Sid": "MyPolicySqs1"}
↪ ]}'
- region: eu-west-1
- keyid: 'AKIAJHTMIQ2ASDFLASDF'
- key: 'fdkjsafkljsASSADFalkfjasdf'
```

**add-saml-provider:**

(continues on next page)

(continued from previous page)

**boto\_iam.saml\_provider\_present:**

- **name:** my\_saml\_provider
- **saml\_metadata\_document:** salt://base/files/provider.xml
- **keyid:** 'AKIAJHTMIQ2ASDFLASDF'
- **key:** 'safsd fsal;fdkjsafkljsASSADFa l k f j'

`salt.states.boto_iam.account_policy` (*name=None, allow\_users\_to\_change\_password=None, hard\_expiry=None, max\_password\_age=None, minimum\_password\_length=None, password\_reuse\_prevention=None, require\_lowercase\_characters=None, require\_numbers=None, require\_symbols=None, require\_uppercase\_characters=None, region=None, key=None, keyid=None, profile=None*)

Change account policy.

New in version 2015.8.0.

**name (string)**

The name of the account policy

**allow\_users\_to\_change\_password (bool)**

Allows all IAM users in your account to use the AWS Management Console to change their own passwords.

**hard\_expiry (bool)**

Prevents IAM users from setting a new password after their password has expired.

**max\_password\_age (int)**

The number of days that an IAM user password is valid.

**minimum\_password\_length (int)**

The minimum number of characters allowed in an IAM user password.

**password\_reuse\_prevention (int)**

Specifies the number of previous passwords that IAM users are prevented from reusing.

**require\_lowercase\_characters (bool)**

Specifies whether IAM user passwords must contain at least one lowercase character from the ISO basic Latin alphabet (a to z).

**require\_numbers (bool)**

Specifies whether IAM user passwords must contain at least one numeric character (0 to 9).

**require\_symbols (bool)**

Specifies whether IAM user passwords must contain at least one of the following non-alphanumeric characters: ! @ # \$ % ^ & \* ( ) \_ + - = [ ] { } | ' "

**require\_uppercase\_characters (bool)**

Specifies whether IAM user passwords must contain at least one uppercase character from the ISO basic Latin alphabet (A to Z).

**region (string)**

Region to connect to.

**key (string)**

Secret key to be used.

**keyid (string)**

Access key to be used.

**profile (dict)**

A dict with region, key and keyid, or a pillar key (string)

`salt.states.boto_iam.group_absent` (*name, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM group is absent.

**name (string)**

The name of the group.

**region (string)**

Region to connect to.

**key (string)**

Secret key to be used.

**keyid (string)**

Access key to be used.

**profile (dict)**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.group_present` (*name*, *policies=None*, *policies\_from\_pillars=None*,  
*managed\_policies=None*, *users=None*, *path='/'*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*, *delete\_policies=True*)

New in version 2015.8.0.

Ensure the IAM group is present

**name (string)**

The name of the new group.

**path (string)**

The path for the group, defaults to '/'

**policies (dict)**

A dict of IAM group policy documents.

**policies\_from\_pillars (list)**

A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument. If keys conflict, the keys in the policies argument will override the keys defined in policies\_from\_pillars.

**managed\_policies (list)**

A list of policy names or ARNs that should be attached to this group.

**users (list)**

A list of users to be added to the group.

**region (string)**

Region to connect to.

**key (string)**

Secret key to be used.

**keyid (string)**

Access key to be used.

**profile (dict)**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**delete\_policies (boolean)**

Delete or detach existing policies that are not in the given list of policies. Default value is True. If False is specified, existing policies will not be deleted or detached allowing manual modifications on the IAM group to be persistent.

`salt.states.boto_iam.keys_absent` (*access\_keys*, *user\_name*, *region=None*, *key=None*, *keyid=None*,  
*profile=None*)

New in version 2015.8.0.

Ensure the IAM user access\_key\_id is absent.

**access\_key\_id (list)**

A list of access key ids

**user\_name (string)**

The username of the user

**region (string)**

Region to connect to.

**key (string)**

Secret key to be used.

**keyid (string)**

Access key to be used.

**profile (dict)**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.keys_present` (*name, number, save\_dir, region=None, key=None, keyid=None, profile=None, save\_format='{2}\n{0}\n{3}\n{1}\n'*)

New in version 2015.8.0.

Ensure the IAM access keys are present.

**name (string)**

The name of the new user.

**number (int)**

Number of keys that user should have.

**save\_dir (string)**

The directory that the key/keys will be saved. Keys are saved to a file named according to the username provided.

**region (string)**

Region to connect to.

**key (string)**

Secret key to be used.

**keyid (string)**

Access key to be used.

**profile (dict)**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**save\_format (dict)**

Save format is repeated for each key. Default format is "{2}\n{0}\n{3}\n{1}\n", where {0} and {1} are placeholders for new key\_id and key respectively, whereas {2} and {3} are "key\_id-{number}" and 'key-{number}' strings kept for compatibility.

`salt.states.boto_iam.policy_absent` (*name, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM managed policy with the specified name is absent

**name (string)**

The name of the new policy.

**region (string)**

Region to connect to.

**key (string)**

Secret key to be used.

**keyid (string)**

Access key to be used.

**profile (dict)**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.policy_present` (*name, policy\_document, path=None, description=None, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM managed policy is present

**name (string)**

The name of the new policy.

**policy\_document (dict)**

The document of the new policy

**path (string)**

The path in which the policy will be created. Default is '/'.

**description (string)**

Description

**region (string)**

Region to connect to.

**key (string)**

Secret key to be used.

**keyid (string)**

Access key to be used.

**profile (dict)**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.saml_provider_absent` (*name*, *region=None*, *key=None*, *keyid=None*,  
*profile=None*)

New in version 2016.11.0.

Ensure the SAML provider with the specified name is absent.

**name (string)**

The name of the SAML provider.

**saml\_metadata\_document (string)**

The xml document of the SAML provider.

**region (string)**

Region to connect to.

**key (string)**

Secret key to be used.

**keyid (string)**

Access key to be used.

**profile (dict)**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.saml_provider_present` (*name*, *saml\_metadata\_document*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

New in version 2016.11.0.

Ensure the SAML provider with the specified name is present.

**name (string)**

The name of the SAML provider.

**saml\_metadata\_document (string)**

The xml document of the SAML provider.

**region (string)**

Region to connect to.

**key (string)**

Secret key to be used.

**keyid (string)**

Access key to be used.

**profile (dict)**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.server_cert_absent` (*name*, *region=None*, *key=None*, *keyid=None*,  
*profile=None*)

Deletes a server certificate.

New in version 2015.8.0.

**name (string)**  
The name for the server certificate. Do not include the path in this value.

**region (string)**  
The name of the region to connect to.

**key (string)**  
The key to be used in order to connect

**keyid (string)**  
The keyid to be used in order to connect

**profile (string)**  
The profile that contains a dict of region, key, keyid

```
salt.states.boto_iam.server_cert_present(name, public_key, private_key, cert_chain=None,
                                         path=None, region=None, key=None, keyid=None,
                                         profile=None)
```

Create server certificate.

New in version 2015.8.0.

**name (string)**  
The name for the server certificate. Do not include the path in this value.

**public\_key (string)**  
The contents of the public key certificate in PEM-encoded format.

**private\_key (string)**  
The contents of the private key in PEM-encoded format.

**cert\_chain (string)**  
The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.

**path (string)**  
The path for the server certificate.

**region (string)**  
The name of the region to connect to.

**key (string)**  
The key to be used in order to connect

**keyid (string)**  
The keyid to be used in order to connect

**profile (string)**  
The profile that contains a dict of region, key, keyid

```
salt.states.boto_iam.user_absent(name, delete_keys=True, delete_mfa_devices=True,
                                 delete_profile=True, region=None, key=None, keyid=None,
                                 profile=None)
```

New in version 2015.8.0.

Ensure the IAM user is absent. User cannot be deleted if it has keys.

**name (string)**  
The name of the new user.

**delete\_keys (bool)**  
Delete all keys from user.

**delete\_mfa\_devices (bool)**  
Delete all mfa devices from user.

New in version 2016.3.0.

**delete\_profile (bool)**  
Delete profile from user.

New in version 2016.3.0.

**region (string)**

Region to connect to.

**key (string)**

Secret key to be used.

**keyid (string)**

Access key to be used.

**profile (dict)**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.user_present` (*name, policies=None, policies\_from\_pillars=None, managed\_policies=None, password=None, path=None, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM user is present

**name (string)**

The name of the new user.

**policies (dict)**

A dict of IAM group policy documents.

**policies\_from\_pillars (list)**

A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument. If keys conflict, the keys in the policies argument will override the keys defined in policies\_from\_pillars.

**managed\_policies (list)**

A list of managed policy names or ARNs that should be attached to this user.

**password (string)**

The password for the new user. Must comply with account policy.

**path (string)**

The path of the user. Default is '/'.  
  
New in version 2015.8.2.

**region (string)**

Region to connect to.

**key (string)**

Secret key to be used.

**keyid (string)**

Access key to be used.

**profile (dict)**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 26.19.38 salt.states.boto\_iam\_role

#### Manage IAM roles

New in version 2014.7.0.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
  region: us-east-1
```

Creating a role will automatically create an instance profile and associate it with the role. This is the default behavior of the AWS console.

```
myrole:
  boto_iam_role.present:
    - region: us-east-1
    - key: GKTADJGHEIQSXMKKRBJ08H
    - keyid: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
    - policies_from_pillars:
      - shared_iam_bootstrap_policy
    - policies:
      MySQSPolicy:
        Statement:
          - Action:
              - sqs:*
            Effect: Allow
            Resource:
              - arn:aws:sqs:*:*:*
            Sid: MyPolicySQS1
      MyS3Policy:
        Statement:
          - Action:
              - s3:GetObject
            Effect: Allow
            Resource:
              - arn:aws:s3:*:*:*:mybucket/*

# Using a credentials profile from pillars
myrole:
  boto_iam_role.present:
    - profile: myiamprofile

# Passing in a credentials profile
myrole:
  boto_iam_role.present:
    - profile:
      key: GKTADJGHEIQSXMKKRBJ08H
      keyid: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
      region: us-east-1
```

If `delete_policies: False` is specified, existing policies that are not in the given list of policies will not be deleted. This allows manual modifications on the IAM role to be persistent. This functionality was added in 2015.8.0.

**Note:** When using the `profile` parameter and `region` is set outside of the profile group, `region` is ignored and a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

---

`salt.states.boto_iam_role.absent` (*name, region=None, key=None, keyid=None, profile=None*)

Ensure the IAM role is deleted.

**name**

Name of the IAM role.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

`salt.states.boto_iam_role.present` (*name, policy\_document=None, policy\_document\_from\_pillars=None, path=None, policies=None, policies\_from\_pillars=None, managed\_policies=None, create\_instance\_profile=True, region=None, key=None, keyid=None, profile=None, delete\_policies=True*)

Ensure the IAM role exists.

**name**

Name of the IAM role.

**policy\_document**

The policy that grants an entity permission to assume the role. (See [https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create\\_role](https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role))

**policy\_document\_from\_pillars**

A pillar key that contains a role policy document. The statements defined here will be appended with the policy document statements defined in the `policy_document` argument.

New in version 2017.7.0.

**path**

The path to the role/instance profile. (See [https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create\\_role](https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role))

**policies**

A dict of IAM role policies.

**policies\_from\_pillars**

A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the `policies` argument. If keys conflict, the keys in the `policies` argument will override the keys defined in `policies_from_pillars`.

**managed\_policies**

A list of (AWS or Customer) managed policies to be attached to the role.

**create\_instance\_profile**

A boolean of whether or not to create an instance profile and associate it with this role.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**delete\_policies**

Deletes existing policies that are not in the given list of policies. Default value is True. If False is specified, existing policies will not be deleted allowing manual modifications on the IAM role to be persistent.

New in version 2015.8.0.

### 26.19.39 salt.states.boto\_iot

#### Manage IoT Objects

New in version 2016.3.0.

Create and destroy IoT objects. Be aware that this interacts with Amazon's services, and so may incur charges.

**depends**

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkdflkjlsdfjajkgghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkjlsdfjajkgghs
  region: us-east-1
```

```
Ensure policy exists:
  boto_iot.policy_present:
    - policyName: mypolicy
    - policyDocument:
      Version: "2012-10-17"
      Statement:
        Action:
          - iot:Publish
        Resource:
          - "*"
        Effect: "Allow"
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
```

(continues on next page)

(continued from previous page)

- **key:** askdjghsdfjkghWupUjasdfklkdflkjgjsdfjajkghs

**Ensure topic rule exists:****boto\_iam.topic\_rule\_present:**

- **ruleName:** myrule
- **sql:** "SELECT \* FROM 'iot/test'"
- **description:** 'test rule'
- **ruleDisabled:** false
- **actions:**
  - **lambda:**
    - functionArn:** "arn:aws:us-east-1:1234:function/functionname"
- **region:** us-east-1
- **keyid:** GKTADJGHEIQSXMKKRBJ08H
- **key:** askdjghsdfjkghWupUjasdfklkdflkjgjsdfjajkghs

`salt.states.boto_iam.policy_absent`(*name, policyName, region=None, key=None, keyid=None, profile=None*)

Ensure policy with passed properties is absent.

**name**

The name of the state definition.

**policyName**

Name of the policy.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.policy_attached`(*name, policyName, principal, region=None, key=None, keyid=None, profile=None*)

Ensure policy is attached to the given principal.

**name**

The name of the state definition

**policyName**

Name of the policy.

**principal**

The principal which can be a certificate ARN or a Cognito ID.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.policy_detached`(*name, policyName, principal, region=None, key=None, keyid=None, profile=None*)

Ensure policy is attached to the given principal.

**name**  
The name of the state definition.

**policyName**  
Name of the policy.

**principal**  
The principal which can be a certificate ARN or a Cognito ID.

**region**  
Region to connect to.

**key**  
Secret key to be used.

**keyid**  
Access key to be used.

**profile**  
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.policy_present` (*name, policyName, policyDocument, region=None, key=None, keyid=None, profile=None*)

Ensure policy exists.

**name**  
The name of the state definition

**policyName**  
Name of the policy.

**policyDocument**  
The JSON document that describes the policy. The length of the policyDocument must be a minimum length of 1, with a maximum length of 2048, excluding whitespace.

**region**  
Region to connect to.

**key**  
Secret key to be used.

**keyid**  
Access key to be used.

**profile**  
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.thing_type_absent` (*name, thingTypeName, region=None, key=None, keyid=None, profile=None*)

Ensure thing type with passed properties is absent.

New in version 2016.11.0.

**name**  
The name of the state definition.

**thingTypeName**  
Name of the thing type.

**region**  
Region to connect to.

**key**  
Secret key to be used.

**keyid**  
Access key to be used.

**profile**  
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.thing_type_present` (*name, thingTypeName, thingTypeDescription, searchableAttributesList, region=None, key=None, keyid=None, profile=None*)

Ensure thing type exists.

New in version 2016.11.0.

**name**

The name of the state definition

**thingTypeName**

Name of the thing type

**thingTypeDescription**

Description of the thing type

**searchableAttributesList**

List of string attributes that are searchable for the thing type

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used

**profile**

A dict with region, key, keyid, or a pillar key (string) that contains a dict with region, key, and keyid

`salt.states.boto_iot.topic_rule_absent` (*name, ruleName, region=None, key=None, keyid=None, profile=None*)

Ensure topic rule with passed properties is absent.

**name**

The name of the state definition.

**ruleName**

Name of the policy.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.topic_rule_present` (*name, ruleName, sql, actions, description="", ruleDisabled=False, region=None, key=None, keyid=None, profile=None*)

Ensure topic rule exists.

**name**

The name of the state definition

**ruleName**

Name of the rule.

**sql**

The SQL statement used to query the topic.

**actions**

The actions associated with the rule.

**description**

The description of the rule.

**ruleDisable**

Specifies whether the rule is disabled.

**region**

Region to connect to.

**key**

Secret key to be used.  
**keyid**  
 Access key to be used.  
**profile**  
 A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 26.19.40 salt.states.boto\_kinesis

### Manage Kinesis Streams

New in version 2017.7.0.

Create and destroy Kinesis streams. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit Kinesis credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
region: us-east-1
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
  region: us-east-1
```

#### Ensure Kinesis stream does not exist:

##### **boto\_kinesis.absent:**

- **name:** new\_stream
- **keyid:** GKTADJGHEIQSXMKKRBJ08H
- **key:** askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
- **region:** us-east-1

#### Ensure Kinesis stream exists:

##### **boto\_kinesis.present:**

- **name:** new\_stream
- **retention\_hours:** 168
- **enhanced\_monitoring:** ['ALL']
- **num\_shards:** 2
- **keyid:** GKTADJGHEIQSXMKKRBJ08H
- **key:** askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
- **region:** us-east-1

**salt.states.boto\_kinesis.absent** (*name, region=None, key=None, keyid=None, profile=None*)

Delete the kinesis stream, if it exists.

**name** (string)

Stream name

**region (string)**

Region to connect to.

**key (string)**

Secret key to be used.

**keyid (string)**

Access key to be used.

**profile (dict)**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_kinesis.present` (*name*, *retention\_hours=None*, *enhanced\_monitoring=None*,  
*num\_shards=None*, *do\_reshard=True*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Ensure the kinesis stream is properly configured and scaled.

**name (string)**

Stream name

**retention\_hours (int)**

Retain data for this many hours. AWS allows minimum 24 hours, maximum 168 hours.

**enhanced\_monitoring (list of string)**

Turn on enhanced monitoring for the specified shard-level metrics. Pass in ['ALL'] or True for all metrics, [] or False for no metrics. Turn on individual metrics by passing in a list: ['IncomingBytes', 'Outgoing-Bytes'] Note that if only some metrics are supplied, the remaining metrics will be turned off.

**num\_shards (int)**

Reshard stream (if necessary) to this number of shards !!!! Resharding is expensive! Each split or merge can take up to 30 seconds, and the reshard method balances the partition space evenly. Resharding from N to N+1 can require 2N operations. Resharding is much faster with powers of 2 (e.g. 2^N to 2^(N+1) !!!!)

**do\_reshard (boolean)**

If set to False, this script will NEVER reshard the stream, regardless of other input. Useful for testing.

**region (string)**

Region to connect to.

**key (string)**

Secret key to be used.

**keyid (string)**

Access key to be used.

**profile (dict)**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 26.19.41 salt.states.boto\_kms

Manage KMS keys, key policies and grants.

New in version 2015.8.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsd fjkghWupUjasdf\kdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsd fjkg hWupUjasdf lkd fklgjsdfjajkg h
  region: us-east-1
```

```
Ensure mykey key exists:
  boto_kms.key_present:
    - name: mykey
    - region: us-east-1

# Using a profile from pillars
Ensure mykey key exists:
  boto_kms.key_present:
    - name: mykey
    - region: us-east-1
    - profile: myprofile

# Passing in a profile
Ensure mykey key exists:
  boto_key.key_present:
    - name: mykey
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsd fjkg hWupUjasdf lkd fklgjsdfjajkg h
```

`salt.states.boto_kms.key_present` (*name, policy, description=None, key\_usage=None, grants=None, manage\_grants=False, key\_rotation=False, enabled=True, region=None, key=None, keyid=None, profile=None*)

Ensure the KMS key exists. KMS keys can not be deleted, so this function must be used to ensure the key is enabled or disabled.

**name**

Name of the key.

**policy**

Key usage policy.

**description**

Description of the key.

**key\_usage**

Specifies the intended use of the key. Can only be set on creation, defaults to ENCRYPT\_DECRYPT, which is also the only supported option.

**grants**

A list of grants to apply to the key. Not currently implemented.

**manage\_grants**

Whether or not to manage grants. False by default, which will not manage any grants.

**key\_rotation**

Whether or not key rotation is enabled for the key. False by default.

**enabled**

Whether or not the key is enabled. True by default.

**region**

Region to connect to.

**key**

Secret key to be used.  
**keyid**  
Access key to be used.  
**profile**  
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 26.19.42 salt.states.boto\_lambda

### Manage Lambda Functions

New in version 2016.3.0.

Create and destroy Lambda Functions. Be aware that this interacts with Amazon's services, and so may incur charges.

#### depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H  
vpc.key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:  
keyid: GKTADJGHEIQSXMKKRBJ08H  
key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs  
region: us-east-1
```

#### Ensure function exists:

```
boto_lambda.function_present:  
- FunctionName: myfunction  
- Runtime: python2.7  
- Role: iam_role_name  
- Handler: entry_function  
- ZipFile: code.zip  
- S3Bucket: bucketname  
- S3Key: keyname  
- S3ObjectVersion: version  
- Description: "My Lambda Function"  
- Timeout: 3  
- MemorySize: 128  
- region: us-east-1  
- keyid: GKTADJGHEIQSXMKKRBJ08H  
- key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

`salt.states.boto_lambda.alias_absent` (*name, FunctionName, Name, region=None, key=None, keyid=None, profile=None*)

Ensure alias with passed properties is absent.

**name**

The name of the state definition.

**FunctionName**

Name of the function.

**Name**

Name of the alias.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.alias_present` (*name, FunctionName, Name, FunctionVersion, Description="", region=None, key=None, keyid=None, profile=None*)

Ensure alias exists.

**name**

The name of the state definition.

**FunctionName**

Name of the function for which you want to create an alias.

**Name**

The name of the alias to be created.

**FunctionVersion**

Function version for which you are creating the alias.

**Description**

A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.event_source_mapping_absent` (*name, EventSourceArn, FunctionName, region=None, key=None, keyid=None, profile=None*)

Ensure event source mapping with passed properties is absent.

**name**

The name of the state definition.

**EventSourceArn**

ARN of the event source.

**FunctionName**

Name of the lambda function.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_lambda.event_source_mapping_present(name, EventSourceArn,  
                                                    FunctionName, StartingPosition,  
                                                    Enabled=True, BatchSize=100,  
                                                    region=None, key=None, keyid=None,  
                                                    profile=None)
```

Ensure event source mapping exists.

**name**

The name of the state definition.

**EventSourceArn**

The Amazon Resource Name (ARN) of the Amazon Kinesis or the Amazon DynamoDB stream that is the event source.

**FunctionName**

The Lambda function to invoke when AWS Lambda detects an event on the stream.

You can specify an unqualified function name (for example, "Thumbnail") or you can specify Amazon Resource Name (ARN) of the function (for example, "arn:aws:lambda:us-west-2:account-id:function:ThumbNail"). AWS Lambda also allows you to specify only the account ID qualifier (for example, "account-id:Thumbnail"). Note that the length constraint applies only to the ARN. If you specify only the function name, it is limited to 64 character in length.

**StartingPosition**

The position in the stream where AWS Lambda should start reading. (TRIM\_HORIZON | LATEST)

**Enabled**

Indicates whether AWS Lambda should begin polling the event source. By default, Enabled is true.

**BatchSize**

The largest number of records that AWS Lambda will retrieve from your event source at the time of invoking your function. Your function receives an event with all the retrieved records. The default is 100 records.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_lambda.function_absent(name, FunctionName, region=None, key=None,  
                                       keyid=None, profile=None)
```

Ensure function with passed properties is absent.

**name**

The name of the state definition.

**FunctionName**

Name of the function.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_lambda.function_present(name, FunctionName, Runtime, Role, Handler,
                                         ZipFile=None, S3Bucket=None, S3Key=None,
                                         S3ObjectVersion=None, Description="", Timeout=3,
                                         MemorySize=128, Permissions=None, RoleRetries=5,
                                         region=None, key=None, keyid=None, profile=None,
                                         VpcConfig=None, Environment=None)

```

Ensure function exists.

**name**

The name of the state definition

**FunctionName**

Name of the Function.

**Runtime**

The Runtime environment for the function. One of 'nodejs', 'java8', or 'python2.7'

**Role**

The name or ARN of the IAM role that the function assumes when it executes your function to access any other AWS resources.

**Handler**

The function within your code that Lambda calls to begin execution. For Node.js it is the module.name.\*export\* value in your function. For Java, it can be package.classname::handler or package.class-name.

**ZipFile**

A path to a .zip file containing your deployment package. If this is specified, S3Bucket and S3Key must not be specified.

**S3Bucket**

Amazon S3 bucket name where the .zip file containing your package is stored. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

**S3Key**

The Amazon S3 object (the deployment package) key name you want to upload. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

**S3ObjectVersion**

The version of S3 object to use. Optional, should only be specified if S3Bucket and S3Key are specified.

**Description**

A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

**Timeout**

The function execution time at which Lambda should terminate this function. Because the execution time has cost implications, we recommend you set this value based on your expected execution time. The default is 3 seconds.

**MemorySize**

The amount of memory, in MB, your function is given. Lambda uses this memory size to infer the amount of CPU and memory allocated to your function. Your function use-case determines your CPU and memory requirements. For example, a database operation might need less memory compared to an image processing function. The default value is 128 MB. The value must be a multiple of 64 MB.

**VpcConfig**

If your Lambda function accesses resources in a VPC, you must provide this parameter identifying the list of security group IDs/Names and subnet IDs/Name. These must all belong to the same VPC. This is a dict of the form:

```

VpcConfig:
  SecurityGroupNames:
    - mysecgroup1

```

(continues on next page)

(continued from previous page)

```

- mysecgroup2
SecurityGroupIds:
- sg-abcdef1234
SubnetNames:
- mysubnet1
SubnetIds:
- subnet-1234abcd
- subnet-abcd1234

```

If VpcConfig is provided at all, you MUST pass at least one security group and one subnet.

**Permissions**

A list of permission definitions to be added to the function's policy

**RoleRetries**

IAM Roles may take some time to propagate to all regions once created. During that time function creation may fail; this state will automatically retry this number of times. The default is 5.

**Environment**

The parent object that contains your environment's configuration settings. This is a dictionary of the form:

```

{
  'Variables': {
    'VariableName': 'VariableValue'
  }
}

```

New in version 2017.7.0.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**26.19.43 salt.states.boto\_lc**

Manage Launch Configurations

New in version 2014.7.0.

Create and destroy Launch Configurations. Be aware that this interacts with Amazon's services, and so may incur charges.

A limitation of this module is that you can not modify launch configurations once they have been created. If a launch configuration with the specified name exists, this module will always report success, even if the specified configuration doesn't match. This is due to a limitation in Amazon's launch configuration API, as it only allows launch configurations to be created and deleted.

Also note that a launch configuration that's in use by an autoscale group can not be deleted until the autoscale group is no longer using it. This may affect the way in which you want to order your states.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
  region: us-east-1
```

Credential information is shared with autoscale groups as launch configurations and autoscale groups are completely dependent on each other.

```
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - key_name: mykey
    - security_groups:
      - mygroup
    - instance_type: m1.small
    - instance_monitoring: true
    - block_device_mappings:
      - '/dev/sda1':
          size: 20
          volume_type: 'io1'
          iops: 220
          delete_on_termination: true
    - cloud_init:
      boothooks:
        'disable-master.sh': |
          #!/bin/bash
          echo "manual" > /etc/init/salt-master.override
      scripts:
        'run_salt.sh': |
          #!/bin/bash

          add-apt-repository -y ppa:saltstack/salt
          apt-get update
          apt-get install -y salt-minion
          salt-call state.highstate
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs

# Using a profile from pillars.
Ensure mylc exists:
```

(continues on next page)

(continued from previous page)

```

boto_lc.present:
- name: mylc
- image_id: ami-0b9c9f62
- profile: myprofile

# Passing in a profile.
Ensure mylc exists:
boto_lc.present:
- name: mylc
- image_id: ami-0b9c9f62
- profile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
  region: us-east-1

```

**salt.states.boto\_lc.absent** (*name, region=None, key=None, keyid=None, profile=None*)

Ensure the named launch configuration is deleted.

**name**

Name of the launch configuration.

**region**

The region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_lc.present** (*name, image\_id, key\_name=None, vpc\_id=None, vpc\_name=None, security\_groups=None, user\_data=None, cloud\_init=None, instance\_type='m1.small', kernel\_id=None, ramdisk\_id=None, block\_device\_mappings=None, delete\_on\_termination=None, instance\_monitoring=False, spot\_price=None, instance\_profile\_name=None, ebs\_optimized=False, associate\_public\_ip\_address=None, region=None, key=None, keyid=None, profile=None*)

Ensure the launch configuration exists.

**name**

Name of the launch configuration.

**image\_id**

AMI to use for instances. AMI must exist or creation of the launch configuration will fail.

**key\_name**

Name of the EC2 key pair to use for instances. Key must exist or creation of the launch configuration will fail.

**vpc\_id**

The VPC id where the security groups are defined. Only necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with vpc\_name.

**vpc\_name**

Name of the VPC where the security groups are defined. Only Necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with vpc\_id.

**security\_groups**

List of Names or security group id's of the security groups with which to associate the EC2 instances or VPC instances, respectively. Security groups must exist, or creation of the launch configuration will fail.

- user\_data**  
The user data available to launched EC2 instances.
- cloud\_init**  
A dict of cloud\_init configuration. Currently supported keys: boothooks, scripts and cloud-config. Mutually exclusive with user\_data.
- instance\_type**  
The instance type. ex: m1.small.
- kernel\_id**  
The kernel id for the instance.
- ramdisk\_id**  
The RAM disk ID for the instance.
- block\_device\_mappings**  
A dict of block device mappings that contains a dict with volume\_type, delete\_on\_termination, iops, size, encrypted, snapshot\_id.
- volume\_type**  
Indicates what volume type to use. Valid values are standard, io1, gp2. Default is standard.
- delete\_on\_termination**  
Whether the volume should be explicitly marked for deletion when its instance is terminated (True), or left around (False). If not provided, or None is explicitly passed, the default AWS behaviour is used, which is True for ROOT volumes of instances, and False for all others.
- iops**  
For Provisioned IOPS (SSD) volumes only. The number of I/O operations per second (IOPS) to provision for the volume.
- size**  
Desired volume size (in GiB).
- encrypted**  
Indicates whether the volume should be encrypted. Encrypted EBS volumes must be attached to instances that support Amazon EBS encryption. Volumes that are created from encrypted snapshots are automatically encrypted. There is no way to create an encrypted volume from an unencrypted snapshot or an unencrypted volume from an encrypted snapshot.
- instance\_monitoring**  
Whether instances in group are launched with detailed monitoring.
- spot\_price**  
The spot price you are bidding. Only applies if you are building an autoscaling group with spot instances.
- instance\_profile\_name**  
The name or the Amazon Resource Name (ARN) of the instance profile associated with the IAM role for the instance. Instance profile must exist or the creation of the launch configuration will fail.
- ebs\_optimized**  
Specifies whether the instance is optimized for EBS I/O (true) or not (false).
- associate\_public\_ip\_address**  
Used for Auto Scaling groups that launch instances into an Amazon Virtual Private Cloud. Specifies whether to assign a public IP address to each instance launched in a Amazon VPC.
- region**  
The region to connect to.
- key**  
Secret key to be used.
- keyid**  
Access key to be used.
- profile**  
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 26.19.44 salt.states.boto\_rds

### Manage RDSs

New in version 2015.8.0.

Create and destroy RDS instances. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit rds credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
rds.keyid: GKTADJGHEIQSXMKKRBJ08H
rds.key: askdjghsdfjkghWupUjasdfklkdflkjgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkjgjsdfjajkghs
  region: us-east-1
```

```
Ensure myrds RDS exists:
  boto_rds.present:
    - name: myrds
    - allocated_storage: 5
    - storage_type: standard
    - db_instance_class: db.t2.micro
    - engine: MySQL
    - master_username: myuser
    - master_user_password: mypass
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdflkjgjsdfjajkghs
    - tags:
      key: value
```

```
Ensure parameter group exists:
  create-parameter-group:
    boto_rds.parameter_present:
      - name: myparametergroup
      - db_parameter_group_family: mysql5.6
      - description: "parameter group family"
      - parameters:
        - binlog_cache_size: 32768
        - binlog_checksum: CRC32
      - region: eu-west-1
```

```
depends
  boto3
```

`salt.states.boto_rds.absent` (*name, skip\_final\_snapshot=None, final\_db\_snapshot\_identifier=None, tags=None, wait\_for\_deletion=True, timeout=180, region=None, key=None, keyid=None, profile=None*)

Ensure RDS instance is absent.

**name**

Name of the RDS instance.

**skip\_final\_snapshot**

Whether a final db snapshot is created before the instance is deleted. If True, no snapshot is created. If False, a snapshot is created before deleting the instance.

**final\_db\_snapshot\_identifier**

If a final snapshot is requested, this is the identifier used for that snapshot.

**tags**

A dict of tags.

**wait\_for\_deletion (bool)**

Wait for the RDS instance to be deleted completely before finishing the state.

**timeout (in seconds)**

The amount of time that can pass before raising an Exception.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_rds.parameter_present` (*name, db\_parameter\_group\_family, description, parameters=None, apply\_method='pending-reboot', tags=None, region=None, key=None, keyid=None, profile=None*)

Ensure DB parameter group exists and update parameters.

**name**

The name for the parameter group.

**db\_parameter\_group\_family**

The DB parameter group family name. A DB parameter group can be associated with one and only one DB parameter group family, and can be applied only to a DB instance running a database engine and engine version compatible with that DB parameter group family.

**description**

Parameter group description.

**parameters**

The DB parameters that need to be changed of type dictionary.

**apply\_method**

The *apply-immediate* method can be used only for dynamic parameters; the *pending-reboot* method can be used with MySQL and Oracle DB instances for either dynamic or static parameters. For Microsoft SQL Server DB instances, the *pending-reboot* method can be used only for static parameters.

**tags**

A dict of tags.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_rds.present` (*name*, *allocated\_storage*, *db\_instance\_class*, *engine*, *master\_username*, *master\_user\_password*, *db\_name=None*, *storage\_type=None*, *db\_security\_groups=None*, *vpc\_security\_group\_ids=None*, *vpc\_security\_groups=None*, *availability\_zone=None*, *db\_subnet\_group\_name=None*, *preferred\_maintenance\_window=None*, *db\_parameter\_group\_name=None*, *db\_cluster\_identifier=None*, *tde\_credential\_arn=None*, *tde\_credential\_password=None*, *storage\_encrypted=None*, *kms\_keyid=None*, *backup\_retention\_period=None*, *preferred\_backup\_window=None*, *port=None*, *multi\_az=None*, *engine\_version=None*, *auto\_minor\_version\_upgrade=None*, *license\_model=None*, *iops=None*, *option\_group\_name=None*, *character\_set\_name=None*, *publicly\_accessible=None*, *wait\_status=None*, *tags=None*, *copy\_tags\_to\_snapshot=None*, *region=None*, *domain=None*, *key=None*, *keyid=None*, *monitoring\_interval=None*, *monitoring\_role\_arn=None*, *domain\_iam\_role\_name=None*, *promotion\_tier=None*, *profile=None*)

Ensure RDS instance exists.

**name**

Name of the RDS state definition.

**allocated\_storage**

The amount of storage (in gigabytes) to be initially allocated for the database instance.

**db\_instance\_class**

The compute and memory capacity of the Amazon RDS DB instance.

**engine**

The name of the database engine to be used for this instance. Supported engine types are: MySQL, mariadb, oracle-se1, oracle-se, oracle-ee, sqlserver-ee, sqlserver-se, sqlserver-ex, sqlserver-web, postgres and aurora. For more information, please see the `engine` argument in the Boto3 RDS `create_db_instance` documentation.

**master\_username**

The name of master user for the client DB instance.

**master\_user\_password**

The password for the master database user. Can be any printable ASCII character except `"/`, `"'`, or `"@"`.

**db\_name**

The meaning of this parameter differs according to the database engine you use. See the Boto3 RDS documentation to determine the appropriate value for your configuration. [https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create\\_db\\_instance](https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create_db_instance)

**storage\_type**

Specifies the storage type to be associated with the DB instance. Options are standard, gp2 and io1. If you specify io1, you must also include a value for the `Iops` parameter.

**db\_security\_groups**

A list of DB security groups to associate with this DB instance.

**vpc\_security\_group\_ids**

A list of EC2 VPC security group IDs to associate with this DB instance.

**vpc\_security\_groups**

A list of EC2 VPC security groups (IDs or Name tags) to associate with this DB instance.

**availability\_zone**

The EC2 Availability Zone that the database instance will be created in.

**db\_subnet\_group\_name**

A DB subnet group to associate with this DB instance.

**preferred\_maintenance\_window**

The weekly time range (in UTC) during which system maintenance can occur.

**db\_parameter\_group\_name**

- A DB parameter group to associate with this DB instance.
- db\_cluster\_identifier**  
If the DB instance is a member of a DB cluster, contains the name of the DB cluster that the DB instance is a member of.
- tde\_credential\_arn**  
The ARN from the Key Store with which the instance is associated for TDE encryption.
- tde\_credential\_password**  
The password to use for TDE encryption if an encryption key is not used.
- storage\_encrypted**  
Specifies whether the DB instance is encrypted.
- kms\_keyid**  
If storage\_encrypted is true, the KMS key identifier for the encrypted DB instance.
- backup\_retention\_period**  
The number of days for which automated backups are retained.
- preferred\_backup\_window**  
The daily time range during which automated backups are created if automated backups are enabled.
- port**  
The port number on which the database accepts connections.
- multi\_az**  
Specifies if the DB instance is a Multi-AZ deployment. You cannot set the AvailabilityZone parameter if the MultiAZ parameter is set to true.
- engine\_version**  
The version number of the database engine to use.
- auto\_minor\_version\_upgrade**  
Indicates that minor engine upgrades will be applied automatically to the DB instance during the maintenance window.
- license\_model**  
License model information for this DB instance.
- iops**  
The amount of Provisioned IOPS (input/output operations per second) to be initially allocated for the DB instance.
- option\_group\_name**  
Indicates that the DB instance should be associated with the specified option group.
- character\_set\_name**  
For supported engines, indicates that the DB instance should be associated with the specified CharacterSet.
- publicly\_accessible**  
Specifies the accessibility options for the DB instance. A value of true specifies an Internet-facing instance with a publicly resolvable DNS name, which resolves to a public IP address. A value of false specifies an internal instance with a DNS name that resolves to a private IP address.
- wait\_status**  
Wait for the RDS instance to reach a desired status before finishing the state. Available states: available, modifying, backing-up
- tags**  
A dict of tags.
- copy\_tags\_to\_snapshot**  
Specifies whether tags are copied from the DB instance to snapshots of the DB instance.
- region**  
Region to connect to.
- domain**  
The identifier of the Active Directory Domain.
- key**  
AWS secret key to be used.
- keyid**

AWS access key to be used.

**monitoring\_interval**

The interval, in seconds, between points when Enhanced Monitoring metrics are collected for the DB instance.

**monitoring\_role\_arn**

The ARN for the IAM role that permits RDS to send Enhanced Monitoring metrics to CloudWatch Logs.

**domain\_iam\_role\_name**

Specify the name of the IAM role to be used when making API calls to the Directory Service.

**promotion\_tier**

A value that specifies the order in which an Aurora Replica is promoted to the primary instance after a failure of the existing primary instance. For more information, see Fault Tolerance for an Aurora DB Cluster .

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_rds.replica_present(name, source, db_instance_class=None,
                                     availability_zone=None, port=None,
                                     auto_minor_version_upgrade=None, iops=None,
                                     option_group_name=None, publicly_accessible=None,
                                     tags=None, region=None, key=None, keyid=None,
                                     profile=None, db_parameter_group_name=None)
```

Ensure RDS replica exists.

**Ensure myrds replica RDS exists:**

**boto\_rds.create\_replica:**

- **name:** myreplica
- **source:** mydb

```
salt.states.boto_rds.subnet_group_absent(name, tags=None, region=None, key=None, keyid=None,
                                          profile=None)
```

```
salt.states.boto_rds.subnet_group_present(name, description, subnet_ids=None,
                                           subnet_names=None, tags=None, region=None,
                                           key=None, keyid=None, profile=None)
```

Ensure DB subnet group exists.

**name**

The name for the DB subnet group. This value is stored as a lowercase string.

**subnet\_ids**

A list of the EC2 Subnet IDs for the DB subnet group. Either `subnet_ids` or `subnet_names` must be provided.

**subnet\_names**

A list of The EC2 Subnet names for the DB subnet group. Either `subnet_ids` or `subnet_names` must be provided.

**description**

Subnet group description.

**tags**

A dict of tags.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 26.19.45 salt.states.boto\_route53

Manage Route53 records

New in version 2014.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsd fjkg hWupUj asdf lkd fkl gjsdfj ajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsd fjkg hWupUj asdf lkd fkl gjsdfj ajkghs
region: us-east-1
```

```
mycnamerecord:
boto_route53.present:
- name: test.example.com.
- value: my-elb.us-east-1.elb.amazonaws.com.
- zone: example.com.
- ttl: 60
- record_type: CNAME
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsd fjkg hWupUj asdf lkd fkl gjsdfj ajkghs
```

*# Using a profile from pillars*

```
myarecord:
boto_route53.present:
- name: test.example.com.
- value: 1.1.1.1
- zone: example.com.
- ttl: 60
- record_type: A
- region: us-east-1
- profile: myprofile
```

*# Passing in a profile*

```
myarecord:
boto_route53.present:
- name: test.example.com.
```

(continues on next page)

(continued from previous page)

```

- value: 1.1.1.1
- zone: example.com.
- ttl: 60
- record_type: A
- region: us-east-1
- profile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs

```

`salt.states.boto_route53.absent` (*name, zone, record\_type, identifier=None, region=None, key=None, keyid=None, profile=None, wait\_for\_sync=True, split\_dns=False, private\_zone=False*)

Ensure the Route53 record is deleted.

**name**

Name of the record.

**zone**

The zone to delete the record from.

**record\_type**

The record type (A, NS, MX, TXT, etc.)

**identifier**

An identifier to match for deletion.

**region**

The region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_sync**

Wait for an INSYNC change status from Route53.

**split\_dns**

Route53 supports a public and private DNS zone with the same names.

**private\_zone**

If using `split_dns`, specify if this is the private zone.

`salt.states.boto_route53.hosted_zone_absent` (*name, domain\_name=None, region=None, key=None, keyid=None, profile=None*)

Ensure the Route53 Hostes Zone described is absent

**name**

The name of the state definition.

**domain\_name**

The FQDN (including final period) of the zone you wish absent. If not provided, the value of name will be used.

`salt.states.boto_route53.hosted_zone_present` (*name, domain\_name=None, private\_zone=False, caller\_ref=None, comment="", vpc\_id=None, vpc\_name=None, vpc\_region=None, region=None, key=None, keyid=None, profile=None*)

Ensure a hosted zone exists with the given attributes. Note that most things cannot be modified once a zone is created - it must be deleted and re-spun to update these attributes:

- `private_zone` (AWS API limitation).

- comment (the appropriate call exists in the AWS API and in boto3, but has not, as of this writing, been added to boto2).
- vpc\_id (same story - we really need to rewrite this module with boto3)
- vpc\_name (really just a pointer to vpc\_id anyway).
- vpc\_region (again, supported in boto3 but not boto2).

If you need the ability to update these attributes, please use the newer boto3\_route53 module instead.

**name**

The name of the state definition.

**domain\_name**

The name of the domain. This must be fully-qualified, terminating with a period. This is the name you have registered with your domain registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. Defaults to the value of name if not provided.

**private\_zone**

Set True if creating a private hosted zone.

**caller\_ref**

A unique string that identifies the request and that allows create\_hosted\_zone() calls to be retried without the risk of executing the operation twice. This helps ensure idempotency across state calls, but can cause issues if a zone is deleted and then an attempt is made to recreate it with the same caller\_ref. If not provided, a unique UUID will be generated at each state run, which avoids the risk of the above (transient) error. This option is generally not needed. Maximum length of 128.

**comment**

Any comments you want to include about the hosted zone.

**vpc\_id**

When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc\_name. Ignored when creating a non-private zone.

**vpc\_name**

When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc\_id. Ignored when creating a non-private zone.

**vpc\_region**

When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from vpc\_id or vpc\_name, where possible. If this fails, you'll need to provide an explicit value for this option. Ignored when creating a non-private zone.

```

salt.states.boto_route53.present(name, value, zone, record_type, ttl=None, identifier=None,
                                region=None, key=None, keyid=None, profile=None,
                                wait_for_sync=True, split_dns=False, private_zone=False)

```

Ensure the Route53 record is present.

**name**

Name of the record.

**value**

**Value of the record. As a special case, you can pass in:**

*private*:<Name tag> to have the function autodetermine the private IP *public*:<Name tag> to have the function autodetermine the public IP

**zone**

The zone to create the record in.

**record\_type**

The record type (A, NS, MX, TXT, etc.)

**ttl**

The time to live for the record.

**identifier**

The unique identifier to use for this record.

**region**

The region to connect to.

**key**  
Secret key to be used.

**keyid**  
Access key to be used.

**profile**  
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_sync**  
Wait for an INSYNC change status from Route53 before returning success.

**split\_dns**  
Route53 supports parallel public and private DNS zones with the same name.

**private\_zone**  
If using split\_dns, specify if this is the private zone.

`salt.states.boto_route53.rr_absent(*args, **kwargs)`

`salt.states.boto_route53.rr_present(*args, **kwargs)`

### 26.19.46 salt.states.boto\_s3

#### Manage S3 Resources

New in version 2018.3.0.

Manage S3 resources. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
Ensure s3 object exists:
boto_s3.object_present:
- name: s3-bucket/s3-key
- source: /path/to/local/file
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
- profile: my-profile
```

**depends**  
boto3

```
salt.states.boto_s3.object_present(name, source=None, hash_type=None, extra_args=None,
                                     extra_args_from_pillar='boto_s3_object_extra_args',
                                     region=None, key=None, keyid=None, profile=None)
```

Ensure object exists in S3.

**name**

The name of the state definition. This will be used to determine the location of the object in S3, by splitting on the first slash and using the first part as the bucket name and the remainder as the S3 key.

**source**

The source file to upload to S3, currently this only supports files hosted on the minion's local file system (starting with /).

**hash\_type**

Hash algorithm to use to check that the object contents are correct. Defaults to the value of the *hash\_type* config option.

**extra\_args**

A dictionary of extra arguments to use when uploading the file. Note that these are only enforced if new objects are uploaded, and not modified on existing objects. The supported args are those in the ALLOWED\_UPLOAD\_ARGS list at <http://boto3.readthedocs.io/en/latest/reference/customizations/s3.html>. However, Note that the 'ACL', 'GrantFullControl', 'GrantRead', 'GrantReadACP', and 'GrantWriteACL' keys are currently not supported.

**extra\_args\_from\_pillar**

Name of pillar dict that contains extra arguments. Extra arguments defined for this specific state will be merged over those from the pillar.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 26.19.47 salt.states.boto\_s3\_bucket

### Manage S3 Buckets

New in version 2016.3.0.

Create and destroy S3 buckets. Be aware that this interacts with Amazon's services, and so may incur charges.

**depends**

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkgsh
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

**myprofile:**

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
region: us-east-1
```

Ensure bucket exists:

```
boto_s3_bucket.present:
- Bucket: mybucket
- LocationConstraint: EU
- ACL:
  - GrantRead: "uri=http://acs.amazonaws.com/groups/global/AllUsers"
- CORSRules:
  - AllowedHeaders: []
    AllowedMethods: ["GET"]
    AllowedOrigins: ["*"]

```

`salt.states.boto_s3_bucket.absent` (*name*, *Bucket*, *Force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure bucket with passed properties is absent.

**name**

The name of the state definition.

**Bucket**

Name of the bucket.

**Force**

Empty the bucket first if necessary - Boolean.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_s3_bucket.present( name, Bucket, LocationConstraint=None, ACL=None,
                                     CORSRules=None, LifecycleConfiguration=None, Logging=None,
                                     NotificationConfiguration=None, Policy=None, Replication=None,
                                     RequestPayment=None, Tagging=None, Versioning=None,
                                     Website=None, region=None, key=None, keyid=None,
                                     profile=None)
```

Ensure bucket exists.

**name**

The name of the state definition

**Bucket**

Name of the bucket.

**LocationConstraint**

'EU'|'eu-west-1'|'us-west-1'|'us-west-2'|'ap-southeast-1'|'ap-southeast-2'|'ap-northeast-1'|'sa-east-1'|'cn-north-1'|'eu-central-1'

**ACL**

The permissions on a bucket using access control lists (ACL).

**CORSRules**

The cors configuration for a bucket.

**LifecycleConfiguration**

Lifecycle configuration for your bucket

**Logging**

The logging parameters for a bucket and to specify permissions for who can view and modify the logging parameters.

**NotificationConfiguration**

notifications of specified events for a bucket

**Policy**

Policy on the bucket

**Replication**

Replication rules. You can add as many as 1,000 rules. Total replication configuration size can be up to 2 MB

**RequestPayment**

The request payment configuration for a bucket. By default, the bucket owner pays for downloads from the bucket. This configuration parameter enables the bucket owner (only) to specify that the person requesting the download will be charged for the download

**Tagging**

A dictionary of tags that should be set on the bucket

**Versioning**

The versioning state of the bucket

**Website**

The website configuration of the bucket

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 26.19.48 salt.states.boto\_secgroup

### Manage Security Groups

New in version 2014.7.0.

Create and destroy Security Groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
secgroup.keyid: GKTADJGHEIQSXMKKRBJ08H
secgroup.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
region: us-east-1
```

```
Ensure mysecgroup exists:
boto_secgroup.present:
- name: mysecgroup
- description: My security group
- vpc_name: myvpc
- rules:
  - ip_protocol: tcp
    from_port: 80
    to_port: 80
    cidr_ip:
      - 10.0.0.0/8
      - 192.168.0.0/16
  - ip_protocol: tcp
    from_port: 8080
    to_port: 8090
    cidr_ip:
```

(continues on next page)

(continued from previous page)

```

        - 10.0.0.0/8
        - 192.168.0.0/16
    - ip_protocol: icmp
      from_port: -1
      to_port: -1
      source_group_name: mysecgroup
    - ip_protocol: tcp
      from_port: 8080
      to_port: 8080
      source_group_name: MyOtherSecGroup
      source_group_name_vpc: MyPeeredVPC
  - rules_egress:
    - ip_protocol: all
      from_port: -1
      to_port: -1
      cidr_ip:
        - 10.0.0.0/8
        - 192.168.0.0/16
  - tags:
    SomeTag: 'My Tag Value'
    SomeOtherTag: 'Other Tag Value'
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs

# Using a profile from pillars
Ensure mysecgroup exists:
  boto_secgroup.present:
    - name: mysecgroup
    - description: My security group
    - profile: myprofile

# Passing in a profile
Ensure mysecgroup exists:
  boto_secgroup.present:
    - name: mysecgroup
    - description: My security group
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs
      region: us-east-1

```

**Note:** When using the `profile` parameter and `region` is set outside of the profile group, `region` is ignored and a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

`salt.states.boto_secgroup.absent` (*name*, *vpc\_id=None*, *vpc\_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a security group with the specified name does not exist.

**name**

Name of the security group.

**vpc\_id**

The ID of the VPC to remove the security group from, if any. Exclusive with vpc\_name.

**vpc\_name**

The name of the VPC to remove the security group from, if any. Exclusive with vpc\_id.

New in version 2016.3.0.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_secgroup.present` (*name, description, vpc\_id=None, vpc\_name=None, rules=None, rules\_egress=None, delete\_ingress\_rules=True, delete\_egress\_rules=True, region=None, key=None, keyid=None, profile=None, tags=None*)

Ensure the security group exists with the specified rules.

**name**

Name of the security group.

**description**

A description of this security group.

**vpc\_id**

The ID of the VPC to create the security group in, if any. Exclusive with vpc\_name.

**vpc\_name**

The name of the VPC to create the security group in, if any. Exclusive with vpc\_id.

New in version 2016.3.0.

New in version 2015.8.2.

**rules**

A list of ingress rule dicts. If not specified, `rules=None`, the ingress rules will be unmanaged. If set to an empty list, `[]`, then all ingress rules will be removed.

**rules\_egress**

A list of egress rule dicts. If not specified, `rules_egress=None`, the egress rules will be unmanaged. If set to an empty list, `[]`, then all egress rules will be removed.

**delete\_ingress\_rules**

Some tools (EMR comes to mind) insist on adding rules on-the-fly, which salt will happily remove on the next run. Set this param to False to avoid deleting rules which were added outside of salt.

**delete\_egress\_rules**

Some tools (EMR comes to mind) insist on adding rules on-the-fly, which salt will happily remove on the next run. Set this param to False to avoid deleting rules which were added outside of salt.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key, and keyid.

**tags**

List of key:value pairs of tags to set on the security group

New in version 2016.3.0.

### 26.19.49 salt.states.boto\_sns

Manage SNS Topics

Create and destroy SNS topics. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBj08H
sns.key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBj08H
  key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
  region: us-east-1
```

```
mytopic:
  boto_sns.present:
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBj08H
    - key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

*# Using a profile from pillars*

```
mytopic:
  boto_sns.present:
    - region: us-east-1
    - profile: mysnsprofile
```

*# Passing in a profile*

```
mytopic:
  boto_sns.present:
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBj08H
      key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

`salt.states.boto_sns.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *unsubscribe=False*)

Ensure the named sns topic is deleted.

**name**

Name of the SNS topic.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**unsubscribe**

If True, unsubscribe all subscriptions to the SNS topic before deleting the SNS topic

New in version 2016.11.0.

`salt.states.boto_sns.present` (*name*, *subscriptions=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the SNS topic exists.

**name**

Name of the SNS topic.

**subscriptions**

List of SNS subscriptions.

Each subscription is a dictionary with a protocol and endpoint key:

```
[
  {'protocol': 'https', 'endpoint': 'https://www.example.com/sns-
  ↪endpoint'},
  {'protocol': 'sqs', 'endpoint': 'arn:aws:sqs:us-west-
  ↪2:123456789012:MyQueue'}
]
```

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 26.19.50 salt.states.boto\_sqs

Manage SQS Queues

New in version 2014.7.0.

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit SQS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkgsh
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsd fjkg hWupUjasdf lkd fklgjsdfjajkghs
  region: us-east-1

```

```

myqueue:
  boto_sqs.present:
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsd fjkg hWupUjasdf lkd fklgjsdfjajkghs
    - attributes:
      ReceiveMessageWaitTimeSeconds: 20

# Using a profile from pillars
myqueue:
  boto_sqs.present:
    - region: us-east-1
    - profile: mysqsprofile

# Passing in a profile
myqueue:
  boto_sqs.present:
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsd fjkg hWupUjasdf lkd fklgjsdfjajkghs

```

`salt.states.boto_sqs.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named sqs queue is deleted.

**name**

Name of the SQS queue.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_sqs.present` (*name*, *attributes=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the SQS queue exists.

**name**

Name of the SQS queue.

**attributes**

A dict of key/value SQS attributes.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**26.19.51 salt.states.boto\_vpc****Manage VPCs**

New in version 2015.8.0.

**depends**

- boto >= 2.8.0
- boto3 >= 1.2.6

Create and destroy VPCs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsd fjkg hWupUjasdf lkd fklgjsdfjajkg h s
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsd fjkg hWupUjasdf lkd fklgjsdfjajkg h s
region: us-east-1
```

```
aws:
region:
  us-east-1:
    profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsd fjkg hWupUjasdf lkd fklgjsdfjajkg h s
      region: us-east-1
```

```
Ensure VPC exists:
  boto_vpc.present:
    - name: myvpc
    - cidr_block: 10.10.11.0/24
    - dns_hostnames: True
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsd fjkg hWupUjasdf lkd fklgjsdfjajkg h s

Ensure subnet exists:
  boto_vpc.subnet_present:
    - name: mysubnet
    - vpc_id: vpc-123456
```

(continues on next page)

(continued from previous page)

```

- cidr_block: 10.0.0.0/16
- region: us-east-1
- profile: myprofile

{% set profile = salt['pillar.get']('aws:region:us-east-1:profile' ) %}
Ensure internet gateway exists:
  boto_vpc.internet_gateway_present:
    - name: myigw
    - vpc_name: myvpc
    - profile: {{ profile }}

Ensure route table exists:
  boto_vpc.route_table_present:
    - name: my_route_table
    - vpc_id: vpc-123456
    - routes:
      - destination_cidr_block: 0.0.0.0/0
        instance_id: i-123456
    - subnet_names:
      - subnet1
      - subnet2
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs

```

New in version 2016.11.0.

Request, accept and delete VPC peering connections. VPC peering connections can be named allowing the name to be used throughout the state file. Following example shows how to request and accept a VPC peering connection.

```

accept the vpc peering connection:
  boto_vpc.accept_vpc_peering_connection:
    - conn_name: salt_vpc_peering
    - region: us-west-2
    - require:
      - boto_vpc: request a vpc peering connection

request a vpc peering connection:
  boto_vpc.request_vpc_peering_connection:
    - requester_vpc_id: vpc-4a3d522e
    - peer_vpc_id: vpc-ae81e9ca
    - region: us-west-2
    - conn_name: salt_vpc_peering

```

VPC peering connections need not be named. In this case the VPC peering connection ID should be used in the state file.

```

accept the vpc peering connection:
  boto_vpc.accept_vpc_peering_connection:
    - conn_id: pcx-1873c371
    - region: us-west-2

```

VPC peering connections can be deleted, as shown below.

```

delete a named vpc peering connection:
boto_vpc.delete_vpc_peering_connection:
  - conn_name: salt_vpc_peering

```

Delete also accepts a VPC peering connection id.

```

delete a vpc peering connection by id:
boto_vpc.delete_vpc_peering_connection:
  - conn_id: pcx-1873c371

```

`salt.states.boto_vpc.absent` (*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure VPC with passed properties is absent.

**name**

Name of the VPC.

**tags**

A list of tags. All tags must match.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.accept_vpc_peering_connection` (*name=None*, *conn\_id=None*, *conn\_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Accept a VPC pending requested peering connection between two VPCs.

**name**

Name of this state

**conn\_id**

The connection ID to accept. Exclusive with `conn_name`. String type.

**conn\_name**

The name of the VPC peering connection to accept. Exclusive with `conn_id`. String type.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```

boto_vpc.accept_vpc_peering_connection:
  - conn_name: salt_peering_connection

# usage with vpc peering connection id and region
boto_vpc.accept_vpc_peering_connection:
  - conn_id: pbx-1873d472
  - region: us-west-2

```

`salt.states.boto_vpc.delete_vpc_peering_connection` (*name*, *conn\_id=None*, *conn\_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

**name**  
Name of the state

**conn\_id**  
ID of the peering connection to delete. Exclusive with `conn_name`.

**conn\_name**  
The name of the peering connection to delete. Exclusive with `conn_id`.

**region**  
Region to connect to.

**key**  
Secret key to be used.

**keyid**  
Access key to be used.

**profile**  
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.  
New in version 2016.11.0.

Example:

```
delete a vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - region: us-west-2
    - conn_id: pcx-4613b12e
```

Connection name can be specified (instead of ID). Specifying both `conn_name` and `conn_id` will result in an error.

```
delete a vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - conn_name: salt_vpc_peering
```

`salt.states.boto_vpc.dhcp_options_absent` (*name=None*, *dhcp\_options\_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a set of DHCP options with the given settings exist.

**name**  
(string) Name of the DHCP options set.

**dhcp\_options\_id**  
(string) Id of the DHCP options set.

**region**  
(string) Region to connect to.

**key**  
(string) Secret key to be used.

**keyid**  
(string) Access key to be used.

**profile**  
(various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.  
New in version 2016.3.0.

`salt.states.boto_vpc.dhcp_options_present` (*name, dhcp\_options\_id=None, vpc\_name=None, vpc\_id=None, domain\_name=None, domain\_name\_servers=None, ntp\_servers=None, netbios\_name\_servers=None, netbios\_node\_type=None, tags=None, region=None, key=None, keyid=None, profile=None*)

Ensure a set of DHCP options with the given settings exist. Note that the current implementation only SETS values during option set creation. It is unable to update option sets in place, and thus merely verifies the set exists via the given name and/or `dhcp_options_id` param.

**name**

(string) Name of the DHCP options.

**vpc\_name**

(string) Name of a VPC to which the options should be associated. Either `vpc_name` or `vpc_id` must be provided.

**vpc\_id**

(string) Id of a VPC to which the options should be associated. Either `vpc_name` or `vpc_id` must be provided.

**domain\_name**

(string) Domain name to be associated with this option set.

**domain\_name\_servers**

(list of strings) The IP address(es) of up to four domain name servers.

**ntp\_servers**

(list of strings) The IP address(es) of up to four desired NTP servers.

**netbios\_name\_servers**

(list of strings) The IP address(es) of up to four NetBIOS name servers.

**netbios\_node\_type**

(string) The NetBIOS node type (1, 2, 4, or 8). For more information about the allowed values, see RFC 2132. The recommended is 2 at this time (broadcast and multicast are currently not supported).

**tags**

(dict of key:value pairs) A set of tags to be added.

**region**

(string) Region to connect to.

**key**

(string) Secret key to be used.

**keyid**

(string) Access key to be used.

**profile**

(various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_vpc.internet_gateway_absent` (*name, detach=False, region=None, key=None, keyid=None, profile=None*)

Ensure the named internet gateway is absent.

**name**

Name of the internet gateway.

**detach**

First detach the internet gateway from a VPC, if attached.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.internet_gateway_present` (*name*, *vpc\_name=None*, *vpc\_id=None*,  
*tags=None*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Ensure an internet gateway exists.

**name**

Name of the internet gateway.

**vpc\_name**

Name of the VPC to which the internet gateway should be attached.

**vpc\_id**

Id of the VPC to which the internet\_gateway should be attached. Only one of vpc\_name or vpc\_id may be provided.

**tags**

A list of tags.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.nat_gateway_absent` (*name=None*, *subnet\_name=None*, *subnet\_id=None*,  
*region=None*, *key=None*, *keyid=None*, *profile=None*,  
*wait\_for\_delete\_retries=0*)

Ensure the nat gateway in the named subnet is absent.

This function requires boto3.

New in version 2016.11.0.

**name**

Name of the state.

**subnet\_name**

Name of the subnet within which the nat gateway should exist

**subnet\_id**

Id of the subnet within which the nat gateway should exist. Either subnet\_name or subnet\_id must be provided.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_delete\_retries**

NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding. Default is set to 0 for backward compatibility.

`salt.states.boto_vpc.nat_gateway_present` (*name*, *subnet\_name=None*, *subnet\_id=None*,  
*region=None*, *key=None*, *keyid=None*, *profile=None*,  
*allocation\_id=None*)

Ensure a nat gateway exists within the specified subnet

This function requires boto3.

New in version 2016.11.0.

Example:

```
boto_vpc.nat_gateway_present:
- subnet_name: my-subnet
```

**name**

Name of the state

**subnet\_name**

Name of the subnet within which the nat gateway should exist

**subnet\_id**

Id of the subnet within which the nat gateway should exist. Either `subnet_name` or `subnet_id` must be provided.

**allocation\_id**

If specified, the elastic IP address referenced by the ID is associated with the gateway. Otherwise, a new `allocation_id` is created and used.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

```
salt.states.boto_vpc.present(name, cidr_block, instance_tenancy=None, dns_support=None, dns_hostnames=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Ensure VPC exists.

**name**

Name of the VPC.

**cidr\_block**

The range of IPs in CIDR format, for example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

**instance\_tenancy**

Instances launched in this VPC will be in single-tenant or dedicated hardware.

**dns\_support**

Indicates whether the DNS resolution is supported for the VPC.

**dns\_hostnames**

Indicates whether the instances launched in the VPC get DNS hostnames.

**tags**

A list of tags.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

`salt.states.boto_vpc.request_vpc_peering_connection` (*name*, *requester\_vpc\_id=None*,  
*requester\_vpc\_name=None*,  
*peer\_vpc\_id=None*,  
*peer\_vpc\_name=None*,  
*conn\_name=None*,  
*peer\_owner\_id=None*,  
*peer\_region=None*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

**name**

Name of the state

**requester\_vpc\_id**ID of the requesting VPC. Exclusive with `requester_vpc_name`. String type.**requester\_vpc\_name**Name tag of the requesting VPC. Exclusive with `requester_vpc_id`. String type.**peer\_vpc\_id**ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with `peer_vpc_name`. String type.**peer\_vpc\_name**Name tag of the VPC to create VPC peering connection with. This can only be a VPC the same account and region. Exclusive with `peer_vpc_id`. String type.**conn\_name**

The (optional) name to use for this VPC peering connection. String type.

**peer\_owner\_id**

ID of the owner of the peer VPC. String type. If this isn't supplied AWS uses your account ID. Required if peering to a different account.

**peer\_region**

Region of peer VPC. For inter-region vpc peering connections. Not required for intra-region peering connections.

New in version 3005.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

New in version 2016.11.0.

Example:

```

request a vpc peering connection:
boto_vpc.request_vpc_peering_connection:
- requester_vpc_id: vpc-4b3522e
- peer_vpc_id: vpc-ae83f9ca
- conn_name: salt_peering_connection

```

`salt.states.boto_vpc.route_table_absent` (*name*, *region=None*, *key=None*, *keyid=None*,  
*profile=None*)

Ensure the named route table is absent.

**name**

Name of the route table.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.route_table_present(name, vpc_name=None, vpc_id=None, routes=None,
                                         subnet_ids=None, subnet_names=None, tags=None,
                                         region=None, key=None, keyid=None, profile=None)
```

Ensure route table with routes exists and is associated to a VPC.

This function requires boto3 to be installed if nat gatewayas are specified.

Example:

```
boto_vpc.route_table_present:
- name: my_route_table
- vpc_id: vpc-123456
- routes:
  - destination_cidr_block: 0.0.0.0/0
    internet_gateway_name: InternetGateway
  - destination_cidr_block: 10.10.11.0/24
    instance_id: i-123456
  - destination_cidr_block: 10.10.12.0/24
    interface_id: eni-123456
  - destination_cidr_block: 10.10.13.0/24
    instance_name: mygatewayserver
- subnet_names:
  - subnet1
  - subnet2
```

**name**

Name of the route table.

**vpc\_name**

Name of the VPC with which the route table should be associated.

**vpc\_id**

Id of the VPC with which the route table should be associated. Either vpc\_name or vpc\_id must be provided.

**routes**

A list of routes. Each route has a cidr and a target.

**subnet\_ids**

A list of subnet ids to associate

**subnet\_names**

A list of subnet names to associate

**tags**

A list of tags.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.subnet_absent` (*name=None, subnet\_id=None, region=None, key=None, keyid=None, profile=None*)

Ensure subnet with passed properties is absent.

**name**

Name of the subnet.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.subnet_present` (*name, cidr\_block, vpc\_name=None, vpc\_id=None, availability\_zone=None, tags=None, region=None, key=None, keyid=None, profile=None, route\_table\_id=None, route\_table\_name=None, auto\_assign\_public\_ipv4=False*)

Ensure a subnet exists.

**name**

Name of the subnet.

**cidr\_block**

The range of IPs for the subnet, in CIDR format. For example: 10.0.0/24. Block size must be between /16 and /28 netmask.

**vpc\_name**

Name of the VPC in which the subnet should be placed. Either vpc\_name or vpc\_id must be provided.

**vpc\_id**

Id of the VPC in which the subnet should be placed. Either vpc\_name or vpc\_id must be provided.

**availability\_zone**

AZ in which the subnet should be placed.

**tags**

A list of tags.

**route\_table\_id**

A route table ID to explicitly associate the subnet with. If both route\_table\_id and route\_table\_name are specified, route\_table\_id will take precedence.

New in version 2016.11.0.

**route\_table\_name**

A route table name to explicitly associate the subnet with. If both route\_table\_id and route\_table\_name are specified, route\_table\_id will take precedence.

New in version 2016.11.0.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.vpc_peering_connection_absent` (*name, conn\_id=None, conn\_name=None, region=None, key=None, keyid=None, profile=None*)

`salt.states.boto_vpc.vpc_peering_connection_present` (*name*, *requester\_vpc\_id=None*,  
*requester\_vpc\_name=None*,  
*peer\_vpc\_id=None*,  
*peer\_vpc\_name=None*,  
*conn\_name=None*,  
*peer\_owner\_id=None*,  
*peer\_region=None*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

**name**

Name of the state

**requester\_vpc\_id**

ID of the requesting VPC. Exclusive with `requester_vpc_name`.

**requester\_vpc\_name**

Name tag of the requesting VPC. Exclusive with `requester_vpc_id`.

**peer\_vpc\_id**

ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with `peer_vpc_name`.

**peer\_vpc\_name**

Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account, else resolving it into a vpc ID will fail. Exclusive with `peer_vpc_id`.

**conn\_name**

The name to use for this VPC peering connection.

**peer\_owner\_id**

ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.

**peer\_region**

Region of peer VPC. For inter-region vpc peering connections. Not required for intra-region peering connections.

New in version 3005.

**region**

Region to connect to.

**key**

Secret key to be used.

**keyid**

Access key to be used.

**profile**

A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

New in version 2016.11.0.

Example:

**ensure peering twixt local vpc and the other guys:**

**boto\_vpc.vpc\_peering\_connection\_present:**

- **requester\_vpc\_name:** my\_local\_vpc
- **peer\_vpc\_name:** some\_other\_guys\_vpc
- **conn\_name:** peering\_from\_here\_to\_there
- **peer\_owner\_id:** 012345654321

## 26.19.52 salt.states.bower

### Installation of Bower Packages

These states manage the installed packages using Bower. Note that npm, git and bower must be installed for these states to be available, so bower states should include requisites to pkg.installed states for the packages which provide npm and git (simply npm and git in most cases), and npm.installed state for the package which provides bower.

Example:

```

npm:
  pkg.installed
git:
  pkg.installed
bower:
  npm.installed
  require:
    - pkg: npm
    - pkg: git

underscore:
  bower.installed:
    - dir: /path/to/project
    - require:
      - npm: bower

```

`salt.states.bower.bootstrap`(*name*, *user=None*)

Bootstraps a frontend distribution.

Will execute 'bower install' on the specified directory.

**user**

The user to run Bower with

`salt.states.bower.installed`(*name*, *dir*, *pkgs=None*, *user=None*, *env=None*)

Verify that the given package is installed and is at the correct version (if specified).

```

underscore:
  bower.installed:
    - dir: /path/to/project
    - user: someuser

jquery#2.0:
  bower.installed:
    - dir: /path/to/project

```

**name**

The package to install

**dir**

The target directory in which to install the package

**pkgs**

A list of packages to install with a single Bower invocation; specifying this argument will ignore the name argument

**user**

The user to run Bower with

**env**

A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

`salt.states.bower.pruned` (*name*, *user=None*, *env=None*)

New in version 2017.7.0.

Cleans up local bower\_components directory.

Will execute 'bower prune' on the specified directory (param: name)

**user**

The user to run Bower with

`salt.states.bower.removed` (*name*, *dir*, *user=None*)

Verify that the given package is not installed.

**dir**

The target directory in which to install the package

**user**

The user to run Bower with

### 26.19.53 salt.states.btrfs

Manage BTRFS file systems.

**maintainer**

Alberto Planas <[aplanas@suse.com](mailto:aplanas@suse.com)>

**maturity**

new

**depends**

None

**platform**

Linux

`salt.states.btrfs.properties` (*name*, *device*, *use\_default=False*, *\_\_dest=None*, *\*\*properties*)

Makes sure that a list of properties are set in a subvolume, file or device.

**name**

Name of the object to change

**device**

Device where the object lives, if None, the device will be in name

**use\_default**

If True, this subvolume will be resolved to the default subvolume assigned during the create operation

**properties**

Dictionary of properties

Valid properties are 'ro', 'label' or 'compression'. Check the documentation to see where those properties are valid for each object.

`salt.states.btrfs.subvolume_created` (*name*, *device*, *qgroupids=None*, *set\_default=False*, *copy\_on\_write=True*, *force\_set\_default=True*, *\_\_dest=None*)

Makes sure that a btrfs subvolume is present.

**name**

Name of the subvolume to add

**device**

Device where to create the subvolume

**qgroupids**

Add the newly created subvolume to a qgroup. This parameter is a list

**set\_default**

If True, this new subvolume will be set as default when mounted, unless `subvol` option in `mount` is used

**copy\_on\_write**

If false, set the subvolume with `chattr +C`

**force\_set\_default**

If false and the subvolume is already present, it will not force it as default if `set_default` is True

`salt.states.btrfs.subvolume_deleted` (*name*, *device*, *commit=False*, *\_\_dest=None*)

Makes sure that a btrfs subvolume is removed.

**name**

Name of the subvolume to remove

**device**

Device where to remove the subvolume

**commit**

Wait until the transaction is over

## 26.19.54 salt.states.cabal

### Installation of Cabal Packages

New in version 2015.8.0.

These states manage the installed packages for Haskell using cabal. Note that `cabal-install` must be installed for these states to be available, so cabal states should include a requisite to a `pkg.installed` state for the package which provides cabal (`cabal-install` in case of Debian based distributions). Example:

```
.. code-block:: yaml
```

**cabal-install:**

pkg.installed

**ShellCheck:**

cabal.installed:

- require: - pkg: cabal-install

`salt.states.cabal.installed` (*name*, *pkgs=None*, *user=None*, *install\_global=False*, *env=None*)

Verify that the given package is installed and is at the correct version (if specified).

**ShellCheck-0.3.5:****cabal:**

- **installed:**

**name**

The package to install

**user**

The user to run cabal install with

**install\_global**

Install package globally instead of locally

**env**

A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

`salt.states.cabal.removed`(*name*, *user=None*, *env=None*)

Verify that given package is not installed.

### 26.19.55 salt.states.ceph

Manage ceph with salt.

New in version 2016.11.0.

`salt.states.ceph.quorum`(*name*, *\*\*kwargs*)

Quorum state

This state checks the mon daemons are in quorum. It does not alter the cluster but can be used in formula as a dependency for many cluster operations.

Example usage in sls file:

```
quorum:
  sesceph.quorum:
    - require:
      - sesceph: mon_running
```

### 26.19.56 salt.states.chef

Execute Chef client runs

Run chef-client or chef-solo

```
my-chef-run:
  chef.client:
    - override-runlist: 'demo1,demo2'
    - server: 'https://chef.domain.com'

default-chef-run:
  chef.client: []

my-solo-run:
  chef.solo:
    - environment: dev
```

`salt.states.chef.client`(*name*, *\*\*kwargs*)

**name**

Unique identifier for the state. Does not affect the Chef run.

**server**

The chef server URL

**client\_key**

Set the client key file location

**config**

The configuration file to use

**config-file-jail**

Directory under which config files are allowed to be loaded (no `client.rb` or `knife.rb` outside this path will be loaded).

**environment**

Set the Chef Environment on the node

**group**

Group to set privilege to

**json-attributes**

Load attributes from a JSON file or URL

**localmode**

Point chef-client at local repository if True

**log\_level**

Set the log level (debug, info, warn, error, fatal)

**logfile**

Set the log file location

**node-name**

The node name for this client

**override-runlist**

Replace current run list with specified items for a single run

**pid**

Set the PID file location, defaults to /tmp/chef-client.pid

**run-lock-timeout**

Set maximum duration to wait for another client run to finish, default is indefinitely.

**runlist**

Permanently replace current run list with specified items

**user**

User to set privilege to

**validation\_key**

Set the validation key file location, used for registering new clients

`salt.states.chef.solo(name, **kwargs)`

**name**

Unique identifier for the state. Does not affect the Chef run.

**config**

The configuration file to use

**environment**

Set the Chef Environment on the node

**group**

Group to set privilege to

**json-attributes**

Load attributes from a JSON file or URL

**log\_level**

Set the log level (debug, info, warn, error, fatal)

**logfile**

Set the log file location

**node-name**

The node name for this client

**override-runlist**

Replace current run list with specified items for a single run

**recipe-url**

Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache

**run-lock-timeout**

Set maximum duration to wait for another client run to finish, default is indefinitely.

**user**

User to set privilege to

## 26.19.57 salt.states.chocolatey

Manage Windows Packages using Chocolatey .. versionadded:: 2016.3.0

**Note:** Chocolatey pulls data from the Chocolatey internet database to determine current versions, find available versions, etc. This is normally a slow operation and may be optimized by specifying a local, smaller chocolatey repo.

`salt.states.chocolatey.bootstrapped` (*name*, *force=False*, *source=None*, *version=None*)

New in version 3007.1.

Ensure chocolatey is installed on the system.

You can't upgrade an existing installation with this state. You must use chocolatey to upgrade chocolatey.

For example:

```
choco upgrade chocolatey --version 2.2.0
```

### Parameters

- **name** (*str*) -- The name of the state that installs chocolatey. Required for all states. This is ignored.
- **force** (*bool*) -- Run the bootstrap process even if Chocolatey is found in the path.

**Note:** If chocolatey is already installed this will just re-run the install script over the existing version. The `version` parameter is ignored.

- **source** (*str*) -- The location of the `.nupkg` file or `.ps1` file to run from an alternate location. This can be one of the following types of URLs:
  - `salt://`
  - `http(s)://`
  - `ftp://`
  - `file://` - A local file on the system
- **version** (*str*) -- The version of chocolatey to install. The latest version is installed if this value is `None`. Default is `None`

Example:

```
# Bootstrap the latest version of chocolatey
bootstrap_chocolatey:
  chocolatey.bootstrapped

# Bootstrap the latest version of chocolatey
# If chocolatey is already present, re-run the install script
bootstrap_chocolatey:
  chocolatey.bootstrapped:
    - force: True

# Bootstrap Chocolatey version 1.4.0
bootstrap_chocolatey:
  chocolatey.bootstrapped:
    - version: 1.4.0

# Bootstrap Chocolatey from a local file
bootstrap_chocolatey:
```

(continues on next page)

(continued from previous page)

```

chocolatey.bootstrapped:
  - source: C:\Temp\chocolatey.nupkg

# Bootstrap Chocolatey from a file on the salt master
bootstrap_chocolatey:
  chocolatey.bootstrapped:
    - source: salt://Temp/chocolatey.nupkg

```

`salt.states.chocolatey.installed`(*name*, *version=None*, *source=None*, *force=False*, *pre\_versions=False*, *install\_args=None*, *override\_args=False*, *force\_x86=False*, *package\_args=None*, *allow\_multiple=False*, *execution\_timeout=None*)

Installs a package if not already installed

#### Parameters

- **name** (*str*) -- The name of the package to be installed. Required.
  - **version** (*str*) -- Install a specific version of the package. Defaults to the latest version. If the version is different to the one installed, then the specified version will be installed. Default is `None`.
  - **source** (*str*) -- Chocolatey repository (directory, share or remote URL, feed). `None` defaults to the official Chocolatey feed. Default is `None`.
  - **force** (*bool*) -- Reinstall the current version of an existing package. Do not use with `allow_multiple`. Default is `False`.
  - **pre\_versions** (*bool*) -- Include pre-release packages. Default is `False`.
  - **install\_args** (*str*) -- Install arguments you want to pass to the installation process, i.e. product key or feature list. Default is `None`.
  - **override\_args** (*bool*) -- Set to `True` to override the original install arguments (for the native installer) in the package and use your own. When this is set to `False`, `install_args` will be appended to the end of the default arguments. Default is `False`.
  - **force\_x86** (*bool*) -- Force x86 (32bit) installation on 64bit systems. Default is `False`.
  - **package\_args** (*str*) -- Arguments you want to pass to the package. Default is `None`.
  - **allow\_multiple** (*bool*) -- Allow multiple versions of the package to be installed. Do not use with `force`. Does not work with all packages. Default is `False`.
- New in version 2017.7.0.
- **execution\_timeout** (*str*) -- Chocolatey execution timeout value you want to pass to the installation process. Default is `None`.

Example:

```

install_some_package:
  chocolatey.installed:
    - name: packagename
    - version: '12.04'
    - source: 'mychocolatey/source'
    - force: True

```

`salt.states.chocolatey.source_present`(*name*, *source\_location*, *username=None*, *password=None*, *force=False*, *priority=None*)

Adds a Chocolatey source if not already present.

#### Parameters

- **name** (*str*) -- The name of the source to be added as a chocolatey repository.
- **source** (*str*) -- Location of the source you want to work with.

- **username** (*str*) -- The username for a chocolatey source that needs authentication credentials.
- **password** (*str*) -- The password for a chocolatey source that needs authentication credentials.
- **force** (*bool*) -- Salt will not modify an existing repository with the same name. Set this option to `True` to update an existing repository.
- **priority** (*int*) -- The priority order of this source as compared to other sources. Lower is better. Defaults to 0 (no priority). All priorities above 0 will be evaluated first, then zero-based values will be evaluated in config file order.

Example:

```
add_some_source:
  chocolatey.source_present:
    - name: reponame
    - source: https://repo.exemple.com
    - username: myuser
    - password: mypassword
    - priority: 100
```

`salt.states.chocolatey.unbootstrapped`(*name*)

New in version 3007.1.

Ensure chocolatey is removed from the system.

#### Parameters

**name** (*str*) -- The name of the state that uninstalls chocolatey. Required for all states. This is ignored.

Example:

```
# Uninstall chocolatey
uninstall_chocolatey:
  chocolatey.unbootstrapped
```

`salt.states.chocolatey.uninstalled`(*name*, *version=None*, *uninstall\_args=None*, *override\_args=False*)

Uninstalls a chocolatey package

#### Parameters

- **name** (*str*) -- The name of the package to be uninstalled. Required.
- **version** (*str*) -- Uninstalls a specific version of the package. Defaults to the latest version installed.
- **uninstall\_args** (*str*) -- A list of uninstall arguments you want to pass to the uninstallation process, i.e. product key or feature list
- **override\_args** (*str*) -- Set to `True` if you want to override the original uninstall arguments (for the native uninstaller) in the package and use your own. When this is set to `False`, `uninstall_args` will be appended to the end of the default arguments

Example:

```
remove_my_package:
  chocolatey.uninstalled:
    - name: mypackage
    - version: '21.5'
```

`salt.states.chocolatey.upgraded`(*name*, *version=None*, *source=None*, *force=False*, *pre\_versions=False*, *install\_args=None*, *override\_args=False*, *force\_x86=False*, *package\_args=None*)

Upgrades a chocolatey package. Will install the package if not installed.

New in version 2018.3.0.

#### Parameters

- **name** (*str*) -- The name of the package to be installed. Required.
- **version** (*str*) -- Install a specific version of the package. Defaults to latest version. If the version is greater than the one installed then the specified version will be installed. Default is None.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL, feed). Defaults to the official Chocolatey feed. Default is None.
- **force** (*bool*) -- True will reinstall an existing package with the same version. Default is False.
- **pre\_versions** (*bool*) -- True will include pre-release packages. Default is False.
- **install\_args** (*str*) -- Install arguments you want to pass to the installation process, i.e product key or feature list. Default is None.
- **override\_args** (*bool*) -- True will override the original install arguments (for the native installer) in the package and use those specified in `install_args`. False will append `install_args` to the end of the default arguments. Default is False.
- **force\_x86** (*bool*) -- True forces 32bit installation on 64bit systems. Default is False.
- **package\_args** (*str*) -- Arguments you want to pass to the package. Default is None.

Example:

```
upgrade_some_package:
  chocolatey.upgraded:
    - name: packagename
    - version: '12.04'
    - source: 'mychocolatey/source'
```

## 26.19.58 salt.states.chronos\_job

Configure Chronos jobs via a salt proxy.

```
my_job:
  chronos_job.config:
    - config:
      schedule: "R//PT2S"
      command: "echo 'hi'"
      owner: "me@example.com"
```

New in version 2015.8.2.

`salt.states.chronos_job.absent`(*name*)

Ensure that the chronos job with the given name is not present.

#### Parameters

**name** -- The app name

#### Returns

A standard Salt changes dictionary

`salt.states.chronos_job.config`(*name*, *config*)

Ensure that the chronos job with the given name is present and is configured to match the given config values.

#### Parameters

- **name** -- The job name

- **config** -- The configuration to apply (dict)

**Returns**

A standard Salt changes dictionary

**26.19.59 salt.states.cimc**

A state module to manage Cisco UCS chassis devices.

**codeauthor**

Spencer Ervin <spencer\_ervin@hotmail.com>

**maturity**

new

**depends**

none

**platform**

unix

**About**

This state module was designed to handle connections to a Cisco Unified Computing System (UCS) chassis. This module relies on the CIMC proxy module to interface with the device.

**See also:**

[CIMC Proxy Module](#)

**salt.states.cimc.hostname** (*name, hostname=None*)

Ensures that the hostname is set to the specified value.

New in version 2019.2.0.

name: The name of the module function to execute.

hostname(str): The hostname of the server.

SLS Example:

```
set_name:
  cimc.hostname:
    - hostname: foobar
```

**salt.states.cimc.logging\_levels** (*name, remote=None, local=None*)

Ensures that the logging levels are set on the device. The logging levels must match the following options: emergency, alert, critical, error, warning, notice, informational, debug.

New in version 2019.2.0.

name: The name of the module function to execute.

remote(str): The logging level for SYSLOG logs.

local(str): The logging level for the local device.

SLS Example:

```

logging_levels:
  cimc.logging_levels:
    - remote: informational
    - local: notice

```

`salt.states.cimc.ntp`(*name*, *servers*)

Ensures that the NTP servers are configured. Servers are provided as an individual string or list format. Only four NTP servers will be reviewed. Any entries past four will be ignored.

*name*: The name of the module function to execute.

*servers*(str, list): The IP address or FQDN of the NTP servers.

SLS Example:

```

ntp_configuration_list:
  cimc.ntp:
    - servers:
      - foo.bar.com
      - 10.10.10.10

ntp_configuration_str:
  cimc.ntp:
    - servers: foo.bar.com

```

`salt.states.cimc.power_configuration`(*name*, *policy=None*, *delayType=None*, *delayValue=None*)

Ensures that the power configuration is configured on the system. This is only available on some C-Series servers.

New in version 2019.2.0.

*name*: The name of the module function to execute.

*policy*(str): The action to be taken when chassis power is restored after an unexpected power loss. This can be one of the following:

*reset*: The server is allowed to boot up normally when power is restored. The server can restart immediately or, optionally, after a fixed or random delay.

*stay-off*: The server remains off until it is manually restarted.

*last-state*: The server restarts and the system attempts to restore any processes that were running before power was lost.

*delayType*(str): If the selected policy is reset, the restart can be delayed with this option. This can be one of the following:

*fixed*: The server restarts after a fixed delay.

*random*: The server restarts after a random delay.

*delayValue*(int): If a fixed delay is selected, once chassis power is restored and the Cisco IMC has finished rebooting, the system waits for the specified number of seconds before restarting the server. Enter an integer between 0 and 240.

SLS Example:

```

reset_power:
  cimc.power_configuration:
    - policy: reset
    - delayType: fixed

```

(continues on next page)

(continued from previous page)

```

- delayValue: 0

power_off:
  cimc.power_configuration:
    - policy: stay-off

```

`salt.states.cimc.syslog`(*name*, *primary=None*, *secondary=None*)

Ensures that the syslog servers are set to the specified values. A value of None will be ignored.

*name*: The name of the module function to execute.

*primary*(str): The IP address or FQDN of the primary syslog server.

*secondary*(str): The IP address or FQDN of the secondary syslog server.

SLS Example:

```

syslog_configuration:
  cimc.syslog:
    - primary: 10.10.10.10
    - secondary: foo.bar.com

```

`salt.states.cimc.user`(*name*, *id=""*, *user=""*, *priv=""*, *password=""*, *status='active'*)

Ensures that a user is configured on the device. Due to being unable to verify the user password. This is a forced operation.

New in version 2019.2.0.

*name*: The name of the module function to execute.

*id*(int): The user ID slot on the device.

*user*(str): The username of the user.

*priv*(str): The privilege level of the user.

*password*(str): The password of the user.

*status*(str): The status of the user. Can be either active or inactive.

SLS Example:

```

user_configuration:
  cimc.user:
    - id: 11
    - user: foo
    - priv: admin
    - password: mypassword
    - status: active

```

### 26.19.60 salt.states.cisconso

State module for Cisco NSO Proxy minions

New in version 2016.11.0.

For documentation on setting up the cisconso proxy minion look in the documentation for [salt.proxy.cisconso](#).

`salt.states.cisconso.value_present(name, datastore, path, config)`

Ensure a specific value exists at a given path

#### Parameters

- **name** (str) -- The name for this rule
- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list, str OR tuple) -- The device path to set the value at, a list of element names in order, / separated
- **config** (dict) -- The new value at the given path

Examples:

```
enable pap auth:
  cisconso.config_present:
    - name: enable_pap_auth
    - datastore: running
    - path: devices/device/ex0/config/sys/interfaces/serial/ppp0/
      → authentication
    - config:
      authentication:
        method: pap
        "list-name": foobar
```

### 26.19.61 salt.states.cloud

#### Using states instead of maps to deploy clouds

New in version 2014.1.0.

Use this minion to spin up a cloud instance:

```
my-ec2-instance:
  cloud.profile:
    my-ec2-config
```

`salt.states.cloud.absent(name, onlyif=None, unless=None)`

Ensure that no instances with the specified names exist.

CAUTION: This is a destructive state, which will search all configured cloud providers for the named instance, and destroy it.

#### name

The name of the instance to destroy

#### onlyif

Do run the state only if is unless succeed

#### unless

Do not run the state at least unless succeed

`salt.states.cloud.present`(*name*, *cloud\_provider*, *onlyif=None*, *unless=None*, *opts=None*, *\*\*kwargs*)

Spin up a single instance on a cloud provider, using salt-cloud. This state does not take a profile argument; rather, it takes the arguments that would normally be configured as part of the state.

Note that while this function does take any configuration argument that would normally be used to create an instance, it will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., `cloud.tagged`, `cloud.untagged`, etc).

**name**

The name of the instance to create

**cloud\_provider**

The name of the cloud provider to use

**onlyif**

Do run the state only if is unless succeed

**unless**

Do not run the state at least unless succeed

**opts**

Any extra opts that need to be used

`salt.states.cloud.profile`(*name*, *profile*, *onlyif=None*, *unless=None*, *opts=None*, *\*\*kwargs*)

Create a single instance on a cloud provider, using a salt-cloud profile.

Note that while profiles used this function do take any configuration argument that would normally be used to create an instance using a profile, this state will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., `cloud.tagged`, `cloud.untagged`, etc).

**name**

The name of the instance to create

**profile**

The name of the cloud profile to use

**onlyif**

Do run the state only if is unless succeed

**unless**

Do not run the state at least unless succeed

**kwargs**

Any profile override or addition

**opts**

Any extra opts that need to be used

`salt.states.cloud.volume_absent`(*name*, *provider=None*, *\*\*kwargs*)

Check that a block volume exists.

`salt.states.cloud.volume_attached`(*name*, *server\_name*, *provider=None*, *\*\*kwargs*)

Check if a block volume is attached.

`salt.states.cloud.volume_detached`(*name*, *server\_name=None*, *provider=None*, *\*\*kwargs*)

Check if a block volume is attached.

Returns True if server or Volume do not exist.

`salt.states.cloud.volume_present`(*name*, *provider=None*, *\*\*kwargs*)

Check that a block volume exists.

## 26.19.62 salt.states.cmd

### Execution of arbitrary commands

The cmd state module manages the enforcement of executed commands, this state can tell a command to run under certain circumstances.

A simple example to execute a command:

```
# Store the current date in a file
'date > /tmp/salt-run':
  cmd.run
```

Only run if another execution failed, in this case truncate syslog if there is no disk space:

```
'> /var/log/messages/':
  cmd.run:
    - unless: echo 'foo' > /tmp/.test && rm -f /tmp/.test
```

Only run if the file specified by `creates` does not exist, in this case touch `/tmp/foo` if it does not exist:

```
touch /tmp/foo:
  cmd.run:
    - creates: /tmp/foo
```

`creates` also accepts a list of files, in which case this state will run if **any** of the files do not exist:

```
"echo 'foo' | tee /tmp/bar > /tmp/baz":
  cmd.run:
    - creates:
      - /tmp/bar
      - /tmp/baz
```

---

**Note:** The `creates` option was added to the `cmd` state in version 2014.7.0, and made a global requisite in 3001.

---

Sometimes when running a command that starts up a daemon, the init script doesn't return properly which causes Salt to wait indefinitely for a response. In situations like this try the following:

```
run_installer:
  cmd.run:
    - name: /tmp/installer.bin > /dev/null 2>&1
```

Salt determines whether the `cmd` state is successfully enforced based on the exit code returned by the command. If the command returns a zero exit code, then salt determines that the state was successfully enforced. If the script returns a non-zero exit code, then salt determines that it failed to successfully enforce the state. If a command returns a non-zero exit code but you wish to treat this as a success, then you must place the command in a script and explicitly set the exit code of the script to zero.

Please note that the success or failure of the state is not affected by whether a state change occurred nor the stateful argument.

When executing a command or script, the state (i.e., changed or not) of the command is unknown to Salt's state system. Therefore, by default, the `cmd` state assumes that any command execution results in a changed state.

This means that if a `cmd` state is watched by another state then the state that's watching will always be executed due to the *changed* state in the `cmd` state.

### Using the "Stateful" Argument

Many state functions in this module now also accept a `stateful` argument. If `stateful` is specified to be true then it is assumed that the command or script will determine its own state and communicate it back by following a simple protocol described below:

1. **If there's nothing in the stdout of the command, then assume no changes.** Otherwise, the stdout must be either in JSON or its *last* non-empty line must be a string of `key=value` pairs delimited by spaces (no spaces on either side of `=`).
2. **If it's JSON then it must be a JSON object (e.g., `{}`).** If it's `key=value` pairs then quoting may be used to include spaces. (Python's `shlex` module is used to parse the `key=value` string)

Two special keys or attributes are recognized in the output:

```
changed: bool (i.e., 'yes', 'no', 'true', 'false', case-insensitive)
comment: str (i.e., any string)
```

So, only if `changed` is `True` then assume the command execution has changed the state, and any other key values or attributes in the output will be set as part of the changes.

3. **If there's a comment then it will be used as the comment of the state.**

Here's an example of how one might write a shell script for use with a stateful command:

```
#!/bin/bash
#
echo "Working hard..."

# writing the state line
echo # an empty line here so the next line will be the last.
echo "changed=yes comment='something has changed' whatever=123"
```

And an example SLS file using this module:

```
Run myscript:
cmd.run:
  - name: /path/to/myscript
  - cwd: /
  - stateful: True

Run only if myscript changed something:
cmd.run:
  - name: echo hello
  - cwd: /
  - onchanges:
    - cmd: Run myscript
```

Note that if the second `cmd.run` state also specifies `stateful: True` it can then be watched by some other states as well.

4. **The `stateful` argument can optionally include a `test_name` parameter.**

This is used to specify a command to run in test mode. This command should return stateful data for changes that would be made by the command in the name parameter.

New in version 2015.2.0.

```

Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful:
      - test_name: /path/to/myscript test

Run masterscript:
  cmd.script:
    - name: masterscript
    - source: salt://path/to/masterscript
    - cwd: /
    - stateful:
      - test_name: masterscript test

```

### Should I use `cmd.run` or `cmd.wait`?

---

**Note:** Use `cmd.run` together with `onchanges` instead of `cmd.wait`.

---

These two states are often confused. The important thing to remember about them is that `cmd.run` states are run each time the SLS file that contains them is applied. If it is more desirable to have a command that only runs after some other state changes, then `cmd.wait` does just that. `cmd.wait` is designed to *watch* other states, and is executed when the state it is watching changes. Example:

```

/usr/local/bin/postinstall.sh:
  cmd.wait:
    - watch:
      - pkg: mycustompkg
  file.managed:
    - source: salt://utils/scripts/postinstall.sh

mycustompkg:
  pkg.installed:
    - require:
      - file: /usr/local/bin/postinstall.sh

```

`cmd.wait` itself do not do anything; all functionality is inside its `mod_watch` function, which is called by `watch` on changes.

The preferred format is using the *onchanges Requisite*, which works on `cmd.run` as well as on any other state. The example would then look as follows:

```

/usr/local/bin/postinstall.sh:
  cmd.run:
    - onchanges:
      - pkg: mycustompkg
  file.managed:

```

(continues on next page)

(continued from previous page)

```
- source: salt://utils/scripts/postinstall.sh
```

**mycustompkg:****pkg.installed:**

```
- require:
  - file: /usr/local/bin/postinstall.sh
```

**How do I create an environment from a pillar map?**

The map that comes from a pillar can be directly consumed by the `env` option! To use it, one may pass it like this. Example:

**printenv:****cmd.run:**

```
- env: {{ salt['pillar.get']('example:key', {}) }}
```

```
salt.states.cmd.call(name, func, args=(), kws=None, output_loglevel='debug', hide_output=False,
                    use_vt=False, **kwargs)
```

Invoke a pre-defined Python function with arguments specified in the state declaration. This function is mainly used by the `salt.renderers.pydsl` renderer.

In addition, the `stateful` argument has no effects here.

The return value of the invoked function will be interpreted as follows.

If it's a dictionary then it will be passed through to the state system, which expects it to have the usual structure returned by any salt state function.

Otherwise, the return value (denoted as `result` in the code below) is expected to be a JSON serializable object, and this dictionary is returned:

```
{
  'name': name
  'changes': {'retval': result},
  'result': True if result is None else bool(result),
  'comment': result if isinstance(result, str) else ''
}
```

```
salt.states.cmd.mod_watch(name, **kwargs)
```

Execute a `cmd` function based on a watch call

---

**Note:** This state exists to support special handling of the `watch requisite`. It should not be called directly.

Parameters for this function should be set by the state being triggered.

---

```
salt.states.cmd.run(name, cwd=None, root=None, runas=None, shell=None, env=None, prepend_path=None,
                  stateful=False, output_loglevel='debug', hide_output=False, timeout=None,
                  ignore_timeout=False, use_vt=False, success_retcodes=None, success_stdout=None,
                  success_stderr=None, **kwargs)
```

Run a command if certain circumstances are met. Use `cmd.wait` if you want to use the `watch requisite`.

---

**Note:** The `**kwargs` of `cmd.run` are passed down to one of the following exec modules:

- `cmdmod.run_all`: If used with default `runas`
- `cmdmod.run_chroot`: If used with `non-root` value for `runas`

For more information on what args are available for either of these, refer to the [cmdmod documentation](#).

---

**name**

The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

**cwd**

The current working directory to execute the command in, defaults to `/root`

**root**

Path to the root of the jail to use. If this parameter is set, the command will run inside a chroot

**runas**

The user name (or uid) to run the command as

**shell**

The shell to use for execution, defaults to the shell `grain`

**env**

A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.run:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```
script-bar:
  cmd.run:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

**Note:** When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses *Path* as opposed to *PATH* for other systems.

---

**prepend\_path**

`$PATH` segment to prepend (trailing `'` not necessary) to `$PATH`. This is an easier alternative to the Jinja workaround.

New in version 2018.3.0.

**stateful**

The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

**output\_loglevel**

[debug] Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

**hide\_output**

[False] Suppress stdout and stderr in the state's results.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

**timeout**

If the command has not terminated after `timeout` seconds, send the subprocess `sigterm`, and if `sigterm` is ignored, follow up with `sigkill`

**ignore\_timeout**

Ignore the timeout of commands, which is useful for running `nohup` processes.

New in version 2015.8.0.

**creates**

Only run if the file specified by `creates` do not exist. If you specify a list of files then this state will only run if **any** of the files do not exist.

New in version 2014.7.0.

**use\_vt**

[False] Use VT utils (`saltstack`) to stream the command output more interactively to the console and the logs. This is experimental.

**bg**

[False] If `True`, run command in background and do not await or deliver its results.

New in version 2016.3.6.

**success\_retcodes**

This parameter allows you to specify a list of non-zero return codes that should be considered as successful. If the return code from the command matches any in the list, the state will have a `True` result instead of `False`.

New in version 2019.2.0.

**success\_stdout: This parameter will allow a list of**

strings that when found in standard out should be considered a success. If `stdout` returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

**success\_stderr: This parameter will allow a list of**

strings that when found in standard error should be considered a success. If `stderr` returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

---

**Note:** `cmd.run` supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. You should only use `reload_modules` if your `cmd.run` does some sort of installation (such as `pip`), if you do not reload the modules future items in your state which rely on the software being installed will fail.

```

getpip:
  cmd.run:
    - name: /usr/bin/python /usr/local/sbin/get-pip.py
    - unless: which pip
    - require:
      - pkg: python
      - file: /usr/local/sbin/get-pip.py
    - reload_modules: True

```

`salt.states.cmd.script` (*name*, *source=None*, *template=None*, *cwd=None*, *runas=None*, *password=None*, *shell=None*, *env=None*, *stateful=False*, *timeout=None*, *use\_vt=False*, *output\_loglevel='debug'*, *hide\_output=False*, *defaults=None*, *context=None*, *success\_retcodes=None*, *success\_stdout=None*, *success\_stderr=None*, *\*\*kwargs*)

Download a script and execute it with specified arguments.

**source**

The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

**template**

If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported

**name**

Either "cmd arg1 arg2 arg3..." (cmd is not used) or a source "salt://..."

**cwd**

The current working directory to execute the command in, defaults to /root

**runas**

Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

---

**Note:** For Windows users, specifically Server users, it may be necessary to specify your runas user using the User Logon Name instead of the legacy logon name. Traditionally, logons would be in the following format.

Domain/user

In the event this causes issues when executing scripts, use the UPN format which looks like the following.

user@domain.local

More information <<https://github.com/saltstack/salt/issues/55080>>

---

**password**

New in version 3000: Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

**shell**

The shell to use for execution. The default is set in grains['shell']

**env**

A list of environment variables to be set prior to execution. Example:

```

salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'

```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

**Note:** When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses *Path* as opposed to *PATH* for other systems.

#### saltenv

[base] The Salt environment to use

#### stateful

The command being executed is expected to return data about executing a state. For more information, see the [Using the "Stateful" Argument](#) section.

#### timeout

If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

#### args

String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: "arg1 'arg two' arg3"

#### creates

Only run if the file specified by `creates` do not exist. If you specify a list of files then this state will only run if **any** of the files do not exist.

New in version 2014.7.0.

#### use\_vt

Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

#### context

New in version 2016.3.0.

Overrides default context variables passed to the template.

#### defaults

New in version 2016.3.0.

Default context passed to the template.

#### output\_loglevel

[debug] Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

**hide\_output**

[False] Suppress stdout and stderr in the state's results.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

**success\_retcodes**

This parameter allows you to specify a list of non-zero return codes that should be considered as successful. If the return code from the command matches any in the list, the state will have a `True` result instead of `False`.

New in version 2019.2.0.

**success\_stdout: This parameter will allow a list of**

strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

**success\_stderr: This parameter will allow a list of**

strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

`salt.states.cmd.wait` (*name*, *cwd*=None, *root*=None, *runas*=None, *shell*=None, *env*=(), *stateful*=False, *output\_loglevel*='debug', *hide\_output*=False, *use\_vt*=False, *success\_retcodes*=None, *success\_stdout*=None, *success\_stderr*=None, *\*\*kwargs*)

Run the given command only if the watch statement calls it.

---

**Note:** Use `cmd.run` together with `onchanges` instead of `cmd.wait`.

---

**name**

The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

**cwd**

The current working directory to execute the command in, defaults to `/root`

**root**

Path to the root of the jail to use. If this parameter is set, the command will run inside a chroot

**runas**

The user name to run the command as

**shell**

The shell to use for execution, defaults to `/bin/sh`

**env**

A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.wait:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```
script-bar:
  cmd.wait:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

---

**Note:** When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses *Path* as opposed to *PATH* for other systems.

---

#### stateful

The command being executed is expected to return data about executing a state. For more information, see the [Using the "Stateful" Argument](#) section.

#### creates

Only run if the file specified by `creates` do not exist. If you specify a list of files then this state will only run if **any** of the files do not exist.

New in version 2014.7.0.

#### output\_loglevel

[debug] Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

#### hide\_output

[False] Suppress stdout and stderr in the state's results.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

#### use\_vt

Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

#### success\_retcodes

This parameter allows you to specify a list of non-zero return codes that should be considered as successful. If the return code from the command matches any in the list, the state will have a `True` result instead of `False`.

New in version 2019.2.0.

**success\_stdout:** This parameter will allow a list of strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

**success\_stderr:** This parameter will allow a list of strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

```
salt.states.cmd.wait_call(name, func, args=(), kws=None, stateful=False, use_vt=False,
                          output_loglevel='debug', hide_output=False, **kwargs)
```

```
salt.states.cmd.wait_script(name, source=None, template=None, cwd=None, runas=None, shell=None,
                            env=None, stateful=False, use_vt=False, output_loglevel='debug',
                            hide_output=False, success_retcodes=None, success_stdout=None,
                            success_stderr=None, **kwargs)
```

Download a script from a remote source and execute it only if a watch statement calls it.

#### source

The source script being downloaded to the minion, this source script is hosted on the salt master server. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

#### template

If this setting is applied then the named templating engine will be used to render the downloaded file, currently jinja, mako, and wempy are supported

#### name

The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

#### cwd

The current working directory to execute the command in, defaults to /root

#### runas

The user name to run the command as

#### shell

The shell to use for execution, defaults to the shell grain

#### env

A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
cmd.wait_script:
- env:
  - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So \$PATH in the following example is a literal '\$PATH':

```
salt://scripts/bar.sh:
cmd.wait_script:
- env: "PATH=/some/path:$PATH"
```

One can still use the existing \$PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

---

**Note:** When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses *Path* as opposed to *PATH* for other systems.

---

#### stateful

The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

#### use\_vt

Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

#### output\_loglevel

[debug] Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the debug loglevel regardless, unless `quiet` is used for this value.

---

#### hide\_output

[False] Suppress stdout and stderr in the state's results.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

#### success\_retcodes

This parameter allows you to specify a list of non-zero return codes that should be considered as successful. If the return code from the command matches any in the list, the state will have a `True` result instead of `False`.

New in version 2019.2.0.

#### success\_stdout: This parameter will allow a list of

strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

#### success\_stderr: This parameter will allow a list of

strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

`salt.states.cmd.watch` (*name*, *cwd=None*, *root=None*, *runas=None*, *shell=None*, *env=()*, *stateful=False*, *output\_loglevel='debug'*, *hide\_output=False*, *use\_vt=False*, *success\_retcodes=None*, *success\_stdout=None*, *success\_stderr=None*, *\*\*kwargs*)

This function is an alias of `wait`.

Run the given command only if the watch statement calls it.

---

**Note:** Use `cmd.run` together with `onchanges` instead of `cmd.wait`.

---

**name**

The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

**cwd**

The current working directory to execute the command in, defaults to /root

**root**

Path to the root of the jail to use. If this parameter is set, the command will run inside a chroot

**runas**

The user name to run the command as

**shell**

The shell to use for execution, defaults to /bin/sh

**env**

A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.wait:
    - env:
      - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```
script-bar:
  cmd.wait:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/
↳bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':')}
↳}}
```

**Note:** When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses *Path* as opposed to *PATH* for other systems.

**stateful**

The command being executed is expected to return data about executing a state. For more information, see the [Using the "Stateful" Argument](#) section.

**creates**

Only run if the file specified by `creates` do not exist. If you specify a list of files then this state will only run if **any** of the files do not exist.

New in version 2014.7.0.

### output\_loglevel

[debug] Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

### hide\_output

[False] Suppress stdout and stderr in the state's results.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

### use\_vt

Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

### success\_retcodes

This parameter allows you to specify a list of non-zero return codes that should be considered as successful. If the return code from the command matches any in the list, the state will have a `True` result instead of `False`.

New in version 2019.2.0.

### success\_stdout: This parameter will allow a list of

strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

### success\_stderr: This parameter will allow a list of

strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

## 26.19.63 salt.states.composer

### Installation of Composer Packages

These states manage the installed packages for composer for PHP. Note that either composer is installed and accessible via a bin directory or you can pass the location of composer in the state.

```

get-composer:
  cmd.run:
    - name: 'CURL=`which curl`; $CURL -sS https://getcomposer.org/installer |
    ↪php'
    - unless: test -f /usr/local/bin/composer
    - cwd: /root/

install-composer:
  cmd.wait:
    - name: mv /root/composer.phar /usr/local/bin/composer
  
```

(continues on next page)

(continued from previous page)

```

- cwd: /root/
- watch:
  - cmd: get-composer

/path/to/project:
  composer.installed:
    - no_dev: true
    - require:
      - cmd: install-composer

# Without composer installed in your PATH
# Note: composer.phar must be executable for state to work properly
/path/to/project:
  composer.installed:
    - composer: /path/to/composer.phar
    - php: /usr/local/bin/php
    - no_dev: true

```

```

salt.states.composer.installed(name, composer=None, php=None, user=None, prefer_source=None,
                                prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None,
                                no_dev=None, quiet=False, composer_home='/root', always_check=True,
                                env=None)

```

Verify that the correct versions of composer dependencies are present.

**name**

Directory location of the `composer.json` file.

**composer**

Location of the `composer.phar` file. If not set composer will just execute `composer` as if it is installed globally. (i.e. `/path/to/composer.phar`)

**php**

Location of the `php` executable to use with composer. (i.e. `/usr/bin/php`)

**user**

Which system user to run composer as.

New in version 2014.1.4.

**prefer\_source**

`--prefer-source` option of composer.

**prefer\_dist**

`--prefer-dist` option of composer.

**no\_scripts**

`--no-scripts` option of composer.

**no\_plugins**

`--no-plugins` option of composer.

**optimize**

`--optimize-autoloader` option of composer. Recommended for production.

**no\_dev**

`--no-dev` option for composer. Recommended for production.

**quiet**

`--quiet` option for composer. Whether or not to return output from composer.

**composer\_home**

`$COMPOSER_HOME` environment variable

**always\_check**

If True, *always* run `composer install` in the directory. This is the default behavior. If False,

only run `composer install` if there is no vendor directory present.

**env**

A list of environment variables to be set prior to execution.

`salt.states.composer.update` (*name*, *composer=None*, *php=None*, *user=None*, *prefer\_source=None*, *prefer\_dist=None*, *no\_scripts=None*, *no\_plugins=None*, *optimize=None*, *no\_dev=None*, *quiet=False*, *composer\_home='/root'*, *env=None*)

Composer update the directory to ensure we have the latest versions of all project dependencies.

**name**

Directory location of the `composer.json` file.

**composer**

Location of the `composer.phar` file. If not set `composer` will just execute `composer` as if it is installed globally. (i.e. `/path/to/composer.phar`)

**php**

Location of the `php` executable to use with `composer`. (i.e. `/usr/bin/php`)

**user**

Which system user to run `composer` as.

New in version 2014.1.4.

**prefer\_source**

`--prefer-source` option of `composer`.

**prefer\_dist**

`--prefer-dist` option of `composer`.

**no\_scripts**

`--no-scripts` option of `composer`.

**no\_plugins**

`--no-plugins` option of `composer`.

**optimize**

`--optimize-autoloader` option of `composer`. Recommended for production.

**no\_dev**

`--no-dev` option for `composer`. Recommended for production.

**quiet**

`--quiet` option for `composer`. Whether or not to return output from `composer`.

**composer\_home**

`$COMPOSER_HOME` environment variable

**env**

A list of environment variables to be set prior to execution.

## 26.19.64 salt.states.consul

### Consul Management

New in version 3005.

The `consul` module is used to create and manage Consul ACLs

**acl\_present:**

**consul.acl\_present:**

- **id:** 38AC8470-4A83-4140-8DFD-F924CD32917F
- **name:** acl\_name
- **rules:** node "" {policy = "write"} service "" {policy = "read"} key "\_  
→reexec" {policy = "write"}
- **type:** client

(continues on next page)

(continued from previous page)

```

- consul_url: http://localhost:8500

acl_delete:
  consul.acl_absent:
    - id: 38AC8470-4A83-4140-8DFD-F924CD32917F

```

`salt.states.consul.acl_absent` (*name*, *id=None*, *token=None*, *consul\_url='http://localhost:8500'*)

Ensure the ACL is absent

**name**

Specifies a human-friendly name for the ACL token.

**id**

Specifies the ID of the ACL.

**token**

token to authenticate you Consul query

**consul\_url**

[<http://localhost:8500>] consul URL to query

---

**Note:** For more information <https://www.consul.io/api/acl.html#delete-acl-token>

---

`salt.states.consul.acl_present` (*name*, *id=None*, *token=None*, *type='client'*, *rules=""*, *consul\_url='http://localhost:8500'*)

Ensure the ACL is present

**name**

Specifies a human-friendly name for the ACL token.

**id**

Specifies the ID of the ACL.

**type: client**

Specifies the type of ACL token. Valid values are: client and management.

**rules**

Specifies rules for this ACL token.

**consul\_url**

[<http://localhost:8500>] consul URL to query

---

**Note:** For more information <https://www.consul.io/api/acl.html#create-acl-token>, <https://www.consul.io/api/acl.html#update-acl-token>

---

## 26.19.65 salt.states.cron

### Management of cron, the Unix command scheduler

Cron declarations require a number of parameters. The following are the parameters used by Salt to define the various timing values for a cron job:

- minute
- hour
- daymonth
- month
- dayweek (0 to 6 are Sunday through Saturday, 7 can also be used for Sunday)

**Warning:** Any timing arguments not specified take a value of `*`. This means that setting `hour` to 5, while not defining the `minute` param, will result in Salt adding a job that will execute every minute between 5 and 6 A.M.!

Additionally, the default user for these states is `root`. Therefore, if the cron job is for another user, it is necessary to specify that user with the `user` parameter.

A long time ago (before 2014.2), when making changes to an existing cron job, the name declaration is the parameter used to uniquely identify the job, so if an existing cron that looks like this:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: 5
```

Is changed to this:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: 7
- hour: 2
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

The current behavior is still relying on that mechanism, but you can also specify an identifier to identify your crontabs:

```
date > /tmp/crontest:
cron.present:
- identifier: SUPERCRON
- user: root
- minute: 7
- hour: 2
```

New in version 2014.1.2.

And, some months later, you modify it:

```
superscript > /tmp/crontest:
cron.present:
- identifier: SUPERCRON
- user: root
- minute: 3
- hour: 4
```

New in version 2014.1.2.

The old `date > /tmp/crontest` will be replaced by `superscript > /tmp/crontest`.

Additionally, Salt also supports running a cron every `x` minutes very similarly to the Unix convention of using `*/5` to have a job run every five minutes. In Salt, this looks like:

```
date > /tmp/crontest:
cron.present:
```

(continues on next page)

(continued from previous page)

- **user:** root
- **minute:** '\*/5'

The job will now run every 5 minutes.

Additionally, the temporal parameters (minute, hour, etc.) can be randomized by using `random` instead of using a specific value. For example, by using the `random` keyword in the `minute` parameter of a cron state, the same cron job can be pushed to hundreds or thousands of hosts, and they would each use a randomly-generated minute. This can be helpful when the cron job accesses a network resource, and it is not desirable for all hosts to run the job concurrently.

```
/path/to/cron/script:
cron.present:
- user: root
- minute: random
- hour: 2
```

New in version 0.16.0.

Since Salt assumes a value of `*` for unspecified temporal parameters, adding a parameter to the state and setting it to `random` will change that value from `*` to a randomized numeric value. However, if that field in the cron entry on the minion already contains a numeric value, then using the `random` keyword will not modify it.

Added the opportunity to set a job with a special keyword like `'@reboot'` or `'@hourly'`. Quotes must be used, otherwise PyYAML will strip the '@' sign.

```
/path/to/cron/script:
cron.present:
- user: root
- special: '@hourly'
```

The script will be executed every reboot if cron daemon support this option.

```
/path/to/cron/otherscript:
cron.absent:
- user: root
- special: '@daily'
```

This counter part definition will ensure than a job with a special keyword is not set.

`salt.states.cron.absent` (*name*, *user='root'*, *identifier=False*, *special=None*, *\*\*kwargs*)

Verifies that the specified cron job is absent for the specified user.

If an `identifier` is not passed then the `name` is used to identify the cron job for removal.

**name**

The command that should be absent in the user crontab.

**user**

The name of the user whose crontab needs to be modified, defaults to the root user

**identifier**

Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name

**special**

The special keyword used in the job (eg. `@reboot`, `@hourly`...). Quotes must be used, otherwise PyYAML will strip the '@' sign.

`salt.states.cron.env_absent` (*name*, *user*='root')

Verifies that the specified environment variable is absent from the crontab for the specified user

**name**

The name of the environment variable to remove from the user crontab

**user**

The name of the user whose crontab needs to be modified, defaults to the root user

`salt.states.cron.env_present` (*name*, *value*=None, *user*='root')

Verifies that the specified environment variable is present in the crontab for the specified user.

**name**

The name of the environment variable to set in the user crontab

**user**

The name of the user whose crontab needs to be modified, defaults to the root user

**value**

The value to set for the given environment variable

`salt.states.cron.file` (*name*, *source\_hash*="", *source\_hash\_name*=None, *user*='root', *template*=None, *context*=None, *replace*=True, *defaults*=None, *backup*="", *\*\*kwargs*)

Provides file.managed-like functionality (templating, etc.) for a pre-made crontab file, to be assigned to a given user.

**name**

The source file to be used as the crontab. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required

**source\_hash**

This can be either a file which contains a source hash string for the source, or a source hash string. The source hash string is the hash algorithm followed by the hash of the file: `md5=e138491e9d5b97023cea823fe17bac22`

**source\_hash\_name**

When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
foo_crontab:
  cron.file:
    - name: https://mydomain.tld/dir2/foo.txt
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.txt
```

**Note:** This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example

above, simply using `foo.txt` would not match.

---

New in version 2016.3.5.

**user**

The user to whom the crontab should be assigned. This defaults to root.

**template**

If this setting is applied then the named templating engine will be used to render the downloaded file. Currently, jinja and mako are supported.

**context**

Overrides default context variables passed to the template.

**replace**

If the crontab should be replaced, if False then this command will be ignored if a crontab exists for the specified user. Default is True.

**defaults**

Default context passed to the template.

**backup**

Overrides the default backup mode for the user's crontab.

`salt.states.cron.present` (*name*, *user*='root', *minute*='\*', *hour*='\*', *daymonth*='\*', *month*='\*', *dayweek*='\*', *comment*=None, *commented*=False, *identifier*=False, *special*=None)

Verifies that the specified cron job is present for the specified user. It is recommended to use *identifier*. Otherwise the cron job is installed twice if you change the name. For more advanced information about what exactly can be set in the cron timing parameters, check your cron system's documentation. Most Unix-like systems' cron documentation can be found via the crontab man page: `man 5 crontab`.

**name**

The command that should be executed by the cron job.

**user**

The name of the user whose crontab needs to be modified, defaults to the root user

**minute**

The information to be set into the minute section, this can be any string supported by your cron system's the minute field. Default is \*

**hour**

The information to be set in the hour section. Default is \*

**daymonth**

The information to be set in the day of month section. Default is \*

**month**

The information to be set in the month section. Default is \*

**dayweek**

The information to be set in the day of week section. Default is \*

**comment**

User comment to be added on line previous the cron job

**commented**

The cron job is set commented (prefixed with #DISABLED#). Defaults to False.

New in version 2016.3.0.

**identifier**

Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name

**special**

A special keyword to specify periodicity (eg. @reboot, @hourly...). Quotes must be used, otherwise PyYAML will strip the '@' sign.

New in version 2016.3.0.

## 26.19.66 salt.states.cryptdev

### Opening of Encrypted Devices

Ensure that an encrypted device is mapped with the *mapped* function:

```

mappedname:
  cryptdev.mapped:
    - device: /dev/sdb1
    - keyfile: /etc/keyfile.key
    - opts:
      - size=256

swap:
  cryptdev.mapped:
    - device: /dev/sdx4
    - keyfile: /dev/urandom
    - opts: swap,cipher=aes-cbc-essiv:sha256,size=256

mappedbyuuid:
  cryptdev.mapped:
    - device: UUID=066e0200-2867-4ebe-b9e6-f30026ca2314
    - keyfile: /etc/keyfile.key
    - config: /etc/alternate-crypttab
  
```

New in version 2018.3.0.

`salt.states.cryptdev.mapped` (*name, device, keyfile=None, opts=None, config='/etc/crypttab', persist=True, immediate=False, match\_on='name'*)

Verify that a device is mapped

**name**

The name under which the device is to be mapped

**device**

The device name, typically the device node, such as `/dev/sdb1` or `UUID=066e0200-2867-4ebe-b9e6-f30026ca2314`.

**keyfile**

Either `None` if the password is to be entered manually on boot, or an absolute path to a keyfile. If the password is to be asked interactively, the mapping cannot be performed with `immediate=True`.

**opts**

A list object of options or a comma delimited list

**config**

Set an alternative location for the crypttab, if the map is persistent, Default is `/etc/crypttab`

**persist**

Set if the map should be saved in the crypttab, Default is `True`

**immediate**

Set if the device mapping should be executed immediately. Requires that the keyfile not be `None`, because the password cannot be asked interactively. Note that options are not passed through on the initial mapping. Default is `False`.

**match\_on**

A name or list of crypttab properties on which this state should be applied. Default is `name`, meaning that the line is matched only by the name parameter. If the desired configuration requires two devices mapped to the same name, supply a list of parameters to match on.

`salt.states.cryptdev.unmapped` (*name, config='/etc/crypttab', persist=True, immediate=False*)

Ensure that a device is unmapped

**name**  
The name to ensure is not mapped

**config**  
Set an alternative location for the crypttab, if the map is persistent, Default is `/etc/crypttab`

**persist**  
Set if the map should be removed from the crypttab. Default is `True`

**immediate**  
Set if the device should be unmapped immediately. Default is `False`.

## 26.19.67 salt.states.csf

### CSF Ip tables management

**depends**

- `csf` utility

**configuration**

See <http://download.configserver.com/csf/install.txt> for setup instructions.

**Simply allow/deny rules:**

**csf.rule\_present:**

**ip:** 1.2.3.4

**method:** allow

`salt.states.csf.nics_skip`(*name, nics, ipv6*)

Alias for `csf.nics_skipped`

`salt.states.csf.nics_skipped`(*name, nics, ipv6=False*)

**name**

Meaningless arg, but required for state.

**nics**

A list of nics to skip.

**ipv6**

Boolean. Set to true if you want to skip the ipv6 interface. Default false (ipv4).

`salt.states.csf.option_present`(*name, value, reload=False*)

Ensure the state of a particular option/setting in csf.

**name**

The option name in `csf.conf`

**value**

The value it should be set to.

**reload**

Boolean. If set to true, csf will be reloaded after.

`salt.states.csf.ports_open`(*name, ports, proto='tcp', direction='in'*)

Ensure ports are open for a protocol, in a direction. e.g. - `proto='tcp', direction='in'` would set the values for `TCP_IN` in the `csf.conf` file.

**ports**

A list of ports that should be open.

**proto**

The protocol. May be one of `'tcp'`, `'udp'`, `'tcp6'`, or `'udp6'`.

**direction**

Choose `'in'`, `'out'`, or both to indicate the port should be opened for inbound traffic, outbound traffic, or both.

`salt.states.csf.rule_absent` (*name, method, port=None, proto='tcp', direction='in', port\_origin='d', ip\_origin='s', ttl=None, reload=False*)

Ensure iptable is not present.

**name**

The ip address or CIDR for the rule.

**method**

The type of rule. Either 'allow' or 'deny'.

**port**

Optional port to be open or closed for the iptables rule.

**proto**

The protocol. Either 'tcp', 'udp'. Only applicable if port is specified.

**direction**

The direction of traffic to apply the rule to. Either 'in', or 'out'. Only applicable if port is specified.

**port\_origin**

Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either 's', or 'd'.

**ip\_origin**

Specifies whether the ip in this rule refers to the source or destination ip. Either 's', or 'd'. Only applicable if port is specified.

**ttl**

How long the rule should exist. If supplied, `csf.tempallow()` or `csf.tempdeny()` are used.

**reload**

Reload the csf service after applying this rule. Default false.

`salt.states.csf.rule_present` (*name, method, port=None, proto='tcp', direction='in', port\_origin='d', ip\_origin='s', ttl=None, comment="", reload=False*)

Ensure iptable rule exists.

**name**

The ip address or CIDR for the rule.

**method**

The type of rule. Either 'allow' or 'deny'.

**port**

Optional port to be open or closed for the iptables rule.

**proto**

The protocol. Either 'tcp', or 'udp'. Only applicable if port is specified.

**direction**

The direction of traffic to apply the rule to. Either 'in', or 'out'. Only applicable if port is specified.

**port\_origin**

Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either 's', or 'd'.

**ip\_origin**

Specifies whether the ip in this rule refers to the source or destination ip. Either 's', or 'd'. Only applicable if port is specified.

**ttl**

How long the rule should exist. If supplied, `csf.tempallow()` or `csf.tempdeny()` are used.

**comment**

An optional comment to appear after the rule as a `#comment`.

**reload**

Reload the csf service after applying this rule. Default false.

`salt.states.csf.testing_off` (*name, reload=False*)

Ensure testing mode is enabled in csf.

**reload**

Reload CSF after changing the testing status. Default false.

`salt.states.csf.testing_on(name, reload=False)`

Ensure testing mode is enabled in csf.

**reload**

Reload CSF after changing the testing status. Default false.

### 26.19.68 salt.states.cyg

Installation of Cygwin packages.

A state module to manage cygwin packages. Packages can be installed or removed.

```
dos2unix:
  cyg.installed
```

**class** `salt.states.cyg.DictDiffer(current_dict, past_dict)`

Calculate the difference between two dictionaries.

- (1) items added
- (2) items removed
- (3) keys same in both but changed values
- (4) keys same in both and unchanged values

**added()**

Return a set of additions to past\_dict.

**changed()**

Return a set of the keys with changed values.

**removed()**

Return a set of things removed from past\_dict.

**same()**

True if the two dicts are the same.

**unchanged()**

Return a set of the keys with unchanged values.

`salt.states.cyg.installed(name, cyg_arch='x86_64', mirrors=None)`

Make sure that a package is installed.

**name**

The name of the package to install

**cyg\_arch**

[x86\_64] The cygwin architecture to install the package into. Current options are x86 and x86\_64

**mirrors**

[None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.installed:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

`salt.states.cyg.removed(name, cyg_arch='x86_64', mirrors=None)`

Make sure that a package is not installed.

**name**

The name of the package to uninstall

**cyg\_arch**

[x86\_64] The cygwin architecture to remove the package from. Current options are x86 and x86\_64

**mirrors**

[None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.removed:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

`salt.states.cyg.updated`(*name=None, cyg\_arch='x86\_64', mirrors=None*)

Make sure all packages are up to date.

**name**

[None] No affect, salt fails poorly without the arg available

**cyg\_arch**

[x86\_64] The cygwin architecture to update. Current options are x86 and x86\_64

**mirrors**

[None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.updated:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

## 26.19.69 salt.states.ddns

### Dynamic DNS updates

Ensure a DNS record is present or absent utilizing RFC 2136 type dynamic updates.

**depends**

- `dnspython`

---

**Note:** The `dnspython` module is required when managing DDNS using a TSIG key. If you are not using a TSIG key, DDNS is allowed by ACLs based on IP address and the `dnspython` module is not required.

---

Example:

```
webserver:
  ddns.present:
    - zone: example.com
    - ttl: 60
    - data: 111.222.333.444
    - nameserver: 123.234.345.456
    - keyfile: /srv/salt/dnspy_tsig_key.txt
```

`salt.states.ddns.absent`(*name, zone, data=None, rdtype=None, \*\*kwargs*)

Ensures that the named DNS record is absent.

**name**

The host portion of the DNS record, e.g., 'webserver'. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

**zone**

The zone to check

**data**

Data for the DNS record. E.g., the IP address for an A record. If omitted, all records matching name (and rdtype, if provided) will be purged.

**rdtype**

DNS resource type. If omitted, all types will be purged.

**\*\*kwargs**

Additional arguments the `ddns.update` function may need (e.g. `nameserver`, `keyfile`, `keyname`). Note that the `nsupdate` key file can't be reused by this function, the `keyfile` and other arguments must follow the `dnspython` spec.

`salt.states.ddns.present` (*name*, *zone*, *ttl*, *data*, *rdtype='A'*, *\*\*kwargs*)

Ensures that the named DNS record is present with the given ttl.

**name**

The host portion of the DNS record, e.g., 'webserver'. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

**zone**

The zone to check/update

**ttl**

TTL for the record

**data**

Data for the DNS record. E.g., the IP address for an A record.

**rdtype**

DNS resource type. Default 'A'.

**\*\*kwargs**

Additional arguments the `ddns.update` function may need (e.g. `nameserver`, `keyfile`, `keyname`). Note that the `nsupdate` key file can't be reused by this function, the `keyfile` and other arguments must follow the `dnspython` spec.

## 26.19.70 salt.states.debconfmod

### Management of debconf selections

**depends**

- `debconf-utils` package

The `debconfmod` state module manages the enforcement of `debconf` selections, this state can set those selections prior to package installation.

## Available Functions

The debconfmod state has two functions, the `set` and `set_file` functions

### set

Set debconf selections from the state itself

### set\_file

Set debconf selections from a file

```
nullmailer-debconf:
  debconf.set:
  - name: nullmailer
  - data:
    'shared/mailname': {'type': 'string', 'value': 'server.domain.tld'}
    'nullmailer/relayhost': {'type': 'string', 'value': 'mail.domain.tld'}

ferm-debconf:
  debconf.set:
  - name: ferm
  - data:
    'ferm/enable': {'type': 'boolean', 'value': True}
```

**Note:** Due to how PyYAML imports nested dicts (see [here](#)), the values in the `data` dict must be indented four spaces instead of two.

If you're setting debconf values that requires `dpkg-reconfigure`, you can use the `onchanges` requisite to reconfigure your package:

```
set-default-shell:
  debconf.set:
  - name: dash
  - data:
    'dash/sh': {'type': 'boolean', 'value': false}

reconfigure-dash:
  cmd.run:
  - name: dpkg-reconfigure -f noninteractive dash
  - onchanges:
    - debconf: set-default-shell
```

Every time the `set-default-shell` state changes, the `reconfigure-dash` state will also run.

**Note:** For boolean types, the value should be `true` or `false`, not `'true'` or `'false'`.

`salt.states.debconfmod.set(name, data, **kwargs)`

Set debconf selections

```
<state_id>:
  debconf.set:
  - name: <name>
  - data:
```

(continues on next page)

(continued from previous page)

```
<question>: {'type': <type>, 'value': <value>}
<question>: {'type': <type>, 'value': <value>}
```

**name:**

The package name to set answers for.

**data:**

A set of questions/answers for debconf. Note that everything under this must be indented twice.

**question:**

The question the is being pre-answered

**type:**

The type of question that is being asked (string, boolean, select, etc.)

**value:**

The answer to the question

`salt.states.debconfmod.set_file`(*name*, *source*, *template=None*, *context=None*, *defaults=None*, *\*\*kwargs*)

Set debconf selections from a file or a template

```
<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections?saltenv=myenvironment

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections.jinja2
    - template: jinja
    - context:
      some_value: "false"
```

**source:**

The location of the file containing the package selections

**template**

If this setting is applied then the named templating engine will be used to render the package selections file, currently jinja, mako, and wempy are supported

**context**

Overrides default context variables passed to the template.

**defaults**

Default context passed to the template.

## 26.19.71 salt.states.dellchassis

Manage chassis via Salt Proxies.

New in version 2015.8.2.

Below is an example state that sets basic parameters:

```
my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - datacenter: dc-1-us
    - location: my-location
    - mode: 2
    - idrac_launch: 1
    - slot_names:
      - server-1: my-slot-name
      - server-2: my-other-slot-name
    - blade_power_states:
      - server-1: on
      - server-2: off
      - server-3: powercycle
```

However, it is possible to place the entire set of chassis configuration data in pillar. Here's an example pillar structure:

```
proxy:
  host: 10.27.20.18
  admin_username: root
  fallback_admin_username: root
  passwords:
    - super-secret
    - old-secret
  proxytype: fx2

chassis:
  name: fx2-1
  username: root
  password: saltstack1
  datacenter: london
  location: rack-1-shelf-3
  management_mode: 2
  idrac_launch: 0
  slot_names:
    - 'server-1': blade1
    - 'server-2': blade2

servers:
  server-1:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.132
    netmask: 255.255.0.0
    gateway: 172.17.17.1
  server-2:
    idrac_password: saltstack1
```

(continues on next page)

(continued from previous page)

```

ipmi_over_lan: True
ip: 172.17.17.2
netmask: 255.255.0.0
gateway: 172.17.17.1
server-3:
  idrac_password: saltstack1
  ipmi_over_lan: True
  ip: 172.17.17.20
  netmask: 255.255.0.0
  gateway: 172.17.17.1
server-4:
  idrac_password: saltstack1
  ipmi_over_lan: True
  ip: 172.17.17.2
  netmask: 255.255.0.0
  gateway: 172.17.17.1

switches:
  switch-1:
    ip: 192.168.1.2
    netmask: 255.255.255.0
    gateway: 192.168.1.1
    snmp: nonpublic
    password: saltstack1
  switch-2:
    ip: 192.168.1.3
    netmask: 255.255.255.0
    gateway: 192.168.1.1
    snmp: nonpublic
    password: saltstack1

```

And to go with it, here's an example state that pulls the data from the pillar stated above:

```

{% set details = pillar.get('proxy:chassis', {}) %}
standup-step1:
  dellchassis.chassis:
    - name: {{ details['name'] }}
    - location: {{ details['location'] }}
    - mode: {{ details['management_mode'] }}
    - idrac_launch: {{ details['idrac_launch'] }}
    - slot_names:
      {% for entry details['slot_names'] %}
        - {{ next(iter(entry)) }}: {{ entry[next(iter(entry))] }}
      {% endfor %}

blade_powercycle:
  dellchassis.chassis:
    - blade_power_states:
      - server-1: powercycle
      - server-2: powercycle
      - server-3: powercycle
      - server-4: powercycle

```

(continues on next page)

(continued from previous page)

```
# Set idrac_passwords for blades.  racadm needs them to be called 'server-x'
{% for k, v in details['servers'].iteritems() %}
{{ k }}:
  dellchassis.blade_idrac:
    - idrac_password: {{ v['idrac_password'] }}
{% endfor %}

# Set management ip addresses, passwords, and snmp strings for switches
{% for k, v in details['switches'].iteritems() %}
{{ k }}-switch-setup:
  dellchassis.switch:
    - name: {{ k }}
    - ip: {{ v['ip'] }}
    - netmask: {{ v['netmask'] }}
    - gateway: {{ v['gateway'] }}
    - password: {{ v['password'] }}
    - snmp: {{ v['snmp'] }}
{% endfor %}
```

**Note:** This state module relies on the `dracr.py` execution module, which runs `racadm` commands on the chassis, blades, etc. The `racadm` command runs very slowly and, depending on your state, the proxy minion return might timeout before the `racadm` commands have completed. If you are repeatedly seeing minions timeout after state calls, please use the `-t` CLI argument to increase the timeout variable.

For example:

```
salt '*' state.sls my-dell-chasis-state-name -t 60
```

**Note:** The Dell CMC units perform adequately but many iDRACs are **excruciatingly** slow. Some functions can take minutes to execute.

```
salt.states.dellchassis.blade_idrac(name, idrac_password=None, idrac_ipmi=None, idrac_ip=None,
                                     idrac_netmask=None, idrac_gateway=None,
                                     idrac_dnsname=None, idrac_dhcp=None)
```

Set parameters for iDRAC in a blade.

#### Parameters

- **idrac\_password** -- Password to use to connect to the iDRACs directly (`idrac_ipmi` and `idrac_dnsname` must be set directly on the iDRAC. They can't be set through the CMC. If this password is present, use it instead of the CMC password)
- **idrac\_ipmi** -- Enable/Disable IPMI over LAN
- **idrac\_ip** -- Set IP address for iDRAC
- **idrac\_netmask** -- Set netmask for iDRAC
- **idrac\_gateway** -- Set gateway for iDRAC
- **idrac\_dhcp** -- Turn on DHCP for iDRAC (True turns on, False does nothing because setting a static IP will disable DHCP).

#### Returns

A standard Salt changes dictionary

NOTE: If any of the IP address settings is configured, all of ip, netmask, and gateway must be present

`salt.states.dellchassis.chassis` (*name*, *chassis\_name*=None, *password*=None, *datacenter*=None, *location*=None, *mode*=None, *idrac\_launch*=None, *slot\_names*=None, *blade\_power\_states*=None)

Manage a Dell Chassis.

**chassis\_name**

The name of the chassis.

**datacenter**

The datacenter in which the chassis is located

**location**

The location of the chassis.

**password**

Password for the chassis. Note: If this password is set for the chassis, the current implementation of this state will set this password both on the chassis and the iDRac passwords on any configured blades. If the password for the blades should be distinct, they should be set separately with the `blade_idrac` function.

**mode**

The management mode of the chassis. Viable options are:

- 0: None
- 1: Monitor
- 2: Manage and Monitor

**idrac\_launch**

The iDRAC launch method of the chassis. Viable options are:

- 0: Disabled (launch iDRAC using IP address)
- 1: Enabled (launch iDRAC using DNS name)

**slot\_names**

The names of the slots, provided as a list identified by their slot numbers.

**blade\_power\_states**

The power states of a blade server, provided as a list and identified by their server numbers. Viable options are:

- on: Ensure the blade server is powered on.
- off: Ensure the blade server is powered off.
- powercycle: Power cycle the blade server.

Example:

```
my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - location: my-location
    - datacenter: london
    - mode: 2
    - idrac_launch: 1
    - slot_names:
      - 1: my-slot-name
      - 2: my-other-slot-name
    - blade_power_states:
      - server-1: on
      - server-2: off
      - server-3: powercycle
```

`salt.states.dellchassis.firmware_update` (*hosts*=None, *directory*="")

State to update the firmware on host using the `racadm` command

**firmwarefile**

filename (string) starting with `salt://`

**host**

string representing the hostname supplied to the `racadm` command

**directory**

Directory name where firmwarefile will be downloaded

```
dell-chassis-firmware-update:
dellchassis.firmware_update:
hosts:
  cmc:
    salt://firmware_cmc.exe
  server-1:
    salt://firmware.exe
directory: /opt/firmwares
```

`salt.states.dellchassis.switch`(*name*, *ip=None*, *netmask=None*, *gateway=None*, *dhcp=None*, *password=None*, *snmp=None*)

Manage switches in a Dell Chassis.

**name**

The switch designation (e.g. switch-1, switch-2)

**ip**

The Static IP Address of the switch

**netmask**

The netmask for the static IP

**gateway**

The gateway for the static IP

**dhcp**

True: Enable DHCP False: Do not change DHCP setup (disabling DHCP is automatic when a static IP is set)

**password**

The access (root) password for the switch

**snmp**

The SNMP community string for the switch

Example:

```
my-dell-chassis:
dellchassis.switch:
  - switch: switch-1
  - ip: 192.168.1.1
  - netmask: 255.255.255.0
  - gateway: 192.168.1.254
  - dhcp: True
  - password: secret
  - snmp: public
```

### 26.19.72 salt.states.disk

Disk monitoring state

Monitor the state of disk resources.

The `disk.status` function can be used to report that the used space of a filesystem is within the specified limits.

```
used_space:
disk.status:
  - name: /dev/xda1
```

(continues on next page)

(continued from previous page)

- **maximum:** 79%
- **minimum:** 11%

It can be used with an `onfail` requisite, for example, to take additional action in response to or in preparation for other states.

```

storage_threshold:
  disk.status:
    - name: /dev/xda1
    - maximum: 97%

clear_cache:
  cmd.run:
    - name: rm -r /var/cache/app
    - onfail:
      - disk: storage_threshold

```

To use kilobytes (KB) for `minimum` and `maximum` rather than percents, specify the `absolute` flag:

```

used_space:
  disk.status:
    - name: /dev/xda1
    - minimum: 1024 KB
    - maximum: 1048576 KB
    - absolute: True

```

`salt.states.disk.status` (*name*, *maximum=None*, *minimum=None*, *absolute=False*, *free=False*)

Return the current disk usage stats for the named mount point

**name**

Disk mount or directory for which to check used space

**maximum**

The maximum disk utilization

**minimum**

The minimum disk utilization

**absolute**

By default, the utilization is measured in percentage. Set the *absolute* flag to use kilobytes.

New in version 2016.11.0.

**free**

By default, *minimum* & *maximum* refer to the amount of used space. Set to *True* to evaluate the free space instead.

### 26.19.73 salt.states.docker\_container

**Warning:** This module will be removed from Salt in version 3009 in favor of the [docker Salt Extension](#).

Management of Docker containers

New in version 2017.7.0.

**depends**

`docker` Python module

**Note:** Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py`  $\geq 1.6.0$  are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release. When running the `docker_container.running` state for the first time after upgrading to 2017.7.0, your container(s) may be replaced. The changes may show diffs for certain parameters which say that the old value was an empty string, and the new value is `None`. This is due to the fact that in prior releases Salt was passing empty strings for these values when creating the container if they were undefined in the SLS file, where now Salt simply does not pass any arguments not explicitly defined in the SLS file. Subsequent runs of the state should not replace the container if the configuration remains unchanged.

**Note:** To pull from a Docker registry, authentication must be configured. See [here](#) for more information on how to configure access to docker registries in `Pillar` data.

`salt.states.docker_container.absent` (*name*, *force=False*)

Ensure that a container is absent

**name**

Name of the container

**force**

[False] Set to `True` to remove the container even if it is running

Usage Examples:

```
mycontainer:
  docker_container.absent

multiple_containers:
  docker_container.absent:
    - names:
      - foo
      - bar
      - baz
```

`salt.states.docker_container.mod_watch` (*name*, *sfun=None*, *\*\*kwargs*)

The `docker_container` watcher, called to invoke the watch command.

**Note:** This state exists to support special handling of the watch *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.docker_container.run` (*name*, *image=None*, *bg=False*, *failhard=True*, *replace=False*, *force=False*, *skip\_translate=None*, *ignore\_collisions=False*, *validate\_ip\_addrs=True*, *client\_timeout=60*, *\*\*kwargs*)

New in version 2018.3.0.

---

**Note:** If no tag is specified in the image name, and nothing matching the specified image is pulled on the minion, the `docker pull` that retrieves the image will pull *all tags* for the image. A tag of `latest` is not implicit for the pull. For this reason, it is recommended to specify the image in `repo:tag` notation.

---

Like the `cmd.run` state, only for Docker. Does the equivalent of a `docker run` and returns information about the container that was created, as well as its output.

This state accepts the same arguments as `docker_container.running`, with the exception of `watch_action`, `start`, and `shutdown_timeout` (though the `force` argument has a different meaning in this state).

In addition, this state accepts the arguments from `docker.logs`, with the exception of `follow`, to control how logs are returned.

Additionally, the following arguments are supported:

**creates**

A path or list of paths. Only run if one or more of the specified paths do not exist on the minion.

**bg**

[False] If True, run container in background and do not await or deliver its results.

---

**Note:** This may not be useful in cases where other states depend on the results of this state. Also, the logs will be inaccessible once the container exits if `auto_remove` is set to True, so keep this in mind.

---

**failhard**

[True] If True, the state will return a False result if the exit code of the container is non-zero. When this argument is set to False, the state will return a True result regardless of the container's exit code.

---

**Note:** This has no effect if `bg` is set to True.

---

**replace**

[False] If True, and if the named container already exists, this will remove the existing container. The default behavior is to return a False result when the container already exists.

**force**

[False] If True, and the named container already exists, *and* `replace` is also set to True, then the container will be forcibly removed. Otherwise, the state will not proceed and will return a False result.

CLI Examples:

```
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/
↳myscript.sh
```

**USAGE EXAMPLE**

```
{% set pkg_version = salt.pillar.get('pkg_version', '1.0-1') %}
build_package:
  docker_container.run:
    - image: myuser/builder:latest
    - binds: /home/myuser/builds:/build_dir
    - command: /scripts/build.sh {{ pkg_version }}
    - creates: /home/myuser/builds/myapp-{{ pkg_version }}.noarch.rpm
    - replace: True
    - networks:
      - mynet
```

(continues on next page)

(continued from previous page)

```
- require:
  - docker_network: mynet
```

```
salt.states.docker_container.running(name, image=None, skip_translate=None,
                                       ignore_collisions=False, validate_ip_addrs=True, force=False,
                                       watch_action='force', start=True, shutdown_timeout=None,
                                       client_timeout=60, networks=None, **kwargs)
```

Ensure that a container with a specific configuration is present and running

**name**

Name of the container

**image**

Image to use for the container

---

**Note:** This state will pull the image if it is not present. However, if the image needs to be built from a Dockerfile or loaded from a saved image, or if you would like to use requisites to trigger a replacement of the container when the image is updated, then the `docker_image.present` state should be used to manage the image.

---

Changed in version 2018.3.0: If no tag is specified in the image name, and nothing matching the specified image is pulled on the minion, the `docker_pull` that retrieves the image will pull *all tags* for the image. A tag of `latest` is no longer implicit for the pull. For this reason, it is recommended to specify the image in `repo:tag` notation.

**skip\_translate**

This function translates Salt CLI or SLS input into the format which `docker-py` expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and *all* translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which `docker-py` expects. This allows for API changes and other issues to be more easily worked around. An example of using this option to skip translation would be:

For example, imagine that there is an issue with processing the `port_bindings` argument, and the following configuration no longer works as expected:

```
mycontainer:
  docker_container.running:
    - image: 7.3.1611
    - port_bindings:
      - 10.2.9.10:8080:80
```

By using `skip_translate`, you can forego the input translation and configure the port binding in the format `docker-py` needs:

```
mycontainer:
  docker_container.running:
    - image: 7.3.1611
    - skip_translate: port_bindings
    - port_bindings: {8080: [('10.2.9.10', 80)], '4193/udp': 9314}
```

See the following links for more information:

- [docker-py Low-level API](#)
- [Docker Engine API](#)

#### **ignore\_collisions**

[False] Since many of `docker-py`'s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the `docker-py` version of that argument so that both CLI and API versions of a given argument are supported. However, if both the alias and the `docker-py` version of the same argument (e.g. `env` and `environment`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the `docker-py` version of the argument.

#### **validate\_ip\_addrs**

[True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`

#### **force**

[False] Set this parameter to `True` to force Salt to re-create the container irrespective of whether or not it is configured as desired.

#### **watch\_action**

[force] Control what type of action is taken when this state *watches* another state that has changes. The default action is `force`, which runs the state with `force` set to `True`, triggering a rebuild of the container.

If any other value is passed, it will be assumed to be a kill signal. If the container matches the specified configuration, and is running, then the action will be to send that signal to the container. Kill signals can be either strings or numbers, and are defined in the **Standard Signals** section of the `signal(7)` manpage. Run `man 7 signal` on a Linux host to browse this manpage. For example:

```
mycontainer:
  docker_container.running:
    - image: busybox
    - watch_action: SIGHUP
    - watch:
      - file: some_file
```

---

**Note:** If the container differs from the specified configuration, or is not running, then instead of sending a signal to the container, the container will be re-created/started and no signal will be sent.

---

#### **start**

[True] Set to `False` to suppress starting of the container if it exists, matches the desired configuration, but is not running. This is useful for data-only containers, or for non-daemonized container processes, such as the Django `migrate` and `collectstatic` commands. In instances such as this, the container only needs to be started the first time.

#### **shutdown\_timeout**

If the container needs to be replaced, the container will be stopped using `docker.stop`. If a `shutdown_timeout` is not set, and the container was created using `stop_timeout`, that timeout will be used. If neither of these values were set, then a timeout of 10 seconds will be used.

Changed in version 2017.7.0: This option was renamed from `stop_timeout` to `shutdown_timeout` to accommodate the `stop_timeout` container configuration setting.

#### **client\_timeout**

[60] Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

---

**Note:** This is only used if Salt needs to pull the requested image.

---

## NETWORK MANAGEMENT

New in version 2018.3.0.

Changed in version 2019.2.0: If the `networks` option is used, any networks (including the default bridge network) which are not specified will be disconnected.

The `networks` argument can be used to ensure that a container is attached to one or more networks. Optionally, arguments can be passed to the networks. In the example below, `net1` is being configured with arguments, while `net2` and `bridge` are being configured *without* arguments:

```
foo:
  docker_container.running:
    - image: myuser/myimage:foo
    - networks:
      - net1:
          - aliases:
              - bar
              - baz
          - ipv4_address: 10.0.20.50
      - net2
      - bridge
    - require:
      - docker_network: net1
      - docker_network: net2
```

The supported arguments are the ones from the `docker-py`'s `connect_container_to_network` function (other than `container` and `net_id`).

---

**Important:** Unlike with the arguments described in the CONTAINER CONFIGURATION PARAMETERS section below, these network configuration parameters are not translated at all. Consult the `connect_container_to_network` documentation for the correct type/format of data to pass.

---

To start a container with no network connectivity (only possible in 2019.2.0 and later) pass this option as an empty list. For example:

```
foo:
  docker_container.running:
    - image: myuser/myimage:foo
    - networks: []
```

## CONTAINER CONFIGURATION PARAMETERS

### `auto_remove` (or *rm*)

[False] Enable auto-removal of the container on daemon side when the container's process exits (analogous to running a docker container with `--rm` on the CLI).

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - auto_remove: True
```

**binds**

Files/directories to bind mount. Each bind mount should be passed in one of the following formats:

- `<host_path>:<container_path>` - `host_path` is mounted within the container as `container_path` with read-write access.
- `<host_path>:<container_path>:<selinux_context>` - `host_path` is mounted within the container as `container_path` with read-write access. Additionally, the specified selinux context will be set within the container.
- `<host_path>:<container_path>:<read_only>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined.
- `<host_path>:<container_path>:<read_only>,<selinux_context>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined. Additionally, the specified selinux context will be set within the container.

`<read_only>` can be either `rw` for read-write access, or `ro` for read-only access. When omitted, it is assumed to be read-write.

`<selinux_context>` can be `z` if the volume is shared between multiple containers, or `Z` if the volume should be private.

---

**Note:** When both `<read_only>` and `<selinux_context>` are specified, there must be a comma before `<selinux_context>`.

---

Binds can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds: /srv/www:/var/www:ro,/etc/foo.conf:/usr/local/etc/foo.
      ↪conf:rw
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds:
      - /srv/www:/var/www:ro
      - /home/myuser/conf/foo.conf:/etc/foo.conf:rw
```

However, in cases where both `ro/rw` and an selinux context are combined, the only option is to use a YAML list, like so:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds:
      - /srv/www:/var/www:ro,Z
      - /home/myuser/conf/foo.conf:/etc/foo.conf:rw,Z
```

Since the second bind in the previous example is mounted read-write, the `rw` and comma can be dropped. For example:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
```

(continues on next page)

(continued from previous page)

```

- binds:
  - /srv/www:/var/www:ro,Z
  - /home/myuser/conf/foo.conf:/etc/foo.conf:Z

```

**blkio\_weight**

Block IO weight (relative weight), accepts a weight value between 10 and 1000.

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - blkio_weight: 100

```

**blkio\_weight\_device**

Block IO weight (relative device weight), specified as a list of expressions in the format `PATH:RATE`

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - blkio_weight_device: /dev/sda:100

```

**cap\_add**

List of capabilities to add within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_add: SYS_ADMIN,MKNOD

```

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_add:
      - SYS_ADMIN
      - MKNOD

```

---

**Note:** This option requires Docker 1.2.0 or newer.

---

**cap\_drop**

List of capabilities to drop within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_drop: SYS_ADMIN,MKNOD

```

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_drop:
      - SYS_ADMIN
      - MKNOD

```

---

**Note:** This option requires Docker 1.2.0 or newer.

---

**command (or *cmd*)**

Command to run in the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - command: bash
```

**cpuset\_cpus (or *cpuset*)**

CPUs on which to allow execution, specified as a string containing a range (e.g. 0-3) or a comma-separated list of CPUs (e.g. 0,1).

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpuset_cpus: "0,1"
```

**cpuset\_mems**

Memory nodes on which to allow execution, specified as a string containing a range (e.g. 0-3) or a comma-separated list of MEMs (e.g. 0,1). Only effective on NUMA systems.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpuset_mems: "0,1"
```

**cpu\_group**

The length of a CPU period in microseconds

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_group: 100000
```

**cpu\_period**

Microseconds of CPU time that the container can get in a CPU period

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_period: 50000
```

**cpu\_shares**

CPU shares (relative weight), specified as an integer between 2 and 1024.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_shares: 512
```

**detach**

[False] If True, run the container's command in the background (daemon mode)

```
foo:
  docker_container.running:
```

(continues on next page)

(continued from previous page)

- **image:** bar/baz:latest
- **detach:** True

**devices**

List of host devices to expose within the container. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices: /dev/net/tun,/dev/xvda1:/dev/xvda1,/dev/xvdb1:/dev/
      ↪ xvdb1:r
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices:
      - /dev/net/tun
      - /dev/xvda1:/dev/xvda1
      - /dev/xvdb1:/dev/xvdb1:r
```

**device\_read\_bps**

Limit read rate (bytes per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is either an integer number of bytes, or a string ending in kb, mb, or gb. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_bps: /dev/sda:1mb,/dev/sdb:5mb
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_bps:
      - /dev/sda:1mb
      - /dev/sdb:5mb
```

**device\_read\_iops**

Limit read rate (I/O per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops: /dev/sda:1000,/dev/sdb:500
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops:
      - /dev/sda:1000
      - /dev/sdb:500
```

**device\_write\_bps**

Limit write rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is either an integer number of bytes, or a string ending in `kb`, `mb`, or `gb`. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_write_bps: /dev/sda:1mb,/dev/sdb:5mb
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_write_bps:
      - /dev/sda:1mb
      - /dev/sdb:5mb
```

**device\_write\_iops**

Limit write rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_write_iops: /dev/sda:1000,/dev/sdb:500
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_write_iops:
      - /dev/sda:1000
      - /dev/sdb:500
```

**dns**

List of DNS nameservers. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns: 8.8.8.8,8.8.4.4
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns:
      - 8.8.8.8
      - 8.8.4.4
```

---

**Note:** To skip IP address validation, use `validate_ip_addrs=False`

---

**dns\_opt**

Additional options to be added to the container's `resolv.conf` file. Can be expressed as a comma-

separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_opt: ndots:9
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_opt:
      - ndots:9
```

#### dns\_search

List of DNS search domains. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_search: foo1.domain.tld,foo2.domain.tld
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_search:
      - foo1.domain.tld
      - foo2.domain.tld
```

#### domainname

The domain name to use for the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - domainname: domain.tld
```

#### entrypoint

Entrypoint for the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - entrypoint: "mycmd --arg1 --arg2"
```

This argument can also be specified as a list:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - entrypoint:
      - mycmd
      - --arg1
      - --arg2
```

#### environment

Either a list of variable/value mappings, or a list of strings in the format VARNAME=value. The below

three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment:
      - VAR1: value
      - VAR2: value
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment: 'VAR1=value,VAR2=value'
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment:
      - VAR1=value
      - VAR2=value
```

#### extra\_hosts

Additional hosts to add to the container's /etc/hosts file. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - extra_hosts: web1:10.9.8.7,web2:10.9.8.8
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - extra_hosts:
      - web1:10.9.8.7
      - web2:10.9.8.8
```

---

**Note:** To skip IP address validation, use `validate_ip_addrs=False`

---

---

**Note:** This option requires Docker 1.3.0 or newer.

---

#### group\_add

List of additional group names and/or IDs that the container process will run as. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - group_add: web,network
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - group_add:
      - web
      - network
```

**hostname**

Hostname of the container. If not provided, the value passed as the container's ``name`` will be used for the hostname.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - hostname: web1
```

**Warning:** hostname cannot be set if network\_mode is set to host. The below example will result in an error:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - hostname: web1
    - network_mode: host
```

**interactive (or *stdin\_open*)**

[False] Leave stdin open, even if not attached

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - interactive: True
```

**ipc\_mode (or *ipc*)**

Set the IPC mode for the container. The default behavior is to create a private IPC namespace for the container, but this option can be used to change that behavior:

- container:<container\_name\_or\_id> reuses another container shared memory, semaphores and message queues
- host: use the host's shared memory, semaphores and message queues

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ipc_mode: container:foo
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ipc_mode: host
```

**Warning:** Using host gives the container full access to local shared memory and is therefore considered insecure.

### isolation

Specifies the type of isolation technology used by containers

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - isolation: hyperv
```

---

**Note:** The default value on Windows server is `process`, while the default value on Windows client is `hyperv`. On Linux, only `default` is supported.

---

### labels

Add metadata to the container. Labels can be set both with and without values, and labels with values can be passed either as `key=value` or `key: value` pairs. For example, while the below would be very confusing to read, it is technically valid, and demonstrates the different ways in which labels can be passed:

```
mynet:
  docker_network.present:
    - labels:
      - foo
      - bar=baz
      - hello: world
```

The labels can also simply be passed as a YAML dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```
foo:
  docker_network.present:
    - labels:
      foo: ''
      bar: baz
      hello: world
```

Changed in version 2018.3.0: Methods for specifying labels can now be mixed. Earlier releases required either labels with or without values.

### links

Link this container to another. Links can be specified as a list of mappings or a comma-separated or Python list of expressions in the format `<container_name_or_id>:<link_alias>`. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links:
      - web1: link1
      - web2: link2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links: web1:link1,web2:link2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links:
      - web1:link1
      - web2:link2
```

**log\_driver and log\_opt**

Set container's logging driver and options to configure that driver. Requires Docker 1.6 or newer.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt:
      - syslog-address: tcp://192.168.0.42
      - syslog-facility: daemon
```

The `log_opt` can also be expressed as a comma-separated or YAML list of `key=value` pairs. The below two examples are equivalent to the above one:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt: "syslog-address=tcp://192.168.0.42,syslog-
      ↪facility=daemon"
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt:
      - syslog-address=tcp://192.168.0.42
      - syslog-facility=daemon
```

**Note:** The logging driver feature was improved in Docker 1.13 introducing option name changes. Please see Docker's [Configure logging drivers](#) documentation for more information.

**lxc\_conf**

Additional LXC configuration parameters to set before starting the container. Either a list of variable/value mappings, or a list of strings in the format `VARIABLE=value`. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf:
      - lxc.utsname: docker
      - lxc.arch: x86_64
```

```
foo:
```

(continues on next page)

(continued from previous page)

```

docker_container.running:
  - image: bar/baz:latest
  - lxc_conf: lxc.utsname=docker, lxc.arch=x86_64

```

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf:
      - lxc.utsname=docker
      - lxc.arch=x86_64

```

**Note:** These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has been deprecated for some time.

**mac\_address**

MAC address to use for the container. If not specified, a random MAC address will be used.

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - mac_address: 01:23:45:67:89:0a

```

**mem\_limit (or *memory*)**

[0] Memory limit. Can be specified in bytes or using single-letter units (i.e. 512M, 2G, etc.). A value of 0 (the default) means no memory limit.

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - mem_limit: 512M

```

**mem\_swappiness**

Tune a container's memory swappiness behavior. Accepts an integer between 0 and 100.

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - mem_swappiness: 60

```

**memswap\_limit (or *memory\_swap*)**

[-1] Total memory limit (memory plus swap). Set to -1 to disable swap. A value of 0 means no swap limit.

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - memswap_limit: 1G

```

**network\_disabled**

[False] If True, networking will be disabled within the container

```

foo:
  docker_container.running:
    - image: bar/baz:latest

```

(continues on next page)

(continued from previous page)

```
- network_disabled: True
```

**network\_mode**

[bridge] One of the following:

- `bridge` - Creates a new network stack for the container on the docker bridge
- `none` - No networking (equivalent of the Docker CLI argument `--net=none`). Not to be confused with Python's `None`.
- `container:<name_or_id>` - Reuses another container's network stack
- `host` - Use the host's network stack inside the container

**Warning:** Using `host` mode gives the container full access to the hosts system's services (such as D-bus), and is therefore considered insecure.

```
foo:
docker_container.running:
- image: bar/baz:latest
- network_mode: "none"
```

```
foo:
docker_container.running:
- image: bar/baz:latest
- network_mode: container:web1
```

**oom\_kill\_disable**

Whether to disable OOM killer

```
foo:
docker_container.running:
- image: bar/baz:latest
- oom_kill_disable: False
```

**oom\_score\_adj**

An integer value containing the score given to the container in order to tune OOM killer preferences

```
foo:
docker_container.running:
- image: bar/baz:latest
- oom_score_adj: 500
```

**pid\_mode**

Set to `host` to use the host container's PID namespace within the container. Requires Docker 1.5.0 or newer.

```
foo:
docker_container.running:
- image: bar/baz:latest
- pid_mode: host
```

---

**Note:** This option requires Docker 1.5.0 or newer.

---

**pids\_limit**

Set the container's PID limit. Set to `-1` for unlimited.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - pids_limit: 2000
```

**port\_bindings (or *publish*)**

Bind exposed ports. Port bindings should be passed in the same way as the `--publish` argument to the `docker run` CLI command:

- `ip:hostPort:containerPort` - Bind a specific IP and port on the host to a specific port within the container.
- `ip::containerPort` - Bind a specific IP and an ephemeral port to a specific port within the container.
- `hostPort:containerPort` - Bind a specific port on all of the host's interfaces to a specific port within the container.
- `containerPort` - Bind an ephemeral port on all of the host's interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or expressed as a YAML list, and port ranges can be defined using dashes. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - port_bindings: "4505-4506:14505-14506,2123:2123/udp,8080"
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - port_bindings:
      - 4505-4506:14505-14506
      - 2123:2123/udp
      - 8080
```

---

**Note:** When specifying a protocol, it must be passed in the `containerPort` value, as seen in the examples above.

---

**ports**

A list of ports to expose on the container. Can either be a comma-separated list or a YAML list. If the protocol is omitted, the port will be assumed to be a TCP port. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports: 1111,2222/udp
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports:
      - 1111
      - 2222/udp
```

**privileged**

[False] If True, runs the exec process with extended privileges

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - privileged: True
```

**publish\_all\_ports** (or *publish\_all*)

[False] Publish all ports to the host

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports: 8080
    - publish_all_ports: True
```

**read\_only**

[False] If True, mount the container's root filesystem as read only

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - read_only: True
```

**restart\_policy** (or *restart*)

Set a restart policy for the container. Must be passed as a string in the format `policy[:retry_count]` where `policy` is one of `always`, `unless-stopped`, or `on-failure`, and `retry_count` is an optional limit to the number of retries. The retry count is ignored when using the `always` or `unless-stopped` restart policy.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - restart_policy: on-failure:5

bar:
  docker_container.running:
    - image: bar/baz:latest
    - restart_policy: always
```

**security\_opt** (or *security\_opts*):

Security configuration for MLS systems such as SELinux and AppArmor. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - security_opt: apparmor:unconfined
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - security_opt:
      - apparmor:unconfined
```

---

**Important:** Some security options can contain commas. In these cases, this argument *must* be passed

as a Python list, as splitting by comma will result in an invalid configuration.

---

**Note:** See the documentation for `security_opt` at <https://docs.docker.com/engine/reference/run/#security-configuration>

---

#### `shm_size`

Size of `/dev/shm`

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - shm_size: 128M
```

#### `stop_signal`

Specify the signal docker will send to the container when stopping. Useful when running systemd as PID 1 inside the container.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - stop_signal: SIGRTMIN+3
```

---

**Note:** This option requires Docker 1.9.0 or newer and docker-py 1.7.0 or newer.

---

New in version 2016.11.0.

#### `stop_timeout`

Timeout to stop the container, in seconds

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - stop_timeout: 5
```

---

**Note:** In releases prior to 2017.7.0, this option was not set in the container configuration, but rather this timeout was enforced only when shutting down an existing container to replace it. To remove the ambiguity, and to allow for the container to have a stop timeout set for it, the old `stop_timeout` argument has been renamed to `shutdown_timeout`, while `stop_timeout` now refer's to the container's configured stop timeout.

---

#### `storage_opt`

Storage driver options for the container. Can be either a list of strings in the format `option=value`, or a list of mappings between option and value. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt:
      - dm.basesize: 40G
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt: dm.basesize=40G
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt:
      - dm.basesize=40G
```

#### sysctls (or sysctl)

Set sysctl options for the container. Can be either a list of strings in the format `option=value`, or a list of mappings between option and value. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls:
      - fs.nr_open: 1048576
      - kernel.pid_max: 32768
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls: fs.nr_open=1048576, kernel.pid_max=32768
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls:
      - fs.nr_open=1048576
      - kernel.pid_max=32768
```

#### tmpfs

A map of container directories which should be replaced by tmpfs mounts and their corresponding mount options.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - tmpfs:
      - /run: rw,noexec,nosuid,size=65536k
```

#### tty

[False] Attach TTYS

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - tty: True
```

#### ulimits

List of ulimits. These limits should be passed in the format `<ulimit_name>:<soft_limit>:<hard_limit>`, with the hard limit being optional. Can be

expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ulimits: nofile=1024:1024,nproc=60
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ulimits:
      - nofile=1024:1024
      - nproc=60
```

#### user

User under which to run exec process

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - user: foo
```

#### usersns\_mode (or *user\_ns\_mode*)

Sets the user namespace mode, when the user namespace remapping option is enabled

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - usersns_mode: host
```

#### volumes (or *volume*)

List of directories to expose as volumes. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes: /mnt/vol1,/mnt/vol2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes:
      - /mnt/vol1
      - /mnt/vol2
```

#### volumes\_from

Container names or IDs from which the container will get volumes. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes_from: foo
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes_from:
      - foo
```

**volume\_driver**

sets the container's volume driver

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volume_driver: foobar
```

**working\_dir (or *workdir*)**

Working directory inside the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - working_dir: /var/log/nginx
```

`salt.states.docker_container.stopped` (*name=None, containers=None, shutdown\_timeout=None, unpause=False, error\_on\_absent=True, \*\*kwargs*)

Ensure that a container (or containers) is stopped

**name**

Name or ID of the container

**containers**

Run this state on more than one container at a time. The following two examples accomplish the same thing:

```
stopped_containers:
  docker_container.stopped:
    - names:
      - foo
      - bar
      - baz
```

```
stopped_containers:
  docker_container.stopped:
    - containers:
      - foo
      - bar
      - baz
```

However, the second example will be a bit quicker since Salt will stop all specified containers in a single run, rather than executing the state separately on each image (as it would in the first example).

**shutdown\_timeout**

Timeout for graceful shutdown of the container. If this timeout is exceeded, the container will be killed. If this value is not passed, then the container's configured `stop_timeout` will be observed. If `stop_timeout` was also unset on the container, then a timeout of 10 seconds will be used.

**unpause**

[False] Set to True to unpause any paused containers before stopping. If unset, then an error will be raised for any container that was paused.

**error\_on\_absent**

[True] By default, this state will return an error if any of the specified containers are absent. Set this to `False` to suppress that error.

### 26.19.74 salt.states.docker\_image

**Warning:** This module will be removed from Salt in version 3009 in favor of the [docker Salt Extension](#).

Management of Docker images

New in version 2017.7.0.

**depends**

`docker` Python module

---

**Note:** Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py`  $\geq$  1.6.0 are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

---

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release.

---

**Note:** To pull from a Docker registry, authentication must be configured. See [here](#) for more information on how to configure access to docker registries in *Pillar* data.

---

`salt.states.docker_image.absent` (*name=None, images=None, force=False*)

Ensure that an image is absent from the Minion. Image names can be specified either using `repo:tag` notation, or just the repo name (in which case a tag of `latest` is assumed).

**name**

The name of the docker image.

**images**

Run this state on more than one image at a time. The following two examples accomplish the same thing:

```
remove_images:
  docker_image.absent:
    - names:
      - busybox
      - centos:6
      - nginx
```

```
remove_images:
  docker_image.absent:
    - images:
```

(continues on next page)

(continued from previous page)

```
- busybox
- centos:6
- nginx
```

However, the second example will be a bit quicker since Salt will do all the deletions in a single run, rather than executing the state separately on each image (as it would in the first example).

**force**

Salt will fail to remove any images currently in use by a container. Set this option to true to remove the image even if it is already present.

**Note:** This option can also be overridden by Pillar data. If the Minion has a pillar variable named `docker.running.force` which is set to `True`, it will turn on this option. This pillar variable can even be set at runtime. For example:

```
salt myminion state.sls docker_stuff pillar="{docker.force: True}"
```

If this pillar variable is present and set to `False`, then it will turn off this option.

For more granular control, setting a pillar variable named `docker.force.image_name` will affect only the named image.

`salt.states.docker_image.mod_watch`(*name*, *sfun=None*, *\*\*kwargs*)

The `docker_image` watcher, called to invoke the watch command.

**Note:** This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.docker_image.present`(*name*, *tag=None*, *build=None*, *load=None*, *force=False*, *insecure\_registry=False*, *client\_timeout=60*, *dockerfile=None*, *sls=None*, *base='opensuse/python'*, *saltenv='base'*, *pillarenv=None*, *pillar=None*, *\*\*kwargs*)

Changed in version 2018.3.0: The `tag` argument has been added. It is now required unless pulling from a registry.

Ensure that an image is present. The image can either be pulled from a Docker registry, built from a Dockerfile, loaded from a saved image, or built by running SLS files against a base image.

If none of the `build`, `load`, or `sls` arguments are used, then Salt will pull from the *configured registries*. If the specified image already exists, it will not be pulled unless `force` is set to `True`. Here is an example of a state that will pull an image from the Docker Hub:

```
myuser/myimage:
  docker_image.present:
    - tag: mytag
```

**name**

The name of the docker image.

**tag**

Tag name for the image. Required when using `build`, `load`, or `sls` to create the image, but optional if pulling from a repository.

New in version 2018.3.0.

**build**

Path to directory on the Minion containing a Dockerfile

```
myuser/myimage:
  docker_image.present:
    - build: /home/myuser/docker/myimage
    - tag: mytag

myuser/myimage:
  docker_image.present:
    - build: /home/myuser/docker/myimage
    - tag: mytag
    - dockerfile: Dockerfile.alternative
```

The image will be built using *docker.build* and the specified image name and tag will be applied to it.

New in version 2016.11.0.

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

**load**

Loads a tar archive created with *docker.save* (or the `docker save` Docker CLI command), and assigns it the specified repo and tag.

```
myuser/myimage:
  docker_image.present:
    - load: salt://path/to/image.tar
    - tag: mytag
```

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

**force**

Set this parameter to `True` to force Salt to pull/build/load the image even if it is already present.

**insecure\_registry**

If `True`, the Docker client will permit the use of insecure (non-HTTPS) registries.

**client\_timeout**

Timeout in seconds for the Docker client. This is not a timeout for the state, but for receiving a response from the API.

**dockerfile**

Allows for an alternative Dockerfile to be specified. Path to alternative Dockerfile is relative to the build path for the Docker container.

New in version 2016.11.0.

**sls**

Allow for building of image with *docker.sls\_build* by specifying the SLS files with which to build. This can be a list or comma-separated string.

```
myuser/myimage:
  docker_image.present:
    - tag: latest
    - sls:
      - webapp1
      - webapp2
    - base: centos
    - saltenv: base
```

New in version 2017.7.0.

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

**base**

Base image with which to start *docker.sls\_build*

New in version 2017.7.0.

**saltenv**

Specify the environment from which to retrieve the SLS indicated by the `mods` parameter.

New in version 2017.7.0.

Changed in version 2018.3.0: Now uses the effective saltenv if not explicitly passed. In earlier versions, `base` was assumed as a default.

**pillarenv**

Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2018.3.0.

**pillar**

Custom Pillar values, passed as a dictionary of key-value pairs

---

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

New in version 2018.3.0.

**kwargs**

Additional keyword arguments to pass to *docker.build*

### 26.19.75 salt.states.docker\_network

**Warning:** This module will be removed from Salt in version 3009 in favor of the [docker Salt Extension](#).

Management of Docker networks

New in version 2017.7.0.

**depends**

*docker* Python module

---

**Note:** Older releases of the Python bindings for Docker were called *docker-py* in PyPI. All releases of *docker*, and releases of *docker-py* `>= 1.6.0` are supported. These python bindings can easily be installed using *pip.install*:

```
salt myminion pip.install docker
```

To upgrade from *docker-py* to *docker*, you must first uninstall *docker-py*, and then install *docker*:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

---

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release.

`salt.states.docker_network.absent(name)`

Ensure that a network is absent.

**name**

Name of the network

Usage Example:

```
network_foo:
  docker_network.absent
```

`salt.states.docker_network.present(name, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, containers=None, reconnect=True, **kwargs)`

Changed in version 2018.3.0: Support added for network configuration options other than `driver` and `driver_opts`, as well as IPAM configuration.

Ensure that a network is present

---

**Note:** This state supports all arguments for network and IPAM pool configuration which are available for the release of `docker-py` installed on the minion. For that reason, the arguments described below in the [NETWORK CONFIGURATION](#) and [IP ADDRESS MANAGEMENT \(IPAM\)](#) sections may not accurately reflect what is available on the minion. The `docker.get_client_args` function can be used to check the available arguments for the installed version of `docker-py` (they are found in the `network_config` and `ipam_config` sections of the return data), but Salt will not prevent a user from attempting to use an argument which is unsupported in the release of Docker which is installed. In those cases, network creation be attempted but will fail.

---

**name**

Network name

**skip\_translate**

This function translates Salt SLS input into the format which `docker-py` expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and *all* translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which `docker-py` expects. This allows for API changes and other issues to be more easily worked around. See the following links for more information:

- [docker-py Low-level API](#)
- [Docker Engine API](#)

New in version 2018.3.0.

**ignore\_collisions**

[False] Since many of `docker-py`'s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the `docker-py` version of that argument. However, if both the alias and the `docker-py` version of the same argument (e.g. `options` and `driver_opts`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the `docker-py` version of the argument.

New in version 2018.3.0.

**validate\_ip\_addrs**

[True] For parameters which accept IP addresses/subnets as input, validation will be performed. To disable, set this to `False`.

New in version 2018.3.0.

### containers

A list of containers which should be connected to this network.

**Note:** As of the 2018.3.0 release, this is not the recommended way of managing a container's membership in a network, for a couple reasons:

1. It does not support setting static IPs, aliases, or links in the container's IP configuration.
2. If a `docker_container.running` state replaces a container, it will not be reconnected to the network until the `docker_network.present` state is run again. Since containers often have `require` requisites to ensure that the network is present, this means that the `docker_network.present` state ends up being run *before* the `docker_container.running`, leaving the container unattached at the end of the Salt run.

For these reasons, it is recommended to use *docker\_container.running's network management support*.

### reconnect

[True] If `containers` is not used, and the network is replaced, then Salt will keep track of the containers which were connected to the network and reconnect them to the network after it is replaced. Salt will first attempt to reconnect using the same IP the container had before the network was replaced. If that fails (for instance, if the network was replaced because the subnet was modified), then the container will be reconnected without an explicit IP address, and its IP will be assigned by Docker.

Set this option to `False` to keep Salt from trying to reconnect containers. This can be useful in some cases when *managing static IPs in docker\_container.running*. For instance, if a network's subnet is modified, it is likely that the static IP will need to be updated in the `docker_container.running` state as well. When the network is replaced, the initial reconnect attempt would fail, and the container would be reconnected with an automatically-assigned IP address. Then, when the `docker_container.running` state executes, it would disconnect the network *again* and reconnect using the new static IP. Disabling the reconnect behavior in these cases would prevent the unnecessary extra reconnection.

New in version 2018.3.0.

## NETWORK CONFIGURATION ARGUMENTS

### driver

Network driver

```
mynet:
  docker_network.present:
    - driver: macvlan
```

### driver\_opts (or *driver\_opt*, or *options*)

Options for the network driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`. The below three examples are equivalent:

```
mynet:
  docker_network.present:
    - driver: macvlan
    - driver_opts: macvlan_mode=bridge,parent=eth0
```

```
mynet:
  docker_network.present:
    - driver: macvlan
    - driver_opts:
      - macvlan_mode=bridge
      - parent=eth0
```

```

mynet:
  docker_network.present:
    - driver: macvlan
    - driver_opts:
      - macvlan_mode: bridge
      - parent: eth0

```

The options can also simply be passed as a dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```

mynet:
  docker_network.present:
    - driver: macvlan
    - driver_opts:
      macvlan_mode: bridge
      parent: eth0

```

#### check\_duplicate

[True] If True, checks for networks with duplicate names. Since networks are primarily keyed based on a random ID and not on the name, and network name is strictly a user-friendly alias to the network which is uniquely identified using ID, there is no guaranteed way to check for duplicates. This option provides a best effort, checking for any networks which have the same name, but it is not guaranteed to catch all name collisions.

```

mynet:
  docker_network.present:
    - check_duplicate: False

```

#### internal

[False] If True, restricts external access to the network

```

mynet:
  docker_network.present:
    - internal: True

```

#### labels

Add metadata to the network. Labels can be set both with and without values, and labels with values can be passed either as `key=value` or `key: value` pairs. For example, while the below would be very confusing to read, it is technically valid, and demonstrates the different ways in which labels can be passed:

```

mynet:
  docker_network.present:
    - labels:
      - foo
      - bar=baz
      - hello: world

```

The labels can also simply be passed as a YAML dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```

foo:
  docker_network.present:
    - labels:
      foo: ''

```

(continues on next page)

(continued from previous page)

```
bar: baz
hello: world
```

Changed in version 2018.3.0: Methods for specifying labels can now be mixed. Earlier releases required either labels with or without values.

**enable\_ipv6 (or *ipv6*)**

[False] Enable IPv6 on the network

```
mynet:
  docker_network.present:
    - enable_ipv6: True
```

**Note:** While it should go without saying, this argument must be set to `True` to *configure an IPv6 subnet*. Also, if this option is turned on without an IPv6 subnet explicitly configured, you will get an error unless you have set up a fixed IPv6 subnet. Consult the [Docker IPv6 docs](#) for information on how to do this.

**attachable**

[False] If `True`, and the network is in the global scope, non-service containers on worker nodes will be able to connect to the network.

```
mynet:
  docker_network.present:
    - attachable: True
```

**Note:** This option cannot be reliably managed on CentOS 7. This is because while support for this option was added in API version 1.24, its value was not added to the inspect results until API version 1.26. The version of Docker which is available for CentOS 7 runs API version 1.24, meaning that while Salt can pass this argument to the API, it has no way of knowing the value of this config option in an existing Docker network.

**scope**

Specify the network's scope (`local`, `global` or `swarm`)

```
mynet:
  docker_network.present:
    - scope: local
```

**ingress**

[False] If `True`, create an ingress network which provides the routing-mesh in swarm mode

```
mynet:
  docker_network.present:
    - ingress: True
```

**IP ADDRESS MANAGEMENT (IPAM)**

This state supports networks with either IPv4, or both IPv4 and IPv6. If configuring IPv4, then you can pass the *IPAM pool arguments* below as individual arguments. However, if configuring IPv4 and IPv6, the arguments must be passed as a list of dictionaries, in the `ipam_pools` argument (click [here](#) for some examples). *These docs* also have more information on these arguments.

*IPAM ARGUMENTS***ipam\_driver**

IPAM driver to use, if different from the default one

```

mynet:
  docker_network.present:
    - ipam_driver: foo

```

**ipam\_opts**

Options for the IPAM driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`. The below three examples are equivalent:

```

mynet:
  docker_network.present:
    - ipam_driver: foo
    - ipam_opts: foo=bar,baz=qux

```

```

mynet:
  docker_network.present:
    - ipam_driver: foo
    - ipam_opts:
      - foo=bar
      - baz=qux

```

```

mynet:
  docker_network.present:
    - ipam_driver: foo
    - ipam_opts:
      - foo: bar
      - baz: qux

```

The options can also simply be passed as a dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```

mynet:
  docker_network.present:
    - ipam_driver: macvlan
    - ipam_opts:
      foo: bar
      baz: qux

```

*IPAM POOL ARGUMENTS***subnet**

Subnet in CIDR format that represents a network segment

**iprange (or *ip\_range*)**

Allocate container IP from a sub-range within the subnet

Subnet in CIDR format that represents a network segment

**gateway**

IPv4 or IPv6 gateway for the master subnet

**aux\_addresses (or *aux\_address*)**

A dictionary of mapping container names to IP addresses which should be allocated for them should they connect to the network. Either a dictionary of option names and values or a Python list of strings in the format `host=ipaddr`.

*IPAM CONFIGURATION EXAMPLES*

Below is an example of an IPv4-only network (keep in mind that `subnet` is the only required argument).

```

mynet:
  docker_network.present:
    - subnet: 10.0.20.0/24
    - iprange: 10.0.20.128/25
    - gateway: 10.0.20.254
    - aux_addresses:
      - foo.bar.tld: 10.0.20.50
      - hello.world.tld: 10.0.20.51

```

Note: The `aux_addresses` can be passed differently, in the same way that `driver_opts` and `ipam_opts` can.

This same network could also be configured this way:

```

mynet:
  docker_network.present:
    - ipam_pools:
      - subnet: 10.0.20.0/24
        iprange: 10.0.20.128/25
        gateway: 10.0.20.254
      aux_addresses:
        foo.bar.tld: 10.0.20.50
        hello.world.tld: 10.0.20.51

```

Here is an example of a mixed IPv4/IPv6 subnet.

```

mynet:
  docker_network.present:
    - ipam_pools:
      - subnet: 10.0.20.0/24
        gateway: 10.0.20.1
      - subnet: fe3f:2180:26:1::/123
        gateway: fe3f:2180:26:1::1

```

### 26.19.76 salt.states.docker\_volume

**Warning:** This module will be removed from Salt in version 3009 in favor of the [docker Salt Extension](#).

Management of Docker volumes

New in version 2017.7.0.

#### depends

`docker` Python module

Note: Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py` `>= 1.6.0` are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

---

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release.

`salt.states.docker_volume.absent` (*name*, *driver=None*)

Ensure that a volume is absent.

New in version 2015.8.4.

Changed in version 2017.7.0: This state was renamed from `docker.volume_absent` to `docker_volume.absent`

**name**  
Name of the volume

Usage Examples:

```
volume_foo:
  docker_volume.absent
```

`salt.states.docker_volume.present` (*name*, *driver=None*, *driver\_opts=None*, *force=False*)

Ensure that a volume is present.

New in version 2015.8.4.

Changed in version 2015.8.6: This state no longer deletes and re-creates a volume if the existing volume's driver does not match the `driver` parameter (unless the `force` parameter is set to `True`).

Changed in version 2017.7.0: This state was renamed from `docker.volume_present` to `docker_volume.present`

**name**  
Name of the volume

**driver**

Type of driver for that volume. If `None` and the volume does not yet exist, the volume will be created using Docker's default driver. If `None` and the volume does exist, this function does nothing, even if the existing volume's driver is not the Docker default driver. (To ensure that an existing volume's driver matches the Docker default, you must explicitly name Docker's default driver here.)

**driver\_opts**

Options for the volume driver

**force**

[False] If the volume already exists but the existing volume's driver does not match the driver specified by the `driver` parameter, this parameter controls whether the function errors out (if `False`) or deletes and re-creates the volume (if `True`).

New in version 2015.8.6.

Usage Examples:

```
volume_foo:
  docker_volume.present
```

```
volume_bar:
  docker_volume.present
  - name: bar
  - driver: local
  - driver_opts:
    foo: bar
```

```

volume_bar:
  docker_volume.present
  - name: bar
  - driver: local
  - driver_opts:
    - foo: bar
    - option: value

```

### 26.19.77 salt.states.drac

Management of Dell DRAC

The DRAC module is used to create and manage DRAC cards on Dell servers

Ensure the user damian is present

```

damian:
  drac.present:
    - name: damian
    - password: secret
    - permission: login,test_alerts,clear_logs

```

Ensure the user damian does not exist

```

damian:
  drac.absent:
    - name: damian

```

Ensure DRAC network is in a consistent state

```

my_network:
  drac.network:
    - ip: 10.225.108.29
    - netmask: 255.255.255.224
    - gateway: 10.225.108.1

```

`salt.states.drac.absent`(*name*)

Ensure a user does not exist on the Dell DRAC

**name:**

The users username

`salt.states.drac.network`(*ip*, *netmask*, *gateway*)

Ensure the DRAC network settings are consistent

`salt.states.drac.present`(*name*, *password*, *permission*)

Ensure the user exists on the Dell DRAC

**name:**

The users username

**password**

The password used to authenticate

**permission**

The permissions that should be assigned to a user

## 26.19.78 salt.states.dvs

Manage VMware distributed virtual switches (DVSs) and their distributed virtual portgroups (DVportgroups).

### codeauthor

*Alexandru Bleotu <alexandru.bleotu@morganstaley.com>*

### Examples

Several settings can be changed for DVSs and DVportgroups. Here are two examples covering all of the settings. Fewer settings can be used

### DVS

```
'name': 'dvs1',
'max_mtu': 1000,
'uplink_names': [
    'dvUplink1',
    'dvUplink2',
    'dvUplink3'
],
'capability': {
    'portgroup_operation_supported': false,
    'operation_supported': true,
    'port_operation_supported': false
},
'lacp_api_version': 'multipleLag',
'contact_email': 'foo@email.com',
'product_info': {
    'version':
    '6.0.0',
    'vendor':
    'VMware,
    Inc.',
    'name':
    'DVS'
},
'network_resource_management_enabled': true,
'contact_name': 'me@email.com',
'infrastructure_traffic_resource_pools': [
    {
        'reservation': 0,
        'limit': 1000,
        'share_level': 'high',
        'key': 'management',
        'num_shares': 100
    },
    {
        'reservation': 0,
        'limit': -1,
        'share_level': 'normal',
        'key': 'faultTolerance',
```

(continues on next page)

(continued from previous page)

```
    'num_shares': 50
  },
  {
    'reservation': 0,
    'limit': 32000,
    'share_level': 'normal',
    'key': 'vmotion',
    'num_shares': 50
  },
  {
    'reservation': 10000,
    'limit': -1,
    'share_level': 'normal',
    'key': 'virtualMachine',
    'num_shares': 50
  },
  {
    'reservation': 0,
    'limit': -1,
    'share_level': 'custom',
    'key': 'iSCSI',
    'num_shares': 75
  },
  {
    'reservation': 0,

```

Note: The mandatory attribute is: name.

## Portgroup

```
'security_policy': {
  'allow_promiscuous': true,
  'mac_changes': false,
  'forged_transmits': true
},
'name': 'vmotion-v702',
'out_shaping': {
  'enabled': true,
  'average_bandwidth': 1500,
  'burst_size': 4096,
  'peak_bandwidth': 1500
},
'num_ports': 128,
'teaming': {
  'port_order': {
    'active': [
      'dvUplink2'
    ],
    'standby': [
      'dvUplink1'
    ]
  },
  'notify_switches': false,
  'reverse_policy': true,
  'rolling_order': false,
  'policy': 'failover_explicit',
  'failure_criteria': {
    'check_error_percent': true,
    'full_duplex': false,
    'check_duplex': false,
    'percentage': 50,
    'check_speed': 'minimum',
    'speed': 20,
    'check_beacon': true
  }
},
'type': 'earlyBinding',
'vlan_id': 100,
```

(continues on next page)

(continued from previous page)

```
'description': 'Managed by Salt. Random settings.'
```

Note: The mandatory attributes are: name, type.

## Dependencies

- pyVmomi Python Module

## pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

**salt.states.dvs.dvs\_configured**(*name*, *dvs*)

Configures a DVS.

Creates a new DVS, if it doesn't exist in the provided datacenter or reconfigures it if configured differently.

**dvs**

DVS dict representations (see module sysdocs)

**salt.states.dvs.portgroups\_configured**(*name*, *dvs*, *portgroups*)

Configures portgroups on a DVS.

Creates/updates/removes portgroups in a provided DVS

**dvs**

Name of the DVS

**portgroups**

Portgroup dict representations (see module sysdocs)

**salt.states.dvs.uplink\_portgroup\_configured**(*name*, *dvs*, *uplink\_portgroup*)

Configures the uplink portgroup on a DVS. The state assumes there is only one uplink portgroup.

**dvs**

Name of the DVS

**uplink\_portgroup**

Uplink portgroup dict representations (see module sysdocs)

## 26.19.79 salt.states.elasticsearch

State module to manage Elasticsearch.

New in version 2017.7.0.

`salt.states.elasticsearch.alias_absent` (*name*, *index*)

Ensure that the index alias is absent.

**name**

Name of the index alias to remove

**index**

Name of the index for the alias

`salt.states.elasticsearch.alias_present` (*name*, *index*, *definition=None*)

Ensure that the named index alias is present.

**name**

Name of the alias

**index**

Name of the index

**definition**

Optional dict for filters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-aliases.html>

Example:

```
mytestalias:
  elasticsearch.alias_present:
    - index: testindex
    - definition:
        filter:
          term:
            user: kimchy
```

`salt.states.elasticsearch.index_absent` (*name*)

Ensure that the named index is absent.

**name**

Name of the index to remove

`salt.states.elasticsearch.index_present` (*name*, *definition=None*)

Ensure that the named index is present.

**name**

Name of the index to add

**definition**

Optional dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html>

Example:

```
# Default settings
mytestindex:
  elasticsearch_index.present

# Extra settings
mytestindex2:
  elasticsearch_index.present:
    - definition:
        settings:
```

(continues on next page)

(continued from previous page)

```

index:
  number_of_shards: 10

```

`salt.states.elasticsearch.index_template_absent`(*name*)

Ensure that the named index template is absent.

**name**

Name of the index to remove

`salt.states.elasticsearch.index_template_present`(*name*, *definition*, *check\_definition=False*)

Ensure that the named index template is present.

**name**

Name of the index to add

**definition**

Required dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html>

**check\_definition**

If the template already exists and the definition is up to date

**Example:**

```

mytestindex2_template:
  elasticsearch.index_template_present:
    - definition:
      template: logstash-*
      order: 1
      settings:
        number_of_shards: 1

```

`salt.states.elasticsearch.pipeline_absent`(*name*)

Ensure that the named pipeline is absent

**name**

Name of the pipeline to remove

`salt.states.elasticsearch.pipeline_present`(*name*, *definition*)

Ensure that the named pipeline is present.

**name**

Name of the index to add

**definition**

Required dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html>

**Example:**

```

test_pipeline:
  elasticsearch.pipeline_present:
    - definition:
      description: example pipeline
      processors:
        - set:
          field: collector_timestamp_millis
          value: '{{ '{{' }}_ingest.timestamp{{ '}}' }}'

```

`salt.states.elasticsearch.search_template_absent`(*name*)

Ensure that the search template is absent

**name**

Name of the search template to remove

`salt.states.elasticsearch.search_template_present` (*name*, *definition*)

Ensure that the named search template is present.

**name**

Name of the search template to add

**definition**Required dict for creation parameters as per <http://www.elastic.co/guide/en/elasticsearch/reference/current/search-template.html>**Example:**

```
test_pipeline:
  elasticsearch.search_template_present:
    - definition:
      inline:
        size: 10
```

### 26.19.80 salt.states.elasticsearch\_index

State module to manage Elasticsearch indices

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use elasticsearch state instead

`salt.states.elasticsearch_index.absent` (*name*)

Ensure that the named index is absent.

**name**

Name of the index to remove

`salt.states.elasticsearch_index.present` (*name*, *definition=None*)

New in version 2015.8.0.

Changed in version 2017.3.0: Marked *definition* as optional.

Ensure that the named index is present.

**name**

Name of the index to add

**definition**Optional dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html>**Example:**

```
# Default settings
mytestindex:
  elasticsearch_index.present

# Extra settings
mytestindex2:
  elasticsearch_index.present:
    - definition:
      settings:
        index:
          number_of_shards: 10
```

## 26.19.81 salt.states.elasticsearch\_index\_template

State module to manage Elasticsearch index templates

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use elasticsearch state instead

`salt.states.elasticsearch_index_template.absent(name)`

Ensure that the named index template is absent.

**name**

Name of the index to remove

`salt.states.elasticsearch_index_template.present(name, definition)`

New in version 2015.8.0.

Changed in version 2017.3.0: Marked definition as required.

Ensure that the named index template is present.

**name**

Name of the index to add

**definition**

Required dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html>

**Example:**

```
mytestindex2_template:
  elasticsearch_index_template.present:
    - definition:
      template: logstash-*
      order: 1
      settings:
        number_of_shards: 1
```

## 26.19.82 salt.states.environ

Support for getting and setting the environment variables of the current salt process.

`salt.states.environ.setenv(name, value, false_unsets=False, clear_all=False, update_minion=False, permanent=False)`

Set the salt process environment variables.

**name**

The environment key to set. Must be a string.

**value**

Either a string or dict. When string, it will be the value set for the environment key of 'name' above. When a dict, each key/value pair represents an environment variable to set.

**false\_unsets**

If a key's value is False and false\_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and false\_unsets is not True, then the key's value will be set to an empty string. Default: False

**clear\_all**

USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear\_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False

**update\_minion**

If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

**permanent**

On Windows minions this will set the environment variable in the registry so that it is always added as a environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

Example:

```
a_string_env:
  environ.setenv:
    - name: foo
    - value: bar
    - update_minion: True

a_dict_env:
  environ.setenv:
    - name: does_not_matter
    - value:
      foo: bar
      baz: quux
```

### 26.19.83 salt.states.eselect

#### Management of Gentoo configuration using eselect

A state module to manage Gentoo configuration via eselect

`salt.states.eselect.set_(name, target, module_parameter=None, action_parameter=None)`

Verify that the given module is set to the given target

**name**

The name of the module

**target**

The target to be set for this module

**module\_parameter**

additional params passed to the defined module

**action\_parameter**

additional params passed to the defined action

```
profile:
  eselect.set:
    - target: hardened/linux/amd64
```

## 26.19.84 salt.states.esxcluster

Manage VMware ESXi Clusters.

**Warning:** This module will be deprecated in a future release of Salt. VMware strongly recommends using the [VMware Salt extensions](#) instead of the ESX cluster module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.

### Dependencies

- pyVmomi Python Module

### pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

**salt.states.esxcluster.cluster\_configured**(*name*, *cluster\_config*)

Configures a cluster. Creates a new cluster, if it doesn't exist on the vCenter or reconfigures it if configured differently

Supported proxies: esxdatacenter, esxcluster

**name**

Name of the state. If the state is run in by an esxdatacenter proxy, it will be the name of the cluster.

**cluster\_config**

Configuration applied to the cluster. Complex datastructure following the ESXClusterConfigSchema. Valid example is:

```
drs:
  default_vm_behavior: fullyAutomated
  enabled: true
  vmotion_rate: 3
ha:
  admission_control
  _enabled: false
  default_vm_settings:
```

(continues on next page)

(continued from previous page)

```

    isolation_response: powerOff
    restart_priority: medium
    enabled: true
    hb_ds_candidate_policy: userSelectedDs
    host_monitoring: enabled
    options:
      - key: das.ignoreinsufficienthbdastore
        value: 'true'
    vm_monitoring: vmMonitoringDisabled
    vm_swap_placement: vmDirectory
    vsan:
      auto_claim_storage: false
      compression_enabled: true
      dedup_enabled: true
      enabled: true

```

`salt.states.esxcluster.licenses_configured`(*name, licenses=None*)

Configures licenses on the cluster entity

Checks if each license exists on the server:

- if it doesn't, it creates it

Check if license is assigned to the cluster:

- if it's not assigned to the cluster:
  - assign it to the cluster if there is space
  - error if there's no space
- if it's assigned to the cluster nothing needs to be done

`salt.states.esxcluster.vsan_datastore_configured`(*name, datastore\_name*)

Configures the cluster's VSAN datastore

WARNING: The VSAN datastore is created automatically after the first ESXi host is added to the cluster; the state assumes that the datastore exists and errors if it doesn't.

### 26.19.85 salt.states.esxdatacenter

Salt states to create and manage VMware vSphere datacenters (datacenters).

**codeauthor**

*Alexandru Bleotu <alexandru.bleotu@morganstaley.com>*

**Warning:** This module will be deprecated in a future release of Salt. VMware strongly recommends using the [VMware Salt extensions](#) instead of the ESX data center module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.

## Dependencies

- pyVmomi Python Module

## States

### datacenter\_configured

Makes sure a datacenter exists and is correctly configured.

If the state is run by an `esxdatacenter` minion, the name of the datacenter is retrieved from the proxy details, otherwise the datacenter has the same name as the state.

Supported proxies: `esxdatacenter`

Example:

1. Make sure that a datacenter named `target_dc` exists on the vCenter, using a `esxdatacenter` proxy:

Proxy minion configuration (connects passthrough to the vCenter):

```
proxy:
  proxytype: esxdatacenter
  datacenter: target_dc
  vcenter: vcenter.fake.com
  mechanism: sspi
  domain: fake.com
  principal: host
```

State configuration:

```
datacenter_state:
  esxdatacenter.datacenter_configured
```

`salt.states.esxdatacenter.datacenter_configured`(*name*)

Makes sure a datacenter exists.

If the state is run by an `esxdatacenter` minion, the name of the datacenter is retrieved from the proxy details, otherwise the datacenter has the same name as the state.

Supported proxies: `esxdatacenter`

**name:**

Datacenter name. Ignored if the proxytype is `esxdatacenter`.

## 26.19.86 salt.states.esxi

Manage VMware ESXi Hosts.

**Warning:** This module will be deprecated in a future release of Salt. VMware strongly recommends using the [VMware Salt extensions](#) instead of the ESXi module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.

## Dependencies

- pyVmomi Python Module
- ESXCLI

### pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

---

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

---

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

### ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

---

**Note:** Be aware that some functionality in this state module may depend on the type of license attached to the ESXi host.

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The ntpd service is restricted to an Enterprise Plus license, while ssh is available via the Standard license.

Please see the [vSphere Comparison](#) page for more information.

---

## About

This state module was written to be used in conjunction with Salt's *ESXi Proxy Minion*. For a tutorial on how to use Salt's ESXi Proxy Minion, please refer to the *ESXi Proxy Minion Tutorial* for configuration examples, dependency installation instructions, how to run remote execution functions against ESXi hosts via a Salt Proxy Minion, and a larger state example.

`salt.states.esxi.coredump_configured`(*name*, *enabled*, *dump\_ip*, *host\_vnic*='vmk0', *dump\_port*=6500)

Ensures a host's core dump configuration.

### name

Name of the state.

### enabled

Sets whether or not ESXi core dump collection should be enabled. This is a boolean value set to `True` or `False` to enable or disable core dumps.

Note that ESXi requires that the core dump must be enabled before any other parameters may be set. This also affects the `changes` results in the state return dictionary. If `enabled` is `False`, we can't obtain any previous settings to compare other state variables, resulting in many old references returning `None`.

Once `enabled` is `True` the `changes` dictionary comparisons will be more accurate. This is due to the way the system `coredump` network configuration command returns data.

### dump\_ip

The IP address of host that will accept the dump.

### host\_vnic

Host VNic port through which to communicate. Defaults to `vmk0`.

### dump\_port

TCP port to use for the dump. Defaults to `6500`.

Example:

```
configure-host-coredump:
  esxi.coredump_configured:
    - enabled: True
    - dump_ip: 'my-coredump-ip.example.com'
```

`salt.states.esxi.diskgroups_configured`(*name*, *diskgroups*, *erase\_disks*=`False`)

Configures the disk groups to use for vsan.

This function will do the following:

1. Check whether or not all disks in the diskgroup spec exist, and raises an error if they do not.
2. Create diskgroups with the correct disk configurations if diskgroup (identified by the cache disk canonical name) doesn't exist
3. Add extra capacity disks to the existing diskgroup

Example:

```
{
  'cache_scsi_addr': 'vmhba1:C0:T0:L0',
  'capacity_scsi_addrs': [
    'vmhba2:C0:T0:L0',
    'vmhba3:C0:T0:L0',
    'vmhba4:C0:T0:L0',
  ]
}
```

### name

Mandatory state name

**diskgroups**

Disk group representation containing scsi disk addresses. Scsi addresses are expected for disks in the diskgroup:

**erase\_disks**

Specifies whether to erase all partitions on all disks member of the disk group before the disk group is created. Default value is False.

```
salt.states.esxi.host_cache_configured(name, enabled, datastore, swap_size='100%',
                                       dedicated_backing_disk=False, erase_backing_disk=False)
```

Configures the host cache used for swapping.

It will do the following:

1. Checks if backing disk exists
2. Creates the VMFS datastore if doesn't exist (datastore partition will be created and use the entire disk)
3. Raises an error if `dedicated_backing_disk` is True and partitions already exist on the backing disk
4. Configures `host_cache` to use a portion of the datastore for caching (either a specific size or a percentage of the datastore)

Examples

Percentage swap size (can't be 100%)

```
{
  'enabled': true,
  'datastore': {
    'backing_disk_scsi_addr': 'vmhba0:C0:T0:L0',
    'vmfs_version': 5,
    'name': 'hostcache'
  }
  'dedicated_backing_disk': false
  'swap_size': '98%',
}
```

Fixed sized swap size

```
{
  'enabled': true,
  'datastore': {
    'backing_disk_scsi_addr': 'vmhba0:C0:T0:L0',
    'vmfs_version': 5,
    'name': 'hostcache'
  }
  'dedicated_backing_disk': true
  'swap_size': '10GiB',
}
```

**name**

Mandatory state name.

**enabled**

Specifies whether the host cache is enabled.

**datastore**

Specifies the host cache datastore.

**swap\_size**

Specifies the size of the host cache swap. Can be a percentage or a value in GiB. Default value is 100%.

**dedicated\_backing\_disk**

Specifies whether the backing disk is dedicated to the host cache which means it must have no other

partitions. Default is False

**erase\_backing\_disk**

Specifies whether to erase all partitions on the backing disk before the datastore is created. Default value is False.

`salt.states.esxi.ntp_configured` (*name*, *service\_running*, *ntp\_servers=None*, *service\_policy=None*, *service\_restart=False*, *update\_datetime=False*)

Ensures a host's NTP server configuration such as setting NTP servers, ensuring the NTP daemon is running or stopped, or restarting the NTP daemon for the ESXi host.

**name**

Name of the state.

**service\_running**

Ensures the running state of the ntp daemon for the host. Boolean value where True indicates that ntpd should be running and False indicates that it should be stopped.

**ntp\_servers**

A list of servers that should be added to the ESXi host's NTP configuration.

**service\_policy**

The policy to set for the NTP service.

---

**Note:** When setting the service policy to `off` or `on`, you *must* quote the setting. If you don't, the yaml parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

---

**service\_restart**

If set to True, the ntp daemon will be restarted, regardless of its previous running state. Default is False.

**update\_datetime**

If set to True, the date/time on the given host will be updated to UTC. Default setting is False. This option should be used with caution since network delays and execution delays can result in time skews.

Example:

```

configure-host-ntp:
  esxi.ntp_configured:
    - service_running: True
    - ntp_servers:
      - 192.174.1.100
      - 192.174.1.200
    - service_policy: 'on'
    - service_restart: True
  
```

`salt.states.esxi.password_present` (*name*, *password*)

Ensures the given password is set on the ESXi host. Passwords cannot be obtained from host, so if a password is set in this state, the `vsphere.update_host_password` function will always run (except when using `test=True` functionality) and the state's changes dictionary will always be populated.

The username for which the password will change is the same username that is used to authenticate against the ESXi host via the Proxy Minion. For example, if the pillar definition for the proxy username is defined as `root`, then the username that the password will be updated for via this state is `root`.

**name**

Name of the state.

**password**

The new password to change on the host.

Example:

```

configure-host-password:
  esxi.password_present:
    - password: 'new-bad-password'

```

`salt.states.esxi.ssh_configured`(*name*, *service\_running*, *ssh\_key=None*, *ssh\_key\_file=None*, *service\_policy=None*, *service\_restart=False*, *certificate\_verify=None*)

Manage the SSH configuration for a host including whether or not SSH is running or the presence of a given SSH key. Note: Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

**name**

Name of the state.

**service\_running**

Ensures whether or not the SSH service should be running on a host. Represented as a boolean value where `True` indicates that SSH should be running and `False` indicates that SSH should be stopped.

In order to update SSH keys, the SSH service must be running.

**ssh\_key**

Public SSH key to be added to the `authorized_keys` file on the ESXi host. You can use `ssh_key` or `ssh_key_file`, but not both.

**ssh\_key\_file**

File containing the public SSH key to be added to the `authorized_keys` file on the ESXi host. You can use `ssh_key_file` or `ssh_key`, but not both.

**service\_policy**

The policy to set for the NTP service.

---

**Note:** When setting the service policy to `off` or `on`, you *must* quote the setting. If you don't, the yml parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

---

**service\_restart**

If set to `True`, the SSH service will be restarted, regardless of its previous running state. Default is `False`.

**certificate\_verify**

If set to `True`, the SSL connection must present a valid certificate. Default is `True`.

Example:

```

configure-host-ssh:
  esxi.ssh_configured:
    - service_running: True
    - ssh_key_file: /etc/salt/ssh_keys/my_key.pub
    - service_policy: 'on'
    - service_restart: True
    - certificate_verify: True

```

`salt.states.esxi.syslog_configured`(*name*, *syslog\_configs*, *firewall=True*, *reset\_service=True*, *reset\_syslog\_config=False*, *reset\_configs=None*)

Ensures the specified syslog configuration parameters. By default, this state will reset the syslog service after any new or changed parameters are set successfully.

**name**

Name of the state.

**syslog\_configs**

Name of parameter to set (corresponds to the command line switch for `esxcli` without the double dashes (--))

Valid `syslog_config` values are `logdir`, `loghost`, `logdir-unique`, `default-rotate`, `default-size`, and `default-timeout`.

Each `syslog_config` option also needs a configuration value to set. For example, `loghost` requires URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas

(reference: <https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html>)

#### **firewall**

Enable the firewall rule set for syslog. Defaults to `True`.

#### **reset\_service**

After a successful parameter set, reset the service. Defaults to `True`.

#### **reset\_syslog\_config**

Resets the syslog service to its default settings. Defaults to `False`. If set to `True`, default settings defined by the list of syslog configs in `reset_configs` will be reset before running any other syslog settings.

#### **reset\_configs**

A comma-delimited list of parameters to reset. Only runs if `reset_syslog_config` is set to `True`. If `reset_syslog_config` is set to `True`, but no syslog configs are listed in `reset_configs`, then `reset_configs` will be set to `all` by default.

See `syslog_configs` parameter above for a list of valid options.

Example:

```

configure-host-syslog:
  esxi.syslog_configured:
    - syslog_configs:
      loghost: ssl://localhost:5432,tcp://10.1.0.1:1514
      default-timeout: 120
    - firewall: True
    - reset_service: True
    - reset_syslog_config: True
    - reset_configs: loghost,default-timeout

```

`salt.states.esxi.vmotion_configured`(*name, enabled, device='vmk0'*)

Configures a host's VMotion properties such as enabling VMotion and setting the device `VirtualNic` that VMotion will use.

#### **name**

Name of the state.

#### **enabled**

Ensures whether or not VMotion should be enabled on a host as a boolean value where `True` indicates that VMotion should be enabled and `False` indicates that VMotion should be disabled.

#### **device**

The device that uniquely identifies the `VirtualNic` that will be used for VMotion for the host. Defaults to `vmk0`.

Example:

```

configure-vmotion:
  esxi.vmotion_configured:
    - enabled: True
    - device: sample-device

```

`salt.states.esxi.vsan_configured`(*name, enabled, add\_disks\_to\_vsan=False*)

Configures a host's VSAN properties such as enabling or disabling VSAN, or adding VSAN-eligible disks to the VSAN system for the host.

**name**

Name of the state.

**enabled**

Ensures whether or not VSAN should be enabled on a host as a boolean value where `True` indicates that VSAN should be enabled and `False` indicates that VSAN should be disabled.

**add\_disks\_to\_vsan**

If set to `True`, any VSAN-eligible disks for the given host will be added to the host's VSAN system. Default is `False`.

Example:

```
configure-host-vsan:  
esxi.vsan_configured:  
- enabled: True  
- add_disks_to_vsan: True
```

### 26.19.87 salt.states.esxvm

Salt state to create, update VMware ESXi Virtual Machines.

**Warning:** This module will be deprecated in a future release of Salt. VMware strongly recommends using the [VMware Salt extensions](#) instead of the ESX VSM module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.

#### Dependencies

- pyVmomi
- jsonschema

#### States

##### **vm\_configured**

Enforces correct virtual machine configuration. Creates, updates and registers a virtual machine.

This state identifies the action which should be taken for the virtual machine and applies that action via the create, update, register state functions.

Supported proxies: `esxvm`

Example:

1. Get the virtual machine `my_vm` status with an `esxvm` proxy:

Proxy minion configuration for `esxvm` proxy:

```
proxy:  
proxytype: esxvm  
datacenter: my_dc  
vcenter: vcenter.fake.com  
mechanism: sspi
```

(continues on next page)

(continued from previous page)

```

domain: fake.com
principal: host

```

State configuration:

```

myvm_state:
  esxvm.vm_configured:
    - vm_name: my_vm
    - cpu: {{ {'count': 4, 'cores_per_socket': 2} }}
    - memory: {{ {'size': 16384, 'unit': 'MB'} }}
    - image: rhel7_64Guest
    - version: vmx-12
    - interfaces: {{ [{
      'adapter': 'Network adapter 1',
      'name': 'my_pg1',
      'switch_type': 'distributed',
      'adapter_type': 'vmxnet3',
      'mac': '00:50:56:00:01:02',
      'connectable': { 'start_connected': true,
        'allow_guest_control': true,
        'connected': true}},
      {
      'adapter': 'Network adapter 2',
      'name': 'my_pg2',
      'switch_type': 'distributed',
      'adapter_type': 'vmxnet3',
      'mac': '00:50:56:00:01:03',
      'connectable': { 'start_connected': true,
        'allow_guest_control': true,
        'connected': true}}
    ] }}
    - disks: {{ [{
      'adapter': 'Hard disk 1',
      'unit': 'MB',
      'size': 51200,
      'filename': 'my_vm/sda.vmdk',
      'datastore': 'my_datastore',
      'address': '0:0',
      'thin_provision': true,
      'eagerly_scrub': false,
      'controller': 'SCSI controller 0'},
      {
      'adapter': 'Hard disk 2',
      'unit': 'MB',
      'size': 10240,
      'filename': 'my_vm/sdb.vmdk',
      'datastore': 'my_datastore',
      'address': '0:1',
      'thin_provision': true,
      'eagerly_scrub': false,
      'controller': 'SCSI controller 0'}
    ] }}

```

(continues on next page)

(continued from previous page)

```
- scsi_devices: {{ [{
    'adapter': 'SCSI controller 0',
    'type': 'paravirtual',
    'bus_sharing': 'no_sharing',
    'bus_number': 0
  ] }}
- serial_ports: {{ [{
    'adapter': 'Serial port 1',
    'type': 'network',
    'yield': false,
    'backing': {
      'uri': 'my_uri',
      'direction': 'server',
      'filename': 'my_file'},
    'connectable': {
      'start_connected': true,
      'allow_guest_control': true,
      'connected': true}}
  ] }}
- datacenter: {{ 'my_dc' }}
- datastore: 'my_datastore'
- placement: {{ {'cluster': 'my_cluster'} }}
- cd_dvd_drives: {{ [] }}
- advanced_configs: {{ {'my_param': '1'} }}
- template: false
- tools: false
- power_on: false
- deploy: false
```

### vm\_updated

Updates a virtual machine to a given configuration.

### vm\_created

Creates a virtual machine with a given configuration.

## vm\_registered

Registers a virtual machine with its configuration file path.

### Dependencies

#### pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==6.0.0.2016.4
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against. To be able to connect through SSPI you must use pyvmomi 6.0.0.2016.4 or above. The ESXVM State Module was tested with this version.

### About

This state module was written to be used in conjunction with Salt's *ESXi Proxy Minion*. For a tutorial on how to use Salt's ESXi Proxy Minion, please refer to the [ESXi Proxy Minion Tutorial](#) for configuration examples, dependency installation instructions, how to run remote execution functions against ESXi hosts via a Salt Proxy Minion, and a larger state example.

`salt.states.esxvm.vm_cloned(name)`

Clones a virtual machine from a template virtual machine if it doesn't exist and a template is defined.

`salt.states.esxvm.vm_configured(name, vm_name, cpu, memory, image, version, interfaces, disks, scsi_devices, serial_ports, datacenter, datastore, placement, cd_dvd_drives=None, sata_controllers=None, advanced_configs=None, template=None, tools=True, power_on=False, deploy=False)`

Selects the correct operation to be executed on a virtual machine, non existing machines will be created, existing ones will be updated if the config differs.

`salt.states.esxvm.vm_created(name, vm_name, cpu, memory, image, version, interfaces, disks, scsi_devices, serial_ports, datacenter, datastore, placement, ide_controllers=None, sata_controllers=None, cd_dvd_drives=None, advanced_configs=None, power_on=False)`

Creates a virtual machine with the given properties if it doesn't exist.

`salt.states.esxvm.vm_registered(vm_name, datacenter, placement, vm_file, power_on=False)`

Registers a virtual machine if the machine files are available on the main datastore.

```
salt.states.esxvm.vm_updated(name, vm_name, cpu, memory, image, version, interfaces, disks,
                             scsi_devices, serial_ports, datacenter, datastore, cd_dvd_drives=None,
                             sata_controllers=None, advanced_configs=None, power_on=False)
```

Updates a virtual machine configuration if there is a difference between the given and deployed configuration.

## 26.19.88 salt.states.etcd\_mod

### Manage etcd Keys

New in version 2015.8.0.

#### depends

- python-etcd or etcd3-py

This state module supports setting and removing keys from etcd.

### Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

In order to choose whether to use etcd API v2 or v3, you can put the following configuration option in the same place as your etcd configuration. This option defaults to true, meaning you will use v2 unless you specify otherwise.

```
etcd.require_v2: True
```

When using API v3, there are some specific options available to be configured within your etcd profile. They are defaulted to the following...

```
etcd.encode_keys: False
etcd.encode_values: True
etcd.raw_keys: False
etcd.raw_values: False
etcd.unicode_errors: "surrogateescape"
```

`etcd.encode_keys` indicates whether you want to pre-encode keys using msgpack before adding them to etcd.

---

**Note:** If you set `etcd.encode_keys` to True, all recursive functionality will no longer work. This includes `tree` and `ls` and all other methods if you set `recurse/recursive` to True. This is due to the fact that when encoding with msgpack, keys like `/salt` and `/salt/stack` will have differing byte prefixes, and etcd v3 searches recursively using prefixes.

---

`etcd.encode_values` indicates whether you want to pre-encode values using `msgpack` before adding them to `etcd`. This defaults to `True` to avoid data loss on non-string values wherever possible.

`etcd.raw_keys` determines whether you want the raw key or a string returned.

`etcd.raw_values` determines whether you want the raw value or a string returned.

`etcd.unicode_errors` determines what you policy to follow when there are encoding/decoding errors.

---

**Note:** The `etcd` configuration can also be set in the Salt Master config file, but in order to use any `etcd` configurations defined in the Salt Master config, the `pillar_opts` must be set to `True`.

Be aware that setting `pillar_opts` to `True` has security implications as this makes all master configuration settings available in all minion's pillars.

---

`Etd` profile configuration can be overridden using following arguments: `host`, `port`, `username`, `password`, `ca`, `client_key` and `client_cert`. The `v3` specific arguments can also be used for overriding if you are using `v3`.

```
my-value:
  etcd.set:
    - name: /path/to/key
    - value: value
    - host: 127.0.0.1
    - port: 2379
    - username: user
    - password: pass
```

## Available Functions

- `set`

This will set a value to a key in `etcd`. Changes will be returned if the key has been created or the value of the key has been updated. This means you can watch these states for changes.

```
/foo/bar/baz:
  etcd.set:
    - value: foo
    - profile: my_etcd_config
```

- `wait_set`

Performs the same functionality as `set` but only if a watch requisite is `True`.

```
/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
  etcd.wait_set:
    - value: foo
    - profile: my_etcd_config
    - watch:
      - file: /some/file.txt
```

- `rm`

This will delete a key from etcd. If the key exists then changes will be returned and thus you can watch for changes on the state, if the key does not exist then no changes will occur.

```
/foo/bar/baz:
  etcd.rm:
    - profile: my_etcd_config
```

- `wait_rm`

Performs the same functionality as `rm` but only if a watch requisite is `True`.

```
/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
  etcd.wait_rm:
    - profile: my_etcd_config
    - watch:
      - file: /some/file.txt
```

`salt.states.etcd_mod.directory`(*name*, *profile=None*, *\*\*kwargs*)

Create a directory in etcd.

**name**

The etcd directory name, for example: `/foo/bar/baz`.

**profile**

Optional, defaults to `NONE`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

`salt.states.etcd_mod.mod_watch`(*name*, *\*\*kwargs*)

The etcd watcher, called to invoke the watch command. When called, execute a etcd function based on a watch call requisite.

---

**Note:** This state exists to support special handling of the `watch requisite`. It should not be called directly.

Parameters for this function should be set by the state being triggered.

---

`salt.states.etcd_mod.rm`(*name*, *recurse=False*, *profile=None*, *\*\*kwargs*)

Deletes a key from etcd

**name**

The etcd key name to remove, for example `/foo/bar/baz`.

**recurse**

Optional, defaults to `False`. If `True` performs a recursive delete.

**profile**

Optional, defaults to `NONE`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

`salt.states.etcd_mod.set_(name, value, profile=None, **kwargs)`

Set a key in etcd

**name**

The etcd key name, for example: `/foo/bar/baz`.

**value**

The value the key should contain.

**profile**

Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

`salt.states.etcd_mod.wait_rm(name, recurse=False, profile=None, **kwargs)`

Deletes a key from etcd only if the watch statement calls it. This function is also aliased as `wait_rm`.

**name**

The etcd key name to remove, for example `/foo/bar/baz`.

**recurse**

Optional, defaults to `False`. If `True` performs a recursive delete, see: <https://python-etcd.readthedocs.io/en/latest/#delete-a-key>.

**profile**

Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

`salt.states.etcd_mod.wait_set(name, value, profile=None, **kwargs)`

Set a key in etcd only if the watch statement calls it. This function is also aliased as `wait_set`.

**name**

The etcd key name, for example: `/foo/bar/baz`.

**value**

The value the key should contain.

**profile**

The etcd profile to use that has been configured on the Salt Master, this is optional and defaults to `None`.

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

## 26.19.89 salt.states.ethtool

Configuration of network device

New in version 2016.11.0.

**codeauthor**

Krzysztof Pawlowski <[msciciel@msciciel.eu](mailto:msciciel@msciciel.eu)>

**maturity**

new

**depends**

python-ethtool

```
platform
  linux
```

```
eth0:
  ethtool.coalesce:
    - name: eth0
    - rx_usecs: 24
    - tx_usecs: 48

eth0:
  ethtool.ring:
    - name: eth0
    - rx: 1024
    - tx: 1024

eth0:
  ethtool.offload:
    - name: eth0
    - tcp_segmentation_offload: on
```

`salt.states.ethtool.coalesce`(*name*, *\*\*kwargs*)

Manage coalescing settings of network device

**name**

Interface name to apply coalescing settings

```
eth0:
  ethtool.coalesce:
    - name: eth0
    - adaptive_rx: on
    - adaptive_tx: on
    - rx_usecs: 24
    - rx_frame: 0
    - rx_usecs_irq: 0
    - rx_frames_irq: 0
    - tx_usecs: 48
    - tx_frames: 0
    - tx_usecs_irq: 0
    - tx_frames_irq: 0
    - stats_block_usecs: 0
    - pkt_rate_low: 0
    - rx_usecs_low: 0
    - rx_frames_low: 0
    - tx_usecs_low: 0
    - tx_frames_low: 0
    - pkt_rate_high: 0
    - rx_usecs_high: 0
    - rx_frames_high: 0
    - tx_usecs_high: 0
    - tx_frames_high: 0
    - sample_interval: 0
```

`salt.states.ethtool.offload`(*name*, *\*\*kwargs*)

Manage protocol offload and other features of network device

**name**

Interface name to apply coalescing settings

```
eth0:
  ethtool.offload:
    - name: eth0
    - tcp_segmentation_offload: on
```

`salt.states.ethtool.pause(name, **kwargs)`

New in version 3006.0.

Manage pause parameters of network device

**name**

Interface name to apply pause parameters

```
eth0:
  ethtool.pause:
    - name: eth0
    - autoneg: off
    - rx: off
    - tx: off
```

`salt.states.ethtool.ring(name, **kwargs)`

Manage rx/tx ring parameters of network device

Use 'max' word to set with factory maximum

**name**

Interface name to apply ring parameters

```
eth0:
  ethtool.ring:
    - name: eth0
    - rx: 1024
    - rx_mini: 0
    - rx_jumbo: 0
    - tx: max
```

### 26.19.90 salt.states.event

Send events through Salt's event system during state runs

`salt.states.event.fire_master(name, data=None, preload=None, with_env=False, with_grains=False, with_pillar=False, show_changed=True, **kwargs)`

This function is an alias of `send`.

Send an event to the Salt Master

New in version 2014.7.0.

Accepts the same arguments as the `event.send` execution module of the same name, with the additional argument:

**param show\_changed**

If `True`, state will show as changed with the data argument as the change value.

If `False`, shows as unchanged.

Example:

```
# ...snip bunch of states above

mycompany/mystaterun/status/update:
  event.send:
    - data:
      status: "Half-way through the state run!"

# ...snip bunch of states below
```

`salt.states.event.mod_watch` (*name*, *data=None*, *preload=None*, *with\_env=False*, *with\_grains=False*, *with\_pillar=False*, *show\_changed=True*, *\*\*kwargs*)

This function is an alias of `send`.

Send an event to the Salt Master

New in version 2014.7.0.

Accepts the same arguments as the `event.send` execution module of the same name, with the additional argument:

param **show\_changed**

If `True`, state will show as changed with the data argument as the change value.

If `False`, shows as unchanged.

Example:

```
# ...snip bunch of states above

mycompany/mystaterun/status/update:
  event.send:
    - data:
      status: "Half-way through the state run!"

# ...snip bunch of states below
```

`salt.states.event.send` (*name*, *data=None*, *preload=None*, *with\_env=False*, *with\_grains=False*, *with\_pillar=False*, *show\_changed=True*, *\*\*kwargs*)

Send an event to the Salt Master

New in version 2014.7.0.

Accepts the same arguments as the `event.send` execution module of the same name, with the additional argument:

Parameters

**show\_changed** -- If `True`, state will show as changed with the data argument as the change value. If `False`, shows as unchanged.

Example:

```
# ...snip bunch of states above

mycompany/mystaterun/status/update:
  event.send:
    - data:
      status: "Half-way through the state run!"

# ...snip bunch of states below
```

`salt.states.event.wait` (*name*, *sfun=None*, *data=None*)

Fire an event on the Salt master event bus if called from a watch statement

New in version 2014.7.0.

Example:

```
# Stand up a new web server.
apache:
  pkg:
    - installed
    - name: httpd
  service:
    - running
    - enable: True
    - name: httpd

# Notify the load balancer to update the pool once Apache is running.
refresh_pool:
  event:
    - wait
    - name: mycompany/loadbalancer/pool/update
    - data:
        new_web_server_ip: {{ grains['ipv4'] | first() }}
    - watch:
        - pkg: apache
```

## 26.19.91 salt.states.file

### Operations on regular files, special files, directories, and symlinks

Salt States can aggressively manipulate files on a system. There are a number of ways in which files can be managed.

Regular files can be enforced with the *file.managed* state. This state downloads files from the salt master and places them on the target system. Managed files can be rendered as a jinja, mako, or wempy template, adding a dynamic component to file management. An example of *file.managed* which makes use of the jinja templating system would look like this:

```
/etc/http/conf/http.conf:
file.managed:
  - source: salt://apache/http.conf
  - user: root
  - group: root
  - mode: 644
  - attrs: ai
  - template: jinja
  - defaults:
      custom_var: "default value"
      other_var: 123
{% if grains['os'] == 'Ubuntu' %}
  - context:
      custom_var: "override"
{% endif %}
```

It is also possible to use the `py renderer` as a templating option. The template would be a Python script which would need to contain a function called `run()`, which returns a string. All arguments to the state will be made available to the Python script as globals. The returned string will be the contents of the managed file. For example:

```
def run():
    lines = ['foo', 'bar', 'baz']
    lines.extend([source, name, user, context]) # Arguments as globals
    return '\n\n'.join(lines)
```

---

**Note:** The `defaults` and `context` arguments require extra indentation (four spaces instead of the normal two) in order to create a nested dictionary. *More information.*

---

If using a template, any user-defined template variables in the file defined in `source` must be passed in using the `defaults` and/or `context` arguments. The general best practice is to place default values in `defaults`, with conditional overrides going into `context`, as seen above.

The template will receive a variable `custom_var`, which would be accessed in the template using `{{ custom_var }}`. If the operating system is Ubuntu, the value of the variable `custom_var` would be `override`, otherwise it is the default *default value*

The `source` parameter can be specified as a list. If this is done, then the first file to be matched will be the one that is used. This allows you to have a default file on which to fall back if the desired file does not exist on the salt fileserver. Here's an example:

```
/etc/foo.conf:
  file.managed:
    - source:
      - salt://foo.conf.{{ grains['fqdn'] }}
      - salt://foo.conf.fallback
    - user: foo
    - group: users
    - mode: 644
    - attrs: i
    - backup: minion
```

---

**Note:** Salt supports backing up managed files via the `backup` option. For more details on this functionality please review the *backup\_mode documentation*.

---

The `source` parameter can also specify a file in another Salt environment. In this example `foo.conf` in the `dev` environment will be used instead.

```
/etc/foo.conf:
  file.managed:
    - source:
      - 'salt://foo.conf?saltenv=dev'
    - user: foo
    - group: users
    - mode: '0644'
    - attrs: i
```

**Warning:** When using a mode that includes a leading zero you must wrap the value in single quotes. If the value is not wrapped in quotes it will be read by YAML as an integer and evaluated as an octal.

The `names` parameter, which is part of the state compiler, can be used to expand the contents of a single state declaration into multiple, single state declarations. Each item in the `names` list receives its own individual state name and is converted into its own low-data structure. This is a convenient way to manage several files with similar attributes.

```
salt_master_conf:
  file.managed:
    - user: root
    - group: root
    - mode: '0644'
    - names:
      - /etc/salt/master.d/master.conf:
        - source: salt://saltmaster/master.conf
      - /etc/salt/minion.d/minion-99.conf:
        - source: salt://saltmaster/minion.conf
```

**Note:** There is more documentation about this feature in the [Names declaration](#) section of the *Highstate docs*.

Special files can be managed via the `mknod` function. This function will create and enforce the permissions on a special file. The function supports the creation of character devices, block devices, and FIFO pipes. The function will create the directory structure up to the special file if it is needed on the minion. The function will not overwrite or operate on (change major/minor numbers) existing special files with the exception of user, group, and permissions. In most cases the creation of some special files require root permissions on the minion. This would require that the minion to be run as the root user. Here is an example of a character device:

```
/var/named/chroot/dev/random:
  file.mknod:
    - ntype: c
    - major: 1
    - minor: 8
    - user: named
    - group: named
    - mode: 660
```

Here is an example of a block device:

```
/var/named/chroot/dev/loop0:
  file.mknod:
    - ntype: b
    - major: 7
    - minor: 0
    - user: named
    - group: named
    - mode: 660
```

Here is an example of a fifo pipe:

```
/var/named/chroot/var/log/logfifo:  
file.mknod:  
- ntype: p  
- user: named  
- group: named  
- mode: 660
```

Directories can be managed via the `directory` function. This function can create and enforce the permissions on a directory. A directory statement will look like this:

```
/srv/stuff/substuf:  
file.directory:  
- user: fred  
- group: users  
- mode: 755  
- makedirs: True
```

If you need to enforce user and/or group ownership or permissions recursively on the directory's contents, you can do so by adding a `recurse` directive:

```
/srv/stuff/substuf:  
file.directory:  
- user: fred  
- group: users  
- mode: 755  
- makedirs: True  
- recurse:  
  - user  
  - group  
  - mode
```

As a default, `mode` will resolve to `dir_mode` and `file_mode`, to specify both directory and file permissions, use this form:

```
/srv/stuff/substuf:  
file.directory:  
- user: fred  
- group: users  
- file_mode: 744  
- dir_mode: 755  
- makedirs: True  
- recurse:  
  - user  
  - group  
  - mode
```

Symlinks can be easily created; the `symlink` function is very simple and only takes a few arguments:

```
/etc/grub.conf:  
file.symlink:  
- target: /boot/grub/grub.conf
```

Recursive directory management can also be set via the `recurse` function. Recursive directory management allows for a directory on the salt master to be recursively copied down to the minion. This is a great tool for deploying large

code and configuration systems. A state using `recurse` would look something like this:

```
/opt/code/flask:
file.recurse:
- source: salt://code/flask
- include_empty: True
```

A more complex `recurse` example:

```
{% set site_user = 'testuser' %}
{% set site_name = 'test_site' %}
{% set project_name = 'test_proj' %}
{% set sites_dir = 'test_dir' %}

django-project:
  file.recurse:
    - name: {{ sites_dir }}/{{ site_name }}/{{ project_name }}
    - user: {{ site_user }}
    - dir_mode: 2775
    - file_mode: '0644'
    - template: jinja
    - source: salt://project/templates_dir
    - include_empty: True
```

Retention scheduling can be applied to manage contents of backup directories. For example:

```
/var/backups/example_directory:
file.retention_schedule:
- strptime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
- retain:
  most_recent: 5
  first_of_hour: 4
  first_of_day: 14
  first_of_week: 6
  first_of_month: 6
  first_of_year: all
```

`salt.states.file.absent`(*name*, *\*\*kwargs*)

Make sure that the named file or directory is absent. If it exists, it will be deleted. This will work to reverse any of the functions in the file state module. If a directory is supplied, it will be recursively deleted.

If only the contents of the directory need to be deleted but not the directory itself, use `file.directory` with `clean=True`

**name**

The path which should be deleted

`salt.states.file.accumulated`(*name*, *filename*, *text*, *\*\*kwargs*)

Prepare accumulator which can be used in template in `file.managed` state. Accumulator dictionary becomes available in template. It can also be used in `file.blockreplace`.

**name**

Accumulator name

**filename**

Filename which would receive this accumulator (see `file.managed` state documentation about name)

**text**

String or list for adding in accumulator

**require\_in / watch\_in**

One of them required for sure we fill up accumulator before we manage the file. Probably the same as filename

Example:

Given the following:

```
animals_doing_things:
  file.accumulated:
    - filename: /tmp/animal_file.txt
    - text: ' jumps over the lazy dog.'
    - require_in:
      - file: animal_file

animal_file:
  file.managed:
    - name: /tmp/animal_file.txt
    - source: salt://animal_file.txt
    - template: jinja
```

One might write a template for animal\_file.txt like the following:

```
The quick brown fox{% for animal in accumulator['animals_doing_things'] %}
→{{ animal }}{% endfor %}
```

Collectively, the above states and template file will produce:

```
The quick brown fox jumps over the lazy dog.
```

Multiple accumulators can be "chained" together.

---

**Note:** The 'accumulator' data structure is a Python dictionary. Do not expect any loop over the keys in a deterministic order!

---

```
salt.states.file.append(name, text=None, makedirs=False, source=None, source_hash=None,
                       template='jinja', sources=None, source_hashes=None, defaults=None,
                       context=None, ignore_whitespace=True)
```

Ensure that some text appears at the end of a file.

The text will not be appended if it already exists in the file. A single string of text or a list of strings may be appended.

**name**

The location of the file to append to.

**text**

The text to be appended, which can be a single string or a list of strings.

**makedirs**

If the file is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file. Defaults to False.

**source**

A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials

(see `s3.get` state documentation). File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs (see `swift.get` documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`.

If the file is hosted on an HTTP or FTP server, the `source_hash` argument is also required.

#### source\_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

Type	Length
sha512	128
sha384	96
sha256	64
sha224	56
sha1	40
md5	32

See the `source_hash` parameter description for `file.managed` function for more details and examples.

#### template

The named templating engine will be used to render the appended-to file. Defaults to `jinja`. The following templates are supported:

- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

#### sources

A list of source files to append. If the files are hosted on an HTTP or FTP server, the `source_hashes` argument is also required.

#### source\_hashes

A list of `source_hashes` corresponding to the `sources` list specified in the `sources` argument.

#### defaults

Default context passed to the template.

#### context

Overrides default context variables passed to the template.

#### ignore\_whitespace

New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

Multi-line example:

```
/etc/motd:
file.append:
- text: |
    Thou hadst better eat salt with the Philosophers of Greece,
    than sugar with the Courtiers of Italy.
```

(continues on next page)

(continued from previous page)

```
- Benjamin Franklin
```

Multiple lines of text:

```
/etc/motd:
file.append:
- text:
  - Trust no one unless you have eaten much salt with him.
  - "Salt is born of the purest of parents: the sun and the sea."
```

Gather text from multiple template files:

```
/etc/motd:
file:
- append
- template: jinja
- sources:
  - salt://motd/devops-messages.tpl
  - salt://motd/hr-messages.tpl
  - salt://motd/general-messages.tpl
```

New in version 0.9.5.

`salt.states.file.blockreplace` (*name*, *marker\_start*='#-- start managed zone --', *marker\_end*='#-- end managed zone --', *source*=None, *source\_hash*=None, *template*='jinja', *sources*=None, *source\_hashes*=None, *defaults*=None, *context*=None, *content*="", *append\_if\_not\_found*=False, *prepend\_if\_not\_found*=False, *backup*='.bak', *show\_changes*=True, *append\_newline*=None, *insert\_before\_match*=None, *insert\_after\_match*=None)

Maintain an edit in a file in a zone delimited by two line markers

New in version 2014.1.0.

Changed in version 2017.7.5,2018.3.1: `append_newline` argument added. Additionally, to improve idempotence, if the string represented by `marker_end` is found in the middle of the line, the content preceding the marker will be removed when the block is replaced. This allows one to remove `append_newline: False` from the SLS and have the block properly replaced if the end of the content block is immediately followed by the `marker_end` (i.e. no newline before the marker).

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal. This can help you maintaining an un-managed file containing manual edits.

---

**Note:** This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

Additionally, you can use `file.accumulated` and target this state. All accumulated data dictionaries' content will be added in the content block.

---

#### **name**

Filesystem path to the file to be edited

#### **marker\_start**

The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

**marker\_end**

The line content identifying the end of the content block. As of versions 2017.7.5 and 2018.3.1, everything up to the text matching the marker will be replaced, so it's important to ensure that your marker includes the beginning of the text you wish to replace.

**content**

The content to be used between the two lines identified by `marker_start` and `marker_end`

**source**

The source file to download to the minion, this source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see `s3.get` state documentation) File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs, see `swift.get` documentation. For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`. If source is left blank or `None` (use `~` in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored.

```
file_override_example:
file.blockreplace:
- name: /etc/example.conf
- source:
- salt://file_that_does_not_exist
- salt://file_that_exists
```

**source\_hash**

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

Type	Length
=====	=====
sha512	128
sha384	96
sha256	64
sha224	56
sha1	40
md5	32

See the `source_hash` parameter description for `file.managed` function for more details and examples.

**template**

Templating engine to be used to render the downloaded file. The following engines are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

**context**

Overrides default context variables passed to the template

#### defaults

Default context passed to the template

#### append\_if\_not\_found

If markers are not found and this option is set to `True`, the content block will be appended to the file.

#### prepend\_if\_not\_found

If markers are not found and this option is set to `True`, the content block will be prepended to the file.

#### insert\_before\_match

If markers are not found, this parameter can be set to a regex which will insert the block before the first found occurrence in the file.

New in version 3001.

#### insert\_after\_match

If markers are not found, this parameter can be set to a regex which will insert the block after the first found occurrence in the file.

New in version 3001.

#### backup

The file extension to use for a backup of the file if any edit is made. Set this to `False` to skip making a backup.

#### show\_changes

Controls how changes are presented. If `True`, the `Changes` section of the state return will contain a unified diff of the changes made. If `False`, then it will contain a boolean (`True` if any changes were made, otherwise `False`).

#### append\_newline

Controls whether or not a newline is appended to the content block. If the value of this argument is `True` then a newline will be added to the content block. If it is `False`, then a newline will *not* be added to the content block. If it is unspecified, then a newline will only be added to the content block if it does not already end in a newline.

New in version 2017.7.5,2018.3.1.

Example of usage with an accumulator and with a variable:

```
{% set myvar = 42 %}
hosts-config-block-{{ myvar }}:
  file.blockreplace:
    - name: /etc/hosts
    - marker_start: "# START managed zone {{ myvar }} -DO-NOT-EDIT-"
    - marker_end: "# END managed zone {{ myvar }} --"
    - content: 'First line of content'
    - append_if_not_found: True
    - backup: '.bak'
    - show_changes: True

hosts-config-block-{{ myvar }}-accumulated1:
  file.accumulated:
    - filename: /etc/hosts
    - name: my-accumulator-{{ myvar }}
    - text: "text 2"
    - require_in:
      - file: hosts-config-block-{{ myvar }}

hosts-config-block-{{ myvar }}-accumulated2:
  file.accumulated:
```

(continues on next page)

(continued from previous page)

```

- filename: /etc/hosts
- name: my-accumulator-{{ myvar }}
- text: |
    text 3
    text 4
- require_in:
  - file: hosts-config-block-{{ myvar }}

```

will generate and maintain a block of content in /etc/hosts:

```

# START managed zone 42 -DO-NOT-EDIT-
First line of content
text 2
text 3
text 4
# END managed zone 42 --

```

`salt.states.file.cached`(*name*, *source\_hash*="", *source\_hash\_name*=None, *skip\_verify*=False, *saltenv*='base', *use\_etag*=False, *source\_hash\_sig*=None, *signed\_by\_any*=None, *signed\_by\_all*=None, *keyring*=None, *gnupghome*=None)

New in version 2017.7.3.

Changed in version 3005.

Ensures that a file is saved to the minion's cache. This state is primarily invoked by other states to ensure that we do not re-download a source file if we do not need to.

#### **name**

The URL of the file to be cached. To cache a file from an environment other than base, either use the `saltenv` argument or include the saltenv in the URL (e.g. `salt://path/to/file.conf?saltenv=dev`).

---

**Note:** A list of URLs is not supported, this must be a single URL. If a local file is passed here, then the state will obviously not try to download anything, but it will compare a hash if one is specified.

---

#### **source\_hash**

See the documentation for this same argument in the *file.managed* state.

---

**Note:** For remote files not originating from the `salt://` fileserver, such as http(s) or ftp servers, this state will not re-download the file if the locally-cached copy matches this hash. This is done to prevent unnecessary downloading on repeated runs of this state. To update the cached copy of a file, it is necessary to update this hash.

---

#### **source\_hash\_name**

See the documentation for this same argument in the *file.managed* state.

#### **skip\_verify**

See the documentation for this same argument in the *file.managed* state.

---

**Note:** Setting this to True will result in a copy of the file being downloaded from a remote (http(s), ftp, etc.) source each time the state is run.

---

#### **saltenv**

Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with

`salt:// URL`).

#### **use\_etag**

If `True`, remote `http/https` file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the `source_hash` parameter.

New in version 3005.

#### **source\_hash\_sig**

When `name` is a remote file source, `source_hash` is a file, `skip_verify` is not `true` and `use_etag` is not `true`, ensure a valid GPG signature exists on the source hash file. Set this to `true` for an inline (clearsigned) signature, or to a file URI retrievable by `:py:func:cp.cache_file <salt.modules.cp.cache_file>` for a detached one.

---

**Note:** A signature on the `source_hash` file is enforced regardless of changes since its contents are used to check if an existing file is in the correct state - but only for remote sources!

---

New in version 3007.0.

#### **signed\_by\_any**

When verifying `source_hash_sig`, require at least one valid signature from one of a list of key fingerprints. This is passed to `gpg.verify`.

New in version 3007.0.

#### **signed\_by\_all**

When verifying `source_hash_sig`, require a valid signature from each of the key fingerprints in this list. This is passed to `gpg.verify`.

New in version 3007.0.

#### **keyring**

When verifying signatures, use this keyring.

New in version 3007.0.

#### **gnupghome**

When verifying signatures, use this GnuPG home.

New in version 3007.0.

This state will in most cases not be useful in SLS files, but it is useful when writing a state or remote-execution module that needs to make sure that a file at a given URL has been downloaded to the `cachedir`. One example of this is in the `archive.extracted` state:

```
result = __states__['file.cached'](source_match,
                                  source_hash=source_hash,
                                  source_hash_name=source_hash_name,
                                  skip_verify=skip_verify,
                                  saltenv=__env__)
```

This will return a dictionary containing the state's return data, including a `result` key which will state whether or not the state was successful. Note that this will not catch exceptions, so it is best used within a `try/except`.

Once this state has been run from within another state or remote-execution module, the actual location of the cached file can be obtained using `cp.is_cached`:

```
cached = __salt__['cp.is_cached'](source_match, saltenv=__env__)
```

This function will return the cached path of the file, or an empty string if the file is not present in the minion cache.

`salt.states.file.comment` (*name, regex, char='#', backup='.bak', ignore\_missing=False*)

New in version 0.9.5.

Changed in version 3005.

Comment out specified lines in a file.

**name**

The full path to the file to be edited

**regex**

A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing `^` or `$` characters outside the parenthesis (e.g., the pattern `^foo$` will be rewritten as `^(foo)$`) Note that you *need* the leading `^`, otherwise each time you run highstate, another comment char will be inserted.

**char**

The character to be inserted at the beginning of a line in order to comment it out

**backup**

The file will be backed up before edit with this file extension

**Warning:** This backup will be overwritten each time `sed / comment / uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to `False/None` to not keep a backup.

**ignore\_missing**

Ignore a failure to find the regex in the file. This is useful for scenarios where a line must only be commented if it is found in the file.

New in version 3005.

Usage:

```
/etc/fstab:
file.comment:
- regex: ^bind 127.0.0.1
```

`salt.states.file.copy_` (*name, source, force=False, makedirs=False, preserve=False, user=None, group=None, mode=None, dir\_mode=None, subdir=False, \*\*kwargs*)

If the file defined by the `source` option exists on the minion, copy it to the named path. The file will not be overwritten if it already exists, unless the `force` option is set to `True`.

---

**Note:** This state only copies files from one location on a minion to another location on the same minion. For copying files from the master, use a *file.managed* state.

---

**name**

The location of the file to copy to

**source**

The location of the file to copy to the location specified with name

**force**

If the target location is present then the file will not be moved, specify `"force: True"` to overwrite the target file

**makedirs**

If the target subdirectories don't exist create them

**preserve**

New in version 2015.5.0.

Set `preserve`: True to preserve user/group ownership and mode after copying. Default is False. If `preserve` is set to True, then user/group/mode attributes will be ignored.

**user**

New in version 2015.5.0.

The user to own the copied file, this defaults to the user salt is running as on the minion. If `preserve` is set to True, then this will be ignored

**group**

New in version 2015.5.0.

The group to own the copied file, this defaults to the group salt is running as on the minion. If `preserve` is set to True or on Windows this will be ignored

**mode**

New in version 2015.5.0.

The permissions to set on the copied file, aka 644, '0775', '4664'. If `preserve` is set to True, then this will be ignored. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**dir\_mode**

New in version 3006.0.

If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds to the umask of the salt process. Not enforced for existing files and directories.

**subdir**

New in version 2015.5.0.

If the name is a directory then place the file inside the named directory

---

**Note:** The copy function accepts paths that are local to the Salt minion. This function does not support salt://, http://, or the other additional file paths that are supported by `states.file.managed` and `states.file.recurse`.

---

Usage:

```
# Use 'copy', not 'copy_'
/etc/example.conf:
file.copy:
  - source: /tmp/example.conf
```

`salt.states.file.decode`(*name*, *encoded\_data*=None, *contents\_pillar*=None, *encoding\_type*='base64', *checksum*='md5')

Decode an encoded file and write it to disk

New in version 2016.3.0.

**name**

Path of the file to be written.

**encoded\_data**

The encoded file. Either this option or `contents_pillar` must be specified.

**contents\_pillar**

A Pillar path to the encoded file. Uses the same path syntax as `pillar.get`. The `hashutil.base64_encodefile` function can load encoded content into Pillar. Either this option or `encoded_data` must be specified.

**encoding\_type**

The type of encoding.

**checksum**

The hashing algorithm to use to generate checksums. Wraps the *hashutil.digest* execution function.

Usage:

```
write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - contents_pillar: mypillar:thefile

# or

write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - encoded_data: |
      Z2V0IHNhbHRlZAo=
```

Be careful with multi-line strings that the YAML indentation is correct. E.g.,

```
write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - encoded_data: |
      {{ salt.pillar.get('path:to:data') | indent(8) }}
```

**salt.states.file.directory** (*name*, *user=None*, *group=None*, *recurse=None*, *max\_depth=None*, *dir\_mode=None*, *file\_mode=None*, *makedirs=False*, *clean=False*, *require=None*, *exclude\_pat=None*, *follow\_symlinks=False*, *force=False*, *backupname=None*, *allow\_symlink=True*, *children\_only=False*, *win\_owner=None*, *win\_perms=None*, *win\_deny\_perms=None*, *win\_inheritance=True*, *win\_perms\_reset=False*, *\*\*kwargs*)

Ensure that a named directory is present and has the right perms

**name**

The location to create or manage a directory, as an absolute path

**user**

The user to own the directory; this defaults to the user salt is running as on the minion

**group**

The group ownership set for the directory; this defaults to the group salt is running as on the minion. On Windows, this is ignored

**recurse**

Enforce user/group ownership and mode of directory recursively. Accepts a list of strings representing what you would like to recurse. If *mode* is defined, will recurse on both *file\_mode* and *dir\_mode* if they are defined. If *ignore\_files* or *ignore\_dirs* is included, files or directories will be left unchanged respectively. directories will be left unchanged respectively. If *silent* is defined, individual file/directory change notifications will be suppressed.

Example:

```
/var/log/httpd:  
file.directory:  
- user: root  
- group: root  
- dir_mode: 755  
- file_mode: 644  
- recurse:  
  - user  
  - group  
  - mode
```

Leave files or directories unchanged:

```
/var/log/httpd:  
file.directory:  
- user: root  
- group: root  
- dir_mode: 755  
- file_mode: 644  
- recurse:  
  - user  
  - group  
  - mode  
  - ignore_dirs
```

New in version 2015.5.0.

#### **max\_depth**

Limit the recursion depth. The default is no limit=None. 'max\_depth' and 'clean' are mutually exclusive.

New in version 2016.11.0.

#### **dir\_mode / mode**

The permissions mode to set any directories created. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

#### **file\_mode**

The permissions mode to set any files created if 'mode' is run in 'recurse'. This defaults to dir\_mode. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

#### **makedirs**

If the directory is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file.

#### **clean**

Remove any files that are not referenced by a required file state. See examples below for more info. If this option is set then everything in this directory will be deleted unless it is required. 'clean' and 'max\_depth' are mutually exclusive.

#### **require**

Require other resources such as packages or files.

#### **exclude\_pat**

When 'clean' is set to True, exclude this pattern from removal list and preserve in the destination.

#### **follow\_symlinks**

If the desired path is a symlink (or recurse is defined and a symlink is encountered while recursing), follow it and check the permissions of the directory/file to which the symlink points.

New in version 2014.1.4.

Changed in version 3001.1: If set to False symlinks permissions are ignored on Linux systems because it does not support permissions modification. Symlinks permissions are always 0o777 on Linux.

**force**

If the name of the directory exists and is not a directory and force is set to False, the state will fail. If force is set to True, the file in the way of the directory will be deleted to make room for the directory, unless backupname is set, then it will be renamed.

New in version 2014.7.0.

**backupname**

If the name of the directory exists and is not a directory, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

New in version 2014.7.0.

**allow\_symlink**

If allow\_symlink is True and the specified path is a symlink, it will be allowed to remain if it points to a directory. If allow\_symlink is False then the state will fail, unless force is also set to True, in which case it will be removed or renamed, depending on the value of the backupname argument.

New in version 2014.7.0.

**children\_only**

If children\_only is True the base of a path is excluded when performing a recursive operation. In case of /path/to/base, base will be ignored while all of /path/to/base/\* are still operated on.

**win\_owner**

The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.

**win\_perms**

A dictionary containing permissions to grant and their propagation. For example: `{'Administrators': {'perms': 'full_control', 'applies_to': 'this_folder_only'}}` Can be a single basic perm or a list of advanced perms. perms must be specified. applies\_to is optional and defaults to `this_folder_subfolder_files`.

New in version 2017.7.0.

**win\_deny\_perms**

A dictionary containing permissions to deny and their propagation. For example: `{'Administrators': {'perms': 'full_control', 'applies_to': 'this_folder_only'}}` Can be a single basic perm or a list of advanced perms.

New in version 2017.7.0.

**win\_inheritance**

True to inherit permissions from the parent directory, False not to inherit permission.

New in version 2017.7.0.

**win\_perms\_reset**

If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Here's an example using the above win\_\* parameters:

```
create_config_dir:
  file.directory:
    - name: 'C:\config\'
    - win_owner: Administrators
```

(continues on next page)

(continued from previous page)

```

- win_perms:
  # Basic Permissions
  dev_ops:
    perms: full_control
  # List of advanced permissions
  appuser:
    perms:
      - read_attributes
      - read_ea
      - create_folders
      - read_permissions
    applies_to: this_folder_only
  joe_snuffy:
    perms: read
    applies_to: this_folder_files
- win_deny_perms:
  fred_snuffy:
    perms: full_control
- win_inheritance: False

```

For `clean: True` there is no mechanism that allows all states and modules to enumerate the files that they manage, so for `file.directory` to know what files are managed by Salt, a `file` state targeting managed files is required. To use a contrived example, the following states will always have changes, despite the file named `okay` being created by a Salt state:

```

silly_way_of_creating_a_file:
  cmd.run:
    - name: mkdir -p /tmp/dont/do/this && echo "seriously" > /tmp/dont/
    ↪do/this/okay
    - unless: grep seriously /tmp/dont/do/this/okay

will_always_clean:
  file.directory:
    - name: /tmp/dont/do/this
    - clean: True

```

Because `cmd.run` has no way of communicating that it's creating a file, `will_always_clean` will remove the newly created file. Of course, every time the states run the same thing will happen - the `silly_way_of_creating_a_file` will create the file and `will_always_clean` will always remove it. Over and over again, no matter how many times you run it.

To make this example work correctly, we need to add a `file` state that targets the file, and a `require` between the file states.

```

silly_way_of_creating_a_file:
  cmd.run:
    - name: mkdir -p /tmp/dont/do/this && echo "seriously" > /tmp/dont/
    ↪do/this/okay
    - unless: grep seriously /tmp/dont/do/this/okay
  file.managed:
    - name: /tmp/dont/do/this/okay
    - create: False
    - replace: False

```

(continues on next page)

(continued from previous page)

- **require\_in:**
- **file:** will\_always\_clean

Now there is a `file` state that `clean` can check, so running those states will work as expected. The file will be created with the specific contents, and `clean` will ignore the file because it is being managed by a salt file state. Note that if `require_in` was placed under `cmd.run`, it would **not** work, because the requisite is for the `cmd`, not the file.

```
silly_way_of_creating_a_file:
  cmd.run:
    - name: mkdir -p /tmp/dont/do/this && echo "seriously" > /tmp/dont/
    →do/this/okay
    - unless: grep seriously /tmp/dont/do/this/okay
      # This part should be under file.managed
    - require_in:
      - file: will_always_clean
  file.managed:
    - name: /tmp/dont/do/this/okay
    - create: False
    - replace: False
```

Any other state that creates a file as a result, for example `pkgrepo`, must have the resulting files referenced in a file state in order for `clean: True` to ignore them. Also note that the requisite (`require_in` vs `require`) works in both directions:

```
clean_dir:
  file.directory:
    - name: /tmp/a/better/way
    - require:
      - file: a_better_way

a_better_way:
  file.managed:
    - name: /tmp/a/better/way/truely
    - makedirs: True
    - contents: a much better way
```

Works the same as this:

```
clean_dir:
  file.directory:
    - name: /tmp/a/better/way
    - clean: True

a_better_way:
  file.managed:
    - name: /tmp/a/better/way/truely
    - makedirs: True
    - contents: a much better way
    - require_in:
      - file: clean_dir
```

A common mistake here is to forget the state name and id are both required for requisites:

```

# Correct:
/path/to/some/file:
  file.managed:
    - contents: Cool
    - require_in:
      - file: clean_dir

# Incorrect
/path/to/some/file:
  file.managed:
    - contents: Cool
    - require_in:
      # should be ` - file: clean_dir `
      - clean_dir

# Also incorrect
/path/to/some/file:
  file.managed:
    - contents: Cool
    - require_in:
      # should be ` - file: clean_dir `
      - file

```

`salt.states.file.exists(name, **kwargs)`

Verify that the named file or directory is present or exists. Ensures pre-requisites outside of Salt's purview (e.g., keytabs, private keys, etc.) have been previously satisfied before deployment.

This function does not create the file if it doesn't exist, it will return an error.

**name**

Absolute path which must exist

`salt.states.file.hardlink(name, target, force=False, makedirs=False, user=None, group=None, dir_mode=None, **kwargs)`

Create a hard link If the file already exists and is a hard link pointing to any location other than the specified target, the hard link will be replaced. If the hard link is a regular file or directory then the state will return False. If the regular file is desired to be replaced with a hard link pass force: True

**name**

The location of the hard link to create

**target**

The location that the hard link points to

**force**

If the name of the hard link exists and force is set to False, the state will fail. If force is set to True, the file or directory in the way of the hard link file will be deleted to make room for the hard link, unless backupname is set, when it will be renamed

**makedirs**

If the location of the hard link does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory

**user**

The user to own any directories made if makedirs is set to true. This defaults to the user salt is running as on the minion

**group**

The group ownership set on any directories made if makedirs is set to true. This defaults to the group salt is running as on the minion. On Windows, this is ignored

**dir\_mode**

If directories are to be created, passing this option specifies the permissions for those directories.

```
salt.states.file.keyvalue (name, key=None, value=None, key_values=None, separator='=',
                          append_if_not_found=False, prepend_if_not_found=False, search_only=False,
                          show_changes=True, ignore_if_missing=False, count=1, uncomment=None,
                          key_ignore_case=False, value_ignore_case=False, create_if_missing=False)
```

Key/Value based editing of a file.

New in version 3001.

This function differs from `file.replace` in that it is able to search for keys, followed by a customizable separator, and replace the value with the given value. Should the value be the same as the one already in the file, no changes will be made.

Either supply both `key` and `value` parameters, or supply a dictionary with `key / value` pairs. It is an error to supply both.

**name**

Name of the file to search/replace in.

**key**

Key to search for when ensuring a value. Use in combination with a `value` parameter.

**value**

Value to set for a given key. Use in combination with a `key` parameter.

**key\_values**

Dictionary of `key / value` pairs to search for and ensure values for. Used to specify multiple `key / values` at once.

**separator**

Separator which separates key from value.

**append\_if\_not\_found**

Append the key/value to the end of the file if not found. Note that this takes precedence over `prepend_if_not_found`.

**prepend\_if\_not\_found**

Prepend the key/value to the beginning of the file if not found. Note that `append_if_not_found` takes precedence.

**show\_changes**

Show a diff of the resulting removals and inserts.

**ignore\_if\_missing**

Return with success even if the file is not found (or not readable).

**count**

Number of occurrences to allow (and correct), default is 1. Set to -1 to replace all, or set to 0 to remove all lines with this key regardless of its value.

---

**Note:** Any additional occurrences after `count` are removed. A count of -1 will only replace all occurrences that are currently uncommented already. Lines commented out will be left alone.

---

**uncomment**

Disregard and remove supplied leading characters when finding keys. When set to `None`, lines that are commented out are left for what they are.

---

**Note:** The argument to `uncomment` is not a prefix string. Rather; it is a set of characters, each of which are stripped.

---

**key\_ignore\_case**

Keys are matched case insensitively. When a value is changed the matched key is kept as-is.

**value\_ignore\_case**

Values are checked case insensitively, trying to set e.g. 'Yes' while the current value is 'yes', will not result in changes when `value_ignore_case` is set to `True`.

**create\_if\_missing**

Create the file if the destination file is not found.

New in version 3007.0.

An example of using `file.keyvalue` to ensure `sshd` does not allow for root to login with a password and at the same time setting the `login-gracetime` to 1 minute and disabling all forwarding:

```
sshd_config_harden:
  file.keyvalue:
    - name: /etc/ssh/sshd_config
    - key_values:
      permitrootlogin: 'without-password'
      LoginGraceTime: '1m'
      DisableForwarding: 'yes'
    - separator: ' '
    - uncomment: '# '
    - key_ignore_case: True
    - append_if_not_found: True
```

The same example, except for only ensuring `PermitRootLogin` is set correctly. Thus being able to use the shorthand key and value parameters instead of `key_values`.

```
sshd_config_harden:
  file.keyvalue:
    - name: /etc/ssh/sshd_config
    - key: PermitRootLogin
    - value: without-password
    - separator: ' '
    - uncomment: '# '
    - key_ignore_case: True
    - append_if_not_found: True
```

---

**Note:** Notice how the key is not matched case-sensitively, this way it will correctly identify both 'PermitRootLogin' as well as 'permitrootlogin'.

---

`salt.states.file.line` (*name, content=None, match=None, mode=None, location=None, before=None, after=None, show\_changes=True, backup=False, quiet=False, indent=True, create=False, user=None, group=None, file\_mode=None*)

Line-focused editing of a file.

New in version 2015.8.0.

---

**Note:** `file.line` exists for historic reasons, and is not generally recommended. It has a lot of quirks. You may find `file.replace` to be more suitable.

---

`file.line` is most useful if you have single lines in a file, potentially a config file, that you would like to manage. It can remove, add, and replace lines.

**name**

Filesystem path to the file to be edited.

**content**

Content of the line. Allowed to be empty if `mode=delete`.

**match**

Match the target line for an action by a fragment of a string or regular expression.

If neither `before` nor `after` are provided, and `match` is also `None`, `match` falls back to the `content` value.

**mode**

Defines how to edit a line. One of the following options is required:

- **ensure**  
If line does not exist, it will be added. If `before` and `after` are specified either zero lines, or lines that contain the `content` line are allowed to be in between `before` and `after`. If there are lines, and none of them match then it will produce an error.
- **replace**  
If line already exists, it will be replaced.
- **delete**  
Delete the line, if found.
- **insert**  
Nearly identical to `ensure`. If a line does not exist, it will be added.  
  
The differences are that multiple (and non-matching) lines are allowed between `before` and `after`, if they are specified. The line will always be inserted right before `before`. `insert` also allows the use of `location` to specify that the line should be added at the beginning or end of the file.

---

**Note:** If `mode=insert` is used, at least one of the following options must also be defined: `location`, `before`, or `after`. If `location` is used, it takes precedence over the other two options.

---

**location**

In `mode=insert` only, whether to place the `content` at the beginning or end of a the file. If `location` is provided, `before` and `after` are ignored. Valid locations:

- **start**  
Place the content at the beginning of the file.
- **end**  
Place the content at the end of the file.

**before**

Regular expression or an exact case-sensitive fragment of the string. Will be tried as **both** a regex **and** a part of the line. Must match **exactly** one line in the file. This value is only used in `ensure` and `insert` modes. The `content` will be inserted just before this line, matching its `indent` unless `indent=False`.

**after**

Regular expression or an exact case-sensitive fragment of the string. Will be tried as **both** a regex **and** a part of the line. Must match **exactly** one line in the file. This value is only used in `ensure` and `insert` modes. The `content` will be inserted directly after this line, unless `before` is also provided. If `before` is not matched, indentation will match this line, unless `indent=False`.

**show\_changes**

Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`

---

**Note:** Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

---

**backup**

Create a backup of the original file with the extension: "Year-Month-Day-Hour-Minutes-Seconds".

**quiet**

Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.

**indent**

Keep indentation with the previous line. This option is not considered when the `delete` mode is specified. Default is `True`.

**create**

Create an empty file if doesn't exist.

New in version 2016.11.0.

**user**

The user to own the file, this defaults to the user salt is running as on the minion.

New in version 2016.11.0.

**group**

The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored.

New in version 2016.11.0.

**file\_mode**

The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

New in version 2016.11.0.

If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
update_config:
  file.line:
    - name: /etc/myconfig.conf
    - mode: ensure
    - content: my key = my value
    - before: somekey.*?
```

**Examples:**

Here's a simple config file.

```
[some_config]
# Some config file
# this line will go away

here=False
away=True
goodybe=away
```

And an sls file:

```
remove_lines:
  file.line:
    - name: /some/file.conf
    - mode: delete
    - match: away
```

This will produce:

```
[some_config]
# Some config file

here=False
away=True
goodbye=away
```

If that state is executed 2 more times, this will be the result:

```
[some_config]
# Some config file

here=False
```

Given that original file with this state:

```
replace_things:
  file.line:
    - name: /some/file.conf
    - mode: replace
    - match: away
    - content: here
```

Three passes with this state will result in this file:

```
[some_config]
# Some config file
here

here=False
here
here
```

Each pass replacing the first line found.

Given this file:

```
insert after me
something
insert before me
```

The following state:

```
insert_a_line:
  file.line:
    - name: /some/file.txt
    - mode: insert
    - after: insert after me
    - before: insert before me
    - content: thrice
```

If this state is executed 3 times, the result will be:

```
insert after me
something
thrice
thrice
thrice
insert before me
```

If the mode is `ensure` instead, it will fail each time. To succeed, we need to remove the incorrect line between before and after:

```
insert after me
insert before me
```

With an `ensure` mode, this will insert `thrice` the first time and make no changes for subsequent calls. For something simple this is fine, but if you have instead blocks like this:

```
Begin SomeBlock
  foo = bar
End

Begin AnotherBlock
  another = value
End
```

And given this state:

```
ensure_someblock:
  file.line:
    - name: /some/file.conf
    - mode: ensure
    - after: Begin SomeBlock
    - content: this = should be my content
    - before: End
```

This will fail because there are multiple `End` lines. Without that problem, it still would fail because there is a non-matching line, `foo = bar`. `Ensure` **only** allows either zero, or the matching line present to be present in between before and after.

```
salt.states.file.managed(name, source=None, source_hash="", source_hash_name=None,
                        keep_source=True, user=None, group=None, mode=None, attrs=None,
                        template=None, makedirs=False, dir_mode=None, context=None, replace=True,
                        defaults=None, backup="", show_changes=True, create=True, contents=None,
                        tmp_dir="", tmp_ext="", contents_pillar=None, contents_grains=None,
                        contents_newline=True, contents_delimiter='!', encoding=None,
                        encoding_errors='strict', allow_empty=True, follow_symlinks=True,
                        check_cmd=None, skip_verify=False, selinux=None, win_owner=None,
                        win_perms=None, win_deny_perms=None, win_inheritance=True,
                        win_perms_reset=False, verify_ssl=True, use_etag=False, signature=None,
                        source_hash_sig=None, signed_by_any=None, signed_by_all=None,
                        keyring=None, gnupghome=None, **kwargs)
```

Manage a given file, this function allows for a file to be downloaded from the salt master and potentially run through a templating system.

**name**

The location of the file to manage, as an absolute path.

**source**

The source file to download to the minion, this source file can be hosted on either the salt master server (`salt://`), the salt minion local file system (`/`), or on an HTTP or FTP server (`http(s)://`, `ftp://`).

Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see `s3.get` state documentation) File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs, see `swift.get` documentation. For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`. If source is left blank or `None` (use `~` in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed. If source is left blank or `None`, please also set `replaced` to `False` to make your intention explicit.

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored. Source list functionality only supports local files and remote files hosted on the salt master server or retrievable via HTTP, HTTPS, or FTP.

```
file_override_example:
file.managed:
  - source:
    - salt://file_that_does_not_exist
    - salt://file_that_exists
```

**source\_hash**

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

Type	Length
sha512	128
sha384	96
sha256	64
sha224	56
sha1	40
md5	32

**Using a Source Hash File**

The file can contain several checksums for several files. Each line must contain both the file name and the hash. If no file name is matched, the first hash encountered will be used, otherwise the most secure hash with the correct source file name will be used.

When using a source hash file the `source_hash` argument needs to be a url, the standard download urls are supported, `ftp`, `http`, `salt` etc:

Example:

```
tomdroid-src-0.7.3.tar.gz:
file.managed:
  - name: /tmp/tomdroid-src-0.7.3.tar.gz
```

(continues on next page)

(continued from previous page)

```

- source: https://launchpad.net/tomdroid/beta/0.7.3/
↳+download/tomdroid-src-0.7.3.tar.gz
- source_hash: https://launchpad.net/tomdroid/beta/0.7.3/
↳+download/tomdroid-src-0.7.3.hash

```

The following lines are all supported formats:

```

/etc/rc.conf ef6e82e4006dee563d98ada2a2a80a27
sha254c8525aee419eb649f0233be91c151178b30f0dff8ebbdcc8de71b1d5c8bcc06a
↳ /etc/resolv.conf
ead48423703509d37c4a90e6a0d53e143b6fc268

```

Debian file type `*.dsc` files are also supported.

### Inserting the Source Hash in the SLS Data

The `source_hash` can be specified as a simple checksum, like so:

```

tomdroid-src-0.7.3.tar.gz:
file.managed:
- name: /tmp/tomdroid-src-0.7.3.tar.gz
- source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
↳tomdroid-src-0.7.3.tar.gz
- source_hash: 79eef25f9b0b2c642c62b7f737d4f53f

```

**Note:** Releases prior to 2016.11.0 must also include the hash type, like in the below example:

```

tomdroid-src-0.7.3.tar.gz:
file.managed:
- name: /tmp/tomdroid-src-0.7.3.tar.gz
- source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
↳tomdroid-src-0.7.3.tar.gz
- source_hash: md5=79eef25f9b0b2c642c62b7f737d4f53f

```

`source_hash` is ignored if the file hosted is not on a HTTP, HTTPS or FTP server.

### Known issues:

If the remote server URL has the hash file as an apparent sub-directory of the source file, the module will discover that it has already cached a directory where a file should be cached. For example:

```

tomdroid-src-0.7.3.tar.gz:
file.managed:
- name: /tmp/tomdroid-src-0.7.3.tar.gz
- source: https://launchpad.net/tomdroid/beta/0.7.3/
↳+download/tomdroid-src-0.7.3.tar.gz
- source_hash: https://launchpad.net/tomdroid/beta/0.7.3/
↳+download/tomdroid-src-0.7.3.tar.gz/+md5

```

### `source_hash_name`

When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/tmp/foo.txt:
file.managed:
  - source: https://mydomain.tld/dir2/foo.txt
  - source_hash: https://mydomain.tld/hashes
  - source_hash_name: ./dir2/foo.txt
```

**Note:** This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.3.5.

#### **keep\_source**

Set to `False` to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file might result in the state needing to re-download the source file if the state is run again. If the source is not a local or `salt://` one, the source hash is known, `skip_verify` is not true and the managed file exists with the correct hash and is not templated, this is not the case (i.e. remote downloads are avoided if the local hash matches the expected one).

New in version 2017.7.3.

#### **user**

The user to own the file, this defaults to the user salt is running as on the minion

#### **group**

The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

#### **mode**

The permissions to set on this file, e.g. `644`, `0775`, or `4664`.

The default mode for new files and directories corresponds to the `umask` of the salt process. The mode of existing files and directories will only be changed if `mode` is specified.

**Note:** This option is **not** supported on Windows.

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the `source` URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the mode to `keep` is also incompatible with the `contents` options.

**Note:** `keep` does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the

master with salt-ssh, salt is unable to stat the file as it exists on the fileserver and thus cannot mirror the mode on the salt-ssh minion

---

**attrs**

The attributes to have on this file, e.g. `a`, `i`. The attributes can be any or a combination of the following characters: `aAcCdDeijPsStTu`.

---

**Note:** This option is **not** supported on Windows.

---

New in version 2018.3.0.

**template**

If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

**makedirs**

If set to `True`, then the parent directories will be created to facilitate the creation of the named file. If `False`, and the parent directory of the destination file doesn't exist, the state will fail.

**dir\_mode**

If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**replace**

If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

**context**

Overrides default context variables passed to the template.

**defaults**

Default context passed to the template.

**backup**

Overrides the default backup mode for this specific file. See [backup\\_mode documentation](#) for more details.

**show\_changes**

Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

**create**

If set to `False`, then the file will only be managed if the file already exists on the system.

**contents**

Specify the contents of the file. Cannot be used in combination with `source`. Ignores hashes and does not use a templating engine.

This value can be either a single string, a multiline YAML string or a list of strings. If a list of strings, then the strings will be joined together with newlines in the resulting file. For example, the below two example states would result in identical file contents:

```
/path/to/file1:
  file.managed:
    - contents:
```

(continues on next page)

(continued from previous page)

```

- This is line 1
- This is line 2

/path/to/file2:
file.managed:
- contents: |
    This is line 1
    This is line 2

```

**contents\_pillar**

New in version 0.17.0.

Changed in version 2016.11.0: `contents_pillar` can also be a list, and the pillars will be concatenated together to form one file.

Operates like `contents`, but draws from a value stored in pillar, using the pillar path syntax used in `pillar.get`. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

For example, the following could be used to deploy an SSH private key:

```

/home/deployer/.ssh/id_rsa:
file.managed:
- user: deployer
- group: deployer
- mode: 600
- attrs: a
- contents_pillar: userdata:deployer:id_rsa

```

This would populate `/home/deployer/.ssh/id_rsa` with the contents of `pillar['userdata']['deployer']['id_rsa']`. An example of this pillar setup would be like so:

```

userdata:
  deployer:
    id_rsa: |
      -----BEGIN RSA PRIVATE KEY-----
      ⓧ
      ↪MIIIEowIBAAKCAQEAOQiwO3JhBquPAa1QF9qP1LLZXVjYMIswrMe2HcWUVBgh+vY
      U7sCwx/
      ↪dH6+VvNwmCoqmNnP+8gTPKGl1vgA0bJAnMT623dMXjVKwnEagZPRJIxDy
      B/
      ↪HaAre9euNiY3LvIzBTWRSeMfT+rWvIKVBpvwlgGrfgz70m0ppqxu+UyFbAGLin+
      GpxzZAMaFpZw4sSbIlRuissXZj/sHpQb8p9M5Ie04Z3rjkCP1cxI
      -----END RSA PRIVATE KEY-----

```

**Note:** The private key above is shortened to keep the example brief, but shows how to do multiline string in YAML. The key is followed by a pipe character, and the multiline string is indented two more spaces.

To avoid the hassle of creating an indented multiline YAML string, the `file_tree_external_pillar` can be used instead. However, this will not work for binary files in Salt releases before 2015.8.4.

**Note:** For information on using Salt Slots and how to incorporate execution module returns into file content or data, refer to the [Salt Slots documentation](#).

---

### **contents\_grains**

New in version 2014.7.0.

Operates like `contents`, but draws from a value stored in grains, using the grains path syntax used in `grains.get`. This functionality works similarly to `contents_pillar`, but with grains.

For example, the following could be used to deploy a "message of the day" file:

```
write_motd:
  file.managed:
    - name: /etc/motd
    - contents_grains: motd
```

This would populate `/etc/motd` file with the contents of the `motd` grain. The `motd` grain is not a default grain, and would need to be set prior to running the state:

```
salt '*' grains.set motd 'Welcome! This system is managed by Salt.'
```

### **contents\_newline**

New in version 2014.7.0.

Changed in version 2015.8.4: This option is now ignored if the contents being deployed contain binary data.

If `True`, files managed using `contents`, `contents_pillar`, or `contents_grains` will have a newline added to the end of the file if one is not present. Setting this option to `False` will ensure the final line, or entry, does not contain a new line. If the last line, or entry in the file does contain a new line already, this option will not remove it.

### **contents\_delimiter**

New in version 2015.8.4.

Can be used to specify an alternate delimiter for `contents_pillar` or `contents_grains`. This delimiter will be passed through to `pillar.get` or `grains.get` when retrieving the contents.

### **encoding**

If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See <https://docs.python.org/3/library/codecs.html#standard-encodings> for the list of available encodings.

New in version 2017.7.0.

### **encoding\_errors**

Error encoding scheme. Default is `'strict'`. See <https://docs.python.org/2/library/codecs.html#codec-base-classes> for the list of available schemes.

New in version 2017.7.0.

### **allow\_empty**

New in version 2015.8.4.

If set to `False`, then the state will fail if the contents specified by `contents_pillar` or `contents_grains` are empty.

### **follow\_symlinks**

New in version 2014.7.0.

If the desired path is a symlink follow it and make changes to the file to which the symlink points.

### **check\_cmd**

New in version 2014.7.0.

The specified command will be run with an appended argument of a *temporary* file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

For example, the following could be used to verify sudoers before making changes:

```
/etc/sudoers:
file.managed:
- user: root
- group: root
- mode: 0440
- attrs: i
- source: salt://sudoers/files/sudoers.jinja
- template: jinja
- check_cmd: /usr/sbin/visudo -c -f
```

NOTE: This `check_cmd` functions differently than the requisite `check_cmd`.

#### **tmp\_dir**

Directory for temp file created by `check_cmd`. Useful for checkers dependent on config file location (e.g. daemons restricted to their own config directories by an apparmor profile).

```
/etc/dhcp/dhcpd.conf:
file.managed:
- user: root
- group: root
- mode: 0755
- tmp_dir: '/etc/dhcp'
- contents: "# Managed by Salt"
- check_cmd: dhcpd -t -cf
```

#### **tmp\_ext**

Suffix for temp file created by `check_cmd`. Useful for checkers dependent on config file extension (e.g. the `init-checkconf` upstart config checker).

```
/etc/init/test.conf:
file.managed:
- user: root
- group: root
- mode: 0440
- tmp_ext: '.conf'
- contents:
- 'description "Salt Minion"'
- 'start on started mountall'
- 'stop on shutdown'
- 'respawn'
- 'exec salt-minion'
- check_cmd: init-checkconf -f
```

#### **skip\_verify**

If True, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

#### **selinux**

Allows setting the selinux user, role, type, and range of a managed file

```

/tmp/selinux.test
file.managed:
- user: root
- selinux:
  seuser: system_u
  serole: object_r
  setype: system_conf_t
  serange: s0

```

New in version 3000.

#### **win\_owner**

The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.

#### **win\_perms**

A dictionary containing permissions to grant and their propagation. For example: {'Administrators': {'perms': 'full\_control'}} Can be a single basic perm or a list of advanced perms. perms must be specified. applies\_to does not apply to file objects.

New in version 2017.7.0.

#### **win\_deny\_perms**

A dictionary containing permissions to deny and their propagation. For example: {'Administrators': {'perms': 'full\_control'}} Can be a single basic perm or a list of advanced perms. perms must be specified. applies\_to does not apply to file objects.

New in version 2017.7.0.

#### **win\_inheritance**

True to inherit permissions from the parent directory, False not to inherit permission.

New in version 2017.7.0.

#### **win\_perms\_reset**

If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Here's an example using the above win\_\* parameters:

```

create_config_file:
file.managed:
- name: C:\config\settings.cfg
- source: salt://settings.cfg
- win_owner: Administrators
- win_perms:
  # Basic Permissions
  dev_ops:
    perms: full_control
  # List of advanced permissions
  appuser:
    perms:
      - read_attributes
      - read_ea
      - create_folders
      - read_permissions
joe_snuffy:

```

(continues on next page)

(continued from previous page)

```

    perms: read
- win_deny_perms:
    fred_snuffly:
    perms: full_control
- win_inheritance: False

```

**verify\_ssl**

If `False`, remote https file sources (`https://`) and `source_hash` will not attempt to validate the servers certificate. Default is `True`.

New in version 3002.

**use\_etag**

If `True`, remote http/https file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the `source_hash` parameter.

New in version 3005.

**signature**

Ensure a valid GPG signature exists on the selected source file. Set this to `true` for inline signatures, or to a file URI retrievable by `:py:func:`cp.cache_file` <salt.modules.cp.cache_file>` for a detached one.

---

**Note:** A signature is only enforced directly after caching the file, before it is moved to its final destination. Existing target files (with the correct checksum) will neither be checked nor deleted.

It will be enforced regardless of source type and will be required on the final output, therefore this does not lend itself well when templates are rendered. The file will not be modified, meaning inline signatures are not removed.

---

New in version 3007.0.

**source\_hash\_sig**

When `source` is a remote file source, `source_hash` is a file, `skip_verify` is not `true` and `use_etag` is not `true`, ensure a valid GPG signature exists on the source hash file. Set this to `true` for an inline (clearsigned) signature, or to a file URI retrievable by `:py:func:`cp.cache_file` <salt.modules.cp.cache_file>` for a detached one.

---

**Note:** A signature on the `source_hash` file is enforced regardless of changes since its contents are used to check if an existing file is in the correct state - but only for remote sources! As for `signature`, existing target files will not be modified, only the cached `source_hash` and `source_hash_sig` files will be removed.

---

New in version 3007.0.

**signed\_by\_any**

When verifying signatures either on the managed file or its source hash file, require at least one valid signature from one of a list of key fingerprints. This is passed to `gpg.verify`.

New in version 3007.0.

**signed\_by\_all**

When verifying signatures either on the managed file or its source hash file, require a valid signature from each of the key fingerprints in this list. This is passed to `gpg.verify`.

New in version 3007.0.

**keyring**

When verifying signatures, use this keyring.

New in version 3007.0.

**gnupghome**

When verifying signatures, use this GnuPG home.

New in version 3007.0.

**salt.states.file.missing**(*name*, *\*\*kwargs*)

Verify that the named file or directory is missing, this returns True only if the named file is missing but does not remove the file if it is present.

**name**

Absolute path which must NOT exist

**salt.states.file.mknod**(*name*, *ntype*, *major=0*, *minor=0*, *user=None*, *group=None*, *mode='0600'*)

Create a special file similar to the 'nix mknod command. The supported device types are **p** (fifo pipe), **c** (character device), and **b** (block device). Provide the major and minor numbers when specifying a character device or block device. A fifo pipe does not require this information. The command will create the necessary dirs if needed. If a file of the same name not of the same type/major/minor exists, it will not be overwritten or unlinked (deleted). This is logically in place as a safety measure because you can really shoot yourself in the foot here and it is the behavior of 'nix mknod. It is also important to note that not just anyone can create special devices. Usually this is only done as root. If the state is executed as none other than root on a minion, you may receive a permission error.

**name**

name of the file

**ntype**

node type 'p' (fifo pipe), 'c' (character device), or 'b' (block device)

**major**

major number of the device does not apply to a fifo pipe

**minor**

minor number of the device does not apply to a fifo pipe

**user**

owning user of the device/pipe

**group**

owning group of the device/pipe

**mode**

permissions on the device/pipe

Usage:

```
/dev/chr:
file.mknod:
- ntype: c
- major: 180
- minor: 31
- user: root
- group: root
- mode: 660

/dev/blk:
file.mknod:
- ntype: b
- major: 8
- minor: 999
- user: root
- group: root
- mode: 660
```

(continues on next page)

(continued from previous page)

```

/dev/fifo:
file.mknod:
- ntype: p
- user: root
- group: root
- mode: 660

```

New in version 0.17.0.

`salt.states.file.mod_beacon`(*name*, *\*\*kwargs*)

Create a beacon to monitor a file based on a beacon state argument.

---

**Note:** This state exists to support special handling of the `beacon` state argument for supported state functions. It should not be called directly.

---

`salt.states.file.mod_run_check_cmd`(*cmd*, *filename*, *\*\*check\_cmd\_opts*)

Execute the `check_cmd` logic.

Return True if `check_cmd` succeeds (`check_cmd == 0`) otherwise return a result dict

`salt.states.file.not_cached`(*name*, *saltenv='base'*)

New in version 2017.7.3.

Ensures that a file is not present in the minion's cache, deleting it if found. This state is primarily invoked by other states to ensure that a fresh copy is fetched.

**name**

The URL of the file to be removed from cache. To remove a file from cache in an environment other than `base`, either use the `saltenv` argument or include the `saltenv` in the URL (e.g. `salt://path/to/file.conf?saltenv=dev`).

---

**Note:** A list of URLs is not supported, this must be a single URL. If a local file is passed here, the state will take no action.

---

**saltenv**

Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with `salt:// URL`).

`salt.states.file.patch`(*name*, *source=None*, *source\_hash=None*, *source\_hash\_name=None*, *skip\_verify=False*, *template=None*, *context=None*, *defaults=None*, *options=""*, *reject\_file=None*, *strip=None*, *saltenv=None*, *\*\*kwargs*)

Ensure that a patch has been applied to the specified file or directory

Changed in version 2019.2.0: The `hash` and `dry_run_first` options are now ignored, as the logic which determines whether or not the patch has already been applied no longer requires them. Additionally, this state now supports patch files that modify more than one file. To use these sort of patches, specify a directory (and, if necessary, the `strip` option) instead of a file.

---

**Note:** A suitable `patch` executable must be available on the minion. Also, keep in mind that the pre-check this state does to determine whether or not changes need to be made will create a temp file and send all patch output to that file. This means that, in the event that the patch would not have applied cleanly, the comment included in the state results will reference a temp file that will no longer exist once the state finishes running.

---

**name**

The file or directory to which the patch should be applied

**source**

The patch file to apply

Changed in version 2019.2.0: The source can now be from any file source supported by Salt (`salt://`, `http://`, `https://`, `ftp://`, etc.). Templating is also now supported.

**source\_hash**

Works the same way as in *file.managed*.

New in version 2019.2.0.

**source\_hash\_name**

Works the same way as in *file.managed*

New in version 2019.2.0.

**skip\_verify**

Works the same way as in *file.managed*

New in version 2019.2.0.

**template**

Works the same way as in *file.managed*

New in version 2019.2.0.

**context**

Works the same way as in *file.managed*

New in version 2019.2.0.

**defaults**

Works the same way as in *file.managed*

New in version 2019.2.0.

**options**

Extra options to pass to patch. This should not be necessary in most cases.

---

**Note:** For best results, short opts should be separate from one another. The `-N` and `-r`, and `-o` options are used internally by this state and cannot be used here. Additionally, instead of using `-pN` or `--strip=N`, use the `strip` option documented below.

---

**reject\_file**

If specified, any rejected hunks will be written to this file. If not specified, then they will be written to a temp file which will be deleted when the state finishes running.

---

**Important:** The parent directory must exist. Also, this will overwrite the file if it is already present.

---

New in version 2019.2.0.

**strip**

Number of directories to strip from paths in the patch file. For example, using the below SLS would instruct Salt to use `-p1` when applying the patch:

```
/etc/myfile.conf:
file.patch:
- source: salt://myfile.patch
- strip: 1
```

New in version 2019.2.0: In previous versions, `-p1` would need to be passed as part of the `options` value.

**saltenv**

Specify the environment from which to retrieve the patch file indicated by the `source` parameter. If not provided, this defaults to the environment from which the state is being executed.

---

**Note:** Ignored when the patch file is from a non-`salt://` source.

---

**Usage:**

```
# Equivalent to `patch --forward /opt/myfile.txt myfile.patch`
/opt/myfile.txt:
file.patch:
- source: salt://myfile.patch
```

`salt.states.file.prepend`(*name*, *text*=None, *makedirs*=False, *source*=None, *source\_hash*=None, *template*='jinja', *sources*=None, *source\_hashes*=None, *defaults*=None, *context*=None, *header*=None)

Ensure that some text appears at the beginning of a file

The text will not be prepended again if it already exists in the file. You may specify a single line of text or a list of lines to append.

**name**

The location of the file to prepend to.

**text**

The text to be prepended, which can be a single string or a list of strings.

**makedirs**

If the file is located in a path without a parent directory, then the state will fail. If `makedirs` is set to True, then the parent directories will be created to facilitate the creation of the named file. Defaults to False.

**source**

A single source file to prepend. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see `s3.get` state documentation). File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs (see `swift.get` documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`.

If the file is hosted on an HTTP or FTP server, the `source_hash` argument is also required.

**source\_hash**

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

Type	Length
===== sha512	===== 128
sha384	96
sha256	64
sha224	56
sha1	40
md5	32

See the `source_hash` parameter description for `file.managed` function for more details and examples.

#### template

The named templating engine will be used to render the source file(s). Defaults to `jinja`. The following templates are supported:

- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

#### sources

A list of source files to prepend. If the files are hosted on an HTTP or FTP server, the `source_hashes` argument is also required.

#### source\_hashes

A list of `source_hashes` corresponding to the sources list specified in the `sources` argument.

#### defaults

Default context passed to the template.

#### context

Overrides default context variables passed to the template.

#### ignore\_whitespace

New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

#### header

Forces the text to be prepended. If it exists in the file but not at the beginning, then it prepends a duplicate.

Multi-line example:

```
/etc/motd:
file.prepend:
- text: |
    Thou hadst better eat salt with the Philosophers of Greece,
    than sugar with the Courtiers of Italy.
    - Benjamin Franklin
```

Multiple lines of text:

```
/etc/motd:
file.prepend:
- text:
  - Trust no one unless you have eaten much salt with him.
  - "Salt is born of the purest of parents: the sun and the sea."
```

Optionally, require the text to appear exactly as specified (order and position). Combine with multi-line or multiple lines of input.

```
/etc/motd:
file.prepend:
- header: True
- text:
  - This will be the very first line in the file.
  - The 2nd line, regardless of duplicates elsewhere in the file.
  - These will be written anew if they do not appear verbatim.
```

Gather text from multiple template files:

```
/etc/motd:
file:
- prepend
- template: jinja
- sources:
- salt://motd/devops-messages.tpl
- salt://motd/hr-messages.tpl
- salt://motd/general-messages.tpl
```

New in version 2014.7.0.

`salt.states.file.pruned`(*name*, *recurse=False*, *ignore\_errors=False*, *older\_than=None*)

New in version 3006.0.

Ensure that the named directory is absent. If it exists and is empty, it will be deleted. An entire directory tree can be pruned of empty directories as well, by using the `recurse` option.

**name**

The directory which should be deleted if empty.

**recurse**

If set to `True`, this option will recursive deletion of empty directories. This is useful if nested paths are all empty, and would be the only items preventing removal of the named root directory.

**ignore\_errors**

If set to `True`, any errors encountered while attempting to delete a directory are ignored. This **AUTOMATICALLY ENABLES** the `recurse` option since it's not terribly useful to ignore errors on the removal of a single directory. Useful for pruning only the empty directories in a tree which contains non-empty directories as well.

**older\_than**

When `older_than` is set to a number, it is used to determine the **number of days** which must have passed since the last modification timestamp before a directory will be allowed to be removed. Setting the value to 0 is equivalent to leaving it at the default of `None`.

`salt.states.file.recurse`(*name*, *source*, *keep\_source=True*, *clean=False*, *require=None*, *user=None*, *group=None*, *dir\_mode=None*, *file\_mode=None*, *sym\_mode=None*, *template=None*, *context=None*, *replace=True*, *defaults=None*, *include\_empty=False*, *backup=""*, *include\_pat=None*, *exclude\_pat=None*, *maxdepth=None*, *keep\_symlinks=False*, *force\_symlinks=False*, *win\_owner=None*, *win\_perms=None*, *win\_deny\_perms=None*, *win\_inheritance=True*, *\*\*kwargs*)

Recurse through a subdirectory on the master and copy said subdirectory over to the specified path.

**name**

The directory to set the recursion in

**source**

The source directory, this directory is located on the salt master file server and is specified with the `salt://` protocol. If the directory is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`

**keep\_source**

Set to `False` to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file will result in the state needing to re-download the source file if the state is run again.

New in version 2017.7.3.

**clean**

Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required.

**require**

Require other resources such as packages or files

**user**

The user to own the directory. This defaults to the user salt is running as on the minion

**group**

The group ownership set for the directory. This defaults to the group salt is running as on the minion. On Windows, this is ignored

**dir\_mode**

The permissions mode to set on any directories created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

---

**Note:** This option is **not** supported on Windows.

---

**file\_mode**

The permissions mode to set on any files created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

---

**Note:** This option is **not** supported on Windows.

---

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the `source` URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the mode to `keep` is also incompatible with the `contents` options.

**sym\_mode**

The permissions mode to set on any symlink created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

---

**Note:** This option is **not** supported on Windows.

---

**template**

If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

---

**Note:** The `template` option is required when recursively applying templates.

---

**replace**

If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

**context**

Overrides default context variables passed to the template.

**defaults**

Default context passed to the template.

#### **include\_empty**

Set this to True if empty directories should also be created (default is False)

#### **backup**

Overrides the default backup mode for all replaced files. See [backup\\_mode documentation](#) for more details.

#### **include\_pat**

When copying, include only this pattern, or list of patterns, from the source. Default is glob match; if prefixed with 'E@', then regexp match. Example:

```
- include_pat: hello*           :: glob matches 'hello01', 'hello02'
                               ... but not 'otherhello'
- include_pat: E@hello         :: regexp matches 'otherhello',
                               'hello01' ...
```

Changed in version 3001: List patterns are now supported

```
- include_pat:
  - hello01
  - hello02
```

#### **exclude\_pat**

Exclude this pattern, or list of patterns, from the source when copying. If both *include\_pat* and *exclude\_pat* are supplied, then it will apply conditions cumulatively. i.e. first select based on *include\_pat*, and then within that result apply *exclude\_pat*.

Also, when 'clean=True', exclude this pattern from the removal list and preserve in the destination. Example:

```
- exclude_pat: APPDATA*        :: glob matches APPDATA.01,
                               APPDATA.02,.. for exclusion
- exclude_pat: E@(APPDATA)|(TEMPDATA) :: regexp matches APPDATA
                               or TEMPDATA for exclusion
```

Changed in version 3001: List patterns are now supported

```
- exclude_pat:
  - APPDATA.01
  - APPDATA.02
```

#### **maxdepth**

When copying, only copy paths which are of depth *maxdepth* from the source path. Example:

```
- maxdepth: 0                 :: Only include files located in the source
                               directory
- maxdepth: 1                 :: Only include files located in the source
                               or immediate subdirectories
```

#### **keep\_symlinks**

Keep symlinks when copying from the source. This option will cause the copy operation to terminate at the symlink. If desire behavior similar to rsync, then set this to True. This option is not taken in account if *fileserver\_followsymlinks* is set to False.

#### **force\_symlinks**

Force symlink creation. This option will force the symlink creation. If a file or directory is obstructing symlink creation it will be recursively removed so that symlink creation can proceed. This option is usually not needed except in special circumstances. This option is not taken in account if *fileserver\_followsymlinks* is set to False.

**win\_owner**

The owner of the symlink and directories if `makedirs` is `True`. If this is not passed, `user` will be used. If `user` is not passed, the account under which Salt is running will be used.

New in version 2017.7.7.

**win\_perms**

A dictionary containing permissions to grant

New in version 2017.7.7.

**win\_deny\_perms**

A dictionary containing permissions to deny

New in version 2017.7.7.

**win\_inheritance**

`True` to inherit permissions from parent, otherwise `False`

New in version 2017.7.7.

`salt.states.file.rename`(*name*, *source*, *force=False*, *makedirs=False*, *\*\*kwargs*)

If the source file exists on the system, rename it to the named file. The named file will not be overwritten if it already exists unless the `force` option is set to `True`.

**name**

The location of the file to rename to

**source**

The location of the file to move to the location specified with `name`

**force**

If the target location is present then the file will not be moved, specify `"force: True"` to overwrite the target file

**makedirs**

If the target subdirectories don't exist create them

`salt.states.file.replace`(*name*, *pattern*, *repl*, *count=0*, *flags=8*, *bufsize=1*, *append\_if\_not\_found=False*, *prepend\_if\_not\_found=False*, *not\_found\_content=None*, *backup='.bak'*, *show\_changes=True*, *ignore\_if\_missing=False*, *backslash\_literal=False*)

Maintain an edit in a file.

New in version 0.17.0.

**name**

Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.

**pattern**

A regular expression, to be matched using Python's `re.search()`.

---

**Note:** If you need to match a literal string that contains regex special characters, you may want to use salt's custom Jinja filter, `regex_escape`.

```
{{ 'http://example.com?foo=bar%20baz' | regex_escape }}
```

---

**repl**

The replacement text

**count**

Maximum number of pattern occurrences to be replaced. Defaults to 0. If `count` is a positive integer `n`, no more than `n` occurrences will be replaced, otherwise all occurrences will be replaced.

**flags**

A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE']`,

'MULTILINE']). Optionally, `flags` may be an int, with a value corresponding to the XOR (|) of all the desired flags. Defaults to 8 (which equates to ['MULTILINE']).

---

**Note:** `file.replace` reads the entire file as a string to support multiline regex patterns. Therefore, when using anchors such as `^` or `$` in the pattern, those anchors may be relative to the line OR relative to the file. The default for `file.replace` is to treat anchors as relative to the line, which is implemented by setting the default value of `flags` to ['MULTILINE']. When overriding the default value for `flags`, if 'MULTILINE' is not present then anchors will be relative to the file. If the desired behavior is for anchors to be relative to the line, then simply add 'MULTILINE' to the list of flags.

---

#### **bufsize**

How much of the file to buffer into memory at once. The default value 1 processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

#### **append\_if\_not\_found**

If set to `True`, and `pattern` is not found, then the content will be appended to the file.

New in version 2014.7.0.

#### **prepend\_if\_not\_found**

If set to `True` and `pattern` is not found, then the content will be prepended to the file.

New in version 2014.7.0.

#### **not\_found\_content**

Content to use for append/prepend if not found. If `None` (default), uses `repl`. Useful when `repl` uses references to group in pattern.

New in version 2014.7.0.

#### **backup**

The file extension to use for a backup of the file before editing. Set to `False` to skip making a backup.

#### **show\_changes**

Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Returns a boolean or a string.

#### **ignore\_if\_missing**

New in version 2016.3.4.

Controls what to do if the file is missing. If set to `False`, the state will display an error raised by the execution module. If set to `True`, the state will simply report no changes.

#### **backslash\_literal**

New in version 2016.11.7.

Interpret backslashes as literal backslashes for the `repl` and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the `repl` on the second run of the state.

For complex regex patterns, it can be useful to avoid the need for complex quoting and escape sequences by making use of YAML's multiline string syntax.

#### **complex\_search\_and\_replace:**

##### **file.replace:**

```
# <...snip...>
```

```
- pattern: |
```

```
CentOS \((2.6.32[^\n]+\)\n\s+root[^\n]+\n\)+
```

---

**Note:** When using YAML multiline string syntax in `pattern:`, make sure to also use that syntax in the `repl:` part, or you might lose line feeds.

---

When regex capture groups are used in `pattern:`, their captured value is available for reuse in the `repl:` part as a backreference (ex. `\1`).

```
add_login_group_to_winbind_ssh_access_list:
  file.replace:
    - name: '/etc/security/pam_winbind.conf'
    - pattern: '^(require_membership_of = )(.*)$'
    - repl: '\1\2,append-new-group-to-line'
```

**Note:** The `file.replace` state uses Python's `re` module. For more advanced options, see <https://docs.python.org/2/library/re.html>

`salt.states.file.retention_schedule` (*name, retain, strptime\_format=None, timezone=None*)

Apply retention scheduling to backup storage directory.

New in version 2016.11.0.

Changed in version 3006.0.

#### Parameters

- **name** -- The filesystem path to the directory containing backups to be managed.
- **retain** -- Delete the backups, except for the ones we want to keep. The `N` below should be an integer but may also be the special value of `all`, which keeps all files matching the criteria. All of the retain options default to `None`, which means to not keep files based on this criteria.
  - most\_recent** `N`  
Keep the most recent `N` files.
  - first\_of\_hour** `N`  
For the last `N` hours from now, keep the first file after the hour.
  - first\_of\_day** `N`  
For the last `N` days from now, keep the first file after midnight. See also `timezone`.
  - first\_of\_week** `N`  
For the last `N` weeks from now, keep the first file after Sunday midnight.
  - first\_of\_month** `N`  
For the last `N` months from now, keep the first file after the start of the month.
  - first\_of\_year** `N`  
For the last `N` years from now, keep the first file after the start of the year.
- **strptime\_format** -- A python `strptime` format string used to first match the filenames of backups and then parse the filename to determine the datetime of the file. <https://docs.python.org/2/library/datetime.html#datetime.datetime.strptime> Defaults to `None`, which considers all files in the directory to be backups eligible for deletion and uses `os.path.getmtime()` to determine the datetime.
- **timezone** -- The timezone to use when determining midnight. This is only used when datetime is pulled from `os.path.getmtime()`. Defaults to `None` which uses the timezone from the locale.

Usage example:

```
/var/backups/example_directory:
  file.retention_schedule:
    - retain:
```

(continues on next page)

(continued from previous page)

```

most_recent: 5
first_of_hour: 4
first_of_day: 7
first_of_week: 6    # NotImplemented yet.
first_of_month: 6
first_of_year: all
- strptime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
- timezone: None

```

`salt.states.file.serialize`(*name*, *dataset=None*, *dataset\_pillar=None*, *user=None*, *group=None*, *mode=None*, *backup=""*, *makedirs=False*, *show\_changes=True*, *create=True*, *merge\_if\_exists=False*, *encoding=None*, *encoding\_errors='strict'*, *serializer=None*, *serializer\_opts=None*, *deserializer\_opts=None*, *check\_cmd=None*, *tmp\_dir=""*, *tmp\_ext=""*, *\*\*kwargs*)

Serializes dataset and store it into managed file. Useful for sharing simple configuration files.

**name**

The location of the file to create

**dataset**

The dataset that will be serialized

**dataset\_pillar**

Operates like `dataset`, but draws from a value stored in pillar, using the pillar path syntax used in `pillar.get`. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

New in version 2015.8.0.

---

**Note:** For information on using Salt Slots and how to incorporate execution module returns into file content or data, refer to the [Salt Slots documentation](#).

---

**serializer (or formatter)**

Write the data as this format. See the list of [serializer modules](#) for supported output formats.

Changed in version 3002: `serializer` argument added as an alternative to `formatter`. Both are accepted, but using both will result in an error.

**encoding**

If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See <https://docs.python.org/3/library/codecs.html#standard-encodings> for the list of available encodings.

New in version 2017.7.0.

**encoding\_errors**

Error encoding scheme. Default is `'strict'`. See <https://docs.python.org/2/library/codecs.html#codec-base-classes> for the list of available schemes.

New in version 2017.7.0.

**user**

The user to own the directory, this defaults to the user salt is running as on the minion

**group**

The group ownership set for the directory, this defaults to the group salt is running as on the minion

**mode**

The permissions to set on this file, e.g. 644, 0775, or 4664.

The default mode for new files and directories corresponds umask of salt process. For existing files and

directories it's not enforced.

---

**Note:** This option is **not** supported on Windows.

---

**backup**

Overrides the default backup mode for this specific file.

**makedirs**

Create parent directories for destination file.

New in version 2014.1.3.

**show\_changes**

Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

**create**

Default is `True`, if `create` is set to `False` then the file will only be managed if the file already exists on the system.

**merge\_if\_exists**

Default is `False`, if `merge_if_exists` is `True` then the existing file will be parsed and the dataset passed in will be merged with the existing content

New in version 2014.7.0.

**serializer\_opts**

Pass through options to serializer. For example:

```
/etc/dummy/package.yaml
file.serialize:
  - serializer: yaml
  - serializer_opts:
    - explicit_start: True
    - default_flow_style: True
    - indent: 4
```

The valid opts are the additional opts (i.e. not the data being serialized) for the function used to serialize the data. Documentation for these functions can be found in the list below:

- For `yaml`: `yaml.dump()`
- For `json`: `json.dumps()`
- For `python`: `pprint.pformat()`
- For `msgpack`: Run `python -c 'import msgpack; help(msgpack.Packer)'` to see the available options (encoding, unicode\_errors, etc.)

**deserializer\_opts**

Like `serializer_opts` above, but only used when merging with an existing file (i.e. when `merge_if_exists` is set to `True`).

The options specified here will be passed to the deserializer to load the existing data, before merging with the specified data and re-serializing.

```
/etc/dummy/package.yaml
file.serialize:
  - serializer: yaml
  - serializer_opts:
    - explicit_start: True
    - default_flow_style: True
    - indent: 4
  - deserializer_opts:
```

(continues on next page)

(continued from previous page)

- **encoding:** latin-1
- **merge\_if\_exists:** True

The valid opts are the additional opts (i.e. not the data being deserialized) for the function used to deserialize the data. Documentation for these functions can be found in the list below:

- For **yaml:** `yaml.load()`
- For **json:** `json.loads()`

However, note that not all arguments are supported. For example, when deserializing JSON, arguments like `parse_float` and `parse_int` which accept a callable object cannot be handled in an SLS file.

New in version 2019.2.0.

### check\_cmd

The specified command will be run with an appended argument of a *temporary* file containing the new file contents. If the command exits with a zero status the new file contents will be written to the state output destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

For example, the following could be used to verify sudoers before making changes:

```
/etc/consul.d/my_config.json:
file.serialize:
- dataset:
  datacenter: "east-aws"
  data_dir: "/opt/consul"
  log_level: "INFO"
  node_name: "foobar"
  server: true
  watches:
  - type: checks
    handler: "/usr/bin/health-check-handler.sh"
  telemetry:
    statsite_address: "127.0.0.1:2180"
- serializer: json
- check_cmd: consul validate
```

NOTE: This `check_cmd` functions differently than the requisite `check_cmd`.

New in version 3007.0.

### tmp\_dir

Directory for temp file created by `check_cmd`. Useful for checkers dependent on config file location (e.g. daemons restricted to their own config directories by an apparmor profile).

New in version 3007.0.

### tmp\_ext

Suffix for temp file created by `check_cmd`. Useful for checkers dependent on config file extension.

New in version 3007.0.

For example, this state:

```
/etc/dummy/package.json:
file.serialize:
- dataset:
  name: naive
  description: A package using naive versioning
```

(continues on next page)

(continued from previous page)

```

author: A confused individual <iam@confused.com>
dependencies:
  express: '>= 1.2.0'
  optimist: '>= 0.1.0'
  engine: node 0.4.1
- serializer: json

```

will manage the file /etc/dummy/package.json:

```

{
  "author": "A confused individual <iam@confused.com>",
  "dependencies": {
    "express": ">= 1.2.0",
    "optimist": ">= 0.1.0"
  },
  "description": "A package using naive versioning",
  "engine": "node 0.4.1",
  "name": "naive"
}

```

`salt.states.file.shortcut` (*name, target, arguments=None, working\_dir=None, description=None, icon\_location=None, force=False, backupname=None, makedirs=False, user=None, \*\*kwargs*)

Create a Windows shortcut

If the file already exists and is a shortcut pointing to any location other than the specified target, the shortcut will be replaced. If it is a regular file or directory then the state will return False. If the regular file or directory is desired to be replaced with a shortcut pass `force: True`, if it is to be renamed, pass a `backupname`.

**name**

The location of the shortcut to create. Must end with either ".lnk" or ".url"

**target**

The location that the shortcut points to

**arguments**

Any arguments to pass in the shortcut

**working\_dir**

Working directory in which to execute target

**description**

Description to set on shortcut

**icon\_location**

Location of shortcut's icon

**force**

If the name of the shortcut exists and is not a file and `force` is set to `False`, the state will fail. If `force` is set to `True`, the link or directory in the way of the shortcut file will be deleted to make room for the shortcut, unless `backupname` is set, when it will be renamed

**backupname**

If the name of the shortcut exists and is not a file, it will be renamed to the `backupname`. If the `backupname` already exists and `force` is `False`, the state will fail. Otherwise, the `backupname` will be removed first.

**makedirs**

If the location of the shortcut does not already have a parent directory then the state will fail, setting `makedirs` to `True` will allow Salt to create the parent directory. Setting this to `True` will also create the parent for `backupname` if necessary.

**user**

The user to own the file, this defaults to the user salt is running as on the minion

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

```
salt.states.file.symlink(name, target, force=False, backupname=None, makedirs=False, user=None,
                        group=None, mode=None, win_owner=None, win_perms=None,
                        win_deny_perms=None, win_inheritance=None, atomic=False,
                        disallow_copy_and_unlink=False, inherit_user_and_group=False,
                        follow_symlinks=True, **kwargs)
```

Create a symbolic link (symlink, soft link)

If the file already exists and is a symlink pointing to any location other than the specified target, the symlink will be replaced. If an entry with the same name exists then the state will return False. If the existing entry is desired to be replaced with a symlink pass force: True, if it is to be renamed, pass a backupname.

**name**

The location of the symlink to create

**target**

The location that the symlink points to

**force**

If the name of the symlink exists and is not a symlink and force is set to False, the state will fail. If force is set to True, the existing entry in the way of the symlink file will be deleted to make room for the symlink, unless backupname is set, when it will be renamed

Changed in version 3000: Force will now remove all types of existing file system entries, not just files, directories and symlinks.

**backupname**

If the name of the symlink exists and is not a symlink, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first. An absolute path OR a basename file/directory name must be provided. The latter will be placed relative to the symlink destination's parent directory.

**makedirs**

If the location of the symlink does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory

**user**

The user to own the file, this defaults to the user salt is running as on the minion unless the link already exists and `inherit_user_and_group` is set

**group**

The group ownership set for the file, this defaults to the group salt is running as on the minion unless the link already exists and `inherit_user_and_group` is set. On Windows, this is ignored

**mode**

The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**win\_owner**

The owner of the symlink and directories if `makedirs` is True. If this is not passed, `user` will be used. If `user` is not passed, the account under which Salt is running will be used.

New in version 2017.7.7.

**win\_perms**

A dictionary containing permissions to grant

New in version 2017.7.7.

**win\_deny\_perms**

A dictionary containing permissions to deny

New in version 2017.7.7.

**win\_inheritance**

True to inherit permissions from parent, otherwise False

New in version 2017.7.7.

**atomic**

Use atomic file operation to create the symlink.

New in version 3006.0.

**disallow\_copy\_and\_unlink**

Only used if `backupname` is used and the name of the symlink exists and is not a symlink. If set to `True`, the operation is offloaded to the `file.rename` execution module function. This will use `os.rename` underneath, which will fail in the event that `src` and `dst` are on different filesystems. If `False` (the default), `shutil.move` will be used in order to fall back on a "copy then unlink" approach, which is required for moving across filesystems.

New in version 3006.0.

**inherit\_user\_and\_group**

If set to `True`, the link already exists, and either `user` or `group` are not set, this parameter will inform Salt to pull the user and group information from the existing link and use it where `user` or `group` is not set. The `user` and `group` parameters will override this behavior.

New in version 3006.0.

**follow\_symlinks (bool):**

If set to `False`, the underlying `file.symlink` execution module and any checks in this state will use `os.path.lexists()` for existence checks instead of `os.path.exists()`.

New in version 3007.0.

`salt.states.file.tidied` (*name*, *age*=0, *matches*=None, *rmdirs*=False, *size*=0, *exclude*=None, *full\_path\_match*=False, *followlinks*=False, *time\_comparison*='atime', *age\_size\_logical\_operator*='OR', *age\_size\_only*=None, *rmlinks*=True, *\*\*kwargs*)

Changed in version 3005,3006.0.

Remove unwanted files based on specific criteria.

The default operation uses an OR operation to evaluate age and size, so a file that is too large but is not old enough will still get tidied. If neither age nor size is given all files which match a pattern in `matches` will be removed.

NOTE: The regex patterns in this function are used in `re.match()`, so there is an implicit "beginning of string" anchor (^) in the regex and it is unanchored at the other end unless explicitly entered (\$) .

**name**

The directory tree that should be tidied

**age**

Maximum age in days after which files are considered for removal

**matches**

List of regular expressions to restrict what gets removed. Default: `['*']`

**rmdirs**

Whether or not it's allowed to remove directories

**size**

Maximum allowed file size. Files greater or equal to this size are removed. Doesn't apply to directories or symbolic links

**exclude**

List of regular expressions to filter the `matches` parameter and better control what gets removed.

New in version 3005.

**full\_path\_match**

Match the `matches` and `exclude` regex patterns against the entire file path instead of just the file or directory name. Default: `False`

New in version 3005.

#### **followlinks**

This module will not descend into subdirectories which are pointed to by symbolic links. If you wish to force it to do so, you may give this option the value `True`. Default: `False`

New in version 3005.

#### **time\_comparison**

Default: `atime`. Options: `atime/mtime/ctime`. This value is used to set the type of time comparison made using `age`. The default is to compare access times (`atime`) or the last time the file was read. A comparison by modification time (`mtime`) uses the last time the contents of the file was changed. The `ctime` parameter is the last time the contents, owner, or permissions of the file were changed.

New in version 3005.

#### **age\_size\_logical\_operator**

This parameter can change the default operation (OR) to an AND operation to evaluate age and size. In that scenario, a file that is too large but is not old enough will NOT get tidied. A file will need to fulfill BOTH conditions in order to be tidied. Accepts OR or AND.

New in version 3006.0.

#### **age\_size\_only**

This parameter can trigger the reduction of age and size conditions which need to be satisfied down to ONLY age or ONLY size. By default, this parameter is `None` and both conditions will be evaluated using the logical operator defined in `age_size_logical_operator`. The parameter can be set to `age` or `size` in order to restrict evaluation down to that specific condition. Path matching and exclusions still apply.

New in version 3006.0.

#### **rmlinks**

Whether or not it's allowed to remove symbolic links

New in version 3006.0.

```
cleanup:
  file.tidied:
    - name: /tmp/salt_test
    - rmdirs: True
    - matches:
      - foo
      - b.*r
```

`salt.states.file.touch`(*name*, *atime=None*, *mtime=None*, *makedirs=False*)

Replicate the 'nix "touch" command to create a new empty file or update the `atime` and `mtime` of an existing file.

Note that if you just want to create a file and don't care about `atime` or `mtime`, you should use `file.managed` instead, as it is more feature-complete. (Just leave out the `source/template/contents` arguments, and it will just create the file and/or check its permissions, without messing with contents)

#### **name**

name of the file

#### **atime**

atime of the file

#### **mtime**

mtime of the file

#### **makedirs**

whether we should create the parent directory/directories in order to touch the file

Usage:

```
/var/log/httpd/logrotate.empty:
file.touch
```

New in version 0.9.5.

`salt.states.file.uncomment` (*name*, *regex*, *char*='#', *backup*='.bak')

Uncomment specified commented lines in a file

**name**

The full path to the file to be edited

**regex**

A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading `^` character will be stripped for convenience (for easily switching between `comment()` and `uncomment()`). The regex will be searched for from the beginning of the line, ignoring leading spaces (we prepend `^[ t]*`)

**char**

The character to remove in order to uncomment a line

**backup**

The file will be backed up before edit with this file extension;

**Warning:** This backup will be overwritten each time `sed / comment / uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to `False/None` to not keep a backup.

Usage:

```
/etc/adduser.conf:
file.uncomment:
- regex: EXTRA_GROUPS
```

New in version 0.9.5.

## 26.19.92 salt.states.firewall

State to check firewall configurations

New in version 2016.3.0.

`salt.states.firewall.check` (*name*, *port*=None, *\*\*kwargs*)

Checks if there is an open connection from the minion to the defined host on a specific port.

**name**

host name or ip address to test connection to

**port**

The port to test the connection on

**kwargs**

Additional parameters, parameters allowed are:

proto (tcp or udp) family (ipv4 or ipv6) timeout

```
testgoogle:
firewall.check:
- name: 'google.com'
- port: 80
- proto: 'tcp'
```

## 26.19.93 salt.states.firewalld

Management of firewalld

New in version 2015.8.0.

The following example applies changes to the public zone, blocks echo-reply and echo-request packets, does not set the zone to be the default, enables masquerading, and allows ports 22/tcp and 25/tcp. It will be applied permanently and directly before restart/reload.

```
public:
  firewalld.present:
    - name: public
    - block_icmp:
      - echo-reply
      - echo-request
    - default: False
    - masquerade: True
    - ports:
      - 22/tcp
      - 25/tcp
```

The following example applies changes to the public zone, enables masquerading and configures port forwarding TCP traffic from port 22 to 2222, and forwards TCP traffic from port 80 to 443 at 192.168.0.1.

```
my_zone:
  firewalld.present:
    - name: public
    - masquerade: True
    - port_fwd:
      - 22:2222:tcp
      - 80:443:tcp:192.168.0.1
```

The following example binds the public zone to interface eth0 and to all packets coming from the 192.168.1.0/24 subnet. It also removes the zone from all other interfaces or sources.

```
public:
  firewalld.present:
    - name: public
    - interfaces:
      - eth0
    - sources:
      - 192.168.1.0/24
```

Here, we define a new service that encompasses TCP ports 4505 4506:

```
saltmaster:
  firewalld.service:
    - name: saltmaster
    - ports:
      - 4505/tcp
      - 4506/tcp
```

To make this new service available in a zone, the following can be used, which would allow access to the salt master from the 10.0.0.0/8 subnet:

```

saltzone:
  firewalld.present:
    - name: saltzone
    - services:
      - saltmaster
    - sources:
      - 10.0.0.0/8

```

Another way of implementing the same rule above using rich rules is demonstrated here:

```

saltzone:
  firewalld.present:
    - name: saltzone
    - rich_rules:
      - rule service name="saltmaster" accept
    - sources:
      - 10.0.0.0/8

```

The format of rich rules is the same as:

```
firewall-cmd --list-rich-rules
```

with an example output of:

```

rule protocol value="icmp" accept
rule protocol value="ipv6-icmp" accept
rule service name="snmp" accept

```

**class** salt.states.firewalld.**ForwardingMapping**(*srcport, destport, protocol, destaddr*)

Represents a port forwarding statement mapping a local port to a remote port for a specific protocol (TCP or UDP)

**todict**()

Returns a pretty dictionary meant for command line output.

**salt.states.firewalld.present**(*name, block\_icmp=None, prune\_block\_icmp=False, default=None, masquerade=None, ports=None, prune\_ports=False, port\_fwd=None, prune\_port\_fwd=False, services=None, prune\_services=False, interfaces=None, prune\_interfaces=False, sources=None, prune\_sources=False, rich\_rules=None, prune\_rich\_rules=False*)

Ensure a zone has specific attributes.

**name**

The zone to modify.

**default**

[None] Set this zone as the default zone if True.

**masquerade**

[None] Enable or disable masquerade for a zone. By default it will not change it.

**block\_icmp**

[None] List of ICMP types to block in the zone.

**prune\_block\_icmp**

[False] If True, remove all but the specified block\_icmp from the zone.

**ports**

[None] List of ports to add to the zone.

**prune\_ports**

[False] If True, remove all but the specified ports from the zone.

**port\_fwd**

[None] List of port forwards to add to the zone.

**prune\_port\_fwd**

[False] If True, remove all but the specified port\_fwd from the zone.

**services**

[None] List of services to add to the zone.

**prune\_services**

[False] If True, remove all but the specified services from the zone. .. note:: Currently defaults to True for compatibility, but will be changed to False in a future release.

**interfaces**

[None] List of interfaces to add to the zone.

**prune\_interfaces**

[False] If True, remove all but the specified interfaces from the zone.

**sources**

[None] List of sources to add to the zone.

**prune\_sources**

[False] If True, remove all but the specified sources from the zone.

**rich\_rules**

[None] List of rich rules to add to the zone.

**prune\_rich\_rules**

[False] If True, remove all but the specified rich rules from the zone.

`salt.states.firewalld.service` (*name*, *ports=None*, *protocols=None*)

Ensure the service exists and encompasses the specified ports and protocols.

New in version 2016.11.0.

## 26.19.94 salt.states.gem

### Installation of Ruby modules packaged as gems

A state module to manage rubygems. Gems can be set up to be installed or removed. This module will use RVM or rbenv if they are installed. In that case, you can specify what ruby version and gemset to target.

**addressable:**

**gem.installed:**

- **user:** rvm
- **ruby:** jruby@jgemset

`salt.states.gem.installed` (*name*, *ruby=None*, *gem\_bin=None*, *user=None*, *version=None*, *rdoc=False*, *ri=False*, *pre\_releases=False*, *proxy=None*, *source=None*)

Make sure that a gem is installed.

**name**

The name of the gem to install

**ruby: None**

Only for RVM or rbenv installations: the ruby version and gemset to target.

**gem\_bin: None**

Custom gem command to run instead of the default. Use this to install gems to a non-default ruby install. If you are using rvm or rbenv use the ruby argument instead.

**user: None**

The user under which to run the gem command

New in version 0.17.0.

**version**

[None] Specify the version to install for the gem. Doesn't play nice with multiple gems at once

**rdoc**

[False] Generate RDoc documentation for the gem(s).

**ri**

[False] Generate RI documentation for the gem(s).

**pre\_releases**

[False] Install pre-release version of gem(s) if available.

**proxy**

[None] Use the specified HTTP proxy server for all outgoing traffic. Format: [http://hostname\[{}\]:port](http://hostname[{}]:port)

**source**

[None] Use the specified HTTP gem source server to download gem. Format: [http://hostname\[{}\]:port](http://hostname[{}]:port)

`salt.states.gem.removed` (*name*, *ruby=None*, *user=None*, *gem\_bin=None*)

Make sure that a gem is not installed.

**name**

The name of the gem to uninstall

**gem\_bin**

[None] Full path to gem binary to use.

**ruby**

[None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

**user: None**

The user under which to run the `gem` command

New in version 0.17.0.

`salt.states.gem.sources_add` (*name*, *ruby=None*, *user=None*)

Make sure that a gem source is added.

**name**

The URL of the gem source to be added

**ruby: None**

For RVM or rbenv installations: the ruby version and gemset to target.

**user: None**

The user under which to run the `gem` command

New in version 0.17.0.

`salt.states.gem.sources_remove` (*name*, *ruby=None*, *user=None*)

Make sure that a gem source is removed.

**name**

The URL of the gem source to be removed

**ruby: None**

For RVM or rbenv installations: the ruby version and gemset to target.

**user: None**

The user under which to run the `gem` command

New in version 0.17.0.

## 26.19.95 salt.states.git

States to manage git repositories and git configuration

---

**Important:** Before using git over ssh, make sure your remote host fingerprint exists in your `~/.ssh/known_hosts` file.

---

Changed in version 2015.8.8: This state module now requires git 1.6.5 (released 10 October 2009) or newer.

`salt.states.git.cloned` (*name*, *target*, *branch=None*, *user=None*, *password=None*, *identity=None*, *https\_user=None*, *https\_pass=None*, *output\_encoding=None*)

New in version 2018.3.3,2019.2.0.

Ensure that a repository has been cloned to the specified target directory. If not, clone that repository. No fetches will be performed once cloned.

**name**

Address of the remote repository

**target**

Name of the target directory where repository should be cloned

**branch**

Remote branch to check out. If unspecified, the default branch (i.e. the one to the remote HEAD points) will be checked out.

---

**Note:** The local branch name will match the remote branch name. If the branch name is changed, then that branch will be checked out locally, but keep in mind that remote repository will not be fetched. If your use case requires that you keep the clone up to date with the remote repository, then consider using `git.latest`.

---

**user**

User under which to run git commands. By default, commands are run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

**identity**

Path to a private key to use for ssh URLs. Works the same way as in `git.latest`, see that state's documentation for more information.

**https\_user**

HTTP Basic Auth username for HTTPS (only) clones

**https\_pass**

HTTP Basic Auth password for HTTPS (only) clones

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

`salt.states.git.config_set` (*name*, *value=None*, *multivar=None*, *repo=None*, *user=None*, *password=None*, *output\_encoding=None*, *\*\*kwargs*)

New in version 2014.7.0.

Changed in version 2015.8.0: Renamed from `git.config` to `git.config_set`. For earlier versions, use `git.config`.

Ensure that a config value is set to the desired value(s)

**name**

Name of the git config value to set

**value**

Set a single value for the config item

**multivar**

Set multiple values for the config item

---

**Note:** The order matters here, if the same parameters are set but in a different order, they will be removed and replaced in the order specified.

---

New in version 2015.8.0.

**repo**

Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.

**user**

User under which to run git commands. By default, the commands are run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**global**

[False] If `True`, this will set a global git config option

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

**Local Config Example:**

```
# Single value
mylocalrepo:
  git.config_set:
    - name: user.email
    - value: foo@bar.net
    - repo: /path/to/repo

# Multiple values
mylocalrepo:
  git.config_set:
    - name: mysection.myattribute
    - multivar:
      - foo
      - bar
      - baz
```

(continues on next page)

(continued from previous page)

```
- repo: /path/to/repo
```

Global Config Example (User ``foo``):

```
mylocalrepo:
  git.config_set:
    - name: user.name
    - value: Foo Bar
    - user: foo
    - global: True
```

```
salt.states.git.config_unset(name, value_regex=None, repo=None, user=None, password=None,
                             output_encoding=None, **kwargs)
```

New in version 2015.8.0.

Ensure that the named config key is not present

**name**

The name of the configuration key to unset. This value can be a regex, but the regex must match the entire key name. For example, `foo\.` would not match all keys in the `foo` section, it would be necessary to use `foo\..+` to do so.

**value\_regex**

Regex indicating the values to unset for the matching key(s)

---

**Note:** This option behaves differently depending on whether or not `all` is set to `True`. If it is, then all values matching the regex will be deleted (this is the only way to delete multiple values from a multivar). If `all` is set to `False`, then this state will fail if the regex matches more than one value in a multivar.

---

**all**

[False] If `True`, unset all matches

**repo**

Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.

**user**

User under which to run git commands. By default, commands are run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**global**

[False] If `True`, this will set a global git config option

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

**Examples:**

```

# Value matching 'baz'
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - value_regex: 'baz'
    - repo: /path/to/repo

# Ensure entire multivar is unset
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - all: True

# Ensure all variables in 'foo' section are unset, including multivars
mylocalrepo:
  git.config_unset:
    - name: 'foo\..+'
    - all: True

# Ensure that global config value is unset
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - global: True

```

`salt.states.git.detached` (*name*, *rev*, *target*, *remote*='origin', *user*=None, *password*=None, *force\_clone*=False, *force\_checkout*=False, *fetch\_remote*=True, *hard\_reset*=False, *submodules*=False, *identity*=None, *https\_user*=None, *https\_pass*=None, *output\_encoding*=None, *\*\*kwargs*)

New in version 2016.3.0.

Make sure a repository is cloned to the given target directory and is a detached HEAD checkout of the commit ID resolved from *rev*.

**name**

Address of the remote repository.

**rev**

The branch, tag, or commit ID to checkout after clone. If a branch or tag is specified it will be resolved to a commit ID and checked out.

**target**

Name of the target directory where repository is about to be cloned.

**remote**

[origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

**user**

User under which to run git commands. By default, commands are run by the user under which the minion is running.

**password**

Windows only. Required when specifying *user*. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**force\_clone**

[False] If the *target* directory exists and is not a git repository, then this state will fail. Set this argument to True to remove the contents of the target directory and clone the repo into it.

**force\_checkout**

[False] When checking out the revision ID, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.

**fetch\_remote**

[True] If `False` a fetch will not be performed and only local refs will be reachable.

**hard\_reset**

[False] If `True` a hard reset will be performed before the checkout and any uncommitted modifications to the working directory will be discarded. Untracked files will remain in place.

---

**Note:** Changes resulting from a hard reset will not trigger requisites.

---

**submodules**

[False] Update submodules

**identity**

A path on the minion (or a SaltStack fileserver URL, e.g. `salt://path/to/identity_file`) to a private key to use for SSH authentication.

**https\_user**

HTTP Basic Auth username for HTTPS (only) clones

**https\_pass**

HTTP Basic Auth password for HTTPS (only) clones

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

```

salt.states.git.latest(name, target, rev='HEAD', branch=None, user=None, password=None,
                       update_head=True, force_checkout=False, force_clone=False, force_fetch=False,
                       force_reset=False, submodules=False, bare=False, mirror=False, remote='origin',
                       fetch_tags=True, sync_tags=True, depth=None, identity=None, https_user=None,
                       https_pass=None, refspec_branch='*', refspec_tag='*', output_encoding=None,
                       **kwargs)

```

Make sure the repository is cloned to the given directory and is up-to-date.

**name**

Address of the remote repository, as passed to `git clone`

---

**Note:** From the [Git documentation](#), there are two URL formats supported for SSH authentication. The below two examples are equivalent:

```

# ssh:// URL
ssh://user@server/project.git

# SCP-like syntax
user@server:project.git

```

A common mistake is to use an `ssh:// URL`, but with a colon after the domain instead of a slash. This is invalid syntax in Git, and will therefore not work in Salt. When in doubt, confirm that a `git clone` works for the URL before using it in Salt.

It has been reported by some users that SCP-like syntax is incompatible with git repos hosted on [Atlas-](#)

sian Stash/BitBucket Server. In these cases, it may be necessary to use `ssh://` URLs for SSH authentication.

---

**rev**

[HEAD] The remote branch, tag, or revision ID to checkout after clone / before update. If specified, then Salt will also ensure that the tracking branch is set to `<remote>/<rev>`, unless `rev` refers to a tag or SHA1, in which case Salt will ensure that the tracking branch is unset.

If `rev` is not specified, it will be assumed to be HEAD, and Salt will not manage the tracking branch at all.

Changed in version 2015.8.0: If not specified, `rev` now defaults to the remote repository's HEAD.

**target**

Name of the target directory where repository is about to be cloned

**branch**

Name of the local branch into which to checkout the specified `rev`. If not specified, then Salt will not care what branch is being used locally and will just use whatever branch is currently there.

New in version 2015.8.0.

---

**Note:** If this argument is not specified, this means that Salt will not change the local branch if the repository is reset to another branch/tag/SHA1. For example, assume that the following state was run initially:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
```

This would have cloned the HEAD of that repo (since a `rev` wasn't specified), and because `branch` is not specified, the branch in the local clone at `/var/www/foo` would be whatever the default branch is on the remote repository (usually `master`, but not always). Now, assume that it becomes necessary to switch this checkout to the `dev` branch. This would require `rev` to be set, and probably would also require `force_reset` to be enabled:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
    - force_reset: True
```

The result of this state would be to perform a hard-reset to `origin/dev`. Since `branch` was not specified though, while `/var/www/foo` would reflect the contents of the remote repo's `dev` branch, the local branch would still remain whatever it was when it was cloned. To make the local branch match the remote one, set `branch` as well, like so:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
```

(continues on next page)

(continued from previous page)

- **branch**: dev
- **force\_reset**: True

This may seem redundant, but Salt tries to support a wide variety of use cases, and doing it this way allows for the use case where the local branch doesn't need to be strictly managed.

**user**

Local system user under which to run git commands. By default, commands are run by the user under which the minion is running.

**Note:** This is not to be confused with the username for http(s)/SSH authentication.

New in version 0.17.0.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**update\_head**

[True] If set to `False`, then the remote repository will be fetched (if necessary) to ensure that the commit to which `rev` points exists in the local checkout, but no changes will be made to the local HEAD.

New in version 2015.8.3.

**force\_checkout**

[False] When checking out the local branch, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.

**force\_clone**

[False] If the `target` directory exists and is not a git repository, then this state will fail. Set this argument to `True` to remove the contents of the target directory and clone the repo into it.

**force\_fetch**

[False] If a fetch needs to be performed, non-fast-forward fetches will cause this state to fail. Set this argument to `True` to force the fetch even if it is a non-fast-forward update.

New in version 2015.8.0.

**force\_reset**

[False] If the update is not a fast-forward, this state will fail. Set this argument to `True` to force a hard-reset to the remote revision in these cases.

Changed in version 2019.2.0: This option can now be set to `remote-changes`, which will instruct Salt not to discard local changes if the repo is up-to-date with the remote repository.

**submodules**

[False] Update submodules on clone or branch change

**bare**

[False] Set to `True` if the repository is to be a bare clone of the remote repository.

**mirror**

Set to `True` if the repository is to be a mirror of the remote repository. This implies that `bare` set to `True`, and thus is incompatible with `rev`.

**remote**

[origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

**fetch\_tags**

[True] If `True`, then when a fetch is performed all tags will be fetched, even those which are not reachable by any branch on the remote.

**sync\_tags**

[True] If True, then Salt will delete tags which exist in the local clone but are not found on the remote repository.

New in version 2018.3.4.

**depth**

Defines depth in history when git a clone is needed in order to ensure latest. E.g. `depth: 1` is useful when deploying from a repository with a long history. Use `rev` to specify branch or tag. This is not compatible with revision IDs.

Changed in version 2019.2.0: This option now supports tags as well as branches, on Git 1.8.0 and newer.

**identity**

Path to a private key to use for ssh URLs. This can be either a single string, or a list of strings. For example:

```
# Single key
git@github.com:user/repo.git:
  git.latest:
    - user: deployer
    - identity: /home/deployer/.ssh/id_rsa

# Two keys
git@github.com:user/repo.git:
  git.latest:
    - user: deployer
    - identity:
      - /home/deployer/.ssh/id_rsa
      - /home/deployer/.ssh/id_rsa_alternate
```

If multiple keys are specified, they will be tried one-by-one in order for each git command which needs to authenticate.

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the [sshd\(8\)](#) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Changed in version 2016.3.0: Key can now be specified as a SaltStack fileserver URL (e.g. `salt://path/to/identity_file`).

**https\_user**

HTTP Basic Auth username for HTTPS (only) clones

New in version 2015.5.0.

**https\_pass**

HTTP Basic Auth password for HTTPS (only) clones

New in version 2015.5.0.

**refspec\_branch**

[\*] A glob expression defining which branches to retrieve when fetching. See [git-fetch\(1\)](#) for more information on how refsspecs work.

New in version 2017.7.0.

**refspec\_tag**

[\*] A glob expression defining which tags to retrieve when fetching. See `git-fetch(1)` for more information on how refspecs work.

New in version 2017.7.0.

#### **output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

**Note:** Clashing ID declarations can be avoided when including different branches from the same git repository in the same SLS file by using the `name` argument. The example below checks out the `gh-pages` and `gh-pages-prod` branches from the same repository into separate directories. The example also sets up the `ssh_known_hosts` ssh key required to perform the git checkout.

```
gitlab.example.com:
  ssh_known_hosts:
    - present
    - user: root
    - enc: ecdsa
    - fingerprint: 4e:94:b0:54:c1:5b:29:a2:70:0e:e1:a3:51:ee:ee:e3

git-website-staging:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages
    - target: /usr/share/nginx/staging
    - identity: /root/.ssh/website_id_rsa
    - require:
      - pkg: git
      - ssh_known_hosts: gitlab.example.com

git-website-staging:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages
    - target: /usr/share/nginx/staging
    - identity: salt://website/id_rsa
    - require:
      - pkg: git
      - ssh_known_hosts: gitlab.example.com

git-website-prod:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages-prod
    - target: /usr/share/nginx/prod
    - identity: /root/.ssh/website_id_rsa
    - require:
      - pkg: git
```

(continues on next page)

(continued from previous page)

```
- ssh_known_hosts: gitlab.example.com
```

```
salt.states.git.present(name, force=False, bare=True, template=None, separate_git_dir=None,
                        shared=None, user=None, password=None, output_encoding=None)
```

Ensure that a repository exists in the given directory

**Warning:** If the minion has Git 2.5 or later installed, `name` points to a `worktree`, and `force` is set to `True`, then the `worktree` will be deleted. This has been corrected in Salt 2015.8.0.

**name**

Path to the directory

Changed in version 2015.8.0: This path must now be absolute

**force**

[False] If `True`, and if `name` points to an existing directory which does not contain a git repository, then the contents of that directory will be recursively removed and a new repository will be initialized in its place.

**bare**

[True] If `True`, and a repository must be initialized, then the repository will be a bare repository.

---

**Note:** This differs from the default behavior of `git.init`, make sure to set this value to `False` if a bare repo is not desired.

---

**template**

If a new repository is initialized, this argument will specify an alternate template directory.

New in version 2015.8.0.

**separate\_git\_dir**

If a new repository is initialized, this argument will specify an alternate `$GIT_DIR`

New in version 2015.8.0.

**shared**

Set sharing permissions on git repo. See `git-init(1)` for more details.

New in version 2015.5.0.

**user**

User under which to run git commands. By default, commands are run by the user under which the minion is running.

New in version 0.17.0.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**output\_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

## 26.19.96 salt.states.github

Github User State Module

New in version 2016.3.0.

This state is used to ensure presence of users in the Organization.

```
ensure user test is present in github:
  github.present:
    - name: 'Example TestUser1'
    - email: example@domain.com
    - username: 'gitexample'
```

`salt.states.github.absent(name, profile='github', **kwargs)`

Ensure a github user is absent

```
ensure user test is absent in github:
  github.absent:
    - name: 'Example TestUser1'
    - email: example@domain.com
    - username: 'gitexample'
```

The following parameters are required:

**name**

Github handle of the user in organization

`salt.states.github.present(name, profile='github', **kwargs)`

Ensure a user is present

```
ensure user test is present in github:
  github.present:
    - name: 'gitexample'
```

The following parameters are required:

**name**

This is the github handle of the user in the organization

`salt.states.github.repo_absent(name, profile='github', **kwargs)`

Ensure a repo is absent.

Example:

```
ensure repo test is absent in github:
  github.repo_absent:
    - name: 'test'
```

The following parameters are required:

**name**

This is the name of the repository in the organization.

New in version 2016.11.0.

`salt.states.github.repo_present` (*name*, *description=None*, *homepage=None*, *private=None*, *has\_issues=None*, *has\_wiki=None*, *has\_downloads=None*, *auto\_init=False*, *gitignore\_template=None*, *license\_template=None*, *teams=None*, *profile='github'*, *\*\*kwargs*)

Ensure a repository is present

**name**

This is the name of the repository.

**description**

The description of the repository.

**homepage**

The URL with more information about the repository.

**private**

The visibility of the repository. Note that private repositories require a paid GitHub account.

**has\_issues**

Whether to enable issues for this repository.

**has\_wiki**

Whether to enable the wiki for this repository.

**has\_downloads**

Whether to enable downloads for this repository.

**auto\_init**

Whether to create an initial commit with an empty README.

**gitignore\_template**

The desired language or platform for a .gitignore, e.g "Haskell".

**license\_template**

The desired LICENSE template to apply, e.g "mit" or "mozilla".

**teams**

The teams for which this repo should belong to, specified as a dict of team name to permission ('pull', 'push' or 'admin').

New in version 2017.7.0.

Example:

```
Ensure repo my-repo is present in github:
github.repo_present:
  - name: 'my-repo'
  - description: 'My very important repository'
```

New in version 2016.11.0.

`salt.states.github.team_absent` (*name*, *profile='github'*, *\*\*kwargs*)

Ensure a team is absent.

Example:

```
ensure team test is present in github:
github.team_absent:
  - name: 'test'
```

The following parameters are required:

**name**

This is the name of the team in the organization.

New in version 2016.11.0.

`salt.states.github.team_present` (*name*, *description=None*, *repo\_names=None*, *privacy='secret'*, *permission='pull'*, *members=None*, *enforce\_mfa=False*, *no\_mfa\_grace\_seconds=0*, *profile='github'*, *\*\*kwargs*)

Ensure a team is present

**name**

This is the name of the team in the organization.

**description**

The description of the team.

**repo\_names**

The names of repositories to add the team to.

**privacy**

The level of privacy for the team, can be 'secret' or 'closed'. Defaults to secret.

**permission**

The default permission for new repositories added to the team, can be 'pull', 'push' or 'admin'. Defaults to pull.

**members**

The members belonging to the team, specified as a dict of member name to optional configuration. Options include 'enforce\_mfa\_from' and 'mfa\_exempt'.

**enforce\_mfa**

Whether to enforce MFA requirements on members of the team. If True then all members without *mfa\_exempt: True* configured will be removed from the team. Note that *no\_mfa\_grace\_seconds* may be set to allow members a grace period.

**no\_mfa\_grace\_seconds**

The number of seconds of grace time that a member will have to enable MFA before being removed from the team. The grace period will begin from *enforce\_mfa\_from* on the member configuration, which defaults to 1970/01/01.

Example:

```

Ensure team test is present in github:
  github.team_present:
    - name: 'test'
    - members:
      user1: {}
      user2: {}

Ensure team test_mfa is present in github:
  github.team_present:
    - name: 'test_mfa'
    - members:
      user1:
        enforce_mfa_from: 2016/06/15
    - enforce_mfa: True
  
```

New in version 2016.11.0.

## 26.19.97 salt.states.glance\_image

### Management of OpenStack Glance Images

New in version 2018.3.0.

**depends**

shade

**configuration**

see *salt.modules.glanceng* for setup instructions

## Example States

```
create image:
  glance_image.present:
    - name: cirros
    - filename: cirros.raw
    - image_format: raw

delete image:
  glance_image.absent:
    - name: cirros
```

```
salt.states.glance_image.absent(name, auth=None)
```

Ensure image does not exist

**name**

Name of the image

```
salt.states.glance_image.present(name, auth=None, **kwargs)
```

Ensure image exists and is up-to-date

**name**

Name of the image

**enabled**

Boolean to control if image is enabled

**description**

An arbitrary description of the image

## 26.19.98 salt.states.glassfish

Manage Glassfish/Payara server .. versionadded:: 2016.11.0

Management of glassfish using its RESTful API You can setup connection parameters like this

```
- server:
  - ssl: true
  - url: localhost
  - port: 4848
  - user: admin
  - password: changeit
```

```
salt.states.glassfish.connection_factory_absent(name, both=True, server=None)
```

Ensures the transaction factory is absent.

**name**

Name of the connection factory

**both**

Delete both the pool and the resource, defaults to true

```
salt.states.glassfish.connection_factory_present(name, restype='connection_factory',
description="", enabled=True, min_size=1,
max_size=250, resize_quantity=2,
idle_timeout=300, wait_timeout=60,
reconnect_on_failure=False,
transaction_support="",
connection_validation=False, server=None)
```

Ensures that the Connection Factory is present

**name**  
Name of the connection factory

**restype**  
Type of the connection factory, can be either `connection_factory`, `queue_connection_factory` or `topic_connection_factory`, defaults to `connection_factory`

**description**  
Description of the connection factory

**enabled**  
Is the connection factory enabled? defaults to `true`

**min\_size**  
Minimum and initial number of connections in the pool, defaults to 1

**max\_size**  
Maximum number of connections that can be created in the pool, defaults to 250

**resize\_quantity**  
Number of connections to be removed when `idle_timeout` expires, defaults to 2

**idle\_timeout**  
Maximum time a connection can remain idle in the pool, in seconds, defaults to 300

**wait\_timeout**  
Maximum time a caller can wait before timeout, in seconds, defaults to 60

**reconnect\_on\_failure**  
Close all connections and reconnect on failure (or reconnect only when used), defaults to `false`

**transaction\_support**  
Level of transaction support, can be either `XATransaction`, `LocalTransaction` or `NoTransaction`

**connection\_validation**  
Connection validation is required, defaults to `false`

`salt.states.glassfish.destination_absent`(*name*, *server=None*)

Ensures that the JMS Destination doesn't exist

**name**  
Name of the JMS Destination

`salt.states.glassfish.destination_present`(*name*, *physical*, *restype='queue'*, *description=""*, *enabled=True*, *server=None*)

Ensures that the JMS Destination Resource (queue or topic) is present

**name**  
The JMS Queue/Topic name

**physical**  
The Physical destination name

**restype**  
The JMS Destination resource type, either `queue` or `topic`, defaults is `queue`

**description**  
A description of the resource

**enabled**  
Defaults to `True`

`salt.states.glassfish.jdbc_datasource_absent`(*name*, *both=True*, *server=None*)

Ensures the JDBC Datasource doesn't exist

**name**  
Name of the datasource

**both**  
Delete both the pool and the resource, defaults to `true`

```
salt.states.glassfish.jdbc_datasource_present(name, description="", enabled=True,
                                             restype='datasource', vendor='mysql', sql_url="",
                                             sql_user="", sql_password="", min_size=8,
                                             max_size=32, resize_quantity=2,
                                             idle_timeout=300, wait_timeout=60,
                                             non_transactional=False,
                                             transaction_isolation="",
                                             isolation_guaranteed=True, server=None)
```

Ensures that the JDBC Datasource exists

**name**

Name of the datasource

**description**

Description of the datasource

**enabled**

Is the datasource enabled? defaults to true

**restype**

Resource type, can be datasource, xa\_datasource, connection\_pool\_datasource or driver, defaults to datasource

**vendor**

SQL Server type, currently supports mysql, postgresql and mssql, defaults to mysql

**sql\_url**

URL of the server in jdbc form

**sql\_user**

Username for the server

**sql\_password**

Password for that username

**min\_size**

Minimum and initial number of connections in the pool, defaults to 8

**max\_size**

Maximum number of connections that can be created in the pool, defaults to 32

**resize\_quantity**

Number of connections to be removed when idle\_timeout expires, defaults to 2

**idle\_timeout**

Maximum time a connection can remain idle in the pool, in seconds, defaults to 300

**wait\_timeout**

Maximum time a caller can wait before timeout, in seconds, defaults to 60

**non\_transactional**

Return non-transactional connections

**transaction\_isolation**

Defaults to the JDBC driver default

**isolation\_guaranteed**

All connections use the same isolation level

```
salt.states.glassfish.system_properties_absent(name, server=None)
```

Ensures that the system property doesn't exist

**name**

Name of the system property

```
salt.states.glassfish.system_properties_present(server=None, **kwargs)
```

Ensures that the system properties are present

**properties**

The system properties

## 26.19.99 salt.states.glusterfs

Manage GlusterFS pool.

`salt.states.glusterfs.add_volume_bricks`(*name*, *bricks*)

Add brick(s) to an existing volume

**name**

Volume name

**bricks**

List of bricks to add to the volume

```
myvolume:
  glusterfs.add_volume_bricks:
    - bricks:
      - host1:/srv/gluster/drive1
      - host2:/srv/gluster/drive2

Replicated Volume:
  glusterfs.add_volume_bricks:
    - name: volume2
    - bricks:
      - host1:/srv/gluster/drive2
      - host2:/srv/gluster/drive3
```

`salt.states.glusterfs.max_op_version`(*name*)

New in version 2019.2.0.

Add brick(s) to an existing volume

**name**

Volume name

```
myvolume:
  glusterfs.max_op_version:
    - name: volume1
    - version: 30707
```

`salt.states.glusterfs.op_version`(*name*, *version*)

New in version 2019.2.0.

Add brick(s) to an existing volume

**name**

Volume name

**version**

Version to which the cluster.op-version should be set

```
myvolume:
  glusterfs.op_version:
    - name: volume1
    - version: 30707
```

`salt.states.glusterfs.peered`(*name*)

Check if node is peered.

**name**

The remote host with which to peer.

```
peer-cluster:
  glusterfs.peered:
    - name: two

peer-clusters:
  glusterfs.peered:
    - names:
      - one
      - two
      - three
      - four
```

`salt.states.glusterfs.started`(*name*)

Check if volume has been started  
**name**  
 name of the volume

```
mycluster:
  glusterfs.started: []
```

`salt.states.glusterfs.volume_present`(*name*, *bricks*, *stripe=False*, *replica=False*, *device\_vg=False*, *transport='tcp'*, *start=False*, *force=False*, *arbiter=False*)

Ensure that the volume exists  
**name**  
 name of the volume  
**bricks**  
 list of brick paths  
**replica**  
 replica count for volume  
**arbiter**  
 use every third brick as arbiter (metadata only)  
 New in version 2019.2.0.  
**start**  
 ensure that the volume is also started

```
myvolume:
  glusterfs.volume_present:
    - bricks:
      - host1:/srv/gluster/drive1
      - host2:/srv/gluster/drive2
```

```
Replicated Volume:
  glusterfs.volume_present:
    - name: volume2
    - bricks:
      - host1:/srv/gluster/drive2
      - host2:/srv/gluster/drive3
    - replica: 2
    - start: True
```

```
Replicated Volume with arbiter brick:
  glusterfs.volume_present:
```

(continues on next page)

(continued from previous page)

- **name:** volume3
- **bricks:**
  - host1:/srv/gluster/drive2
  - host2:/srv/gluster/drive3
  - host3:/srv/gluster/drive4
- **replica:** 3
- **arbiter:** True
- **start:** True

## 26.19.100 salt.states.gnomedesktop

### Configuration of the GNOME desktop

Control the GNOME settings

```
localdesktop_wm_prefs:
  gnomedesktop.wm_preferences:
    - user: username
    - audible_bell: false
    - action_double_click_titlebar: 'toggle-maximize'
    - visual_bell: true
    - num_workspaces: 6
localdesktop_lockdown:
  gnomedesktop.desktop_lockdown:
    - user: username
    - disable_user_switching: true
localdesktop_interface:
  gnomedesktop.desktop_interface:
    - user: username
    - clock_show_date: true
    - clock_format: 12h
```

`salt.states.gnomedesktop.desktop_interface` (*name*, *user*=None, *automatic\_mnemonics*=None, *buttons\_have\_icons*=None, *can\_change\_accels*=None, *clock\_format*=None, *clock\_show\_date*=None, *clock\_show\_seconds*=None, *cursor\_blink*=None, *cursor\_blink\_time*=None, *cursor\_blink\_timeout*=None, *cursor\_size*=None, *cursor\_theme*=None, *document\_font\_name*=None, *enable\_animations*=None, *font\_name*=None, *gtk\_color\_palette*=None, *gtk\_color\_scheme*=None, *gtk\_im\_module*=None, *gtk\_im\_preedit\_style*=None, *gtk\_im\_status\_style*=None, *gtk\_key\_theme*=None, *gtk\_theme*=None, *gtk\_timeout\_initial*=None, *gtk\_timeout\_repeat*=None, *icon\_theme*=None, *menubar\_accel*=None, *menubar\_detachable*=None, *menus\_have\_icons*=None, *menus\_have\_tearoff*=None, *monospace\_font\_name*=None, *show\_input\_method\_menu*=None, *show\_unicode\_menu*=None, *text\_scaling\_factor*=None, *toolbar\_detachable*=None, *toolbar\_icons\_size*=None, *toolbar\_style*=None, *toolkit\_accessibility*=None, *\*\*kwargs*)

`desktop_interface`: sets values in the `org.gnome.desktop.interface` schema

`salt.states.gnomedesktop.desktop_lockdown` (*name*, *user*=None, *disable\_application\_handlers*=None, *disable\_command\_line*=None, *disable\_lock\_screen*=None, *disable\_log\_out*=None, *disable\_print\_setup*=None, *disable\_printing*=None, *disable\_save\_to\_disk*=None, *disable\_user\_switching*=None, *user\_administration\_disabled*=None, *\*\*kwargs*)

`desktop_lockdown`: sets values in the `org.gnome.desktop.lockdown` schema

`salt.states.gnomedesktop.wm_preferences` (*name*, *user*=None, *action\_double\_click\_titlebar*=None, *action\_middle\_click\_titlebar*=None, *action\_right\_click\_titlebar*=None, *application\_based*=None, *audible\_bell*=None, *auto\_raise*=None, *auto\_raise\_delay*=None, *button\_layout*=None, *disable\_workarounds*=None, *focus\_mode*=None, *focus\_new\_windows*=None, *mouse\_button\_modifier*=None, *num\_workspaces*=None, *raise\_on\_click*=None, *resize\_with\_right\_button*=None, *theme*=None, *titlebar\_font*=None, *titlebar\_uses\_system\_font*=None, *visual\_bell*=None, *visual\_bell\_type*=None, *workspace\_names*=None, *\*\*kwargs*)

`wm_preferences`: sets values in the `org.gnome.desktop.wm.preferences` schema

## 26.19.101 salt.states.gpg

### Manage GPG keychains

New in version 2016.3.0.

`salt.states.gpg.absent` (*name, keys=None, user=None, gnupghome=None, keyring=None, keyring\_absent\_if\_empty=False, \*\*kwargs*)

Ensure a GPG public key is absent from the keychain.

**name**

The key ID of the GPG public key.

**keys**

The key ID or key IDs to remove from the GPG keychain.

**user**

Remove GPG keys from the specified user's keychain.

**gnupghome**

Override GnuPG home directory.

**keyring**

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

**keyring\_absent\_if\_empty**

Make sure to not leave behind an empty keyring file if `keyring` was specified. Defaults to false.

New in version 3007.0.

`salt.states.gpg.present` (*name, keys=None, user=None, keyserver=None, gnupghome=None, trust=None, keyring=None, \*\*kwargs*)

Ensure a GPG public key is present in the GPG keychain.

**name**

The key ID of the GPG public key.

**keys**

The key ID or key IDs to add to the GPG keychain.

**user**

Add GPG keys to the specified user's keychain.

**keyserver**

The keyserver to retrieve the keys from.

**gnupghome**

Override GnuPG home directory.

**trust**

Trust level for the key in the keychain, ignored by default. Valid trust levels: `expired`, `unknown`, `not_trusted`, `marginally`, `fully`, `ultimately`

**keyring**

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

## 26.19.102 salt.states.grafana

Manage Grafana Dashboards

This module uses `elasticsearch`, which can be installed via `package`, or `pip`.

You can specify `elasticsearch` hosts directly to the module, or you can use an `elasticsearch` profile via pillars:

### mygrafanaprofile:

#### hosts:

- es1.example.com:9200
- es2.example.com:9200

**index:** grafana-dash

```
# Basic usage (uses default pillar profile key 'grafana')
```

**Ensure myservice dashboard is managed:**

#### grafana.dashboard\_present:

- **name:** myservice
- **dashboard\_from\_pillar:** default
- **rows\_from\_pillar:**
  - systemhealth
  - requests

```
# Passing hosts in
```

**Ensure myservice dashboard is managed:**

#### grafana.dashboard\_present:

- **name:** myservice
- **dashboard\_from\_pillar:** default
- **rows:**
  - **collapse:** false
  - editable:** true
  - height:** 150px
  - title:** System Health
  - panels:**
    - **aliasColors:** {}
    - id:** 200000
    - annotate:**
      - enable:** false
    - bars:** false
    - datasource:** null
    - editable:** true
    - error:** false
    - fill:** 7
    - grid:**
      - leftMax:** 100
      - leftMin:** null
      - rightMax:** null
      - rightMin:** null
      - threshold1:** 60
      - threshold1Color:** rgb(216, 27, 27)
      - threshold2:** null
      - threshold2Color:** rgba(234, 112, 112, 0.22)
      - leftYAxisLabel:** ''
    - legend:**

    from: now-2h
    to: now
  timezone: browser
  - rows_from_pillars:
    - systemhealth
    - requests
  - profile: mygrafanaprofile
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing

dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

`salt.states.grafana.dashboard_absent` (*name*, *hosts=None*, *profile='grafana'*)

Ensure the named grafana dashboard is deleted.

**name**

Name of the grafana dashboard.

**profile**

A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

`salt.states.grafana.dashboard_present` (*name*, *dashboard=None*, *dashboard\_from\_pillar=None*, *rows=None*, *rows\_from\_pillar=None*, *profile='grafana'*)

Ensure the grafana dashboard exists and is managed.

**name**

Name of the grafana dashboard.

**dashboard**

A dict that defines a dashboard that should be managed.

**dashboard\_from\_pillar**

A pillar key that contains a grafana dashboard dict. Mutually exclusive with `dashboard`.

**rows**

A list of grafana rows.

**rows\_from\_pillar**

A list of pillar keys that contain lists of grafana dashboard rows. Rows defined in the pillars will be appended to the rows defined in the state.

**profile**

A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

### 26.19.103 salt.states.grafana4\_dashboard

Manage Grafana v4.0 Dashboards

New in version 2017.7.0.

**configuration**

This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

**Ensure minimum dashboard is managed:**

```
grafana4_dashboard.present:
- name: insightful-dashboard
- base_dashboards_from_pillar:
  - default_dashboard
- base_rows_from_pillar:
  - default_row
- base_panels_from_pillar:
  - default_panel
- dashboard:
  rows:
  - title: Usage
  panels:
  - targets:
    - target: alias(constantLine(50), 'max')
    title: Imaginary
    type: graph
```

`salt.states.grafana4_dashboard.absent` (*name*, *orgname=None*, *profile='grafana'*)

Ensure the named grafana dashboard is absent.

**name**

Name of the grafana dashboard.

**orgname**

Name of the organization in which the dashboard should be present.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

`salt.states.grafana4_dashboard.present` (*name*, *base\_dashboards\_from\_pillar=None*,  
*base\_panels\_from\_pillar=None*,  
*base\_rows\_from\_pillar=None*, *dashboard=None*,  
*orgname=None*, *profile='grafana'*)

Ensure the grafana dashboard exists and is managed.

**name**

Name of the grafana dashboard.

**base\_dashboards\_from\_pillar**

A pillar key that contains a list of dashboards to inherit from

**base\_panels\_from\_pillar**

A pillar key that contains a list of panels to inherit from

**base\_rows\_from\_pillar**

A pillar key that contains a list of rows to inherit from

**dashboard**

A dict that defines a dashboard that should be managed.

**orgname**

Name of the organization in which the dashboard should be present.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

## 26.19.104 salt.states.grafana4\_datasource

Manage Grafana v4.0 data sources

New in version 2017.7.0.

### configuration

This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

The behavior of this module is to create data sources if the do not exists, and to update data sources if the already exists.

### Ensure influxdb data source is present:

```
grafana4_datasource.present:
- name: influxdb
- type: influxdb
- url: http://localhost:8086
- access: proxy
- basic_auth: true
- basic_auth_user: myuser
- basic_auth_password: mypass
- is_default: true
```

`salt.states.grafana4_datasource.absent` (*name, orgname=None, profile='grafana'*)

Ensure that a data source is present.

#### name

Name of the data source to remove.

#### orgname

Name of the organization from which the data source should be absent.

#### profile

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

`salt.states.grafana4_datasource.present` (*name, type, url, access=None, user=None, password=None, database=None, basic\_auth=None, basic\_auth\_user=None, basic\_auth\_password=None, tls\_auth=None, json\_data=None, is\_default=None, with\_credentials=None, type\_logo\_url=None, orgname=None, profile='grafana'*)

Ensure that a data source is present.

<b>name</b>	Name of the data source.
<b>type</b>	Type of the datasource ('graphite', 'influxdb' etc.).
<b>access</b>	Use proxy or direct. Default: proxy
<b>url</b>	The URL to the data source API.
<b>user</b>	Optional - user to authenticate with the data source.
<b>password</b>	Optional - password to authenticate with the data source.
<b>database</b>	Optional - database to use with the data source.
<b>basic_auth</b>	Optional - set to True to use HTTP basic auth to authenticate with the data source.
<b>basic_auth_user</b>	Optional - HTTP basic auth username.
<b>basic_auth_password</b>	Optional - HTTP basic auth password.
<b>json_data</b>	Optional - additional json data to post (eg. "timeInterval").
<b>is_default</b>	Optional - set data source as default.
<b>with_credentials</b>	Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.
<b>type_logo_url</b>	Optional - Logo to use for this datasource.
<b>orgname</b>	Name of the organization in which the data source should be present.
<b>profile</b>	Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

### 26.19.105 salt.states.grafana4\_org

Manage Grafana v4.0 orgs

New in version 2017.7.0.

#### configuration

This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:  
  grafana_url: http://grafana.localhost  
  grafana_user: admin  
  grafana_password: admin  
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

**Ensure foobar org is present:****grafana4\_org.present:**

- **name:** foobar
- **theme:** ""
- **home\_dashboard\_id:** 0
- **timezone:** "utc"
- **address1:** ""
- **address2:** ""
- **city:** ""
- **zip\_code:** ""
- **state:** ""
- **country:** ""

`salt.states.grafana4_org.absent` (*name*, *profile*='grafana')

Ensure that a org is present.

**name**

Name of the org to remove.

**profile**

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

`salt.states.grafana4_org.present` (*name*, *users*=None, *theme*=None, *home\_dashboard\_id*=None, *timezone*=None, *address1*=None, *address2*=None, *city*=None, *zip\_code*=None, *address\_state*=None, *country*=None, *profile*='grafana')

Ensure that an organization is present.

**name**

Name of the org.

**users**

Optional - Dict of user/role associated with the org. Example:

```
users:
  foo: Viewer
  bar: Editor
```

**theme**

Optional - Selected theme for the org.

**home\_dashboard\_id**

Optional - Home dashboard for the org.

**timezone**

Optional - Timezone for the org (one of: "browser", "utc", or "").

**address1**

Optional - address1 of the org.

**address2**

Optional - address2 of the org.

**city**

Optional - city of the org.

**zip\_code**

Optional - zip\_code of the org.

**address\_state**

- Optional - state of the org.
- country**
  - Optional - country of the org.
- profile**
  - Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

### 26.19.106 salt.states.grafana4\_user

Manage Grafana v4.0 users

New in version 2017.7.0.

#### configuration

This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:  
  grafana_url: http://grafana.localhost  
  grafana_user: admin  
  grafana_password: admin  
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:  
  grafana_url: http://grafana.localhost  
  grafana_token: token  
  grafana_timeout: 3
```

#### Ensure foobar user is present:

```
grafana4_user.present:  
- name: foobar  
- password: mypass  
- email: "foobar@localhost"  
- fullname: Foo Bar  
- is_admin: true
```

`salt.states.grafana4_user.absent` (*name*, *profile='grafana'*)

Ensure that a user is present.

#### name

Name of the user to remove.

#### profile

Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

`salt.states.grafana4_user.present` (*name*, *password*, *email*, *is\_admin=False*, *fullname=None*, *theme=None*, *profile='grafana'*)

Ensure that a user is present.

#### name

Name of the user.

#### password

Password of the user.

#### email

Email of the user.

- is\_admin**  
Optional - Set user as admin user. Default: False
- fullname**  
Optional - Full name of the user.
- theme**  
Optional - Selected theme of the user.
- profile**  
Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

### 26.19.107 salt.states.grafana\_dashboard

Manage Grafana v2.0 Dashboards

New in version 2016.3.0.

```
grafana:
  grafana_timeout: 3
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

```
Ensure minimum dashboard is managed:
grafana_dashboard.present:
- name: insightful-dashboard
- base_dashboards_from_pillar:
  - default_dashboard
- base_rows_from_pillar:
  - default_row
- base_panels_from_pillar:
  - default_panel
- dashboard:
  rows:
  - title: Usage
    panels:
    - targets:
      - target: alias(constantLine(50), 'max')
        title: Imaginary
        type: graph
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

`salt.states.grafana_dashboard.absent` (*name*, *profile*='grafana')

Ensure the named grafana dashboard is absent.

**name**

Name of the grafana dashboard.

**profile**

A pillar key or dict that contains grafana information

`salt.states.grafana_dashboard.present` (*name*, *base\_dashboards\_from\_pillar*=None, *base\_panels\_from\_pillar*=None, *base\_rows\_from\_pillar*=None, *dashboard*=None, *profile*='grafana')

Ensure the grafana dashboard exists and is managed.

**name**  
Name of the grafana dashboard.

**base\_dashboards\_from\_pillar**  
A pillar key that contains a list of dashboards to inherit from

**base\_panels\_from\_pillar**  
A pillar key that contains a list of panels to inherit from

**base\_rows\_from\_pillar**  
A pillar key that contains a list of rows to inherit from

**dashboard**  
A dict that defines a dashboard that should be managed.

**profile**  
A pillar key or dict that contains grafana information

### 26.19.108 salt.states.grafana\_datasource

Manage Grafana v2.0 data sources

New in version 2016.3.0.

```
grafana:
  grafana_timeout: 3
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

#### Ensure influxdb data source is present:

```
grafana_datasource.present:
- name: influxdb
- type: influxdb
- url: http://localhost:8086
- access: proxy
- basic_auth: true
- basic_auth_user: myuser
- basic_auth_password: mypass
- is_default: true
```

`salt.states.grafana_datasource.absent` (*name*, *profile*='grafana')

Ensure that a data source is present.

**name**

Name of the data source to remove.

`salt.states.grafana_datasource.present` (*name*, *type*, *url*, *access*='proxy', *user*="", *password*="", *database*="", *basic\_auth*=False, *basic\_auth\_user*="", *basic\_auth\_password*="", *is\_default*=False, *json\_data*=None, *profile*='grafana')

Ensure that a data source is present.

**name**

Name of the data source.

**type**

Which type of data source it is ('graphite', 'influxdb' etc.).

**url**

The URL to the data source API.

**user**

Optional - user to authenticate with the data source

**password**  
Optional - password to authenticate with the data source

**basic\_auth**  
Optional - set to True to use HTTP basic auth to authenticate with the data source.

**basic\_auth\_user**  
Optional - HTTP basic auth username.

**basic\_auth\_password**  
Optional - HTTP basic auth password.

**is\_default**  
Default: False

### 26.19.109 salt.states.grains

#### Manage grains on the minion

This state allows for grains to be set.

Grains set or altered with this module are stored in the 'grains' file on the minions, By default, this file is located at: `/etc/salt/grains`

---

**Note:** This does NOT override any grains set in the minion config file.

---

`salt.states.grains.absent` (*name, destructive=False, delimiter=':', force=False*)

New in version 2014.7.0.

Delete a grain from the grains config file

**name**

The grain name

**destructive**

If destructive is True, delete the entire grain. If destructive is False, set the grain's value to None. Defaults to False.

**force**

If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version 2015.8.2.

**delimiter**

A delimiter different from the default can be provided.

New in version 2015.8.2.

Changed in version 2015.8.2.

This state now support nested grains and complex values. It is also more conservative: if a grain has a value that is a list or a dict, it will not be removed unless the *force* parameter is True.

**grain\_name:**  
`grains.absent`

`salt.states.grains.append` (*name, value, convert=False, delimiter=':'*)

New in version 2014.7.0.

Append a value to a list in the grains config file. The grain that is being appended to (*name*) must exist before the new value can be added.

**name**

The grain name

**value**

The value to append

**convert**

If convert is True, convert non-list contents into a list. If convert is False and the grain contains non-list contents, an error is given. Defaults to False.

**delimiter**

A delimiter different from the default can be provided.

New in version 2015.8.2.

```
grain_name:
grains.append:
- value: to_be_appended
```

`salt.states.grains.exists`(*name*, *delimiter*=':')

Ensure that a grain is set

**name**

The grain name

**delimiter**

A delimiter different from the default can be provided.

Check whether a grain exists. Does not attempt to check or set the value.

`salt.states.grains.list_absent`(*name*, *value*, *delimiter*=':')

Delete a value from a grain formed as a list.

New in version 2014.1.0.

**name**

The grain name.

**value**

The value to delete from the grain list.

**delimiter**

A delimiter different from the default : can be provided.

New in version 2015.8.2.

The grain should be `list` type

```
roles:
grains.list_absent:
- value: db
```

For multiple grains, the syntax looks like:

```
roles:
grains.list_absent:
- value:
- web
- dev
```

`salt.states.grains.list_present`(*name*, *value*, *delimiter*=':')

New in version 2014.1.0.

Ensure the value is present in the list-type grain. Note: If the grain that is provided in `name` is not present on the system, this new grain will be created with the corresponding provided value.

**name**

The grain name.

**value**

The value is present in the list type grain.

**delimiter**

A delimiter different from the default `:` can be provided.

New in version 2015.8.2.

The grain should be `list` type

```
roles:
  grains.list_present:
    - value: web
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_present:
    - value:
      - web
      - dev
```

`salt.states.grains.make_hashable(list_grain, result=None)`

Ensure that a list grain is hashable.

**list\_grain**

The list grain that should be hashable

**result**

This function is recursive, so it must be possible to use a sublist as parameter to the function. Should not be used by a caller outside of the function.

Make it possible to compare two list grains to each other if the list contains complex objects.

`salt.states.grains.present(name, value, delimiter=':', force=False)`

Ensure that a grain is set

Changed in version 2015.8.2.

**name**

The grain name

**value**

The value to set on the grain

**force**

If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version 2015.8.2.

**delimiter**

A delimiter different from the default can be provided.

New in version 2015.8.2.

It is now capable to set a grain to a complex value (ie. lists and dicts) and supports nested grains as well.

If the grain does not yet exist, a new grain is set to the given value. For a nested grain, the necessary keys are created if they don't exist. If a given key is an existing value, it will be converted, but an existing value different from the given key will fail the state.

If the grain with the given name exists, its value is updated to the new value unless its existing or provided value is complex (list or dict). Use `force: True` to overwrite.

```
cheese:
  grains.present:
    - value: edam
```

(continues on next page)

(continued from previous page)

```

nested_grain_with_complex_value:
  grains.present:
    - name: icinga:Apache SSL
    - value:
      - command: check_https
      - params: -H localhost -p 443 -S

with,a,custom,delimiter:
  grains.present:
    - value: yay
    - delimiter: ','

```

### 26.19.110 salt.states.group

#### Management of user groups

The group module is used to create and manage group settings, groups can be either present or absent. User/Group names can be passed to the `adduser`, `deluser`, and `members` parameters. `adduser` and `deluser` can be used together but not with `members`.

In Windows, if no domain is specified in the user or group name (i.e. `DOMAIN\username`) the module will assume a local user or group.

```

cheese:
  group.present:
    - gid: 7648
    - system: True
    - addusers:
      - user1
      - users2
    - delusers:
      - foo

```

```

cheese:
  group.present:
    - gid: 7648
    - system: True
    - members:
      - foo
      - bar
      - user1
      - user2

```

`salt.states.group.absent` (*name*, *local=False*)

Ensure that the named group is absent

#### Parameters

- **name** (*str*) -- The name of the group to remove
- **local** (*Only on systems with lgroupdel available*) -- Ensure the group account is removed locally ignoring global account management (default is False).

New in version 3007.0.

Example:

```
# Removes the local group `db_admin`
db_admin:
  group.absent
```

`salt.states.group.present` (*name*, *gid=None*, *system=False*, *addusers=None*, *delusers=None*, *members=None*, *non\_unique=False*, *local=False*)

Changed in version 3006.0.

Ensure that a group is present

#### Parameters

- **name** (*str*) -- The name of the group to manage
  - **gid** (*str*) -- The group id to assign to the named group; if left empty, then the next available group id will be assigned. Ignored on Windows
  - **system** (*bool*) -- Whether or not the named group is a system group. This is essentially the '-r' option of 'groupadd'. Ignored on Windows
  - **addusers** (*list*) -- List of additional users to be added as a group members. Cannot conflict with names in delusers. Cannot be used in conjunction with members.
  - **delusers** (*list*) -- Ensure these user are removed from the group membership. Cannot conflict with names in addusers. Cannot be used in conjunction with members.
  - **members** (*list*) -- Replace existing group members with a list of new members. Cannot be used in conjunction with addusers or delusers.
  - **non\_unique** (*bool*) -- Allow creating groups with duplicate (non-unique) GIDs
- New in version 3006.0.
- **local** (*Only on systems with lgroupadd available*) -- Create the group account locally ignoring global account management (default is False).

New in version 3007.0.

Example:

```
# Adds DOMAIN\db_admins and Administrators to the local db_admin group
# Removes Users
db_admin:
  group.present:
    - addusers:
      - DOMAIN\db_admins
      - Administrators
    - delusers:
      - Users

# Ensures only DOMAIN\domain_admins and the local Administrator are
# members of the local Administrators group. All other users are
# removed
Administrators:
  group.present:
    - members:
      - DOMAIN\domain_admins
      - Administrator
```

## 26.19.111 salt.states.heat

### Management of Heat

New in version 2017.7.0.

#### depends

- heat Python module

#### configuration

See `salt.modules.heat` for setup instructions.

The heat module is used to create, show, list and delete Heat staks. Stack can be set as either absent or deploy.

```
heat.deployed:
- name:
- template: #Required
- environment:
- params: {}
- poll: 5
- rollback: False
- timeout: 60

heat.absent:
- name:
- poll: 5
```

mysql:

#### heat.deployed:

- template: salt://templates/mysql.heat.yaml
- params: image: Debian 7
- rollback: True

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *enviroment* was corrected to *environment*. The *enviroment* spelling mistake has been removed in Salt 3000.

`salt.states.heat.absent` (*name*, *poll=5*, *timeout=60*, *profile=None*)

Ensure that the named stack is absent

#### name

The name of the stack to remove

#### poll

Poll(in sec.) and report events until stack complete

#### timeout

Stack creation timeout in minutes

#### profile

Profile to use

`salt.states.heat.deployed` (*name*, *template=None*, *environment=None*, *params=None*, *poll=5*, *rollback=False*, *timeout=60*, *update=False*, *profile=None*, *\*\*connection\_args*)

Deploy stack with the specified properties

#### name

The name of the stack

#### template

File of template

**environment**

File of environment

**params**

Parameter dict used to create the stack

**poll**

Poll (in sec.) and report events until stack complete

**rollback**

Enable rollback on create failure

**timeout**

Stack creation timeout in minutes

**profile**

Profile to use

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *enviroment* was corrected to *environment*. The *enviroment* spelling mistake has been removed in Salt 3000.

**26.19.112 salt.states.helm**

**salt.states.helm.release\_absent** (*name*, *namespace=None*, *flags=None*, *kvflags=None*)

Make sure the release name is absent.

**name**

(string) The release name to uninstall.

**namespace**

(string) The namespace scope for this request.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

Example:

```
helm_release_is_absent:
  helm.release_absent:
    - name: release_name

# In dry-run mode.
helm_release_is_absent_dry-run:
  helm.release_absent:
    - name: release_name
    - flags:
      - dry-run
```

**salt.states.helm.release\_present** (*name*, *chart*, *values=None*, *version=None*, *namespace=None*, *set=None*, *flags=None*, *kvflags=None*)

Make sure the release name is present.

**name**

(string) The release name to install.

**chart**

(string) The chart to install.

**values**

(string) Absolute path to the values.yaml file.

**version**

(string) The exact chart version to install. If this is not specified, the latest version is installed.

**namespace**

(string) The namespace scope for this request.

**set**

(string or list) Set a values on the command line.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

Example:

```

helm_release_is_present:
  helm.release_present:
    - name: release_name
    - chart: repo/chart

# In dry-run mode.
helm_release_is_present_dry-run:
  helm.release_present:
    - name: release_name
    - chart: repo/chart
    - flags:
      - dry-run

# With values.yaml file.
helm_release_is_present_values:
  helm.release_present:
    - name: release_name
    - chart: repo/chart
    - kvflags:
      values: /path/to/values.yaml

```

**salt.states.helm.repo\_managed** (*name, present=None, absent=None, prune=False, repo\_update=False, namespace=None, flags=None, kvflags=None*)

Make sure the repository is updated.

**name**

(string) Not used.

**present**

(list) List of repository to be present. It's a list of dict: [{'name': 'local\_name', 'url': 'repository\_url'}]

**absent**

(list) List of local name repository to be absent.

**prune**

(boolean - default: False) If True, all repository already present but not in the present list would be removed.

**repo\_update**

(boolean - default: False) If True, the Helm repository is updated after a repository add or remove.

**namespace**

(string) The namespace scope for this request.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

Example:

```

helm_repository_is_managed:
  helm.repo_managed:

```

(continues on next page)

(continued from previous page)

- **present:**
  - **name:** local\_name\_1
  - url:** repository\_url
- **absent:**
  - local\_name\_2

`salt.states.helm.repo_updated` (*name, namespace=None, flags=None, kvflags=None*)

Make sure the repository is updated. To execute after a repository changes.

**name**

(string) Not used.

**namespace**

(string) The namespace scope for this request.

**flags**

(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

Example:

```
helm_repository_is_updated:
  helm.repo_updated
```

### 26.19.113 salt.states.hg

#### Interaction with Mercurial repositories

Before using hg over ssh, make sure the remote host fingerprint already exists in ~/.ssh/known\_hosts, and the remote host has this host's public key.

```
https://bitbucket.org/example_user/example_repo:
```

```
hg.latest:
```

- **rev:** tip
- **target:** /tmp/example\_repo

`salt.states.hg.latest` (*name, rev=None, target=None, clean=False, user=None, identity=None, force=False, opts=False, update\_head=True*)

Make sure the repository is cloned to the given directory and is up to date

**name**

Address of the remote repository as passed to "hg clone"

**rev**

The remote branch, tag, or revision hash to clone/pull

**target**

Target destination directory path on minion to clone into

**clean**

Force a clean update with -C (Default: False)

**user**

Name of the user performing repository management operations

New in version 0.17.0.

**identity**

Private SSH key on the minion server for authentication (`ssh://`)

New in version 2015.5.0.

**force**

Force hg to clone into pre-existing directories (deletes contents)

**opts**

Include additional arguments and options to the hg command line

**update\_head**

Should we update the head if new changes are found? Defaults to True

New in version 2017.7.0.

**26.19.114 salt.states.highstate\_doc**

To be used with processors in module *highstate\_doc*.

`salt.states.highstate_doc.note` (*name*, *source=None*, *contents=None*, *\*\*kwargs*)

Add content to a document generated using *highstate\_doc.render*.

This state does not preform any tasks on the host. It only is used in *highstate\_doc* lowstate processors to include extra documents.

```

{{sls}} example note:
highstate_doc.note:
- name: example note
- require_in:
  - pkg: somepackage
- contents: |
  example `highstate_doc.note`
  -----
  This state does not do anything to the system! It is only
  →used by a `processor`
  you can use `requisites` and `order` to move your docs around
  →the rendered file.
  .. this message appare above the `pkg: somepackage` state.
- source: salt://{{tpldir}}/also_include_a_file.md

{{sls}} extra help:
highstate_doc.note:
- name: example
- order: 0
- source: salt://{{tpldir}}/HELP.md

```

**26.19.115 salt.states.host****Management of addresses and names in hosts file**

The `/etc/hosts` file can be managed to contain definitions for specific hosts:

```

salt-master:
host.present:
- ip: 192.168.0.42

```

Or using the `names` directive, you can put several names for the same IP. (Do not try one name with space-separated values).

```

server1:
  host.present:
    - ip: 192.168.0.42
    - names:
      - server1
      - florida

```

**Note:** Changing the names in `host.present` does not cause an update to remove the old entry.

```

server1:
  host.present:
    - ip:
      - 192.168.0.42
      - 192.168.0.43
      - 192.168.0.44
    - names:
      - server1

```

You can replace all existing names for a particular IP address:

```

127.0.1.1:
  host.only:
    - hostnames:
      - foo.example.com
      - foo

```

Or delete all existing names for an address:

```

203.0.113.25:
  host.only:
    - hostnames: []

```

You can also include comments:

```

server1:
  host.present:
    - ip: 192.168.0.42
    - names:
      - server1
      - florida
    - comment: A very important comment

```

`salt.states.host.absent` (*name*, *ip*)

Ensure that the named host is absent

**name**

The host to remove

**ip**

The ip addr(s) of the host to remove

`salt.states.host.only` (*name*, *hostnames*)

Ensure that only the given hostnames are associated with the given IP address.

New in version 2016.3.0.

**name**

The IP address to associate with the given hostnames.

**hostnames**

Either a single hostname or a list of hostnames to associate with the given IP address in the given order. Any other hostname associated with the IP address is removed. If no hostnames are specified, all hostnames associated with the given IP address are removed.

`salt.states.host.present` (*name*, *ip*, *comment=""*, *clean=False*)

Ensures that the named host is present with the given ip

**name**

The host to assign an ip to

**ip**

The ip addr(s) to apply to the host. Can be a single IP or a list of IP addresses.

**comment**

A comment to include for the host entry

New in version 3001.

**clean**

Remove any entries which don't match those configured in the `ip` option. Default is `False`.

New in version 2018.3.4.

## 26.19.116 salt.states.http

HTTP monitoring states

Perform an HTTP query and statefully return the result

New in version 2015.5.0.

`salt.states.http.query` (*name*, *match=None*, *match\_type='string'*, *status=None*, *status\_type='string'*, *wait\_for=None*, *\*\*kwargs*)

Perform an HTTP query and statefully return the result

Passes through all the parameters described in the [utils.http.query function](#):

**name**

The name of the query.

**match**

Specifies a pattern to look for in the return text. By default, this will perform a string comparison of looking for the value of `match` in the return text.

**match\_type**

Specifies the type of pattern matching to use on `match`. Default is `string`, but can also be set to `pcr` to use regular expression matching if a more complex pattern matching is required.

---

**Note:** Despite the name of `match_type` for this argument, this setting actually uses Python's `re.search()` function rather than Python's `re.match()` function.

---

**status**

The status code for a URL for which to be checked. Can be used instead of or in addition to the `match` setting. This can be passed as an individual status code or a list of status codes.

**status\_type**

Specifies the type of pattern matching to use for `status`. Default is `string`, but can also be set to `pcr` to use regular expression matching if a more complex pattern matching is required. Additionally, if a list of strings representing statuses is given, the type `list` can be used.

New in version 3000.

---

**Note:** Despite the name of `match_type` for this argument, this setting actually uses Python's `re.search()` function rather than Python's `re.match()` function.

---

If both `match` and `status` options are set, both settings will be checked. However, note that if only one option is `True` and the other is `False`, then `False` will be returned. If this case is reached, the comments in the return data will contain troubleshooting information.

For more information about the `http.query` state, refer to the [HTTP Tutorial](#).

```

query_example:
  http.query:
    - name: 'http://example.com/'
    - status: 200

query_example2:
  http.query:
    - name: 'http://example.com/'
    - status:
      - 200
      - 201
    - status_type: list

```

`salt.states.http.wait_for_successful_query` (*name*, *wait\_for=300*, *\*\*kwargs*)

Like `query` but, repeat and wait until `match/match_type` or `status` is fulfilled. State returns result from last query state in case of success or if no successful query was made within `wait_for` timeout.

**name**

The name of the query.

**wait\_for**

Total time to wait for requests that succeed.

**request\_interval**

Optional interval to delay requests by N seconds to reduce the number of requests sent.

---

**Note:** All other arguments are passed to the `http.query` state.

---

## 26.19.117 salt.states.icinga2

### Icinga2 state

New in version 2017.7.0.

**depends**

- Icinga2 Python module

**configuration**

See `salt.modules.icinga2` for setup instructions.

The `icinga2` module is used to execute commands. Its output may be stored in a file or in a grain.

```

command_id:
  icinga2.generate_ticket:
    - name: domain.tld
    - output: "/tmp/query_id.txt"

```

`salt.states.icinga2.generate_cert(name)`

Generate an icinga2 certificate and key on the client.

**name**

The domain name for which this certificate and key will be generated

`salt.states.icinga2.generate_ticket(name, output=None, grain=None, key=None, overwrite=True)`

Generate an icinga2 ticket on the master.

**name**

The domain name for which this ticket will be generated

**output**

grain: output in a grain other: the file to store results None: output to the result comment (default)

**grain:**

grain to store the output (need output=grain)

**key:**

the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

**overwrite:**

The file or grain will be overwritten if it already exists (default)

`salt.states.icinga2.node_setup(name, master, ticket)`

Setup the icinga2 node.

**name**

The domain name for which this certificate will be saved

**master**

Icinga2 master node for which this certificate will be saved

**ticket**

Authentication ticket generated on icinga2 master

`salt.states.icinga2.request_cert(name, master, ticket, port='5665')`

Request CA certificate from master icinga2 node.

**name**

The domain name for which this certificate will be saved

**master**

Icinga2 master node for which this certificate will be saved

**ticket**

Authentication ticket generated on icinga2 master

**port**

Icinga2 port, defaults to 5665

`salt.states.icinga2.save_cert(name, master)`

Save the certificate on master icinga2 node.

**name**

The domain name for which this certificate will be saved

**master**

Icinga2 master node for which this certificate will be saved

## 26.19.118 salt.states.idem

### Idem Support

This state provides access to idem states

New in version 3002.

`salt.states.idem.state` (*name, sls, acct\_file=None, acct\_key=None, acct\_profile=None, cache\_dir=None, render=None, runtime=None, source\_dir=None, test=False*)

Execute an idem sls file through a salt state

**sls**

A list of idem sls files or sources

**acct\_file**

Path to the acct file used in generating idem ctx parameters. Defaults to the value in the ACCT\_FILE environment variable.

**acct\_key**

Key used to decrypt the acct file. Defaults to the value in the ACCT\_KEY environment variable.

**acct\_profile**

Name of the profile to add to idem's ctx.acct parameter Defaults to the value in the ACCT\_PROFILE environment variable.

**cache\_dir**

The location to use for the cache directory

**render**

The render pipe to use, this allows for the language to be specified (jinja|yaml)

**runtime**

Select which execution runtime to use (serial|parallel)

**source\_dir**

The directory containing sls files

```
cheese:
  idem.state:
    - runtime: parallel
    - sls:
      - idem_state.sls
      - sls_source
```

**Maturity**

new

**Depends**

acct, pop, pop-config, idem

**Platform**

all

## 26.19.119 salt.states.ifttt

### Trigger an event in IFTTT

This state is useful for triggering events in IFTTT.

New in version 2015.8.0.

```
ifttt-event:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'This state was executed successfully.'
    - value2: 'Another value we can send.'
    - value3: 'A third value we can send.'
```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

```
ifttt:
  secret_key: bzMRb-KKIAaNOwKEEw792J7Eb-B3z7muhdhYblJn4V6
```

`salt.states.ifttt.trigger_event` (*name, event, value1=None, value2=None, value3=None*)

Trigger an event in IFTTT

```
ifttt-event:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'A value that we want to send.'
    - value2: 'A second value that we want to send.'
    - value3: 'A third value that we want to send.'
```

The following parameters are required:

**name**

The unique name for this event.

**event**

The name of the event to trigger in IFTTT.

The following parameters are optional:

**value1**

One of the values that we can send to IFTT.

**value2**

One of the values that we can send to IFTT.

**value3**

One of the values that we can send to IFTT.

## 26.19.120 salt.states.incron

### Management of incron, the inotify cron

The incron state module allows for user incrontabs to be cleanly managed.

Incron declarations require a number of parameters. The parameters needed to be declared: `path`, `mask`, and `cmd`. The `user` whose incrontab is to be edited also needs to be defined.

When making changes to an existing incron job, the `path` declaration is the unique factor, so if an existing cron that looks like this:

```
Watch for modifications in /home/user:
incron.present:
  - user: root
  - path: /home/user
  - mask:
    - IN_MODIFY
  - cmd: 'echo "$$ @$@"'
```

Is changed to this:

**Watch for modifications and access in /home/user:**

**incron.present:**

- **user:** root
- **path:** /home/user
- **mask:**
  - IN\_MODIFY
  - IN\_ACCESS
- **cmd:** 'echo "\$\$ @\$@"'

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

New in version 0.17.0.

`salt.states.incron.absent` (*name, path, mask, cmd, user='root'*)

Verifies that the specified incron job is absent for the specified user; only the name is matched when removing a incron job.

**name**

Unique comment describing the entry

**path**

The path that should be watched

**user**

The name of the user who's crontab needs to be modified, defaults to the root user

**mask**

The mask of events that should be monitored for

**cmd**

The cmd that should be executed

`salt.states.incron.present` (*name, path, mask, cmd, user='root'*)

Verifies that the specified incron job is present for the specified user. For more advanced information about what exactly can be set in the cron timing parameters, check your incron system's documentation. Most Unix-like systems' incron documentation can be found via the incrontab man page: `man 5 incrontab`.

**name**

Unique comment describing the entry

**path**

The path that should be watched

**user**

The name of the user who's crontab needs to be modified, defaults to the root user

**mask**

The mask of events that should be monitored for

**cmd**

The cmd that should be executed

## 26.19.121 salt.states.influxdb08\_database

### Management of Influxdb 0.8 databases

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

`salt.states.influxdb08_database.absent` (*name, user=None, password=None, host=None, port=None*)

Ensure that the named database is absent

**name**

The name of the database to remove

**user**

The user to connect as (must be able to remove the database)

**password**

The password of the user

**host**

The host to connect to

**port**

The port to connect to

`salt.states.influxdb08_database.present` (*name, user=None, password=None, host=None, port=None*)

Ensure that the named database is present

**name**

The name of the database to create

**user**

The user to connect as (must be able to remove the database)

**password**

The password of the user

**host**

The host to connect to

**port**

The port to connect to

## 26.19.122 salt.states.influxdb08\_user

### Management of InfluxDB 0.8 users

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

`salt.states.influxdb08_user.absent` (*name, database=None, user=None, password=None, host=None, port=None*)

Ensure that the named cluster admin or database user is absent.

**name**

The name of the user to remove

**database**

The database to remove the user from

**user**

The user to connect as (must be able to remove the user)

**password**

The password of the user

**host**  
The host to connect to

**port**  
The port to connect to

`salt.states.influxdb08_user.present` (*name, passwd, database=None, user=None, password=None, host=None, port=None*)

Ensure that the cluster admin or database user is present.

**name**  
The name of the user to manage

**passwd**  
The password of the user

**database**  
The database to create the user in

**user**  
The user to connect as (must be able to create the user)

**password**  
The password of the user

**host**  
The host to connect to

**port**  
The port to connect to

### 26.19.123 salt.states.influxdb\_continuous\_query

#### Management of Influxdb continuous queries

New in version 2017.7.0.

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_continuous_query.absent` (*name, database, \*\*client\_args*)

Ensure that given continuous query is absent.

**name**  
Name of the continuous query to remove.

**database**  
Name of the database that the continuous query was defined on.

`salt.states.influxdb_continuous_query.present` (*name, database, query, resample\_time=None, coverage\_period=None, \*\*client\_args*)

Ensure that given continuous query is present.

**name**  
Name of the continuous query to create.

**database**  
Database to create continuous query on.

**query**  
The query content

**resample\_time**  
[None] Duration between continuous query resampling.

**coverage\_period**  
[None] Duration specifying time period per sample.

## 26.19.124 salt.states.influxdb\_database

### Management of Influxdb databases

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_database.absent(name, **client_args)`

Ensure that given database is absent.

**name**

Name of the database to remove.

`salt.states.influxdb_database.present(name, **client_args)`

Ensure that given database is present.

**name**

Name of the database to create.

## 26.19.125 salt.states.influxdb\_retention\_policy

### Management of Influxdb retention policies

New in version 2017.7.0.

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_retention_policy.absent(name, database, **client_args)`

Ensure that given retention policy is absent.

**name**

Name of the retention policy to remove.

**database**

Name of the database that the retention policy was defined on.

`salt.states.influxdb_retention_policy.convert_duration(duration)`

Convert the a duration string into XXhYYmZZs format

**duration**

Duration to convert

**Returns: duration\_string**

String representation of duration in XXhYYmZZs format

`salt.states.influxdb_retention_policy.present(name, database, duration='7d', replication=1, default=False, **client_args)`

Ensure that given retention policy is present.

**name**

Name of the retention policy to create.

**database**

Database to create retention policy on.

## 26.19.126 salt.states.influxdb\_user

### Management of InfluxDB users

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_user.absent`(*name*, *\*\*client\_args*)

Ensure that given user is absent.

**name**

The name of the user to manage

`salt.states.influxdb_user.present`(*name*, *passwd*, *admin=False*, *grants=None*, *\*\*client\_args*)

Ensure that given user is present.

**name**

Name of the user to manage

**passwd**

Password of the user

**admin**

[False] Whether the user should have cluster administration privileges or not.

**grants**

Optional - Dict of database:privilege items associated with the user. Example:

**grants:**

foo\_db: read bar\_db: all

Example:

```
example user present in influxdb:
```

```
influxdb_user.present:
```

- **name:** example
- **passwd:** somepassword
- **admin:** False
- **grants:**
  - foo\_db:** read
  - bar\_db:** all

## 26.19.127 salt.states.infoblox\_a

Infoblox A record management.

functions accept `api_opts`:

`api_verifyssl`: verify SSL [default to True or pillar value] `api_url`: server to connect to [default to pillar value] `api_username`: [default to pillar value] `api_password`: [default to pillar value]

`salt.states.infoblox_a.absent`(*name=None*, *ipv4addr=None*, *\*\*api\_opts*)

Ensure infoblox A record is removed.

State example:

```
infoblox_a.absent:
```

- **name:** example-ha-0.domain.com

```
infoblox_a.absent:
```

- **name:**
- **ipv4addr:** 127.0.23.23

```
salt.states.infoblox_a.present(name=None, ipv4addr=None, data=None, ensure_data=True,
                               **api_opts)
```

Ensure infoblox A record.

When you wish to update a hostname ensure *name* is set to the hostname of the current record. You can give a new name in the *data.name*.

State example:

```
infoblox_a.present:
- name: example-ha-0.domain.com
- data:
  name: example-ha-0.domain.com
  ipv4addr: 123.0.31.2
  view: Internal
```

### 26.19.128 salt.states.infoblox\_cname

Infoblox CNAME management.

functions accept api\_opts:

api\_verifyssl: verify SSL [default to True or pillar value] api\_url: server to connect to [default to pillar value] api\_username: [default to pillar value] api\_password: [default to pillar value]

```
salt.states.infoblox_cname.absent(name=None, canonical=None, **api_opts)
```

Ensure the CNAME with the given name or canonical name is removed

```
salt.states.infoblox_cname.present(name=None, data=None, ensure_data=True, **api_opts)
```

Ensure the CNAME with the given data is present.

**name**

CNAME of record

**data**

raw CNAME api data see: <https://INFOBLOX/wapidoc>

State example:

```
infoblox_cname.present:
- name: example-ha-0.domain.com
- data:
  name: example-ha-0.domain.com
  canonical: example.domain.com
  zone: example.com
  view: Internal
  comment: Example comment

infoblox_cname.present:
- name: example-ha-0.domain.com
- data:
  name: example-ha-0.domain.com
  canonical: example.domain.com
  zone: example.com
  view: Internal
  comment: Example comment
- api_url: https://INFOBLOX/wapi/v1.2.1
```

(continues on next page)

(continued from previous page)

- **api\_username**: username
- **api\_password**: passwd

### 26.19.129 salt.states.infoblox\_host\_record

Infoblox host record management.

functions accept `api_opts`:

`api_verifyssl`: verify SSL [default to True or pillar value] `api_url`: server to connect to [default to pillar value] `api_username`: [default to pillar value] `api_password`: [default to pillar value]

`salt.states.infoblox_host_record.absent` (*name=None, ipv4addr=None, mac=None, \*\*api\_opts*)

Ensure the host with the given Name `ipv4addr` or `mac` is removed.

State example:

```
infoblox_host_record.absent:
  - name: hostname.of.record.to.remove

infoblox_host_record.absent:
  - name:
  - ipv4addr: 192.168.0.1

infoblox_host_record.absent:
  - name:
  - mac: 12:02:12:31:23:43
```

`salt.states.infoblox_host_record.present` (*name=None, data=None, ensure\_data=True, \*\*api\_opts*)

This will ensure that a host with the provided name exists. This will try to ensure that the state of the host matches the given data. If the host is not found then one will be created.

When trying to update a hostname ensure `name` is set to the hostname of the current record. You can give a new name in the `data.name`.

**Avoid race conditions, use `func:nextavailableip`:**

- `func:nextavailableip:network/ZG54dfgsrDFEFfsfsLzA:10.0.0.0/8/default`
- `func:nextavailableip:10.0.0.0/8`
- `func:nextavailableip:10.0.0.0/8,externalconfigure_for_dns`
- `func:nextavailableip:10.0.0.3-10.0.0.10`

State Example:

```
# this would update `original_hostname.example.ca` to changed `data`.
infoblox_host_record.present:
  - name: original_hostname.example.ca
  - data: {'namhostname.example.cae': 'hostname.example.ca',
         'aliases': ['hostname.math.example.ca'],
         'extattrs': [{'Business Contact': {'value': 'EXAMPLE@example.ca'}}]
  → },
  'ipv4addrs': [{'configure_for_dhcp': True,
                'ipv4addr': 'func:nextavailableip:129.97.139.0/24',
                'mac': '00:50:56:84:6e:ae'}],
  'ipv6addrs': [], }
```

### 26.19.130 salt.states.infoblox\_range

Infoblox host record management.

functions accept `api_opts`:

`api_verifyssl`: verify SSL [default to True or pillar value] `api_url`: server to connect to [default to pillar value] `api_username`: [default to pillar value] `api_password`: [default to pillar value]

`salt.states.infoblox_range.absent` (`name=None, start_addr=None, end_addr=None, data=None, **api_opts`)

Ensure the range is removed

Supplying the end of the range is optional.

State example:

```
infoblox_range.absent:
- name: 'vlan10'

infoblox_range.absent:
- name:
- start_addr: 127.0.1.20
```

`salt.states.infoblox_range.present` (`name=None, start_addr=None, end_addr=None, data=None, **api_opts`)

Ensure range record is present.

`infoblox_range.present`:

`start_addr: '129.97.150.160', end_addr: '129.97.150.170'`,

Verbose state example:

```
infoblox_range.present:
  data: {
    'always_update_dns': False,
    'authority': False,
    'comment': 'range of IP addresses used for salt.. was used for
→ghost images deployment',
    'ddns_generate_hostname': True,
    'deny_all_clients': False,
    'deny_bootp': False,
    'disable': False,
    'email_list': [],
    'enable_ddns': False,
    'enable_dhcp_thresholds': False,
    'enable_email_warnings': False,
    'enable_ifmap_publishing': False,
    'enable_snmp_warnings': False,
    'end_addr': '129.97.150.169',
    'exclude': [],
    'extattrs': {},
    'fingerprint_filter_rules': [],
    'high_water_mark': 95,
    'high_water_mark_reset': 85,
    'ignore_dhcp_option_list_request': False,
    'lease_scavenge_time': -1,
```

(continues on next page)

(continued from previous page)

```
'logic_filter_rules': [],
'low_water_mark': 0,
'low_water_mark_reset': 10,
'mac_filter_rules': [],
'member': {'_struct': 'dhcpmember',
            'ipv4addr': '129.97.128.9',
            'name': 'cn-dhcp-mc.example.ca'},
'ms_options': [],
'nac_filter_rules': [],
'name': 'ghost-range',
'network': '129.97.150.0/24',
'network_view': 'default',
'option_filter_rules': [],
'options': [{'name': 'dhcp-lease-time',
              'num': 51,
              'use_option': False,
              'value': '43200',
              'vendor_class': 'DHCP'}],
'recycle_leases': True,
'relay_agent_filter_rules': [],
'server_association_type': 'MEMBER',
'start_addr': '129.97.150.160',
'update_dns_on_lease_renewal': False,
'use_authority': False,
'use_bootfile': False,
'use_bootserver': False,
'use_ddns_domainname': False,
'use_ddns_generate_hostname': True,
'use_deny_bootp': False,
'use_email_list': False,
'use_enable_ddns': False,
'use_enable_dhcp_thresholds': False,
'use_enable_ifmap_publishing': False,
'use_ignore_dhcp_option_list_request': False,
'use_known_clients': False,
'use_lease_scavenge_time': False,
'use_nextserver': False,
'use_options': False,
'use_recycle_leases': False,
'use_unknown_clients': False,
'use_update_dns_on_lease_renewal': False
}
```

## 26.19.131 salt.states.ini\_manage

### Manage ini files

```

maintainer
    <akilesh1597@gmail.com>

maturity
    new

depends
    re

platform
    all

```

`salt.states.ini_manage.options_absent` (*name*, *sections=None*, *separator='='*)

```

/home/saltminion/api-paste.ini:
ini.options_absent:
- separator: '='
- sections:
    test:
        - testkey
        - secondoption
    test1:
        - testkey1

```

options present in file and not specified in sections dict will be untouched

changes dict will contain the list of changes made

`salt.states.ini_manage.options_present` (*name*, *sections=None*, *separator='='*, *strict=False*)

```

/home/saltminion/api-paste.ini:
ini.options_present:
- separator: '='
- strict: True
- sections:
    test:
        testkey: 'testval'
        secondoption: 'secondvalue'
    test1:
        testkey1: 'testval121'

```

options present in file and not specified in sections dict will be untouched, unless *strict: True* flag is used

changes dict will contain the list of changes made

`salt.states.ini_manage.sections_absent` (*name*, *sections=None*, *separator='='*)

```

/home/saltminion/api-paste.ini:
ini.sections_absent:
- separator: '='
- sections:
    - test
    - test1

```

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

`salt.states.ini_manage.sections_present`(*name*, *sections=None*, *separator='='*)

```
/home/saltminion/api-paste.ini:
ini.sections_present:
- separator: '='
- sections:
  - section_one
  - section_two
```

This will only create empty sections. To also create options, use `options_present` state

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

### 26.19.132 salt.states.ipmi

#### Manage IPMI devices over LAN

The following configuration defaults can be defined in the minion, master config or pillar:

```
ipmi.config:
api_host: 127.0.0.1
api_user: admin
api_pass: apassword
api_port: 623
api_kg: None
```

Every call can override the config defaults:

```
ensure myipmi system is set to network boot:
ipmi.boot_device:
- name: network
- api_host: myipmi.hostname.com
- api_user: root
- api_pass: apassword
- api_kg: None

ensure myipmi system is powered on:
ipmi.power:
- name: boot
- api_host: myipmi.hostname.com
- api_user: root
- api_pass: apassword
```

`salt.states.ipmi.boot_device`(*name='default'*, *\*\*kwargs*)

Request power state change

**name = default**

- network -- Request network boot
- hd -- Boot from hard drive
- safe -- Boot from hard drive, requesting 'safe mode'
- optical -- boot from CD/DVD/BD drive

- setup -- Boot into setup utility
- default -- remove any IPMI directed boot device request

**kwargs**

- api\_host=localhost
- api\_user=admin
- api\_pass=
- api\_port=623
- api\_kg=None

`salt.states.ipmi.power` (*name='power\_on', wait=300, \*\*kwargs*)

Request power state change

**name**

Ensure power state one of:

- power\_on -- system turn on
- power\_off -- system turn off (without waiting for OS)
- shutdown -- request OS proper shutdown
- reset -- reset (without waiting for OS)
- boot -- If system is off, then 'on', else 'reset'

**wait**

wait X seconds for the job to complete before forcing. (defaults to 300 seconds)

**kwargs**

- api\_host=localhost
- api\_user=admin
- api\_pass=
- api\_port=623
- api\_kg=None

`salt.states.ipmi.user_absent` (*name, channel=14, \*\*kwargs*)

Remove user Delete all user (uid) records having the matching name.

**name**

string name of user to delete

**channel**

channel to remove user access from defaults to 14 for auto.

**kwargs**

- api\_host=localhost
- api\_user=admin
- api\_pass=
- api\_port=623
- api\_kg=None

`salt.states.ipmi.user_present` (*name, uid, password, channel=14, callback=False, link\_auth=True, ipmi\_msg=True, privilege\_level='administrator', \*\*kwargs*)

Ensure IPMI user and user privileges.

**name**

name of user (limit 16 bytes)

**uid**

user id number (1 to 7)

**password**

user password (limit 16 bytes)

**channel**

ipmi channel defaults to 14 for auto

**callback**

User Restricted to Callback

**False = User Privilege Limit is determined by the User Privilege Limit**

parameter privilege\_level, for both callback and non-callback connections.

**True = User Privilege Limit is determined by the privilege\_level**

parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they 'call in' to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.

#### **link\_auth**

User Link authentication True/False user name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.

#### **ipmi\_msg**

User IPMI Messaging True/False user name and password information will be used for IPMI Messaging. In this case, 'IPMI Messaging' refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.) ipmi\_msg

#### **privilege\_level**

- callback
- user
- operator
- administrator
- proprietary
- no\_access

#### **kwargs**

- api\_user=admin
- api\_pass=
- api\_port=623
- api\_kg=None

### 26.19.133 salt.states.ipset

#### Management of ipsets

This is an ipset-specific module designed to manage IPSets for use in IPTables Firewalls.

```

setname:
  ipset.set_present:
    - set_type: bitmap:ip
    - range: 192.168.0.0/16
    - comment: True

setname:
  ipset.set_absent:
    - set_type: bitmap:ip
    - range: 192.168.0.0/16
    - comment: True

setname_entries:
  ipset.present:
    - set_name: setname
    - entry: 192.168.0.3
    - comment: Hello
  
```

(continues on next page)

(continued from previous page)

```

- require:
  - ipset: baz

setname_entries:
ipset.present:
- set_name: setname
- entry:
  - 192.168.0.3
  - 192.168.1.3
- comment: Hello
- require:
  - ipset: baz

setname_entries:
ipset.absent:
- set_name: setname
- entry:
  - 192.168.0.3
  - 192.168.1.3
- comment: Hello
- require:
  - ipset: baz

setname:
ipset.flush:

```

`salt.states.ipset.absent` (*name*, *entry=None*, *entries=None*, *family='ipv4'*, *\*\*kwargs*)

New in version 2014.7.0.

Remove a entry or entries from a chain

**name**

A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.

**family**

Network family, ipv4 or ipv6.

`salt.states.ipset.flush` (*name*, *family='ipv4'*, *\*\*kwargs*)

New in version 2014.7.0.

Flush current ipset set

**family**

Networking family, either ipv4 or ipv6

`salt.states.ipset.present` (*name*, *entry=None*, *family='ipv4'*, *\*\*kwargs*)

New in version 2014.7.0.

Append a entry to a set

**name**

A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.

**entry**

A single entry to add to a set or a list of entries to add to a set

**family**

Network family, ipv4 or ipv6.

`salt.states.ipset.set_absent(name, family='ipv4', **kwargs)`

New in version 2014.7.0.

Verify the set is absent.

**family**

Networking family, either ipv4 or ipv6

`salt.states.ipset.set_present(name, set_type, family='ipv4', **kwargs)`

New in version 2014.7.0.

Verify the set exists.

**name**

A user-defined set name.

**set\_type**

The type for the set.

**family**

Networking family, either ipv4 or ipv6

## 26.19.134 salt.states.iptables

### Management of iptables

This is an iptables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic `firewall` state.

**httpd:**

**iptables.append:**

- **table:** filter
- **chain:** INPUT
- **jump:** ACCEPT
- **match:** state
- **connstate:** NEW
- **dport:** 80
- **protocol:** tcp
- **sport:** 1025:65535
- **save:** True

**httpd:**

**iptables.append:**

- **table:** filter
- **chain:** INPUT
- **jump:** ACCEPT
- **match:**
  - state
  - comment
- **comment:** "Allow HTTP"
- **connstate:** NEW
- **dport:** 80
- **protocol:** tcp
- **sport:** 1025:65535
- **save:** True

**httpd:**

(continues on next page)

(continued from previous page)

iptables.append:
- table: filter
- chain: INPUT
- jump: ACCEPT
- match:
  - state
  - comment
- comment: "Allow HTTP"
- connstate: NEW
- source: '127.0.0.1'
- dport: 80
- protocol: tcp
- sport: 1025:65535
- save: True

.. Invert Rule
httpd:
iptables.append:
- table: filter
- chain: INPUT
- jump: ACCEPT
- match:
  - state
  - comment
- comment: "Allow HTTP"
- connstate: NEW
- source: '! 127.0.0.1'
- dport: 80
- protocol: tcp
- sport: 1025:65535
- save: True

httpd:
iptables.append:
- table: filter
- chain: INPUT
- jump: ACCEPT
- match:
  - state
  - comment
- comment: "Allow HTTP"
- connstate: NEW
- source: 'not 127.0.0.1'
- dport: 80
- protocol: tcp
- sport: 1025:65535
- save: True

httpd:
iptables.append:
- table: filter
- family: ipv6
```

(continues on next page)

(continued from previous page)

- **chain:** INPUT
- **jump:** ACCEPT
- **match:** state
- **connstate:** NEW
- **dport:** 80
- **protocol:** tcp
- **sport:** 1025:65535
- **save:** True

**httpd:****iptables.append:**

- **table:** filter
- **family:** ipv4
- **chain:** INPUT
- **jump:** ACCEPT
- **match:** state
- **connstate:** NEW
- **dports:**
  - 80
  - 443
- **protocol:** tcp
- **sport:** 1025:65535
- **save:** True

**httpd:****iptables.insert:**

- **position:** 1
- **table:** filter
- **chain:** INPUT
- **jump:** ACCEPT
- **match:** state
- **connstate:** NEW
- **dport:** 80
- **protocol:** tcp
- **sport:** 1025:65535
- **save:** True

**httpd:****iptables.insert:**

- **position:** 1
- **table:** filter
- **family:** ipv6
- **chain:** INPUT
- **jump:** ACCEPT
- **match:** state
- **connstate:** NEW
- **dport:** 80
- **protocol:** tcp
- **sport:** 1025:65535
- **save:** True

**httpd:**

(continues on next page)

(continued from previous page)

```

iptables.delete:
- table: filter
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- protocol: tcp
- sport: 1025:65535
- save: True

```

**httpd:**

```

iptables.delete:
- position: 1
- table: filter
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- protocol: tcp
- sport: 1025:65535
- save: True

```

**httpd:**

```

iptables.delete:
- table: filter
- family: ipv6
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- protocol: tcp
- sport: 1025:65535
- save: True

```

**default to accept:**

```

iptables.set_policy:
- chain: INPUT
- policy: ACCEPT

```

---

**Note:** Whereas iptables will accept `-p, --proto[[c[o[l]]]]` as synonyms of `--protocol`, if `--proto` appears in an iptables command after the appearance of `-m policy`, it is interpreted as the `--proto` option of the policy extension (see the `iptables-extensions(8)` man page).

---

Example rules for IPsec policy:

```

accept_esp_in:
iptables.append:
- table: filter

```

(continues on next page)

(continued from previous page)

```

- chain: INPUT
- jump: ACCEPT
- source: 10.20.0.0/24
- destination: 10.10.0.0/24
- in-interface: eth0
- match: policy
- dir: in
- pol: ipsec
- reqid: 1
- proto: esp
accept_esp_forward_in:
  iptables.append:
    - use:
      - iptables: accept_esp_in
      - chain: FORWARD

accept_esp_out:
  iptables.append:
    - table: filter
    - chain: OUTPUT
    - jump: ACCEPT
    - source: 10.10.0.0/24
    - destination: 10.20.0.0/24
    - out-interface: eth0
    - match: policy
    - dir: out
    - pol: ipsec
    - reqid: 1
    - proto: esp
accept_esp_forward_out:
  iptables.append:
    - use:
      - iptables: accept_esp_out
      - chain: FORWARD

```

---

**Note:** `name` is reserved for the Salt state name. To pass `--name EXAMPLE` to `iptables`, provide it with `- name_ : EXAMPLE`.

---

**Note:** Various functions of the `iptables` module use the `--check` option. If the version of `iptables` on the target system does not include this option, an alternate version of this check will be performed using the output of `iptables-save`. This may have unintended consequences on legacy releases of `iptables`.

---

`salt.states.iptables.append`(*name*, *table='filter'*, *family='ipv4'*, *\*\*kwargs*)

New in version 0.17.0.

Add a rule to the end of the specified chain. If the rule is already present anywhere in the chain, its position is not changed.

**name**

A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**table**

The table that owns the chain which should be modified

**family**

Network family, ipv4 or ipv6.

**save**

If set to a true value, the new iptables rules for the given family will be saved to a file.

If the value is True, rules are saved to an OS-dependent file that will be loaded during system startup, resulting in the firewall rule remaining active across reboots if possible.

Note that loading the iptables rules during system startup may require non-default packages to be installed. On Debian-derived systems, the iptables-persistent package is required.

If the value is a string, it is taken to be a filename to which the rules will be saved. Arranging for the rules to be loaded during system startup must be done separately.

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.chain_absent(name, table='filter', family='ipv4')`

New in version 2014.1.0.

Verify the chain is absent.

**table**

The table to remove the chain from

**family**

Networking family, either ipv4 or ipv6

`salt.states.iptables.chain_present(name, table='filter', family='ipv4')`

New in version 2014.1.0.

Verify the chain is exist.

**name**

A user-defined chain name.

**table**

The table to own the chain.

**family**

Networking family, either ipv4 or ipv6

`salt.states.iptables.delete(name, table='filter', family='ipv4', **kwargs)`

New in version 2014.1.0.

Delete a rule from a chain if present. If the rule is already absent, this is not an error and nothing is changed.

**name**

A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**table**

The table that owns the chain that should be modified

**family**

Networking family, either ipv4 or ipv6

**save**

If set to a true value, the new iptables rules for the given family will be saved to a file. See the append state for more details.

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.flush(name, table='filter', family='ipv4', **kwargs)`

New in version 2014.1.0.

Flush current iptables state

**table**

The table that owns the chain that should be modified

**family**

Networking family, either ipv4 or ipv6

**chain**

The chain to be flushed. All the chains in the table if none is given.

`salt.states.iptables.insert(name, table='filter', family='ipv4', **kwargs)`

New in version 2014.1.0.

Insert a rule into a chain. If the rule is already present anywhere in the chain, its position is not changed.

**name**

A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**table**

The table that owns the chain that should be modified

**family**

Networking family, either ipv4 or ipv6

**position**

The numerical representation of where the rule should be inserted into the chain. Note that -1 is not a supported position value.

**save**

If set to a true value, the new iptables rules for the given family will be saved to a file. See the `append` state for more details.

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.mod_aggregate(low, chunks, running)`

The `mod_aggregate` function which looks up all rules in the available low chunks and merges them into a single rules ref in the present low data

`salt.states.iptables.set_policy(name, table='filter', family='ipv4', **kwargs)`

New in version 2014.1.0.

Sets the default policy for iptables firewall tables

**table**

The table that owns the chain that should be modified

**family**

Networking family, either ipv4 or ipv6

**policy**

The requested table policy

**save**

If set to a true value, the new iptables rules for the given family will be saved to a file. See the `append` state for more details.

## 26.19.135 salt.states.jboss7

Manage JBoss 7 Application Server via CLI interface

New in version 2015.5.0.

This state uses the `jboss-cli.sh` script from a JBoss or Wildfly installation and parses its output to determine the execution result.

In order to run each state, a `jboss_config` dictionary with the following properties must be passed:

```

jboss:
  cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
  controller: 10.11.12.13:9999
  cli_user: 'jbossadm'
  cli_password: 'jbossadm'

```

If the controller doesn't require a password, then the `cli_user` and `cli_password` parameters are optional.

Since same dictionary with configuration will be used in all the states, it may be more convenient to move JBoss configuration and other properties to the pillar.

Example of application deployment from local filesystem:

```

application_deployed:
  jboss7.deployed:
    - salt_source:
      target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar['jboss'] }}

```

For the sake of brevity, examples for each state assume that `jboss_config` is contained in the pillar.

`salt.states.jboss7.bindings_exist` (*name, jboss\_config, bindings, profile=None*)

Ensures that given JNDI binding are present on the server. If a binding doesn't exist on the server it will be created. If it already exists its value will be changed.

**jboss\_config:**

Dict with connection properties (see state description)

**bindings:**

Dict with bindings to set.

**profile:**

The profile name (domain mode only)

Example:

```

jndi_entries_created:
  jboss7.bindings_exist:
    - bindings:
      'java:global/sampleapp/environment': 'DEV'
      'java:global/sampleapp/configurationFile': '/var/opt/sampleapp/
      →config.properties'
    - jboss_config: {{ pillar['jboss'] }}

```

`salt.states.jboss7.datasource_exists` (*name, jboss\_config, datasource\_properties, recreate=False, profile=None*)

Ensures that a datasource with given properties exist on the jboss instance. If datasource doesn't exist, it is created, otherwise only the properties that are different will be updated.

**name**

Datasource property name

**jboss\_config**

Dict with connection properties (see state description)

**datasource\_properties**

Dict with datasource properties

**recreate**

[False] If set to True and datasource exists it will be removed and created again. However, if there are deployments that depend on the datasource, it will not be possible to remove it.

**profile**

[None] The profile name for this datasource (domain mode only)

Example:

```
sampleDS:
  jboss7.datasource_exists:
    - recreate: False
    - datasource_properties:
        driver-name: mysql
        connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
        jndi-name: 'java:jboss/datasources/sampleDS'
        user-name: sampleuser
        password: secret
        min-pool-size: 3
        use-java-context: True
    - jboss_config: {{ pillar['jboss'] }}
    - profile: full-ha
```

`salt.states.jboss7.deployed(name, jboss_config, salt_source=None)`

Ensures that the given application is deployed on server.

**jboss\_config:**

Dict with connection properties (see state description)

**salt\_source:**

**How to find the artifact to be deployed.**

**target\_file:**

Where to look in the minion's file system for the artifact to be deployed (e.g. '/tmp/application-web-0.39.war'). When source is specified, also specifies where to save the retrieved file.

**source:**

(optional) File on salt master (e.g. salt://application-web-0.39.war). If absent, no files will be retrieved and the artifact in target\_file will be used for the deployment.

**undeploy:**

(optional) Regular expression to match against existing deployments. When present, if there is a deployment that matches the regular expression, it will be undeployed before the new artifact is deployed.

**undeploy\_force:**

(optional) If True, the artifact will be undeployed although it has not changed.

Examples:

Deployment of a file from minion's local file system:

```
application_deployed:
  jboss7.deployed:
    - salt_source:
        target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar['jboss'] }}
```

It is assumed that /tmp/webapp.war was made available by some other means. No applications will be un-

deployed; if an existing deployment that shares that name exists, then it will be replaced with the updated version.

Deployment of a file from the Salt master's file system:

```
application_deployed:
  jboss7.deployed:
    - salt_source:
        source: salt://application-web-0.39.war
        target_file: '/tmp/application-web-0.39.war'
        undeploy: 'application-web-.*'
    - jboss_config: {{ pillar['jboss'] }}
```

Here, application-web-0.39.war file is downloaded from Salt file system to /tmp/application-web-0.39.war file on minion. Existing deployments are checked if any of them matches 'application-web-.\*' regular expression, and if so then it is undeployed before deploying the application. This is useful to automate deployment of new application versions.

If the source parameter of salt\_source is specified, it can use any protocol that the file states use. This includes not only downloading from the master but also HTTP, HTTPS, FTP, Amazon S3, and OpenStack Swift.

`salt.states.jboss7.reloaded`(*name*, *jboss\_config*, *timeout=60*, *interval=5*)

Reloads configuration of jboss server.

**jboss\_config:**

Dict with connection properties (see state description)

**timeout:**

Time to wait until jboss is back in running state. Default timeout is 60s.

**interval:**

Interval between state checks. Default interval is 5s. Decreasing the interval may slightly decrease waiting time but be aware that every status check is a call to jboss-cli which is a java process. If interval is smaller than process cleanup time it may easily lead to excessive resource consumption.

This step performs the following operations:

- Ensures that server is in running or reload-required state (by reading server-state attribute)
- Reloads configuration
- Waits for server to reload and be in running state

Example:

```
configuration_reloaded:
  jboss7.reloaded:
    - jboss_config: {{ pillar['jboss'] }}
```

## 26.19.136 salt.states.jenkins

### Management of Jenkins

New in version 2016.3.0.

`salt.states.jenkins.absent`(*name*, *\*\*kwargs*)

Ensure the job is absent from the Jenkins configured jobs

**name**

The name of the Jenkins job to remove

`salt.states.jenkins.present`(*name*, *config=None*, *\*\*kwargs*)

Ensure the job is present in the Jenkins configured jobs

<b>name</b>	The unique name for the Jenkins job
<b>config</b>	The Salt URL for the file to use for configuring the job

### 26.19.137 salt.states.junos

State modules to interact with Junos devices.

<b>maturity</b>	new
<b>dependencies</b>	junos-eznc, jxmlease

---

**Note:** Those who wish to use junos-eznc (PyEZ) version  $\geq 2.1.0$ , must use the latest salt code from github until the next release.

---

Refer to [junos](#) for information on connecting to junos proxy.

`salt.states.junos.cli`(*name*, *\*\*kwargs*)

Executes the CLI commands and reuturns the text output.

```

show version:
junos.cli:
  - format: xml

get software version of device:
junos.cli:
  - name: show version
  - format: text
  - dest: /home/user/show_version.log

```

Parameters

- **Required** --
  - *name*: The command that need to be executed on Junos CLI. (default = None)
- **Optional** --
  - *kwargs*: **Keyworded arguments which can be provided like-**
    - \* *format*: Format in which to get the CLI output. (text or xml, default = 'text')
    - \* *timeout*: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
    - \* *dest*: The destination file where the CLI output can be stored. (default = None)

`salt.states.junos.commit`(*name*, *\*\*kwargs*)

Commits the changes loaded into the candidate configuration.

```

commit the changes:
junos.commit:
  - confirm: 10

```

Parameters

**Optional** --

- **kwargs:** Keyworded arguments which can be provided like-
  - **timeout:** Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
  - **comment:** Provide a comment to the commit. (default = None)
  - **confirm:** Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.
  - **sync:** On dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines. (default = False)
  - **force\_sync:** On dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.
  - **full:** When set to True requires all the daemons to check and evaluate the new configuration.
  - **detail:** When true return commit detail.

`salt.states.junos.commit_check(name)`

Perform a commit check on the configuration.

```
perform commit check:
junos.commit_check
```

`salt.states.junos.diff(name, d_id=0, **kwargs)`

Changed in version 3001.

Gets the difference between the candidate and the current configuration.

```
get the diff:
junos.diff:
- d_id: 10
```

Parameters

**Optional** --

- **d\_id:** The rollback diff id (d\_id) value [0-49]. (default = 0)

`salt.states.junos.file_copy(name, dest=None, **kwargs)`

Copies the file from the local device to the junos device.

```
/home/m2/info.txt:
junos.file_copy:
- dest: info_copy.txt
```

Parameters

**Required** --

- **name:** The source path where the file is kept.
- **dest:** The destination path where the file will be copied.

`salt.states.junos.get_table(name, table, table_file, **kwargs)`

New in version 3001.

Retrieve data from a Junos device using Tables/Views

```
get route details:
junos.get_table:
- table: RouteTable
```

(continues on next page)

(continued from previous page)

```

- table_file: routes.yml

get interface details:
junos.get_table:
- table: EthPortTable
- table_file: ethport.yml
- table_args:
    interface_name: ge-0/0/0

```

**name (required)**

task definition

**table (required)**

Name of PyEZ Table

**file**

YAML file that has the table specified in table parameter

**path:**

Path of location of the YAML file. defaults to op directory in jnpr.junos.op

**target:**

if command need to run on FPC, can specify fpc target

**key:**

To overwrite key provided in YAML

**key\_items:**

To select only given key items

**filters:**

To select only filter for the dictionary from columns

**template\_args:**

key/value pair which should render Jinja template command

`salt.states.junos.install_config(name, **kwargs)`

Loads and commits the configuration provided.

**Install the mentioned config:**

```

junos.install_config:
- name: salt://configs/interface.set
- timeout: 100
- diffs_file: '/var/log/diff'

```

**Install the mentioned config:**

```

junos.install_config:
- path: salt://configs/interface.set
- timeout: 100
- template_vars:
    interface_name: lo0
    description: Creating interface via SaltStack.

```

**name**

Path where the configuration/template file is present. If the file has a \*.conf extension, the content is treated as text format. If the file has a \*.xml extension, the content is treated as XML format. If the file has a \*.set extension, the content is treated as Junos OS set commands

**template\_vars**

The dictionary of data for the jinja variables present in the jinja template

**timeout**

[30] Set NETCONF RPC timeout. Can be used for commands which take a while to execute.

**overwrite**

[False] Set to True if you want this file is to completely replace the configuration file. Sets action to override

---

**Note:** This option cannot be used if **format** is "set".

---

**merge**

[False] If set to True will set the load-config action to merge. the default load-config action is 'replace' for xml/json/text config

**comment**

Provide a comment to the commit. (default = None)

**confirm**

Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.

**diffs\_file**

Path to the file where the diff (difference in old configuration and the committed configuration) will be stored.

---

**Note:** The file will be stored on the proxy minion. To push the files to the master use *cp.push*.

---

`salt.states.junos.install_os(name, **kwargs)`

Installs the given image on the device. After the installation is complete the device is rebooted, if `reboot=True` is given as a keyworded argument.

```
salt://images/junos_image.tgz:
junos.install_os:
- timeout: 100
- reboot: True
```

**Parameters**

- **Required** --
  - `name`: Path where the image file is present on the proxy minion.
- **Optional** --
  - `kwargs`: keyworded arguments to be given such as `timeout`, `reboot` etc
    - \* `timeout`: Set NETCONF RPC timeout. Can be used to RPCs which take a while to execute. (default = 30 seconds)
    - \* `reboot`: Whether to reboot after installation (default = False)
    - \* `no_copy`: When True the software package will not be SCP'd to the device. (default = False)

`salt.states.junos.load(name, **kwargs)`

Loads the configuration provided onto the junos device.

```
Install the mentioned config:
junos.load:
- name: salt://configs/interface.set
```

```
Install the mentioned config:
junos.load:
- name: salt://configs/interface.set
- template_vars:
```

(continues on next page)

(continued from previous page)

```
interface_name: lo0
description: Creating interface via SaltStack.
```

Sample template:

```
set interfaces {{ interface_name }} unit 0
```

**name**

Path where the configuration/template file is present. If the file has a `.conf` extension, the content is treated as text format. If the file has a `.xml` extension, the content is treated as XML format. If the file has a `.set` extension, the content is treated as Junos OS set commands.

**overwrite**

[False] Set to True if you want this file is to completely replace the configuration file.

---

**Note:** This option cannot be used if `format` is "set".

---

**merge**

[False] If set to True will set the load-config action to merge. the default load-config action is 'replace' for xml/json/text config

**update**

[False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1 (default = False)

**template\_vars**

Variables to be passed into the template processing engine in addition to those present in `__pillar__`, `__opts__`, `__grains__`, etc. You may reference these variables in your template like so: `{{ template_vars["var_name"] }}`

`salt.states.junos.lock(name)`

Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

---

**Note:** Any user who wishes to use lock, must necessarily unlock the configuration too. Ensure `unlock` is called in the same orchestration run in which the lock is called.

---

**lock the config:**

```
junos.lock
```

`salt.states.junos.resultdecorator(function)`

`salt.states.junos.rollback(name, d_id, **kwargs)`

Rollbacks the committed changes.

**rollback the changes:**

```
junos.rollback:
- id: 5
```

**Parameters****Optional --**

- id:

- `d_id`: The rollback id value [0-49]. (default = 0) (this variable cannot be named `id`, it conflicts with the state compiler's internal id)
- `kwargs`: **Keyworded arguments which can be provided like-**
  - `timeout`: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
  - `comment`: Provide a comment to the commit. (default = None)
  - `confirm`: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.
  - `diffs_file`: Path to the file where any diffs will be written. (default = None)

`salt.states.junos.rpc`(*name*, *dest=None*, *format='xml'*, *args=None*, *\*\*kwargs*)

Executes the given rpc. The returned data can be stored in a file by specifying the destination path with `dest` as an argument

```

get-interface-information:
  junos.rpc:
    - dest: /home/user/rpc.log
    - interface_name: lo0

fetch interface information with terse:
  junos.rpc:
    - name: get-interface-information
    - terse: True

```

#### Parameters

- **Required** --
  - `name`: The rpc to be executed. (default = None)
- **Optional** --
  - `dest`: Destination file where the rpc output is stored. (default = None) Note that the file will be stored on the proxy minion. To push the files to the master use the salt's following execution module: `cp.push`
  - `format`: The format in which the rpc reply must be stored in file specified in the `dest` (used only when `dest` is specified) (default = xml)
  - `kwargs`: **keyworded arguments taken by rpc call like-**
    - \* `timeout`: 30 Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default= 30 seconds)
    - \* `filter`: Only to be used with 'get-config' rpc to get specific configuration.
    - \* `terse`: Amount of information you want.
    - \* `interface_name`: Name of the interface whose information you want.

`salt.states.junos.set_hostname`(*name*, *\*\*kwargs*)

Changes the hostname of the device.

```

device_name:
  junos.set_hostname:
    - comment: "Host-name set via saltstack."

```

#### Parameters

- **Required** --
  - `name`: The name to be set. (default = None)
- **Optional** --
  - `kwargs`: **Keyworded arguments which can be provided like-**

- \* `timeout`: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
- \* `comment`: Provide a comment to the commit. (default = None)
- \* `confirm`: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.

`salt.states.junos.shutdown`(*name*, *\*\*kwargs*)

Shuts down the device.

```
shut the device:
junos.shutdown:
- in_min: 10
```

Parameters

**Optional** --

- `kwargs`:
  - `reboot`: Whether to reboot instead of shutdown. (default=False)
  - `at`: Specify time for reboot. (To be used only if `reboot=yes`)
  - `in_min`: Specify delay in minutes for shutdown

`salt.states.junos.unlock`(*name*)

Unlocks the candidate configuration.

```
unlock the config:
junos.unlock
```

`salt.states.junos.zeroize`(*name*)

Resets the device to default factory settings.

```
reset my device:
junos.zeroize
```

`name`: can be anything

### 26.19.138 salt.states.kapacitor

Kapacitor state module.

**configuration**

This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```
kapacitor.unsafe_ssl: 'false'
kapacitor.protocol: 'http'
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar.

New in version 2016.11.0.

`salt.states.kapacitor.task_absent`(*name*)

Ensure that a task is absent from Kapacitor.

**name**

Name of the task.

`salt.states.kapacitor.task_present` (*name*, *tick\_script*, *task\_type='stream'*, *database=None*, *retention\_policy='default'*, *enable=True*, *dbrps=None*)

Ensure that a task is present and up-to-date in Kapacitor.

**name**

Name of the task.

**tick\_script**

Path to the TICK script for the task. Can be a salt:// source.

**task\_type**

Task type. Defaults to 'stream'

**dbrps**

A list of databases and retention policies in "dbname"rpname" format to fetch data from. For backward compatibility, the value of 'database' and 'retention\_policy' will be merged as part of dbrps.

New in version 2019.2.0.

**database**

Which database to fetch data from. Defaults to None, which will use the default database in InfluxDB.

**retention\_policy**

Which retention policy to fetch data from. Defaults to 'default'.

**enable**

Whether to enable the task or not. Defaults to True.

### 26.19.139 salt.states.kernelpkg

#### Manage kernel packages and active kernel version

Example state to install the latest kernel from package repositories:

```
install-latest-kernel:
  kernelpkg.latest_installed: []
```

Example state to boot the system if a new kernel has been installed:

```
boot-latest-kernel:
  kernelpkg.latest_active:
    - at_time: 1
```

Example state chaining the install and reboot operations:

```
install-latest-kernel:
  kernelpkg.latest_installed: []

boot-latest-kernel:
  kernelpkg.latest_active:
    - at_time: 1
    - onchanges:
      - kernelpkg: install-latest-kernel
```

Chaining can also be achieved using wait/listen requisites:

```
install-latest-kernel:
  kernelpkg.latest_installed: []
```

(continues on next page)

(continued from previous page)

```

boot-latest-kernel:
  kernelpkg.latest_wait:
    - at_time: 1
    - listen:
      - kernelpkg: install-latest-kernel

```

`salt.states.kernelpkg.latest_active`(*name*, *at\_time=None*, *\*\*kwargs*)

Initiate a reboot if the running kernel is not the latest one installed.

---

**Note:** This state does not install any patches. It only compares the running kernel version number to other kernel versions also installed in the system. If the running version is not the latest one installed, this state will reboot the system.

See `kernelpkg.upgrade` and `latest_installed()` for ways to install new kernel packages.

This module does not attempt to understand or manage boot loader configurations it is possible to have a new kernel installed, but a boot loader configuration that will never activate it. For this reason, it would not be advisable to schedule this state to run automatically.

Because this state function may cause the system to reboot, it may be preferable to move it to the very end of the state run. See `latest_wait()` for a waitable state that can be called with the `listen` requisite.

---

**name**

Arbitrary name for the state. Does not affect behavior.

**at\_time**

The wait time in minutes before the system will be rebooted.

`salt.states.kernelpkg.latest_installed`(*name*, *\*\*kwargs*)

Ensure that the latest version of the kernel available in the repositories is installed.

---

**Note:** This state only installs the kernel, but does not activate it. The new kernel should become active at the next reboot. See `kernelpkg.needs_reboot` for details on how to detect this condition, and `latest_active()` to initiate a reboot when needed.

---

**name**

Arbitrary name for the state. Does not affect behavior.

`salt.states.kernelpkg.latest_wait`(*name*, *at\_time=None*, *\*\*kwargs*)

Initiate a reboot if the running kernel is not the latest one installed. This is the waitable version of `latest_active()` and will not take any action unless triggered by a watch or listen requisite.

---

**Note:** Because this state function may cause the system to reboot, it may be preferable to move it to the very end of the state run using `listen` or `listen_in` requisites.

```

system-up-to-date:
  pkg.uptodate:
    - refresh: true

boot-latest-kernel:
  kernelpkg.latest_wait:

```

(continues on next page)

(continued from previous page)

- ```

- at_time: 1
- listen:
  - pkg: system-up-to-date

```

**name**

Arbitrary name for the state. Does not affect behavior.

**at\_time**

The wait time in minutes before the system will be rebooted.

```
salt.states.kernelpkg.mod_watch(name, sfun, **kwargs)
```

Execute a kernelpkg state based on a watch or listen call

**26.19.140 salt.states.keyboard****Management of keyboard layouts**

The keyboard layout can be managed for the system:

```

us:
  keyboard.system

```

Or it can be managed for XOrg:

```

us:
  keyboard.xorg

```

```
salt.states.keyboard.system(name)
```

Set the keyboard layout for the system

**name**

The keyboard layout to use

```
salt.states.keyboard.xorg(name)
```

Set the keyboard layout for XOrg

**layout**

The keyboard layout to use

**26.19.141 salt.states.keystone****Management of Keystone users****depends**

- keystoneclient Python module

**configuration**See *salt.modules.keystone* for setup instructions.

```

Keystone tenants:
keystone.tenant_present:
- names:
  - admin

```

(continues on next page)

(continued from previous page)

```

- demo
- service

Keystone roles:
  keystone.role_present:
    - names:
      - admin
      - Member

admin:
  keystone.user_present:
    - password: R00T_4CC3SS
    - email: admin@domain.com

nova service:
  keystone.service_present:
    - name: nova
    - service_type: compute
    - description: OpenStack Compute Service

```

`salt.states.keystone.endpoint_absent` (*name*, *region=None*, *profile=None*, *interface=None*,  
 \*\**connection\_args*)

Ensure that the endpoint for a service doesn't exist in Keystone catalog

**name**

The name of the service whose endpoints should not exist

**region (optional)**

The region of the endpoint. Defaults to `RegionOne`.

**interface**

The interface type, which describes the visibility of the endpoint. (for V3 API)

`salt.states.keystone.endpoint_present` (*name*, *publicurl=None*, *internalurl=None*, *adminurl=None*,  
*region=None*, *profile=None*, *url=None*, *interface=None*,  
 \*\**connection\_args*)

Ensure the specified endpoints exists for service

**name**

The Service name

**publicurl**

The public url of service endpoint (for V2 API)

**internalurl**

The internal url of service endpoint (for V2 API)

**adminurl**

The admin url of the service endpoint (for V2 API)

**region**

The region of the endpoint

**url**

The endpoint URL (for V3 API)

**interface**

The interface type, which describes the visibility of the endpoint. (for V3 API)

`salt.states.keystone.project_absent` (*name*, *profile=None*, \*\**connection\_args*)

Ensure that the keystone project is absent. Alias for `tenant_absent` from V2 API to fulfill V3 API naming convention.

New in version 2016.11.0.

**name**

The name of the project that should not exist

**delete\_nova:**

**keystone.project\_absent:**

- **name:** nova

`salt.states.keystone.project_present` (*name*, *description=None*, *enabled=True*, *profile=None*,  
 \*\**connection\_args*)

Ensures that the keystone project exists Alias for `tenant_present` from V2 API to fulfill V3 API naming convention.

New in version 2016.11.0.

**name**

The name of the project to manage

**description**

The description to use for this project

**enabled**

Availability state for this project

```

nova:
  keystone.project_present:
    - enabled: True
    - description: 'Nova Compute Service'

```

`salt.states.keystone.role_absent` (*name*, *profile=None*, *\*\*connection\_args*)

Ensure that the keystone role is absent.

**name**

The name of the role that should not exist

`salt.states.keystone.role_present` (*name*, *profile=None*, *\*\*connection\_args*)

' Ensures that the keystone role exists

**name**

The name of the role that should be present

`salt.states.keystone.service_absent` (*name*, *profile=None*, *\*\*connection\_args*)

Ensure that the service doesn't exist in Keystone catalog

**name**

The name of the service that should not exist

`salt.states.keystone.service_present` (*name*, *service\_type*, *description=None*, *profile=None*, *\*\*connection\_args*)

Ensure service present in Keystone catalog

**name**

The name of the service

**service\_type**

The type of Openstack Service

**description (optional)**

Description of the service

`salt.states.keystone.tenant_absent` (*name*, *profile=None*, *\*\*connection\_args*)

Ensure that the keystone tenant is absent.

**name**

The name of the tenant that should not exist

`salt.states.keystone.tenant_present` (*name*, *description=None*, *enabled=True*, *profile=None*, *\*\*connection\_args*)

Ensures that the keystone tenant exists

**name**

The name of the tenant to manage

**description**

The description to use for this tenant

**enabled**

Availability state for this tenant

`salt.states.keystone.user_absent` (*name*, *profile=None*, *\*\*connection\_args*)

Ensure that the keystone user is absent.

**name**

The name of the user that should not exist

`salt.states.keystone.user_present` (*name*, *password*, *email*, *tenant=None*, *enabled=True*, *roles=None*, *profile=None*, *password\_reset=True*, *project=None*, *\*\*connection\_args*)

Ensure that the keystone user is present with the specified properties.

**name**

The name of the user to manage

**password**

The password to use for this user.

---

**Note:** If the user already exists and a different password was set for the user than the one specified here, the password for the user will be updated. Please set the `password_reset` option to `False` if this is not the desired behavior.

---

**password\_reset**

Whether or not to reset password after initial set. Defaults to `True`.

**email**

The email address for this user

**tenant**

The tenant (name) for this user

**project**

The project (name) for this user (overrides tenant in api v3)

**enabled**

Availability state for this user

**roles**

The roles the user should have under given tenants. Passed as a dictionary mapping tenant names to a list of roles in this tenant, i.e.:

```
roles:
  admin:  # tenant
    - admin # role
  service:
    - admin
    - Member
```

## 26.19.142 salt.states.keystone\_domain

### Management of OpenStack Keystone Domains

New in version 2018.3.0.

**depends**

shade

**configuration**

see *salt.modules.keystoneng* for setup instructions

Example States

```
create domain:
  keystone_domain.present:
    - name: domain1

create domain with optional params:
  keystone_domain.present:
    - name: domain1
    - enabled: False
    - description: 'my domain'
```

(continues on next page)

(continued from previous page)

```

delete domain:
  keystone_domain.absent:
    - name: domain1

```

`salt.states.keystone_domain.absent` (*name*, *auth=None*)

Ensure domain does not exist

**name**

Name of the domain

`salt.states.keystone_domain.present` (*name*, *auth=None*, *\*\*kwargs*)

Ensure domain exists and is up-to-date

**name**

Name of the domain

**enabled**

Boolean to control if domain is enabled

**description**

An arbitrary description of the domain

### 26.19.143 salt.states.keystone\_endpoint

#### Management of OpenStack Keystone Endpoints

New in version 2018.3.0.

**depends**

shade

**configuration**

see `salt.modules.keystoneng` for setup instructions

Example States

```

create endpoint:
  keystone_endpoint.present:
    - name: public
    - url: https://example.org:9292
    - region: RegionOne
    - service_name: glance

destroy endpoint:
  keystone_endpoint.absent:
    - name: public
    - url: https://example.org:9292
    - region: RegionOne
    - service_name: glance

create multiple endpoints:
  keystone_endpoint.absent:
    - names:
      - public
      - admin
      - internal

```

(continues on next page)

(continued from previous page)

- **url**: https://example.org:9292
- **region**: RegionOne
- **service\_name**: glance

`salt.states.keystone_endpoint.absent` (*name, service\_name, auth=None, \*\*kwargs*)

Ensure an endpoint does not exist

**name**

Interface name

**url**

URL of the endpoint

**service\_name**

Service name or ID

**region**

The region name to assign the endpoint

`salt.states.keystone_endpoint.present` (*name, service\_name, auth=None, \*\*kwargs*)

Ensure an endpoint exists and is up-to-date

**name**

Interface name

**url**

URL of the endpoint

**service\_name**

Service name or ID

**region**

The region name to assign the endpoint

**enabled**

Boolean to control if endpoint is enabled

### 26.19.144 salt.states.keystone\_group

#### Management of OpenStack Keystone Groups

New in version 2018.3.0.

**depends**

shade

**configuration**

see `salt.modules.keystoneng` for setup instructions

Example States

**create group:**

**keystone\_group.present:**

- **name**: group1

**delete group:**

**keystone\_group.absent:**

- **name**: group1

**create group with optional params:**

**keystone\_group.present:**

- **name**: group1

(continues on next page)

(continued from previous page)

- **domain:** domain1
- **description:** 'my group'

`salt.states.keystone_group.absent(name, auth=None, **kwargs)`

Ensure group does not exist

**name**

Name of the group

**domain**

The name or id of the domain

`salt.states.keystone_group.present(name, auth=None, **kwargs)`

Ensure an group exists and is up-to-date

**name**

Name of the group

**domain**

The name or id of the domain

**description**

An arbitrary description of the group

### 26.19.145 salt.states.keystone\_project

#### Management of OpenStack Keystone Projects

New in version 2018.3.0.

**depends**

shade

**configuration**

see `salt.modules.keystoneng` for setup instructions

Example States

```

create project:
  keystone_project.present:
    - name: project1

delete project:
  keystone_project.absent:
    - name: project1

create project with optional params:
  keystone_project.present:
    - name: project1
    - domain: domain1
    - enabled: False
    - description: 'my project'

```

`salt.states.keystone_project.absent(name, auth=None, **kwargs)`

Ensure a project does not exists

**name**

Name of the project

**domain**

The name or id of the domain

`salt.states.keystone_project.present(name, auth=None, **kwargs)`

Ensure a project exists and is up-to-date

**name**

Name of the project

**domain**

The name or id of the domain

**description**

An arbitrary description of the project

## 26.19.146 salt.states.keystone\_role

### Management of OpenStack Keystone Roles

New in version 2018.3.0.

**depends**

shade

**configuration**see `salt.modules.keystoneng` for setup instructions

Example States

```
create role:
  keystone_role.present:
    - name: role1

delete role:
  keystone_role.absent:
    - name: role1

create role with optional params:
  keystone_role.present:
    - name: role1
    - description: 'my group'
```

`salt.states.keystone_role.absent(name, auth=None, **kwargs)`

Ensure role does not exist

**name**

Name of the role

`salt.states.keystone_role.present(name, auth=None, **kwargs)`

Ensure an role exists

**name**

Name of the role

**description**

An arbitrary description of the role

## 26.19.147 salt.states.keystone\_role\_grant

### Management of OpenStack Keystone Role Grants

New in version 2018.3.0.

**depends**

shade

**configuration**

see *salt.modules.keystoneng* for setup instructions

Example States

```

create group:
  keystone_group.present:
    - name: group1

delete group:
  keystone_group.absent:
    - name: group1

create group with optional params:
  keystone_group.present:
    - name: group1
    - domain: domain1
    - description: 'my group'

```

`salt.states.keystone_role_grant.absent`(*name*, *auth=None*, *\*\*kwargs*)

`salt.states.keystone_role_grant.present`(*name*, *auth=None*, *\*\*kwargs*)

## 26.19.148 salt.states.keystone\_service

### Management of OpenStack Keystone Services

New in version 2018.3.0.

**depends**

shade

**configuration**

see *salt.modules.keystoneng* for setup instructions

Example States

```

create service:
  keystone_service.present:
    - name: glance
    - type: image

delete service:
  keystone_service.absent:
    - name: glance

```

(continues on next page)

**create service with optional params:****keystone\_service.present:**

- **name:** glance
- **type:** image
- **enabled:** False
- **description:** 'OpenStack Image'

`salt.states.keystone_service.absent`(*name*, *auth=None*)

Ensure service does not exist

**name**

Name of the service

`salt.states.keystone_service.present`(*name*, *auth=None*, *\*\*kwargs*)

Ensure an service exists and is up-to-date

**name**

Name of the group

**type**

Service type

**enabled**

Boolean to control if service is enabled

**description**

An arbitrary description of the service

### 26.19.149 salt.states.keystone\_user

#### Management of OpenStack Keystone Users

New in version 2018.3.0.

**depends**

shade

**configuration**

see `salt.modules.keystoneng` for setup instructions

Example States

**create user:****keystone\_user.present:**

- **name:** user1

**delete user:****keystone\_user.absent:**

- **name:** user1

**create user with optional params:****keystone\_user.present:**

- **name:** user1
- **domain:** domain1
- **enabled:** False
- **password:** password123
- **email:** "user1@example.org"
- **description:** 'my user'

`salt.states.keystone_user.absent(name, auth=None, **kwargs)`

Ensure user does not exists

**name**

Name of the user

**domain**

The name or id of the domain

`salt.states.keystone_user.present(name, auth=None, **kwargs)`

Ensure domain exists and is up-to-date

**name**

Name of the domain

**domain**

The name or id of the domain

**enabled**

Boolean to control if domain is enabled

**description**

An arbitrary description of the domain

**password**

The user password

**email**

The users email address

### 26.19.150 salt.states.keystore

State management of a java keystore

`salt.states.keystore.managed(name, passphrase, entries, force_remove=False)`

Create or manage a java keystore.

**Parameters**

- **name** -- The path to the keystore file
- **passphrase** -- The password to the keystore
- **entries** -- A list containing an alias, certificate, and optional private\_key. The certificate and private\_key can be a file or a string

```
- entries:
  - alias: hostname2
    certificate: /path/to/cert.crt
    private_key: /path/to/key.key
  - alias: stringhost
    certificate: |
      -----BEGIN CERTIFICATE-----
      [X]
      ↪MIICEjCCAXsCAg36MA0GCSqGSIb3DQEBBQUAMIGbMQswCQYDVQQGEwJKUDEOMAwG
      [X]
      ↪2VguKv4SWjRFoRkIFiLHX0qVviMhS1Ny2ioFLy7JcPZb+v3ftDGywUqcBiVDoea0
      -----END CERTIFICATE-----
```

- **force\_remove** -- If True will cause the state to remove any entries found in the keystore which are not defined in the state. The default is False. Example:

```
define_keystore:
  keystore.managed:
    - name: /path/to/keystore
    - passphrase: changeit
```

(continues on next page)

(continued from previous page)

```

- force_remove: True
- entries:
  - alias: hostname1
    certificate: /path/to/cert.crt
  - alias: remotehost
    certificate: /path/to/cert2.crt
    private_key: /path/to/key2.key
  - alias: pillarhost
    certificate: {{ salt.pillar.get('path:to:cert') }}
- }

```

### 26.19.151 salt.states.kmod

#### Loading and unloading of kernel modules

The Kernel modules on a system can be managed cleanly with the kmod state module:

```

add_kvm:
  kmod.present:
    - name: kvm_amd
remove_beep:
  kmod.absent:
    - name: pcspkr

```

Multiple modules can be specified for both kmod.present and kmod.absent.

```

add_sound:
  kmod.present:
    - mods:
      - snd_hda_codec_hdmi
      - snd_hda_codec
      - snd_hwdep
      - snd_hda_core
      - snd_pcm
      - snd_timer
      - snd

```

`salt.states.kmod.absent` (*name*, *persist=False*, *comment=True*, *mods=None*)

Verify that the named kernel module is not loaded

**name**

The name of the kernel module to verify is not loaded

**persist**

Remove module from `/etc/modules` (or `/etc/modules-load.d/salt_managed.conf` if the `systemd` key is present in Grains.

**comment**

Comment out module in `/etc/modules` rather than remove it

**mods**

A list of modules to verify are unloaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

`salt.states.kmod.present` (*name*, *persist=False*, *mods=None*)

Ensure that the specified kernel module is loaded

**name**

The name of the kernel module to verify is loaded

**persist**

Also add module to `/etc/modules` (or `/etc/modules-load.d/salt_managed.conf` if the `systemd` key is present in Grains.

**mods**

A list of modules to verify are loaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

## 26.19.152 salt.states.kubernetes

**Warning:** This module will be removed from Salt in version 3009 in favor of the [kubernetes Salt Extension](#).

### Manage kubernetes resources as salt states

NOTE: This module requires the proper pillar values set. See `salt.modules.kubernetesmod` for more information.

**Warning:** Configuration options will change in 2019.2.0.

The kubernetes module is used to manage different kubernetes resources.

```

my-nginx:
  kubernetes.deployment_present:
    - namespace: default
      metadata:

```

New in version 2017.7.0.

`salt.states.kubernetes.configmap_absent`(*name*, *namespace='default'*, *\*\*kwargs*)

Ensures that the named configmap is absent from the given namespace.

**name**

The name of the configmap

**namespace**

The namespace holding the configmap. The 'default' one is going to be used unless a different one is specified.

`salt.states.kubernetes.configmap_present`(*name*, *namespace='default'*, *data=None*, *source=None*, *template=None*, *\*\*kwargs*)

Ensures that the named configmap is present inside of the specified namespace with the given data. If the configmap exists it will be replaced.

**name**  
The name of the configmap.

**namespace**  
The namespace holding the configmap. The 'default' one is going to be used unless a different one is specified.

**data**  
The dictionary holding the configmaps.

**source**  
A file containing the data of the configmap in plain format.

**template**  
Template engine to be used to render the source file.

`salt.states.kubernetes.deployment_absent(name, namespace='default', **kwargs)`

Ensures that the named deployment is absent from the given namespace.

**name**  
The name of the deployment

**namespace**  
The name of the namespace

`salt.states.kubernetes.deployment_present(name, namespace='default', metadata=None, spec=None, source="", template="", **kwargs)`

Ensures that the named deployment is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.

**name**  
The name of the deployment.

**namespace**  
The namespace holding the deployment. The 'default' one is going to be used unless a different one is specified.

**metadata**  
The metadata of the deployment object.

**spec**  
The spec of the deployment object.

**source**  
A file containing the definition of the deployment (metadata and spec) in the official kubernetes format.

**template**  
Template engine to be used to render the source file.

`salt.states.kubernetes.namespace_absent(name, **kwargs)`

Ensures that the named namespace is absent.

**name**  
The name of the namespace

`salt.states.kubernetes.namespace_present(name, **kwargs)`

Ensures that the named namespace is present.

**name**  
The name of the namespace.

`salt.states.kubernetes.node_label_absent(name, node, **kwargs)`

Ensures that the named label is absent from the node.

**name**  
The name of the label

**node**  
The name of the node

`salt.states.kubernetes.node_label_folder_absent(name, node, **kwargs)`

Ensures the label folder doesn't exist on the specified node.

**name**

The name of label folder

**node**

The name of the node

`salt.states.kubernetes.node_label_present` (*name*, *node*, *value*, *\*\*kwargs*)

Ensures that the named label is set on the named node with the given value. If the label exists it will be replaced.

**name**

The name of the label.

**value**

Value of the label.

**node**

Node to change.

`salt.states.kubernetes.pod_absent` (*name*, *namespace='default'*, *\*\*kwargs*)

Ensures that the named pod is absent from the given namespace.

**name**

The name of the pod

**namespace**

The name of the namespace

`salt.states.kubernetes.pod_present` (*name*, *namespace='default'*, *metadata=None*, *spec=None*, *source=""*, *template=""*, *\*\*kwargs*)

Ensures that the named pod is present inside of the specified namespace with the given metadata and spec. If the pod exists it will be replaced.

**name**

The name of the pod.

**namespace**

The namespace holding the pod. The 'default' one is going to be used unless a different one is specified.

**metadata**

The metadata of the pod object.

**spec**

The spec of the pod object.

**source**

A file containing the definition of the pod (metadata and spec) in the official kubernetes format.

**template**

Template engine to be used to render the source file.

`salt.states.kubernetes.secret_absent` (*name*, *namespace='default'*, *\*\*kwargs*)

Ensures that the named secret is absent from the given namespace.

**name**

The name of the secret

**namespace**

The name of the namespace

`salt.states.kubernetes.secret_present` (*name*, *namespace='default'*, *data=None*, *source=None*, *template=None*, *\*\*kwargs*)

Ensures that the named secret is present inside of the specified namespace with the given data. If the secret exists it will be replaced.

**name**

The name of the secret.

**namespace**

The namespace holding the secret. The 'default' one is going to be used unless a different one is specified.

**data**  
The dictionary holding the secrets.

**source**  
A file containing the data of the secret in plain format.

**template**  
Template engine to be used to render the source file.

`salt.states.kubernetes.service_absent` (*name*, *namespace='default'*, *\*\*kwargs*)

Ensures that the named service is absent from the given namespace.

**name**  
The name of the service

**namespace**  
The name of the namespace

`salt.states.kubernetes.service_present` (*name*, *namespace='default'*, *metadata=None*, *spec=None*, *source=""*, *template=""*, *\*\*kwargs*)

Ensures that the named service is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.

**name**  
The name of the service.

**namespace**  
The namespace holding the service. The 'default' one is going to be used unless a different one is specified.

**metadata**  
The metadata of the service object.

**spec**  
The spec of the service object.

**source**  
A file containing the definition of the service (metadata and spec) in the official kubernetes format.

**template**  
Template engine to be used to render the source file.

### 26.19.153 salt.states.layman

#### Management of Gentoo Overlays using layman

A state module to manage Gentoo package overlays via layman

```
sunrise:
  layman.present
```

`salt.states.layman.absent` (*name*)

Verify that the overlay is absent

**name**  
The name of the overlay to delete

`salt.states.layman.present` (*name*)

Verify that the overlay is present

**name**  
The name of the overlay to add

## 26.19.154 salt.states.ldap

### Manage entries in an LDAP database

New in version 2016.3.0.

The `states.ldap` state module allows you to manage LDAP entries and their attributes.

`salt.states.ldap.managed`(*name*, *entries*, *connect\_spec=None*)

Ensure the existence (or not) of LDAP entries and their attributes

Example:

```

ldap:///:
  ldap.managed:
    - connect_spec:
      bind:
        method: sasl

    - entries:

      # make sure the entry doesn't exist
      - cn=foo,ou=users,dc=example,dc=com:
        - delete_others: True

      # make sure the entry exists with only the specified
      # attribute values
      - cn=admin,dc=example,dc=com:
        - delete_others: True
        - replace:
          cn:
            - admin
          description:
            - LDAP administrator
          objectClass:
            - simpleSecurityObject
            - organizationalRole
          userPassword:
            - {{pillar.ldap_admin_password}}

      # make sure the entry exists, its olcRootDN attribute
      # has only the specified value, the olcRootDN attribute
      # doesn't exist, and all other attributes are ignored
      - 'olcDatabase={1}hdb,cn=config':
        - replace:
          olcRootDN:
            - cn=admin,dc=example,dc=com
          # the admin entry has its own password attribute
          olcRootPW: []

      # note the use of 'default'. also note how you don't
      # have to use list syntax if there is only one attribute
      # value
      - cn=foo,ou=users,dc=example,dc=com:

```

(continues on next page)

(continued from previous page)

```

- delete_others: True
- default:
  userPassword: changeme
  shadowLastChange: 0
  # keep sshPublicKey if present, but don't create
  # the attribute if it is missing
  sshPublicKey: []
- replace:
  cn: foo
  uid: foo
  uidNumber: 1000
  gidNumber: 1000
  gecos: Foo Bar
  givenName: Foo
  sn: Bar
  homeDirectory: /home/foo
  loginShell: /bin/bash
  objectClass:
    - inetOrgPerson
    - posixAccount
    - top
    - ldapPublicKey
    - shadowAccount

```

### Parameters

- **name** -- The URL of the LDAP server. This is ignored if `connect_spec` is either a connection object or a dict with a `'url'` entry.
- **entries** -- A description of the desired state of zero or more LDAP entries.

`entries` is an iterable of dicts. Each of these dict's keys are the distinguished names (DNs) of LDAP entries to manage. Each of these dicts is processed in order. A later dict can reference an LDAP entry that was already mentioned in an earlier dict, which makes it possible for later dicts to enhance or alter the desired state of an LDAP entry.

The DN's are mapped to a description of the LDAP entry's desired state. These LDAP entry descriptions are themselves iterables of dicts. Each dict in the iterable is processed in order. They contain directives controlling the entry's state. The key names the directive type and the value is state information for the directive. The specific structure of the state information depends on the directive type.

The structure of `entries` looks like this:

```

[{'dn1': [{'directive1': directive1_state,
          directive2': directive2_state},
         {'directive3': directive3_state}],
  'dn2': [{'directive4': directive4_state,
          directive5': directive5_state}]},
 {'dn3': [{'directive6': directive6_state}]}]

```

These are the directives:

- **'delete\_others'**

Boolean indicating whether to delete attributes not mentioned in this dict or any of the other directive dicts for this DN. Defaults to `False`.

If you don't want to delete an attribute if present, but you also don't want

to add it if it is missing or modify it if it is present, you can use either the 'default' directive or the 'add' directive with an empty value list.

– **'default'**

A dict mapping an attribute name to an iterable of default values for that attribute. If the attribute already exists, it is left alone. If not, it is created using the given list of values.

An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the 'delete\_others' key is True.

– **'add'**

Attribute values to add to the entry. This is a dict mapping an attribute name to an iterable of values to add.

An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the 'delete\_others' key is True.

– **'delete'**

Attribute values to remove from the entry. This is a dict mapping an attribute name to an iterable of values to delete from the attribute. If the iterable is empty, all of the attribute's values are deleted.

– **'replace'**

Attributes to replace. This is a dict mapping an attribute name to an iterable of values. Any existing values for the attribute are deleted, then the given values are added. The iterable may be empty.

In the above directives, the iterables of attribute values may instead be None, in which case an empty list is used, or a scalar such as a string or number, in which case a new list containing the scalar is used.

Note that if all attribute values are removed from an entry, the entire entry is deleted.

- **connect\_spec** -- See the description of the connect\_spec parameter of the [ldap3.connect](#) function in the [ldap3](#) execution module. If this is a dict and the 'url' entry is not specified, the 'url' entry is set to the value of the name parameter.

## Returns

A dict with the following keys:

- **'name'**

This is the same object passed to the name parameter.

- **'changes'**

This is a dict describing the changes made (or, in test mode, the changes that would have been attempted). If no changes were made (or no changes would have been attempted), then this dict is empty. Only successful changes are included.

Each key is a DN of an entry that was changed (or would have been changed). Entries that were not changed (or would not have been changed) are not included. The value is a dict with two keys:

- **'old'**

The state of the entry before modification. If the entry did not previously exist, this key maps to None. Otherwise, the value is a dict mapping each of the old entry's attributes to a list of its values before any modifications were made. Unchanged attributes are excluded from this dict.

- **'new'**

The state of the entry after modification. If the entry was deleted,

this key maps to `None`. Otherwise, the value is a dict mapping each of the entry's attributes to a list of its values after the modifications were made. Unchanged attributes are excluded from this dict.

Example 'changes' dict where a new entry was created with a single attribute containing two values:

```
{'dn1': {'old': None,
        'new': {'attr1': ['val1', 'val2']}}}
```

Example 'changes' dict where a new attribute was added to an existing entry:

```
{'dn1': {'old': {},
        'new': {'attr2': ['val3']}}}
```

#### • 'result'

One of the following values:

- True if no changes were necessary or if all changes were applied successfully.
- False if at least one change was unable to be applied.
- None if changes would be applied but it is in test mode.

## 26.19.155 salt.states.libcloud\_dns

Manage DNS records and zones using libcloud

#### codeauthor

Anthony Shaw <[anthonyshaw@apache.org](mailto:anthonyshaw@apache.org)>

New in version 2016.11.0.

Create and delete DNS records or zones through Libcloud. Libcloud's DNS system supports over 20 DNS providers including Amazon, Google, GoDaddy, Softlayer

This module uses `libcloud`, which can be installed via package, or pip.

#### configuration

This module uses a configuration profile for one or multiple DNS providers

```
libcloud_dns:
  profile1:
    driver: godaddy
    key: 2orgk34kgk34g
  profile2:
    driver: route53
    key: blah
    secret: blah
```

Example:

```
my-zone:
  libcloud_dns.zone_present:
    - name: mywebsite.com
    - profile: profile1
my-website:
  libcloud_dns.record_present:
```

(continues on next page)

(continued from previous page)

```

- name: www
- zone: mywebsite.com
- type: A
- data: 12.34.32.3
- profile: profile1
- require:
  - libcloud_dns: my-zone

```

**depends**

apache-libcloud

`salt.states.libcloud_dns.record_absent`(*name, zone, type, data, profile*)

Ensures a record is absent.

**Parameters**

- **name** (str) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string ("") for this argument.
- **zone** (str) -- Zone where the requested record is created, the domain name
- **type** (str) -- DNS record type (A, AAAA, ...).
- **data** (str) -- Data for the record (depends on the record type).
- **profile** (str) -- The profile key

`salt.states.libcloud_dns.record_present`(*name, zone, type, data, profile*)

Ensures a record is present.

**Parameters**

- **name** (str) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string ("") for this argument.
- **zone** (str) -- Zone where the requested record is created, the domain name
- **type** (str) -- DNS record type (A, AAAA, ...).
- **data** (str) -- Data for the record (depends on the record type).
- **profile** (str) -- The profile key

`salt.states.libcloud_dns.state_result`(*result, message, name, changes=None*)

`salt.states.libcloud_dns.zone_absent`(*domain, profile*)

Ensures a record is absent.

**Parameters**

- **domain** (str) -- Zone name, i.e. the domain name
- **profile** (str) -- The profile key

`salt.states.libcloud_dns.zone_present`(*domain, type, profile*)

Ensures a record is present.

**Parameters**

- **domain** (str) -- Zone name, i.e. the domain name
- **type** (str) -- Zone type (master / slave), defaults to master
- **profile** (str) -- The profile key

## 26.19.156 salt.states.libcloud\_loadbalancer

### Apache Libcloud Load Balancer State

Manage load balancers using libcloud

#### codeauthor

Anthony Shaw <anthonyshaw@apache.org>

Apache Libcloud load balancer management for a full list of supported clouds, see [http://libcloud.readthedocs.io/en/latest/loadbalancer/supported\\_providers.html](http://libcloud.readthedocs.io/en/latest/loadbalancer/supported_providers.html)

Clouds include Amazon ELB, ALB, Google, Aliyun, CloudStack, Softlayer

New in version 2018.3.0.

#### configuration

This module uses a configuration profile for one or multiple Cloud providers

```
libcloud_loadbalancer:
  profile_test1:
    driver: gce
    key: G00G0123456789ABCXYZ
    secret: mysecret
  profile_test2:
    driver: alb
    key: 12345
    secret: mysecret
```

Example:

Using States to deploy a load balancer with extended arguments to specify region

```
lb_test:
  libcloud_loadbalancer.balancer_present:
    - name: example
    - port: 80
    - protocol: http
    - profile: google
    - ex_region: us-east1
```

#### depends

apache-libcloud

`salt.states.libcloud_loadbalancer.balancer_absent` (*name*, *profile*, *\*\*libcloud\_kwargs*)

Ensures a load balancer is absent.

#### Parameters

- **name** (str) -- Load Balancer name
- **profile** (str) -- The profile key

`salt.states.libcloud_loadbalancer.balancer_present` (*name*, *port*, *protocol*, *profile*, *algorithm=None*, *members=None*, *\*\*libcloud\_kwargs*)

Ensures a load balancer is present.

#### Parameters

- **name** (str) -- Load Balancer name
- **port** (str) -- Port the load balancer should listen on, defaults to 80
- **protocol** (str) -- Loadbalancer protocol, defaults to http.

- **profile** (str) -- The profile key
- **algorithm** (str) -- Load balancing algorithm, defaults to ROUND\_ROBIN. See Algorithm type in Libcloud documentation for a full listing.
- **members** (list of dict (ip, port)) -- An optional list of members to create on deployment

`salt.states.libcloud_loadbalancer.member_absent` (*ip, port, balancer\_id, profile, \*\*libcloud\_kwargs*)

Ensure a load balancer member is absent, based on IP and Port

**Parameters**

- **ip** (str) -- IP address for the member
- **port** (int) -- Port for the member
- **balancer\_id** (str) -- id of a load balancer you want to detach the member from
- **profile** (str) -- The profile key

`salt.states.libcloud_loadbalancer.member_present` (*ip, port, balancer\_id, profile, \*\*libcloud\_kwargs*)

Ensure a load balancer member is present

**Parameters**

- **ip** (str) -- IP address for the new member
- **port** (int) -- Port for the new member
- **balancer\_id** (str) -- id of a load balancer you want to attach the member to
- **profile** (str) -- The profile key

`salt.states.libcloud_loadbalancer.state_result` (*result, message, name, changes=None*)

## 26.19.157 salt.states.libcloud\_storage

### Apache Libcloud Storage State

Manage cloud storage using libcloud

**codeauthor**

Anthony Shaw <anthonyshaw@apache.org>

Apache Libcloud Storage (object/blob) management for a full list of supported clouds, see [http://libcloud.readthedocs.io/en/latest/storage/supported\\_providers.html](http://libcloud.readthedocs.io/en/latest/storage/supported_providers.html)

Clouds include Amazon S3, Google Storage, Aliyun, Azure Blobs, Ceph, OpenStack swift

New in version 2018.3.0.

**configuration**

This module uses a configuration profile for one or multiple Storage providers

```
libcloud_storage:
  profile_test1:
    driver: google_storage
    key: G00G0123456789ABCXYZ
    secret: mysecret
  profile_test2:
    driver: s3
    key: 12345
    secret: mysecret
```

## Examples

### Creating a container and uploading a file

```
web_things:
  libcloud_storage.container_present:
    name: my_container_name
    profile: profile1
  libcloud_storage.object_present:
    name: my_file.jpg
    container: my_container_name
    path: /path/to/local/file.jpg
    profile: profile1
```

### Downloading a file

This example will download the file from the remote cloud and keep it locally

```
web_things:
  libcloud_storage.file_present:
    name: my_file.jpg
    container: my_container_name
    path: /path/to/local/file.jpg
    profile: profile1
```

#### depends

apache-libcloud

`salt.states.libcloud_storage.container_absent` (*name*, *profile*)

Ensures a container is absent.

#### Parameters

- **name** (str) -- Container name
- **profile** (str) -- The profile key

`salt.states.libcloud_storage.container_present` (*name*, *profile*)

Ensures a container is present.

#### Parameters

- **name** (str) -- Container name
- **profile** (str) -- The profile key

`salt.states.libcloud_storage.file_present` (*container*, *name*, *path*, *profile*,  
*overwrite\_existing=False*)

Ensures a object is downloaded locally.

#### Parameters

- **container** (str) -- Container name
- **name** (str) -- Object name in cloud
- **path** (str) -- Local path to file
- **profile** (str) -- The profile key
- **overwrite\_existing** (bool) -- Replace if already exists

`salt.states.libcloud_storage.object_absent` (*container*, *name*, *profile*)

Ensures a object is absent.

#### Parameters

- **container** (str) -- Container name
- **name** (str) -- Object name in cloud
- **profile** (str) -- The profile key

`salt.states.libcloud_storage.object_present`(*container, name, path, profile*)

Ensures a object is present.

Parameters

- **container** (str) -- Container name
- **name** (str) -- Object name in cloud
- **path** (str) -- Local path to file
- **profile** (str) -- The profile key

`salt.states.libcloud_storage.state_result`(*result, message, name, changes*)

### 26.19.158 salt.states.linux\_acl

Linux File Access Control Lists

The Linux ACL state module requires the `getfacl` and `setfacl` binaries.

Ensure a Linux ACL is present

```
root:
  acl.present:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```

Ensure a Linux ACL is present as a default for all new objects

```
root:
  acl.present:
    - name: /root
    - acl_type: "default:user"
    - acl_name: damian
    - perms: rwx
```

Ensure a Linux ACL does not exist

```
root:
  acl.absent:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```

Ensure a Linux ACL list is present

```
root:
  acl.list_present:
    - name: /root
    - acl_type: user
    - acl_names:
      - damian
```

(continues on next page)

(continued from previous page)

- homer
- **perms:** rwx

Ensure a Linux ACL list does not exist

```
root:
  acl.list_absent:
    - name: /root
    - acl_type: user
    - acl_names:
      - damian
      - homer
    - perms: rwx
```

**Warning:** The effective permissions of Linux file access control lists (ACLs) are governed by the "effective rights mask" (the *mask* line in the output of the *getfacl* command) combined with the *perms* set by this module: any permission bits (for example, r=read) present in an ACL but not in the mask are ignored. The mask is automatically recomputed when setting an ACL, so normally this isn't important. However, if the file permissions are changed (with *chmod* or *file.managed*, for example), the mask will generally be set based on just the group bits of the file permissions.

As a result, when using *file.managed* or similar to control file permissions as well as this module, you should set your group permissions to be at least as broad as any permissions in your ACL. Otherwise, the two state declarations will each register changes each run, and if the *file* declaration runs later, your ACL will be ineffective.

`salt.states.linux_acl.absent` (*name*, *acl\_type*, *acl\_name=""*, *perms=""*, *recurse=False*)

Ensure a Linux ACL does not exist

**name**

The acl path

**acl\_type**

The type of the acl is used for, it can be 'user' or 'group'

**acl\_name**

The user or group

**perms**

Remove the permissions eg.: rwx

**recurse**

Set the permissions recursive in the path

`salt.states.linux_acl.list_absent` (*name*, *acl\_type*, *acl\_names=None*, *recurse=False*)

Ensure a Linux ACL list does not exist

Takes a list of acl names and remove them from the given path

**name**

The acl path

**acl\_type**

The type of the acl is used for, it can be 'user' or 'group'

**acl\_names**

The list of users or groups

**perms**

Remove the permissions eg.: rwx

**recurse**

Set the permissions recursive in the path

`salt.states.linux_acl.list_present`(*name*, *acl\_type*, *acl\_names=None*, *perms=""*, *recurse=False*, *force=False*)

Ensure a Linux ACL list is present

Takes a list of acl names and add them to the given path

**name**

The acl path

**acl\_type**

The type of the acl is used for it can be 'user' or 'group'

**acl\_names**

The list of users or groups

**perms**

Set the permissions eg.: rwx

**recurse**

Set the permissions recursive in the path

**force**

Wipe out old permissions and ensure only the new permissions are set

`salt.states.linux_acl.present`(*name*, *acl\_type*, *acl\_name=""*, *perms=""*, *recurse=False*, *force=False*)

Ensure a Linux ACL is present

**name**

The acl path

**acl\_type**

The type of the acl is used for it can be 'user' or 'group'

**acl\_name**

The user or group

**perms**

Set the permissions eg.: rwx

**recurse**

Set the permissions recursive in the path

**force**

Wipe out old permissions and ensure only the new permissions are set

### 26.19.159 salt.states.locale

#### Management of languages/locales

Manage the available locales and the system default:

```
us_locale:
  locale.present:
    - name: en_US.UTF-8

default_locale:
  locale.system:
    - name: en_US.UTF-8
    - require:
      - locale: us_locale
```

`salt.states.locale.present`(*name*)

Generate a locale if it is not present

New in version 2014.7.0.

**name**  
The name of the locale to be present. Some distributions require the charmap to be specified as part of the locale at this point.

`salt.states.locale.system(name)`

Set the locale for the system

**name**  
The name of the locale to use

### 26.19.160 salt.states.logadm

Management of logs using Solaris logadm.

**maintainer**  
Jorge Schrauwen <sjorge@blackdot.be>

**maturity**  
new

**depends**  
salt.modulus.logadm

**platform**  
Oracle Solaris, Sun Solaris, illumos

New in version 2017.7.0.

**.. note::**  
TODO

`salt.states.logadm.remove(name, log_file=None)`

Remove a log from the logadm configuration

**name**  
[string] entryname

**log\_file**  
[string] (optional) log file path

---

**Note:** If `log_file` is specified it will be used instead of the entry name.

---

`salt.states.logadm.rotate(name, **kwargs)`

Add a log to the logadm configuration

**name**  
[string] alias for entryname

**kwargs**  
[boolean|string|int] optional additional flags and parameters

### 26.19.161 salt.states.logrotate

Module for managing logrotate.

New in version 2017.7.0.

`salt.states.logrotate.set_(name, key, value, setting=None, conf_file='/etc/logrotate.conf')`

Set a new value for a specific configuration line.

#### Parameters

- **key** (*str*) -- The command or block to configure.
- **value** (*str*) -- The command value or command of the block specified by the key parameter.
- **setting** (*str*) -- The command value for the command specified by the value parameter.
- **conf\_file** (*str*) -- The logrotate configuration file.

Example of usage with only the required arguments:

```
logrotate-rotate:
logrotate.set:
- key: rotate
- value: 2
```

Example of usage specifying all available arguments:

```
logrotate-wtmp-rotate:
logrotate.set:
- key: /var/log/wtmp
- value: rotate
- setting: 2
- conf_file: /etc/logrotate.conf
```

### 26.19.162 salt.states.loop

Loop state

Allows for looping over execution modules.

New in version 2017.7.0.

In both examples below, the execution module function `boto_elb.get_instance_health` returns a list of dicts. The condition checks the `state`-key of the first dict in the returned list and compares its value to the string `InService`.

```
wait_for_service_to_be_healthy:
loop.until:
- name: boto_elb.get_instance_health
- condition: m_ret[0]['state'] == 'InService'
- period: 5
- timeout: 20
- m_args:
- {{ elb }}
- m_kwargs:
  keyid: {{ access_key }}
  key: {{ secret_key }}
  instances: "{{ instance }}"
```

**Warning:** This state allows arbitrary python code to be executed through the condition parameter which is literally evaluated within the state. Please use caution.

Changed in version 3000.

A version that does not use eval is now available. It uses either the python operator to compare the result of the function called in name, which can be one of the following: lt, le, eq (default), ne, ge, gt. Alternatively, *compare\_operator* can be filled with a function from an execution module in `__salt__` or `__utils__` like the example below. The function `data.subdict_match` checks if the expected expression matches the data returned by calling the name function (with passed args and kwargs).

**Wait for service to be healthy:**

```

loop.until_no_eval:
- name: boto_elb.get_instance_health
- expected: '0:state:InService'
- compare_operator: data.subdict_match
- period: 5
- timeout: 20
- args:
  - {{ elb }}
- kwargs:
  keyid: {{ access_key }}
  key: {{ secret_key }}
  instances: "{{ instance }}"

```

`salt.states.loop.until(name, m_args=None, m_kwargs=None, condition=None, period=1, timeout=60)`

Loop over an execution module until a condition is met.

Parameters

- **name** (*str*) -- The name of the execution module
- **m\_args** (*list*) -- The execution module's positional arguments
- **m\_kwargs** (*dict*) -- The execution module's keyword arguments
- **condition** (*str*) -- The condition which must be met for the loop to break. This should contain `m_ret` which is the return from the execution module.
- **period** (*int or float*) -- The number of seconds to wait between executions
- **timeout** (*int or float*) -- The timeout in seconds

`salt.states.loop.until_no_eval(name, expected, compare_operator='eq', timeout=60, period=1, init_wait=0, args=None, kwargs=None)`

Generic waiter state that waits for a specific salt function to produce an expected result. The state fails if the function does not exist or raises an exception, or does not produce the expected result within the allotted retries.

Parameters

- **name** (*str*) -- Name of the module.function to call
- **expected** -- Expected return value. This can be almost anything.
- **compare\_operator** (*str*) -- Operator to use to compare the result of the module.function call with the expected value. This can be anything present in `__salt__` or `__utils__`. Will be called with 2 args: result, expected.
- **timeout** (*int or float*) -- Abort after this amount of seconds (excluding `init_wait`).
- **period** (*int or float*) -- Time (in seconds) to wait between attempts.
- **init\_wait** (*int or float*) -- Time (in seconds) to wait before trying anything.
- **args** (*list*) -- args to pass to the salt module.function.
- **kwargs** (*dict*) -- kwargs to pass to the salt module.function.

New in version 3000.

### 26.19.163 salt.states.lvm

#### Management of Linux logical volumes

A state module to manage LVMs

```
/dev/sda:
  lvm.pv_present

my_vg:
  lvm.vg_present:
    - devices: /dev/sda

lvroot:
  lvm.lv_present:
    - vgname: my_vg
    - size: 10G
    - stripes: 5
    - stripesize: 8K
```

**salt.states.lvm.lv\_absent** (*name*, *vgname=None*)

Remove a given existing Logical Volume from a named existing volume group

**name**

The Logical Volume to remove

**vgname**

The name of the Volume Group on which the Logical Volume resides

**salt.states.lvm.lv\_present** (*name*, *vgname=None*, *size=None*, *extents=None*, *snapshot=None*, *pv=""*, *thinvolume=False*, *thinpool=False*, *force=False*, *resizefs=False*, **\*\*kwargs**)

Ensure that a Logical Volume is present, creating it if absent.

**name**

The name of the Logical Volume

**vgname**

The name of the Volume Group on which the Logical Volume resides

**size**

The size of the Logical Volume in megabytes, or use a suffix such as S, M, G, T, P for 512 byte sectors, megabytes, gigabytes or terabytes respectively. The suffix is case insensitive.

**extents**

The number of logical extents allocated to the Logical Volume It can be a percentage allowed by lvcreate's syntax, in this case it will set the Logical Volume initial size and won't be resized.

**snapshot**

The name of the snapshot

**pv**

The Physical Volume to use

**kwargs**

Any supported options to lvcreate. See *linux\_lvm* for more details.

New in version 2016.11.0.

**thinvolume**

Logical Volume is thinly provisioned

**thinpool**

Logical Volume is a thin pool

New in version 2018.3.0.

**force**

Assume yes to all prompts

New in version 3002.

**resizefs**

Use fsadm to resize the logical volume filesystem if needed

`salt.states.lvm.pv_absent(name)`

Ensure that a Physical Device is not being used by lvm

**name**

The device name to initialize.

`salt.states.lvm.pv_present(name, **kwargs)`

Set a Physical Device to be used as an LVM Physical Volume

**name**

The device name to initialize.

**kwargs**

Any supported options to pvcreate. See [linux\\_lvm](#) for more details.

`salt.states.lvm.vg_absent(name)`

Remove an LVM volume group

**name**

The volume group to remove

`salt.states.lvm.vg_present(name, devices=None, **kwargs)`

Create an LVM Volume Group

**name**

The Volume Group name to create

**devices**

A list of devices that will be added to the Volume Group

**kwargs**

Any supported options to vgcreate. See [linux\\_lvm](#) for more details.

## 26.19.164 salt.states.lvs\_server

### Management of LVS (Linux Virtual Server) Real Server

`salt.states.lvs_server.absent(name, protocol=None, service_address=None, server_address=None)`

Ensure the LVS Real Server in specified service is absent.

**name**

The name of the LVS server.

**protocol**

The service protocol(only support tcp, udp and fwmark service).

**service\_address**

The LVS service address.

**server\_address**

The LVS real server address.

`salt.states.lvs_server.present(name, protocol=None, service_address=None, server_address=None, packet_forward_method='dr', weight=1)`

Ensure that the named service is present.

**name**

The LVS server name

**protocol**

The service protocol

**service\_address**

The LVS service address

**server\_address**

The real server address.

**packet\_forward\_method**

The LVS packet forwarding method(`dr` for direct routing, `tunnel` for tunneling, `nat` for network access translation).

**weight**

The capacity of a server relative to the others in the pool.

```
lvrs:
  lvs_server.present:
    - protocol: tcp
    - service_address: 1.1.1.1:80
    - server_address: 192.168.0.11:8080
    - packet_forward_method: dr
    - weight: 10
```

## 26.19.165 salt.states.lvs\_service

### Management of LVS (Linux Virtual Server) Service

`salt.states.lvs_service.absent` (*name*, *protocol=None*, *service\_address=None*)

Ensure the LVS service is absent.

**name**

The name of the LVS service

**protocol**

The service protocol

**service\_address**

The LVS service address

`salt.states.lvs_service.present` (*name*, *protocol=None*, *service\_address=None*, *scheduler='wlc'*)

Ensure that the named service is present.

**name**

The LVS service name

**protocol**

The service protocol

**service\_address**

The LVS service address

**scheduler**

Algorithm for allocating TCP connections and UDP datagrams to real servers.

```
lvstest:
  lvs_service.present:
    - service_address: 1.1.1.1:80
    - protocol: tcp
    - scheduler: rr
```

## 26.19.166 salt.states.lxc

### Manage Linux Containers

`salt.states.lxc.absent` (*name*, *stop=False*, *path=None*)

Ensure a container is not present, destroying it if present

**name**

Name of the container to destroy

**stop**

stop before destroying default: false

New in version 2015.5.2.

**path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
web01:
  lxc.absent
```

`salt.states.lxc.edited_conf` (*name*, *lxc\_conf=None*, *lxc\_conf\_unset=None*)

**Warning:** This state is unsuitable for setting parameters that appear more than once in an LXC config file, or parameters which must appear in a certain order (such as when configuring more than one network interface).

[Issue #35523](#) was opened to track the addition of a suitable replacement or fix.

Edit LXC configuration options

Deprecated since version 2015.5.0.

**path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
setconf:
  lxc.edited_conf:
    - name: ubuntu
    - lxc_conf:
      - network.ipv4.ip: 10.0.3.6
    - lxc_conf_unset:
      - lxc.utsname
```

`salt.states.lxc.frozen` (*name*, *start=True*, *path=None*)

New in version 2015.5.0.

Ensure that a container is frozen

**Note:** This state does not enforce the existence of the named container, it just freezes the container if it is running. To ensure that the named container exists, use `lxc.present`.

**name**

The name of the container

**path**

path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**start**

[True] Start container first, if necessary. If `False`, then this state will fail if the container is not running.

**web01:**

`lxc.frozen`

**web02:**

**`lxc.frozen:`**

- **`start:`** `False`

`salt.states.lxc.present` (*name, running=None, clone\_from=None, snapshot=False, profile=None, network\_profile=None, template=None, options=None, image=None, config=None, fstype=None, size=None, backing=None, vgname=None, lvname=None, thinpool=None, path=None*)

Changed in version 2015.8.0: The `lxc.created` state has been renamed to `lxc.present`, and the `lxc.cloned` state has been merged into this state.

Create the named container if it does not exist

**name**

The name of the container to be created

**path**

path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**running**

[False]

- If `True`, ensure that the container is running
- If `False`, ensure that the container is stopped
- If `None`, do nothing with regards to the running state of the container

New in version 2015.8.0.

**clone\_from**

Create named container as a clone of the specified container

**snapshot**

[False] Use Copy On Write snapshots (LVM). Only supported with `clone_from`.

**profile**

Profile to use in container creation (see the [LXC Tutorial](#) for more information). Values in a profile will be overridden by the parameters listed below.

**network\_profile**

Network Profile to use in container creation (see the [LXC Tutorial](#) for more information). Values in a profile will be overridden by the parameters listed below.

New in version 2015.5.2.

**Container Creation Arguments****template**

The template to use. For example, `ubuntu` or `fedora`. For a full list of available templates, check out the `lxc.templates` function.

Conflicts with the `image` argument.

---

**Note:** The `download` template requires the following three parameters to be defined in `options`:

- `dist` - The name of the distribution
- `release` - Release name/version

- **arch** - Architecture of the container

The available images can be listed using the `lxc.images` function.

#### options

New in version 2015.5.0.

Template-specific options to pass to the `lxc-create` command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
web01:
  lxc.present:
    - template: download
    - options:
      dist: centos
      release: 6
      arch: amd64
```

Remember to double-indent the options, due to *how PyYAML works*.

For available template options, refer to the `lxc` template scripts which are usually located under `/usr/share/lxc/templates`, or run `lxc-create -t <template> -h`.

#### image

A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

#### backing

The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within `/var/lib/lxc`.

#### fstype

Filesystem type to use on LVM logical volume

#### size

Size of the volume to create. Only applicable if `backing` is set to `lvm`.

#### vgname

[lxc] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

#### lvname

Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

#### thinpool

Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing` is set to `lvm`.

`salt.states.lxc.running`(*name*, *restart=False*, *path=None*)

Changed in version 2015.5.0: The `lxc.started` state has been renamed to `lxc.running`

Ensure that a container is running

---

**Note:** This state does not enforce the existence of the named container, it just starts the container if it is not running. To ensure that the named container exists, use `lxc.present`.

---

#### name

The name of the container

#### path

path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

#### restart

[False] Restart container if it is already running

```
web01:
  lxc.running

web02:
  lxc.running:
    - restart: True
```

`salt.states.lxc.set_pass`(*name*, *\*\*kwargs*)

Deprecated since version 2015.5.0.

This state function has been disabled, as it did not conform to design guidelines. Specifically, due to the fact that `lxc.set_password` uses `chpasswd(8)` to set the password, there was no method to make this action idempotent (in other words, the password would be changed every time). This makes this state redundant, since the following state will do the same thing:

```
setpass:
  module.run:
    - name: set_pass
    - m_name: root
    - password: secret
```

`salt.states.lxc.stopped`(*name*, *kill=False*, *path=None*)

Ensure that a container is stopped

---

**Note:** This state does not enforce the existence of the named container, it just stops the container if it running or frozen. To ensure that the named container exists, use `lxc.present`, or use the `lxc.absent` state to ensure that the container does not exist.

---

**name**

The name of the container

**path**

path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**kill**

[False] Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

New in version 2015.5.0.

```
web01:
  lxc.stopped
```

### 26.19.167 salt.states.lxd

Manage LXD profiles.

New in version 2019.2.0.

**maintainer**

René Jochum <rene@jochums.at>

**maturity**

new

**depends**  
python-pylxd

**platform**  
Linux

`salt.states.lxd.authenticate`(*name, remote\_addr, password, cert, key, verify\_cert=True*)

Authenticate with a remote peer.

**remote\_addr** :

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

**Examples:**

`https://myserver.lan:8443 /var/lib/mysocket.sock`

**password** :

The PaSsW0rD

**cert** :

PEM Formatted SSL Zertifikate.

**Examples:**

`/root/.config/lxc/client.crt`

**key** :

PEM Formatted SSL Key.

**Examples:**

`/root/.config/lxc/client.key`

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**name:**

Ignore this. This is just here for salt.

`salt.states.lxd.config_managed`(*name, value, force\_password=False*)

Manage a LXD Server config setting.

**name** :

The name of the config key.

**value** :

Its value.

**force\_password**

[False] Set this to True if you want to set the password on every run.

As we can't retrieve the password from LXD we can't check if the current one is the same as the given one.

`salt.states.lxd.init`(*name, storage\_backend='dir', trust\_password=None, network\_address=None, network\_port=None, storage\_create\_device=None, storage\_create\_loop=None, storage\_pool=None, done\_file='%SALT\_CONFIG\_DIR%/lxd\_initialized'*)

Initializes the LXD Daemon, as LXD doesn't tell if its initialized we touch the done\_file and check if it exist.

This can only be called once per host unless you remove the done\_file.

**name** :

Ignore this. This is just here for salt.

**storage\_backend** :

Storage backend to use (zfs or dir, default: dir)

**trust\_password** :

Password required to add new clients

**network\_address**

[None] Address to bind LXD to (default: none)

**network\_port**

[None] Port to bind LXD to (Default: 8443)

**storage\_create\_device**

[None] Setup device based storage using this DEVICE

**storage\_create\_loop**

[None] Setup loop based storage with this SIZE in GB

**storage\_pool**

[None] Storage pool to use or create

**done\_file** :

Path where we check that this method has been called, as it can run only once and there's currently no way to ask LXD if init has been called.

### 26.19.168 salt.states.lxd\_container

Manage LXD containers.

New in version 2019.2.0.

**maintainer**

René Jochum <rene@jochums.at>

**maturity**

new

**depends**

python-pylxd

**platform**

Linux

**salt.states.lxd\_container.absent** (*name*, *stop=False*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*)

Ensure a LXD container is not present, destroying it if present

**name** :

The name of the container to destroy

**stop** :

stop before destroying default: false

**remote\_addr** :

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

**Examples:**

`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert** :

PEM Formatted SSL Zertifikate.

**Examples:**

`~/config/lxc/client.crt`

**key** :

PEM Formatted SSL Key.

**Examples:**

`~/config/lxc/client.key`

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**salt.states.lxd\_container.frozen** (*name*, *start=True*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*)

Ensure a LXD container is frozen, start and freeze it if start is true

**name** :

The name of the container to freeze

**start :**  
start and freeze it

**remote\_addr :**  
An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!  
**Examples:**  
`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**  
PEM Formatted SSL Zertifikate.  
**Examples:**  
`~/config/lxc/client.crt`

**key :**  
PEM Formatted SSL Key.  
**Examples:**  
`~/config/lxc/client.key`

**verify\_cert**  
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXN normally uses self-signed certificates.

```
salt.states.lxd_container.migrated(name, remote_addr, cert, key, verify_cert, src_remote_addr,
                                   stop_and_start=False, src_cert=None, src_key=None,
                                   src_verify_cert=None)
```

Ensure a container is migrated to another host

If the container is running, it either must be shut down first (use stop\_and\_start=True) or criu must be installed on the source and destination machines.

For this operation both certs need to be authenticated, use `lxd.authenticate <salt.states.lxd.authenticate` to authenticate your cert(s).

**name :**  
The container to migrate

**remote\_addr :**  
An URL to the destination remote Server  
**Examples:**  
`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**  
PEM Formatted SSL Zertifikate.  
**Examples:**  
`~/config/lxc/client.crt`

**key :**  
PEM Formatted SSL Key.  
**Examples:**  
`~/config/lxc/client.key`

**verify\_cert**  
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXN normally uses self-signed certificates.

**src\_remote\_addr :**  
An URL to the source remote Server  
**Examples:**  
`https://myserver.lan:8443 /var/lib/mysocket.sock`

**stop\_and\_start:**  
Stop before migrating and start after

**src\_cert :**  
PEM Formatted SSL Zertifikate, if None we copy "cert"  
**Examples:**  
`~/config/lxc/client.crt`

**src\_key** :  
 PEM Formatted SSL Key, if None we copy "key"

**Examples:**  
 ~/.config/lxc/client.key

**src\_verify\_cert** :  
 Wherever to verify the cert, if None we copy "verify\_cert"

**salt.states.lxd\_container.present** (*name*, *running=None*, *source=None*, *profiles=None*, *config=None*, *devices=None*, *architecture='x86\_64'*, *ephemeral=False*, *restart\_on\_change=False*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*)

Create the named container if it does not exist

**name**

The name of the container to be created

**running**

[None]

- If True, ensure that the container is running
- If False, ensure that the container is stopped
- If None, do nothing with regards to the running state of the container

**source**

[None] Can be either a string containing an image alias:

```
"xenial/amd64"
```

or an dict with type "image" with alias:

```
{"type": "image",
 "alias": "xenial/amd64"}
```

or image with "fingerprint":

```
{"type": "image",
 "fingerprint": "SHA-256"}
```

or image with "properties":

```
{"type": "image",
 "properties": {
   "os": "ubuntu",
   "release": "14.04",
   "architecture": "x86_64"
 }}
```

or none:

```
{"type": "none"}
```

or copy:

```
{"type": "copy",
 "source": "my-old-container"}
```

**profiles**

[[ 'default' ]] List of profiles to apply on this container

**config** :

A config dict or None (None = unset).

Can also be a list:

```
[{'key': 'boot.autostart', 'value': 1},
 {'key': 'security.privileged', 'value': '1'}]
```

**devices :**

A device dict or None (None = unset).

**architecture**

['x86\_64'] Can be one of the following:

- unknown
- i686
- x86\_64
- armv7l
- aarch64
- ppc
- ppc64
- ppc64le
- s390x

**ephemeral**

[False] Destroy this container after stop?

**restart\_on\_change**

[False] Restart the container when we detect changes on the config or its devices?

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Zertifikate.

**Examples:**

```
~/config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXN normally uses self-signed certificates.

**salt.states.lxd\_container.running**(*name, restart=False, remote\_addr=None, cert=None, key=None, verify\_cert=True*)

Ensure a LXN container is running and restart it if restart is True

**name :**

The name of the container to start/restart.

**restart :**

restart the container if it is already started.

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Zertifikate.

**Examples:**

```
~/config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

```
salt.states.lxd_container.stopped(name, kill=False, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Ensure a LXD container is stopped, kill it if kill is true else stop it

**name :**

The name of the container to stop

**kill :**

kill if true

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Zertifikate.

**Examples:**

```
~/config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

## 26.19.169 salt.states.lxd\_image

Manage LXD images.

New in version 2019.2.0.

**maintainer**

René Jochum <rene@jochums.at>

**maturity**

new

**depends**

python-pylxd

**platform**

Linux

```
salt.states.lxd_image.absent(name, remote_addr=None, cert=None, key=None, verify_cert=True)
```

**name :**

An alias or fingerprint of the image to check and delete.

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Zertifikate.

**Examples:**

```
~/.config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/.config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXID normally uses self-signed certificates.

```
salt.states.lxd_image.present(name, source, aliases=None, public=None, auto_update=None,
                                remote_addr=None, cert=None, key=None, verify_cert=True)
```

Ensure an image exists, copy it else from source

**name :**

An alias of the image, this is used to check if the image exists and it will be added as alias to the image on copy/create.

**source :**

Source dict.

For an LXD to LXD copy:

```
source:
  type: lxd
  name: ubuntu/xenial/amd64 # This can also be a fingerprint.
  remote_addr: https://images.linuxcontainers.org:8443
  cert: ~/.config/lxd/client.crt
  key: ~/.config/lxd/client.key
  verify_cert: False
```

From file:

```
source:
  type: file
  filename: salt://lxd/files/busybox.tar.xz
  saltenv: base
```

From simplestreams:

```
source:
  type: simplestreams
  server: https://cloud-images.ubuntu.com/releases
  name: xenial/amd64
```

From an URL:

```
source:
  type: url
  url: https://dl.stgraber.org/lxd
```

**aliases :**

List of aliases to append, can be empty.

**public :**

**Make this image public available on this instance?**

None on source\_type LXD means copy source None on source\_type file means False

**auto\_update :**

Try to auto-update from the original source?

None on source\_type LXD means copy source source\_type file does not have auto-update.

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

**Examples:**

`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**

PEM Formatted SSL Zertifikate.

**Examples:**

`~/config/lxc/client.crt`

**key :**

PEM Formatted SSL Key.

**Examples:**

`~/config/lxc/client.key`

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

### 26.19.170 salt.states.lxd\_profile

Manage LXD profiles.

New in version 2019.2.0.

**maintainer**

René Jochum <rene@jochums.at>

**maturity**

new

**depends**

python-pylxd

**platform**

Linux

**salt.states.lxd\_profile.absent** (*name, remote\_addr=None, cert=None, key=None, verify\_cert=True*)

Ensure a LXD profile is not present, removing it if present.

**name :**

The name of the profile to remove.

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

**Examples:**

`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert :**

PEM Formatted SSL Zertifikate.

**Examples:**

`~/config/lxc/client.crt`

**key :**

PEM Formatted SSL Key.

**Examples:**

`~/config/lxc/client.key`

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

See the *requests-docs* for the SSL stuff.

`salt.states.lxd_profile.present` (*name*, *description=None*, *config=None*, *devices=None*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*)

Creates or updates LXD profiles

**name :**

The name of the profile to create/update

**description :**

A description string

**config :**

A config dict or None (None = unset).

Can also be a list:

```
[[{'key': 'boot.autostart', 'value': 1},
  {'key': 'security.privileged', 'value': '1'}]
```

**devices :**

A device dict or None (None = unset).

**remote\_addr :**

An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

**cert :**

PEM Formatted SSL Zertifikate.

**Examples:**

```
~/config/lxc/client.crt
```

**key :**

PEM Formatted SSL Key.

**Examples:**

```
~/config/lxc/client.key
```

**verify\_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

See the [lxd-docs](#) for the details about the config and devices dicts. See the [requests-docs](#) for the SSL stuff.

## 26.19.171 salt.states.mac\_assistive

Allows you to manage assistive access on macOS minions with 10.9+

Install, enable and disable assistive access on macOS minions

```
/usr/bin/osascript:
assistive_installed:
- enabled: True
```

`salt.states.mac_assistive.installed` (*name*, *enabled=True*)

Make sure that we have the given bundle ID or path to command installed in the assistive access panel.

**name**

The bundle ID or path to command

**enable**

Should assistive access be enabled on this application?

## 26.19.172 salt.states.mac\_keychain

### Installing of certificates to the keychain

Install certificats to the macOS keychain

```
/mnt/test.p12:  
keychain.installed:  
- password: test123
```

`salt.states.mac_keychain.default_keychain`(*name*, *domain*='user', *user*=None)

Set the default keychain to use

**name**

The chain in which to use as the default

**domain**

The domain to use valid values are user|system|common|dynamic, the default is user

**user**

The user to run as

`salt.states.mac_keychain.installed`(*name*, *password*, *keychain*='/Library/Keychains/System.keychain',  
\*\**kwargs*)

Install a p12 certificate file into the macOS keychain

**name**

The certificate to install

**password**

The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

**keychain**

The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

**allow\_any**

Allow any application to access the imported certificate without warning

**keychain\_password**

If your keychain is likely to be locked pass the password and it will be unlocked before running the import

`salt.states.mac_keychain.uninstalled`(*name*, *password*,  
*keychain*='/Library/Keychains/System.keychain',  
*keychain\_password*=None)

Uninstall a p12 certificate file from the macOS keychain

**name**

The certificate to uninstall, this can be a path for a .p12 or the friendly name

**password**

The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

**cert\_name**

The friendly name of the certificate, this can be used instead of giving a certificate

**keychain**

The keychain to remove the certificate from, this defaults to /Library/Keychains/System.keychain

**keychain\_password**

If your keychain is likely to be locked pass the password and it will be unlocked before running the import

## 26.19.173 salt.states.mac\_xattr

Allows you to manage extended attributes on files or directories

Install, enable and disable assistive access on macOS minions

```

/path/to/file:
  xattr.exists:
    - attributes:
      - com.file.attr=test
      - com.apple.quarantine=0x00001111

```

`salt.states.mac_xattr.delete`(*name*, *attributes*)

Make sure the given attributes are deleted from the file/directory

**name**

The path to the file/directory

**attributes**

The attributes that should be removed from the file/directory, this is accepted as an array.

`salt.states.mac_xattr.exists`(*name*, *attributes*)

Make sure the given attributes exist on the file/directory

**name**

The path to the file/directory

**attributes**

The attributes that should exist on the file/directory, this is accepted as an array, with key and value split with an equals sign, if you want to specify a hex value then add 0x to the beginning of the value.

## 26.19.174 salt.states.macdefaults

Writing/reading defaults from a macOS minion

`salt.states.macdefaults.absent`(*name*, *domain*, *user=None*)

Make sure the defaults value is absent

**name**

The key of the given domain to remove

**domain**

The name of the domain to remove from

**user**

The user to write the defaults to

`salt.states.macdefaults.write`(*name*, *domain*, *value*, *vtype='string'*, *user=None*)

Write a default to the system

**name**

The key of the given domain to write to

**domain**

The name of the domain to write to

**value**

The value to write to the given key

**vtype**

The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add

**user**

The user to write the defaults to

## 26.19.175 salt.states.macpackage

### Installing of mac pkg files

Install any kind of pkg, dmg or app file on macOS:

```

/mnt/test.pkg:
  macpackage.installed:
    - store: True

/mnt/test.dmg:
  macpackage.installed:
    - dmg: True

/mnt/xcode.dmg:
  macpackage.installed:
    - dmg: True
    - app: True
    - target: /Applications/Xcode.app
    - version_check: xcodebuild -version=Xcode 7.1\n.*7B91b

```

```

salt.states.macpackage.installed(name, target='LocalSystem', dmg=False, store=False, app=False,
                                 mpkg=False, force=False, allow_untrusted=False,
                                 version_check=None)

```

Install a Mac OS Package from a pkg or dmg file, if given a dmg file it will first be mounted in a temporary location

**name**

The pkg or dmg file to install

**target**

The location in which to install the package. This can be a path or LocalSystem

**dmg**

Is the given file a dmg file?

**store**

Should the pkg be installed as if it was from the Mac OS Store?

**app**

Is the file a .app? If so then we'll just copy that to /Applications/ or the given target

**mpkg**

Is the file a .mpkg? If so then we'll check all of the .pkg files found are installed

**force**

Force the package to be installed even if its already been found installed

**allow\_untrusted**

Allow the installation of untrusted packages

**version\_check**

The command and version that we want to check against, the version number can use regex.

```

version_check: python --version_check=2.7.[0-9]

```

## 26.19.176 salt.states.makeconf

### Management of Gentoo make.conf

A state module to manage Gentoo's make.conf file

```

makeopts:
  makeconf.present:
    - value: '-j3'

```

`salt.states.makeconf.absent(name)`

Verify that the variable is not in the make.conf.

**name**

The variable name. This will automatically be converted to upper case since variables in make.conf are in upper case

`salt.states.makeconf.present(name, value=None, contains=None, excludes=None)`

Verify that the variable is in the make.conf and has the provided settings. If value is set, contains and excludes will be ignored.

**name**

The variable name. This will automatically be converted to upper case since variables in make.conf are in upper case

**value**

Enforce that the value of the variable is set to the provided value

**contains**

Enforce that the value of the variable contains the provided value

**excludes**

Enforce that the value of the variable does not contain the provided value.

## 26.19.177 salt.states.marathon\_app

Configure Marathon apps via a salt proxy.

```

my_app:
  marathon_app.config:
    - config:
      cmd: "while [ true ] ; do echo 'Hello Marathon' ; sleep 5 ; done"
      cpus: 0.1
      mem: 10
      instances: 3

```

New in version 2015.8.2.

`salt.states.marathon_app.absent(name)`

Ensure that the marathon app with the given id is not present.

**Parameters**

**name** -- The app name/id

**Returns**

A standard Salt changes dictionary

`salt.states.marathon_app.config(name, config)`

Ensure that the marathon app with the given id is present and is configured to match the given config values.

**Parameters**

• **name** -- The app name/id

- **config** -- The configuration to apply (dict)

**Returns**

A standard Salt changes dictionary

`salt.states.marathon_app.running(name, restart=False, force=True)`

Ensure that the marathon app with the given id is present and restart if set.

**Parameters**

- **name** -- The app name/id
- **restart** -- Restart the app
- **force** -- Override the current deployment

**Returns**

A standard Salt changes dictionary

## 26.19.178 salt.states.mdadm\_raid

### Managing software RAID with mdadm

**depends**

mdadm

A state module for creating or destroying software RAID devices.

```
/dev/md0:  
raid.present:  
- level: 5  
- devices:  
  - /dev/xvdd  
  - /dev/xvde  
  - /dev/xvdf  
- chunk: 256  
- run: True
```

`salt.states.mdadm_raid.absent(name)`

Verify that the raid is absent

**name**

The name of raid device to be destroyed

```
/dev/md0:  
raid:  
- absent
```

`salt.states.mdadm_raid.present(name, level, devices, **kwargs)`

Verify that the raid is present

Changed in version 2014.7.0.

**name**

The name of raid device to be created

**level**

The RAID level to use when creating the raid.

**devices**

A list of devices used to build the array.

**kwargs**

Optional arguments to be passed to mdadm.

Example:

```

/dev/md0:
  raid.present:
    - level: 5
    - devices:
      - /dev/xvdd
      - /dev/xvde
      - /dev/xvdf
    - chunk: 256
    - run: True

```

### 26.19.179 salt.states.memcached

#### States for Management of Memcached Keys

New in version 2014.1.0.

`salt.states.memcached.absent` (*name*, *value=None*, *host='127.0.0.1'*, *port=11211*, *time=0*)

Ensure that a memcached key is not present.

**name**

The key

**value**

[None] If specified, only ensure that the key is absent if it matches the specified value.

**host**

The memcached server IP address

**port**

The memcached server port

```

foo:
  memcached.absent

bar:
  memcached.absent:
    - host: 10.0.0.1

```

`salt.states.memcached.managed` (*name*, *value=None*, *host='127.0.0.1'*, *port=11211*, *time=0*, *min\_compress\_len=0*)

Manage a memcached key.

**name**

The key to manage

**value**

The value to set for that key

**host**

The memcached server IP address

**port**

The memcached server port

```

foo:
  memcached.managed:
    - value: bar

```

## 26.19.180 salt.states.modjk

State to control Apache modjk

`salt.states.modjk.worker_activated`(*name*, *workers=None*, *profile='default'*)

Activate all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_activated:
    - workers:
      - app1
      - app2
```

`salt.states.modjk.worker_disabled`(*name*, *workers=None*, *profile='default'*)

Disable all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_disabled:
    - workers:
      - app1
      - app2
```

`salt.states.modjk.worker_recover`(*name*, *workers=None*, *profile='default'*)

Recover all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_recover:
    - workers:
      - app1
      - app2
```

`salt.states.modjk.worker_stopped`(*name*, *workers=None*, *profile='default'*)

Stop all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_stopped:
    - workers:
      - app1
      - app2
```

## 26.19.181 salt.states.modjk\_worker

### Manage modjk workers

Send commands to a **modjk** load balancer via the peer system.

This module can be used with the *prereq* requisite to remove/add the worker from the load balancer before deploying/restarting service.

Mandatory Settings:

- The minion needs to have permission to publish the **modjk.\*** functions (see [here](#) for information on configuring peer publishing permissions)
- The modjk load balancer must be configured as stated in the **modjk** execution module *documentation*

`salt.states.modjk_worker.activate` (*name, lbn, target, profile='default', tgt\_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Activate the named worker from the lbn load balancers at the targeted minions

Example:

```
disable-before-deploy:
  modjk_worker.activate:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

`salt.states.modjk_worker.disable` (*name, lbn, target, profile='default', tgt\_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Disable the named worker from the lbn load balancers at the targeted minions. The worker will get traffic only for current sessions and won't get new ones.

Example:

```
disable-before-deploy:
  modjk_worker.disable:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

`salt.states.modjk_worker.stop` (*name, lbn, target, profile='default', tgt\_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Stop the named worker from the lbn load balancers at the targeted minions The worker won't get any traffic from the lbn

Example:

```
disable-before-deploy:
  modjk_worker.stop:
```

(continues on next page)

(continued from previous page)

```
- name: {{ grains['id'] }}
- lbn: application
- target: 'roles:balancer'
- tgt_type: grain
```

## 26.19.182 salt.states.module

### Execution of Salt modules from within states

**Note:** As of the 3005 release, you no longer need to opt-in to the new style of calling `module.run`. The following config can be removed from `/etc/salt/minion`:

```
use_superseded:
- module.run
```

Both 'new' and 'legacy' styles of calling `module.run` are supported.

With `module.run` these states allow individual execution module calls to be made via states. Here's a contrived example, to show you how it's done:

```
# New Style
test.random_hash:
  module.run:
    - test.random_hash:
      - size: 42
      - hash_type: sha256

# Legacy Style
test.random_hash:
  module.run:
    - size: 42
    - hash_type: sha256
```

In the new style, the state ID (`test.random_hash`, in this case) is irrelevant when using `module.run`. It could have very well been written:

```
Generate a random hash:
module.run:
  - test.random_hash:
    - size: 42
    - hash_type: sha256
```

For a simple state like that it's not a big deal, but if the module you're using has certain parameters, things can get cluttered, fast. Using the contrived custom module (stuck in `/srv/salt/_modules/foo.py`, or your configured `file_roots`):

```
def bar(name, names, fun, state, saltenv):
    return "Name: {name} Names: {names} Fun: {fun} State: {state} Saltenv:
    ↪{saltenv}".format(**locals())
```

Your legacy state has to look like this:

```
# Legacy style
Unfortunate example:
module.run:
- name: foo.bar
- m_name: Some name
- m_names:
  - Such names
  - very wow
- m_state: Arkansas
- m_fun: Such fun
- m_saltenv: Salty
```

With the new style it's much cleaner:

```
# New style
Better:
module.run:
- foo.bar:
  - name: Some name
  - names:
    - Such names
    - very wow
  - state: Arkansas
  - fun: Such fun
  - saltenv: Salty
```

The new style also allows multiple modules in one state. For instance, you can do this:

```
Do many things:
module.run:
- test.random_hash:
  - size: 10
  - hash_type: md5
# Note the `:` at the end
- test.true:
- test.arg:
  - this
  - has
  - args
  - and: kwargs
  - isn't: that neat?
# Note the `:` at the end, too
- test.version:
- test.fib:
  - 4
```

Where in the legacy style you would have had to split your states like this:

```
test.random_hash:
module.run:
- size: 10
- hash_type: md5
```

(continues on next page)

(continued from previous page)

```
test.nop:
  module.run
```

```
test.arg:
  module.run:
    - args:
      - this
      - has
      - args
    - kwargs:
      and: kwargs
      isn't: that neat?
```

```
test.version:
  module.run
```

Another difference is that in the legacy style, unconsumed arguments to the `module` state were simply passed into the module function being executed:

```
show off module.run with args:
  module.run:
    - name: test.random_hash
    - size: 42
    - hash_type: sha256
```

The new style is much more explicit, with the arguments and keyword arguments being nested under the name of the function:

```
show off module.run with args:
  module.run:
    # Note the lack of `name: `, and trailing `:`
    - test.random_hash:
      - size: 42
      - hash_type: sha256
```

If the function takes `*args`, they can be passed in as well:

```
args and kwargs:
  module.run:
    - test.arg:
      - isn't
      - this
      - fun
      - this: that
      - salt: stack
```

## Modern Examples

Here are some other examples using the modern `module.run`:

```
fetch_out_of_band:
  module.run:
    - git.fetch:
      - cwd: /path/to/my/repo
      - user: myuser
      - opts: '--all'
```

A more complex example:

```
eventsviewer:
  module.run:
    - task.create_task:
      - name: events-viewer
      - user_name: System
      - action_type: Execute
      - cmd: 'c:\netops\scripts\events_viewer.bat'
      - trigger_type: 'Daily'
      - start_date: '2017-1-20'
      - start_time: '11:59PM'
```

It is sometimes desirable to trigger a function call after a state is executed, for this the `module.wait` state can be used:

```
add example to hosts:
  file.append:
    - name: /etc/hosts
    - text: 203.0.113.13      example.com

# New Style
mine.send:
  module.wait:
    # Again, note the trailing ``
    - hosts.list_hosts:
    - watch:
      - file: add example to hosts
```

## Legacy (Default) Examples

If you're using the legacy `module.run`, due to how the state system works, if a module function accepts an argument called, `name`, then `m_name` must be used to specify that argument, to avoid a collision with the `name` argument.

Here is a list of keywords hidden by the state system, which must be prefixed with `m_`:

- fun
- name
- names
- state

- saltenv

For example:

```
disable_nfs:  
module.run:  
- name: service.disable  
- m_name: nfs
```

Note that some modules read all or some of the arguments from a list of keyword arguments. For example:

```
mine.send:  
module.run:  
- func: network.ip_addrs  
- kwargs:  
  interface: eth0
```

```
cloud.create:  
module.run:  
- func: cloud.create  
- provider: test-provider  
- m_names:  
  - test-vlad  
- kwargs: {  
    ssh_username: 'ubuntu',  
    image: 'ami-8d6d9daa',  
    securitygroup: 'default',  
    size: 'c3.large',  
    location: 'ap-northeast-1',  
    delvol_on_destroy: 'True'  
  }
```

Other modules take the keyword arguments using this style:

```
mac_enable_ssh:  
module.run:  
- name: system.set_remote_login  
- enable: True
```

Another example that creates a recurring task that runs a batch file on a Windows system:

```
eventsviewer:  
module.run:  
- name: task.create_task  
- m_name: 'events-viewer'  
- user_name: System  
- kwargs: {  
  action_type: 'Execute',  
  cmd: 'c:\netops\scripts\events_viewer.bat',  
  trigger_type: 'Daily',  
  start_date: '2017-1-20',  
  start_time: '11:59PM'  
}
```

```
salt.states.module.mod_watch(**kwargs)
```

This function is an alias of `run`.

Run a single module function or a range of module functions in a batch. Supersedes `module.run` function, which requires `m_` prefix to function-specific parameters.

**param returner**

Specify a common returner for the whole batch to send the return data

**param kwargs**

Pass any arguments needed to execute the function(s)

```
some_id_of_state:
  module.run:
    - network.ip_addrs:
    - interface: eth0
    - cloud.create:
    - names:
      - test-isbm-1
      - test-isbm-2
    - ssh_username: sles
    - image: sles12sp2
    - securitygroup: default
    - size: 'c3.large'
    - location: ap-northeast-1
    - delvol_on_destroy: True
```

**return**

`salt.states.module.run(**kwargs)`

Run a single module function or a range of module functions in a batch. Supersedes `module.run` function, which requires `m_` prefix to function-specific parameters.

**Parameters**

- **returner** -- Specify a common returner for the whole batch to send the return data
- **kwargs** -- Pass any arguments needed to execute the function(s)

```
some_id_of_state:
  module.run:
    - network.ip_addrs:
    - interface: eth0
    - cloud.create:
    - names:
      - test-isbm-1
      - test-isbm-2
    - ssh_username: sles
    - image: sles12sp2
    - securitygroup: default
    - size: 'c3.large'
    - location: ap-northeast-1
    - delvol_on_destroy: True
```

**Returns**

`salt.states.module.wait(name, **kwargs)`

Run a single module function only if the watch statement calls it

**name**

The module function to execute

**\*\*kwargs**

Pass any arguments needed to execute the function

---

**Note:** Like the `cmd.run` state, this state will return `True` but not actually execute, unless one of the following two things happens:

1. The state has a `watch requisite`, and the state which it is watching changes.
  2. Another state has a `watch_in requisite` which references this state, and the state with the `watch_in` changes.
- 

`salt.states.module.watch(name, **kwargs)`

This function is an alias of `wait`.

Run a single module function only if the watch statement calls it

**name**

The module function to execute

**\*\*kwargs**

Pass any arguments needed to execute the function

---

**Note:** Like the `cmd.run` state, this state will return `True` but not actually execute, unless one of the following two things happens:

1. The state has a `watch requisite`, and the state which it is watching changes.
  2. Another state has a `watch_in requisite` which references this state, and the state with the `watch_in` changes.
- 

## 26.19.183 salt.states.mongodb\_database

### Management of MongoDB Databases

**depends**

- pymongo Python module

Only deletion is supported, creation doesn't make sense and can be done using `mongodb_user.present`.

`salt.states.mongodb_database.absent(name, user=None, password=None, host=None, port=None, authdb=None)`

Ensure that the named database is absent. Note that creation doesn't make sense in MongoDB.

**name**

The name of the database to remove

**user**

The user to connect as (must be able to create the user)

**password**

The password of the user

**host**

The host to connect to

**port**

The port to connect to

**authdb**

The database in which to authenticate

## 26.19.184 salt.states.mongodb\_user

### Management of MongoDB Users

#### depends

- pymongo Python module

`salt.states.mongodb_user.absent` (*name, user=None, password=None, host=None, port=None, database='admin', authdb=None*)

Ensure that the named user is absent

#### name

The name of the user to remove

#### user

MongoDB user with sufficient privilege to create the user

#### password

Password for the admin user specified by the `user` parameter

#### host

The hostname/IP address of the MongoDB server

#### port

The port on which MongoDB is listening

#### database

The database from which to remove the user specified by the `name` parameter

#### authdb

The database in which to authenticate

`salt.states.mongodb_user.present` (*name, passwd, database='admin', user=None, password=None, host='localhost', port=27017, authdb=None, roles=None*)

Ensure that the user is present with the specified properties

#### name

The name of the user to manage

#### passwd

The password of the user to manage

#### user

MongoDB user with sufficient privilege to create the user

#### password

Password for the admin user specified with the `user` parameter

#### host

The hostname/IP address of the MongoDB server

#### port

The port on which MongoDB is listening

#### database

The database in which to create the user

---

**Note:** If the database doesn't exist, it will be created.

---

#### authdb

The database in which to authenticate

#### roles

The roles assigned to user specified with the `name` parameter

Example:

```
mongouser-myapp:
  mongodb_user.present:
```

(continues on next page)

(continued from previous page)

```

- name: myapp
- passwd: password-of-myapp
- database: admin
# Connect as admin:sekrit
- user: admin
- password: sekret
- roles:
  - readWrite
  - userAdmin
  - dbOwner

```

### 26.19.185 salt.states.monit

#### Monit state

Manage monit states

```

monit_enable_service_monitoring:
  monit.monitor:
    - name: service

monit_disable_service_monitoring:
  monit.unmonitor:
    - name: service

```

---

**Note:** Use of these states require that the *monit* execution module is available.

---

`salt.states.monit.monitor(name)`

Get the summary from module monit and try to see if service is being monitored. If not then monitor the service.

`salt.states.monit.unmonitor(name)`

Get the summary from module monit and try to see if service is being monitored. If it is then stop monitoring the service.

### 26.19.186 salt.states.mount

#### Mounting of filesystems

Mount any type of mountable filesystem with the mounted function:

```

/mnt/sdb:
  mount.mounted:
    - device: /dev/sdb1
    - fstype: ext4
    - mkmnt: True
    - opts:
      - defaults

```

(continues on next page)

(continued from previous page)

```

/srv/bigdata:
  mount.mounted:
    - device: UUID=066e0200-2867-4ebe-b9e6-f30026ca2314
    - fstype: xfs
    - opts: nobootwait,noatime,nodiratime,nobarrier,logbufs=8
    - dump: 0
    - pass_num: 2
    - persist: True
    - mkmnt: True

/var/lib/bigdata:
  mount.mounted:
    - device: /srv/bigdata
    - fstype: none
    - opts: bind
    - dump: 0
    - pass_num: 0
    - persist: True
    - mkmnt: True

```

`salt.states.mount.fstab_absent` (*name, fs\_file, mount\_by=None, config='/etc/fstab'*)

Makes sure that a fstab mount point is absent.

**name**

The name of block device. Can be any valid `fs_spec` value.

**fs\_file**

Mount point (target) for the filesystem.

**mount\_by**

Select the final value for `fs_spec`. Can be `[None, device, label, uuid, partlabel, partuuid]`. If `None`, the value for `fs_spec` will be the parameter `name`, in other case will search the correct value based on the device name. For example, for `uuid`, the value for `fs_spec` will be of type `'UUID=xxx'` instead of the device name set in `name`.

**config**

Place where the fstab file lives

`salt.states.mount.fstab_present` (*name, fs\_file, fs\_vfstype, fs\_mntops='defaults', fs\_freq=0, fs\_passno=0, mount\_by=None, config='/etc/fstab', mount=True, match\_on='auto', not\_change=False, fs\_mount=True*)

Makes sure that a fstab mount point is present.

**name**

The name of block device. Can be any valid `fs_spec` value.

**fs\_file**

Mount point (target) for the filesystem.

**fs\_vfstype**

The type of the filesystem (e.g. `ext4`, `xfs`, `btrfs`, ...)

**fs\_mntops**

The mount options associated with the filesystem. Default is `defaults`.

**fs\_freq**

Field is used by `dump` to determine which fs need to be dumped. Default is `0`

**fs\_passno**

Field is used by `fsck` to determine the order in which filesystem checks are done at boot time. Default is `0`

**fs\_mount**

Field is used only in AIX systems to determine if the filesystem will be mounted by `mount -all`

**mount\_by**  
Select the final value for `fs_spec`. Can be [None, device, label, uuid, partlabel, partuuid]. If None, the value for `fs_spec` will be the parameter name, in other case will search the correct value based on the device name. For example, for `uuid`, the value for `fs_spec` will be of type 'UUID=xxx' instead of the device name set in `name`.

**config**  
Place where the `fstab` file lives. Default is `/etc/fstab`

**mount**  
Set if the mount should be mounted immediately. Default is `True`

**match\_on**  
A name or list of `fstab` properties on which this state should be applied. Default is `auto`, a special value indicating to guess based on `fstype`. In general, `auto` matches on name for recognized special devices and device otherwise.

**not\_change**  
By default, if the entry is found in the `fstab` file but is different from the expected content (like different options), the entry will be replaced with the correct content. If this parameter is set to `True` and the line is found, the original content will be preserved.

`salt.states.mount.mod_watch`(*name*, *user=None*, *\*\*kwargs*)

The mounted watcher, called to invoke the watch command.

---

**Note:** This state exists to support special handling of the `watch requisite`. It should not be called directly.

Parameters for this function should be set by the state being triggered.

---

**name**  
The name of the mount point

`salt.states.mount.mounted`(*name*, *device*, *fstype*, *mkmnt=False*, *opts='defaults'*, *dump=0*, *pass\_num=0*, *config='/etc/fstab'*, *persist=True*, *mount=True*, *user=None*, *match\_on='auto'*, *device\_name\_regex=None*, *extra\_mount\_invisible\_options=None*, *extra\_mount\_invisible\_keys=None*, *extra\_mount\_ignore\_fs\_keys=None*, *extra\_mount\_translate\_options=None*, *hidden\_opts=None*, *bind\_mount\_copy\_active\_opts=True*, *\*\*kwargs*)

Verify that a device is mounted

**name**  
The path to the location where the device is to be mounted

**device**  
The device name, typically the device node, such as `/dev/sdb1` or `UUID=066e0200-2867-4ebe-b9e6-f30026ca2314` or `LABEL=DATA`

**fstype**  
The filesystem type, this will be `xfs`, `ext2/3/4` in the case of classic filesystems, `fuse` in the case of fuse mounts, and `nfs` in the case of `nfs` mounts

**mkmnt**  
If the mount point is not present then the state will fail, set `mkmnt: True` to create the mount point if it is otherwise not present

**opts**  
A list object of options or a comma delimited list

**dump**  
The dump value to be passed into the `fstab`, Default is `0`

**pass\_num**  
The pass value to be passed into the `fstab`, Default is `0`

**config**

Set an alternative location for the fstab, Default is `/etc/fstab`

**persist**

Set if the mount should be saved in the fstab, Default is `True`

**mount**

Set if the mount should be mounted immediately, Default is `True`

**user**

The account used to execute the mount; this defaults to the user salt is running as on the minion

**match\_on**

A name or list of fstab properties on which this state should be applied. Default is `auto`, a special value indicating to guess based on fstype. In general, `auto` matches on name for recognized special devices and device otherwise.

**device\_name\_regex**

A list of device exact names or regular expressions which should not force a remount. For example, glusterfs may be mounted with a comma-separated list of servers in fstab, but the `/proc/self/mountinfo` will show only the first available server.

```
{% set glusterfs_ip_list = ['10.0.0.1', '10.0.0.2', '10.0.0.3'] %}

mount glusterfs volume:
  mount.mounted:
    - name: /mnt/glusterfs_mount_point
    - device: {{ glusterfs_ip_list|join(',') }}:/volume_name
    - fstype: glusterfs
    - opts: _netdev,rw,defaults,direct-io-mode=disable
    - mkmnt: True
    - persist: True
    - dump: 0
    - pass_num: 0
    - device_name_regex:
      - ({{ glusterfs_ip_list|join('|') }}):/volume_name
```

New in version 2016.11.0.

**extra\_mount\_invisible\_options**

A list of extra options that are not visible through the `/proc/self/mountinfo` interface.

If a option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_options` list.

**extra\_mount\_invisible\_keys**

A list of extra key options that are not visible through the `/proc/self/mountinfo` interface.

If a key option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_keys` list.

A good example for a key option is the password option:

```
password=badsecret
```

**extra\_mount\_ignore\_fs\_keys**

A dict of filesystem options which should not force a remount. This will update the internal dictionary. The dict should look like this:

```
{
  'ramfs': ['size']
}
```

**extra\_mount\_translate\_options**

A dict of mount options that gets translated when mounted. To prevent a remount add additional options to the default dictionary. This will update the internal dictionary. The dictionary should look like this:

```
{
  'tcp': 'proto=tcp',
  'udp': 'proto=udp'
}
```

**hidden\_opts**

A list of mount options that will be ignored when considering a remount as part of the state application

New in version 2015.8.2.

**bind\_mount\_copy\_active\_opts**

If set to `False`, this option disables the default behavior of copying the options from the bind mount if it was found to be active.

New in version 3006.0.

`salt.states.mount.swap` (*name*, *persist=True*, *config='/etc/fstab'*)

Activates a swap device

```
/root/swapfile:
mount.swap
```

---

**Note:** swap does not currently support LABEL

---

`salt.states.mount.unmounted` (*name*, *device=None*, *config='/etc/fstab'*, *persist=False*, *user=None*, **\*\*kwargs**)

New in version 0.17.0.

Verify that a device is not mounted

**name**

The path to the location where the device is to be unmounted from

**device**

The device to be unmounted. This is optional because the device could be mounted in multiple places.

New in version 2015.5.0.

**config**

Set an alternative location for the fstab, Default is `/etc/fstab`

**persist**

Set if the mount should be purged from the fstab, Default is `False`

**user**

The user to own the mount; this defaults to the user salt is running as on the minion

## 26.19.187 salt.states.mssql\_database

### Management of Microsoft SQLServer Databases

The `mssql_database` module is used to create and manage SQL Server Databases

```
yolo:
mssql_database.present
```

`salt.states.mssql_database.absent` (*name*, **\*\*kwargs**)

Ensure that the named database is absent

**name**

The name of the database to remove

`salt.states.mssql_database.present`(*name*, *containment*='NONE', *options*=None, *\*\*kwargs*)

Ensure that the named database is present with the specified options

**name**

The name of the database to manage

**containment**

Defaults to NONE

**options**

Can be a list of strings, a dictionary, or a list of dictionaries

## 26.19.188 salt.states.mssql\_login

### Management of Microsoft SQLServer Logins

The `mssql_login` module is used to create and manage SQL Server Logins

**frank:**

```
mssql_login.present
- domain: mydomain
```

`salt.states.mssql_login.absent`(*name*, *\*\*kwargs*)

Ensure that the named login is absent

**name**

The name of the login to remove

`salt.states.mssql_login.present`(*name*, *password*=None, *domain*=None, *server\_roles*=None, *options*=None, *\*\*kwargs*)

Checks existence of the named login. If not present, creates the login with the specified roles and options.

**name**

The name of the login to manage

**password**

Creates a SQL Server authentication login Since hashed passwords are varbinary values, if the `new_login_password` is 'long', it will be considered to be HASHED.

**domain**

Creates a Windows authentication login. Needs to be NetBIOS domain or hostname

**server\_roles**

Add this login to all the server roles in the list

**options**

Can be a list of strings, a dictionary, or a list of dictionaries

## 26.19.189 salt.states.mssql\_role

### Management of Microsoft SQLServer Databases

The `mssql_role` module is used to create and manage SQL Server Roles

**yolo:**

```
mssql_role.present
```

`salt.states.mssql_role.absent(name, **kwargs)`

Ensure that the named database is absent

**name**

The name of the database to remove

`salt.states.mssql_role.present(name, owner=None, grants=None, **kwargs)`

Ensure that the named database is present with the specified options

**name**

The name of the database to manage

**owner**

Adds owner using AUTHORIZATION option

**Grants**

Can only be a list of strings

## 26.19.190 salt.states.mssql\_user

### Management of Microsoft SQLServer Users

The `mssql_user` module is used to create and manage SQL Server Users

```
frank:
  mssql_user.present:
    - database: yolo
```

`salt.states.mssql_user.absent(name, **kwargs)`

Ensure that the named user is absent

**name**

The username of the user to remove

`salt.states.mssql_user.present(name, login=None, domain=None, database=None, roles=None, options=None, **kwargs)`

Checks existence of the named user. If not present, creates the user with the specified roles and options.

**name**

The name of the user to manage

**login**

If not specified, will be created WITHOUT LOGIN

**domain**

Creates a Windows authentication user. Needs to be NetBIOS domain or hostname

**database**

The database of the user (not the login)

**roles**

Add this user to all the roles in the list

**options**

Can be a list of strings, a dictionary, or a list of dictionaries

## 26.19.191 salt.states.msteams

### Send a message card to Microsoft Teams

This state is useful for sending messages to Teams during state runs.

New in version 2017.7.0.

```
teams-message:
  msteams.post_card:
    - message: 'This state was executed successfully.'
    - hook_url: https://outlook.office.com/webhook/837
```

The hook\_url can be specified in the master or minion configuration like below:

```
msteams:
  hook_url: https://outlook.office.com/webhook/837
```

`salt.states.msteams.post_card`(*name*, *message*, *hook\_url=None*, *title=None*, *theme\_color=None*)

Send a message to a Microsoft Teams channel

```
send-msteams-message:
  msteams.post_card:
    - message: 'This state was executed successfully.'
    - hook_url: https://outlook.office.com/webhook/837
```

The following parameters are required:

**message**

The message that is to be sent to the MS Teams channel.

The following parameters are optional:

**hook\_url**

The webhook URL given configured in Teams interface, if not specified in the configuration options of master or minion.

**title**

The title for the card posted to the channel

**theme\_color**

A hex code for the desired highlight color

## 26.19.192 salt.states.mysql\_database

### Management of MySQL databases (schemas)

**depends**

- MySQLdb Python module

**configuration**

See `salt.modules.mysql` for setup instructions.

The `mysql_database` module is used to create and manage MySQL databases. Databases can be set as either absent or present.

```
frank:
  mysql_database.present
```

`salt.states.mysql_database.absent`(*name*, *\*\*connection\_args*)

Ensure that the named database is absent

**name**

The name of the database to remove

`salt.states.mysql_database.present`(*name*, *character\_set=None*, *collate=None*, *\*\*connection\_args*)

Ensure that the named database is present with the specified properties

**name**

The name of the database to manage

### 26.19.193 salt.states.mysql\_grants

#### Management of MySQL grants (user permissions)

**depends**

- MySQLdb Python module

**configuration**

See `salt.modules.mysql` for setup instructions.

The `mysql_grants` module is used to grant and revoke MySQL permissions.

The name you pass in purely symbolic and does not have anything to do with the grant itself.

The database parameter needs to specify a 'priv\_level' in the same specification as defined in the MySQL documentation:

- \*
- \*\*
- db\_name.\*
- db\_name.tbl\_name
- etc...

This state is not able to set password for the permission from the specified host. See `salt.states.mysql_user` for further instructions.

```

frank_exempledb:
  mysql_grants.present:
    - grant: select,insert,update
    - database: exempledb.*
    - user: frank
    - host: localhost

frank_otherdb:
  mysql_grants.present:
    - grant: all privileges
    - database: otherdb.*
    - user: frank

restricted_singletable:
  mysql_grants.present:
    - grant: select
  
```

(continues on next page)

(continued from previous page)

- **database:** somedb.sometable
- **user:** joe

`salt.states.mysql_grants.absent` (*name, grant=None, database=None, user=None, host='localhost', grant\_option=False, escape=True, \*\*connection\_args*)

Ensure that the grant is absent

**name**

The name (key) of the grant to add

**grant**

The grant priv\_type (i.e. select,insert,update OR all privileges)

**database**

The database priv\_level (i.e. db.tbl OR db.\*)

**user**

The user to apply the grant to

**host**

The network/host that the grant should apply to

`salt.states.mysql_grants.present` (*name, grant=None, database=None, user=None, host='localhost', grant\_option=False, escape=True, revoke\_first=False, ssl\_option=False, \*\*connection\_args*)

Ensure that the grant is present with the specified properties

**name**

The name (key) of the grant to add

**grant**

The grant priv\_type (i.e. select,insert,update OR all privileges)

**database**

The database priv\_level (i.e. db.tbl OR db.\*)

**user**

The user to apply the grant to

**host**

The network/host that the grant should apply to

**grant\_option**

Adds the WITH GRANT OPTION to the defined grant. Default is `False`

**escape**

Defines if the database value gets escaped or not. Default is `True`

**revoke\_first**

By default, MySQL will not do anything if you issue a command to grant privileges that are more restrictive than what's already in place. This effectively means that you cannot downgrade permissions without first revoking permissions applied to a db.table/user pair first.

To have Salt forcibly revoke perms before applying a new grant, enable the 'revoke\_first' options.

WARNING: This will *remove* permissions for a database before attempting to apply new permissions. There is no guarantee that new permissions will be applied correctly which can leave your database security in an unknown and potentially dangerous state. Use with caution!

Default is `False`

**ssl\_option**

Adds the specified ssl options for the connecting user as requirements for this grant. Value is a list of single-element dicts corresponding to the list of ssl options to use.

Possible key/value pairings for the dicts in the value:

```
- SSL: True
- X509: True
- SUBJECT: <subject>
- ISSUER: <issuer>
- CIPHER: <cipher>
```

The non-boolean ssl options take a string as their values, which should be an appropriate value as specified by the MySQL documentation for these options.

Default is `False` (no ssl options will be used)

### 26.19.194 salt.states.mysql\_query

#### Execution of MySQL queries

New in version 2014.7.0.

##### depends

- MySQLdb Python module

##### configuration

See `salt.modules.mysql` for setup instructions.

The `mysql_query` module is used to execute queries on MySQL databases. Its output may be stored in a file or in a grain.

##### query\_id:

```
mysql_query.run
- database: my_database
- query: "SELECT * FROM table;"
- output: "/tmp/query_id.txt"
```

`salt.states.mysql_query.run`(*name, database, query, output=None, grain=None, key=None, overwrite=True, check\_db\_exists=True, client\_flags=None, \*\*connection\_args*)

Execute an arbitrary query on the specified database

##### name

Used only as an ID

##### database

The name of the database to execute the query on

##### query

The query to execute

##### output

grain: output in a grain other: the file to store results None: output to the result comment (default)

##### grain:

grain to store the output (need output=grain)

##### key:

the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

##### overwrite:

The file or grain will be overwritten if it already exists (default)

##### check\_db\_exists:

The state run will check that the specified database exists (default=True) before running any queries

**client\_flags:**

A list of client flags to pass to the MySQL connection. <https://dev.mysql.com/doc/internals/en/capability-flags.html>

`salt.states.mysql_query.run_file` (*name*, *database*, *query\_file=None*, *output=None*, *grain=None*, *key=None*, *overwrite=True*, *saltenv=None*, *check\_db\_exists=True*, *client\_flags=None*, **\*\*connection\_args**)

Execute an arbitrary query on the specified database

New in version 2017.7.0.

**name**

Used only as an ID

**database**

The name of the database to execute the `query_file` on

**query\_file**

The file of mysql commands to run

**output**

grain: output in a grain other: the file to store results None: output to the result comment (default)

**grain:**

grain to store the output (need `output=grain`)

**key:**

the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

**overwrite:**

The file or grain will be overwritten if it already exists (default)

**saltenv:**

The saltenv to pull the `query_file` from

**check\_db\_exists:**

The state run will check that the specified database exists (default=True) before running any queries

**client\_flags:**

A list of client flags to pass to the MySQL connection. <https://dev.mysql.com/doc/internals/en/capability-flags.html>

## 26.19.195 salt.states.mysql\_user

### Management of MySQL users

**depends**

- MySQLdb Python module

**configuration**

See `salt.modules.mysql` for setup instructions.

**frank:****mysql\_user.present:**

- **host:** localhost
- **password:** bobcat

New in version 0.16.2: Authentication overrides have been added.

The MySQL authentication information specified in the minion config file can be overridden in states using the following arguments: `connection_host`, `connection_port`, `connection_user`, `connection_pass`, `connection_db`, `connection_unix_socket`, `connection_default_file` and `connection_charset`.

```
frank:
  mysql_user.present:
    - host: localhost
    - password: "bob@cat"
    - connection_user: someuser
    - connection_pass: somepass
    - connection_charset: utf8
    - saltenv:
      - LC_ALL: "en_US.utf8"
```

This state is not able to grant permissions for the user. See `salt.states.mysql_grants` for further instructions.

`salt.states.mysql_user.absent` (*name*, *host*='localhost', *\*\*connection\_args*)

Ensure that the named user is absent

**name**

The name of the user to remove

`salt.states.mysql_user.present` (*name*, *host*='localhost', *password*=None, *password\_hash*=None, *allow\_passwordless*=False, *unix\_socket*=False, *password\_column*=None, *auth\_plugin*='mysql\_native\_password', *\*\*connection\_args*)

Ensure that the named user is present with the specified properties. A passwordless user can be configured by omitting `password` and `password_hash`, and setting `allow_passwordless` to `True`.

**name**

The name of the user to manage

**host**

Host for which this user/password combo applies

**password**

The password to use for this user. Will take precedence over the `password_hash` option if both are specified.

**password\_hash**

The password in hashed form. Be sure to quote the password because YAML doesn't like the `*`. A password hash can be obtained from the `mysql` command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-----+
| PASSWORD('mypass') |
+-----+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-----+
1 row in set (0.00 sec)
```

**allow\_passwordless**

If `True`, then `password` and `password_hash` can be omitted to permit a passwordless login.

New in version 0.16.2.

**unix\_socket**

If `True` and `allow_passwordless` is `True`, the `unix_socket` auth plugin will be used.

## 26.19.196 salt.states.net\_napalm\_yang

### NAPALM YANG state

Manage the configuration of network devices according to the YANG models (OpenConfig/IETF).

New in version 2017.7.0.

#### Dependencies

- napalm-yang
- pyangbing > 0.5.11

To be able to load configuration on network devices, it requires [NAPALM](#) library to be installed: `pip install napalm`. Please check [Installation](#) for complete details.

`salt.states.net_napalm_yang.configured(name, data, **kwargs)`

Configure the network device, given the input data structured according to the YANG models.

---

**Note:** The main difference between this function and `managed` is that the later generates and loads the configuration only when there are differences between the existing configuration on the device and the expected configuration. Depending on the platform and hardware capabilities, one could be more optimal than the other. Additionally, the output of the `managed` is different, in such a way that the `pchange` field in the output contains structured data, rather than text.

---

#### data

YANG structured data.

#### models

A list of models to be used when generating the config.

#### profiles: **None**

Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

#### test: **False**

Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

#### commit: **True**

Commit? Default: `True`.

#### debug: **False**

Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

#### replace: **False**

Should replace the config with the new generate one?

State SLS example:

```
{%- set expected_config = pillar.get('openconfig_interfaces_cfg') -%}
interfaces_config:
  napalm_yang.configured:
    - data: {{ expected_config | json }}
    - models:
      - models.openconfig_interfaces
    - debug: true
```

Pillar example:

```

openconfig_interfaces_cfg:
  _kwargs:
    filter: true
  interfaces:
    interface:
      Et1:
        config:
          mtu: 9000
      Et2:
        config:
          description: "description example"

```

`salt.states.net_napalm_yang.managed`(*name*, *data*, *\*\*kwargs*)

Manage the device configuration given the input data structured according to the YANG models.

**data**

YANG structured data.

**models**

A list of models to be used when generating the config.

**profiles: None**

Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

**compliance\_report: False**

Return the compliance report in the comment.

New in version 2017.7.3.

**test: False**

Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True**

Commit? Default: `True`.

**debug: False**

Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace: False**

Should replace the config with the new generate one?

State SLS example:

```

{%- set expected_config = pillar.get('openconfig_interfaces_cfg') -%}
interfaces_config:
  napalm_yang.managed:
    - data: {{ expected_config | json }}
    - models:
      - models.openconfig_interfaces
    - debug: true

```

Pillar example:

```

openconfig_interfaces_cfg:
  _kwargs:
    filter: true
  interfaces:
    interface:
      Et1:
        config:

```

(continues on next page)

(continued from previous page)

```

    mtu: 9000
  Et2:
    config:
      description: "description example"

```

## 26.19.197 salt.states.netacl

### Network ACL

Manage the firewall configuration on the network device managed through NAPALM. The firewall configuration is generated by [Capirca](#).

New in version 2017.7.0.

```

codeauthor
  Mircea Ulinic <ping@mirceaulinic.net>

maturity
  new

depends
  capirca, napalm

platform
  unix

```

### Dependencies

#### Capirca

To install Capirca, execute: `pip install capirca`.

#### NAPALM

To be able to load configuration on network devices, it requires [NAPALM](#) library to be installed: `pip install napalm`. Please check [Installation](#) for complete details.

`salt.states.netacl.filter` (*name, filter\_name, filter\_options=None, terms=None, prepend=True, pillar\_key='acl', pillarenv=None, saltenv=None, merge\_pillar=False, only\_lower\_merge=False, revision\_id=None, revision\_no=None, revision\_date=True, revision\_date\_format='%Y/%m/%d', test=False, commit=True, debug=False*)

Generate and load the configuration of a policy filter.

#### filter\_name

The name of the policy filter.

#### filter\_options

Additional filter options. These options are platform-specific. See the complete list of [options](#).

#### terms

Dictionary of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

**prepend: True**

When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

**pillar\_key: acl**

The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv**

Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**

Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar: False**

Merge `terms` with the corresponding value from the pillar. Default: `False`.

---

**Note:** By default this state does not merge, to avoid any unexpected behaviours.

The merge logic depends on the `prepend` argument.

The terms specified through the `terms` argument have higher priority than the pillar.

---

**only\_lower\_merge: False**

Specify if it should merge only the `terms` fields. Otherwise it will try to merge also filters fields. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

**revision\_id**

Add a comment in the filter config having the description for the changes applied.

**revision\_no**

The revision count.

**revision\_date: True**

Boolean flag: display the date when the filter configuration was generated. Default: `True`.

**revision\_date\_format: %Y/%m/%d**

The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

**test: False**

Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True**

Commit? Default: `True`.

**debug: False**

Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

CLI Example:

```
salt 'edge01.flw01' state.sls router.acl test=True
```

Output Example:

```
edge01.flw01:
-----
      ID: my-filter
  Function: netacl.filter
     Result: None
  Comment: Testing mode: Configuration discarded.
  Started: 12:24:40.598232
  Duration: 2437.139 ms
```

(continues on next page)

(continued from previous page)

  remark $Revision: 5 $
  remark my-other-term
  permit tcp any range 5678 5680 any
exit

```

Summary for edge01.flw01

-----

Succeeded: 1 (unchanged=1, changed=1)

Failed: 0

-----

Total states run: 1

Total run time: 2.437 s

Pillar example:

```

acl:
- my-filter:
  options:
  - inet6
  terms:
  - my-term:
    source_port: [1234, 1235]
    protocol:
    - tcp
    - udp
    source_address: 1.2.3.4
    action: reject
  - my-other-term:
    source_port:
    - [5678, 5680]
    protocol: tcp
    action: accept

```

State SLS Example:

```
{%- set filter_name = 'my-filter' -%}
{%- set my_filter_cfg = salt.netacl.get_filter_pillar(filter_name, pillar_
  ↳key='firewall') -%}
my_first_filter_state:
  netacl.filter:
    - filter_name: {{ filter_name }}
    - options: {{ my_filter_cfg['options'] | json }}
    - terms: {{ my_filter_cfg['terms'] | json }}
    - revision_date: false
    - revision_no: 5
    - debug: true
```

Or:

```
my_first_filter_state:
  netacl.filter:
    - filter_name: my-filter
    - merge_pillar: true
    - pillar_key: firewall
    - revision_date: false
    - revision_no: 5
    - debug: true
```

In the example above, as `inet6` has been specified in the `filter_options`, the configuration chunk referring to `my-term` has been ignored as it referred to IPv4 only (from `source_address` field).

---

**Note:** The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

---

---

**Note:** When passing retrieved pillar data into the state file, it is strongly recommended to use the `json` serializer explicitly (`` | json ``), instead of relying on the default Python serializer.

---

```
salt.states.netacl.managed(name, filters=None, prepend=True, pillar_key='acl', pillarenv=None,
  saltenv=None, merge_pillar=False, only_lower_merge=False,
  revision_id=None, revision_no=None, revision_date=True,
  revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False)
```

Manage the whole firewall configuration.

#### filters

Dictionary of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

#### prepend: True

When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

#### pillar\_key: acl

The key in the pillar containing the default attributes values. Default: `acl`.

#### pillarenv

Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**

Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar: False**

Merge the filters with the corresponding values from the pillar. Default: `False`.

---

**Note:** By default this state does not merge, to avoid any unexpected behaviours.

The merge logic depends on the `prepend` argument.

The filters specified through the `filters` argument have higher priority than the pillar.

---

**only\_lower\_merge: False**

Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

**test: False**

Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**revision\_id**

Add a comment in the policy config having the description for the changes applied.

**revision\_no**

The revision count.

**revision\_date: True**

Boolean flag: display the date when the policy configuration was generated. Default: `True`.

**revision\_date\_format: %Y/%m/%d**

The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (`<year>/<month>/<day>`).

**commit: True**

Commit? Default: `True`.

**debug: False**

Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

CLI Example:

```
salt 'edge01.bjm01' state.sls router.acl test=True
```

Output Example:

```
edge01.bjm01:
-----
          ID: netacl_example
    Function: netacl.managed
       Result: None
    Comment: Testing mode: Configuration discarded.
   Started: 12:03:24.807023
  Duration: 5569.453 ms
   Changes:
           -----
          diff:
             [edit firewall]

Summary for edge01.bjm01

-----  
Succeeded: 1 (unchanged=1, changed=1)

(continues on next page)

(continued from previous page)

```
Failed:    0
-----
Total states run:    1
Total run time:    5.569 s
```

The policy configuration has been loaded from the pillar, having the following structure:

```
firewall:
- my-filter:
  terms:
  - my-term:
    source_port: [1234, 1235]
    protocol:
    - tcp
    - udp
    source_address: 1.2.3.4
    action: reject
  - my-other-term:
    source_port:
    - [5678, 5680]
    protocol: tcp
    action: accept
- block-icmp:
  terms:
  - first-term:
    protocol:
    - icmp
    action: reject
```

Example SLS file:

```
{%- set fw_filters = pillar.get('firewall', {}) -%}
netacl_example:
  netacl.managed:
  - filters: {{ fw_filters | json }}
  - revision_no: 2
  - debug: true
```

Or:

```
netacl_example:
  netacl.managed:
  - pillar_key: firewall
  - merge_pillar: true
  - revision_no: 2
  - debug: true
```

---

**Note:** The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

---

---

**Note:** When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (``|json``), instead of relying on the default Python serializer.

---

```
salt.states.netacl.term(name, filter_name, term_name, filter_options=None, pillar_key='acl',
                       pillarenv=None, saltenv=None, merge_pillar=False, revision_id=None,
                       revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d',
                       test=False, commit=True, debug=False, source_service=None,
                       destination_service=None, **term_fields)
```

Manage the configuration of a specific policy term.

**filter\_name**

The name of the policy filter.

**term\_name**

The name of the term.

**filter\_options**

Additional filter options. These options are platform-specific. See the complete list of [options](#).

**pillar\_key: acl**

The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv**

Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**

Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar: False**

Merge the CLI variables with the pillar. Default: `False`.

The properties specified through the state arguments have higher priority than the pillar.

**revision\_id**

Add a comment in the term config having the description for the changes applied.

**revision\_no**

The revision count.

**revision\_date: True**

Boolean flag: display the date when the term configuration was generated. Default: `True`.

**revision\_date\_format: %Y/%m/%d**

The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

**test: False**

Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True**

Commit? Default: `True`.

**debug: False**

Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**source\_service**

A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `source_port` and protocol.

As this module is available on Unix platforms only, it reads the [IANA](#) port assignment from `/etc/services`.

If the user requires additional shortcuts to be referenced, they can add entries under `/etc/services`, which can be managed using the [file state](#).

**destination\_service**

A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a `destination_port` and protocol. Allows the same options as `source_service`.

### term\_fields

Term attributes. To see what fields are supported, please consult the list of supported [keywords](#). Some platforms have few other [optional](#) keywords.

---

**Note:** The following fields are accepted:

- action
- address
- address\_exclude
- comment
- counter
- expiration
- destination\_address
- destination\_address\_exclude
- destination\_port
- destination\_prefix
- forwarding\_class
- forwarding\_class\_except
- logging
- log\_name
- loss\_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol\_except
- qos
- pan\_application
- routing\_instance
- source\_address
- source\_address\_exclude
- source\_port
- source\_prefix
- verbatim
- packet\_length
- fragment\_offset
- hop\_limit
- icmp\_type
- ether\_type
- traffic\_class\_count
- traffic\_type
- translated
- dscp\_set
- dscp\_match
- dscp\_except
- next\_ip
- flexible\_match\_range
- source\_prefix\_except
- destination\_prefix\_except
- vpn
- source\_tag
- destination\_tag
- source\_interface

- destination\_interface
  - flattened
  - flattened\_addr
  - flattened\_saddr
  - flattened\_daddr
  - priority
- 

**Note:** The following fields can be also a single value and a list of values:

- action
- address
- address\_exclude
- comment
- destination\_address
- destination\_address\_exclude
- destination\_port
- destination\_prefix
- forwarding\_class
- forwarding\_class\_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol\_except
- pan\_application
- source\_address
- source\_address\_exclude
- source\_port
- source\_prefix
- verbatim
- icmp\_type
- ether\_type
- traffic\_type
- dscp\_match
- dscp\_except
- flexible\_match\_range
- source\_prefix\_except
- destination\_prefix\_except
- source\_tag
- destination\_tag
- source\_service
- destination\_service

Example: destination\_address can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:  
- 172.17.17.1/24  
- 172.17.19.1/24
```

or a list of services to be matched:

**source\_service:**

- ntp
- snmp
- ldap
- bgpd

**Note:** The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

**source\_port:**

- [1000, 2000]
- [3000, 4000]

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

CLI Example:

```
salt 'edge01.bjm01' state.sls router.acl
```

Output Example:

```
edge01.bjm01:
-----
      ID: update_icmp_first_term
Function: netacl.term
Result: None
Comment: Testing mode: Configuration discarded.
Started: 12:49:09.174179
Duration: 5751.882 ms
Changes:
-----
diff:
  [edit firewall]
+   family inet {
+     /*
+     ** $Id: update_icmp_first_term $
+     ** $Date: 2017/02/30 $
+     **
+     */
+     filter block-icmp {
+       term first-term {
+         from {
+           protocol icmp;
+         }
+         then {
+           reject;
+         }
+       }
+     }
+   }
```

(continues on next page)

(continued from previous page)

```

Summary for edge01.bjm01
-----
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
-----
Total states run:    1
Total run time:    5.752 s

```

Pillar example:

```

firewall:
  - block-icmp:
    terms:
      - first-term:
        protocol:
          - icmp
        action: reject

```

State SLS example:

```

{%- set filter_name = 'block-icmp' -%}
{%- set term_name = 'first-term' -%}
{%- set my_term_cfg = salt.netacl.get_term_pillar(filter_name, term_name)
  ↳-%}

update_icmp_first_term:
  netacl.term:
    - filter_name: {{ filter_name }}
    - filter_options:
      - not-interface-specific
    - term_name: {{ term_name }}
    - {{ my_term_cfg | json }}

```

Or directly referencing the pillar keys:

```

update_icmp_first_term:
  netacl.term:
    - filter_name: block-icmp
    - filter_options:
      - not-interface-specific
    - term_name: first-term
    - merge_pillar: true

```

---

**Note:** The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

---

---

**Note:** When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (`| json`), instead of relying on the default Python serializer.

---

## 26.19.198 salt.states.netconfig

### Network Config

Manage the configuration on a network device given a specific static config or template.

**codeauthor**

Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

**maturity**

new

**depends**

napalm

**platform**

unix

### Dependencies

- *NAPALM proxy minion*
- *Network-related basic features execution module*

New in version 2017.7.0.

**salt.states.netconfig.commit\_cancelled**(*name*)

New in version 2019.2.0.

Cancel a commit scheduled to be executed via the `commit_in` and `commit_at` arguments from the *net.load\_template* or *net.load\_config* execution functions. The commit ID is displayed when the commit is scheduled via the functions named above.

State SLS Example:

```
'20180726083540640360':
  netconfig.commit_cancelled
```

**salt.states.netconfig.commit\_confirmed**(*name*)

New in version 2019.2.0.

Confirm a commit scheduled to be reverted via the `revert_in` and `revert_at` arguments from the *net.load\_template* or *net.load\_config* execution functions. The commit ID is displayed when the commit confirmed is scheduled via the functions named above.

State SLS Example:

```
'20180726083540640360':
  netconfig.commit_confirmed
```

**salt.states.netconfig.managed**(*name*, *template\_name*=None, *template\_source*=None, *template\_hash*=None, *template\_hash\_name*=None, *saltenv*='base', *template\_engine*='jinja', *skip\_verify*=False, *context*=None, *defaults*=None, *test*=False, *commit*=True, *debug*=False, *replace*=False, *commit\_in*=None, *commit\_at*=None, *revert\_in*=None, *revert\_at*=None, *\*\*template\_vars*)

Manages the configuration on network devices.

By default this state will commit the changes on the device. If there are no changes required, it does not commit and the field `already_configured` from the output dictionary will be set as `True` to notify that.

To avoid committing the configuration, set the argument `test` to `True` (or via the CLI argument `test=True`) and will discard (dry run).

To preserve the changes, set `commit` to `False` (either as CLI argument, either as state parameter). However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set `replace` to `True`. This option is recommended to be used with caution!

**template\_name**

Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the `file_roots` as specified in the master config file. For example, let's suppose the `file_roots` is configured as:

```
file_roots:
  base:
    - /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as `salt://templates/example.jinja`. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via `http`, `https` or `ftp`.

Examples:

- `salt://my_template.jinja`
- `/absolute/path/to/my_template.jinja`
- `http://example.com/template.cheetah`
- `https://example.com/template.mako`
- `ftp://example.com/template.py`

Changed in version 2019.2.0: This argument can now support a list of templates to be rendered. The resulting configuration text is loaded at once, as a single configuration chunk.

**template\_source: None**

Inline config template to be rendered and loaded on the device.

**template\_hash: None**

Hash of the template file. Format: `{hash_type: 'md5', 'hsum': <md5sum>}`

**template\_hash\_name: None**

When `template_hash` refers to a remote file, this specifies the filename to look for in that file.

**saltenv: base**

Specifies the template environment. This will influence the relative imports inside the templates.

**template\_engine: jinja**

The following templates engines are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

**skip\_verify: False**

If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

Changed in version 2017.7.1.

**test: False**

Dry run? If set to `True`, will apply the config, discard and return the changes. Default: `False` (will commit the changes on the device).

**commit: True**

Commit? Default: True.

**debug: False**

Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw result after the template was rendered.

---

**Note:** This argument cannot be used directly on the command line. Instead, it can be passed through the `pillar` variable when executing either of the `state.sls` or `state.apply` (see below for an example).

---

**commit\_in: None**

Commit the changes in a specific number of minutes / hours. Example of accepted formats: 5 (commit in 5 minutes), 2m (commit in 2 minutes), 1h (commit the changes in 1 hour), 5h30m (commit the changes in 5 hours and 30 minutes).

---

**Note:** This feature works on any platforms, as it does not rely on the native features of the network operating system.

---

---

**Note:** After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

---

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**commit\_at: None**

Commit the changes at a specific time. Example of accepted formats: 1am (will commit the changes at the next 1AM), 13:20 (will commit at 13:20), 1:20am, etc.

---

**Note:** This feature works on any platforms, as it does not rely on the native features of the network operating system.

---

---

**Note:** After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

---

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**revert\_in: None**

Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats:

5 (revert in 5 minutes), 2m (revert in 2 minutes), 1h (revert the changes in 1 hour), 5h30m (revert the changes in 5 hours and 30 minutes).

---

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

---

**Warning:** This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**revert\_at: None**

Commit and revert the changes at a specific time. Example of accepted formats: 1am (will commit and revert the changes at the next 1AM), 13:20 (will commit and revert at 13:20), 1:20am, etc.

---

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

---

**Warning:** This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**replace: False**

Load and replace the configuration. Default: `False` (will apply load merge).

**context: None**

Overrides default context variables passed to the template.

New in version 2019.2.0.

**defaults: None**

Default variables/context passed to the template.

**template\_vars**

Dictionary with the arguments/context to be used when the template is rendered. Do not explicitly specify this argument. This represents any other variable that will be sent to the template render-

ing system. Please see an example below! In both `ntp_peers_example_using_pillar` and `ntp_peers_example`, `peers` is sent as template variable.

**Note:** It is more recommended to use the `context` argument instead, to avoid any conflicts with other arguments.

SLS Example (e.g.: under `salt://router/config.sls`):

```

whole_config_example:
  netconfig.managed:
    - template_name: salt://path/to/complete_config.jinja
    - debug: True
    - replace: True
bgp_config_example:
  netconfig.managed:
    - template_name: /absolute/path/to/bgp_neighbors.mako
    - template_engine: mako
prefix_lists_example:
  netconfig.managed:
    - template_name: prefix_lists.cheetah
    - debug: True
    - template_engine: cheetah
ntp_peers_example:
  netconfig.managed:
    - template_name: http://bit.ly/2gK0j20
    - skip_verify: False
    - debug: True
    - peers:
      - 192.168.0.1
      - 192.168.0.1
ntp_peers_example_using_pillar:
  netconfig.managed:
    - template_name: http://bit.ly/2gK0j20
    - peers: {{ pillar.get('ntp.peers', []) }}
  
```

Multi template example:

```

hostname_and_ntp:
  netconfig.managed:
    - template_name:
      - https://bit.ly/20hSgqP
      - https://bit.ly/2M6C4Lx
      - https://bit.ly/20IWVTs
    - debug: true
    - context:
      hostname: {{ opts.id }}
      servers:
        - 172.17.17.1
        - 172.17.17.2
      peers:
        - 192.168.0.1
        - 192.168.0.2
  
```

Usage examples:

```
$ sudo salt 'juniper.device' state.sls router.config test=True
$ sudo salt -N all-routers state.sls router.config pillar="{ 'debug': True }
→"
```

`router.config` depends on the location of the SLS file (see above). Running this command, will be executed all five steps from above. These examples above are not meant to be used in a production environment, their sole purpose is to provide usage examples.

Output example:

```
$ sudo salt 'juniper.device' state.sls router.config test=True
juniper.device:
-----
      ID: ntp_peers_example_using_pillar
  Function: netconfig.managed
     Result: None
  Comment: Testing mode: Configuration discarded.
  Started: 12:01:40.744535
  Duration: 8755.788 ms
  Changes:
    -----
    diff:
      [edit system ntp]
        peer 192.168.0.1 { ... }
      + peer 172.17.17.1;
      + peer 172.17.17.3;

Summary for juniper.device
-----
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
-----
Total states run:    1
Total run time:    8.756 s
```

Raw output example (useful when the output is reused in other states/execution modules):

```
$ sudo salt --out=pprint 'juniper.device' state.sls router.config
→test=True debug=True
```

```
{
  'juniper.device': {
    'netconfig_|-ntp_peers_example_using_pillar_|-ntp_peers_example_
→using_pillar_|-managed': {
      '__id__': 'ntp_peers_example_using_pillar',
      '__run_num__': 0,
      'already_configured': False,
      'changes': {
        'diff': '[edit system ntp]  peer 192.168.0.1 { ... }+
→peer 172.17.17.1;+  peer 172.17.17.3;'
      },
      'comment': 'Testing mode: Configuration discarded.',
    },
  },
}
```

(continues on next page)

(continued from previous page)

```

        'duration': 7400.759,
        'loaded_config': 'system { ntp { peer 172.17.17.1; peer
→172.17.17.3; } }',
        'name': 'ntp_peers_example_using_pillar',
        'result': None,
        'start_time': '12:09:09.811445'
    }
}
}

```

`salt.states.netconfig.replace_pattern`(*name*, *pattern*, *repl*, *count*=0, *flags*=8, *bufsize*=1, *append\_if\_not\_found*=False, *prepend\_if\_not\_found*=False, *not\_found\_content*=None, *search\_only*=False, *show\_changes*=True, *backslash\_literal*=False, *source*='running', *path*=None, *test*=False, *replace*=True, *debug*=False, *commit*=True)

New in version 2019.2.0.

Replace occurrences of a pattern in the configuration source. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made. This is a pure Python implementation that wraps Python's `sub()`.

**pattern**

A regular expression, to be matched using Python's `search()`.

**repl**

The replacement text.

**count: 0**

Maximum number of pattern occurrences to be replaced. If `count` is a positive integer `n`, only `n` occurrences will be replaced, otherwise all occurrences will be replaced.

**flags (list or int): 8**

A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., [`'IGNORECASE'`, `'MULTILINE'`]. Optionally, `flags` may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to 8 (which supports `'MULTILINE'`).

**bufsize (int or str): 1**

How much of the configuration to buffer into memory at once. The default value 1 processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

**append\_if\_not\_found: False**

If set to `True`, and `pattern` is not found, then the content will be appended to the file.

**prepend\_if\_not\_found: False**

If set to `True` and `pattern` is not found, then the content will be prepended to the file.

**not\_found\_content**

Content to use for append/prepend if not found. If `None` (default), uses `repl`. Useful when `repl` uses references to group in `pattern`.

**search\_only: False**

If set to `true`, this no changes will be performed on the file, and this function will simply return `True` if the pattern was matched, and `False` if not.

**show\_changes: True**

If `True`, return a diff of changes made. Otherwise, return `True` if changes were made, and `False` if not.

**backslash\_literal: False**

Interpret backslashes as literal backslashes for the `repl` and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the `repl` on the second run of the

state.

**source: running**

The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

**path**

Save the temporary configuration to a specific path, then read from there.

**test: False**

Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True**

Commit the configuration changes? Default: `True`.

**debug: False**

Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace: True**

Load and replace the configuration. Default: `True`.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the `kwarg`:

State SLS Example:

```
update_policy_name:
  netconfig.replace_pattern:
    - pattern: OLD-POLICY-NAME
    - repl: new-policy-name
    - debug: true
```

```
salt.states.netconfig.saved(name, source='running', user=None, group=None, mode=None, attrs=None,
                             makedirs=False, dir_mode=None, replace=True, backup="",
                             show_changes=True, create=True, tmp_dir="", tmp_ext="", encoding=None,
                             encoding_errors='strict', allow_empty=False, follow_symlinks=True,
                             check_cmd=None, win_owner=None, win_perms=None,
                             win_deny_perms=None, win_inheritance=True, win_perms_reset=False,
                             **kwargs)
```

New in version 2019.2.0.

Save the configuration to a file on the local file system.

**name**

Absolute path to file where to save the configuration. To push the files to the Master, use `cp.push` Execution function.

**source: running**

The configuration source. Choose from: `running`, `candidate`, `startup`. Default: `running`.

**user**

The user to own the file, this defaults to the user salt is running as on the minion

**group**

The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

**mode**

The permissions to set on this file, e.g. `644`, `0775`, or `4664`. The default mode for new files and directories corresponds to the `umask` of the salt process. The mode of existing files and directories will only be changed if `mode` is specified.

---

**Note:** This option is **not** supported on Windows.

---

**attrs**

The attributes to have on this file, e.g. `a`, `i`. The attributes can be any or a combination of the following characters: `aAcCdDeijPsStTu`.

---

**Note:** This option is **not** supported on Windows.

---

**makedirs: False**

If set to `True`, then the parent directories will be created to facilitate the creation of the named file. If `False`, and the parent directory of the destination file doesn't exist, the state will fail.

**dir\_mode**

If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**replace: True**

If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

**backup**

Overrides the default backup mode for this specific file. See [backup\\_mode documentation](#) for more details.

**show\_changes: True**

Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

**create: True**

If set to `False`, then the file will only be managed if the file already exists on the system.

**encoding**

If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See <https://docs.python.org/3/library/codecs.html#standard-encodings> for the list of available encodings.

**encoding\_errors: 'strict'**

Error encoding scheme. Default is `'strict'`. See <https://docs.python.org/2/library/codecs.html#codec-base-classes> for the list of available schemes.

**allow\_empty: True**

If set to `False`, then the state will fail if the contents specified by `contents_pillar` or `contents_grains` are empty.

**follow\_symlinks: True**

If the desired path is a symlink follow it and make changes to the file to which the symlink points.

**check\_cmd**

The specified command will be run with an appended argument of a *temporary* file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

**tmp\_dir**

Directory for temp file created by `check_cmd`. Useful for checkers dependent on config file location (e.g. daemons restricted to their own config directories by an apparmor profile).

**tmp\_ext**

Suffix for temp file created by `check_cmd`. Useful for checkers dependent on config file extension (e.g. the `init-checkconf` upstart config checker).

**win\_owner: None**

The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

**win\_perms: None**

A dictionary containing permissions to grant and their propagation. For example: `{'Administrators': {'perms': 'full_control'}}` Can be a single basic perm or

a list of advanced perms. perms must be specified. applies\_to does not apply to file objects.

**win\_deny\_perms: None**

A dictionary containing permissions to deny and their propagation. For example: {'Administrators': {'perms': 'full\_control'}} Can be a single basic perm or a list of advanced perms. perms must be specified. applies\_to does not apply to file objects.

**win\_inheritance: True**

True to inherit permissions from the parent directory, False not to inherit permission.

**win\_perms\_reset: False**

If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

State SLS Example:

```
/var/backups/{{ opts.id }}/{{ salt.status.time('%s') }}.cfg:
netconfig.saved:
- source: running
- makedirs: true
```

The state SLS above would create a backup config grouping the files by the Minion ID, in chronological files. For example, if the state is executed at on the 3rd of August 2018, at 5:15PM, on the Minion core1.lon01, the configuration would saved in the file: /var/backups/core01.lon01/1533316558.cfg

## 26.19.199 salt.states.netntp

### Network NTP

New in version 2016.11.0.

Manage the configuration of NTP peers and servers on the network devices through the NAPALM proxy.

**codeauthor**

Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

**maturity**

new

**depends**

napalm

**platform**

unix

### Dependencies

- Requires `netaddr` to be installed: `pip install netaddr` to check if IP Addresses are correctly specified
- Requires `dnspython` to be installed: `pip install dnspython` to resolve the nameserver entities (in case the user does not configure the peers/servers using their IP addresses)
- *NAPALM proxy minion*
- *NTP operational and configuration management module*

`salt.states.netntp.managed`(*name*, *peers=None*, *servers=None*)

Manages the configuration of NTP peers and servers on the device, as specified in the state SLS file. NTP entities not specified in these lists will be removed whilst entities not configured on the device will be set.

SLS Example:

```

netntp_example:
  netntp.managed:
    - peers:
      - 192.168.0.1
      - 172.17.17.1
    - servers:
      - 24.124.0.251
      - 138.236.128.36

```

Output example:

```

{
  'edge01.nrt04': {
    'netntp_|-netntp_example_|-netntp_example_|-managed': {
      'comment': 'NTP servers already configured as needed.',
      'name': 'netntp_example',
      'start_time': '12:45:24.056659',
      'duration': 2938.857,
      'changes': {
        'peers': {
          'removed': [
            '192.168.0.2',
            '192.168.0.3'
          ],
          'added': [
            '192.168.0.1',
            '172.17.17.1'
          ]
        }
      },
      'result': None
    }
  }
}

```

## 26.19.200 salt.states.netsnmp

### Network SNMP

Manage the SNMP configuration on network devices.

#### codeauthor

Mircea Ulinic <ping@mirceaulinic.net>

#### maturity

new

#### depends

napalm

#### platform

unix

## Dependencies

- *napalm snmp management module (salt.modules.napalm\_snmp)*

New in version 2016.11.0.

`salt.states.netsnmp.managed`(*name, config=None, defaults=None*)

Configures the SNMP on the device as specified in the SLS file.

SLS Example:

```
snmp_example:
  netsnmp.managed:
    - config:
      location: Honolulu, HI, US
    - defaults:
      contact: noc@cloudflare.com
```

Output example (for the SLS above, e.g. called snmp.sls under /router/):

```
$ sudo salt edge01.hnl01 state.sls router.snmp test=True
edge01.hnl01:
-----
      ID: snmp_example
  Function: snmp.managed
     Result: None
  Comment: Testing mode: configuration was not changed!
  Started: 13:29:06.872363
  Duration: 920.466 ms
  Changes:
  -----
      added:
  -----
          chassis_id:
              None
          contact:
              noc@cloudflare.com
          location:
              Honolulu, HI, US

Summary for edge01.hnl01
-----
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
-----
Total states run:    1
Total run time: 920.466 ms
```

## 26.19.201 salt.states.netusers

### Network Users

Manage the users configuration on network devices via the NAPALM proxy.

```
codeauthor
    Mircea Ulinic <ping@mirceaulinic.net>

maturity
    new

depends
    napalm

platform
    unix
```

### Dependencies

- *NAPALM proxy minion*
- *Users configuration management module*

New in version 2016.11.0.

`salt.states.netusers.managed`(*name, users=None, defaults=None*)

Manages the configuration of the users on the device, as specified in the state SLS file. Users not defined in that file will be removed whilst users not configured on the device, will be added.

SLS Example:

```
netusers_example:
  netusers.managed:
    - users:
      admin:
        level: 15
        password: $1$knmhgPPv$g8745biu4rb.Zf.IT.F/U1
        sshkeys: []
      restricted:
        level: 1
        password: $1$j34j5k4b$4d5SVjTiz1l.Zf.IT.F/K7
      martin:
        level: 15
        password: ''

## 26.19.202 salt.states.network

### Configuration of network interfaces

The network module is used to create and manage network settings, interfaces can be set as either managed or ignored. By default all interfaces are ignored unless specified.

---

**Note:** RedHat-based systems (RHEL, CentOS, Scientific, etc.) have been supported since version 2014.1.0.

Debian-based systems (Debian, Ubuntu, etc.) have been supported since version 2017.7.0. The following options are not supported: `ipaddr_start`, and `ipaddr_end`.

Other platforms are not yet supported.

---

**Note:** On Debian-based systems, networking configuration can be specified in `/etc/network/interfaces` or via included files such as (by default) `/etc/network/interfaces.d/*`. This can be problematic for configuration management. It is recommended to use either `file.managed` or `network.managed`.

If using `network.managed`, it can be useful to ensure `interfaces.d/` is empty. This can be done using the following state

```
/etc/network/interfaces.d:  
file.directory:  
- clean: True
```

---

### Configuring Global Network Settings

Use the `network.system` state to set global network settings:

```
system:  
  network.system:  
    - enabled: True  
    - hostname: server1.example.com  
    - gateway: 192.168.0.1  
    - gatewaydev: eth0  
    - nozeroconf: True  
    - nisdomain: example.com  
    - require_reboot: True  
    - apply_hostname: True
```

---

**Note:** The use of `apply_hostname` above will apply changes to the hostname immediately.

---

Changed in version 2015.5.0: `apply_hostname` added

## retain\_settings

New in version 2016.11.0.

Use *retain\_settings* to retain current network settings that are not otherwise specified in the state. Particularly useful if only setting the hostname. Default behavior is to delete unspecified network settings.

```

system:
  network.system:
    - hostname: server2.example.com
    - apply_hostname: True
    - retain_settings: True

```

## Configuring Network Routes

Use the *network.routes* state to set network routes.

```

routes:
  network.routes:
    - name: eth0
    - routes:
      - name: secure_network
        ipaddr: 10.2.0.0
        netmask: 255.255.255.0
        gateway: 10.1.0.3
      - name: HQ_network
        ipaddr: 10.100.0.0
        netmask: 255.255.0.0
        gateway: 10.1.0.10

```

## Managing Network Interfaces

The *network.managed* state is used to configure network interfaces. Here are several examples:

### Ethernet Interface

```

eth0:
  network.managed:
    - enabled: True
    - type: eth
    - proto: static
    - ipaddr: 10.1.0.7
    - netmask: 255.255.255.0
    - gateway: 10.1.0.1
    - enable_ipv6: true
    - ipv6proto: static
    - ipv6addrs:
      - 2001:db8:dead:beef::3/64
      - 2001:db8:dead:beef::7/64

```

(continues on next page)

(continued from previous page)

- **ipv6gateway**: 2001:db8:dead:beef::1
- **ipv6netmask**: 64
- **dns**:
  - 8.8.8.8
  - 8.8.4.4
- **channels**:
  - rx**: 4
  - tx**: 4
  - other**: 4
  - combined**: 4

### Ranged Interfaces (RHEL/CentOS Only)

New in version 2015.8.0.

Ranged interfaces can be created by including the word `range` in the interface name.

---

**Important:** The interface type must be `eth`.

---

```
eth0-range0:
network.managed:
- type: eth
- ipaddr_start: 192.168.1.1
- ipaddr_end: 192.168.1.10
- clonenum_start: 10
- mtu: 9000

bond0-range0:
network.managed:
- type: eth
- ipaddr_start: 192.168.1.1
- ipaddr_end: 192.168.1.10
- clonenum_start: 10
- mtu: 9000

eth1.0-range0:
network.managed:
- type: eth
- ipaddr_start: 192.168.1.1
- ipaddr_end: 192.168.1.10
- clonenum_start: 10
- vlan: True
- mtu: 9000

bond0.1-range0:
network.managed:
- type: eth
- ipaddr_start: 192.168.1.1
- ipaddr_end: 192.168.1.10
- clonenum_start: 10
```

(continues on next page)

(continued from previous page)

- **vlan**: True
- **mtu**: 9000

## Bond Interfaces

To configure a bond, you must do the following:

- Configure the bond slaves with a `type` of `slave`, and a `master` option set to the name of the bond interface.
- Configure the bond interface with a `type` of `bond`, and a `slaves` option defining the bond slaves for the bond interface.

```
eth2:
network.managed:
- enabled: True
- type: slave
- master: bond0

eth3:
network.managed:
- enabled: True
- type: slave
- master: bond0

bond0:
network.managed:
- type: bond
- ipaddr: 10.1.0.1
- netmask: 255.255.255.0
- mode: gre
- proto: static
- dns:
- 8.8.8.8
- 8.8.4.4
- enabled: False
- slaves: eth2 eth3
- require:
- network: eth2
- network: eth3
- miimon: 100
- arp_interval: 250
- downdelay: 200
- lacp_rate: fast
- max_bonds: 1
- updelay: 0
- use_carrier: on
- hashing-algorithm: layer2
- mtu: 9000
- autoneg: on
- speed: 1000
- duplex: full
- rx: on
```

(continues on next page)

(continued from previous page)

- **tx**: off
- **sg**: on
- **tso**: off
- **ufo**: off
- **gso**: off
- **gro**: off
- **lro**: off

## VLANs

Set type to `vlan` to configure a VLANs. These VLANs are configured on the bond interface defined above.

```
bond0.2:
  network.managed:
    - type: vlan
    - ipaddr: 10.1.0.2
    - use:
      - network: bond0
    - require:
      - network: bond0

bond0.3:
  network.managed:
    - type: vlan
    - ipaddr: 10.1.0.3
    - use:
      - network: bond0
    - require:
      - network: bond0

bond0.10:
  network.managed:
    - type: vlan
    - ipaddr: 10.1.0.4
    - use:
      - network: bond0
    - require:
      - network: bond0

bond0.12:
  network.managed:
    - type: vlan
    - ipaddr: 10.1.0.5
    - use:
      - network: bond0
    - require:
      - network: bond0
```

## Bridge Interfaces

```

eth4:
  network.managed:
    - enabled: True
    - type: eth
    - proto: dhcp
    - bridge: br0

br0:
  network.managed:
    - enabled: True
    - type: bridge
    - proto: dhcp
    - bridge: br0
    - delay: 0
    - ports: eth4
    - bypassfirewall: True
    - use:
      - network: eth4
    - require:
      - network: eth4

```

---

**Note:** When managing bridged interfaces on a Debian/Ubuntu based system, the `ports` argument is required. RedHat-based systems will ignore the argument.

---

## Network Teaming (RHEL/CentOS 7 and later)

New in version 3002.

- Configure the members of the team interface with a `type` of `teamport`, and a `team_master` option set to the name of the bond interface.
  - `master` also works, but will be ignored if both `team_master` and `master` are present.
  - If applicable, include a `team_port_config` option. This should be formatted as a dictionary. Keep in mind that due to a quirk of PyYAML, dictionaries nested under a list item must be double-indented (see example below for interface `eth5`).
- Configure the team interface with a `type` of `team`. The team configuration should be passed via the `team_config` option. As with `team_port_config`, the dictionary should be double-indented.

```

eth5:
  network.managed:
    - type: teamport
    - team_master: team0
    - team_port_config:
      prio: 100

eth6:
  network.managed:
    - type: teamport

```

(continues on next page)

(continued from previous page)

```
- team_master: team0

team0:
  network.managed:
    - type: team
    - ipaddr: 172.24.90.42
    - netmask: 255.255.255.128
    - enable_ipv6: True
    - ipv6addr: 'fee1:dead:beef:af43::'
    - team_config:
      runner:
        hwaddr_policy: by_active
        name: activebackup
        link_watch:
          name: ethtool
```

---

**Note:** While `teamd` must be installed to manage a team interface, it is not required to configure a separate `pkg.installed` state for it, as it will be silently installed if needed.

---

### Configuring the Loopback Interface

Use `network.managed` with a type of `eth` and a proto of `loopback`.

```
lo:
  network.managed:
    - name: lo
    - type: eth
    - proto: loopback
    - onboot: yes
    - userctl: no
    - ipv6_autoconf: no
    - enable_ipv6: true
```

### Other Useful Options

#### `noifupdown`

The `noifupdown` option, if set to `True`, will keep Salt from restart the interface if changes are made, requiring them to be restarted manually. Here are a couple examples:

```
eth7:
  network.managed:
    - enabled: True
    - type: eth
    # Automatic IP/DNS
    - proto: dhcp
    - noifupdown: True
```

(continues on next page)

(continued from previous page)

```

eth8:
  network.managed:
    - type: eth
    - noifupdown: True

    # IPv4
    - proto: static
    - ipaddr: 192.168.4.9
    - netmask: 255.255.255.0
    - gateway: 192.168.4.1
    - enable_ipv6: True

    # IPv6
    - ipv6proto: static
    - ipv6addr: 2001:db8:dead:c0::3
    - ipv6netmask: 64
    - ipv6gateway: 2001:db8:dead:c0::1
    # override shared; makes those options v4-only
    - ipv6ttl: 15

    # Shared
    - mtu: 1480
    - ttl: 18
    - dns:
      - 8.8.8.8
      - 8.8.4.4

```

`salt.states.network.managed`(*name*, *enabled=True*, *\*\*kwargs*)

Ensure that the named interface is configured properly.

**name**

The name of the interface to manage

**type**

[eth] Type of interface and configuration

Changed in version 3002.

**enabled**

Designates the state of this interface.

`salt.states.network.routes`(*name*, *\*\*kwargs*)

Manage network interface static routes.

**name**

Interface name to apply the route to.

**kwargs**

Named routes

`salt.states.network.system`(*name*, *\*\*kwargs*)

Ensure that global network settings are configured properly.

**name**

Custom name to represent this configuration change.

**kwargs**

The global parameters for the system.

## 26.19.203 salt.states.neutron\_network

### Management of OpenStack Neutron Networks

New in version 2018.3.0.

**depends**

shade

**configuration**

see *salt.modules.neutronng* for setup instructions

Example States

```
create network:
  neutron_network.present:
    - name: network1

delete network:
  neutron_network.absent:
    - name: network1

create network with optional params:
  neutron_network.present:
    - name: network1
    - vlan: 200
    - shared: False
    - external: False
    - project: project1
```

`salt.states.neutron_network.absent`(*name*, *auth=None*, *\*\*kwargs*)

Ensure a network does not exists

**name**

Name of the network

`salt.states.neutron_network.present`(*name*, *auth=None*, *\*\*kwargs*)

Ensure a network exists and is up-to-date

**name**

Name of the network

**provider**

A dict of network provider options.

**shared**

Set the network as shared.

**external**

Whether this network is externally accessible.

**admin\_state\_up**

Set the network administrative state to up.

**vlan**

Vlan ID. Alias for provider

- `physical_network`: provider
- `network_type`: vlan
- `segmentation_id`: (vlan id)

## 26.19.204 salt.states.neutron\_secgroup

### Management of OpenStack Neutron Security Groups

New in version 2018.3.0.

- depends**
  - shade
- configuration**
  - see *salt.modules.neutronng* for setup instructions

Example States

```
create security group;
neutron_secgroup.present:
- name: security_group1
- description: "Very Secure Security Group"

delete security group:
neutron_secgroup.absent:
- name_or_id: security_group1
- project_name: Project1

create security group with optional params:
neutron_secgroup.present:
- name: security_group1
- description: "Very Secure Security Group"
- project_id: 1dcac318a83b4610b7a7f7ba01465548

create security group with optional params:
neutron_secgroup.present:
- name: security_group1
- description: "Very Secure Security Group"
- project_name: Project1
```

`salt.states.neutron_secgroup.absent` (*name*, *auth=None*, *\*\*kwargs*)

Ensure a security group does not exist

**name**

Name of the security group

`salt.states.neutron_secgroup.present` (*name*, *auth=None*, *\*\*kwargs*)

Ensure a security group exists.

You can supply either `project_name` or `project_id`.

Creating a default security group will not show up as a change; it gets created through the lookup process.

**name**

Name of the security group

**description**

Description of the security group

**project\_name**

Name of Project

**project\_id**

ID of Project

## 26.19.205 salt.states.neutron\_secgroup\_rule

### Management of OpenStack Neutron Security Group Rules

New in version 2018.3.0.

**depends**

shade

**configuration**

see *salt.modules.neutronng* for setup instructions

Example States

```

create security group rule:
  neutron_secgroup_rule.present:
  - name: security_group1
  - project_name: Project1
  - protocol: icmp

delete security group:
  neutron_secgroup_rule.absent:
  - name_or_id: security_group1

create security group with optional params:
  neutron_secgroup_rule.present:
  - name: security_group1
  - description: "Very Secure Security Group"
  - project_id: 1dcac318a83b4610b7a7f7ba01465548

```

`salt.states.neutron_secgroup_rule.absent`(*name*, *auth=None*, *\*\*kwargs*)

Ensure a security group rule does not exist

**name**

name or id of the security group rule to delete

**rule\_id**

uuid of the rule to delete

**project\_id**

id of project to delete rule from

`salt.states.neutron_secgroup_rule.present`(*name*, *auth=None*, *\*\*kwargs*)

Ensure a security group rule exists

**defaults:** *port\_range\_min=None*, *port\_range\_max=None*, *protocol=None*,

*remote\_ip\_prefix=None*, *remote\_group\_id=None*, *direction='ingress'*, *ethertype='IPv4'*,  
*project\_id=None*

**name**

Name of the security group to associate with this rule

**project\_name**

Name of the project associated with the security group

**protocol**

The protocol that is matched by the security group rule. Valid values are None, tcp, udp, and icmp.

## 26.19.206 salt.states.neutron\_subnet

### Management of OpenStack Neutron Subnets

New in version 2018.3.0.

- depends**
  - shade
- configuration**
  - see `salt.modules.neutronng` for setup instructions

Example States

```

create subnet:
  neutron_subnet.present:
  - name: subnet1
  - network_name_or_id: network1
  - cidr: 192.168.199.0/24

delete subnet:
  neutron_subnet.absent:
  - name: subnet2

create subnet with optional params:
  neutron_subnet.present:
  - name: subnet1
  - network_name_or_id: network1
  - enable_dhcp: True
  - cidr: 192.168.199.0/24
  - allocation_pools:
    - start: 192.168.199.5
      end: 192.168.199.250
  - host_routes:
    - destination: 192.168..0.0/24
      nextthop: 192.168.0.1
  - gateway_ip: 192.168.199.1
  - dns_nameservers:
    - 8.8.8.8
    - 8.8.8.7

create ipv6 subnet:
  neutron_subnet.present:
  - name: v6subnet1
  - network_name_or_id: network1
  - ip_version: 6
  
```

`salt.states.neutron_subnet.absent`(*name*, *auth=None*)

Ensure a subnet does not exists

**name**

Name of the subnet

`salt.states.neutron_subnet.present`(*name*, *auth=None*, *\*\*kwargs*)

Ensure a subnet exists and is up-to-date

|                           |                                                                                                          |
|---------------------------|----------------------------------------------------------------------------------------------------------|
| <b>name</b>               | Name of the subnet                                                                                       |
| <b>network_name_or_id</b> | The unique name or ID of the attached network. If a non-unique name is supplied, an exception is raised. |
| <b>allocation_pools</b>   | A list of dictionaries of the start and end addresses for the allocation pools                           |
| <b>gateway_ip</b>         | The gateway IP address.                                                                                  |
| <b>dns_nameservers</b>    | A list of DNS name servers for the subnet.                                                               |
| <b>host_routes</b>        | A list of host route dictionaries for the subnet.                                                        |
| <b>ipv6_ra_mode</b>       | IPv6 Router Advertisement mode. Valid values are: 'dhcpv6-stateful', 'dhcpv6-stateless', or 'slaac'.     |
| <b>ipv6_address_mode</b>  | IPv6 address mode. Valid values are: 'dhcpv6-stateful', 'dhcpv6-stateless', or 'slaac'.                  |

### 26.19.207 salt.states.nexus

This state downloads artifacts from Nexus 3.x.

New in version 2018.3.0.

`salt.states.nexus.downloaded` (*name, artifact, target\_dir='/tmp', target\_file=None*)

Ensures that the artifact from nexus exists at given location. If it doesn't exist, then it will be downloaded. If it already exists then the checksum of existing file is checked against checksum in nexus. If it is different then the step will fail.

#### artifact

Details of the artifact to be downloaded from nexus. Various options are:

- `nexus_url`: URL of the nexus instance
- `repository`: Repository in nexus
- `artifact_id`: Artifact ID
- `group_id`: Group ID
- `packaging`: Packaging
- `classifier`: Classifier
- **version**: **Version**  
One of the following: - `Version` to download - `latest` - Download the latest release of this artifact - `latest_snapshot` - Download the latest snapshot for this artifact
- `username`: nexus username
- `password`: nexus password

#### target\_dir

Directory where the artifact should be downloaded. By default it is downloaded to /tmp directory.

#### target\_file

Target file to download artifact to. By default file name is resolved by nexus.

An example to download an artifact to a specific file:

```

jboss_module_downloaded:
  nexus.downloaded:
    - artifact:
      nexus_url: http://nexus.intranet.example.com/repository
      repository: 'libs-release-local'
      artifact_id: 'module'
      group_id: 'com.company.module'

```

(continues on next page)

(continued from previous page)

```

packaging: 'jar'
classifier: 'sources'
version: '1.0'
- target_file: /opt/jboss7/modules/com/company/lib/module.jar

```

Download artifact to the folder (automatically resolves file name):

```

maven_artifact_downloaded:
nexus.downloaded:
- artifact:
  nexus_url: http://nexus.intranet.example.com/repository
  repository: 'maven-releases'
  artifact_id: 'module'
  group_id: 'com.company.module'
  packaging: 'zip'
  classifier: 'dist'
  version: '1.0'
- target_dir: /opt/maven/modules/com/company/release

```

### 26.19.208 salt.states.nfs\_export

#### Management of NFS exports

New in version 2018.3.0.

To ensure an NFS export exists:

```

add_simple_export:
nfs_export.present:
- name: '/srv/nfs'
- hosts: '10.0.2.0/24'
- options:
  - 'rw'

```

This creates the following in /etc/exports:

```
/srv/nfs 10.0.2.0/24(rw)
```

For more complex exports with multiple groups of hosts, use 'clients':

```

add_complex_export:
nfs_export.present:
- name: '/srv/nfs'
- clients:
  # First export, same as simple one above
  - hosts: '10.0.2.0/24'
    options:
      - 'rw'
  # Second export
  - hosts: '*.example.com'
    options:

```

(continues on next page)

(continued from previous page)

```
- 'ro'
- 'subtree_check'
```

This creates the following in `/etc/exports`:

```
/srv/nfs 10.0.2.0/24(rw) 192.168.0.0/24,172.19.0.0/16(ro,subtree_check)
```

Any export of the given path will be modified to match the one specified.

To ensure an NFS export is absent:

```
delete_export:
nfs_export.absent:
  - name: '/srv/nfs'
```

`salt.states.nfs_export.absent` (*name*, *exports='/etc/exports'*)

Ensure that the named path is not exported

**name**

The export path to remove

`salt.states.nfs_export.present` (*name*, *clients=None*, *hosts=None*, *options=None*, *exports='/etc/exports'*)

Ensure that the named export is present with the given options

**name**

The export path to configure

**clients**

A list of hosts and the options applied to them. This option may not be used in combination with the 'hosts' or 'options' shortcuts.

```
- clients:
  # First export
  - hosts: '10.0.2.0/24'
    options:
      - 'rw'
  # Second export
  - hosts: '*.example.com'
    options:
      - 'ro'
      - 'subtree_check'
```

**hosts**

A string matching a number of hosts, for example:

```
hosts: '10.0.2.123'

hosts: '10.0.2.0/24'

hosts: 'minion1.example.com'

hosts: '*.example.com'

hosts: '*'
```

**options**

A list of NFS options, for example:

**options:**

- 'rw'
- 'subtree\_check'

**26.19.209 salt.states.nftables****Management of nftables**

This is an nftables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic *firewall* state.

**httpd:****nftables.append:**

- **table:** filter

- **proto:** tcp
- **sport:** 1025:65535
- **save:** True

**output:****nftables.chain\_present:**

(continues on next page)

(continued from previous page)

- **family:** ip
- **table:** filter

**output:****nftables.chain\_absent:**

- **family:** ip
- **table:** filter

`salt.states.nftables.append`(*name*, *family*='ipv4', *\*\*kwargs*)

New in version 0.17.0.

Append a rule to a chain

**name**

A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**family**

Network family, ipv4 or ipv6.

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

`salt.states.nftables.chain_absent`(*name*, *table*='filter', *family*='ipv4')

New in version 2014.7.0.

Verify the chain is absent.

**family**

Networking family, either ipv4 or ipv6

`salt.states.nftables.chain_present`(*name*, *table*='filter', *table\_type*=None, *hook*=None, *priority*=None, *family*='ipv4')

New in version 2014.7.0.

Changed in version 3002.

Verify a chain exists in a table.

**name**

A user-defined chain name.

**table**

The table to own the chain.

**family**

Networking family, either ipv4 or ipv6

`salt.states.nftables.delete`(*name*, *family*='ipv4', *\*\*kwargs*)

New in version 2014.7.0.

Delete a rule to a chain

**name**

A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**family**

Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

`salt.states.nftables.flush`(*name*, *family*='ipv4', *ignore\_absence*=False, *\*\*kwargs*)

New in version 2014.7.0.

Changed in version 3002.

Flush current nftables state

**family**

Networking family, either ipv4 or ipv6

**ignore\_absence**

If set to True, attempts to flush a non-existent table will not result in a failed state.

New in version 3002.

`salt.states.nftables.insert(name, family='ipv4', **kwargs)`

New in version 2014.7.0.

Insert a rule into a chain

**name**

A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**family**

Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

`salt.states.nftables.set_policy(name, table='filter', family='ipv4', **kwargs)`

New in version 3002.

Sets the default policy for nftables chains

**table**

The table that owns the chain that should be modified

**family**

Networking family, either ipv4 or ipv6

**policy**

The requested table policy (accept or drop)

**save**

Boolean to save the in-memory nftables settings to a file.

**save\_filename**

The filename to save the nftables settings (default: `/etc/nftables` or `/etc/nftables/salt-all-in-one.nft` if the former is a directory)

`salt.states.nftables.table_absent(name, family='ipv4', **kwargs)`

New in version 3002.

Ensure an nftables table is absent

**name**

Name of the table to ensure is absent

**family**

Networking family, either ipv4 or ipv6

`salt.states.nftables.table_present(name, family='ipv4', **kwargs)`

New in version 3002.

Ensure an nftables table is present

**name**

A user-defined table name.

**family**

Networking family, either ipv4 or ipv6

## 26.19.210 salt.states.npm

### Installation of NPM Packages

These states manage the installed packages for node.js using the Node Package Manager (npm). Note that npm must be installed for these states to be available, so npm states should include a requisite to a pkg.installed state for the package which provides npm (simply npm in most cases). Example:

```

npm:
  pkg.installed

yaml:
  npm.installed:
    - require:
      - pkg: npm
  
```

**salt.states.npm.bootstrap** (*name, user=None, silent=True*)

Bootstraps a node.js application.

Will execute 'npm install --json' on the specified directory.

**user**

The user to run NPM with

New in version 0.17.0.

**salt.states.npm.cache\_cleaned** (*name=None, user=None, force=False*)

Ensure that the given package is not cached.

If no package is specified, this ensures the entire cache is cleared.

**name**

The name of the package to remove from the cache, or None for all packages

**user**

The user to run NPM with

**force**

Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

**salt.states.npm.installed** (*name, pkgs=None, dir=None, user=None, force\_reinstall=False, registry=None, env=None*)

Verify that the given package is installed and is at the correct version (if specified).

```

coffee-script:
  npm.installed:
    - user: someuser

coffee-script@1.0.1:
  npm.installed: []
  
```

**name**

The package to install

Changed in version 2014.7.2: This parameter is no longer lowercased by salt so that case-sensitive NPM package names will work.

**pkgs**

A list of packages to install with a single npm invocation; specifying this argument will ignore the name argument

New in version 2014.7.0.

**dir**

The target directory in which to install the package, or None for global installation

**user**

The user to run NPM with

New in version 0.17.0.

**registry**

The NPM registry from which to install the package

New in version 2014.7.0.

**env**

A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

New in version 2014.7.0.

**force\_reinstall**

Install the package even if it is already installed

`salt.states.npm.removed` (*name*, *dir=None*, *user=None*)

Verify that the given package is not installed.

**dir**

The target directory in which to install the package, or None for global installation

**user**

The user to run NPM with

New in version 0.17.0.

## 26.19.211 salt.states.ntp

### Management of NTP servers

New in version 2014.1.0.

This state is used to manage NTP servers. Currently only Windows is supported.

```
win_ntp:
  ntp.managed:
    - servers:
      - pool.ntp.org
      - us.pool.ntp.org
```

`salt.states.ntp.managed` (*name*, *servers=None*)

Manage NTP servers

**servers**

A list of NTP servers

## 26.19.212 salt.states.nxos

State module for Cisco NX-OS Switch Proxy and Native minions

New in version 2016.11.0.

For documentation on setting up the nxos proxy minion look in the documentation for *salt.proxy.nxos*.

**salt.states.nxos.config\_absent**(*name*)

Ensure a specific configuration line does not exist in the running config

**name**

config line to remove

Examples:

```

add snmp group:
  nxos.config_absent:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator
      - snmp-server community AnotherRandomSNMPString group network-admin

```

**Note:** For certain cases extra lines could be removed based on dependencies. In this example, included after the example for `config_present`, the ACLs would be removed because they depend on the existence of the group.

**salt.states.nxos.config\_present**(*name*)

Ensure a specific configuration line exists in the running config

**name**

config line to set

Examples:

```

add snmp group:
  nxos.config_present:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator
      - snmp-server community AnotherRandomSNMPString group network-admin

add snmp acl:
  nxos.config_present:
    - names:
      - snmp-server community randoSNMPstringHERE use-acl snmp-acl-ro
      - snmp-server community AnotherRandomSNMPString use-acl snmp-acl-rw

```

**salt.states.nxos.replace**(*name*, *repl*, *full\_match=False*)

Replace all instances of a string or full line in the running config

**name**

String to replace

**repl**

The replacement text

**full\_match**

Whether *name* will match the full line or only a subset of the line. Defaults to False. When False, \* is added around *name* for matching in the *show run* config.

Examples:

```

replace snmp string:
  nxos.replace:
    - name: randoSNMPstringHERE
    - repl: NEWrandoSNMPstringHERE

replace full snmp string:
  nxos.replace:
    - name: ^snmp-server community randoSNMPstringHERE group network-
    →operator$
    - repl: snmp-server community NEWrandoSNMPstringHERE group network-
    →operator
    - full_match: True

```

**Note:** The first example will replace the SNMP string on both the group and the ACL, so you will not lose the ACL setting. Because the second is an exact match of the line, when the group is removed, the ACL is removed, but not readded, because it was not matched.

`salt.states.nxos.user_absent(name)`

Ensure a user is not present

**name**

username to remove if it exists

Examples:

```

delete:
  nxos.user_absent:
    - name: daniel

```

`salt.states.nxos.user_present(name, password=None, roles=None, encrypted=False, crypt_salt=None, algorithm='sha256')`

Ensure a user is present with the specified groups

**name**

Name of user

**password**

Encrypted or Plain Text password for user

**roles**

List of roles the user should be assigned. Any roles not in this list will be removed

**encrypted**

Whether the password is encrypted already or not. Defaults to False

**crypt\_salt**

Salt to use when encrypting the password. Default is None (salt is randomly generated for unhashed passwords)

**algorithm**

Algorithm to use for hashing password. Defaults to sha256. Accepts md5, blowfish, sha256, sha512

Examples:

```

create:
  nxos.user_present:
    - name: daniel
    - roles:
      - vdc-admin

```

(continues on next page)

(continued from previous page)

```

set_password:
  nxos.user_present:
    - name: daniel
    - password: admin
    - roles:
      - network-admin

update:
  nxos.user_present:
    - name: daniel
    - password: AiN9jaoP
    - roles:
      - network-admin
      - vdc-admin

```

### 26.19.213 salt.states.nxos\_upgrade

Manage NX-OS System Image Upgrades.

New in version 3001.

```

maturity
  new

platform
  nxos

codeauthor
  Michael G Wiebe

```

For documentation on setting up the nxos proxy minion look in the documentation for *salt.proxy.nxos*.

`salt.states.nxos_upgrade.image_running` (*name*, *system\_image*, *kickstart\_image=None*, *issu=True*, *\*\*kwargs*)

Ensure the NX-OS system image is running on the device.

```

name
  Name of the salt state task

system_image
  Name of the system image file on bootflash:

kickstart_image
  Name of the kickstart image file on bootflash: This is not needed if the system_image is a combined
  system and kickstart image Default: None

issu
  Ensure the correct system is running on the device using an in service software upgrade, or force a
  disruptive upgrade by setting the option to False. Default: False

timeout
  Timeout in seconds for long running 'install all' upgrade command. Default: 900

Examples:

```

```

upgrade_software_image_n9k:
  nxos.image_running:
    - name: Ensure nxos.7.0.3.I7.5a.bin is running
    - system_image: nxos.7.0.3.I7.5a.bin

```

(continues on next page)

(continued from previous page)

```

- issu: True

upgrade_software_image_n7k:
  nxos.image_running:
    - name: Ensure n7000-s2-kickstart.8.0.1.bin is running
    - kickstart_image: n7000-s2-kickstart.8.0.1.bin
    - system_image: n7000-s2-dk9.8.0.1.bin
    - issu: False

```

### 26.19.214 salt.states.openstack\_config

Manage OpenStack configuration file settings.

```

maintainer
  Jeffrey C. Ollie <jeff@ocjtech.us>

maturity
  new

depends
platform
  linux

```

`salt.states.openstack_config.absent` (*name*, *filename*, *section*, *parameter=None*)

Ensure a value is not set in an OpenStack configuration file.

**filename**

The full path to the configuration file

**section**

The section in which the parameter will be set

**parameter (optional)**

The parameter to change. If the parameter is not supplied, the name will be used as the parameter.

`salt.states.openstack_config.present` (*name*, *filename*, *section*, *value*, *parameter=None*)

Ensure a value is set in an OpenStack configuration file.

**filename**

The full path to the configuration file

**section**

The section in which the parameter will be set

**parameter (optional)**

The parameter to change. If the parameter is not supplied, the name will be used as the parameter.

**value**

The value to set

### 26.19.215 salt.states.openvswitch\_bridge

Management of Open vSwitch bridges.

`salt.states.openvswitch_bridge.absent` (*name*)

Ensures that the named bridge does not exist, eventually deletes it.

**Parameters**

**name** -- The name of the bridge.

`salt.states.openvswitch_bridge.present` (*name*, *parent=None*, *vlan=None*)

Ensures that the named bridge exists, eventually creates it.

**Parameters**

- **name** -- string name of the bridge
- **parent** -- string name of the parent bridge (if the bridge shall be created as a fake bridge). If specified, *vlan* must also be specified.
- **versionadded:** ( . . ) -- 3006.0:
- **vlan** -- int VLAN ID of the bridge (if the bridge shall be created as a fake bridge). If specified, *parent* must also be specified.
- **versionadded:** -- 3006.0:

### 26.19.216 salt.states.openvswitch\_db module

Management of Open vSwitch database records.

New in version 3006.0.

`salt.states.openvswitch_db.managed` (*name*, *table*, *data*, *record=None*)

Ensures that the specified columns of the named record have the specified values.

**Parameters**

- **name** -- string name of the record
- **table** -- string name of the table to which the record belongs.
- **data** -- dict dictionary containing a mapping from column names to the desired values. Columns that exist, but are not specified in this dictionary are not touched.
- **record** -- string name of the record (optional). Replaces *name* if specified.

### 26.19.217 salt.states.openvswitch\_port

Management of Open vSwitch ports.

`salt.states.openvswitch_port.absent` (*name*, *bridge=None*)

Ensures that the named port exists on bridge, eventually deletes it. If *bridge* is not set, port is removed from whatever bridge contains it.

**Parameters**

- **name** -- The name of the port.
- **bridge** -- The name of the bridge.

`salt.states.openvswitch_port.present` (*name*, *bridge*, *tunnel\_type=None*, *id=None*, *remote=None*, *dst\_port=None*, *internal=False*)

Ensures that the named port exists on bridge, eventually creates it.

**Parameters**

- **name** -- The name of the port.
- **bridge** -- The name of the bridge.
- **tunnel\_type** -- Optional type of interface to create, currently supports: *vlan*, *vxlan* and *gre*.
- **id** -- Optional tunnel's key.
- **remote** -- Remote endpoint's IP address.
- **dst\_port** -- Port to use when creating tunnelport in the switch.
- **internal** -- Create an internal port if one does not exist

## 26.19.218 salt.states.opsgenie

### Create/Close an alert in OpsGenie

New in version 2018.3.0.

This state is useful for creating or closing alerts in OpsGenie during state runs.

```

used_space:
  disk.status:
  - name: /
  - maximum: 79%
  - minimum: 20%

opsgenie_create_action_sender:
  opsgenie.create_alert:
  - api_key: XXXXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXXX
  - reason: 'Disk capacity is out of designated range.'
  - name: disk.status
  - onfail:
    - disk: used_space

opsgenie_close_action_sender:
  opsgenie.close_alert:
  - api_key: XXXXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXXX
  - name: disk.status
  - require:
    - disk: used_space

```

```

salt.states.opsgenie.close_alert(name=None, api_key=None, reason='Conditions are met.',
                                  action_type='Close')

```

Close an alert in OpsGenie. It's a wrapper function for create\_alert. Example usage with Salt's requisites and other global state arguments could be found above.

Required Parameters:

**name**

It will be used as alert's alias. If you want to use the close functionality you must provide name field for both states like in above case.

Optional Parameters:

**api\_key**

It's the API Key you've copied while adding integration in OpsGenie.

**reason**

It will be used as alert's default message in OpsGenie.

**action\_type**

OpsGenie supports the default values Create/Close for action\_type. You can customize this field with OpsGenie's custom actions for other purposes like adding notes or acknowledging alerts.

```

salt.states.opsgenie.create_alert(name=None, api_key=None, reason=None, action_type='Create')

```

Create an alert in OpsGenie. Example usage with Salt's requisites and other global state arguments could be found above.

Required Parameters:

**api\_key**

It's the API Key you've copied while adding integration in OpsGenie.

**reason**

It will be used as alert's default message in OpsGenie.

Optional Parameters:

**name**

It will be used as alert's alias. If you want to use the close functionality you must provide name field for both states like in above case.

**action\_type**

OpsGenie supports the default values Create/Close for action\_type. You can customize this field with OpsGenie's custom actions for other purposes like adding notes or acknowledging alerts.

## 26.19.219 salt.states.pagerduty

### Create an Event in PagerDuty

New in version 2014.1.0.

This state is useful for creating events on the PagerDuty service during state runs.

```
server-warning-message:
  pagerduty.create_event:
    - name: 'This is a server warning message'
    - details: 'This is a much more detailed message'
    - service_key: 9abcd123456789efabcde362783cdbaf
    - profile: my-pagerduty-account
```

`salt.states.pagerduty.create_event`(*name*, *details*, *service\_key*, *profile*)

Create an event on the PagerDuty service

```
server-warning-message:
  pagerduty.create_event:
    - name: 'This is a server warning message'
    - details: 'This is a much more detailed message'
    - service_key: 9abcd123456789efabcde362783cdbaf
    - profile: my-pagerduty-account
```

The following parameters are required:

**name**

This is a short description of the event.

**details**

This can be a more detailed description of the event.

**service\_key**

This key can be found by using `pagerduty.list_services`.

**profile**

This refers to the configuration profile to use to connect to the PagerDuty service.

## 26.19.220 salt.states.pagerduty\_escalation\_policy

Manage PagerDuty escalation policies.

Schedules and users can be referenced by pagerduty ID, or by name, or by email address.

For example:

```
ensure test escalation policy:
  pagerduty_escalation_policy.present:
```

(continues on next page)

(continued from previous page)

```

- name: bruce test escalation policy
- escalation_rules:
  - targets:
    - type: schedule
      id: 'bruce test schedule level1'
    - type: user
      id: 'Bruce Sherrod'
  escalation_delay_in_minutes: 15
- targets:
  - type: schedule
    id: 'bruce test schedule level2'
  escalation_delay_in_minutes: 15
- targets:
  - type: user
    id: 'Bruce TestUser1'
  - type: user
    id: 'Bruce TestUser2'
  - type: user
    id: 'Bruce TestUser3'
  - type: user
    id: 'bruce+test4@lyft.com'
  escalation_delay_in_minutes: 15

```

`salt.states.pagerduty_escalation_policy.absent` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure that a PagerDuty escalation policy does not exist. Accepts all the arguments that `pagerduty_escalation_policy.present` accepts; but ignores all arguments except the name.

Name can be the escalation policy id or the escalation policy name.

`salt.states.pagerduty_escalation_policy.present` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure that a pagerduty escalation policy exists. Will create or update as needed.

This method accepts as args everything defined in [https://developer.pagerduty.com/documentation/rest/escalation\\_policies/create](https://developer.pagerduty.com/documentation/rest/escalation_policies/create). In addition, user and schedule id's will be translated from name (or email address) into PagerDuty unique ids. For example:

`pagerduty_escalation_policy.present:`

- name: bruce test escalation policy
- **escalation\_rules:**
  - **targets:**
    - \* type: schedule id: 'bruce test schedule level1'
    - \* type: user id: 'Bruce Sherrod'

In this example, 'Bruce Sherrod' will be looked up and replaced with the PagerDuty id (usually a 7 digit all-caps string, e.g. PX6GQL7)

## 26.19.221 salt.states.pagerduty\_schedule

Manage PagerDuty schedules.

Example:

```
ensure test schedule:
  pagerduty_schedule.present:
    - name: 'bruce test schedule level1'
    - schedule:
      name: 'bruce test schedule level1'
      time_zone: 'Pacific Time (US & Canada)'
      schedule_layers:
        - name: 'Schedule Layer 1'
          start: '2015-01-01T00:00:00'
          users:
            - user:
              'id': 'Bruce TestUser1'
              member_order: 1
            - user:
              'id': 'Bruce TestUser2'
              member_order: 2
            - user:
              'id': 'bruce+test3@lyft.com'
              member_order: 3
            - user:
              'id': 'bruce+test4@lyft.com'
              member_order: 4
          rotation_virtual_start: '2015-01-01T00:00:00'
          priority: 1
          rotation_turn_length_seconds: 604800
```

`salt.states.pagerduty_schedule.absent` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure that a pagerduty schedule does not exist. Name can be pagerduty schedule id or pagerduty schedule name.

`salt.states.pagerduty_schedule.present` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure that a pagerduty schedule exists. This method accepts as args everything defined in <https://developer.pagerduty.com/documentation/rest/schedules/create>. This means that most arguments are in a dict called "schedule."

User id's can be pagerduty id, or name, or email address.

## 26.19.222 salt.states.pagerduty\_service

Manage PagerDuty services

Escalation policies can be referenced by pagerduty ID or by namea.

For example:

```
ensure test service
  pagerduty_service.present:
    - name: 'my service'
    - escalation_policy_id: 'my escalation policy'
    - type: nagios
```

`salt.states.pagerduty_service.absent` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure a pagerduty service does not exist. Name can be the service name or pagerduty service id.

`salt.states.pagerduty_service.present` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure pagerduty service exists. This method accepts as arguments everything defined in <https://developer.pagerduty.com/documentation/rest/services/create>

Note that many arguments are mutually exclusive, depending on the "type" argument.

Examples:

```
# create a PagerDuty email service at test-email@DOMAIN.pagerduty.com
ensure generic email service exists:
  pagerduty_service.present:
    - name: my email service
    - service:
      description: "email service controlled by salt"
      escalation_policy_id: "my escalation policy"
      type: "generic_email"
      service_key: "test-email"
```

```
# create a pagerduty service using cloudwatch integration
ensure my cloudwatch service exists:
  pagerduty_service.present:
    - name: my cloudwatch service
    - service:
      escalation_policy_id: "my escalation policy"
      type: aws_cloudwatch
      description: "my cloudwatch service controlled by salt"
```

### 26.19.223 salt.states.pagerduty\_user

Manage PagerDuty users.

#### Example

ensure bruce test user 1:

pagerduty.user\_present:

- name: 'Bruce TestUser1'
- email: bruce+test1@lyft.com
- requester\_id: P1GV5NT

salt.states.pagerduty\_user.**absent**(profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs)

Ensure pagerduty user does not exist. Name can be pagerduty id, email address, or user name.

salt.states.pagerduty\_user.**present**(profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs)

Ensure pagerduty user exists. Arguments match those supported by <https://developer.pagerduty.com/documentation/rest/users/create>.

### 26.19.224 salt.states.panos

A state module to manage Palo Alto network devices.

codeauthor

Spencer Ervin <spencer\_ervin@hotmail.com>

maturity

new

depends

none

platform

unix

#### About

This state module was designed to handle connections to a Palo Alto based firewall. This module relies on the Palo Alto proxy module to interface with the devices.

This state module is designed to give extreme flexibility in the control over XPATH values on the PANOS device. It exposes the core XML API commands and allows state modules to chain complex XPATH commands.

Below is an example of how to construct a security rule and move to the top of the policy. This will take a config lock to prevent execution during the operation, then remove the lock. After the XPATH has been deployed, it will commit to the device.

**panos/takelock:**

panos.add\_config\_lock

**panos/service\_tcp\_22:**

(continues on next page)

(continued from previous page)

```

panos.set_config:
  - xpath: /config/devices/entry[@name='localhost.localdomain']/vsys/
  ↳entry[@name='vsys1']/service
  - value: <entry name='tcp-22'><protocol><tcp><port>22</port></tcp></
  ↳protocol></entry>
  - commit: False
panos/create_rule1:
  panos.set_config:
  - xpath: /config/devices/entry[@name='localhost.localdomain']/vsys/
  ↳entry[@name='vsys1']/rulebase/security/rules
  - value: '
    <entry name="rule1">
      <from><member>trust</member></from>
      <to><member>untrust</member></to>
      <source><member>10.0.0.1</member></source>
      <destination><member>10.0.1.1</member></destination>
      <service><member>tcp-22</member></service>
      <application><member>any</member></application>
      <action>allow</action>
      <disabled>no</disabled>
    </entry>'
  - commit: False
panos/moveruletop:
  panos.move_config:
  - xpath: /config/devices/entry[@name='localhost.localdomain']/vsys/
  ↳entry[@name='vsys1']/rulebase/security/rules/entry[@name='rule1']
  - where: top
  - commit: False
panos/removelock:
  panos.remove_config_lock
panos/commit:
  panos.commit_config

```

## Version Specific Configurations

Palo Alto devices running different versions will have different supported features and different command structures. In order to account for this, the proxy module can be leveraged to check if the panos device is at a specific revision level.

The proxy['panos.is\_required\_version'] method will check if a panos device is currently running a version equal or greater than the passed version. For example, proxy['panos.is\_required\_version']('7.0.0') would match both 7.1.0 and 8.0.0.

```

{% if proxy['panos.is_required_version']('8.0.0') %}
panos/deviceconfig/system/motd-and-banner:
  panos.set_config:
    - xpath: /config/devices/entry[@name='localhost.localdomain']/
    ↳deviceconfig/system/motd-and-banner
    - value: |
      <banner-header>BANNER TEXT</banner-header>
      <banner-header-color>color2</banner-header-color>

```

(continues on next page)

(continued from previous page)

```

    <banner-header-text-color>color18</banner-header-text-color>
    <banner-header-footer-match>yes</banner-header-footer-match>
    - commit: False
{% endif %}

```

See also:

*Palo Alto Proxy Module*

`salt.states.panos.add_config_lock`(*name*)

Prevent other users from changing configuration until the lock is released.

name: The name of the module function to execute.

SLS Example:

```

panos/takeLock:
  panos.add_config_lock

```

`salt.states.panos.address_exists`(*name*, *addressname=None*, *vsys=1*, *ipnetmask=None*, *iprange=None*, *fqdn=None*, *description=None*, *commit=False*)

Ensures that an address object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will only process a single address type (ip-netmask, ip-range, or fqdn). It will process the specified value if the following order: ip-netmask, ip-range, fqdn. For proper execution, only specify a single address type.

name: The name of the module function to execute.

addressname(str): The name of the address object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

ipnetmask(str): The IPv4 or IPv6 address or IP address range using the format ip\_address/mask or ip\_address where the mask is the number of significant binary digits used for the network portion of the address. Ideally, for IPv6, you specify only the network portion, not the host portion.

iprange(str): A range of addresses using the format ip\_address-ip\_address where both addresses can be IPv4 or both can be IPv6.

fqdn(str): A fully qualified domain name format. The FQDN initially resolves at commit time. Entries are subsequently refreshed when the firewall performs a check every 30 minutes; all changes in the IP address for the entries are picked up at the refresh cycle.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```

panos/address/h-10.10.10.10:
  panos.address_exists:
    - addressname: h-10.10.10.10
    - vsys: 1
    - ipnetmask: 10.10.10.10
    - commit: False

```

(continues on next page)

(continued from previous page)

```

panos/address/10.0.0.1-10.0.0.50:
  panos.address_exists:
    - addressname: r-10.0.0.1-10.0.0.50
    - vsys: 1
    - iprange: 10.0.0.1-10.0.0.50
    - commit: False

panos/address/foo.bar.com:
  panos.address_exists:
    - addressname: foo.bar.com
    - vsys: 1
    - fqdn: foo.bar.com
    - description: My fqdn object
    - commit: False

```

`salt.states.panos.address_group_exists` (*name*, *groupname=None*, *vsys=1*, *members=None*, *description=None*, *commit=False*)

Ensures that an address group object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will enforce group membership. If a group exists and contains members this state does not include, those members will be removed and replaced with the specified members in the state.

*name*: The name of the module function to execute.

*groupname*(str): The name of the address group object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

*vsys*(str): The string representation of the VSYS ID. Defaults to VSYS 1.

*members*(str, list): The members of the address group. These must be valid address objects or address groups on the system that already exist prior to the execution of this state.

*description*(str): A description for the policy (up to 255 characters).

*commit*(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```

panos/address-group/my-group:
  panos.address_group_exists:
    - groupname: my-group
    - vsys: 1
    - members:
      - my-address-object
      - my-other-address-group
    - description: A group that needs to exist
    - commit: False

```

`salt.states.panos.clone_config` (*name*, *xpath=None*, *newname=None*, *commit=False*)

Clone a specific XPATH and set it to a new name.

*name*: The name of the module function to execute.

*xpath*(str): The XPATH of the configuration API tree to clone.

`newname(str)`: The new name of the XPATH clone.

`commit(bool)`: If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/clonerule:
  panos.clone_config:
    - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/
      ↪security/rules&from=/config/devices/
      ↪entry/vsys/entry[@name='vsys1']/rulebase/security/rules/entry[@name=
      ↪'rule1']
    - value: rule2
    - commit: True
```

`salt.states.panos.commit_config(name)`

Commits the candidate configuration to the running configuration.

`name`: The name of the module function to execute.

SLS Example:

```
panos/commit:
  panos.commit_config
```

`salt.states.panos.delete_config(name, xpath=None, commit=False)`

Deletes a Palo Alto XPATH to a specific value.

Use the `xpath` parameter to specify the location of the object to be deleted.

`name`: The name of the module function to execute.

`xpath(str)`: The XPATH of the configuration API tree to control.

`commit(bool)`: If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/deletegroup:
  panos.delete_config:
    - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/address-
      ↪group/entry[@name='test']
    - commit: True
```

`salt.states.panos.download_software(name, version=None, synch=False, check=False)`

Ensures that a software version is downloaded.

`name`: The name of the module function to execute.

`version(str)`: The software version to check. If this version is not already downloaded, it will attempt to download the file from Palo Alto.

`synch(bool)`: If true, after downloading the file it will be synched to its peer.

`check(bool)`: If true, the PANOS device will first attempt to pull the most recent software inventory list from Palo Alto.

SLS Example:

```

panos/version8.0.0:
  panos.download_software:
    - version: 8.0.0
    - synch: False
    - check: True

```

`salt.states.panos.edit_config(name, xpath=None, value=None, commit=False)`

Edits a Palo Alto XPATH to a specific value. This will always overwrite the existing value, even if it is not changed.

You can replace an existing object hierarchy at a specified location in the configuration with a new value. Use the `xpath` parameter to specify the location of the object, including the node to be replaced.

This is the recommended state to enforce configurations on a `xpath`.

`name`: The name of the module function to execute.

`xpath(str)`: The XPATH of the configuration API tree to control.

`value(str)`: The XML value to edit. This must be a child to the XPATH.

`commit(bool)`: If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```

panos/addressgroup:
  panos.edit_config:
    - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/address-
    ↪group/entry[@name='test']
    - value: <static><entry name='test'><member>abc</member><member>xyz
    ↪</member></entry></static>
    - commit: True

```

`salt.states.panos.move_config(name, xpath=None, where=None, dst=None, commit=False)`

Moves a XPATH value to a new location.

Use the `xpath` parameter to specify the location of the object to be moved, the `where` parameter to specify type of move, and `dst` parameter to specify the destination path.

`name`: The name of the module function to execute.

`xpath(str)`: The XPATH of the configuration API tree to move.

`where(str)`: The type of move to execute. Valid options are after, before, top, bottom. The after and before options will require the `dst` option to specify the destination of the action. The top action will move the XPATH to the top of its structure. The bottom action will move the XPATH to the bottom of its structure.

`dst(str)`: Optional. Specifies the destination to utilize for a move action. This is ignored for the top or bottom action.

`commit(bool)`: If true the firewall will commit the changes, if false do not commit changes. If the operation is not successful, it will not commit.

SLS Example:

```

panos/moveruletop:
  panos.move_config:
    - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/
    ↪security/rules/entry[@name='rule1']

```

(continues on next page)

(continued from previous page)

```

- where: top
- commit: True

panos/moveruleafter:
  panos.move_config:
  - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/
  ↪security/rules/entry[@name='rule1']
  - where: after
  - dst: rule2
  - commit: True

```

`salt.states.panos.remove_config_lock(name)`

Release config lock previously held.

name: The name of the module function to execute.

SLS Example:

```

panos/takelock:
  panos.remove_config_lock

```

`salt.states.panos.rename_config(name, xpath=None, newname=None, commit=False)`

Rename a Palo Alto XPATH to a specific value. This will always rename the value even if a change is not needed.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to control.

newname(str): The new name of the XPATH value.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```

panos/renamegroup:
  panos.rename_config:
  - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/address/
  ↪entry[@name='old_address']
  - value: new_address
  - commit: True

```

`salt.states.panos.security_rule_exists(name, rulename=None, vsys='1', action=None, disabled=None, sourcezone=None, destinationzone=None, source=None, destination=None, application=None, service=None, description=None, logsetting=None, logstart=None, logend=None, negatesource=None, negatedestination=None, profilegroup=None, datafilter=None, fileblock=None, spyware=None, urlfilter=None, virus=None, vulnerability=None, wildfire=None, move=None, movetarget=None, commit=False)`

Ensures that a security rule exists on the device. Also, ensure that all configurations are set appropriately.

This method will create the rule if it does not exist. If the rule does exist, it will ensure that the configurations are set appropriately.

If the rule does not exist and is created, any value that is not provided will be provided as the default. The action, to, from, source, destination, application, and service fields are mandatory and must be provided.

This will enforce the exact match of the rule. For example, if the rule is currently configured with the log-end option, but this option is not specified in the state method, it will be removed and reset to the system default.

It is strongly recommended to specify all options to ensure proper operation.

When defining the profile group settings, the device can only support either a profile group or individual settings. If both are specified, the profile group will be preferred and the individual settings are ignored. If neither are specified, the value will be set to system default of none.

**name:** The name of the module function to execute.

**rulename(str):** The name of the security rule. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

**vsys(str):** The string representation of the VSYS ID. Defaults to VSYS 1.

**action(str):** The action that the security rule will enforce. Valid options are: allow, deny, drop, reset-client, reset-server, reset-both.

**disabled(bool):** Controls if the rule is disabled. Set 'True' to disable and 'False' to enable.

**sourcezone(str, list):** The source zone(s). The value 'any' will match all zones.

**destinationzone(str, list):** The destination zone(s). The value 'any' will match all zones.

**source(str, list):** The source address(es). The value 'any' will match all addresses.

**destination(str, list):** The destination address(es). The value 'any' will match all addresses.

**application(str, list):** The application(s) matched. The value 'any' will match all applications.

**service(str, list):** The service(s) matched. The value 'any' will match all services. The value 'application-default' will match based upon the application defined ports.

**description(str):** A description for the policy (up to 255 characters).

**logsetting(str):** The name of a valid log forwarding profile.

**logstart(bool):** Generates a traffic log entry for the start of a session (disabled by default).

**logend(bool):** Generates a traffic log entry for the end of a session (enabled by default).

**negatesource(bool):** Match all but the specified source addresses.

**negatedestination(bool):** Match all but the specified destination addresses.

**profilegroup(str):** A valid profile group name.

**datafilter(str):** A valid data filter profile name. Ignored with the profilegroup option set.

**fileblock(str):** A valid file blocking profile name. Ignored with the profilegroup option set.

**spyware(str):** A valid spyware profile name. Ignored with the profilegroup option set.

**urlfilter(str):** A valid URL filtering profile name. Ignored with the profilegroup option set.

**virus(str):** A valid virus profile name. Ignored with the profilegroup option set.

**vulnerability(str):** A valid vulnerability profile name. Ignored with the profilegroup option set.

**wildfire(str):** A valid vulnerability profile name. Ignored with the profilegroup option set.

`move(str)`: An optional argument that ensure the rule is moved to a specific location. Valid options are 'top', 'bottom', 'before', or 'after'. The 'before' and 'after' options require the use of the 'movetarget' argument to define the location of the move request.

`movetarget(str)`: An optional argument that defines the target of the move operation if the move argument is set to 'before' or 'after'.

`commit(bool)`: If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/rulebase/security/rule01:
  panos.security_rule_exists:
    - rulename: rule01
    - vsys: 1
    - action: allow
    - disabled: False
    - sourcezone: untrust
    - destinationzone: trust
    - source:
      - 10.10.10.0/24
      - 1.1.1.1
    - destination:
      - 2.2.2.2-2.2.2.4
    - application:
      - any
    - service:
      - tcp-25
    - description: My test security rule
    - logsetting: logprofile
    - logstart: False
    - logend: True
    - negatesource: False
    - negatedestination: False
    - profilegroup: myprofilegroup
    - move: top
    - commit: False

panos/rulebase/security/rule01:
  panos.security_rule_exists:
    - rulename: rule01
    - vsys: 1
    - action: allow
    - disabled: False
    - sourcezone: untrust
    - destinationzone: trust
    - source:
      - 10.10.10.0/24
      - 1.1.1.1
    - destination:
      - 2.2.2.2-2.2.2.4
    - application:
      - any
    - service:
      - tcp-25
```

(continues on next page)

(continued from previous page)

```

- description: My test security rule
- logsetting: logprofile
- logstart: False
- logend: False
- datafilter: foobar
- fileblock: foobar
- spyware: foobar
- urlfilter: foobar
- virus: foobar
- vulnerability: foobar
- wildfire: foobar
- move: after
- movetarget: rule02
- commit: False

```

`salt.states.panos.service_exists` (*name*, *servicename=None*, *vsys=1*, *protocol=None*, *port=None*, *description=None*, *commit=False*)

Ensures that a service object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

*name*: The name of the module function to execute.

*servicename*(str): The name of the security object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

*vsys*(str): The string representation of the VSYS ID. Defaults to VSYS 1.

*protocol*(str): The protocol that is used by the service object. The only valid options are tcp and udp.

*port*(str): The port number that is used by the service object. This can be specified as a single integer or a valid range of ports.

*description*(str): A description for the policy (up to 255 characters).

*commit*(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```

panos/service/tcp-80:
  panos.service_exists:
    - servicename: tcp-80
    - vsys: 1
    - protocol: tcp
    - port: 80
    - description: Hypertext Transfer Protocol
    - commit: False

panos/service/udp-500-550:
  panos.service_exists:
    - servicename: udp-500-550
    - vsys: 3
    - protocol: udp
    - port: 500-550
    - commit: False

```

`salt.states.panos.service_group_exists`(*name*, *groupname=None*, *vsys=1*, *members=None*, *description=None*, *commit=False*)

Ensures that a service group object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will enforce group membership. If a group exists and contains members this state does not include, those members will be removed and replaced with the specified members in the state.

*name*: The name of the module function to execute.

*groupname*(str): The name of the service group object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

*vsys*(str): The string representation of the VSYS ID. Defaults to VSYS 1.

*members*(str, list): The members of the service group. These must be valid service objects or service groups on the system that already exist prior to the execution of this state.

*description*(str): A description for the policy (up to 255 characters).

*commit*(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/service-group/my-group:
  panos.service_group_exists:
    - groupname: my-group
    - vsys: 1
    - members:
      - tcp-80
      - custom-port-group
    - description: A group that needs to exist
    - commit: False
```

`salt.states.panos.set_config`(*name*, *xpath=None*, *value=None*, *commit=False*)

Sets a Palo Alto XPATH to a specific value. This will always overwrite the existing value, even if it is not changed.

You can add or create a new object at a specified location in the configuration hierarchy. Use the *xpath* parameter to specify the location of the object in the configuration

*name*: The name of the module function to execute.

*xpath*(str): The XPATH of the configuration API tree to control.

*value*(str): The XML value to set. This must be a child to the XPATH.

*commit*(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/hostname:
  panos.set_config:
    - xpath: /config/devices/entry[@name='localhost.localdomain']/
      ↪ deviceconfig/system
    - value: <hostname>foobar</hostname>
    - commit: True
```

## 26.19.225 salt.states.pbm

Manages VMware storage policies (called pbm because the vCenter endpoint is /pbm)

### Examples

}

```

## Dependencies

- pyVmomi Python Module

## pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See *Issue #29537* <<https://github.com/saltstack/salt/issues/29537>> for more information.

**salt.states.pbm.default\_storage\_policy\_assigned**(*name, policy, datastore*)

Assigns a default storage policy to a datastore

**policy**

Name of storage policy

**datastore**

Name of datastore

**salt.states.pbm.default\_vsan\_policy\_configured**(*name, policy*)

Configures the default VSAN policy on a vCenter. The state assumes there is only one default VSAN policy on a vCenter.

**policy**

Dict representation of a policy

**salt.states.pbm.storage\_policies\_configured**(*name, policies*)

Configures storage policies on a vCenter.

**policies**

List of dict representation of the required storage policies

## 26.19.226 salt.states.pcs

### Management of Pacemaker/Corosync clusters with PCS

A state module to manage Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

New in version 2016.11.0.

**depends**  
pcs

Walkthrough of a complete PCS cluster setup: [http://clusterlabs.org/doc/en-US/Pacemaker/1.1/html/Clusters\\_from\\_Scratch/](http://clusterlabs.org/doc/en-US/Pacemaker/1.1/html/Clusters_from_Scratch/)

#### Requirements:

PCS is installed, pcs service is started and the password for the hacluster user is set and known.

#### Remark on the cibname variable used in the examples:

The use of the cibname variable is optional. Use it only if you want to deploy your changes into a cibfile first and then push it. This makes only sense if you want to deploy multiple changes (which require each other) at once to the cluster.

At first the cibfile must be created:

```
mysql_pcs__cib_present_cib_for_galera:
  pcs.cib_present:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

Then the cibfile can be modified by creating resources (creating only 1 resource for demonstration, see also 7.):

```
mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.
      ↪org,node3.example.org'
      - '--master'
    - cibname: cib_for_galera
```

After modifying the cibfile, it can be pushed to the live CIB in the cluster:

```
mysql_pcs__cib_pushed_cib_for_galera:
  pcs.cib_pushed:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None
```

Create a cluster from scratch:

1. **This authorizes nodes to each other. It probably won't work with Ubuntu as** it rolls out a default cluster that needs to be destroyed before the new cluster can be created. This is a little complicated so it's best to just run the cluster\_setup below in most cases.:

```

pcs_auth__auth:
  pcs.auth:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsuser: hacluster
    - pcspasswd: hoonetorg

```

2. Do the initial cluster setup:

```

pcs_setup__setup:
  pcs.cluster_setup:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsclustername: pcscluster
    - extra_args:
      - '--start'
      - '--enable'
    - pcsuser: hacluster
    - pcspasswd: hoonetorg

```

3. Optional: Set cluster properties:

```

pcs_properties__prop_has_value_no-quorum-policy:
  pcs.prop_has_value:
    - prop: no-quorum-policy
    - value: ignore
    - cibname: cib_for_cluster_settings

```

4. Optional: Set resource defaults:

```

pcs_properties__resource_defaults_to_resource-stickiness:
  pcs.resource_defaults_to:
    - default: resource-stickiness
    - value: 100
    - cibname: cib_for_cluster_settings

```

5. Optional: Set resource op defaults:

```

pcs_properties__resource_op_defaults_to_monitor-interval:
  pcs.resource_op_defaults_to:
    - op_default: monitor-interval
    - value: 60s
    - cibname: cib_for_cluster_settings

```

6. Configure Fencing (!is often not optional on production ready cluster!):

```

pcs_stonith__created_eps_fence:
  pcs.stonith_present:
    - stonith_id: eps_fence
    - stonith_device_type: fence_eps
    - stonith_device_options:
      - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'

```

(continues on next page)

(continued from previous page)

```

- 'ipaddr=myepsdevice.example.org'
- 'power_wait=5'
- 'verbose=1'
- 'debug=/var/log/pcsd/eps_fence.log'
- 'login=hidden'
- 'passwd=hoonetorg'
- cibname: cib_for_stonith

```

7. Add resources to your cluster:

```

mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.
→example.org,node3.example.org'
      - '--master'
    - cibname: cib_for_galera

```

8. Optional: Add constraints (locations, colocations, orders):

```

haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-
→INFINITY:
  pcs.constraint_present:
    - constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
    - constraint_type: colocation
    - constraint_options:
      - 'add'
      - 'vip_galera'
      - 'with'
      - 'haproxy-clone'
    - cibname: cib_for_haproxy

```

New in version 2016.3.0.

`salt.states.pcs.auth`(*name*, *nodes*, *pcsuser*='hacluster', *pcpasswd*='hacluster', *extra\_args*=None)

Ensure all nodes are authorized to the cluster

**name**

Irrelevant, not used (recommended: `pcs_auth__auth`)

**nodes**

a list of nodes which should be authorized to the cluster

**pcsuser**

user for communication with pcs (default: hacluster)

**pcpasswd**

password for pcsuser (default: hacluster)

**extra\_args**

list of extra args for the 'pcs cluster auth' command, there are none so it's here for compatibility.

Example:

```

pcs_auth__auth:
  pcs.auth:
    - nodes:

```

(continues on next page)

(continued from previous page)

```

- node1.example.com
- node2.example.com
- pcsuser: hacluster
- pcspasswd: hoonetorg
- extra_args: []

```

`salt.states.pcs.cib_present`(*name, cibname, scope=None, extra\_args=None*)

Ensure that a CIB-file with the content of the current live CIB is created

Should be run on one cluster node only (there may be races)

**name**

Irrelevant, not used (recommended: `{{formulaname}}__cib_present_{{cibname}}`)

**cibname**

name/path of the file containing the CIB

**scope**

specific section of the CIB (default: None)

**extra\_args**

additional options for creating the CIB-file

Example:

```

mysql_pcs__cib_present_cib_for_galera:
  pcs.cib_present:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None

```

`salt.states.pcs.cib_pushed`(*name, cibname, scope=None, extra\_args=None*)

Ensure that a CIB-file is pushed if it is changed since the creation of it with `pcs.cib_present`

Should be run on one cluster node only (there may be races)

**name**

Irrelevant, not used (recommended: `{{formulaname}}__cib_pushed_{{cibname}}`)

**cibname**

name/path of the file containing the CIB

**scope**

specific section of the CIB

**extra\_args**

additional options for creating the CIB-file

Example:

```

mysql_pcs__cib_pushed_cib_for_galera:
  pcs.cib_pushed:
    - cibname: cib_for_galera
    - scope: None
    - extra_args: None

```

`salt.states.pcs.cluster_node_present`(*name, node, extra\_args=None*)

Add a node to the Pacemaker cluster via PCS Should be run on one cluster node only (there may be races) Can only be run on a already setup/added node

**name**

Irrelevant, not used (recommended: `pcs_setup__node_add_{{node}}`)

**node**

node that should be added

**extra\_args**  
list of extra args for the 'pcs cluster node add' command

Example:

```
pcs_setup__node_add_node1.example.com:
  pcs.cluster_node_present:
    - node: node1.example.com
    - extra_args:
      - '--start'
      - '--enable'
```

`salt.states.pcs.cluster_setup` (*name*, *nodes*, *pcsclustername*='pcscluster', *extra\_args*=None, *pcsuser*='hacluster', *pcspasswd*='hacluster', *pcs\_auth\_extra\_args*=None, *wipe\_default*=False)

Setup Pacemaker cluster on nodes. Should be run on one cluster node only to avoid race conditions. This performs auth as well as setup so can be run in place of the auth state. It is recommended not to run auth on Debian/Ubuntu for a new cluster and just to run this because of the initial cluster config that is installed on Ubuntu/Debian by default.

**name**

Irrelevant, not used (recommended: pcs\_setup\_\_setup)

**nodes**

a list of nodes which should be set up

**pcsclustername**

Name of the Pacemaker cluster

**extra\_args**

list of extra args for the 'pcs cluster setup' command

**pcsuser**

The username for authenticating the cluster (default: hacluster)

**pcspasswd**

The password for authenticating the cluster (default: hacluster)

**pcs\_auth\_extra\_args**

Extra args to be passed to the auth function in case of reauth.

**wipe\_default**

This removes the files that are installed with Debian based operating systems.

Example:

```
pcs_setup__setup:
  pcs.cluster_setup:
    - nodes:
      - node1.example.com
      - node2.example.com
    - pcsclustername: pcscluster
    - extra_args:
      - '--start'
      - '--enable'
    - pcsuser: hacluster
    - pcspasswd: hoonetorg
```

`salt.states.pcs.constraint_present` (*name*, *constraint\_id*, *constraint\_type*, *constraint\_options*=None, *cibname*=None)

Ensure that a constraint is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name**  
Irrelevant, not used (recommended: `{{formulaname}}__constraint_present_{{constraint_id}}`)

**constraint\_id**  
name for the constraint (try first to create manually to find out the autogenerated name)

**constraint\_type**  
constraint type (location, colocation, order)

**constraint\_options**  
options for creating the constraint

**cibname**  
use a cached CIB-file named like `cibname` instead of the live CIB

Example:

```
haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-
→INFINITY:
  pcs.constraint_present:
    - constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
    - constraint_type: colocation
    - constraint_options:
      - 'add'
      - 'vip_galera'
      - 'with'
      - 'haproxy-clone'
    - cibname: cib_for_haproxy
```

`salt.states.pcs.prop_has_value` (*name, prop, value, extra\_args=None, cibname=None*)

Ensure that a property in the cluster is set to a given value

Should be run on one cluster node only (there may be races)

**name**  
Irrelevant, not used (recommended: `pcs_properties__prop_has_value_{{prop}}`)

**prop**  
name of the property

**value**  
value of the property

**extra\_args**  
additional options for the pcs property command

**cibname**  
use a cached CIB-file named like `cibname` instead of the live CIB

Example:

```
pcs_properties__prop_has_value_no-quorum-policy:
  pcs.prop_has_value:
    - prop: no-quorum-policy
    - value: ignore
    - cibname: cib_for_cluster_settings
```

`salt.states.pcs.resource_defaults_to` (*name, default, value, extra\_args=None, cibname=None*)

Ensure a resource default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name**  
Irrelevant, not used (recommended: `pcs_properties__resource_defaults_to_{{default}}`)

**default**  
name of the default resource property

**value**

value of the default resource property

**extra\_args**

additional options for the pcs command

**cibname**

use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_properties__resource_defaults_to_resource-stickiness:
  pcs.resource_defaults_to:
    - default: resource-stickiness
    - value: 100
    - cibname: cib_for_cluster_settings
```

```
salt.states.pcs.resource_op_defaults_to(name, op_default, value, extra_args=None,
                                       cibname=None)
```

Ensure a resource operation default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name**

Irrelevant, not used (recommended: pcs\_properties\_\_resource\_op\_defaults\_to\_{{op\_default}})

**op\_default**

name of the operation default resource property

**value**

value of the operation default resource property

**extra\_args**

additional options for the pcs command

**cibname**

use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_properties__resource_op_defaults_to_monitor-interval:
  pcs.resource_op_defaults_to:
    - op_default: monitor-interval
    - value: 60s
    - cibname: cib_for_cluster_settings
```

```
salt.states.pcs.resource_present(name, resource_id, resource_type, resource_options=None,
                                cibname=None)
```

Ensure that a resource is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name**

Irrelevant, not used (recommended: {{formulaname}}\_\_resource\_present\_{{resource\_id}})

**resource\_id**

name for the resource

**resource\_type**

resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)

**resource\_options**

additional options for creating the resource

**cibname**

use a cached CIB-file named like cibname instead of the live CIB

Example:

```
mysql_pcs__resource_present_galera:
  pcs.resource_present:
    - resource_id: galera
    - resource_type: "ocf:heartbeat:galera"
    - resource_options:
      - 'wsrep_cluster_address=gcomm://node1.example.org,node2.
→example.org,node3.example.org'
      - '--master'
    - cibname: cib_for_galera
```

`salt.states.pcs.stonith_present` (*name*, *stonith\_id*, *stonith\_device\_type*, *stonith\_device\_options*=None, *cibname*=None)

Ensure that a fencing resource is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name**

Irrelevant, not used (recommended: `pcs_stonith__created_{{stonith_id}}`)

**stonith\_id**

name for the stonith resource

**stonith\_device\_type**

name of the stonith agent `fence_eps`, `fence_xvm` f.e.

**stonith\_device\_options**

additional options for creating the stonith resource

**cibname**

use a cached CIB-file named like `cibname` instead of the live CIB

Example:

```
pcs_stonith__created_eps_fence:
  pcs.stonith_present:
    - stonith_id: eps_fence
    - stonith_device_type: fence_eps
    - stonith_device_options:
      - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
      - 'ipaddr=myepsdevice.example.org'
      - 'power_wait=5'
      - 'verbose=1'
      - 'debug=/var/log/pcsd/eps_fence.log'
      - 'login=hidden'
      - 'passwd=hoonetorg'
    - cibname: cib_for_stonith
```

### 26.19.227 salt.states.pdbedit

Manage accounts in Samba's passdb using pdbedit

**maintainer**

Jorge Schrauwen <[sjorge@blackdot.be](mailto:sjorge@blackdot.be)>

**maturity**

new

**depends**

pdbedit

platform  
posix

New in version 2017.7.0.

```
wash:  
  pdbedit.absent  
  
kaylee:  
  pdbedit.managed:  
    - password: A70C708517B5DD0EDB67714FE25336EB  
    - password_hashed: True  
    - drive: 'X:'  
    - homedir: '\\serenity\mechanic\profile'
```

`salt.states.pdbedit.absent(name)`

Ensure user account is absent

**name**  
[string] username

`salt.states.pdbedit.managed(name, **kwargs)`

Manage user account

**login**  
[string] login name  
**password**  
[string] password  
**password\_hashed**  
[boolean] set if password is a nt hash instead of plain text  
**domain**  
[string] users domain  
**profile**  
[string] profile path  
**script**  
[string] logon script  
**drive**  
[string] home drive  
**homedir**  
[string] home directory  
**fullname**  
[string] full name  
**account\_desc**  
[string] account description  
**machine\_sid**  
[string] specify the machines new primary group SID or rid  
**user\_sid**  
[string] specify the users new primary group SID or rid  
**account\_control**  
[string] specify user account control properties

---

**Note:** Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire

---

**reset\_login\_hours**  
[boolean] reset the users allowed logon hours

**reset\_bad\_password\_count**  
 [boolean] reset the stored bad login counter

`salt.states.pdbedit.present`(*name*, *\*\*kwargs*)

Alias for `pdbedit.managed`

## 26.19.228 salt.states.pecl

### Installation of PHP Extensions Using pecl

These states manage the installed pecl extensions. Note that `php-pear` must be installed for these states to be available, so pecl states should include a requisite to a `pkg.installed` state for the package which provides pecl (`php-pear` in most cases). Example:

```
php-pear:
  pkg.installed

mongo:
  pecl.installed:
    - require:
      - pkg: php-pear
```

`salt.states.pecl.installed`(*name*, *version=None*, *defaults=False*, *force=False*, *preferred\_state='stable'*)

New in version 0.17.0.

Make sure that a pecl extension is installed.

**name**

The pecl extension name to install

**version**

The pecl extension version to install. This option may be ignored to install the latest stable version.

**defaults**

Use default answers for extensions such as `pecl_http` which ask questions before installation. Without this option, the `pecl.installed` state will hang indefinitely when trying to install these extensions.

**force**

Whether to force the installed version or not

**preferred\_state**

The pecl extension state to install

`salt.states.pecl.removed`(*name*)

Make sure that a pecl extension is not installed.

**name**

The pecl extension name to uninstall

## 26.19.229 salt.states.pip\_state

### Installation of Python Packages Using pip

These states manage system installed python packages. Note that `pip` must be installed for these states to be available, so pip states should include a requisite to a `pkg.installed` state for the package which provides pip (`python-pip` in most cases). Example:

```
python-pip:
  pkg.installed

virtualenvwrapper:
  pip.installed:
    - require:
      - pkg: python-pip
```

`salt.states.pip_state.installed`(*name*, *pkgs*=None, *pip\_bin*=None, *requirements*=None, *bin\_env*=None, *use\_wheel*=False, *no\_use\_wheel*=False, *log*=None, *proxy*=None, *timeout*=None, *repo*=None, *editable*=None, *find\_links*=None, *index\_url*=None, *extra\_index\_url*=None, *no\_index*=False, *mirrors*=None, *build*=None, *target*=None, *download*=None, *download\_cache*=None, *source*=None, *upgrade*=False, *force\_reinstall*=False, *ignore\_installed*=False, *exists\_action*=None, *no\_deps*=False, *no\_install*=False, *no\_download*=False, *install\_options*=None, *global\_options*=None, *user*=None, *cwd*=None, *pre\_releases*=False, *cert*=None, *allow\_all\_external*=False, *allow\_external*=None, *allow\_unverified*=None, *process\_dependency\_links*=False, *env\_vars*=None, *use\_vt*=False, *trusted\_host*=None, *no\_cache\_dir*=False, *cache\_dir*=None, *no\_binary*=None, *extra\_args*=None, **\*\*kwargs**)

Make sure the package is installed

#### name

The name of the python package to install. You can also specify version numbers here using the standard operators ==, >=, <=. If requirements or pkgs is given, this parameter will be ignored.

Example:

```
django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - require:
      - pkg: python-pip
```

Installs the latest Django version greater than 1.6 but less than 1.7.

#### pkgs

A list of python packages to install. This let you install multiple packages at the same time.

Example:

```
django-and-psycopg2:
  pip.installed:
    - pkgs:
      - django >= 1.6, <= 1.7
      - psycopg2 >= 2.8.4
    - require:
      - pkg: python-pip
```

Installs the latest Django version greater than 1.6 but less than 1.7 and the latest psycopg2 greater than 2.8.4 at the same time.

#### requirements

Path to a pip requirements file. If the path begins with salt:// the file will be transferred from the master file server.

**user**

The user under which to run pip

**use\_wheel**

[False] Prefer wheel archives (requires pip>=1.4)

**no\_use\_wheel**

[False] Force to not use wheel archives (requires pip>=1.4)

**no\_binary**

Force to not use binary packages (requires pip >= 7.0.0) Accepts either `:all:` to disable all binary packages, `:none:` to empty the set, or a list of one or more packages

Example:

```
django:
  pip.installed:
    - no_binary: ':all:'

flask:
  pip.installed:
    - no_binary:
      - itsdangerous
      - click
```

**log**

Log file where a complete (maximum verbosity) record will be kept

**proxy**

Specify a proxy in the form `user:passwd@proxy.server:port`. Note that the `user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.

**timeout**

Set the socket timeout (default 15 seconds)

**editable**

install something editable (i.e. `git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed`)

**find\_links**

URL to look for packages at

**index\_url**

Base URL of Python Package Index

**extra\_index\_url**

Extra URLs of package indexes to use in addition to `index_url`

**no\_index**

Ignore package index

**mirrors**

Specific mirror URL(s) to query (automatically adds `--use-mirrors`)

**build**

Unpack packages into `build` dir

**target**

Install packages into `target` dir

**download**

Download packages into `download` instead of installing them

**download\_cache**

Cache downloaded packages in `download_cache` dir

**source**

Check out `editable` packages into `source` dir

**upgrade**

Upgrade all packages to the newest available version

**force\_reinstall**

When upgrading, reinstall all packages even if they are already up-to-date.

**ignore\_installed**

Ignore the installed packages (reinstalling instead)

**exists\_action**

Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup

**no\_deps**

Ignore package dependencies

**no\_install**

Download and unpack all packages, but don't actually install them

**no\_cache\_dir:**

Disable the cache.

**cwd**

Current working directory to run pip from

**pre\_releases**

Include pre-releases in the available versions

**cert**

Provide a path to an alternate CA bundle

**allow\_all\_external**

Allow the installation of all externally hosted files

**allow\_external**

Allow the installation of externally hosted files (comma separated list)

**allow\_unverified**

Allow the installation of insecure and unverifiable files (comma separated list)

**process\_dependency\_links**

Enable the processing of dependency links

**env\_vars**

Add or modify environment variables. Useful for tweaking build steps, such as specifying INCLUDE or LIBRARY paths in Makefiles, build scripts or compiler calls. This must be in the form of a dictionary or a mapping.

Example:

```
django:
  pip.installed:
    - name: django_app
    - env_vars:
      CUSTOM_PATH: /opt/django_app
      VERBOSE: True
```

**use\_vt**

Use VT terminal emulation (see output while installing)

**trusted\_host**

Mark this host as trusted, even though it does not have valid or any HTTPS.

**bin\_env**

[None] Absolute path to a virtual environment directory or absolute path to a pip executable. The example below assumes a virtual environment has been created at `/foo/.virtualenvs/bar`.

Example:

```
django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - bin_env: /foo/.virtualenvs/bar
    - require:
    - pkg: python-pip
```

Or

Example:

```
django:
pip.installed:
- name: django >= 1.6, <= 1.7
- bin_env: /foo/.virtualenvs/bar/bin/pip
- require:
- pkg: python-pip
```

---

### Attention

The following arguments are deprecated, do not use.

---

#### pip\_bin

[None] Deprecated, use `bin_env`

Changed in version 0.17.0: `use_wheel` option added.

#### install\_options

Extra arguments to be supplied to the `setup.py` install command. If you are using an option with a directory path, be sure to use absolute path.

Example:

```
django:
pip.installed:
- name: django
- install_options:
- --prefix=/blah
- require:
- pkg: python-pip
```

#### global\_options

Extra global options to be supplied to the `setup.py` call before the install command.

New in version 2014.1.3.

---

### Attention

As of Salt 0.17.0 the `pip` state **needs** an importable `pip` module. This usually means having the system's `pip` package installed or running Salt from an active `virtualenv`.

The reason for this requirement is because `pip` already does a pretty good job parsing its own requirements. It makes no sense for Salt to do `pip` requirements parsing and validation before passing them to the `pip` library. It's functionality duplication and it's more error prone.

---

---

### Attention

Please set `reload_modules: True` to have the salt minion import this module after installation.

---

Example:

```

pyopenssl:
  pip.installed:
    - name: pyOpenSSL
    - reload_modules: True
    - exists_action: i

```

**extra\_args**

pip keyword and positional arguments not yet implemented in salt

```

pandas:
  pip.installed:
    - name: pandas
    - extra_args:
      - --latest-pip-kwarg: param
      - --latest-pip-arg

```

**Warning:** If unsupported options are passed here that are not supported in a minion's version of pip, a *No such option error* will be thrown.

If you are using onedir packages and you need to install python packages into the system python environment, you must provide the `pip_bin` or `bin_env` to the pip state module.

```

lib-foo:
  pip.installed:
    - pip_bin: /usr/bin/pip3
lib-bar:
  pip.installed:
    - bin_env: /usr/bin/python3

```

`salt.states.pip_state.pip_has_exceptions_mod(ver)`

True when the pip version has the `pip.exceptions` module

`salt.states.pip_state.pip_has_internal_exceptions_mod(ver)`

True when the pip version has the `pip._internal.exceptions` module

`salt.states.pip_state.purge_pip()`

Purge pip and its sub-modules

`salt.states.pip_state.removed(name, requirements=None, bin_env=None, log=None, proxy=None, timeout=None, user=None, cwd=None, use_vt=False)`

Make sure that a package is not installed.

**name**

The name of the package to uninstall

**user**

The user under which to run pip

**bin\_env**

[None] the pip executable or virtualenv to use

**use\_vt**

Use VT terminal emulation (see output while installing)

`salt.states.pip_state.uptodate(name, bin_env=None, user=None, cwd=None, use_vt=False)`

New in version 2015.5.0.

Verify that the system is completely up to date.

- name**  
The name has no functional value and is only used as a tracking reference
- user**  
The user under which to run pip
- bin\_env**  
the pip executable or virtualenv to use
- use\_vt**  
Use VT terminal emulation (see output while installing)

### 26.19.230 salt.states.pkg

#### Installation of packages using OS package managers such as yum or apt-get

**Note:** On minions running systemd $\geq$ 205, as of version 2015.8.12, 2016.3.3, and 2016.11.0, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing the package manager commands spawned by Salt, when Salt updates itself (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Salt can manage software packages via the `pkg` state module, packages can be set up to be installed, latest, removed and purged. Package management declarations are typically rather simple:

```
vim:
  pkg.installed
```

A more involved example involves pulling from a custom repository.

```
base:
  pkgrepo.managed:
    - name: ppa:wolfnet/logstash
    - dist: precise
    - file: /etc/apt/sources.list.d/logstash.list
    - keyid: 28B04E4A
    - keyserver: keyserver.ubuntu.com

logstash:
  pkg.installed:
    - fromrepo: ppa:wolfnet/logstash
```

Multiple packages can also be installed with the use of the `pkgs` state module

```
dotdeb.repo:
  pkgrepo.managed:
    - name: deb http://packages.dotdeb.org wheezy-php55 all
    - dist: wheezy-php55
    - file: /etc/apt/sources.list.d/dotbeb.list
    - keyid: 89DF5277
    - keyserver: keys.gnupg.net
    - refresh_db: true
```

(continues on next page)

(continued from previous page)

```

php.packages:
  pkg.installed:
    - fromrepo: wheezy-php55
    - pkgs:
      - php5-fpm
      - php5-cli
      - php5-curl

```

**Warning:** Make sure the package name has the correct case for package managers which are case-sensitive (such as *pkgng*).

```

salt.states.pkg.downloaded(name, version=None, pkgs=None, fromrepo=None, ignore_epoch=None,
                          **kwargs)

```

New in version 2017.7.0.

Ensure that the package is downloaded, and that it is the correct version (if specified).

**Note:** Any argument which is either a) not explicitly defined for this state, or b) not a global state argument like `saltenv`, or `reload_modules`, will be passed through to the call to `pkg.install` to download the package(s). For example, you can include a `disablerepo` argument on platforms that use yum/dnf to disable that repo:

```

mypkg:
  pkg.downloaded:
    - disablerepo: base,updates

```

To see what is supported, check [this page](#) to find the documentation for your platform's `pkg` module, then look at the documentation for the `install` function.

Any argument that is passed through to the `install` function, which is not defined for that function, will be silently ignored.

Currently supported for the following `pkg` providers: *yum*, *zypper* and *apt*

#### Parameters

- **name** (*str*) -- The name of the package to be downloaded. This parameter is ignored if either "pkgs" is used. Additionally, please note that this option can only be used to download packages from a software repository.
- **version** (*str*) -- Download a specific version of a package.

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon must have the epoch included when specifying the version number. For example:

```

vim-enhanced:
  pkg.downloaded:
    - version: 2:7.4.160-1.el7

```

An `ignore_epoch` argument has been added to which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

You can install a specific version when using the `pkgs` argument by including the version after the package:

```
common_packages:
  pkg.downloaded:
    - pkgs:
      - unzip
      - dos2unix
      - salt-minion: 2015.8.5-1.el6
```

- **resolve\_capabilities** (*bool*) -- Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

New in version 2018.3.0.

CLI Example:

```
zsh:
  pkg.downloaded:
    - version: 5.0.5-4.63
    - fromrepo: "myrepository"
```

`salt.states.pkg.group_installed` (*name*, *skip=None*, *include=None*, *\*\*kwargs*)

New in version 2015.8.0.

Changed in version 2016.11.0: Added support in pacman

Changed in version 3006.2: For RPM-based systems, support for `fromrepo`, `enablerepo`, and `disablerepo` (as used in `pkg.install`) has been added. This allows one to, for example, use `enablerepo` to perform a group install from a repo that is otherwise disabled.

Ensure that an entire package group is installed. This state is currently only supported for the `yum` and `pacman` package managers.

**skip**

Packages that would normally be installed by the package group ("default" packages), which should not be installed.

```
Load Balancer:
  pkg.group_installed:
    - skip:
      - piranha
```

**include**

Packages which are included in a group, which would not normally be installed by a `yum groupinstall` ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed.

```
Load Balancer:
  pkg.group_installed:
    - include:
      - haproxy
```

Changed in version 2016.3.0: This option can no longer be passed as a comma-separated list, it must now be passed as a list (as shown in the above example).

---

**Note:** The below options are only supported on RPM-based systems

---

**fromrepo**

Restrict yum groupinfo to the specified repo(s). (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

```
MyGroup:
  pkg.group_installed:
    - fromrepo: base,updates
```

New in version 3006.2.

**enablerepo (ignored if **fromrepo** is specified)**

Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

```
MyGroup:
  pkg.group_installed:
    - enablerepo: myrepo
```

New in version 3006.2.

**disablerepo (ignored if **fromrepo** is specified)**

Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

```
MyGroup:
  pkg.group_installed:
    - disablerepo: epel
```

New in version 3006.2.

---

**Note:** Because this is essentially a wrapper around `pkg.install`, any argument which can be passed to `pkg.install` may also be included here, and it will be passed on to the call to `pkg.install`.

---

`salt.states.pkg.held` (*name*, *version=None*, *pkgs=None*, *replace=False*, *\*\*kwargs*)

New in version 3005.

Set package in 'hold' state, meaning it will not be changed.

**Parameters**

- **name** (*str*) -- The name of the package to be held. This parameter is ignored if `pkgs` is used.
- **version** (*str*) -- Hold a specific version of a package. Full description of this parameter is in `installed` function.

---

**Note:** This parameter make sense for Zypper-based systems. Ignored for YUM/DNF and APT

---

- **pkgs** (*list*) -- A list of packages to be held. All packages listed under `pkgs` will be held.

```
mypkgs:
  pkg.held:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
```

---

**Note:** For Zypper-based systems the package could be held for the version specified. YUM/DNF and APT ignore it.

---

- **replace** (*bool*) -- Force replacement of existings holds with specified. By default, this parameter is set to `False`.

`salt.states.pkg.installed` (*name*, *version=None*, *refresh=None*, *fromrepo=None*, *skip\_verify=False*, *skip\_suggestions=False*, *pkgs=None*, *sources=None*, *allow\_updates=False*, *pkg\_verify=False*, *normalize=True*, *ignore\_epoch=None*, *reinstall=False*, *update\_holds=False*, *\*\*kwargs*)

Changed in version 3007.0.

Ensure that the package is installed, and that it is the correct version (if specified).

---

**Note:** Any argument which is either a) not explicitly defined for this state, or b) not a global state argument like `saltenv`, or `reload_modules`, will be passed through to the call to `pkg.install` to install the package(s). For example, you can include a `disablerepo` argument on platforms that use yum/dnf to disable that repo:

```
mypkg:
  pkg.installed:
    - disablerepo: base,updates
```

To see what is supported, check [this page](#) to find the documentation for your platform's `pkg` module, then look at the documentation for the `install` function.

Any argument that is passed through to the `install` function, which is not defined for that function, will be silently ignored.

---

---

**Note:** In Windows, some packages are installed using the task manager. The Salt minion installer does this. In that case, there is no way to know if the package installs correctly. All that can be reported is that the task that launches the installer started successfully.

---

### Parameters

- **name** (*str*) -- The name of the package to be installed. This parameter is ignored if either "pkgs" or "sources" is used. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option detailed below.
- **version** (*str*) -- Install a specific version of a package. This option is ignored if "sources" is used. Currently, this option is supported for the following pkg providers: `apt`, `ebuild`, `pacman`, `pkgin`, `win_pkg`, `yum`, and `zypper`. The version number includes the release designation where applicable, to allow Salt to target a specific release of a given version. When in doubt, using the `pkg.latest_version` function for an uninstalled package will tell you the version available.

```
# salt myminion pkg.latest_version vim-enhanced
myminion:
  2:7.4.160-1.el7
```

---

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number

followed by a colon like in the `pkg.latest_version` output above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

Also, while this function is not yet implemented for all `pkg` frontends, `pkg.list_repo_pkgs` will show all versions available in the various repositories for a given package, irrespective of whether or not it is installed.

```
# salt myminion pkg.list_repo_pkgs bash
myminion:
-----
  bash:
    - 4.2.46-21.el7_3
    - 4.2.46-20.el7_2
```

This function was first added for `pkg.list_repo_pkgs` in 2014.1.0, and was expanded to *Debian/Ubuntu* and Arch Linux-based distros in the 2017.7.0 release.

The version strings returned by either of these functions can be used as version specifiers in `pkg` states.

You can install a specific version when using the `pkgs` argument by including the version after the package:

```
common_packages:
  pkg.installed:
    - pkgs:
      - unzip
      - dos2unix
      - salt-minion: 2015.8.5-1.el6
```

If the version given is the string `latest`, the latest available package version will be installed à la `pkg.latest`.

#### WILDCARD VERSIONS

As of the 2017.7.0 release, this state now supports wildcards in package versions for SUSE SLES/Leap/Tumbleweed, Debian/Ubuntu, RHEL/CentOS, Arch Linux, and their derivatives. Using wildcards can be useful for packages where the release name is built into the version in some way, such as for RHEL/CentOS which typically has version numbers like `1.2.34-5.el7`. An example of the usage for this would be:

```
mypkg:
  pkg.installed:
    - version: '1.2.34*'
```

Keep in mind that using wildcard versions will result in a slower state run since Salt must gather the available versions of the specified packages and figure out which of them match the specified wildcard expression.

- **refresh** (*bool*) -- This parameter controls whether or not the package repo database is updated prior to installing the requested package(s).

If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before installing.

If `False`, the package database will *not* be refreshed before installing.

If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

- **cache\_valid\_time** (*str*) -- New in version 2016.11.0.

This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

Example:

```
httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6~ubuntu3
    - refresh: True
    - cache_valid_time: 300
    - allow_updates: True
    - hold: False
```

In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

---

**Note:** This parameter is available only on Debian based distributions and has no effect on the rest.

---

- **fromrepo** (*str*) -- Specify a repository from which to install

---

**Note:** Distros which use APT (Debian, Ubuntu, etc.) do not have a concept of repositories, in the same way as YUM-based distros do. When a source is added, it is assigned to a given release. Consider the following source configuration:

```
deb http://ppa.launchpad.net/saltstack/salt/ubuntu☒
↳precise main
```

The packages provided by this source would be made available via the `precise` release, therefore `fromrepo` would need to be set to `precise` for Salt to install the package from this source.

Having multiple sources in the same release may result in the default install candidate being newer than what is desired. If this is the case, the desired version must be specified using the `version` parameter.

If the `pkgs` parameter is being used to install multiple packages in the same state, then instead of using `version`, use the method of version specification described in

the **Multiple Package Installation Options** section below.

Running the shell command `apt-cache policy pkgname` on a minion can help elucidate the APT configuration and aid in properly configuring states:

```
root@saltmaster:~# salt ubuntu01 cmd.run 'apt-cache
↳policy ffmpeg'
ubuntu01:
  ffmpeg:
    Installed: (none)
    Candidate: 7:0.10.11-1~precise1
    Version table:
       7:0.10.11-1~precise1 0
          500 http://ppa.launchpad.net/jon-severinsson/
↳ffmpeg/ubuntu/ precise/main amd64 Packages
          4:0.8.10-0ubuntu0.12.04.1 0
          500 http://us.archive.ubuntu.com/ubuntu/
↳precise-updates/main amd64 Packages
          500 http://security.ubuntu.com/ubuntu/
↳precise-security/main amd64 Packages
          4:0.8.1-0ubuntu1 0
          500 http://us.archive.ubuntu.com/ubuntu/
↳precise/main amd64 Packages
```

The release is located directly after the source's URL. The actual release name is the part before the slash, so to install version `4:0.8.10-0ubuntu0.12.04.1` either `precise-updates` or `precise-security` could be used for the `fromrepo` value.

- **skip\_verify** (*bool*) -- Skip the GPG verification check for the package to be installed
- **skip\_suggestions** (*bool*) -- Force strict package naming. Disables lookup of package alternatives.

New in version 2014.1.1.

- **resolve\_capabilities** (*bool*) -- Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

New in version 2018.3.0.

- **allow\_updates** (*bool*) -- Allow the package to be updated outside Salt's control (e.g. auto updates on Windows). This means a package on the Minion can have a newer version than the latest available in the repository without enforcing a re-installation of the package.

New in version 2014.7.0.

Example:

```
httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6~ubuntu3
    - refresh: True
    - allow_updates: True
```

(continues on next page)

(continued from previous page)

```
- hold: False
```

- **pkg\_verify** (*bool*) -- New in version 2014.7.0.

Use `pkg.verify` to check if already installed packages require reinstallation. Requested packages that are already installed and not targeted for up- or downgrade are verified with `pkg.verify` to determine if any file installed by the package have been modified or if package dependencies are not fulfilled. `ignore_types` and `verify_options` can be passed to `pkg.verify`. See examples below. Currently, this option is supported for the following pkg providers: *yum*, *zypper* *pkg*.

Examples:

```
httpd:
  pkg.installed:
    - version: 2.2.15-30.el6.centos
    - pkg_verify: True
```

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc
```

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc
      - verify_options:
        - nodeps
        - nofiledigest
```

- **ignore\_types** (*list*) -- List of types to ignore when verifying the package  
New in version 2014.7.0.
- **verify\_options** (*list*) -- List of additional options to pass when verifying the package. These options will be added to the `rpm -V` command, prepended with `--` (for example, when `nodeps` is passed in this option, `rpm -V` will be run with `--nodeps`).  
New in version 2016.11.0.
- **normalize** (*bool*) -- Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which

include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2014.7.0.

Example:

```
gpgfs.gplbin-2.6.32-279.31.1.el6.x86_64:
  pkg.installed:
    - normalize: False
```

- **ignore\_epoch** (*bool*) -- If this option is not explicitly set, and there is no epoch in the desired package version, the epoch will be implicitly ignored. Set this argument to `True` to explicitly ignore the epoch, and `False` to strictly enforce it.

New in version 2015.8.9.

Changed in version 3001: In prior releases, the default behavior was to strictly enforce epochs unless this argument was set to `True`.

#### MULTIPLE PACKAGE INSTALLATION OPTIONS:

##### Parameters

- **pkgs** (*list*) -- A list of packages to install from a software repository. All packages listed under `pkgs` will be installed via a single command.

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar
      - baz
    - hold: True
```

NOTE: For `apt`, `ebuild`, `pacman`, `winrepo`, `yum`, and `zypper`, version numbers can be specified in the `pkgs` argument. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
```

Additionally, `ebuild`, `pacman`, `zypper`, `yum/dnf`, and `apt` support the `<`, `<=`, `>=`, and `>` operators for more control over what versions will be installed. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: '>=1.2.3-4'
      - baz
```

NOTE : When using comparison operators, the expression must be enclosed in quotes to avoid a YAML render error.

With `ebuild` is also possible to specify a use flag list and/or if the given packages should be in `package.accept_keywords` file and/or the overlay from which you want the package to be installed. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo: '~'
      - bar: '~>=1.2:slot::overlay[use,-otheruse]'
      - baz
```

- **sources** (*list*) -- A list of packages to install, along with the source URI or local path from which to install each package. In the example below, `foo`, `bar`, `baz`, etc. refer to the name of the package, as it would appear in the output of the `pkg.version` or `pkg.list_pkgs` salt CLI commands.

```
mypkgs:
  pkg.installed:
    - sources:
      - foo: salt://rpms/foo.rpm
      - bar: http://somesite.org/bar.rpm
      - baz: ftp://someothersite.org/baz.rpm
      - qux: /minion/path/to/qux.rpm
```

## PLATFORM-SPECIFIC ARGUMENTS

These are specific to each OS. If it does not apply to the execution module for your OS, it is ignored.

### Parameters

- **hold** (*bool*) -- Force the package to be held at the current installed version.  
Supported on YUM/DNF & APT based systems.  
New in version 2014.7.0.  
Supported on Zypper-based systems.  
New in version 3003.
- **update\_holds** (*bool*) -- If `True`, and this function would update the package version, any packages which are being held will be temporarily unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and the state will fail. By default, this parameter is set to `False`.  
Supported on YUM/DNF & APT based systems.  
New in version 2016.11.0.  
Supported on Zypper-based systems.  
New in version 3003.
- **names** (*list*) -- A list of packages to install from a software repository. Each package will be installed individually by the package manager.

**Warning:** Unlike `pkgs`, the `names` parameter cannot specify a version. In addition, it makes a separate call to the package management frontend to install each package, whereas `pkgs` makes just a single call. It is therefore recommended to

use `pkgs` instead of `names` to install multiple packages, both for the additional features and the performance improvement that it brings.

- **`install_recommends`** (*bool*) -- Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.installed:
    - install_recommends: False
```

- **`only_upgrade`** (*bool*) -- Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.installed:
    - only_upgrade: True
```

---

**Note:** If this parameter is set to `True` and the package is not already installed, the state will fail.

---

- **`report_reboot_exit_codes`** (*bool*) -- If the installer exits with a recognized exit code indicating that a reboot is required, the module function `win_system.set_reboot_required_witnessed` will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, `3010` is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to `True`. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```
ms vcpp installed:
  pkg.installed:
    - name: ms-vcpp
    - version: 10.0.40219
    - report_reboot_exit_codes: False
```

#### Returns

A dictionary containing the state of the software installation

Rtype dict

---

**Note:** The `pkg.installed` state supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. In many cases, Salt is clever enough to transparently reload the modules. For example, if you install a package, Salt reloads modules because some other module or state might require the package which was installed. However, there are some edge cases where this may not be the case, which is what `reload_modules` is meant to resolve.

You should only use `reload_modules` if your `pkg.installed` does some sort of installation where if you do not reload the modules future items in your state which rely on the software being installed will fail. Please see the [Reloading Modules](#) documentation for more information.

---

See also:

unless and onlyif

If running pkg commands together with *aggregate* isn't an option, you can use the *creates*, *unless*, or *onlyif* syntax to skip a full package run. This can be helpful in large environments with multiple states that include requisites for packages to be installed.

```
# Using creates for a simple single-factor check
install_nginx:
  pkg.installed:
    - name: nginx
    - creates:
      - /etc/nginx/nginx.conf
```

```
# Using file.file_exists for a single-factor check
install_nginx:
  pkg.installed:
    - name: nginx
    - unless:
      - fun: file.file_exists
      args:
        - /etc/nginx/nginx.conf
```

```
# Using unless with a shell test
install_nginx:
  pkg.installed:
    - name: nginx
    - unless: test -f /etc/nginx/nginx.conf
```

```
# Using file.search for a two-factor check
install_nginx:
  pkg.installed:
    - name: nginx
    - unless:
      - fun: file.search
      args:
        - /etc/nginx/nginx.conf
        - 'user www-data;'
```

The above examples use different methods to reasonably ensure that a package has already been installed. First, with checking for a file that would be created with the package. Second, by checking for specific text within a file that would be created or managed by salt. With these requisists satisfied, *creates/unless* will return True and the `pkg.installed` state will be skipped.

```
# Example of state run without unless used
salt 'saltdev' state.apply nginx
saltdev:
-----
      ID: install_nginx
      Function: pkg.installed
      Name: nginx
      Result: True
      Comment: All specified packages are already installed
```

(continues on next page)

(continued from previous page)

```

        Started: 20:11:56.388331
        Duration: 4290.0 ms
        Changes:

# Example of state run using unless requisite
salt 'saltdev' state.apply nginx
saltdev:
-----
        ID: install_nginx
        Function: pkg.installed
        Name: nginx
        Result: True
        Comment: unless condition is true
        Started: 20:10:50.659215
        Duration: 1530.0 ms
        Changes:

```

The result is a reduction of almost 3 seconds. In larger environments, small reductions in waiting time can add up.

#### Unless Requisite

`salt.states.pkg.latest` (*name, refresh=None, fromrepo=None, skip\_verify=False, pkgs=None, watch\_flags=True, \*\*kwargs*)

Changed in version 3007.0.

Ensure that the named package is installed and the latest available package. If the package can be updated, this state function will update the package. Generally it is better for the `installed` function to be used, as `latest` will update the package whenever a new package is available.

**Note:** Any argument which is either a) not explicitly defined for this state, or b) not a global state argument like `saltenv`, or `reload_modules`, will be passed through to the call to `pkg.install` to install the package(s). For example, you can include a `disablerepo` argument on platforms that use yum/dnf to disable that repo:

```

mypkg:
  pkg.latest:
    - disablerepo: base,updates

```

To see what is supported, check [this page](#) to find the documentation for your platform's `pkg` module, then look at the documentation for the `install` function.

Any argument that is passed through to the `install` function, which is not defined for that function, will be silently ignored.

#### name

The name of the package to maintain at the latest available version. This parameter is ignored if "pkgs" is used.

#### fromrepo

Specify a repository from which to install

#### skip\_verify

Skip the GPG verification check for the package to be installed

#### refresh

This parameter controls whether or not the package repo database is updated prior to checking for the

latest available version of the requested packages.

If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before checking for the latest available version of the requested packages.

If `False`, the package database will *not* be refreshed before checking.

If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

#### Parameters

- **cache\_valid\_time** (*str*) -- New in version 2016.11.0.

This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

Example:

```
httpd:
  pkg.latest:
    - refresh: True
    - cache_valid_time: 300
```

In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

---

**Note:** This parameter is available only on Debian based distributions and has no effect on the rest.

---

- **resolve\_capabilities** (*bool*) -- Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

New in version 2018.3.0.

Multiple Package Installation Options:

(Not yet supported for: FreeBSD, OpenBSD, MacOS, and Solaris pkgutil)

**pkgs**

A list of packages to maintain at the latest available version.

```
mypkgs:
  pkg.latest:
    - pkgs:
      - foo
      - bar
      - baz
```

#### install\_recommends

Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:  
  pkg.latest:  
    - install_recommends: False
```

**only\_upgrade**

Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:  
  pkg.latest:  
    - only_upgrade: True
```

---

**Note:** If this parameter is set to `True` and the package is not already installed, the state will fail.

---

**report\_reboot\_exit\_codes**

If the installer exits with a recognized exit code indicating that a reboot is required, the module function `win_system.set_reboot_required_witnessed` will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to `True`. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```
ms vcpp installed:  
  pkg.latest:  
    - name: ms-vcpp  
    - report_reboot_exit_codes: False
```

**salt.states.pkg.mod\_aggregate** (*low, chunks, running*)

The `mod_aggregate` function which looks up all packages in the available low chunks and merges them into a single pkgs ref in the present low data

**salt.states.pkg.mod\_beacon** (*name, \*\*kwargs*)

Create a beacon to monitor a package or packages based on a beacon state argument.

---

**Note:** This state exists to support special handling of the `beacon` state argument for supported state functions. It should not be called directly.

---

**salt.states.pkg.mod\_watch** (*name, \*\*kwargs*)

Install/reinstall a package based on a watch requisite

---

**Note:** This state exists to support special handling of the `watch requisite`. It should not be called directly. Parameters for this function should be set by the state being triggered.

---

**salt.states.pkg.patch\_downloaded** (*name, advisory\_ids=None, \*\*kwargs*)

New in version 2017.7.0.

Ensure that packages related to certain advisory ids are downloaded.

Currently supported for the following pkg providers: *yum* and *zypper*

CLI Example:

```
preparing-to-fix-issues:
  pkg.patch_downloaded:
    - advisory_ids:
      - SUSE-SLE-SERVER-12-SP2-2017-185
      - SUSE-SLE-SERVER-12-SP2-2017-150
      - SUSE-SLE-SERVER-12-SP2-2017-120
```

`salt.states.pkg.patch_installed(name, advisory_ids=None, downloadonly=None, **kwargs)`

New in version 2017.7.0.

Ensure that packages related to certain advisory ids are installed.

---

**Note:** Any argument which is either a) not explicitly defined for this state, or b) not a global state argument like `saltenv`, or `reload_modules`, will be passed through to the call to `pkg.install` to install the patch(es).

To see what is supported, check [this page](#) to find the documentation for your platform's `pkg` module, then look at the documentation for the `install` function.

Any argument that is passed through to the `install` function, which is not defined for that function, will be silently ignored.

---

Currently supported for the following pkg providers: *yum* and *zypper*

CLI Example:

```
issue-foo-fixed:
  pkg.patch_installed:
    - advisory_ids:
      - SUSE-SLE-SERVER-12-SP2-2017-185
      - SUSE-SLE-SERVER-12-SP2-2017-150
      - SUSE-SLE-SERVER-12-SP2-2017-120
```

`salt.states.pkg.purged(name, version=None, pkgs=None, normalize=True, ignore_epoch=None, **kwargs)`

Verify that a package is not installed, calling `pkg.purge` if necessary to purge the package. All configuration files are also removed.

**name**

The name of the package to be purged.

**version**

The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

---

**Important:** As of version 2015.8.7, for distros which use `yum/dnf`, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.purged:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If `ignore_epoch` was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

---

#### normalize

[True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

#### ignore\_epoch

[None] If this option is not explicitly set, and there is no epoch in the desired package version, the epoch will be implicitly ignored. Set this argument to `True` to explicitly ignore the epoch, and `False` to strictly enforce it.

New in version 2015.8.9.

Changed in version 3001: In prior releases, the default behavior was to strictly enforce epochs unless this argument was set to `True`.

Multiple Package Options:

#### pkgs

A list of packages to purge. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

`salt.states.pkg.removed` (*name*, *version=None*, *pkgs=None*, *normalize=True*, *ignore\_epoch=None*, *\*\*kwargs*)

Verify that a package is not installed, calling `pkg.remove` if necessary to remove the package.

#### name

The name of the package to be removed.

#### version

The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

---

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.removed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If `ignore_epoch` was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

---

#### normalize

[True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

### ignore\_epoch

[None] If this option is not explicitly set, and there is no epoch in the desired package version, the epoch will be implicitly ignored. Set this argument to `True` to explicitly ignore the epoch, and `False` to strictly enforce it.

New in version 2015.8.9.

Changed in version 3001: In prior releases, the default behavior was to strictly enforce epochs unless this argument was set to `True`.

Multiple Package Options:

### pkgs

A list of packages to remove. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

`salt.states.pkg.unheld` (*name*, *version=None*, *pkgs=None*, *all=False*, *\*\*kwargs*)

New in version 3005.

Unset package from 'hold' state, to allow operations with the package.

#### Parameters

- **name** (*str*) -- The name of the package to be unheld. This parameter is ignored if `pkgs` is used.
- **version** (*str*) -- Unhold a specific version of a package. Full description of this parameter is in *installed* function.

---

**Note:** This parameter make sense for Zypper-based systems. Ignored for YUM/DNF and APT

---

- **pkgs** (*list*) -- A list of packages to be unheld. All packages listed under `pkgs` will be unheld.

```

mypkgs:
  pkg.unheld:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
  
```

---

**Note:** For Zypper-based systems the package could be held for the version specified. YUM/DNF and APT ignore it. For `unheld` there is no need to specify the exact version to be unheld.

---

- **all** (*bool*) -- Force removing of all existings locks. By default, this parameter is set to `False`.

`salt.states.pkg.uptodate` (*name*, *refresh=False*, *pkgs=None*, *\*\*kwargs*)

New in version 2014.7.0.

Changed in version 2018.3.0: Added support for the `pkgin` provider.

Verify that the system is completely up to date.

#### :param str name

The name has no functional value and is only used as a tracking reference

- :param bool refresh**  
refresh the package database before checking for new upgrades
- :param list pkgs**  
list of packages to upgrade

**Parameters**

**resolve\_capabilities** (*bool*) -- Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

New in version 2018.3.0.

- :param kwargs**  
Any keyword arguments to pass through to the pkg module.  
For example, for apt systems: *dist\_upgrade*, *cache\_valid\_time*, *force\_conf\_new*
- New in version 2015.5.0.

**26.19.231 salt.states.pkgbuild**

The pkgbuild state is the front of Salt package building backend. It automatically builds DEB and RPM packages from specified sources

New in version 2015.8.0.

```

salt_2015.5.2:
  pkgbuild.built:
    - runas: thatch
    - results:
      - salt-2015.5.2-2.el7.centos.noarch.rpm
      - salt-api-2015.5.2-2.el7.centos.noarch.rpm
      - salt-cloud-2015.5.2-2.el7.centos.noarch.rpm
      - salt-master-2015.5.2-2.el7.centos.noarch.rpm
      - salt-minion-2015.5.2-2.el7.centos.noarch.rpm
      - salt-ssh-2015.5.2-2.el7.centos.noarch.rpm
      - salt-syndic-2015.5.2-2.el7.centos.noarch.rpm
    - dest_dir: /tmp/pkg
    - spec: salt://pkg/salt/spec/salt.spec
    - template: jinja
    - deps:
      - salt://pkg/salt/sources/required_dependency.rpm
    - tgt: epel-7-x86_64
    - sources:
      - salt://pkg/salt/sources/logrotate.salt
      - salt://pkg/salt/sources/README.fedora
      - salt://pkg/salt/sources/salt-2015.5.2.tar.gz
      - salt://pkg/salt/sources/salt-2015.5.2-tests.patch
      - salt://pkg/salt/sources/salt-api
      - salt://pkg/salt/sources/salt-api.service
      - salt://pkg/salt/sources/salt-master
      - salt://pkg/salt/sources/salt-master.service
      - salt://pkg/salt/sources/salt-minion
      - salt://pkg/salt/sources/salt-minion.service
      - salt://pkg/salt/sources/saltpkg.sls
      - salt://pkg/salt/sources/salt-syndic
  
```

(continues on next page)

(continued from previous page)

```

- salt://pkg/salt/sources/salt-syndic.service
- salt://pkg/salt/sources/SaltTesting-2015.5.8.tar.gz
/tmp/pkg:
  pkgbuild.repo

```

`salt.states.pkgbuild.built`(*name, runas, dest\_dir, spec, sources, tgt, template=None, deps=None, env=None, results=None, force=False, saltenv='base', log\_dir='/var/log/salt/pkgbuild'*)

Ensure that the named package is built and exists in the named directory

**name**

The name to track the build, the name value is otherwise unused

**runas**

The user to run the build process as

**dest\_dir**

The directory on the minion to place the built package(s)

**spec**

The location of the spec file (used for rpms)

**sources**

The list of package sources

**tgt**

The target platform to run the build on

**template**

Run the spec file through a templating engine

Changed in version 2015.8.2: This argument is now optional, allowing for no templating engine to be used if none is desired.

**deps**

Packages required to ensure that the named package is built can be hosted on either the salt master server or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials

**env**

A dictionary of environment variables to be set prior to execution. Example:

```

- env:
  DEB_BUILD_OPTIONS: 'nocheck'

```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

**results**

The names of the expected rpms that will be built

**force**

[False] If True, packages will be built even if they already exist in the `dest_dir`. This is useful when building a package for continuous or nightly package builds.

New in version 2015.8.2.

**saltenv**

The saltenv to use for files downloaded from the salt fileserver

**log\_dir**

[/var/log/salt/rpmbuild] Root directory for log files created from the build. Logs will be organized by package name, version, OS release, and CPU architecture under this directory.

New in version 2015.8.2.

`salt.states.pkgbuild.repo` (*name*, *keyid=None*, *env=None*, *use\_passphrase=False*, *gnupghome='/etc/salt/gpgkeys'*, *runas='builder'*, *timeout=15.0*)

Make a package repository and optionally sign it and packages present

The name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

**name**

The directory to find packages that will be in the repository

**keyid**

Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
  -----BEGIN PGP PRIVATE KEY BLOCK-----
  Version: GnuPG v1

  lQ0+BFciIfQBCADAPCtzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
  .
  .
  Ebe+8JCQTWqSXPRTzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRPv/rawukEcNptn
  R50mgHqvYdEn04pWbn8JzQ09YX/Us0SMHBVzLC8eIi5ZIopzalvX
  =JvW8
  -----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
  -----BEGIN PGP PUBLIC KEY BLOCK-----
  Version: GnuPG v1

  mQENBFciIfQBCADAPCtzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
  .
  .
  bYP7t5iwJmQzRMMyFIInYRt77wkJBPCpJc9FPNebL9vLZcN4zv0KQta+4alcWivvoP
  4QIxE+/+trC6QRw2m2dHk6aAeq/J0Sc7ilZufwnNA71hf9SzRIwcFXMsLx4iLlki
  inNqW9c=
  =s1CX
  -----END PGP PUBLIC KEY BLOCK-----

gpg_pkg_pub_keyname: gpg_pkg_key.pub
```

**env**

Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository. Example:

```
- env:
  OPTIONS: 'ask-passphrase'
```

**Warning:** The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Use of `OPTIONS` on some platforms, for example: `ask-passphrase`, will require `gpg-agent` or similar to cache passphrases.

---

**Note:** This parameter is not used for making yum repositories.

---

#### **use\_passphrase**

[False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

#### **gnupghome**

[/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with 'keyid'

#### **runas**

[builder] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

---

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

---

#### **timeout**

[15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

## 26.19.232 salt.states.pkgng

### Manage package remote repo using FreeBSD pkgng

Salt can manage the URL pkgng pulls packages from. ATM the state and module are small so use cases are typically rather simple:

```
pkgng_clients:
  pkgng.update_packaging_site:
    - name: "http://192.168.0.2"
```

`salt.states.pkgng.update_packaging_site` (*name*)

## 26.19.233 salt.states.pkgrepo

### Management of APT/DNF/YUM/Zypper package repos

States for managing software package repositories on Linux distros. Supported package managers are APT, DNF, YUM and Zypper. Here is some example SLS:

```
base:
  pkgrepo.managed:
    - humaname: CentOS-$releasever - Base
    - mirrorlist: http://mirrorlist.centos.org/?release=$releasever&arch=
      ↪ $basearch&repo=os
    - comments:
      - 'http://mirror.centos.org/centos/$releasever/os/$basearch/'
    - gpgcheck: 1
    - gpgkey: file:///etc/pki/rpm-gpg/RPM-GPG-KEY-CentOS-6
```

```
base:
  pkgrepo.managed:
    - humaname: Logstash PPA
    - name: deb http://ppa.launchpad.net/wolfnet/logstash/ubuntu precise main
    - dist: precise
    - file: /etc/apt/sources.list.d/logstash.list
    - keyid: 28B04E4A
    - keyserver: keyserver.ubuntu.com
    - require_in:
      - pkg: logstash

  pkg.latest:
    - name: logstash
    - refresh: True
```

```
base:
  pkgrepo.managed:
    - humaname: deb-multimedia
    - name: deb http://www.deb-multimedia.org stable main
    - file: /etc/apt/sources.list.d/deb-multimedia.list
    - key_url: salt://deb-multimedia/files/marillat.pub
```

```
base:
  pkgrepo.managed:
    - humaname: Google Chrome
    - name: deb http://dl.google.com/linux/chrome/deb/ stable main
    - dist: stable
    - file: /etc/apt/sources.list.d/chrome-browser.list
    - require_in:
      - pkg: google-chrome-stable
    - gpgcheck: 1
    - key_url: https://dl-ssl.google.com/linux/linux_signing_key.pub
```

```
base:
  pkgrepo.managed:
```

(continues on next page)

(continued from previous page)

```

- ppa: wolfnet/logstash
pkg.latest:
- name: logstash
- refresh: True

```

**Note:** On Ubuntu systems, the `python-software-properties` package should be installed for better support of PPA repositories. To check if this package is installed, run `dpkg -l python-software-properties`.

On Ubuntu & Debian systems, the `python-apt` package is required to be installed. To check if this package is installed, run `dpkg -l python-apt`. `python-apt` will need to be manually installed if it is not present.

```

hello-copr:
  pkgrepo.managed:
    - copr: mymindstorm/hello
  pkg.installed:
    - name: hello

```

### apt-key deprecated

`apt-key` is deprecated and will be last available in Debian 11 and Ubuntu 22.04. The recommended way to manage repo keys going forward is to download the keys into `/etc/apt/keyrings` and use `signed-by` in your repo file pointing to the key. This module was updated in version 3005 to implement the recommended approach. You need to add `- aptkey: False` to your state and set `signed-by` in your repo name, to use this recommended approach. If the cli command `apt-key` is not available it will automatically set `aptkey` to `False`.

Using `aptkey: False` with `key_url` example:

```

deb [signed-by=/etc/apt/keyrings/salt-archive-keyring.gpg arch=amd64] https://
↳repo.saltproject.io/py3/ubuntu/18.04/amd64/latest bionic main:
  pkgrepo.managed:
    - file: /etc/apt/sources.list.d/salt.list
    - key_url: https://repo.saltproject.io/py3/ubuntu/18.04/amd64/latest/salt-
↳archive-keyring.gpg
    - aptkey: False

```

Using `aptkey: False` with `keyserver` and `keyid`:

```

deb [signed-by=/etc/apt/keyrings/salt-archive-keyring.gpg arch=amd64] https://
↳repo.saltproject.io/py3/ubuntu/18.04/amd64/latest bionic main:
  pkgrepo.managed:
    - file: /etc/apt/sources.list.d/salt.list
    - keyserver: keyserver.ubuntu.com
    - keyid: 0E08A149DE57BFBE
    - aptkey: False

```

`salt.states.pkgrepo.absent`(*name*, *\*\*kwargs*)

This function deletes the specified repo on the system, if it exists. It is essentially a wrapper around `pkg.del_repo`.

**name**

The name of the package repo, as it would be referred to when running the regular package manager commands.

**Note:** On apt-based systems this must be the complete source entry. For example, if you include `[arch=amd64]`, and a repo matching the specified URI, dist, etc. exists `_without_` an architecture, then no changes will be made and the state will report a `True` result.

---

## FEDORA/REDHAT-SPECIFIC OPTIONS

### `copr`

Use community packages outside of the main package repository.

New in version 3002.

```
hello-copr:
  pkgrepo.absent:
    - copr: mymindstorm/hello
```

## UBUNTU-SPECIFIC OPTIONS

### `ppa`

On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name.

```
logstash-ppa:
  pkgrepo.absent:
    - ppa: wolfnet/logstash
```

### `ppa_auth`

For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be specified. This is required for matching if the name format uses the `ppa:` specifier and is private (requires username/password to access, which is encoded in the URI).

```
logstash-ppa:
  pkgrepo.absent:
    - ppa: wolfnet/logstash
    - ppa_auth: username:password
```

### `keyid`

If passed, then the GPG key corresponding to the passed KeyID will also be removed.

### `keyid_ppa`

[False] If set to `True`, the GPG key's ID will be looked up from `ppa.launchpad.net` and removed, and the `keyid` argument will be ignored.

---

**Note:** This option will be disregarded unless the `ppa` argument is present.

---

`salt.states.pkgrepo.managed` (*name*, *ppa=None*, *copr=None*, *aptkey=True*, *\*\*kwargs*)

This state manages software package repositories. Currently, *yum*, *apt*, and *zypper* repositories are supported.

## YUM/DNF/ZYPPER-BASED SYSTEMS

---

**Note:** One of `baseurl` or `mirrorlist` below is required. Additionally, note that this state is not presently capable of managing more than one repo in a single repo file, so each instance of this state will manage a single repo file containing the configuration for a single repo.

---

### `name`

This value will be used in two ways: Firstly, it will be the repo ID, as seen in the entry in square brackets

(e.g. [foo]) for a given repo. Secondly, it will be the name of the file as stored in /etc/yum.repos.d (e.g. /etc/yum.repos.d/foo.conf).

**enabled**

[True] Whether the repo is enabled or not. Can be specified as True/False or 1/0.

**disabled**

[False] Included to reduce confusion due to APT's use of the disabled argument. If this is passed for a YUM/DNF/Zypper-based distro, then the reverse will be passed as enabled. For example passing disabled=True will assume enabled=False.

**copr**

Fedora and RedHat based distributions only. Use community packages outside of the main package repository.

New in version 3002.

**humanname**

This is used as the name value in the repo file in /etc/yum.repos.d/ (or /etc/zypp/repos.d for SUSE distros).

**baseurl**

The URL to a yum repository

**mirrorlist**

A URL which points to a file containing a collection of baseurls

**comments**

Sometimes you want to supply additional information, but not as enabled configuration. Anything supplied for this list will be saved in the repo configuration with a comment marker (#) in front.

**gpgautoimport**

Only valid for Zypper package manager. If set to True, automatically trust and import the new repository signing key. The key should be specified with gpgkey parameter. See details below.

Additional configuration values seen in YUM/DNF/Zypper repo files, such as gpgkey or gpgcheck, will be used directly as key-value pairs. For example:

```
foo:
  pkgrepo.managed:
    - humanname: Personal repo for foo
    - baseurl: https://mydomain.tld/repo/foo/$releasever/$basearch
    - gpgkey: file:///etc/pki/rpm-gpg/foo-signing-key
    - gpgcheck: 1
```

**APT-BASED SYSTEMS****ppa**

On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name. The keyid will be queried from launchpad and everything else is set automatically. You can override any of the below settings by simply setting them as you would normally. For example:

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
```

**ppa\_auth**

For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be passed as an HTTP Basic style username/password combination.

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
    - ppa_auth: username:password
```

**name**

On apt-based systems this must be the complete entry as it would be seen in the `sources.list` file. This can have a limited subset of components (e.g. `main`) which can be added/modified with the `comps` option.

```
precise-repo:
  pkgrepo.managed:
    - name: deb http://us.archive.ubuntu.com/ubuntu precise main
```

---

**Note:** The above example is intended as a more readable way of configuring the SLS, it is equivalent to the following:

```
'deb http://us.archive.ubuntu.com/ubuntu precise main':
  pkgrepo.managed
```

**disabled**

[False] Toggles whether or not the repo is used for resolving dependencies and/or installing packages.

**enabled**

[True] Included to reduce confusion due to YUM/DNF/Zypper's use of the `enabled` argument. If this is passed for an APT-based distro, then the reverse will be passed as `disabled`. For example, passing `enabled=False` will assume `disabled=False`.

**architectures**

On apt-based systems, `architectures` can restrict the available architectures that the repository provides (e.g. `only amd64`). `architectures` should be a comma-separated list.

**comps**

On apt-based systems, `comps` dictate the types of packages to be installed from the repository (e.g. `main`, `nonfree`, ...). For purposes of this, `comps` should be a comma-separated list.

**file**

The filename for the `*.list` that the repository is configured in. It is important to include the full-path AND make sure it is in a directory that APT will look in when handling packages

**dist**

This dictates the release of the distro the packages should be built for. (e.g. `unstable`). This option is rarely needed.

**keyid**

The KeyID or a list of KeyIDs of the GPG key to install. This option also requires the `keyserver` option to be set.

**keyserver**

This is the name of the keyserver to retrieve GPG keys from. The `keyid` option must also be set for this option to work.

**key\_url**

URL to retrieve a GPG key from. Allows the usage of `https://` as well as `salt://`. If `allow_insecure_key` is `True`, this also allows `http://`.

---

**Note:** Use either `keyid/keyserver` or `key_url`, but not both.

---

**key\_text**

The string representation of the GPG key to install.

New in version 2018.3.0.

---

**Note:** Use either `keyid/keyserver`, `key_url`, or `key_text` but not more than one method.

---

**consolidate**

[False] If set to `True`, this will consolidate all sources definitions to the `sources.list` file, cleanup the now unused files, consolidate components (e.g. `main`) for the same URI, type, and architecture to a single line, and finally remove comments from the `sources.list` file. The consolidation will run every time the state is processed. The option only needs to be set on one repo managed by Salt to take effect.

**clean\_file**

[False] If set to `True`, empty the file before configuring the defined repository

---

**Note:** Use with care. This can be dangerous if multiple sources are configured in the same file.

---

New in version 2015.8.0.

**refresh**

[True] If set to `False` this will skip refreshing the apt package database on Debian based systems.

**refresh\_db**

[True] Deprecated since version 2018.3.0: Use `refresh` instead.

**require\_in**

Set this to a list of `pkg.installed` or `pkg.latest` to trigger the running of `apt-get update` prior to attempting to install these packages. Setting a require in the `pkg` state will not work for this.

**aptkey:**

Use the binary apt-key. If the command `apt-key` is not found in the path, aptkey will be `False`, regardless of what is passed into this argument.

**allow\_insecure\_key**

[True] Whether to allow an insecure (e.g. http vs. https) key\_url.

New in version 3006.0.

## 26.19.234 salt.states.portage\_config

### Management of Portage package configuration on Gentoo

A state module to manage Portage configuration on Gentoo

```

salt:
  portage_config.flags:
    - use:
      - openssl
  
```

`salt.states.portage_config.flags` (*name, use=None, accept\_keywords=None, env=None, license=None, properties=None, unmask=False, mask=False*)

Enforce the given flags on the given package or DEPEND atom.

**Warning:** In most cases, the affected package(s) need to be rebuilt in order to apply the changes.

**name**

The name of the package or its DEPEND atom

**use**

A list of USE flags

**accept\_keywords**

A list of keywords to accept. `~ARCH` means current host arch, and will be translated into a line without keywords

**env**  
A list of environment files

**license**  
A list of accepted licenses

**properties**  
A list of additional properties

**unmask**  
A boolean to unmask the package

**mask**  
A boolean to mask the package

### 26.19.235 salt.states.ports

Manage software from FreeBSD ports

New in version 2014.1.0.

---

**Note:** It may be helpful to use a higher timeout when running a `ports.installed` state, since compiling the port may exceed Salt's timeout.

```
salt -t 1200 '*' state.highstate
```

---

`salt.states.ports.installed`(*name*, *options=None*)

Verify that the desired port is installed, and that it was compiled with the desired options.

**options**

Make sure that the desired non-default options are set

**Warning:** Any build options not passed here assume the default values for the port, and are not just differences from the existing cached options from a previous `make config`.

Example usage:

```
security/nmap:  
ports.installed:  
- options:  
- IPV6: off
```

### 26.19.236 salt.states.postgres\_cluster

Management of PostgreSQL clusters

The `postgres_cluster` state module is used to manage PostgreSQL clusters. Clusters can be set as either absent or present

```
create cluster 9.3 main:  
postgres_cluster.present:  
- name: 'main'  
- version: '9.3'
```

`salt.states.postgres_cluster.absent` (*version, name*)

Ensure that the named cluster is absent

**version**

Version of the postgresql server of the cluster to remove

**name**

The name of the cluster to remove

New in version 2016.3.0.

`salt.states.postgres_cluster.present` (*version, name, port=None, encoding=None, locale=None, datadir=None, allow\_group\_access=None, data\_checksums=None, wal\_segsize=None*)

Ensure that the named cluster is present with the specified properties. For more information about all of these options see `man pg_createcluster(1)`

**version**

Version of the postgresql cluster

**name**

The name of the cluster

**port**

Cluster port

**encoding**

The character encoding scheme to be used in this database

**locale**

Locale with which to create cluster

**datadir**

Where the cluster is stored

**allow\_group\_access**

Allows users in the same group as the cluster owner to read all cluster files created by initdb

**data\_checksums**

Use checksums on data pages

**wal\_segsize**

Set the WAL segment size, in megabytes

New in version 2016.3.0.

### 26.19.237 salt.states.postgres\_database

#### Management of PostgreSQL databases

The `postgres_database` module is used to create and manage Postgres databases. Databases can be set as either absent or present

**frank:**

```
postgres_database.present
```

`salt.states.postgres_database.absent` (*name, user=None, maintenance\_db=None, db\_password=None, db\_host=None, db\_port=None, db\_user=None*)

Ensure that the named database is absent

**name**

The name of the database to remove

**db\_user**

database username if different from config or default

**db\_password**

user password if any password for a specified user

**db\_host**

Database host if different from config or default

**db\_port**

Database port if different from config or default

**user**

System user all operations should be performed on behalf of

New in version 0.17.0.

`salt.states.postgres_database.present` (*name*, *tablespace=None*, *encoding=None*, *lc\_collate=None*, *lc\_ctype=None*, *owner=None*, *owner\_recurse=False*, *template=None*, *user=None*, *maintenance\_db=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*, *db\_user=None*)

Ensure that the named database is present with the specified properties. For more information about all of these options see `man createdb(1)`

**name**

The name of the database to manage

**tablespace**

Default tablespace for the database

**encoding**

The character encoding scheme to be used in this database. The encoding has to be defined in the following format (without hyphen).

```
- encoding: UTF8
```

**lc\_collate**

The LC\_COLLATE setting to be used in this database

**lc\_ctype**

The LC\_CTYPE setting to be used in this database

**owner**

The username of the database owner

**owner\_recurse**

Recurse owner change to all relations in the database

**template**

The template database from which to build this database

**user**

System user all operations should be performed on behalf of

**db\_user**

database username if different from config or default

**db\_password**

user password if any password for a specified user

**db\_host**

Database host if different from config or default

**db\_port**

Database port if different from config or default

New in version 0.17.0.

## 26.19.238 salt.states.postgres\_extension

### Management of PostgreSQL extensions

A module used to install and manage PostgreSQL extensions.

**adminpack:**  
postgres\_extension.present

New in version 2014.7.0.

**salt.states.postgres\_extension.absent** (*name, if\_exists=None, restrict=None, cascade=None, user=None, maintenance\_db=None, db\_user=None, db\_password=None, db\_host=None, db\_port=None*)

Ensure that the named extension is absent.

**name**

Extension name of the extension to remove

**if\_exists**

Add if exist slug

**restrict**

Add restrict slug

**cascade**

Drop on cascade

**user**

System user all operations should be performed on behalf of

**maintenance\_db**

Database to act on

**db\_user**

Database username if different from config or default

**db\_password**

User password if any password for a specified user

**db\_host**

Database host if different from config or default

**db\_port**

Database port if different from config or default

**salt.states.postgres\_extension.present** (*name, if\_not\_exists=None, schema=None, ext\_version=None, from\_version=None, user=None, maintenance\_db=None, db\_user=None, db\_password=None, db\_host=None, db\_port=None*)

Ensure that the named extension is present.

---

**Note:** Before you can use the state to load an extension into a database, the extension's supporting files must be already installed.

---

For more information about all of these options see CREATE EXTENSION SQL command reference in the PostgreSQL documentation.

**name**

The name of the extension to be installed

**if\_not\_exists**

Add an IF NOT EXISTS parameter to the DDL statement

**schema**

Schema to install the extension into

**ext\_version**  
Version to install

**from\_version**  
Old extension version if already installed

**user**  
System user all operations should be performed on behalf of

**maintenance\_db**  
Database to act on

**db\_user**  
Database username if different from config or default

**db\_password**  
User password if any password for a specified user

**db\_host**  
Database host if different from config or default

**db\_port**  
Database port if different from config or default

### 26.19.239 salt.states.postgres\_group

#### Management of PostgreSQL groups (roles)

The postgres\_group module is used to create and manage Postgres groups.

```
frank:
postgres_group.present
```

**salt.states.postgres\_group.absent** (*name, user=None, maintenance\_db=None, db\_password=None, db\_host=None, db\_port=None, db\_user=None*)

Ensure that the named group is absent

**name**

The groupname of the group to remove

**user**

System user all operations should be performed on behalf of

New in version 0.17.0.

**db\_user**

database username if different from config or default

**db\_password**

user password if any password for a specified user

**db\_host**

Database host if different from config or default

**db\_port**

Database port if different from config or default

**salt.states.postgres\_group.present** (*name, createdb=None, createroles=None, encrypted=None, superuser=None, inherit=None, login=None, replication=None, password=None, refresh\_password=None, groups=None, user=None, maintenance\_db=None, db\_password=None, db\_host=None, db\_port=None, db\_user=None*)

Ensure that the named group is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

**name**

The name of the group to manage

**createdb**

Is the group allowed to create databases?

**createroles**

Is the group allowed to create other roles/users

**encrypted**

How the password should be stored.

If encrypted is `None`, `True`, or `md5`, it will use PostgreSQL's MD5 algorithm.

If encrypted is `False`, it will be stored in plaintext.

If encrypted is `scram-sha-256`, it will use the algorithm described in RFC 7677.

Changed in version 3003: Prior versions only supported `True` and `False`

**login**

Should the group have login perm

**inherit**

Should the group inherit permissions

**superuser**

Should the new group be a "superuser"

**replication**

Should the new group be allowed to initiate streaming replication

**password**

The group's password. It can be either a plain string or a pre-hashed password:

```
'md5{MD50F({password}{role}}'
```

```
'SCRAM-SHA-256${iterations}:{salt}${stored_key}:{server_key}'
```

If encrypted is not `False`, then the password will be converted to the appropriate format above, if not already. As a consequence, passwords that start with "md5" or "SCRAM-SHA-256" cannot be used.

**refresh\_password**

Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If `refresh_password` is `True`, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

**groups**

A string of comma separated groups the group should be in

**user**

System user all operations should be performed on behalf of

New in version 0.17.0.

**db\_user**

database username if different from config or default

**db\_password**

user password if any password for a specified user

**db\_host**

Database host if different from config or default

**db\_port**

Database port if different from config or default

## 26.19.240 salt.states.postgres\_initdb

### Initialization of PostgreSQL data directory

The postgres\_initdb module is used to initialize the postgresql data directory.

New in version 2016.3.0.

```
pgsql-data-dir:
postgres_initdb.present:
- name: /var/lib/pgsql/data
- auth: password
- user: postgres
- password: strong_password
- encoding: UTF8
- locale: C
- runas: postgres
- checksums: True
- waldir: /var/postgresql/wal
```

salt.states.postgres\_initdb.**present** (*name*, *user=None*, *password=None*, *auth='password'*, *encoding='UTF8'*, *locale=None*, *runas=None*, *waldir=None*, *checksums=False*)

Initialize the PostgreSQL data directory

**name**

The name of the directory to initialize

**user**

The database superuser name

**password**

The password to set for the postgres user

**auth**

The default authentication method for local connections

**encoding**

The default encoding for new databases

**locale**

The default locale for new databases

**waldir**

The transaction log (WAL) directory (default is to keep WAL inside the data directory)

New in version 2019.2.0.

**checksums**

If True, the cluster will be created with data page checksums.

---

**Note:** Data page checksums are supported since PostgreSQL 9.3.

---

New in version 2019.2.0.

**runas**

The system user the operation should be performed on behalf of

## 26.19.241 salt.states.postgres\_language

### Management of PostgreSQL languages

The postgres\_language module is used to create and manage Postgres languages. Languages can be set as either absent or present

New in version 2016.3.0.

```
plpgsql:
postgres_language.present:
- maintenance_db: testdb
```

```
plpgsql:
postgres_language.absent:
- maintenance_db: testdb
```

`salt.states.postgres_language.absent` (*name, maintenance\_db, user=None, db\_password=None, db\_host=None, db\_port=None, db\_user=None*)

Ensure that a named language is absent in the specified database.

**name**

The name of the language to remove

**maintenance\_db**

The name of the database in which the language is to be installed

**user**

System user all operations should be performed on behalf of

**db\_user**

database username if different from config or default

**db\_password**

user password if any password for a specified user

**db\_host**

Database host if different from config or default

**db\_port**

Database port if different from config or default

`salt.states.postgres_language.present` (*name, maintenance\_db, user=None, db\_password=None, db\_host=None, db\_port=None, db\_user=None*)

Ensure that a named language is present in the specified database.

**name**

The name of the language to install

**maintenance\_db**

The name of the database in which the language is to be installed

**user**

System user all operations should be performed on behalf of

**db\_user**

database username if different from config or default

**db\_password**

user password if any password for a specified user

**db\_host**

Database host if different from config or default

**db\_port**

Database port if different from config or default

## 26.19.242 salt.states.postgres\_privileges

### Management of PostgreSQL Privileges

The postgres\_privileges module is used to manage Postgres privileges. Privileges can be set as either absent or present.

Privileges can be set on the following database object types:

- database
- schema
- tablespace
- table
- sequence
- language
- group

Setting the grant option is supported as well.

New in version 2016.3.0.

```
baruwa:
  postgres_privileges.present:
    - object_name: awl
    - object_type: table
    - privileges:
      - SELECT
      - INSERT
      - DELETE
    - grant_option: False
    - prepend: public
    - maintenance_db: testdb
```

```
andrew:
  postgres_privileges.present:
    - object_name: admins
    - object_type: group
    - grant_option: False
    - maintenance_db: testdb
```

```
baruwa:
  postgres_privileges.absent:
    - object_name: awl
    - object_type: table
    - privileges:
      - SELECT
      - INSERT
      - DELETE
    - prepend: public
    - maintenance_db: testdb
```

**andrew:**

**postgres\_privileges.absent:**

- **object\_name:** admins
- **object\_type:** group
- **maintenance\_db:** testdb

`salt.states.postgres_privileges.absent` (*name*, *object\_name*, *object\_type*, *privileges=None*, *prepend='public'*, *maintenance\_db=None*, *user=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*, *db\_user=None*)

Revoke the requested privilege(s) on the specified object(s)

**name**

Name of the role whose privileges should be revoked

**object\_name**

Name of the object on which the revoke is to be performed

**object\_type**

The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

View permissions should specify *object\_type: table*.

**privileges**

Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**note**

privileges should not be set when revoking group membership

**prepend**

Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

**maintenance\_db**

The name of the database in which the language is to be installed

**user**

System user all operations should be performed on behalf of

**db\_user**

database username if different from config or default

**db\_password**

user password if any password for a specified user

**db\_host**

Database host if different from config or default

**db\_port**

Database port if different from config or default

`salt.states.postgres_privileges.present` (*name, object\_name, object\_type, privileges=None, grant\_option=None, prepend='public', maintenance\_db=None, user=None, db\_password=None, db\_host=None, db\_port=None, db\_user=None*)

Grant the requested privilege(s) on the specified object to a role

**name**

Name of the role to which privileges should be granted

**object\_name**

Name of the object on which the grant is to be performed. 'ALL' may be used for objects of type 'table' or 'sequence'.

**object\_type**

The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

View permissions should specify *object\_type: table*.

**privileges**

List of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**note**

privileges should not be set when granting group membership

**grant\_option**

If `grant_option` is set to True, the recipient of the privilege can in turn grant it to others

**prepend**

Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

**maintenance\_db**

The name of the database in which the language is to be installed

**user**

System user all operations should be performed on behalf of

**db\_user**

database username if different from config or default

**db\_password**  
user password if any password for a specified user

**db\_host**  
Database host if different from config or default

**db\_port**  
Database port if different from config or default

### 26.19.243 salt.states.postgres\_schema

#### Management of PostgreSQL schemas

The postgres\_schemas module is used to create and manage Postgres schemas.

```
public:
postgres_schema.present 'dbname' 'name'
```

`salt.states.postgres_schema.absent` (*dbname, name, user=None, db\_user=None, db\_password=None, db\_host=None, db\_port=None*)

Ensure that the named schema is absent.

**dbname**

The database's name will work on

**name**

The name of the schema to remove

**user**

system user all operations should be performed on behalf of

**db\_user**

database username if different from config or default

**db\_password**

user password if any password for a specified user

**db\_host**

Database host if different from config or default

**db\_port**

Database port if different from config or default

`salt.states.postgres_schema.present` (*dbname, name, owner=None, user=None, db\_user=None, db\_password=None, db\_host=None, db\_port=None*)

Ensure that the named schema is present in the database.

**dbname**

The database's name will work on

**name**

The name of the schema to manage

**user**

system user all operations should be performed on behalf of

**db\_user**

database username if different from config or default

**db\_password**

user password if any password for a specified user

**db\_host**

Database host if different from config or default

**db\_port**

Database port if different from config or default

## 26.19.244 salt.states.postgres\_tablespace

### Management of PostgreSQL tablespace

A module used to create and manage PostgreSQL tablespaces.

```

ssd-tablespace:
  postgres_tablespace.present:
    - name: indexes
    - directory: /mnt/ssd-data
  
```

New in version 2015.8.0.

**absent** (*name*, *user=None*, *maintenance\_db=None*, *db\_user=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*)

Ensure that the named tablespace is absent.

**name**

The name of the tablespace to remove

**user**

System user all operations should be performed on behalf of

**maintenance\_db**

Database to act on

**db\_user**

Database username if different from config or default

**db\_password**

User password if any password for a specified user

**db\_host**

Database host if different from config or default

**db\_port**

Database port if different from config or default

**present** (*name*, *directory*, *options=None*, *owner=None*, *user=None*, *maintenance\_db=None*, *db\_password=None*, *db\_host=None*, *db\_port=None*, *db\_user=None*)

Ensure that the named tablespace is present with the specified properties. For more information about all of these options run `man 7 create_tablespace`.

**name**

The name of the tablespace to create/manage.

**directory**

The directory where the tablespace will be located, must already exist

**options**

A dictionary of options to specify for the tablespace. Currently, the only tablespace options supported are `seq_page_cost` and `random_page_cost`. Default values are shown in the example below:

```

my_space:
  postgres_tablespace.present:
    - directory: /srv/my_tablespace
    - options:
      seq_page_cost: 1.0
      random_page_cost: 4.0
  
```

**owner**

The database user that will be the owner of the tablespace. Defaults to the user executing the command (i.e. the `user` option)

**user**  
System user all operations should be performed on behalf of

**maintenance\_db**  
Database to act on

**db\_user**  
Database username if different from config or default

**db\_password**  
User password if any password for a specified user

**db\_host**  
Database host if different from config or default

**db\_port**  
Database port if different from config or default

### 26.19.245 salt.states.postgres\_user

#### Management of PostgreSQL users (roles)

The postgres\_users module is used to create and manage Postgres users.

```
frank:
postgres_user.present
```

**salt.states.postgres\_user.absent** (*name, user=None, maintenance\_db=None, db\_password=None, db\_host=None, db\_port=None, db\_user=None*)

Ensure that the named user is absent

**name**  
The username of the user to remove

**user**  
System user all operations should be performed on behalf of  
New in version 0.17.0.

**db\_user**  
database username if different from config or default

**db\_password**  
user password if any password for a specified user

**db\_host**  
Database host if different from config or default

**db\_port**  
Database port if different from config or default

**salt.states.postgres\_user.present** (*name, createdb=None, createroles=None, encrypted=None, superuser=None, replication=None, inherit=None, login=None, password=None, default\_password=None, refresh\_password=None, valid\_until=None, groups=None, user=None, maintenance\_db=None, db\_password=None, db\_host=None, db\_port=None, db\_user=None*)

Ensure that the named user is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

**name**  
The name of the system user to manage.

**createdb**  
Is the user allowed to create databases?

**createroles**

Is the user allowed to create other users?

**encrypted**

How the password should be stored.

If encrypted is `None`, `True`, or `md5`, it will use PostgreSQL's MD5 algorithm.

If encrypted is `False`, it will be stored in plaintext.

If encrypted is `scram-sha-256`, it will use the algorithm described in RFC 7677.

Changed in version 3003: Prior versions only supported `True` and `False`

**login**

Should the group have login perm

**inherit**

Should the group inherit permissions

**superuser**

Should the new user be a "superuser"

**replication**

Should the new user be allowed to initiate streaming replication

**password**

The user's password. It can be either a plain string or a pre-hashed password:

```
'md5{MD50F({password}{role}}'  
'SCRAM-SHA-256${iterations}:{salt}${stored_key}:{server_key}'
```

If encrypted is not `False`, then the password will be converted to the appropriate format above, if not already. As a consequence, passwords that start with "md5" or "SCRAM-SHA-256" cannot be used.

**default\_password**

The password used only when creating the user, unless password is set.

New in version 2016.3.0.

**refresh\_password**

Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If `refresh_password` is `True`, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

**valid\_until**

A date and time after which the role's password is no longer valid.

**groups**

A string of comma separated groups the user should be in

**user**

System user all operations should be performed on behalf of

New in version 0.17.0.

**db\_user**

Postgres database username, if different from config or default.

**db\_password**

Postgres user's password, if any password, for a specified `db_user`.

**db\_host**

Postgres database host, if different from config or default.

**db\_port**

Postgres database port, if different from config or default.

## 26.19.246 salt.states.powerpath

### Powerpath configuration support

Allows configuration of EMC Powerpath. Currently only addition/deletion of licenses is supported.

#### key:

```
powerpath.license_present: []
```

`salt.states.powerpath.license_absent` (*name*)

Ensures that the specified PowerPath license key is absent on the host.

#### name

The license key to ensure is absent

`salt.states.powerpath.license_present` (*name*)

Ensures that the specified PowerPath license key is present on the host.

#### name

The license key to ensure is present

## 26.19.247 salt.states.probes

### Network Probes

Configure RPM (JunOS)/SLA (Cisco) probes on the device via NAPALM proxy.

#### codeauthor

Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

#### maturity

new

#### depends

napalm

#### platform

unix

### Dependencies

- *napalm probes management module*

New in version 2016.11.0.

`salt.states.probes.managed` (*name, probes, defaults=None*)

Ensure the networks device is configured as specified in the state SLS file. Probes not specified will be removed, while probes not configured as expected will trigger config updates.

#### Parameters

- **probes** -- Defines the probes as expected to be configured on the device. In order to ease the configuration and avoid repeating the same parameters for each probe, the next parameter (*defaults*) can be used, providing common characteristics.
- **defaults** -- Specifies common parameters for the probes.

SLS Example:

```

rmpmprobes:
  probes.managed:
    - probes:
        probe_name1:
          probe1_test1:
            source: 192.168.0.2
            target: 192.168.0.1
          probe1_test2:
            target: 172.17.17.1
          probe1_test3:
            target: 8.8.8.8
            probe_type: http-ping
        probe_name2:
          probe2_test1:
            test_interval: 100
    - defaults:
        target: 10.10.10.10
        probe_count: 15
        test_interval: 3
        probe_type: icmp-ping

```

In the probes configuration, the only mandatory attribute is *target* (specified either in probes configuration, either in the defaults dictionary). All the other parameters will use the operating system defaults, if not provided:

- *source* - Specifies the source IP Address to be used during the tests. If not specified will use the IP Address of the logical interface loopback0.
- *target* - Destination IP Address.
- *probe\_count* - Total number of probes per test (1..15). System defaults: 1 on both JunOS & Cisco.
- *probe\_interval* - Delay between tests (0..86400 seconds). System defaults: 3 on JunOS, 5 on Cisco.
- *probe\_type* - Probe request type. Available options:
  - icmp-ping
  - tcp-ping
  - udp-ping

Using the example configuration above, after running the state, on the device will be configured 4 probes, with the following properties:

```

probe_name1:
  probe1_test1:
    source: 192.168.0.2
    target: 192.168.0.1
    probe_count: 15
    test_interval: 3
    probe_type: icmp-ping
  probe1_test2:
    target: 172.17.17.1
    probe_count: 15
    test_interval: 3
    probe_type: icmp-ping
  probe1_test3:
    target: 8.8.8.8
    probe_count: 15
    test_interval: 3
    probe_type: http-ping

```

(continues on next page)

(continued from previous page)

```

probe_name2:
  probe2_test1:
    target: 10.10.10.10
    probe_count: 15
    test_interval: 3
    probe_type: icmp-ping

```

## 26.19.248 salt.states.process

### Process Management

Ensure a process matching a given pattern is absent.

```

httpd-absent:
  process.absent:
    - name: apache2

```

`salt.states.process.absent` (*name*, *user=None*, *signal=None*)

Ensures that the named command is not running.

**name**

The pattern to match.

**user**

The user to which the process belongs

**signal**

Signal to send to the process(es).

## 26.19.249 salt.states.proxy

Allows you to manage proxy settings on minions

Setup proxy settings on minions

```

192.168.1.4:
  proxy.managed:
    - port: 3128
    - bypass_domains:
      - localhost
      - 127.0.0.1

```

`salt.states.proxy.managed` (*name*, *port*, *services=None*, *user=None*, *password=None*, *bypass\_domains=None*, *network\_service='Ethernet'*)

Manages proxy settings for this minion

**name**

The proxy server to use

**port**

The port used by the proxy server

**services**

A list of the services that should use the given proxy settings, valid services include http, https and ftp. If no service is given all of the valid services will be used.

**user**

The username to use for the proxy server if required

**password**

The password to use for the proxy server if required

**bypass\_domains**

An array of the domains that should bypass the proxy

**network\_service**

The network service to apply the changes to, this only necessary on macOS

### 26.19.250 salt.states.pushover

**Warning:** This module will be removed from Salt in version 3009 in favor of the [pushover Salt Extension](#).

#### Send a message to PushOver

This state is useful for sending messages to PushOver during state runs.

New in version 2015.5.0.

```
pushover-message:
  pushover.post_message:
    - user: xx
    - token: xx
    - title: Salt Returner
    - device: phone
    - priority: -1
    - expire: 3600
    - retry: 5
    - message: 'This state was executed successfully.'
```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

```
pushover:
  token: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

```
salt.states.pushover.post_message(name, user=None, device=None, message=None, title=None,
                                   priority=None, expire=None, retry=None, sound=None,
                                   api_version=1, token=None)
```

Send a message to a PushOver channel.

```
pushover-message:
  pushover.post_message:
    - user: xx
    - token: xx
    - title: Salt Returner
    - device: phone
    - priority: -1
    - expire: 3600
    - retry: 5
```

The following parameters are required:

**name**

The unique name for this event.

|                                        |                                                                                                                      |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>user</b>                            | The user or group of users to send the message to. Must be ID of user, not name or email address.                    |
| <b>message</b>                         | The message that is to be sent to the PushOver channel.                                                              |
| The following parameters are optional: |                                                                                                                      |
| <b>title</b>                           | The title to use for the message.                                                                                    |
| <b>device</b>                          | The device for the user to send the message to.                                                                      |
| <b>priority</b>                        | The priority for the message.                                                                                        |
| <b>expire</b>                          | The message should expire after specified amount of seconds.                                                         |
| <b>retry</b>                           | The message should be resent this many times.                                                                        |
| <b>token</b>                           | The token for PushOver to use for authentication, if not specified in the configuration options of master or minion. |

### 26.19.251 salt.states.pyenv

#### Managing python installations with pyenv

This module is used to install and manage python installations with pyenv. Different versions of python can be installed, and uninstalled. pyenv will be installed automatically the first time it is needed and can be updated later. This module will *not* automatically install packages which pyenv will need to compile the versions of python.

If pyenv is run as the root user then it will be installed to /usr/local/pyenv, otherwise it will be installed to the users ~/.pyenv directory. To make pyenv available in the shell you may need to add the pyenv/shims and pyenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access pyenv then you will need to add pyenv\_ROOT to their environment.

This is how a state configuration could look like:

```

pyenv-deps:
  pkg.installed:
    - pkgs:
      - make
      - build-essential
      - libssl-dev
      - zlib1g-dev
      - libbz2-dev
      - libreadline-dev
      - libsqlite3-dev
      - wget
      - curl
      - llvm
python-2.6:
  pyenv.absent:
    - require:
      - pkg: pyenv-deps
python-2.7.6:

```

(continues on next page)

(continued from previous page)

```

pyenv.installed:
- default: True
- require:
  - pkg: pyenv-deps

```

---

**Note:** Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

---

`salt.states.pyenv.absent`(*name*, *user=None*)

Verify that the specified python is not installed with pyenv. pyenv is installed if necessary.

**name**

The version of python to uninstall

**user: None**

The user to run pyenv as.

New in version 0.17.0.

New in version 0.16.0.

`salt.states.pyenv.install_pyenv`(*name*, *user=None*)

Install pyenv if not installed. Allows you to require pyenv be installed prior to installing the plugins. Useful if you want to install pyenv plugins via the git or file modules and need them installed before installing any rubies.

Use the `pyenv.root` configuration option to set the path for pyenv if you want a system wide install that is not in a user home dir.

**user: None**

The user to run pyenv as.

`salt.states.pyenv.installed`(*name*, *default=False*, *user=None*)

Verify that the specified python is installed with pyenv. pyenv is installed if necessary.

**name**

The version of python to install

**default**

[False] Whether to make this python the default.

**user: None**

The user to run pyenv as.

New in version 0.17.0.

New in version 0.16.0.

## 26.19.252 salt.states.pyrax\_queues

### Manage Rackspace Queues

New in version 2015.5.0.

Create and destroy Rackspace queues. Be aware that this interacts with Rackspace's services, and so may incur charges.

This module uses `pyrax`, which can be installed via package, or pip. This module is greatly inspired by `boto_*` modules from SaltStack code source.

```

myqueue:
  pyrax_queues.present:
    - provider: my-pyrax

myqueue:
  pyrax_queues.absent:
    - provider: my-pyrax

```

`salt.states.pyrax_queues.absent` (*name*, *provider*)

Ensure the named Rackspace queue is deleted.

**name**

Name of the Rackspace queue.

**provider**

Salt Cloud provider

`salt.states.pyrax_queues.present` (*name*, *provider*)

Ensure the RackSpace queue exists.

**name**

Name of the Rackspace queue.

**provider**

Salt Cloud Provider

### 26.19.253 salt.states.quota

#### Management of POSIX Quotas

The quota can be managed for the system:

```

/:
  quota.mode:
    mode: off
    quotatype: user

```

`salt.states.quota.mode` (*name*, *mode*, *quotatype*)

Set the quota for the system

**name**

The filesystem to set the quota mode on

**mode**

Whether the quota system is on or off

**quotatype**

Must be user or group

## 26.19.254 salt.states.rabbitmq\_cluster

### Manage RabbitMQ Clusters

Example:

```
rabbit@rabbit.example.com:
rabbitmq_cluster.join:
- user: rabbit
- host: rabbit.example.com
```
