salt.modules.mac_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, fullname=None, createhome=True, **kwargs)

Add a user to the minion

CLI Example:

```
salt '* user.add name <uid> <gid> <groups> <home> <shell>
```

salt.modules.mac_user.chfullname(name, fullname)

Change the user's Full Name

CLI Example:

```
salt '* user.chfullname foo 'Foo Bar'
```

salt.modules.mac_user.chgid(name, gid)

Change the default group of the user

CLI Example:

```
salt '* user.chgid foo 4376
```

salt.modules.mac_user.chgroups(name, groups, append=False)

Change the groups to which the user belongs. Note that the user's primary group does not have to be one of the groups passed, membership in the user's primary group is automatically assumed.

**groups**
Groups to which the user should belong, can be passed either as a python list or a comma-separated string

**append**
Instead of removing user from groups not included in the groups parameter, just add user to any groups for which they are not members

CLI Example:

```
salt '* user.chgroups foo wheel,root
```

salt.modules.mac_user.chhome(name, home, **kwargs)

Change the home directory of the user

CLI Example:

```
salt '* user.chhome foo /Users/foo
```

salt.modules.mac_user.chshell(name, shell)

Change the default shell of the user

CLI Example:
salt modules.mac_user.chuid(name, uid)
Change the uid for a named user
CLI Example:
salt '*' user.chuid foo 4376

salt modules.mac_user.delete(name, remove=False, force=False)
Remove a user from the minion
CLI Example:
salt '*' user.delete name remove=True force=True

salt modules.mac_user.disable_auto_login()
New in version 2016.3.0.
Disables auto login on the machine
Returns
True if successful, otherwise False
Return type
bool
CLI Example:
salt '*' user.disable_auto_login

salt modules.mac_user.enable_auto_login(name, password)
New in version 2016.3.0.
Configures the machine to auto login with the specified user
Parameters
- name (str) -- The user account use for auto login
- password (str) -- The password to user for auto login
New in version 2017.7.3.
Returns
True if successful, otherwise False
Return type
bool
CLI Example:
salt '*' user.enable_auto_login stevej

salt modules.mac_user.get_auto_login()
New in version 2016.3.0.
Gets the current setting for Auto Login
Returns
If enabled, returns the user name, otherwise returns False
Return type
str, bool
CLI Example:
salt '*' user.get_auto_login

salt.modules.mac_user.getent(refresh=False)
    Return the list of all info for all users

    CLI Example:
    
    salt '*' user.getent

salt.modules.mac_user.info(name)
    Return user information

    CLI Example:
    
    salt '*' user.info root

salt.modules.mac_user.list_groups(name)
    Return a list of groups the named user belongs to.

    name
    The name of the user for which to list groups. Starting in Salt 2016.11.0, all groups for the user, including groups beginning with an underscore will be listed.

    Changed in version 2016.11.0.

    CLI Example:
    
    salt '*' user.list_groups foo

salt.modules.mac_user.list_users()
    Return a list of all users

    CLI Example:
    
    salt '*' user.list_users

salt.modules.mac_user.primary_group(name)
    Return the primary group of the named user

    New in version 2016.3.0.

    CLI Example:
    
    salt '*' user.primary_group saltadmin

salt.modules.mac_user.rename(name, new_name)
    Change the username for a named user

    CLI Example:
    
    salt '*' user.rename name new_name
26.6.249 `salt.modules.mac_xattr`

This module allows you to manage extended attributes on files or directories

```python
salt '*/' xattr.list /path/to/file
```

`salt.modules.mac_xattr.clear(path)`
Causes the all attributes on the file/directory to be removed

- **Parameters**
  - `path (str)` -- The file(s) to get attributes from
- **Returns**
  - True if successful, otherwise False
- **Raises**
  - CommandExecutionError on file not found or any other unknown error

CLI Example:

```python
salt '*/' xattr.delete /path/to/file "com.test.attr"
```

`salt.modules.mac_xattr.delete(path, attribute)`
Removes the given attribute from the file

- **Parameters**
  - `path (str)` -- The file(s) to get attributes from
  - `attribute (str)` -- The attribute name to be deleted from the file/directory
- **Returns**
  - True if successful, otherwise False
- **Return type**
  - bool
- **Raises**
  - CommandExecutionError on file not found, attribute not found, and any other unknown error

CLI Example:

```python
salt '*/' xattr.delete /path/to/file "com.test.attr"
```

`salt.modules.mac_xattr.list_(path, **kwargs)`
List all of the extended attributes on the given file/directory

- **Parameters**
  - `path (str)` -- The file(s) to get attributes from
  - `hex (bool)` -- Return the values with forced hexadecimal values
- **Returns**
  - A dictionary containing extended attributes and values for the given file
- **Return type**
  - dict
- **Raises**
  - CommandExecutionError on file not found or any other unknown error

CLI Example:

```python
salt '*/' xattr.list /path/to/file
salt '*/' xattr.list /path/to/file hex=True
```

`salt.modules.mac_xattr.read(path, attribute, **kwargs)`
Read the given attributes on the given file/directory
Parameters

- **path** *(str)* -- The file to get attributes from
- **attribute** *(str)* -- The attribute to read
- **hex** *(bool)* -- Return the values with forced hexadecimal values

Returns

A string containing the value of the named attribute

Return type

str

Raises

CommandExecutionError on file not found, attribute not found, and any other unknown error

CLI Example:

```python
salt '/*/xattr.read /path/to/file com.test.attr
salt '/*/xattr.read /path/to/file com.test.attr hex=True
```

**salt.modules.mac_xattr.write(path, attribute, value, **kwargs)**

Causes the given attribute name to be assigned the given value

Parameters

- **path** *(str)* -- The file(s) to get attributes from
- **attribute** *(str)* -- The attribute name to be written to the file/directory
- **value** *(str)* -- The value to assign to the given attribute
- **hex** *(bool)* -- Set the values with forced hexadecimal values

Returns

True if successful, otherwise False

Return type

bool

Raises

CommandExecutionError on file not found or any other unknown error

CLI Example:

```python
salt '/*/xattr.write /path/to/file "com.test.attr" "value"
```

### 26.6.250 salt.modules.macdefaults

Set defaults on Mac OS

**salt.modules.macdefaults.delete(domain, key, user=None)**

Delete a default from the system

CLI Example:

```python
salt '/*/macdefaults.delete com.apple.CrashReporter DialogType
salt '/*/macdefaults.delete NSGlobalDomain ApplePersistence
```

domain
The name of the domain to delete from

key
The key of the given domain to delete
user
The user to delete the defaults with

```
salt.modules.macdefaults.read(domain, key, user=None)
```
Read a default from the system

CLI Example:

```
salt '*' macdefaults.read com.apple.CrashReporter DialogType
salt '*' macdefaults.read NSGlobalDomain ApplePersistence
```

**domain**
The name of the domain to read from

**key**
The key of the given domain to read from

**user**
The user to read the defaults as

```
salt.modules.macdefaults.write(domain, key, value, type='string', user=None)
```
Write a default to the system

CLI Example:

```
salt '*' macdefaults.write com.apple.CrashReporter DialogType Server
salt '*' macdefaults.write NSGlobalDomain ApplePersistence True type=bool
```

**domain**
The name of the domain to write to

**key**
The key of the given domain to write to

**value**
The value to write to the given key

**type**
The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add

**user**
The user to write the defaults to

## 26.6.251 salt.modules.macpackage

Install pkg, dmg and .app applications on macOS minions.

```
salt.modules.macpackage.get_mpkg_ids(mpkg)
```
Attempt to get the package IDs from a mounted .mpkg file

Parameters

**mpkg** *(str)* -- The location of the mounted mpkg file

Returns

List of package IDs

Return type

list

CLI Example:
salt.modules.macpackage.get_pkg_id(pkg)

Attempt to get the package ID from a .pkg file

Parameters

pkg (str) -- The location of the pkg file

Returns

List of all of the package IDs

Return type

list

CLI Example:

```bash
salt '*' macpackage.get_pkg_id /dev/disk2
```

salt.modules.macpackage.install(pkg, target='LocalSystem', store=False, allow_untrusted=False)

Install a pkg file

Parameters

- pkg (str) -- The package to install
- target (str) -- The target in which to install the package to
- store (bool) -- Should the package be installed as if it was from the store?
- allow_untrusted (bool) -- Allow the installation of untrusted packages?

Returns

A dictionary containing the results of the installation

Return type

dict

CLI Example:

```bash
salt '*' macpackage.install test.pkg
```

salt.modules.macpackage.install_app(app, target='/Applications/')</n

Install an app file by moving it into the specified Applications directory

Parameters

- app (str) -- The location of the .app file
- target (str) -- The target in which to install the package to Default is "/Applications/"

Returns

The results of the rsync command

Return type

str

CLI Example:

```bash
salt '*' macpackage.install_app /tmp/tmp.app /Applications/
```

salt.modules.macpackage.installed_pkgs()  

Return the list of installed packages on the machine

Returns

List of installed packages

Return type

list

CLI Example:
salt 'ْ' macpackage.installed_pkgs

**salt.modules.macpackage.mount**(dmg)

Attempt to mount a dmg file to a temporary location and return the location of the pkg file inside

*Parameters*

  * **dmg** *(str)* -- The location of the dmg file to mount

*Returns*

  Tuple containing the results of the command along with the mount point

*Return type*

  *tuple*

*CLI Example:*

```
salt 'ْ' macpackage.mount /tmp/software.dmg
```

**salt.modules.macpackage.uninstall_app**(app)

Uninstall an app file by removing it from the Applications directory

*Parameters*

  * **app** *(str)* -- The location of the .app file

*Returns*

  True if successful, otherwise False

*Return type*

  *bool*

*CLI Example:*

```
salt 'ْ' macpackage.uninstall_app /Applications/app.app
```

**salt.modules.macpackage.unmount**(mountpoint)

Attempt to unmount a dmg file from a temporary location

*Parameters*

  * **mountpoint** *(str)* -- The location of the mount point

*Returns*

  The results of the hdutil detach command

*Return type*

  *str*

*CLI Example:*

```
salt 'ْ' macpackage.unmount /dev/disk2
```

### 26.6.252 salt.modules.makeconf

Support for modifying make.conf under Gentoo

**salt.modules.makeconf.append_cflags**(value)

Add to or create a new CFLAGS in the make.conf

Return a dict containing the new value for variable:

```json
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```

*CLI Example:*

```bash
salt '*' makeconf.append_cflags -c "CFLAGS=\"-DFOO\""
```
The document provides a detailed explanation of various functions within the Salt documentation, Release 3007.1. The functions described are:

- `salt '*' makeconf.append_cflags '-pipe'`:
  - Function: `salt.modules.makeconf.append_cxxflags(value)`
  - Description: Add to or create a new CXXFLAGS in the make.conf
  - Return: a dict containing the new value for variable:
    ```
    {'<variable>': {'old': '<old-value>',
                   'new': '<new-value>'}}
    ```
  - CLI Example:
    ```
    salt '*' makeconf.append_cxxflags '-pipe'
    ```

- `salt.modules.makeconf.append_emerge_default_opts(value)`:
  - Description: Add to or create a new EMERGE_DEFAULT_OPTS in the make.conf
  - Return: a dict containing the new value for variable:
    ```
    {'<variable>': {'old': '<old-value>',
                   'new': '<new-value>'}}
    ```
  - CLI Example:
    ```
    salt '*' makeconf.append_emerge_default_opts 'weis-jobs'
    ```

- `salt.modules.makeconf.append_features(value)`:
  - Description: Add to or create a new FEATURES in the make.conf
  - Return: a dict containing the new value for variable:
    ```
    {'<variable>': {'old': '<old-value>',
                   'new': '<new-value>'}}
    ```
  - CLI Example:
    ```
    salt '*' makeconf.append_features 'websync-gpg'
    ```

- `salt.modules.makeconf.append_gentoo_mirrors(value)`:
  - Description: Add to or create a new GENTOO_MIRRORS in the make.conf
  - Return: a dict containing the new value for variable:
    ```
    {'<variable>': {'old': '<old-value>',
                   'new': '<new-value>'}}
    ```
  - CLI Example:
    ```
    salt '*' makeconf.append_gentoo_mirrors 'http://distfiles.gentoo.org'
    ```

- `salt.modules.makeconf.append_makeopts(value)`:
  - Description: Add to or create a new MAKEOPTS in the make.conf
  - Return: a dict containing the new value for variable:

The document is part of the Salt Documentation, Release 3007.1.
salt.modules.makeconf.append_makeopts('-j3')

**append_var(var, value)**

Add to or create a new variable in the make.conf

Return a dict containing the new value for variable:

```json
{"<variable>": {"old": "<old-value>",
  "new": "<new-value>"}}
```

**cflags_contains(value)**

Verify if CFLAGS variable contains a value in make.conf

Return True if value is set for var

**chost_contains(value)**

Verify if CHOST variable contains a value in make.conf

Return True if value is set for var

**cxxflags_contains(value)**

Verify if CXXFLAGS variable contains a value in make.conf

Return True if value is set for var

**emerge_default_opts_contains(value)**

Verify if EMERGE_DEFAULT_OPTS variable contains a value in make.conf

Return True if value is set for var

```bash
salt '*' makeconf.chost_contains 'x86_64-pc-linux-gnu'
salt.modules.makeconf.cxxflags_contains '-pipe'
salt.modules.makeconf.emerge_default_opts_contains '--jobs'
```
salt.modules.makeconf.features_contains(value)
    Verify if FEATURES variable contains a value in make.conf
    Return True if value is set for var
    CLI Example:

        salt '*' makeconf.features_contains 'webrsync-gpg'

salt.modules.makeconf.gentoo_mirrors_contains(value)
    Verify if GENTOO_MIRRORS variable contains a value in make.conf
    Return True if value is set for var
    CLI Example:

        salt '*' makeconf.gentoo_mirrors_contains 'http://distfiles.gentoo.org'

salt.modules.makeconf.get_cflags()
    Get the value of CFLAGS variable in the make.conf
    Return the value of the variable or None if the variable is not in the make.conf
    CLI Example:

        salt '*' makeconf.get_cflags

salt.modules.makeconf.get_chost()
    Get the value of CHOST variable in the make.conf
    Return the value of the variable or None if the variable is not in the make.conf
    CLI Example:

        salt '*' makeconf.get_chost

salt.modules.makeconf.get_cxxflags()
    Get the value of CXXFLAGS variable in the make.conf
    Return the value of the variable or None if the variable is not in the make.conf
    CLI Example:

        salt '*' makeconf.get_cxxflags

salt.modules.makeconf.get_emerge_default_opts()
    Get the value of EMERGE_DEFAULT_OPTS variable in the make.conf
    Return the value of the variable or None if the variable is not in the make.conf
    CLI Example:

        salt '*' makeconf.get_emerge_default_opts

salt.modules.makeconf.get_features()
    Get the value of FEATURES variable in the make.conf
    Return the value of the variable or None if the variable is not in the make.conf
    CLI Example:
salt.modules.makeconf.get_features

Get the value of GENTOO_MIRRORS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:
salt '*' makeconf.get_features

salt.modules.makeconf.get_gentoo_mirrors()

Get the value of GENTOO_MIRRORS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:
salt '*' makeconf.get_gentoo_mirrors

salt.modules.makeconf.get_makeopts()

Get the value of MAKEOPTS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:
salt '*' makeconf.get_makeopts

salt.modules.makeconf.get_sync()

Get the value of SYNC variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:
salt '*' makeconf.get_sync

salt.modules.makeconf.get_var(var)

Get the value of a variable in make.conf

Return the value of the variable or None if the variable is not in make.conf

CLI Example:
salt '*' makeconf.get_var 'LINGUAS'

salt.modules.makeconf.makeopts_contains(value)

Verify if MAKEOPTS variable contains a value in make.conf

Return True if value is set for var

CLI Example:
salt '*' makeconf.makeopts_contains '-j3'

salt.modules.makeconf.remove_var(var)

Remove a variable from the make.conf

Return a dict containing the new value for the variable:

```
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.remove_var 'LINGUAS'
salt.modules.makeconf.set_cflags\(value\)
Set the CFLAGS variable
Return a dict containing the new value for variable:

```
{
'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}
}
```

CLI Example:

```
salt '*' makeconf.set_cflags '-march=native -O2 -pipe'
```

salt.modules.makeconf.set_chost\(value\)
Set the CHOST variable
Return a dict containing the new value for variable:

```
{
'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}
}
```

CLI Example:

```
salt '*' makeconf.set_chost 'x86_64-pc-linux-gnu'
```

salt.modules.makeconf.set_cxxflags\(value\)
Set the CXXFLAGS variable
Return a dict containing the new value for variable:

```
{
'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}
}
```

CLI Example:

```
salt '*' makeconf.set_cxxflags '-march=native -O2 -pipe'
```

salt.modules.makeconf.set_emerge_default_opts\(value\)
Set the EMERGE_DEFAULT_OPTS variable
Return a dict containing the new value for variable:

```
{
'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}
}
```

CLI Example:

```
salt '*' makeconf.set_emerge_default_opts '--jobs'
```

salt.modules.makeconf.set_gentoo_mirrors\(value\)
Set the GENTOO_MIRRORS variable
Return a dict containing the new value for variable:

```
{
'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}
}
```

CLI Example:

```
salt '*' makeconf.set_gentoo_mirrors
```
```
salt '*' makeconf.set_gentoo_mirrors 'http://distfiles.gentoo.org'
```

**salt.modules.makeconf.set_makeopts(value)**

Set the MAKEOPTS variable

Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_makeopts '-j3'
```

**salt.modules.makeconf.set_sync(value)**

Set the SYNC variable

Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_sync 'rsync://rsync.namerica.gentoo.org/gentoo-
→portage'
```

**salt.modules.makeconf.set_var(var, value)**

Set a variable in the make.conf

Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_var 'LINGUAS' 'en'
```

**salt.modules.makeconf.sync_contains(value)**

Verify if SYNC variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.sync_contains 'rsync://rsync.namerica.gentoo.org/gentoo-
→portage'
```

**salt.modules.makeconf.trim_cflags(value)**

Remove a value from CFLAGS variable in the make.conf

Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```
CLI Example:
```bash
salt '*' makeconf.trim_cxxflags '-pipe'
```

**salt.modules.makeconf.trim_cxxflags(value)**
Remove a value from CXXFLAGS variable in the make.conf
Return a dict containing the new value for variable:

```json
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' }}
```

CLI Example:
```bash
salt '*' makeconf.trim_cxxflags '-pipe'
```

**salt.modules.makeconf.trim_emerge_default_opts(value)**
Remove a value from EMERGE_DEFAULT_OPTS variable in the make.conf
Return a dict containing the new value for variable:

```json
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' }}
```

CLI Example:
```bash
salt '*' makeconf.trim_emerge_default_opts '--jobs'
```

**salt.modules.makeconf.trim_features(value)**
Remove a value from FEATURES variable in the make.conf
Return a dict containing the new value for variable:

```json
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' }}
```

CLI Example:
```bash
salt '*' makeconf.trim_features 'webrsync-gpg'
```

**salt.modules.makeconf.trim_gentoo_mirrors(value)**
Remove a value from GENTOO_MIRRORS variable in the make.conf
Return a dict containing the new value for variable:

```json
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' }}
```

CLI Example:
```bash
salt '*' makeconf.trim_gentoo_mirrors 'http://distfiles.gentoo.org'
```

**salt.modules.makeconf.trim_makeopts(value)**
Remove a value from MAKEOPTS variable in the make.conf
Return a dict containing the new value for variable:
```
{'<variable>': {'old': '<old-value>',
    'new': '<new-value>'}}
```

CLI Example:
```
salt '* makeconf.trim_makeopts '-j3'
```

```python
salt.modules.makeconf.trim_var(var, value)
```
Remove a value from a variable in the make.conf
Return a dict containing the new value for variable:
```
{'<variable>': {'old': '<old-value>',
    'new': '<new-value>'}}
```

CLI Example:
```
salt '* makeconf.trim_var 'LINGUAS' 'en'
```

```python
salt.modules.makeconf.var_contains(var, value)
```
Verify if variable contains a value in make.conf
Return True if value is set for var
CLI Example:
```
salt '* makeconf.var_contains 'LINGUAS' 'en'
```

## 26.6.253 salt.modules.mandrill

**Mandrill**

Send out emails using the Mandrill API.

In the minion configuration file, the following block is required:

```yaml
mandrill:
    key: <API_KEY>
```

New in version 2018.3.0.

```python
salt.modules.mandrill.send(message, asynchronous=False, ip_pool=None, send_at=None, api_url=None, api_version=None, api_key=None)
```
Send out the email using the details from the message argument.

**message**
The information on the message to send. This argument must be sent as dictionary with at fields as specified in the Mandrill API documentation.

**asynchronous: False**
Enable a background sending mode that is optimized for bulk sending. In asynchronous mode, messages/send will immediately return a status of "queued" for every recipient. To handle rejections when sending in asynchronous mode, set up a webhook for the 'reject' event. Defaults to false for messages with no more than 10 recipients; messages with more than 10 recipients are always sent asynchronously, regardless of the value of asynchronous.
ip_pool

The name of the dedicated ip pool that should be used to send the message. If you do not have any
dedicated IPs, this parameter has no effect. If you specify a pool that does not exist, your default pool
will be used instead.

send_at

When this message should be sent as a UTC timestamp in YYYY-MM-DD HH:MM:SS format. If you
specify a time in the past, the message will be sent immediately. An additional fee applies for scheduled
email, and this feature is only available to accounts with a positive balance.

Note: For further details please consult the API documentation.

CLI Example:

```
salt '*' mandrill.send message="{"subject": 'Hi', 'from_email':
  "test@example.com", 'to': [{"email": 'recv@example.com', 'type': 'to'}]}
```

message structure example (as YAML for readability):

```
message:
  text:
      This is the body of the email.
      This is the second line.
  subject: Email subject
  from_name: Test At Example Dot Com
  from_email: test@example.com
  to:
      - email: recv@example.com
        type: to
        name:Recv At Example Dot Com
      - email: cc@example.com
        type: cc
        name:CC At Example Dot Com
  important: true
  track_clicks: true
  track_opens: true
  attachments:
      - type: text/x-yaml
        name: yaml_file.yml
        content: aV9hbV9zdXBlc19jdXJpb3VzOiB0cnVl
```

Output example:

```
minion:---------------------
comment: out:
   |---------------------
   _id: c4353540a3c123eca112bbdd704ab6
   email: recv@example.com
```

(continues on next page)
26.6.254  salt.modules.marathon

Module providing a simple management interface to a marathon cluster.
Currently this only works when run through a proxy minion.
New in version 2015.8.2.
salt.modules.marathon.app(id)
   Return the current server configuration for the specified app.
   CLI Example:
   ```
salt marathon-minion-id marathon.app my-app
   ```
salt.modules.marathon.apps()
   Return a list of the currently installed app ids.
   CLI Example:
   ```
salt marathon-minion-id marathon.apps
   ```
salt.modules.marathon.has_app(id)
   Return whether the given app id is currently configured.
   CLI Example:
   ```
salt marathon-minion-id marathon.has_app my-app
   ```
salt.modules.marathon.info()
   Return configuration and status information about the marathon instance.
   CLI Example:
   ```
salt marathon-minion-id marathon.info
   ```
salt.modules.marathon.restart_app(id, restart=False, force=True)
   Restart the current server configuration for the specified app.
   Parameters
   ```
   • restart -- Restart the app
   • force -- Override the current deployment
   ```
   CLI Example:
   ```
salt marathon-minion-id marathon.restart_app my-app
   ```
   By default, this will only check if the app exists in marathon. It does not check if there are any tasks associated with it or if the app is suspended.
The restart option needs to be set to True to actually issue a rolling restart to marathon.
The force option tells marathon to ignore the current app deployment if there is one.

```
salt marathon-minion-id marathon.restart_app my-app true true
```

salt.modules.marathon.update_app(id)
Remove the specified app from the server.

```
salt marathon-minion-id marathon.rm_app my-app
```

salt.modules.marathon.update_app(id, config)
Update the specified app with the given configuration.

```
salt marathon-minion-id marathon.update_app my-app '<config yaml>'
```

### 26.6.255 salt.modules.match

The match module allows for match routines to be run and determine target specs

salt.modules.match.compound(tgt, minion_id=None)
Return True if the minion ID matches the given compound target

```
salt '*' match.compound 'L@cheese,foo and *'
```

salt.modules.match.data(tgt)
Return True if the minion matches the given data target

```
salt '*' match.data 'spam:eggs'
```

salt.modules.match.filter_by(lookup, tgt_type='compound', minion_id=None, merge=None, merge_lists=False, default='default')
Return the first match in a dictionary of target patterns

New in version 2014.7.0.

```
salt '*' match.filter_by '{foo*: Foo!, bar*: Bar!}' minion_id=bar03
```

Pillar Example:
# Filter the data for the current minion into a variable:
{% set roles = salt['match.filter_by']({
   'web*': ['app', 'caching'],
   'db*': ['db'],
}, minion_id=grains['id'], default='web*') %}

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}

salt.modules.match.glob(tgt, minion_id=None)

Return True if the minion ID matches the given glob target

```
salt '*' match.glob '*'
```

salt.modules.match.grain(tgt, delimiter=':')

Return True if the minion matches the given grain target. The `delimiter` argument can be used to specify a different delimiter.

```
salt '*' match.grain 'os:Ubuntu'
salt '*' match.grain 'ipv6|2001:db8::ff00:42:8329' delimiter='|'
```

delimiter

Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim

Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

 Deprecated since version 2015.8.0.

salt.modules.match.grain_pcre(tgt, delimiter=':')

Return True if the minion matches the given grain_pcre target. The `delimiter` argument can be used to specify a different delimiter.

```
salt '*' match.grain_pcre 'os:Fedo.*'
salt '*' match.grain_pcre 'ipv6|2001:.*' delimiter='|'
```

delimiter

Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim

Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

 Deprecated since version 2015.8.0.
salt.modules.match.ifelse(*args, tgt_type='compound', minion_id=None, merge=None, merge_lists=False)

New in version 3006.0.

Evaluate each pair of arguments up to the last one as a (matcher, value) tuple, returning value if matched. If none match, returns the last argument.

The ifelse function is like a multi-level if-else statement. It was inspired by CFEngine's ifelse function which in turn was inspired by Oracle's DECODE function. It must have an odd number of arguments (from 1 to N). The last argument is the default value, like the else clause in standard programming languages. Every pair of arguments before the last one are evaluated as a pair. If the first one evaluates true then the second one is returned, as if you had used the first one in a compound match expression. Boolean values can also be used as the first item in a pair, as it will be translated to a match that will always match ("*") or never match ("SALT_IFELSE_MATCH NOTHING") a target system.

This is essentially another way to express the filter_by functionality in way that's familiar to CFEngine or Oracle users. Consider using filter_by unless this function fits your workflow.

CLI Example:

```
salt '*' match.ifelse 'foo*' 'Foo!' 'bar*' 'Bar!' minion_id=bar03
```

salt.modules.match.ipcidr(tgt)

Return True if the minion matches the given ipcidr target

CLI Example:

```
salt '*' match.ipcidr '192.168.44.0/24'
```

delimiter Pillar Example:

```
'172.16.0.0/12':
- match: ipcidr
- nodeclass: internal
```

click.modules.match.list_(tgt, minion_id=None)

Return True if the minion ID matches the given list target

**minion_id**

Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.list 'server1,server2'
```

click.modules.match.pcre(tgt, minion_id=None)

Return True if the minion ID matches the given pcre target

**minion_id**

Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.pcre '.*'
```

click.modules.match.pillar(tgt, delimiter=':')

Return True if the minion matches the given pillar target. The delimiter argument can be used to specify a different delimiter.
CLI Example:

```
salt '*' match.pillar 'cheese:foo'
salt '*' match.pillar 'clone_url|https://github.com/saltstack/salt.git'
  ←delimiter='|'
```

delimiter

Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim

Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

salt.modules.match.pillar_pcre(tgt, delimiter=': ')

Return True if the minion matches the given pillar_pcre target. The delimiter argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar_pcre 'cheese:(swiss|american)'
salt '*' match.pillar_pcre 'clone_url|https://github\.com/.*\.git'
  ←delimiter='|'
```

delimiter

Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim

Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

salt.modules.match.search_by(lookup, tgt_type='compound', minion_id=None)

Search a dictionary of target strings for matching targets

This is the inverse of match.filter_by and allows matching values instead of matching keys. A minion can be matched by multiple entries.

New in version 2017.7.0.

CLI Example:

```
salt '*' match.search_by '{web: [node1, node2], db: [node2, node]}'
```

Pillar Example:

```
{% set roles = salt.match.search_by(
    'web': ['G@os_family:Debian not nodeX'],
    'db': ['L@node2,node3 and G@datacenter:west'],
    'caching': ['node3', 'node4'],
)) %}

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
```
26.6.256  salt.modules.mattermost

Module for sending messages to Mattermost
New in version 2017.7.0.

configuration
This module can be used by either passing an api_url and hook directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```
mattermost:
  hook: peWcBiMOS9HRZG15peWcBiMOS9HRZG15
  api_url: https://example.com
```

salt.modules.mattermost.post_message(message, channel=None, username=None, api_url=None, hook=None)
Send a message to a Mattermost channel.
Parameters
- channel -- The channel name, either will work.
- username -- The username of the poster.
- message -- The message to send to the Mattermost channel.
- api_url -- The Mattermost api url, if not specified in the configuration.
- hook -- The Mattermost hook, if not specified in the configuration.
Returns
Boolean if message was sent successfully.
CLI Example:
```
salt '*' mattermost.post_message message='Build is done'
```

26.6.257  salt.modules.mdadm_raid

Salt module to manage RAID arrays with mdadm
salt.modules.mdadm_raid.add(name, device)
Add new device to RAID array.
CLI Example:
```
salt '*' raid.add /dev/md0 /dev/sda1
```

salt.modules.mdadm_raid.assemble(name, devices, test_mode=False, **kwargs)
Assemble a RAID device.
CLI Examples:
```
salt '*' raid.assemble /dev/md0 ['/dev/xvdd', '/dev/xvde']
```

Note: Adding test_mode=True as an argument will print out the mdadm command that would have been run.
name
The name of the array to assemble.
devices
The list of devices comprising the array to assemble.
kwargs
Optional arguments to be passed to mdadm.
returns
  test_mode=True:
    Prints out the full command.
  test_mode=False (Default):
    Executes command on the host(s) and prints out the mdadm output.

For more info, read the mdadm manpage.
salt.modules.mdadm_raid.create(name, level, devices, metadata='default', test_mode=False, **kwargs)
Create a RAID device.
Changed in version 2014.7.0.

Warning: Use with CAUTION, as this function can be very destructive if not used properly!

CLI Examples:
salt '*' raid.create /dev/md0 level=1 chunk=256 devices="[/dev/xvdd', '/dev/xvde']" test_mode=True

Note: Adding test_mode=True as an argument will print out the mdadm command that would have been run.

name
The name of the array to create.
level
The RAID level to use when creating the raid.
devices
A list of devices used to build the array.
metadata
Version of metadata to use when creating the array.
kwargs
Optional arguments to be passed to mdadm.
returns
  test_mode=True:
    Prints out the full command.
  test_mode=False (Default):
    Executes command on remote the host(s) and prints out the mdadm output.

Note: It takes time to create a RAID array. You can check the progress in "resync_status:" field of the results from the following command:
salt '*' raid.detail /dev/md0

For more info, read the mdadm(8) manpage
salt.modules.mdadm_raid.destroy(device)
   Destroy a RAID device.
   WARNING This will zero the superblock of all members of the RAID array.
   
   CLI Example:
   ```
salt '*' raid.destroy /dev/md0
   ```

salt.modules.mdadm_raid.detail(device='/dev/md0')
   Show detail for a specified RAID device
   
   CLI Example:
   ```
salt '*' raid.detail '/dev/md0'
   ```

salt.modules.mdadm_raid.examine(device, quiet=False)
   Show detail for a specified RAID component device
   
   CLI Example:
   ```
salt '*' raid.examine '/dev/sda1'
   ```

salt.modules.mdadm_raid.list_()
   List the RAID devices.
   
   CLI Example:
   ```
salt '*' raid.list
   ```

salt.modules.mdadm_raid.save_config()
   Save RAID configuration to config file.
   
   Same as: mdadm --detail --scan >> /etc/mdadm/mdadm.conf
   
   Fixes this issue with Ubuntu REF: http://askubuntu.com/questions/209702/why-is-my-raid-dev-md1-showing-up-as-dev-md126-is-mdadm-conf-being-ignored
   
   CLI Example:
   ```
salt '*' raid.save_config
   ```

salt.modules.mdadm_raid.stop()
   Shut down all arrays that can be shut down (i.e. are not currently in use).
   
   CLI Example:
   ```
salt '*' raid.stop
   ```
26.6.258 salt.modules.mdata

Module for managing metadata in SmartOS Zones

New in version 2016.3.0.

maintainer
Jorge Schrauwen <sjorge@blackdot.be>

maturity
new

platform
smartos

salt.modules.mdata.delete_(*keyname)
Delete metadata

prop
[string] name of property

CLI Example:

```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.get_(*keyname)
Get metadata

keyname
[string] name of key

Note: If no keynames are specified, we get all (public) properties

CLI Example:

```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.list_()
List available metadata

CLI Example:

```
salt '*' mdata.list
```

salt.modules.mdata.put_(*keyname, val)
Put metadata

prop
[string] name of property

val
[string] value to set

CLI Example:

```
salt '*' mdata.list
```
26.6.259 salt.modules.memcached

Module for Management of Memcached Keys

New in version 2014.1.0.

salt.modules.memcached.add(key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0)

Add a key to the memcached server, but only if it does not exist. Returns False if the key already exists.

CLI Example:

```
salt '*' memcached.add <key> <value>
```

salt.modules.memcached.decr(key, delta=1, host='127.0.0.1', port=11211)

This function is an alias of decrement.

Decrement the value of a key

CLI Example:

```
salt '*' memcached.decrement <key>
salt '*' memcached.decrement <key> 2
```

salt.modules.memcached.delete(key, host='127.0.0.1', port=11211, time=0)

Delete a key from memcache server

CLI Example:

```
salt '*' memcached.delete <key>
```

salt.modules.memcached.get(key, host='127.0.0.1', port=11211)

Retrieve value for a key

CLI Example:

```
salt '*' memcached.get <key>
```

salt.modules.memcached.incr(key, delta=1, host='127.0.0.1', port=11211)

This function is an alias of increment.

Increment the value of a key

CLI Example:

```
salt '*' memcached.increment <key>
salt '*' memcached.increment <key> 2
```

salt.modules.memcached.increment(key, delta=1, host='127.0.0.1', port=11211)

Increment the value of a key

CLI Example:
```python
salt '*' memcached.increment <key>
salt '*' memcached.increment <key> 2
```

```python
salt.modules.memcached.replace(key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0)
```

Replace a key on the memcached server. This only succeeds if the key already exists. This is the opposite of `memcached.add`

CLI Example:

```python
salt '*' memcached.replace <key> <value>
```

```python
salt.modules.memcached.set_(key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0)
```

Set a key on the memcached server, overwriting the value if it exists.

CLI Example:

```python
salt '*' memcached.set <key> <value>
```

```python
salt.modules.memcached.status(host='127.0.0.1', port=11211)
```

Get memcached status

CLI Example:

```python
salt '*' memcached.status
```

### 26.6.260 salt.modules.mine

The function cache system allows for data to be stored on the master so it can be easily read by other minions

```python
salt.modules.mine.delete(fun)
```

Remove specific function contents of minion.

**Parameters**

- `fun (str)` -- The name of the function.

**Returns**

- `bool`

CLI Example:

```python
salt '*' mine.delete 'network.interfaces'
```

```python
salt.modules.mine.flush()
```

Remove all mine contents of minion.

**Return type**

- `bool`

**Returns**

- True on success

CLI Example:

```python
salt '*' mine.flush
```

```python
salt.modules.mine.get(tgt, fun, tgt_type='glob', exclude_minion=False)
```

Get data from the mine.

**Parameters**
- **tgt** *(str)* -- Target whose mine data to get.
- **fun** *(str or list)* -- Function to get the mine data of. You can specify multiple functions to retrieve using either a list or a comma-separated string of functions.
- **tgt_type** *(str)* -- Default glob. Target type to use with tgt. See Targeting Minions for more information. Note that all pillar matches, whether using the compound matching system or the pillar matching system, will be exact matches, with globbing disabled.
- **exclude_minion** *(bool)* -- Excludes the current minion from the result set.

CLI Example:

```shell
salt '*' mine.get '*' network.interfaces
salt '*' mine.get 'os:Fedora' network.interfaces grain
salt '*' mine.get 'G@os:Fedora and S@192.168.5.0/24' network.ipaddrs
```

See also:

Retrieving Mine data from Pillar and Orchestrate

This execution module is intended to be executed on minions. Master-side operations such as Pillar or Orchestrate that require Mine data should use the Mine Runner module instead; it can be invoked from a Pillar SLS file using the `saltutil.runner` module. For example:

```python
{% set minion_ips = salt.saltutil.runner('mine.get',
  tgt='*',
  fun='network.ip_addrs',
  tgt_type='glob') %}
```

---

**salt.modules.mine.get_docker** *(interfaces=None, cidrs=None, with_container_id=False)*

Changed in version 2017.7.8, 2018.3.3: When `docker.update_mine` is set to `False` for a given minion, no mine data will be populated for that minion, and thus none will be returned for it.

Changed in version 2019.2.0: `docker.update_mine` now defaults to `False`

Get all mine data for `docker.ps` and run an aggregation routine. The `interfaces` parameter allows for specifying the network interfaces from which to select IP addresses. The `cidrs` parameter allows for specifying a list of subnets which the IP address must match.

**with_container_id**

Boolean, to expose container_id in the list of results

New in version 2015.8.2.

CLI Example:

```shell
salt '*' mine.get_docker
salt '*' mine.get_docker interfaces='eth0'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]'
salt '*' mine.get_docker cidrs='107.170.147.0/24'
salt '*' mine.get_docker cidrs='["107.170.147.0/24", "172.17.42.0/24"]'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]' cidrs='["107.170.147.0/24", "172.17.42.0/24"]'
```

---

**salt.modules.mine.send** *(name, *args, **kwargs)*

Send a specific function and its result to the salt mine. This gets stored in either the local cache, or the salt master's cache.
Parameters

name *(str)* -- Name of the function to add to the mine.

The following parameters are extracted from kwargs if present:

Parameters

- **mine_function** *(str)* -- The name of the execution_module.function to run and whose value will be stored in the salt mine. Defaults to `name`.
- **allow_tgt** *(str)* -- Targeting specification for ACL. Specifies which minions are allowed to access this function. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.
- **allow_tgt_type** *(str)* -- Type of the targeting specification. This value will be ignored if `allow_tgt` is not specified. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.

Remaining args and kwargs will be passed on to the function to run.

**Return type**

bool

**Returns**

Whether executing the function and storing the information was successful.

Changed in version 3000: Added `allow_tgt`- and `allow_tgt_type`-parameters to specify which minions are allowed to access this function. See Targeting Minions for more information about targeting.

CLI Example:

```bash
salt '*' mine.send network.ip_addrs interface=eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs
    → interface=eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs
    → interface=eth0 allow_tgt='G@grain:value' allow_tgt_type=compound
```

salt.modules.mine.update(*clear=False, mine_functions=None*)

Call the configured functions and send the data back up to the master. The functions to be called are merged from the master config, pillar and minion config under the option `mine_functions`:

```
mine_functions:
    network.ip_addrs:
    - eth0
    disk.usage: []
```

This function accepts the following arguments:

Parameters

- **clear** *(bool)* -- Default: False Specifies whether updating will clear the existing values (True), or whether it will update them (False).
- **mine_functions** *(dict)* -- Update (or clear, see `clear`) the mine data on these functions only. This will need to have the structure as defined on https://docs.saltproject.io/en/latest/topics/mine/index.html#mine-functions

This feature can be used when updating the mine for functions that require a refresh at different intervals than the rest of the functions specified under `mine_functions` in the minion/master config or pillar. A potential use would be together with the `scheduler`, for example:

```
schedule:
    lldp_mine_update:
```

(continues on next page)
function: mine.update
kwargs:
mine_functions:
net.lldp: []
hours: 12

In the example above, the mine for net.lldp would be refreshed every 12 hours, while network.ip_addrs would continue to be updated as specified in mine_interval.

The function cache will be populated with information from executing these functions.

CLI Example:
salt '*' mine.update

salt.modules.mine.valid()
List valid entries in mine configuration.

CLI Example:
salt '*' mine.valid

26.6.261 salt.modules.minion

Module to provide information about minions

salt.modules.minion.kill(timeout=15)
Kill the salt minion.

timeout
int seconds to wait for the minion to die.

If you have a monitor that restarts salt-minion when it dies then this is a great way to restart after a minion upgrade.

CLI Example:
salt minion[12] minion.kill

minion1:
-------
killed: 7874
retcode: 0

minion2:
-------
killed: 29071
retcode: 0

The result of the salt command shows the process ID of the minions and the results of a kill signal to the minion in as the retcode value: 0 is success, anything else is a failure.
**salt.modules.minion.list()**

Return a list of accepted, denied, unaccepted and rejected keys. This is the same output as `salt-key -L`.

CLI Example:

```
salt 'master' minion.list
```

**salt.modules.minion.restart()**

Kill and restart the salt minion.

The configuration key `minion_restart_command` is an argv list for the command to restart the minion. If `minion_restart_command` is not specified or empty then the argv of the current process will be used. If the configuration value `minion_restart_command` is not set and the `-d` (daemonize) argument is missing from argv then the minion will be killed but will not be restarted and will require the parent process to perform the restart. This behavior is intended for managed salt minion processes.

CLI Example:

```
salt minion[12] minion.restart
```

```
minion1: -----------
  comment: - Restart using process argv:
    - /home/omniture/install/bin/salt-minion
    - -d
    - -c
    - /home/omniture/install/etc/salt
  killed: 10070
restart: -----------
  stderr:  stdout:  retcode: 0

minion2: -----------
  comment: - Using configuration minion_restart_command:
    - /home/omniture/install/bin/salt-minion
    - --not-an-option
    - -d
    - -c
    - /home/omniture/install/etc/salt
  killed: 10896
restart: -----------
  stderr: Usage: salt-minion
           salt-minion: error: no such option: --not-an-option
```

(continues on next page)
The result of the command shows the process ID of minion1 that is shutdown (killed) and the results of the restart. If there is a failure in the restart it will be reflected in a non-zero retcode and possibly output in the stderr and/or stdout values along with addition information in the comment field as is demonstrated with minion2.

26.6.262 salt.modules.mod_random

Provides access to randomness generators.

New in version 2014.7.0.

salt.modules.mod_random.get_str(length=20, chars=None, lowercase=True, uppercase=True, digits=True, punctuation=True, whitespace=False, printable=False)

New in version 2014.7.0.

Changed in version 3004: Changed the default character set used to include symbols and implemented arguments to control the used character set.

Returns a random string of the specified length.

length

chars

[None] New in version 3004.

String with any character that should be used to generate random string.

This argument supersedes all other character controlling arguments.

lowercase

[True] New in version 3004.

Use lowercase letters in generated random string. (see string.ascii_lowercase)

This argument is superseded by chars.

uppercase

[True] New in version 3004.

Use uppercase letters in generated random string. (see string.ascii_uppercase)

This argument is superseded by chars.

digits

[True] New in version 3004.

Use digits in generated random string. (see string.digits)

This argument is superseded by chars.

printable

[False] New in version 3004.

Use printable characters in generated random string and includes lowercase, uppercase, digits, punctuation and whitespace. (see string.printable)

It is disabled by default as includes whitespace characters which some systems do not handle well in passwords. This argument also supersedes all other classes because it includes them.
This argument is superseded by chars.

**punctuation**

[True] New in version 3004.

Use punctuation characters in generated random string. (see `string.punctuation`)

This argument is superseded by chars.

**whitespace**

[False] New in version 3004.

Use whitespace characters in generated random string. (see `string.whitespace`)

It is disabled by default as some systems do not handle whitespace characters in passwords well.

This argument is superseded by chars.

**CLI Example:**

```
salt '*' random.get_str 128
salt '*' random.get_str 128 chars='abc123.!()'
salt '*' random.get_str 128 lowercase=False whitespace=True
```

**salt.modules.mod_random.hash(value, algorithm='sha512')**

New in version 2014.7.0.

Encodes a value with the specified encoder.

**value**

The value to be hashed.

**algorithm**

[sha512] The algorithm to use. May be any valid algorithm supported by hashlib.

**CLI Example:**

```
salt '*' random.hash 'I am a string' md5
```

**salt.modules.mod_random.rand_int(start=1, end=10, seed=None)**

Returns a random integer number between the start and end number.

New in version 2015.5.3.

**start**

[1] Any valid integer number

**end**

[10] Any valid integer number

**seed**

Optional hashable object

Changed in version 2019.2.0: Added seed argument. Will return the same result when run with the same seed.

**CLI Example:**

```
salt '*' random.rand_int 1 10
```

**salt.modules.mod_random.sample(value, size, seed=None)**

Return a given sample size from a list. By default, the random number generator uses the current system time unless given a seed value.

New in version 3005.

**value**

A list to e used as input.

**size**

The sample size to return.
Salt Documentation, Release 3007.1

seed
Any value which will be hashed as a seed for random.

CLI Example:

```bash
salt '*' random.sample ['"one", "two"] 1 seed="something"
```

salt.modules.mod_random.seed(range=10, hash=None)

Returns a random number within a range. Optional hash argument can be any hashable object. If hash is omitted or None, the id of the minion is used.

New in version 2015.8.0.
hash: None
Any hashable object.
range: 10
Any valid integer number

CLI Example:

```bash
salt '*' random.seed 10 hash=None
```

salt.modules.mod_random.shadow_hash(crypt_salt=None, password=None, algorithm='sha512')

Generates a salted hash suitable for /etc/shadow.

crypt_salt
[None] Salt to be used in the generation of the hash. If one is not provided, a random salt will be generated.

password
[None] Value to be salted and hashed. If one is not provided, a random password will be generated.

algorithm
[sha512] Hash algorithm to use.

CLI Example:

```bash
salt '*' random.shadow_hash 'MySalt' 'MyP@sswd' md5
```

salt.modules.mod_random.shuffle(value, seed=None)

Return a shuffled copy of an input list. By default, the random number generator uses the current system time unless given a seed value.

New in version 3005.
value
A list to be used as input.

seed
Any value which will be hashed as a seed for random.

CLI Example:

```bash
salt '*' random.shuffle ['"one", "two"] seed="something"
```

salt.modules.mod_random.str_encode(value, encoder='base64')

New in version 2014.7.0.
value
The value to be encoded.

encoder
[base64] The encoder to use on the subsequent string.

CLI Example:

```bash
salt '*' random.str_encode 'I am a new string' base64
```
26.6.263 salt.modules.modjk

Below is an example of the configuration needed for this module. This configuration data can be placed either in grains or pillar.

If using grains, this can be accomplished statically or via a grain module.

If using pillar, the yaml configuration can be placed directly into a pillar SLS file, making this both the easier and more dynamic method of configuring this module.

```
mlok:
  default:
    url: http://localhost/jkstatus
    user: modjk
    pass: secret
    realm: authentication realm for digest passwords
    timeout: 5
  otherVhost:
    url: http://otherVhost/jkstatus
    user: modjk
    pass: secret2
    realm: authentication realm2 for digest passwords
    timeout: 600
```

salt.modules.modjk.bulk_activate(workers, lbn, profile='default')

Activate all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1 other-profile
salt '*' modjk.bulk_activate ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_activate ["node1","node2","node3"] loadbalancer1 other-profile
```

salt.modules.modjk.bulk_disable(workers, lbn, profile='default')

Disable all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1 other-profile
salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1 other-profile
```

salt.modules.modjk.bulk_recover(workers, lbn, profile='default')

Recover all the given workers in the specific load balancer

CLI Examples:
salt.modules.modjk.bulk_stop(workers, lbn, profile='default')

Stop all the given workers in the specific load balancer

CLI Examples:

salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1 other-profile

salt.modules.modjk.dump_config(profile='default')

Dump the original configuration that was loaded from disk

CLI Examples:

salt '*' modjk.dump_config
salt '*' modjk.dump_config other-profile

salt.modules.modjk.get_running(profile='default')

Get the current running config (not from disk)

CLI Examples:

salt '*' modjk.get_running
salt '*' modjk.get_running other-profile

salt.modules.modjk.lb_edit(lbn, settings, profile='default')

Edit the loadbalancer settings

Note: http://tomcat.apache.org/connectors-doc/reference/status.html Data Parameters for the standard Update Action

CLI Examples:

salt '*' modjk.lb_edit loadbalancer1 "{'vlr': 1, 'vlt': 60}"

salt '*' modjk.lb_edit loadbalancer1 "{'vlr': 1, 'vlt': 60}" other-profile

salt.modules.modjk.list_configured_members(lbn, profile='default')

Return a list of member workers from the configuration files

CLI Examples:

salt '*' modjk.list_configured_members loadbalancer1
salt '*' modjk.list_configured_members loadbalancer1 other-profile
salt.modules.modjk.recover_all(lbn, profile='default')
Set the all the workers in lbn to recover and activate them if they are not
CLI Examples:

```
salt '*' modjk.recover_all loadbalancer1
salt '*' modjk.recover_all loadbalancer1 other-profile
```

salt.modules.modjk.reset_stats(lbn, profile='default')
Reset all runtime statistics for the load balancer
CLI Examples:

```
salt '*' modjk.reset_stats loadbalancer1
salt '*' modjk.reset_stats loadbalancer1 other-profile
```

salt.modules.modjk.version(profile='default')
Return the modjk version
CLI Examples:

```
salt '*' modjk.version
salt '*' modjk.version other-profile
```

salt.modules.modjk.worker_activate(worker, lbn, profile='default')
Set the worker to activate state in the lbn load balancer
CLI Examples:

```
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
```

salt.modules.modjk.worker_disable(worker, lbn, profile='default')
Set the worker to disable state in the lbn load balancer
CLI Examples:

```
salt '*' modjk.worker_disable node1 loadbalancer1
salt '*' modjk.worker_disable node1 loadbalancer1 other-profile
```

salt.modules.modjk.worker_edit(worker, lbn, settings, profile='default')
Edit the worker settings
CLI Examples:

```
salt '*' modjk.worker_edit node1 loadbalancer1 "'vwf': 500, 'vwd': 60"
salt '*' modjk.worker_edit node1 loadbalancer1 "'vwf': 500, 'vwd': 60" other-profile
```

salt.modules.modjk.worker_recover(worker, lbn, profile='default')
Set the worker to recover this module will fail if it is in OK state
CLI Examples:
salt '*/' modjk.worker_recover node1 loadbalancer1
salt '*/' modjk.worker_recover node1 loadbalancer1 other-profile

salt.modules.modjk.worker_status(worker, profile='default')
Return the state of the worker

CLI Examples:
salt '*/' modjk.worker_status node1
salt '*/' modjk.worker_status node1 other-profile

salt.modules.modjk.worker_stop(worker, lbn, profile='default')
Set the worker to stopped state in the lbn load balancer

CLI Examples:
salt '*/' modjk.worker_activate node1 loadbalancer1
salt '*/' modjk.worker_activate node1 loadbalancer1 other-profile

salt.modules.modjk.workers(profile='default')
Return a list of member workers and their status

CLI Examples:
salt '*/' modjk.workers
salt '*/' modjk.workers other-profile

26.6.264  salt.modules.mongodb
Module to provide MongoDB functionality to Salt

configuration
This module uses PyMongo, and accepts configuration details as parameters as well as configuration settings:

```
mongodb.host: 'localhost'
mongodb.port: 27017
mongodb.user: '
mongodb.password: '
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

salt.modules.mongodb.collection_create(collection, user=None, password=None, host=None, port=None, database='admin', authdb=None)

New in version 3006.0.
Create a collection in the specified database.
collection
The name of the collection to create.
user
The user to connect to MongoDB as. Default is None.
password
The password to use to connect to MongoDB as. Default is None.
host
  The host where MongoDB is running. Default is None.

port
  The host where MongoDB is running. Default is None.

authdb
  The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.collection_create mycollection <user> <password> <host> -><port> <database>
salt.modules.mongodb.collection_drop(collection, user=None, password=None, host=None, port=None, database='admin', authdb=None)
```

New in version 3006.0.

Drop a collection in the specified database.

collection
  The name of the collection to drop.

user
  The user to connect to MongoDB as. Default is None.

password
  The password to use to connect to MongoDB as. Default is None.

host
  The host where MongoDB is running. Default is None.

port
  The host where MongoDB is running. Default is None.

authdb
  The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.collection_drop mycollection <user> <password> <host> -><port> <database>
salt.modules.mongodb.collections_list(user=None, password=None, host=None, port=None, database='admin', authdb=None)
```

New in version 3006.0.

List the collections available in the specified database.

user
  The user to connect to MongoDB as. Default is None.

password
  The password to use to connect to MongoDB as. Default is None.

host
  The host where MongoDB is running. Default is None.

port
  The host where MongoDB is running. Default is None.

authdb
  The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.collections_list mycollection <user> <password> <host> -><port> <database>
salt.modules.mongodb.db_exists(name, user=None, password=None, host=None, port=None, authdb=None)
```

salt.modules.mongodb.db_exists(name, user=None, password=None, host=None, port=None, authdb=None)
Checks if a database exists in MongoDB

name
The name of the database to check for.
user
The user to connect to MongoDB as. Default is None.
password
The password to use to connect to MongoDB as. Default is None.
host
The host where MongoDB is running. Default is None.
port
The host where MongoDB is running. Default is None.
authdb
The MongoDB database to use for authentication. Default is None.

CLI Example:
salt '*' mongodb.db_exists <name> <user> <password> <host> <port>

salt.modules.mongodb.db_list(user=None, password=None, host=None, port=None, authdb=None)
List all MongoDB databases
user
The user to connect to MongoDB as. Default is None.
password
The password to use to connect to MongoDB as. Default is None.
host
The host where MongoDB is running. Default is None.
port
The host where MongoDB is running. Default is None.
authdb
The MongoDB database to use for authentication. Default is None.

CLI Example:
salt '*' mongodb.db_list <user> <password> <host> <port>

salt.modules.mongodb.db_remove(name, user=None, password=None, host=None, port=None, authdb=None)
Remove a MongoDB database
name
The name of the database to remove.
user
The user to connect to MongoDB as. Default is None.
password
The password to use to connect to MongoDB as. Default is None.
host
The host where MongoDB is running. Default is None.
port
The host where MongoDB is running. Default is None.
authdb
The MongoDB database to use for authentication. Default is None.

CLI Example:
salt '*' mongodb.db_remove <name> <user> <password> <host> <port>

salt.modules.mongodb.find(collection, query=None, user=None, password=None, host=None, port=None, database='admin', authdb=None)
Find an object or list of objects in a collection

**collection**
The collection to find the objects in.

**query**
The query to use when locating objects in the collection.

**user**
The user to connect to MongoDB as. Default is None.

**password**
The password to use to connect to MongoDB as. Default is None.

**host**
The host where MongoDB is running. Default is None.

**port**
The host where MongoDB is running. Default is None.

**authdb**
The MongoDB database to use for authentication. Default is None.

CLI Example:
```
salt '*' mongodb.find mycollection '[["foo": "FOO", "bar": "BAR"]]' <user>
← <password> <host> <port> <database>
```

salt.modules.mongodb.insert(objects, collection, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Insert an object or list of objects into a collection

**objects**
The objects to insert into the collection, should be provided as a list.

**collection**
The collection to insert the objects into.

**user**
The user to connect to MongoDB as. Default is None.

**password**
The password to use to connect to MongoDB as. Default is None.

**host**
The host where MongoDB is running. Default is None.

**port**
The host where MongoDB is running. Default is None.

**authdb**
The MongoDB database to use for authentication. Default is None.

CLI Example:
```
salt '*' mongodb.insert '[["foo": "FOO", "bar": "BAR"], {"foo": "BAZ", "bar": "BAM"]]' mycollection <user> <password> <host> <port> <database>
```

salt.modules.mongodb.remove(collection, query=None, user=None, password=None, host=None, port=None, database='admin', w=1, authdb=None)

Remove an object or list of objects from a collection

**collection**
The collection to remove objects from based on the query.

**query**
Query to determine which objects to remove.

**user**
The user to connect to MongoDB as. Default is None.

**password**
The password to use to connect to MongoDB as. Default is None.
host
  The host where MongoDB is running. Default is None.

port
  The port where MongoDB is running. Default is None.

database
  The database where the collection is.

w
  The number of matches to remove from the collection.

authdb
  The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.remove mycollection "["foo": "FOO", "bar": "BAR"],  
{"foo": "BAZ", "bar": "BAM"}]
```

```
<user> <password> <host> <port> <database>
```

salt.modules.mongodb.update_one(objects, collection, user=None, password=None, host=None, port=None, database='admin', authdb=None)

New in version 2016.11.0.

objects
  The objects to update in the collection, should be provided as a list.

collection
  The collection to insert the objects into.

user
  The user to connect to MongoDB as. Default is None.

password
  The password to use to connect to MongoDB as. Default is None.

host
  The host where MongoDB is running. Default is None.

port
  The host where MongoDB is running. Default is None.

authdb
  The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.update_one '{"_id": "my_minion"} "{bar": "BAR"}"
```

```
<user> <password> <host> <port> <database>
```

salt.modules.mongodb.user_create(name, passwd, user=None, password=None, host=None, port=None, database='admin', authdb=None, roles=None)

Create a MongoDB user.

name
  The name of the user to create.

passwd
  The password for the user that is being created.

user
  The user to connect to MongoDB as. Default is None.

password
  The password to use to connect to MongoDB as. Default is None.

host
  The host where MongoDB is running. Default is None.

port
The host where MongoDB is running. Default is None.

database
The MongoDB database to use when checking if the user exists. Default is admin.

authdb
The MongoDB database to use for authentication. Default is None.

roles
The roles that should be associated with the user. Default is None.

CLI Example:
```
salt '*' mongodb.user_create <user_name> <user_password> <roles> <user> →<password> <host> <port> <database>
```

salt.modules.mongodb.user_exists(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Checks if a user exists in MongoDB

user
The user to connect to MongoDB as. Default is None.

password
The password to use to connect to MongoDB as. Default is None.

host
The host where MongoDB is running. Default is None.

port
The host where MongoDB is running. Default is None.

database
The MongoDB database to use when checking if the user exists. Default is admin.

authdb
The MongoDB database to use for authentication. Default is None.

CLI Example:
```
salt '*' mongodb.user_exists <name> <user> <password> <host> <port> →<database>
```

salt.modules.mongodb.user_find(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Get single user from MongoDB

name
The name of the user to find.

user
The user to connect to MongoDB as. Default is None.

password
The password to use to connect to MongoDB as. Default is None.

host
The host where MongoDB is running. Default is None.

port
The host where MongoDB is running. Default is None.

database
The MongoDB database to use when looking for the user. Default is admin.

authdb
The MongoDB database to use for authentication. Default is None.

CLI Example:
```
salt '*' mongodb.user_find <name> <user> <password> <host> <port> →<database> <authdb>
```
salt.modules.mongodb.user_grant_roles(name, roles, database, user=None, password=None, host=None, port=None, authdb=None)

Grant one or many roles to a MongoDB user

name
   The user to grant the specified roles to.
roles
   The roles to grant to the specified user.
database
   The database to great the roles against for the specified user.
user
   The user to connect to MongoDB as. Default is None.
password
   The password to use to connect to MongoDB as. Default is None.
host
   The host where MongoDB is running. Default is None.
port
   The host where MongoDB is running. Default is None.
authdb
   The MongoDB database to use for authentication. Default is None.

CLI Examples:

```
salt '*' mongodb.user_grant_roles johndoe 
   ["readWrite"]
   dbname admin
   →adminpwd
   localhost 27017

salt '*' mongodb.user_grant_roles janedoe 
   ["role": "readWrite", "db": "dbname"]
   ["role": "read", "db": "otherdb"]
   dbname admin
   →adminpwd
   localhost 27017
```

salt.modules.mongodb.user_list(user=None, password=None, host=None, port=None, database='admin', authdb=None)

List users of a MongoDB database

user
   The user to connect to MongoDB as. Default is None.
password
   The password to use to connect to MongoDB as. Default is None.
host
   The host where MongoDB is running. Default is None.
port
   The host where MongoDB is running. Default is None.
database
   The MongoDB database to use when listing users. Default is admin.
authdb
   The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.user_list <user> <password> <host> <port> <database>
```

salt.modules.mongodb.user_remove(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Remove a MongoDB user

name
   The name of the user that should be removed.
user
The user to connect to MongoDB as. Default is None.

password
The password to use to connect to MongoDB as. Default is None.

host
The host where MongoDB is running. Default is None.

port
The host where MongoDB is running. Default is None.

authdb
The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.user_remove <name> <user> <password> <host> <port>
←<database>
```

salt.modules.mongodb.user_revoke_roles(name, roles, database, user=None, password=None, host=None, port=None, authdb=None)

Revoke one or many roles to a MongoDB user

user
The user to connect to MongoDB as. Default is None.

roles
The roles to revoke from the specified user.

database
The database to revoke the roles from for the specified user.

password
The password to use to connect to MongoDB as. Default is None.

host
The host where MongoDB is running. Default is None.

port
The host where MongoDB is running. Default is None.

authdb
The MongoDB database to use for authentication. Default is None.

CLI Examples:

```
salt '*' mongodb.user_revoke_roles johndoe 
["readWrite"] dbname adminadminpwd localhost 27017
```

```
salt '*' mongodb.user_revoke_roles janedoe 
[{"role": "readWrite", "db": "dbname" },
{"role": "read", "db": "otherdb"}] dbname admin adminpwd
←localhost 27017
```

salt.modules.mongodb.user_roles_exists(name, roles, database, user=None, password=None, host=None, port=None, authdb=None)

Checks if a user of a MongoDB database has specified roles

name
The name of the user to check for the specified roles.

roles
The roles to check are associated with the specified user.

database
The database to check has the specified roles for the specified user.

user
The user to connect to MongoDB as. Default is None.

password
The password to use to connect to MongoDB as. Default is None.
host
The host where MongoDB is running. Default is None.

port
The host where MongoDB is running. Default is None.

authdb
The MongoDB database to use for authentication. Default is None.

CLI Examples:

```bash
salt '*' mongodb.user_roles_exists johndoe ["readWrite"] dbname admin
adminpwd localhost 27017
```

```bash
salt '*' mongodb.user_roles_exists johndoe ["role": "readWrite", "db": "dbname" ], ["role": "read", "db": "otherdb" ]] dbname admin adminpwd
dbname adminpwd localhost 27017
```

salt.modules.mongodb.version

Get MongoDB instance version

```bash
salt '*' mongodb.version <user> <password> <host> <port> <database>
```

26.6.265 salt.modules.monit

Monit service module. This module will create a monit type service watcher.

salt.modules.monit.configtest()

New in version 2016.3.0.

Test monit configuration syntax

CLI Example:

```bash
salt '*' monit.configtest
```

salt.modules.monit.id_(reset=False)

New in version 2016.3.0.

Return monit unique id.

reset
[False] Reset current id and generate a new id when it’s True.

CLI Example:
Salt Documentation, Release 3007.1

```python
salt '*' monit.id [reset=True]
```

salt.modules.monit.monitor(name)

monitor service via monit

CLI Example:
```
salt '*' monit.monitor <service name>
```

salt.modules.monit.reload()

New in version 2016.3.0.

Reload monit configuration

CLI Example:
```
salt '*' monit.reload
```

salt.modules.monit.restart(name)

Restart service via monit

CLI Example:
```
salt '*' monit.restart <service name>
```

salt.modules.monit.start(name)

CLI Example:
```
salt '*' monit.start <service name>
```

salt.modules.monit.status(svc_name='')

Display a process status from monit

CLI Example:
```
salt '*' monit.status
salt '*' monit.status <service name>
```

salt.modules.monit.stop(name)

Stops service via monit

CLI Example:
```
salt '*' monit.stop <service name>
```

salt.modules.monit.summary(svc_name='')

Display a summary from monit

CLI Example:
```
salt '*' monit.summary
salt '*' monit.summary <service name>
```

salt.modules.monit.unmonitor(name)

Unmonitor service via monit

CLI Example:
salt '*' monit.unmonitor <service name>

```
salt.modules.monit.validate()
```

New in version 2016.3.0.
Check all services

```
salt '*' monit.validate
```

```
salt.modules.monit.version()
```

New in version 2016.3.0.
Return version from monit -V

```
salt '*' monit.version
```

26.6.266 salt.modules.moosefs

Module for gathering and managing information about MooseFS

```
salt.modules.moosefs.dirinfo(path, opts=None)
```

Return information on a directory located on the Moose

```
salt '*' moosefs.dirinfo /path/to/dir/ [-n][h][H]]
```

```
salt.modules.moosefs.fileinfo(path)
```

Return information on a file located on the Moose

```
salt '*' moosefs.fileinfo /path/to/dir/
```

```
salt.modules.moosefs.getgoal(path, opts=None)
```

Return goal(s) for a file or directory

```
salt '*' moosefs.getgoal /path/to/file [-n][h][H]]
salt '*' moosefs.getgoal /path/to/dir/ [-n][h][H][r]]
```

```
salt.modules.moosefs.mounts()
```

Return a list of current MooseFS mounts

```
salt '*' moosefs.mounts
```

26.6. execution modules
26.6.267 salt.modules.mount

Salt module to manage Unix mounts and the fstab file

salt.modules.mount.active(extended=False)
List the active mounts.

CLI Example:
```
salt '*' mount.active
```

salt.modules.mount.automaster(config='/etc/auto_salt')
List the contents of the auto master

CLI Example:
```
salt '*' mount.automaster
```

salt.modules.mount.delete_mount_cache(real_name)
New in version 2018.3.0.
Provide information if the path is mounted

CLI Example:
```
salt '*' mount.delete_mount_cache /mnt/share
```

salt.modules.mount.filesystems(config='/etc/filesystems')
New in version 2018.3.3.
List the contents of the filesystems

CLI Example:
```
salt '*' mount.filesystems
```

salt.modules.mount.fstab(config='/etc/fstab')
Changed in version 2016.3.2.
List the contents of the fstab

CLI Example:
```
salt '*' mount.fstab
```

salt.modules.mount.get_device_from_path(path)
Return the underlying device for a specified path.
New in version 3006.0.

path
The path for the function to evaluate.

CLI Example:
```
salt '*' mount.get_device_from_path /
```

salt.modules.mount.get_mount_from_path(path)
Return the mount providing a specified path.
New in version 3006.0.
path
The path for the function to evaluate.

CLI Example:
```
salt '*' mount.get_mount_from_path /opt/some/nested/path
```

salt.modules.mount.is_fuse_exec(cmd)
Returns true if the command passed is a fuse mountable application.

CLI Example:
```
salt '*' mount.is_fuse_exec sshfs
```

salt.modules.mount.is_mounted(name)
New in version 2014.7.0.
Provide information if the path is mounted

CLI Example:
```
salt '*' mount.is_mounted /mnt/share
```

salt.modules.mount.mount(name, device=False, mkmnt=False, fstype='', opts='defaults', user=None, util='mount')
Mount a device

CLI Example:
```
salt '*' mount.mount /mnt/foo /dev/sdz1 True
```

salt.modules.mount.read_mount_cache(name)
New in version 2018.3.0.
Provide information if the path is mounted

CLI Example:
```
salt '*' mount.read_mount_cache /mnt/share
```

salt.modules.mount.remount(name, device, mkmnt=False, fstype='', opts='defaults', user=None)
Attempt to remount a device, if the device is not already mounted, mount is called

CLI Example:
```
salt '*' mount.remount /mnt/foo /dev/sdz1 True
```

salt.modules.mount.rm_automaster(name, device, config='/etc/auto_salt')
Remove the mount point from the auto_master

CLI Example:
```
salt '*' mount.rm_automaster /mnt/foo /dev/sdg
```

salt.modules.mount.rm_filesystems(name, device, config='/etc/filesystems')
New in version 2018.3.3.
Remove the mount point from the filesystems

CLI Example:
salt_modules.mount.rm_filesystems(name, device, config='/etc/fstab')

Remove the mount point from the fstab

CLI Example:
```bash
salt '*' mount.rm_filesystems /mnt/foo /dev/sdg
```

salt_modules.mount.rm_vfstab(name, device, config='/etc/vfstab')

New in version 2016.3.2.

Remove the mount point from the vfstab

CLI Example:
```bash
salt '*' mount.rm_vfstab /mnt/foo /device/c0t0d0p0
```

salt_modules.mount.set_automaster(name, device, fstype='', opts='-', config='/etc/auto_salt', test=False, not_change=False, **kwargs)

Verify that this mount is represented in the auto_salt, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:
```bash
salt '*' mount.set_automaster /mnt/foo /dev/sdz1 ext4
```

salt_modules.mount.set_filesystems(name, device, vfstype, opts='-', mount='true', config='/etc/filesystems', test=False, match_on='auto', not_change=False, **kwargs)

New in version 2018.3.3.

Verify that this mount is represented in the filesystems, change the mount to match the data passed, or add the mount if it is not present on AIX

If the entry is found via match_on and not_change is True, the current line will be preserved.

Provide information if the path is mounted

Parameters

- **name** -- The name of the mount point where the device is mounted.
- **device** -- The device that is being mounted.
- **vfstype** -- The file system that is used (AIX has two fstypes, fstype and vfstype - similar to Linux fstype)
- **opts** -- Additional options used when mounting the device.
- **mount** -- Mount if not mounted, default True.
- **config** -- Configuration file, default /etc/filesystems.
- **match** -- File systems type to match on, default auto

CLI Example:
```bash
salt '*' mount.set_filesystems /mnt/foo /dev/sdz1 jfs2
```
salt.modules.mount.set_fstab(name, device, fstype, opts='defaults', dump=0, pass_num=0, config='/etc/fstab', test=False, match_on='auto', not_change=False, **kwargs)

Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via match_on and not_change is True, the current line will be preserved.

CLI Example:
salt '*' mount.set_fstab /mnt/foo /dev/sdz1 ext4

salt.modules.mount.set_vfstab(name, device, fstype, opts='-', device_fsck='-', pass_fsck='-', mount_at_boot='yes', config='/etc/vfstab', test=False, match_on='auto', not_change=False, **kwargs)

New in version 2016.3.2.

Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via match_on and not_change is True, the current line will be preserved.

CLI Example:
salt '*' mount.set_vfstab /mnt/foo /device/c0t0d0p0 ufs

salt.modules.mount.swapoff(name)

Deactivate a named swap mount

Changed in version 2016.3.2.

CLI Example:
salt '*' mount.swapoff /root/swapfile

salt.modules.mount.swapon(name, priority=None)

Activate a swap disk

Changed in version 2016.3.2.

CLI Example:
salt '*' mount.swapon /root/swapfile

salt.modules.mount.swaps()

Return a dict containing information on active swap

Changed in version 2016.3.2.

CLI Example:
salt '*' mount.swaps

salt.modules.mount.umount(name, device=None, user=None, util='mount', lazy=False)

Attempt to unmount a device by specifying the directory it is mounted on

CLI Example:
salt '*' mount.umount /mnt/foo

New in version 2015.5.0.

salt '*' mount.umount /mnt/foo /dev/xvdc1

salt.modules.mount.vfstab(config='/etc/vfstab')
New in version 2016.3.2.
List the contents of the vfstab

CLI Example:

salt '*' mount.vfstab

salt.modules.mount.write_mount_cache(real_name, device, mkmnt, fstype, mount_opts)
New in version 2018.3.0.
Provide information if the path is mounted

Parameters

- **real_name** -- The real name of the mount point where the device is mounted.
- **device** -- The device that is being mounted.
- **mkmnt** -- Whether or not the mount point should be created.
- **fstype** -- The file system that is used.
- **mount_opts** -- Additional options used when mounting the device.

Returns

Boolean if message was sent successfully.

CLI Example:

salt '*' mount.write_mount_cache /mnt/share /dev/sda1 False ext4 defaults, →nosuid

26.6.268  salt.modules.mssql

Module to provide MS SQL Server compatibility to salt.

depends

- FreeTDS
- pymssql Python module

configuration

In order to connect to MS SQL Server, certain configuration is required in minion configs/pillars on the relevant minions. Some sample pillars might look like:

```yaml
mssql.server: 'localhost'
mssql.port: 1433
mssql.user: 'sysdba'
mssql.password: 'Some preferable complex password'
mssql.database: '
```
The default for the port is '1433' and for the database is '' (empty string); in most cases they can be left at the default setting. Options that are directly passed into functions will overwrite options from configs or pillars.

`salt.modules.mssql.db_create(database, containment='NONE', new_database_options=None, **kwargs)`

Creates a new database. Does not update options of existing databases. new_database_options can only be a list of strings

**CLI Example:**
```
salt minion mssql.db_create DB_NAME
```

`salt.modules.mssql.db_exists(database_name, **kwargs)`

Find if a specific database exists on the MS SQL server.

**CLI Example:**
```
salt minion mssql.db_exists database_name='DBNAME'
```

`salt.modules.mssql.db_list(**kwargs)`

Return the database list created on a MS SQL server.

**CLI Example:**
```
salt minion mssql.db_list
```

`salt.modules.mssql.db_remove(database_name, **kwargs)`

Drops a specific database from the MS SQL server. It will not drop any of 'master', 'model', 'msdb' or 'tempdb'.

**CLI Example:**
```
salt minion mssql.db_remove database_name='DBNAME'
```

`salt.modules.mssql.login_create(login, new_login_password=None, new_login_domain='', new_login_roles=None, new_login_options=None, **kwargs)`

Creates a new login. Does not update password of existing logins. For Windows authentication, provide new_login_domain. For SQL Server authentication, provide new_login_password. Since hashed passwords are varbinary values, if the new_login_password is 'int / long', it will be considered to be HASHED.

new_login_roles
   a list of SERVER roles
new_login_options
   a list of strings

**CLI Example:**
```
salt minion mssql.login_create LOGIN_NAME database=DBNAME [new_login_password=PASSWORD]
```

`salt.modules.mssql.login_exists(login, domain='', **kwargs)`

Find if a login exists in the MS SQL server. domain, if provided, will be prepended to login

**CLI Example:**
```
salt minion mssql.login_exists 'LOGIN'
```

26.6. execution modules 2399
salt.modules.mssql.login_remove(login, **kwargs)
    Removes an login.

    CLI Example:
    
    ```
    salt minion mssql.login_remove LOGINNAME
    ```

salt.modules.mssql.role_create(role, owner=None, grants=None, **kwargs)
    Creates a new database role. If no owner is specified, the role will be owned by the user that executes CREATE
    ROLE, which is the user argument or mssql.user option. grants is list of strings.

    CLI Example:
    
    ```
    salt minion mssql.role_create role=product01 owner=sysdba grants='["SELECT →", "INSERT", "UPDATE", "DELETE", "EXECUTE"]'
    ```

salt.modules.mssql.role_exists(role, **kwargs)
    Checks if a role exists.

    CLI Example:
    
    ```
    salt minion mssql.role_exists db_owner
    ```

salt.modules.mssql.role_list(**kwargs)
    Lists database roles.

    CLI Example:
    
    ```
    salt minion mssql.role_list
    ```

salt.modules.mssql.role_remove(role, **kwargs)
    Remove a database role.

    CLI Example:
    
    ```
    salt minion mssql.role_create role=test_role01
    ```

salt.modules.mssql.tsql_query(query, **kwargs)
    Run a SQL query and return query result as list of tuples, or a list of dictionaries if as_dict was passed, or an
    empty list if no data is available.

    CLI Example:
    
    ```
    salt minion mssql.tsql_query 'SELECT @@version as version' as_dict=True
    ```

salt.modules.mssql.user_create(username, login=None, domain='', database=None, roles=None,
    options=None, **kwargs)
    Creates a new user. If login is not specified, the user will be created without a login. domain, if provided, will
    be prepended to username. options can only be a list of strings.

    CLI Example:
    
    ```
    salt minion mssql.user_create USERNAME database=DBNAME
    ```
salt.modules.mssql.user_exists(*username*, *domain='', *database=None, **kwargs*)

Find if an user exists in a specific database on the MS SQL server. domain, if provided, will be prepended to username

CLI Example:

```
salt minion mssql.user_exists 'USERNAME' [database='DBNAME']
```

salt.modules.mssql.user_list(**kwargs)

Get the user list for a specific database on the MS SQL server.

CLI Example:

```
salt minion mssql.user_list [database='DBNAME']
```

salt.modules.mssql.user_remove(*username*, **kwargs)

Removes an user.

CLI Example:

```
salt minion mssql.user_remove USERNAME database=DBNAME
```

salt.modules.mssql.version(**kwargs)

Return the version of a MS SQL server.

CLI Example:

```
salt minion mssql.version
```

26.6.269 salt.modules.msteams

Module for sending messages to MS Teams

New in version 2017.7.0.

**configuration**

This module can be used by either passing a hook_url directly or by specifying it in a configuration profile in the salt master/minion config. For example:

```
msteams:
    hook_url: https://outlook.office.com/webhook/837
```

salt.modules.msteams.post_card(*message*, *hook_url=None, *title=None, *theme_color=None*)

Send a message to an MS Teams channel.

:param message: The message to send to the MS Teams channel.
:param hook_url: The Teams webhook URL, if not specified in the configuration.
:param title: Optional title for the posted card
:param theme_color: Optional hex color highlight for the posted card
:return: Boolean if message was sent successfully.

CLI Example:

```
salt '*' msteams.post_card message="Build is done"
```
26.6.270 salt.modules.munin

Run munin plugins/checks from salt and format the output as data.

```python
salt.modules.munin.list_plugins()
```

List all the munin plugins

CLI Example:

```
salt '*' munin.list_plugins
```

```python
salt.modules.munin.run(plugins)
```

Run one or more named munin plugins

CLI Example:

```
salt '*' munin.run uptime
salt '*' munin.run uptime,cpu,load,memory
```

```python
salt.modules.munin.run_all()
```

Run all the munin plugins

CLI Example:

```
salt '*' munin.run_all
```

26.6.271 salt.modules.mysql

Module to provide MySQL compatibility to salt.

depends

- Python module: MySQLdb, mysqlclient, or PyMySQL

configuration

In order to connect to MySQL, certain configuration is required in either the relevant minion config (/etc/salt/minion), or pillar.

Some sample configs might look like:

```python
mysql.host: 'localhost'
mysql.port: 3306
mysql.user: 'root'
mysql.pass: ''
mysql.db: 'mysql'
mysql.unix_socket: '/tmp/mysql.sock'
mysql.charset: 'utf8'
```

You can also use a defaults file:

```python
mysql.default_file: '/etc/mysql/debian.cnf'
```

Changed in version 2014.1.0: 'charset' connection argument added. This is a MySQL charset, not a python one.

Changed in version 0.16.2: Connection arguments from the minion config file can be overridden on the CLI by using the arguments defined here. Additionally, it is now possible to setup a user with no password.
salt.modules.mysql.alter_db(name, character_set=None, collate=None, **connection_args)

Modify database using ALTER DATABASE %(dbname)s CHARACTER SET %(charset)s COLLATE %(collation)s; query.

CLI Example:
```
salt '*' mysql.alter_db testdb charset='latin1'
```

salt.modules.mysql.db_check(name, table=None, **connection_args)

Repairs the full database or just a given table

CLI Example:
```
salt '*' mysql.db_check dbname
salt '*' mysql.db_check dbname dbtable
```

salt.modules.mysql.db_create(name, character_set=None, collate=None, **connection_args)

Adds a databases to the MySQL server.

name
The name of the database to manage

character_set
The character set, if left empty the MySQL default will be used

collate
The collation, if left empty the MySQL default will be used

CLI Example:
```
salt '*' mysql.db_create 'dbname'
salt '*' mysql.db_create 'dbname' 'utf8' 'utf8_general_ci'
```

salt.modules.mysql.db_exists(name, **connection_args)

Checks if a database exists on the MySQL server.

CLI Example:
```
salt '*' mysql.db_exists 'dbname'
```

salt.modules.mysql.db_get(name, **connection_args)

Return a list of databases of a MySQL server using the output from the
SELECT DEFAULT_CHARACTER_SET_NAME, DEFAULT_COLLATION_NAME FROM INFORMATION_SCHEMA.SCHEMATA WHERE SCHEMA_NAME='dbname'; query.

CLI Example:
```
salt '*' mysql.db_get test
```

salt.modules.mysql.db_list(**connection_args)

Return a list of databases of a MySQL server using the output from the SHOW DATABASES query.

CLI Example:
```
salt '*' mysql.db_list
```

salt.modules.mysql.db_optimize(name, table=None, **connection_args)

Optimizes the full database or just a given table

CLI Example:
salt '*' mysql.db_optimize dbname

salt.modules.mysql.db_remove(name, **connection_args)
Removes a databases from the MySQL server.
CLI Example:
salt '*' mysql.db_remove 'dbname'

salt.modules.mysql.db_repair(name, table=None, **connection_args)
Repairs the full database or just a given table
CLI Example:
salt '*' mysql.db_repair dbname

salt.modules.mysql.db_tables(name, **connection_args)
Shows the tables in the given MySQL database (if exists)
CLI Example:
salt '*' mysql.db_tables 'database'

salt.modules.mysql.file_query(database, file_name, **connection_args)
Run an arbitrary SQL query from the specified file and return the the number of affected rows.
New in version 2017.7.0.
database
database to run script inside
file_name
File name of the script. This can be on the minion, or a file that is reachable by the files
CLI Example:
salt '*' mysql.file_query mydb file_name=/tmp/sqlfile.sql
salt '*' mysql.file_query mydb file_name=salt://sqlfile.sql

Return data:
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1}

salt.modules.mysql.free_slave(**connection_args)
Frees a slave from its master. This is a WIP, do not use.
CLI Example:
salt '*' mysql.free_slave

salt.modules.mysql.get_master_status(**connection_args)
Retrieves the master status from the minion.
Returns:
{'host.domain.com': {'Binlog_Do_DB': '',
       'Binlog_Ignore_DB': '',
       'File': 'mysql-bin.000021',
       'Position': 107}}
CLI Example:

```bash
salt '*' mysql.get_master_status
```

`mysql.get_slave_status(connection_args)`

Retrieves the slave status from the minion.

Returns:

```python
{'host.domain.com': {'Connect_Retry': 60,
                     'Exec_Master_Log_Pos': 107,
                     'Last_Errno': 0,
                     'Last_Error': '',
                     'Last_IO_Errno': 0,
                     'Last_IO_Error': '',
                     'Last_SQL_Errno': 0,
                     'Last_SQL_Error': '',
                     'Master_Host': 'comet.scion-eng.com',
                     'Master_Log_File': 'mysql-bin.000021',
                     'Master_Port': 3306,
                     'Master_SSL_Allowed': 'No',
                     'Master_SSL_CA_File': '',
                     'Master_SSL_CA_Path': '',
                     'Master_SSL_Cert': '',
                     'Master_SSL_CIPHER': '',
                     'Master_SSL_KEY': '',
                     'Master_SSL_Verify_Server_Cert': 'No',
                     'Master_Server_Id': 1,
                     'Master_User': 'replu',
                     'Read_Master_Log_Pos': 107,
                     'Relay_Log_File': 'klo-relay-bin.000071',
                     'Relay_Log_Pos': 253,
                     'Relay_Log_Space': 553,
                     'Relay_Master_Log_File': 'mysql-bin.000021',
                     'Replicate_Do_DB': '',
                     'Replicate_Do_Table': '',
                     'Replicate_Ignore_DB': '',
                     'Replicate_Ignore_Server_Ids': '',
                     'Replicate_Ignore_Table': '',
                     'Replicate_Wild_Do_Table': '',
                     'Replicate_Wild_Ignore_Table': '',
                     'Seconds_Behind_Master': 0,
                     'Skip_Counter': 0,
                     'Slave_IO_Running': 'Yes',
                     'Slave_IO_State': 'Waiting for master to send event',
                     'Slave_SQL_Running': 'Yes',
                     'Until_Condition': 'None',
                     'Until_Log_File': '',
                     'Until_Log_Pos': 0}}
```

CLI Example:

```bash
salt '*' mysql.get_slave_status
```

`mysql.grant_add(grant, database, user, host='localhost', grant_option=False, escape=True, ssl_option=False, connection_args)`

26.6. execution modules
Adds a grant to the MySQL server.

For database, make sure you specify database.table or database.*

CLI Example:
salt '*' mysql.grant_add 'SELECT,INSERT,UPDATE,...' 'database.→*' 'frank' 'localhost'

```
salt.modules.mysql.grant_exists(grant, database, user, host='localhost', grant_option=False, escape=True, **connection_args)
```

Checks to see if a grant exists in the database

CLI Example:
salt '*' mysql.grant_exists 'SELECT,INSERT,UPDATE,...' 'database.→' 'frank' 'localhost'

```
salt.modules.mysql.grant_revoke(grant, database, user, host='localhost', grant_option=False, escape=True, **connection_args)
```

Removes a grant from the MySQL server.

CLI Example:
salt '*' mysql.grant_revoke 'SELECT,INSERT,UPDATE' 'database.→' 'frank' 'localhost'

```
salt.modules.mysql.plugin_add(name, soname=None, **connection_args)
```

Add a plugin.

CLI Example:
salt '*' mysql.plugin_add auth_socket

```
salt.modules.mysql.plugin_remove(name, **connection_args)
```

Remove a plugin.

CLI Example:
salt '*' mysql.plugin_remove auth_socket

```
salt.modules.mysql.plugin_status(name, **connection_args)
```

Return the status of a plugin.

CLI Example:
salt '*' mysql.plugin_status auth_socket

```
salt.modules.mysql.plugins_list(**connection_args)
```

Return a list of plugins and their status from the SHOW PLUGINS query.

CLI Example:
salt '*' mysql.plugins_list
salt.modules.mysql.processlist(**connection_args)

Retrieves the processlist from the MySQL server via "SHOW FULL PROCESSLIST".

Returns: a list of dicts, with each dict representing a process:

```python
{
    'Command': 'Query',
    'Host': 'localhost',
    'Id': 39,
    'Info': 'SHOW FULL PROCESSLIST',
    'Rows_examined': 0,
    'Rows_read': 1,
    'Rows_sent': 0,
    'State': 'None',
    'Time': 0,
    'User': 'root',
    'db': 'mysql'
}
```

CLI Example:

```
salt '*' mysql.processlist
```

salt.modules.mysql.query(database, query, **connection_args)

Run an arbitrary SQL query and return the results or the number of affected rows.

CLI Example:

```
salt '*' mysql.query mydb "UPDATE mytable set myfield=1 limit 1"
```

Return data:

```json
{ 'query time': { 'human': '39.0ms', 'raw': '0.03899' }, 'rows affected': 1L }
```

CLI Example:

```
salt '*' mysql.query mydb "SELECT id,name,cash from users limit 3"
```

Return data:

```json
{ 'columns': ('id', 'name', 'cash'),
  'query time': { 'human': '1.0ms', 'raw': '0.001' },
  'results': ((1L, 'User 1', Decimal('110.000000')),
  (2L, 'User 2', Decimal('215.636756')),
  (3L, 'User 3', Decimal('0.040000'))),
  'rows returned': 3L }
```

CLI Example:

```
salt '*' mysql.query mydb 'INSERT into users values (null,"user 4", 5)'
```

Return data:

```json
{ 'query time': { 'human': '25.6ms', 'raw': '0.02563' }, 'rows affected': 1L }
```

CLI Example:
Jinja Example: Run a query on `mydb` and use row 0, column 0's data.

```
{{ salt['mysql.query']('mydb', 'SELECT info from mytable limit 1')[
    'results'][0][0] }}
```

**salt.modules.mysql.quote_identifier** *(identifier, for_grants=False)*

Return an identifier name (column, table, database, etc) escaped for MySQL. This means surrounded by `''` character and escaping this character inside. It also means doubling the '%' character for MySQLdb internal usage.

**Parameters**

- `identifier` -- the table, column or database identifier
- `for_grants` -- is False by default, when using database names on grant queries you should set it to True to also escape "_" and "%" characters as requested by MySQL. Note that these characters should only be escaped when requesting grants on the database level (my_%db.*) but not for table level grants (my_%db.`foo`)

**CLI Example:**

```
salt '*' mysql.quote_identifier 'foo`bar'
```

**salt.modules.mysql.showglobal** *(**connection_args)**

Retrieves the show global variables from the minion.

**Returns:**
- show global variables full dict

**CLI Example:**

```
salt '*' mysql.showglobal
```

**salt.modules.mysql.showvariables** *(**connection_args)**

Retrieves the show variables from the minion.

**Returns:**
- show variables full dict

**CLI Example:**

```
salt '*' mysql.showvariables
```

**salt.modules.mysql.slave_lag** *(**connection_args)**

Return the number of seconds that a slave SQL server is lagging behind the master, if the host is not a slave it will return -1. If the server is configured to be a slave for replication but slave IO is not running then -2 will be returned. If there was an error connecting to the database or checking the slave status, -3 will be returned.

**CLI Example:**

```
salt '*' mysql.slave_lag
```

**salt.modules.mysql.status** *(**connection_args)**

Return the status of a MySQL server using the output from the SHOW STATUS query.
Salt Documentation, Release 3007.1

CLI Example:

```
salt '*' mysql.status
```

**salt.modules.mysql.tokenize_grant(grant)**

External wrapper function

- param: grant
- return: dict

CLI Example:

```
salt '*' mysql.tokenize_grant
   "GRANT SELECT, INSERT ON testdb.
   → TO 'testuser'@'localhost'"
```

**salt.modules.mysql.user_chpass(user, host='localhost', password=None, password_hash=None, allow_passwordless=False, unix_socket=None, password_column=None, **connection_args)**

Change password for a MySQL user

- host
  - Host for which this user/password combo applies
- password
  - The password to set for the new user. Will take precedence over the password_hash option if both are specified.
- password_hash
  - The password in hashed form. Be sure to quote the password because YAML doesn't like the *.
  
  A password hash can be obtained from the mysql command-line client like so:

  ```
  mysql> SELECT PASSWORD('mypass');
  +---------------------+
  | PASSWORD('mypass')  |
  +---------------------+
  | 6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
  +---------------------+
  1 row in set (0.00 sec)
  ```

- allow_passwordless
  - If True, then password and password_hash can be omitted (or set to None) to permit a pass-
    wordless login.

New in version 0.16.2: The allow_passwordless option was added.

CLI Examples:

```
salt '*' mysql.user_chpass frank localhost newpassword
salt '*' mysql.user_chpass frank localhost password_hash='hash'
salt '*' mysql.user_chpass frank localhost allow_passwordless=True
```

**salt.modules.mysql.user_create(user, host='localhost', password=None, password_hash=None, allow_passwordless=False, unix_socket=False, password_column=None, auth_plugin='mysql_native_password', **connection_args)**

Creates a MySQL user

- host
  - Host for which this user/password combo applies
- password
  - The password to use for the new user. Will take precedence over the password_hash option if both are specified.
- password_hash
  - The password in hashed form. Be sure to quote the password because YAML doesn't like the *.

A password hash can be obtained from the mysql command-line client like so:
allow_passwordless
If True, then password and password_hash can be omitted (or set to None) to permit a passwordless login.

unix_socket
If True and allow_passwordless is True then will be used unix_socket auth plugin.

password_column
The password column to use in the user table.

auth_plugin
The authentication plugin to use, default is to use the mysql_native_password plugin.
New in version 0.16.2: The allow_passwordless option was added.

CLI Examples:

```bash
salt '*' mysql.user_create 'username' 'hostname' 'password'
salt '*' mysql.user_create 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_create 'username' 'hostname' allow_passwordless=True
```

salt.modules.mysql.user_exists(user, host='localhost', password=None, password_hash=None,
passwordless=False, unix_socket=False, password_column=None,**connection_args)

Checks if a user exists on the MySQL server. A login can be checked to see if passwordless login is permitted by omitting password and password_hash, and using passwordless=True.

New in version 0.16.2: The passwordless option was added.

CLI Example:

```bash
salt '*' mysql.user_exists 'username' 'hostname' 'password'
salt '*' mysql.user_exists 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_exists 'username' passwordless=True
salt '*' mysql.user_exists 'username' password_column='authentication_'
```

salt.modules.mysql.user_grants(user, host='localhost', **connection_args)
Shows the grants for the given MySQL user (if it exists)

CLI Example:

```bash
salt '*' mysql.user_grants 'frank' 'localhost'
```

salt.modules.mysql.user_info(user, host='localhost', **connection_args)
Get full info on a MySQL user

CLI Example:

```bash
salt '*' mysql.user_info root localhost
```
salt.modules.mysql.user_list(**connection_args**)

Return a list of users on a MySQL server

CLI Example:

```
salt '*\' mysql.user_list
```

salt.modules.mysql.user_remove(user, host='localhost', **connection_args**)

Delete MySQL user

CLI Example:

```
salt '*\' mysql.user_remove frank localhost
```

salt.modules.mysql.verify_login(user, password=None, **connection_args**)

Attempt to login using the provided credentials. If successful, return True. Otherwise, return False.

CLI Example:

```
salt '*\' mysql.verify_login root password
```

salt.modules.mysql.version(**connection_args**)

Return the version of a MySQL server using the output from the SELECT VERSION() query.

CLI Example:

```
salt '*\' mysql.version
```

26.6.272 salt.modules.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

depends

PyNaCl, https://github.com/pyca/pynacl

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don’t advise making your pillars public regardless if they are encrypted or not.

When generating keys and encrypting passwords use --local when using salt-call for extra security. Also consider using just the salt runner nacl when encrypting pillar passwords.

configuration

The following configuration defaults can be define (pillar or config files) Avoid storing private keys in pillars! Ensure master does not have pillar_opts=True:

```
# cat /etc/salt/master.d/nacl.conf
nacl.config:
    # NOTE: `key` and `key_file` have been renamed to `sk`, `sk_file`
    # also `box_type` default changed from secretbox to  
    # sealedbox.
    box_type: sealedbox (default)
    sk_file: /etc/salt/pki/master/nacl (default)
    pk_file: /etc/salt/pki/master/nacl.pub (default)
    sk: None
    pk: None
```

26.6. execution modules
Usage can override the config defaults:

```
salt-call nacl.enc sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/pki/master/nacl.pub
```

The nacl lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your `sk_file` and `pk_file` use:

```
salt-call --local nacl.keygen sk_file=/etc/salt/pki/master/nacl
# or if you want to work without files.
salt-call --local nacl.keygen
```

```
local:
--------
pk: /kfGX7PbWevu099702PBBkWLpG/9p06IQRsWkdWHCDk0=
sk: SVWut5SqNpuPeNzb1b9y6b2eXg2PLIOg43GBzp48Sow=
```

Now with your keypair, you can encrypt data:

You have two option, sealedbox or secretbox.

SecretBox is data encrypted using private key `pk`. Sealedbox is encrypted using public key `pk`.

Recommend using Sealedbox because the one way encryption permits developers to encrypt data for source control but not decrypt. Sealedbox only has one key that is for both encryption and decryption.

```
salt-call --local nacl.enc asecretpass pk=/kfGX7PbWevu099702PBBkWLpG/9p06IQRsWkdWHCDk0=
tqXzeI3nTAM9Xf0mdLcpEdklMbfBGpj2oTKmlgrm3S1DTVVHnh9h8mU1GKllGq/
\+cYsk6m5WhGdk58=
```

To decrypt the data:

```
salt-call --local nacl.dec data=
'tqXzeI3nTAM9Xf0mdLcpEdklMbfBGpj2oTKmlgrm3S1DTVVHnh9h8mU1GKllGq/
\+cYsk6m5WhGdk58='
```

When the keys are defined in the master config you can use them from the nacl runner without extra parameters:

```
# cat /etc/salt/master.d/nacl.conf
nacl.config:
  sk_file: /etc/salt/pki/master/nacl
  pk: 'cTIqXwnUiD1ul4kXsbeCE7/NoeKEzd4nLeYCFpd9k='
```

```
salt-run nacl.enc 'asecretpass'
salt-run nacl.dec data=
'tqXzeI3nTAM9Xf0mdLcpEdklMbfBGpj2oTKmlgrm3S1DTVVHnh9h8mU1GKllGq/
\+cYsk6m5WhGdk58='
```

```
# a salt developers minion could have pillar data that includes a nacl public key
```

```
nacl.config:
  pk: '/kfGX7PbWevu099702PBBkWLpG/9p06IQRsWkdWHCDk0='
```

The developer can then use a less-secure system to encrypt data.
Pillar files can include protected data that the salt master decrypts:

```
pillarexample:
    user: root
    password1: {{salt.nacl.dec('DRB7Q6/X5gGSRCTpZyxS6hIbWj0llUA+uaVvyou3vJ4=')}|json}
    cert_key: {{salt.nacl.dec_file('/srv/salt/certs/example.com/key.nacl')|json}
    cert_key2: {{salt.nacl.dec_file('salt://certs/example.com/key.nacl')|json}
```

Larger files like certificates can be encrypted with:

```
salt-call nacl.enc_file /tmp/cert.crt out=/tmp/cert.nacl
```

In pillars rendered with jinja be sure to include `|json` so line breaks are encoded:

```
cert: "{{salt.nacl.dec('S2uogToXkgENz9...085KYt')|json}}"
```

In states rendered with jinja it is also good practice to include `|json`:

```
{{sls}} private key:
    file.managed:
        - name: /etc/ssl/private/cert.key
        - mode: 700
        - contents: "{{pillar['pillarexample']['cert_key']|json}}"
```

Optional small program to encrypt data without needing salt modules.

```
#!/bin/python3
import sys, base64, nacl.public
pk = base64.b64decode('YOURPUBKEY')
b = nacl.public.SealedBox(pk)
data = sys.stdin.buffer.read()
print(base64.b64encode(b.encrypt(data)).decode())
```

```
echo 'apassword' | nacl_enc.py
```

```
salt.modules.nacl.dec(data, **kwargs)
    Alias to {box_type}_decrypt
    box_type: secretbox, sealedbox(default)
```

```
salt.modules.nacl.dec_file(name, out=None, **kwargs)
    This is a helper function to decrypt a file and return its contents.
    You can provide an optional output file using `out`
    `name` can be a local file or when not using `salt-run` can be a url like `salt://`, `https://` etc.
    CLI Examples:
```
salt-run nacl.dec_file name=/tmp/id_rsa.nacl
salt-call nacl.dec_file name=salt://crt/mycert.nacl out=/tmp/id_rsa
salt-run nacl.dec_file name=/tmp/id_rsa.nacl box_type=secretbox
  sk_file=/etc/salt/pki/master/nacl.pub

Alias to [box_type]_encrypt
box_type: secretbox, sealedbox(default)

salt.modules.nacl.enc_file(name, out=None, **kwargs)
This is a helper function to encrypt a file and return its contents.
You can provide an optional output file using out
name can be a local file or when not using salt-run can be a url like salt://, https:// etc.

CLI Examples:
salt-run nacl.enc_file name=/tmp/id_rsa
salt-call nacl.enc_file name=salt://crt/mycert out=/tmp/cert
salt-run nacl.enc_file name=/tmp/id_rsa box_type=secretbox
  sk_file=/etc/salt/pki/master/nacl.pub

Use PyNaCl to generate a keypair.
If no sk_file is defined return a keypair.
If only the sk_file is defined pk_file will use the same name with a postfix .pub.
When the sk_file is already existing, but pk_file is not. The pk_file will be generated using the sk_file.

CLI Examples:
salt-call nacl.keygen
salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl
salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/pki/master/nacl.pub
salt-call --local nacl.keygen

Decrypt data using a secret key that was encrypted using a public key with nacl.sealedbox_encrypt.

CLI Examples:
salt-call nacl.sealedbox_decrypt pEXHQM6cuaF7A=
salt-call --local nacl.sealedbox_decrypt data='pEXHQM6cuaF7A' sk_file=/etc/salt/pki/master/nacl
salt-call --local nacl.sealedbox_decrypt data='pEXHQM6cuaF7A' sk=YmFkcGFzcwo=

Encrypt data using a public key generated from nacl.keygen. The encrypted data can be decrypted using
nacl.sealedbox_decrypt only with the secret key.

CLI Examples:
```bash
salt-run nacl.sealedbox_encrypt datatoenc
salt-call --local nacl.sealedbox_encrypt datatoenc pk_file=/etc/salt/pki/master/nacl.pub
salt-call --local nacl.sealedbox_encrypt datatoenc pk="'vrwQF7cNiNAVQVAiS3bvcbJUnF0cN6fU9YTZD9mBfzQ='"
```

salt.modules.nacl.secretbox_decrypt(data, **kwargs)

Decrypt data that was encrypted using `nacl.secretbox_encrypt` using the secret key that was generated from `nacl.keygen`.

CLI Examples:

```bash
salt-call nacl.secretbox_decrypt pEXHQM6cuaF7A=
salt-call --local nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/etc/salt/pki/master/nacl
salt-call --local nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk='YmFkcGFzcwo='
```

salt.modules.nacl.secretbox_encrypt(data, **kwargs)

Encrypt data using a secret key generated from `nacl.keygen`. The same secret key can be used to decrypt the data using `nacl.secretbox_decrypt`.

CLI Examples:

```bash
salt-run nacl.secretbox_encrypt datatoenc
salt-call --local nacl.secretbox_encrypt datatoenc sk_file=/etc/salt/pki/master/nacl
salt-call --local nacl.secretbox_encrypt datatoenc sk='YmFkcGFzcwo='
```

### 26.6.273 salt.modules.nagios

Run nagios plugins/checks from salt and get the return as data.

salt.modules.nagios.list_plugins()

List all the nagios plugins

CLI Example:

```bash
salt '*' nagios.list_plugins
```

salt.modules.nagios.retcode(plugin, args='', key_name=None)

Run one nagios plugin and return retcode of the execution

salt.modules.nagios.retcode_pillar(pillar_name)

Run one or more nagios plugins from pillar data and get the result of cmd.retcode The pillar have to be in this format:

```bash
webserver:
  - Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
```

(continues on next page)
webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You must group different checks (one or more) and always it will return the highest value of all the checks

CLI Example:

```
salt '*' nagios.retcode webserver
```

**salt.modules.nagios.run(plugin, args='')**

Run nagios plugin and return all the data execution with cmd.run

CLI Example:

```
salt '*' nagios.run check_apt
salt '*' nagios.run check_icmp '8.8.8.8'
```

**salt.modules.nagios.run_all(plugin, args='')**

Run nagios plugin and return all the data execution with cmd.run_all

**salt.modules.nagios.run_all_pillar(pillar_name)**

Run one or more nagios plugins from pillar data and get the result of cmd.run_all The pillar have to be in this format:

```
webserver:
  Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
  Load:
    - check_load: -w 0.8 -c 1
  APT:
```

You have to group different checks in a group

CLI Example:

```
salt '*' nagios.run webserver
```

**salt.modules.nagios.run_pillar(pillar_name)**

Run one or more nagios plugins from pillar data and get the result of cmd.run The pillar have to be in this format:
Ping_google:
- check_icmp: 8.8.8.8
- check_icmp: google.com

Load:
- check_load: -w 0.8 -c 1

APT:
- check_apt

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:
```bash
salt '*' nagios.run webserver
```

### 26.6.274 salt.modules.nagios_rpc

Check Host & Service status from Nagios via JSON RPC.
New in version 2015.8.0.

salt.modules.nagios_rpc.host_status(hostname=None, **kwargs)

Check status of a particular host. By default statuses are returned in a numeric format.

Parameters:
- hostname
  The hostname to check the status of the service in Nagios.
- numeric
  Turn to false in order to return status in text format ('OK' instead of 0, 'Warning' instead of 1 etc)

Returns
- status: 'OK', 'Warning', 'Critical' or 'Unknown'

CLI Example:
```bash
salt '*' nagios_rpc.host_status hostname=webserver.domain.com
salt '*' nagios_rpc.host_status hostname=webserver.domain.com numeric=False
```

salt.modules.nagios_rpc.service_status(hostname=None, service=None, **kwargs)

Check status of a particular service on a host on it in Nagios. By default statuses are returned in a numeric format.

Parameters:
- hostname
  The hostname to check the status of the service in Nagios.
- service
  The service to check the status of in Nagios.
- numeric
  Turn to false in order to return status in text format ('OK' instead of 0, 'Warning' instead of 1 etc)

Returns
- status: 'OK', 'Warning', 'Critical' or 'Unknown'
26.6.275 salt.modules.namecheap_domains

Namecheap Domain Management
New in version 2017.7.0.

Prerequisites
This module uses the requests Python module to communicate to the namecheap API.

Configuration
The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
# Real url
namecheap.url: https://api.namecheap.com/xml.response
# Sandbox url
# namecheap.url: https://api.sandbox.namecheap.xml.response
```

salt.modules.namecheap_domains.check('domains_to_check')
Checks the availability of domains
`domains_to_check` array of strings List of domains to check
Returns a dictionary mapping the each domain name to a boolean denoting whether or not it is available.

CLI Example:
```
salt 'my-minion' namecheap_domains.check domain-to-check
```

salt.modules.namecheap_domains.create(domain_name, years, **kwargs)
Try to register the specified domain name
`domain_name` The domain name to be registered
`years` Number of years to register
Returns the following information:
- Whether or not the domain was renewed successfully
- Whether or not WhoisGuard is enabled
- Whether or not registration is instant
- The amount charged for registration
- The domain ID
- The order ID
• The transaction ID

CLI Example:
```
salt 'my-minion' namecheap_domains.create my-domain-name 2
```

```namecheap_domains.get_info(domain_name)```

- Returns information about the requested domain
  - `domain_name` (string): Domain name to get information about

CLI Example:
```
salt 'my-minion' namecheap_domains.get_info my-domain-name
```

```namecheap_domains.get_list(list_type=None, search_term=None, page=None, page_size=None, sort_by=None)```

- Returns a list of domains for the particular user as a list of objects offset by `page` length of `page_size`
  - `list_type`: [ALL] One of ALL, EXPIRING, EXPIRED
  - `search_term`: Keyword to look for on the domain list
  - `page`: [1] Number of result page to return
  - `page_size`: [20] Number of domains to be listed per page (minimum: 10, maximum: 100)
  - `sort_by`: One of NAME, NAME_DESC, EXPIREDATE, EXPIREDATE_DESC, CREATEDATE, or CREATEDATE_DESC

CLI Example:
```
salt 'my-minion' namecheap_domains.get_list
```

```namecheap_domains.get_tld_list()```

- Returns a list of TLDs as objects

CLI Example:
```
salt 'my-minion' namecheap_domains.get_tld_list
```

```namecheap_domains.reactivate(domain_name)```

- Try to reactivate the expired domain name
  - Returns the following information:
    - Whether or not the domain was reactivated successfully
    - The amount charged for reactivation
    - The order ID
    - The transaction ID

CLI Example:
```
salt 'my-minion' namecheap_domains.reactivate my-domain-name
```

```namecheap_domains.renew(domain_name, years, promotion_code=None)```

- Try to renew the specified expiring domain name for a specified number of years
  - `domain_name`: The domain name to be renewed
years
Number of years to renew
Returns the following information:
  • Whether or not the domain was renewed successfully
  • The domain ID
  • The order ID
  • The transaction ID
  • The amount charged for renewal
CLI Example:

```
salt 'my-minion' namecheap_domains.renew my-domain-name 5
```

26.6.276 salt.modules.namecheap_domains_dns

Namecheap DNS Management

New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f6789c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

salt.modules.namecheap_domains_dns.get_hosts(sld, tld)

Retrieves DNS host record settings for the requested domain.

```
salt 'my-minion' namecheap_domains_dns.get_hosts sld tld
```

salt.modules.namecheap_domains_dns.get_list(sld, tld)

Gets a list of DNS servers associated with the requested domain.

```
salt 'my-minion' namecheap_domains_dns.get_list sld tld
```

2420 Chapter 26. Salt Module Reference
tld
TLD of the domain name

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.get_list sld tld
```

```
salt.modules.namecheap_domains_dns.set_custom(sld, tld, nameservers)
```

Sets domain to use custom DNS servers.

```
salt.modules.namecheap_domains_dns.set_custom(sld, tld, nameserver)
```

Sets domain to use custom DNS servers. Returns True if the custom nameservers were set successfully.

```
salt.modules.namecheap_domains_dns.set_default(sld, tld)
```

Sets domain to use Namecheap default DNS servers. Required for free services like Host record management, URL forwarding, email forwarding, dynamic DNS and other value added services.

```
salt.modules.namecheap_domains_dns.set_default(sld, tld)
```

Sets domain to use Namecheap default DNS servers. Returns True if the domain was successfully pointed at the default DNS servers.

```
salt.modules.namecheap_domains_dns.set_hosts(sld, tld, hosts)
```

Sets DNS host records settings for the requested domain.

```
salt.modules.namecheap_domains_dns.set_hosts(sld, tld, hosts)
```

Sets DNS host records settings for the requested domain. Must be passed as a list of Python dictionaries, with each dictionary containing the following keys:

- **hostname**
- **recordtype** - One of A, AAAA, CNAME, MX, MXE, TXT, URL, URL301, or FRAME
- **address** - URL or IP address
- **ttl** - An integer between 60 and 60000 (default: 1800)

Additionally, the mxpref key can be present, but must be accompanied by an emailtype key.

```
salt 'my-minion' namecheap_domains_dns.get_list sld tld
```

```
salt 'my-minion' namecheap_domains_dns.set_custom sld tld nameserver
```

```
salt 'my-minion' namecheap_domains_dns.set_default sld tld
```

```
salt 'my-minion' namecheap_domains_dns.set_hosts sld tld hosts
```

26.6. execution modules
26.6.277  **salt.modules.namecheap_domains_ns**

Namecheap Nameserver Management

New in version 2017.7.0.

**Prerequisites**

This module uses the `requests` Python module to communicate to the namecheap API.

**Configuration**

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>namecheap.name</td>
<td>companyname</td>
</tr>
<tr>
<td>namecheap.key</td>
<td>a1b2c3d4e5f67a8b9c0d1e2f3</td>

</tbody>
</table>

salt.modules.namecheap_domains_ns.create(sld, tld, nameserver, ip)

Creates a new nameserver. Returns `True` if the nameserver was created successfully.

- **sld**: SLD of the domain name
- **tld**: TLD of the domain name
- **nameserver**: Nameserver to create
- **ip**: Nameserver IP address

CLI Example:

```
salt '*' namecheap_domains_ns.create sld tld nameserver ip
```

salt.modules.namecheap_domains_ns.delete(sld, tld, nameserver)

Deletes a nameserver. Returns `True` if the nameserver was deleted successfully.

- **sld**: SLD of the domain name
- **tld**: TLD of the domain name
- **nameserver**: Nameserver to delete

CLI Example:

```
salt '*' namecheap_domains_ns.delete sld tld nameserver
```

salt.modules.namecheap_domains_ns.get_info(sld, tld, nameserver)

Retrieves information about a registered nameserver. Returns the following information:

- IP Address set for the nameserver
- Domain name which was queried
- A list of nameservers and their statuses
sld
  SLD of the domain name
tld
  TLD of the domain name
nameserver
  Nameserver to retrieve

CLI Example:

```
salt '*' namecheap_domains_ns.get_info sld tld nameserver
```

salt.modules.namecheap_domains_ns.update(sld, tld, nameserver, old_ip, new_ip)

Deletes a nameserver. Returns True if the nameserver was updated successfully.

sld
  SLD of the domain name
tld
  TLD of the domain name
nameserver
  Nameserver to create
old_ip
  Current ip address
new_ip
  New ip address

CLI Example:

```
salt '*' namecheap_domains_ns.update sld tld nameserver old_ip new_ip
```

### 26.6.278 salt.modules.namecheap_ssl

Namecheap SSL Certificate Management

New in version 2017.7.0.

#### Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

#### Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: alb2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
namecheap.url: https://api.sandbox.namecheap.xml.response
```

salt.modules.namecheap_ssl.activate(csr_file, certificate_id, web_server_type, approver_email=None, http_dc_validation=False, **kwargs)

Activates a newly-purchased SSL certificate. Returns a dictionary of result values.
**csr_file**
Path to Certificate Signing Request file

**certificate_id**
Unique ID of the SSL certificate you wish to activate

**web_server_type**
The type of certificate format to return. Possible values include:
- apache2
- apachepachessl
- apacheopenssl
- apacheraven
- apachessl
- apachessleay
- c2net
- cobalsenaries
- cpanel
- domino
- dominogo4625
- dominogo4626
- ensim
- hsphere
- ibmhttp
- iis
- iis4
- iis5
- iplanet
- ipswitch
- netscape
- other
- plesk
- tomcat
- weblogic
- website
- webstar
- zeusv3

**approver_email**
The email ID which is on the approver email list.

---

**Note:** `http_dc_validation` must be set to `False` if this option is used.

---

**http_dc_validation**
[False] Whether or not to activate using HTTP-based validation.

---

**Note:** For other parameters which may be required, see here.

---

CLI Example:
```
salt 'my-minion' namecheap_ssl.activate my-csr-file my-cert-id apachessl
```

salt.modules.namecheap_ssl.create(years, certificate_type, promotion_code=None, sans_to_add=None)

Creates a new SSL certificate. Returns the following information:
- Whether or not the SSL order was successful
- The certificate ID
- The order ID
- The transaction ID
- The amount charged for the order
- The date on which the certificate was created
- The date on which the certificate will expire
- The type of SSL certificate
- The number of years for which the certificate was purchased
- The current status of the SSL certificate

years

[1] Number of years to register

certificate_type

Type of SSL Certificate. Possible values include:
- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
- SSL Webserver EV
- SSL123
- Secure Site
- Secure Site Pro
- Secure Site Pro with EV
- Secure Site with EV
- True BusinessID
- True BusinessID Multi Domain
- True BusinessID Wildcard
- True BusinessID with EV
- True BusinessID with EV Multi Domain
- Unified Communications

promotional_code

An optional promo code to use when creating the certificate

sans_to_add

[0] This parameter defines the number of add-on domains to be purchased in addition to the default number of domains included with a multi-domain certificate. Each certificate that supports SANs has the default number of domains included. You may check the default number of domains included and the maximum number of domains that can be added to it in the table below.
<table>
<thead>
<tr>
<th>Provider</th>
<th>Product name</th>
<th>Default number of domains (domain from CSR is counted here)</th>
<th>Maximum number of total domains</th>
<th>Maximum number of domains that can be passed in sans_to_add parameter</th>

</tbody>
</table>

CLI Example:

```
salt 'my-minion' namecheap_ssl.create 2 RapidSSL
```

`salt.modules.namecheap_ssl.get_info(certificate_id, returncertificate=False, returntype=None)`

Retrieves information about the requested SSL certificate. Returns a dictionary of information about the SSL certificate with two keys:

- `ssl` - Contains the metadata information
- `certificate` - Contains the details for the certificate such as the CSR, Approver, and certificate data

`certificate_id`  
Unique ID of the SSL certificate

`returncertificate`  
[False] Set to `True` to ask for the certificate in response

`returntype`  
Optional type for the returned certificate. Can be either "Individual" (for X.509 format) or "PKCS7"

| Note: Required if `returncertificate` is `True` |

CLI Example:
salt 'my-minion' namecheap_ssl.get_info my-cert-id

salt.modules.namecheap_ssl.get_list(**kwargs)

Returns a list of SSL certificates for a particular user

ListType

[All] Possible values:
• All
• Processing
• EmailSent
• TechnicalProblem
• InProgress
• Completed
• Deactivated
• Active
• Cancelled
• NewPurchase
• NewRenewal

SearchTerm

Keyword to look for on the SSL list

Page

[1] Page number to return

PageSize

[20] Total number of SSL certificates to display per page (minimum: 10, maximum: 100)

SortBy

One of PURCHASEDATE, PURCHASEDATE_DESC, SSLTYPE, SSLTYPE_DESC, EXPIREDATETIME, EXPIREDATETIME_DESC, Host_Name, or Host_Name_DESC

CLI Example:
salt 'my-minion' namecheap_ssl.get_list Processing

salt.modules.namecheap_ssl.parse_csr(csr_file, certificate_type, http_dc_validation=False)

Parses the CSR. Returns a dictionary of result values.

csr_file

Path to Certificate Signing Request file

certificate_type

Type of SSL Certificate. Possible values include:
• EV Multi Domain SSL
• EV SSL
• EV SSL SGC
• EssentialSSL
• EssentialSSL Wildcard
• InstantSSL
• InstantSSL Pro
• Multi Domain SSL
• PositiveSSL
• PositiveSSL Multi Domain
• PositiveSSL Wildcard

True BusinessID
True BusinessID Multi Domain
True BusinessID Wildcard
True BusinessID with EV
True BusinessID with EV Multi Domain
Unified Communications

http_dc_validation
[False] Set to True if a Comodo certificate and validation should be done with files instead of emails and to return the info to do so

CLI Example:
```
salt 'my-minion' namecheap_ssl.parse_csr my-csr-file PremiumSSL
```

salt.modules.namecheap_ssl.reissue(csr_file, certificate_id, web_server_type, approver_email=None, http_dc_validation=False, **kwargs)

Reissues a purchased SSL certificate. Returns a dictionary of result values.

csr_file
Path to Certificate Signing Request file
certificate_id
Unique ID of the SSL certificate you wish to activate
web_server_type
The type of certificate format to return. Possible values include:
  - apache2
  - apachepachessl
  - apacheopenssl
  - apacheraven
  - apachessl
  - apachessley
  - c2net
  - cobaltservers
  - cpanel
  - domino

  - iis5
  - iplanet
  - ipswitch
  - netscape
  - other
  - plesk
  - tomcat
  - weblogic
• website
• webstar
• zeusv3

approver_email
The email ID which is on the approver email list.

**Note:** *http_dc_validation* must be set to *False* if this option is used.

**http_dc_validation**

[False] Whether or not to activate using HTTP-based validation.

**Note:** For other parameters which may be required, see [here](#).

CLI Example:

```bash
salt 'my-minion' namecheap_ssl.reissue my-csr-file my-cert-id apachessl
```

salt.modules.namecheap_ssl.renew(*years*, *certificate_id*, *certificate_type*, *promotion_code=None*)

Renews an SSL certificate if it is ACTIVE and Expires <= 30 days. Returns the following information:

- The certificate ID
- The order ID
- The transaction ID
- The amount charged for the order

**years**

[1] Number of years to register

**certificate_id**

Unique ID of the SSL certificate you wish to renew

**certificate_type**

Type of SSL Certificate. Possible values include:

- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard

---

26.6. execution modules
• Secure Site with EV
• True BusinessID
• True BusinessID Multi Domain
• True BusinessID Wildcard
• True BusinessID with EV
• True BusinessID with EV Multi Domain
• Unified Communications

promotional_code
An optional promo code to use when renewing the certificate

CLI Example:

salt 'my-minion' namecheap_ssl.renew 1 my-cert-id RapidSSL

26.6.279 salt.modules.namecheap_users

Namecheap User Management
New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

salt.modules.namecheap_users.check_balances(minimum=100)

Checks if the provided minimum value is present in the user's account.

Returns a boolean. Returns False if the user's account balance is less than the provided minimum or True if greater than the minimum.

minimum
[100] The value to check

CLI Example:

```
salt 'my-minion' namecheap_users.check_balances
salt 'my-minion' namecheap_users.check_balances minimum=150
```

salt.modules.namecheap_users.get_balances()

Gets information about fund in the user's account. This method returns the following information: Available Balance, Account Balance, Earned Amount, Withdrawable Amount and Funds Required for AutoRenew.
Note: If a domain setup with automatic renewal is expiring within the next 90 days, the FundsRequired-ForAutoRenew attribute shows the amount needed in your Namecheap account to complete auto renewal.

CLI Example:

```
salt 'my-minion' namecheap_users.get_balances
```

## 26.6.280 `salt.modules.napalm_bgp`

**NAPALM BGP**

Manages BGP configuration on network devices and provides statistics.

**codeauthor**

Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

**maturity**

new

**depends**

napalm

**platform**

unix

### Dependencies

- `napalm proxy minion`

New in version 2016.11.0.

**salt.modules.napalm_bgp.config(group=None, neighbor=None, **kwargs)**

Provides the BGP configuration on the device.

**Parameters**

- `group` -- Name of the group selected to display the configuration.
- `neighbor` -- IP Address of the neighbor to display the configuration. If the group parameter is not specified, the neighbor setting will be ignored.

**Returns**

A dictionary containing the BGP configuration from the network device. The keys of the main dictionary are the group names.

Each group has the following properties:

- type (string)
- description (string)
- apply_groups (string list)
- multihop_ttl (int)
- multipath (True/False)
- local_address (string)
- local_as (int)
- remote_as (int)
- import_policy (string)
- export_policy (string)
- remove_private_as (True/False)
• prefix_limit (dictionary)
• neighbors (dictionary)

Each neighbor in the dictionary of neighbors provides:
• description (string)
• import_policy (string)
• export_policy (string)
• local_address (string)
• local_as (int)
• remote_as (int)
• authentication_key (string)
• prefix_limit (dictionary)
• route_reflector_client (True/False)
• nhs (True/False)

CLI Example:

salt '*' bgp.config # entire BGP config
salt '*' bgp.config PEERS-GROUP-NAME # provides detail only about BGP
→ group PEERS-GROUP-NAME
salt '*' bgp.config PEERS-GROUP-NAME 172.17.17.1 # provides details only→ about BGP neighbor 172.17.17.1,
# configured in the group PEERS-GROUP-NAME

Output Example:

```
{
    'PEERS-GROUP-NAME':{
        'type': 'external',
        'description': 'Here we should have a nice description',
        'apply_groups': ['BGP-PREFIX-LIMIT'],
        'import_policy': 'PUBLIC-PEER-IN',
        'export_policy': 'PUBLIC-PEER-OUT',
        'remove_private': True,
        'multipath': True,
        'multihop_ttl': 30,
        'neighbors':{
            '192.168.0.1':{
                'description': 'Facebook [CDN]',
                'prefix_limit':{
                    'inet':{
                        'unicast':{
                            'limit': 100,
                            'teardown':{
                                'threshold': 95,
                                'timeout': 5
                            }
                        }
                    }
                }
            },
            'peer-as': 32934,
            'route_reflector': False,
            'nhs': True
        },
        '172.17.17.1':{
            'description': 'Twitter [CDN],

(continues on next page)
```
salt.modules.napalm_bgp.neighbors(neighbor=None, **kwargs)

Provides details regarding the BGP sessions configured on the network device.

Parameters

neighbor -- IP Address of a specific neighbor.

Returns

A dictionary with the statistics of the all/selected BGP neighbors. Outer dictionary keys
represent the VRF name. Keys of inner dictionary represent the AS numbers, while the
values are lists of dictionaries, having the following keys:

- up (True/False)
- local_as (int)
- remote_as (int)
- local_address (string)
- routing_table (string)
- local_address_configured (True/False)
- local_port (int)
- remote_address (string)
- remote_port (int)
- multihop (True/False)
- multipath (True/False)
- remove_private_as (True/False)
- import_policy (string)
- export_policy (string)
- input_messages (int)
- output_messages (int)
- input_updates (int)
- output_updates (int)
- messages_queued_out (int)
- connection_state (string)
- previous_connection_state (string)
- last_event (string)
- suppress_4byte_as (True/False)
- local_as_prepend (True/False)
- holdtime (int)
- configured_holdtime (int)
- keepalive (int)
- configured_keepalive (int)
- active_prefix_count (int)
- received_prefix_count (int)
- accepted_prefix_count (int)
- suppressed_prefix_count (int)
- advertised_prefix_count (int)
- flap_count (int)

CLI Example:

```
salt '*' bgp.neighbors  # all neighbors
salt '*' bgp.neighbors 172.17.17.1  # only session with BGP neighbor(s) with 172.17.17.1
```

Output Example:

```
{
'default': {
  8121: [
    {'up': True,
     'local_as': 13335,
     'remote_as': 8121,
     'local_address': '172.101.76.1',
     'local_address_configured': True,
     'local_port': 179,
     'remote_address': '192.247.78.0',
     'router_id': '192.168.0.1',
     'remote_port': 58380,
     'multihop': False,
     'import_policy': '4-NTT-TRANSIT-IN',
     'export_policy': '4-NTT-TRANSIT-OUT',
     'input_messages': 123,
     'output_messages': 13,
     'input_updates': 123,
     'output_updates': 5,
     'messages_queued_out': 23,
     'connection_state': 'Established'},
    ...
  ]
}
```
previous_connection_state: 'EstabSync',
last_event: 'RecvKeepAlive',
suppress_4byte_as: False,
local_as_prepend: False,
holdtime: 90,
configured_holdtime: 90,
keepalive: 30,
configured_keepalive: 30,
active_prefix_count: 132808,
received_prefix_count: 566739,
accepted_prefix_count: 566479,
suppressed_prefix_count: 0,
adVERTISE_prefix_count: 0,
flap_count: 27

26.6.281 salt.modules.napalm_formula

NAPALM Formula helpers

New in version 2019.2.0.

This is an Execution Module providing helpers for various NAPALM formulas, e.g., napalm-interfaces-formula, napalm-bgp-formula, napalm-ntp-formula etc., meant to provide various helper functions to make the templates more readable.

salt.modules.napalm_formula.container_path(model, key=None, container=None, delim=':')

Return the list of all the possible paths in a container, down to the config container. This function can be used to verify that the model is a Python object correctly structured and respecting the OpenConfig hierarchy.

model

The OpenConfig-structured object to inspect.

delim:

The key delimiter. In particular cases, it is indicated to use // as : might be already used in various cases, e.g., IPv6 addresses, interface name (e.g., Juniper QFX series), etc.

CLI Example:

```
salt '*' napalm_formula.container_path "{"interfaces": {"interface": {"Ethernet1": {"config": {"name": "Ethernet1"}}}}}"
```

The example above would return a list with the following element: interfaces:interface:Ethernet1:config which is the only possible path in that hierarchy.

Other output examples:

- interfaces:interface:Ethernet1:config
- interfaces:interface:Ethernet1:subinterfaces:subinterface:0:config
- interfaces:interface:Ethernet2:config

salt.modules.napalm_formula.defaults(model, defaults_, delim='/', flipped_merge=False)

Apply the defaults to a Python dictionary having the structure as described in the OpenConfig standards.
model
The OpenConfig model to apply the defaults to.

defaults
The dictionary of defaults. This argument must equally be structured with respect to the OpenConfig standards.

For ease of use, the keys of these support glob matching, therefore we don’t have to provide the defaults for each entity but only for the entity type. See an example below.

delim: //
The key delimiter to use. Generally, // should cover all the possible cases, and you don’t need to override this value.

flipped_merge: False
Whether should merge the model into the defaults, or the defaults into the model. Default: False (merge the model into the defaults, i.e., any defaults would be overridden by the values from the model).

CLI Example:

```
salt '*' napalm_formula.defaults "{"interfaces": {"interface": {"Ethernet1 \*": {"config": {"name": 'Ethernet1'}}}}}" "{"interfaces": {"interface": {\*": {"config": {"enabled": True}}}}}"```  

As one can notice in the example above, the * corresponds to the interface name, therefore, the defaults will be applied on all the interfaces.

```
salt.modules.napalm_formula.dictupdate(dest, upd, recursive_update=True, merge_lists=False)
```

Recursive version of the default dict.update

Merges upd recursively into dest

If recursive_update=False, will use the classic dict.update, or fall back on a manual merge (helpful for non-dict types like FunctionWrapper).

If merge_lists=True, will aggregate list object types instead of replace. The list in upd is added to the list in dest, so the resulting list is dest[key] + upd[key]. This behaviour is only activated when recursive_update=True. By default merge_lists=False.

```
salt.modules.napalm_formula.render_field(dictionary, field, prepend=None, append=None, quotes=False, **opts)
```

Render a field found under the field level of the hierarchy in the dictionary object. This is useful to render a field in a Jinja template without worrying that the hierarchy might not exist. For example if we do the following in Jinja: `{{ interfaces.interface.Ethernet5.config.description }}` for the following object: `{'interfaces': {'interface': {'Ethernet1': {'config': {'enabled': True}}}}}` it would error, as the Ethernet5 key does not exist. With this helper, we can skip this and avoid existence checks. This must be however used with care.

dictionary
The dictionary to traverse.

field
The key name or part to traverse in the dictionary.

prepend: None
The text to prepend in front of the text. Usually, we need to have the name of the field too when generating the configuration.

append: None
Text to append at the end.

quotes: False
Whether should wrap the text around quotes.
salt '//' napalm_formula.render_field "{'enabled': True}" enabled
# This would return the value of the `enabled` leaf key
salt '//' napalm_formula.render_field "{'enabled': True}" description
# This would not error

Jinja usage example:

```%
- set config = {'enabled': True, 'description': 'Interface description'}
- %

{{ salt.napalm_formula.render_field(config, 'description', quotes=True) }}
```

The example above would be rendered on Arista / Cisco as:

description "Interface description"

While on Junos (the semicolon is important to be added, otherwise the configuration won't be accepted by Junos):

description "Interface description";

salt.modules.napalm_formula.render_fields(dictionary, *fields, **opts)

This function works similarly to render_field but for a list of fields from the same dictionary, rendering, indenting and distributing them on separate lines.

dictionary
The dictionary to traverse.

fields
A list of field names or paths in the dictionary.

indent: 0
The indentation to use, prepended to the rendered field.

separator: 

The separator to use between fields.

CLI Example:

```salt '//' napalm_formula.render_fields "{'mtu': 68, 'description': 'Interface description'}" mtu description```

Jinja usage example:

```%
- set config={'mtu': 68, 'description': 'Interface description'}
- %

{{ salt.napalm_formula.render_fields(config, 'mtu', 'description', quotes=True) }}
```

The Jinja example above would generate the following configuration:

mtu "68"
description "Interface description"

salt.modules.napalm_formula.setval(key, val, dict_=None, delim=': ')

Set a value under the dictionary hierarchy identified under the key. The target 'foo/bar/baz' returns the dictionary hierarchy ['foo': {'bar': {'baz': []}}].

**Note:** Currently this doesn't work with integers, i.e. cannot build lists dynamically.
CLI Example:

```bash
salt '*' formula.setval foo:baz:bar True
```

**salt.modules.napalm_formula.traverse**(data, key, default=None, delimiter=":")

Traverse a dict or list using a colon-delimited (or otherwise delimited, using the delimiter param) target string. The target `foo:bar:0` will return `data['foo']['bar'][0]` if this value exists, and will otherwise return the dict in the default argument. Function will automatically determine the target type. The target `foo:bar:0` will return `data['foo']['bar'][0]` if data like `{ 'foo': { 'bar': [ 'baz' ] } }`, if data like `{ 'foo': { 'bar': { '0': 'baz' } } }` then return `data['foo']['bar']['0']`

CLI Example:

```bash
salt '*' napalm_formula.traverse "{'foo': {'bar': {'baz': True}}}" foo:baz:bar
```

### 26.6.282 salt.modules.napalm_mod

**NAPALM helpers**

Helpers for the NAPALM modules.

New in version 2017.7.0.

**salt.modules.napalm_mod.alive**(**kwargs)

Returns the alive status of the connection layer. The output is a dictionary under the usual dictionary output of the NAPALM modules.

CLI Example:

```bash
salt '*' napalm.alive
```

Output Example:

```
result: True
out:
  is_alive: False
comment: '':
```

**salt.modules.napalm_mod.call**(method, *args, **kwargs)

Execute arbitrary methods from the NAPALM library. To see the expected output, please consult the NAPALM documentation.

**Note:** This feature is not recommended to be used in production. It should be used for testing only!

CLI Example:

```bash
salt '*' napalm.call get_lldp_neighbors
salt '*' napalm.call get_firewall_policies
salt '*' napalm.call get_bgp_config group='my-group'
```

**salt.modules.napalm_mod.compliance_report**(filepath=None, string=None, renderer='jinja|yaml', **kwargs)

Return the compliance report.
filepath

The absolute path to the validation file.

Changed in version 2019.2.0.

Beginning with release codename 2019.2.0, this function has been enhanced, to be able to leverage the multi-engine template rendering of Salt, besides the possibility to retrieve the file source from remote systems, the URL schemes supported being:

- salt://
- ftp://
- s3://
- swift://

Or on the local file system (on the Minion).

Note: The rendering result does not necessarily need to be YAML, instead it can be any format interpreted by Salt's rendering pipeline (including pure Python).

string

New in version 2019.2.0.

The compliance report send as inline string, to be used as the file to send through the renderer system. Note, not all renderer modules can work with strings; the 'py' renderer requires a file, for example.

renderer: jinja|yaml

New in version 2019.2.0.

The renderer pipe to send the file through; this is overridden by a "she-bang" at the top of the file.

kwargs

Changed in version 2019.2.0.

Keyword args to pass to Salt's compile_template() function.

CLI Example:

```
salt '*' napalm.compliance_report ~/validate.yml
salt '*' napalm.compliance_report salt://path/to/validator.sls
```

Validation File Example (pure YAML):

```
- get_facts:
  os_version: 4.17

- get_interfaces_ip:
  Management1:
    ipv4:
      10.0.2.14:
        prefix_length: 24
        _mode: strict
```

Validation File Example (as Jinja + YAML):

```
- get_facts:
  os_version: {{ grains.version }}

- get_interfaces_ip:
  Loopback0:
    ipv4:
      {{ grains.lo0.ipv4 }}:
```

(continues on next page)
prefix_length: 24
mode: strict
- get_bgp_neighbors: {{ pillar.bgp.neighbors }}

Output Example:

```
device1:
    -------
    comment:
    out:
        -------
        complies:
        False
    get_facts:
        -------
        complies:
        False
        extra:
        missing:
        present:
            -------
            os_version:
                -------
                actual_value:
                15.1F6-S1.4
                complies:
                False
                nested:
                False
    get_interfaces_ip:
        -------
        complies:
        False
        extra:
        missing:
            - Management1
        present:
            -------
    skipped:
    result:
        True
```

New in version 2019.2.0.

Return the diff, as text, between the two different configuration sources. The sources can be either specified using the `source1` and `source2` arguments when retrieving from the managed network device.

**source1**: `candidate`

The source from where to retrieve the configuration to be compared with. Available options: candidate, running, startup. Default: candidate.

**candidate_path**

Absolute or remote path from where to load the candidate configuration text. This argument allows any
source2: **running**
The source from where to retrieve the configuration to compare with. Available options: candidate, running, startup. Default: running.

**running_path**
Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by cp.get_url(), e.g., salt://, https://, s3://, ftp://, etc.

**saltenv**: **base**
Salt fileserver environment from which to retrieve the file. Ignored if candidate_path or running_path is not a salt:// URL.

**CLI Example:**
```
salt '*' napalm.config_diff_text
salt '*' napalm.config_diff_text candidate_path=https://bit.ly/2mAdq7z
# Would compare the running config with the configuration available at
# https://bit.ly/2mAdq7z
```

**salt.modules.napalm_mod.config_diff_tree** *(source1='candidate', candidate_path=None, source2='running', running_path=None)*

New in version 2019.2.0.

Return the diff, as Python dictionary, between two different sources. The sources can be either specified using the source1 and source2 arguments when retrieving from the managed network device.

source1: **candidate**
The source from where to retrieve the configuration to be compared with. Available options: candidate, running, startup. Default: candidate.

candidate_path
Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by cp.get_url(), e.g., salt://, https://, s3://, ftp://, etc.

source2: **running**
The source from where to retrieve the configuration to compare with. Available options: candidate, running, startup. Default: running.

**running_path**
Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by cp.get_url(), e.g., salt://, https://, s3://, ftp://, etc.

**saltenv**: **base**
Salt fileserver environment from which to retrieve the file. Ignored if candidate_path or running_path is not a salt:// URL.

**CLI Example:**
```
salt '*' napalm.config_diff_text
salt '*' napalm.config_diff_text candidate_path=https://bit.ly/2mAdq7z
# Would compare the running config with the configuration available at
# https://bit.ly/2mAdq7z
```

**salt.modules.napalm_mod.config_filter_lines** *(parent_regex, child_regex, source='running')*

New in version 2019.2.0.

Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent respects the regular expressions configured via the parent_regex argument, and the child matches the...
child_regex regular expression. The result is a list of dictionaries with the following keys:
  • match: a boolean value that tells whether child_regex matched any children lines.
  • parent: the parent line (as text).
  • child: the child line (as text). If no child line matched, this field will be None.

Note: This function is only available only when the underlying library ciscoconfparse is installed. See ciscoconfparse module for more details.

parent_regex
  The regular expression to match the parent configuration lines against.
child_regex
  The regular expression to match the child configuration lines against.
source: running
  The configuration type to retrieve from the network device. Default: running. Available options:
  running, startup, candidate.

CLI Example:

```
salt '*' napalm.config_filter_lines '^interface' 'ip address'
salt '*' napalm.config_filter_lines '^interface' 'shutdown'
salt.modules.napalm_mod.config_find_lines(regex, source='running')
```

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the regex argument. The configuration is read from the network device interrogated.

regex
  The regular expression to match the configuration lines against.
source: running
  The configuration type to retrieve from the network device. Default: running. Available options:
  running, startup, candidate.

CLI Example:

```
salt '*' napalm.config_find_lines '^interface Ethernet1\d'
```

salt.modules.napalm_mod.config_lines_w_child(parent_regex, child_regex, source='running')

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the parent_regex argument, having child lines matching child_regex. The configuration is read from the network device interrogated.

Note: This function is only available only when the underlying library ciscoconfparse is installed. See ciscoconfparse module for more details.

parent_regex
  The regular expression to match the parent configuration lines against.
child_regex
  The regular expression to match the child configuration lines against.
source: running
  The configuration type to retrieve from the network device. Default: running. Available options:
  running, startup, candidate.

CLI Example:
**salt.modules.napalm_mod.config_lines_w_child** *(parent_regex, child_regex, source='running')*

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the `parent_regex` argument, having the child lines *not* matching `child_regex`. The configuration is read from the network device interrogated.

**Note:** This function is only available only when the underlying library `ciscoconfparse` is installed. See `ciscoconfparse` module for more details.

**parent_regex**
- The regular expression to match the parent configuration lines against.

**child_regex**
- The regular expression to match the child configuration lines against.

**source:** `running`
- The configuration type to retrieve from the network device. Default: `running`. Available options: running, startup, candidate.

CLI Example:

```bash
salt '*' napalm.config_lines_w_child '^interface' 'ip address'
salt '*' napalm.config_lines_w_child '^interface' 'shutdown'
```

- `source=candidate`

---

**salt.modules.napalm_mod.config_lines_wo_child** *(parent_regex, child_regex, source='running')*

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the `parent_regex` argument, having the child lines *not* matching `child_regex`. The configuration is read from the network device interrogated.

**source:** `candidate`
- The configuration type to retrieve from the network device. Default: `candidate`.

---

**salt.modules.napalm_mod.config_merge_diff** *(source='running', merge_config=None, merge_path=None, saltenv='base')*

New in version 2019.2.0.

Return the merge diff, as text, after merging the merge config into the configuration source requested (without loading the config on the device).

**source:** `running`
- The configuration type to retrieve from the network device. Default: `running`. Available options: running, startup, candidate.

**merge_config**
- The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

**merge_path**
- Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv:** `base`
- Salt fileserver environment from which to retrieve the file. Ignored if `merge_path` is not a `salt://` URL.

CLI Example:

```bash
salt '*' napalm.config_merge_diff merge_path=salt://path/to/merge.cfg
```

---

**salt.modules.napalm_mod.config_merge_text** *(source='running', merge_config=None, merge_path=None, saltenv='base')*

New in version 2019.2.0.

Return the merge result of the configuration from `source` with the merge configuration, as plain text (without loading the config on the device).

---

26.6. execution modules 2443
source: **running**
The configuration type to retrieve from the network device. Default: running. Available options:
running, startup, candidate.

merge_config
The config to be merged into the initial config, sent as text. This argument is ignored when
merge_path is set.

merge_path
Absolute or remote path from where to load the merge configuration text. This argument allows any
URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

saltenv: **base**
Salt fileserver environment from which to retrieve the file. Ignored if merge_path is not a salt://
URL.

CLI Example:

```bash
classic '!' napalm.config_merge_text merge_path=salt://path/to/merge.cfg
```

salt.modules.napalm_mod.config_merge_tree(source='running', merge_config=None,
merge_path=None, saltenv='base')

New in version 2019.2.0.

Return the merge tree of the initial_config with the merge_config, as a Python dictionary.

source: **running**
The configuration type to retrieve from the network device. Default: running. Available options:
running, startup, candidate.

merge_config
The config to be merged into the initial config, sent as text. This argument is ignored when
merge_path is set.

merge_path
Absolute or remote path from where to load the merge configuration text. This argument allows any
URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

saltenv: **base**
Salt fileserver environment from which to retrieve the file. Ignored if merge_path is not a salt://
URL.

CLI Example:

```bash
classic '!' napalm.config_merge_tree merge_path=salt://path/to/merge.cfg
```

salt.modules.napalm_mod.config_tree(source='running', with_tags=False)

New in version 2019.2.0.

Transform Cisco IOS style configuration to structured Python dictionary. Depending on the value of the
with_tags argument, this function may provide different views, valuable in different situations.

source: **running**
The configuration type to retrieve from the network device. Default: running. Available options:
running, startup, candidate.

with_tags: **False**
Whether this function should return a detailed view, with tags.

CLI Example:

```bash
classic '!' napalm.config_tree
```

salt.modules.napalm_mod.junos_call(fun, *args, **kwargs)

New in version 2019.2.0.

Execute an arbitrary function from the junos execution module. To check what args and kwargs
you must send to the function, please consult the appropriate documentation.
fun
   The name of the function. E.g., set_hostname.
args
   List of arguments to send to the junos function invoked.
kwargs
   Dictionary of key-value arguments to send to the junos function invoked.

CLI Example:
salt '*' napalm.junos_fun cli 'show system commit'

salt.modules.napalm_mod.junos_cli(command, format=None, dev_timeout=None, dest=None, **kwargs)

New in version 2019.2.0.
Execute a CLI command and return the output in the specified format.

command
   The command to execute on the Junos CLI.
format: text
   Format in which to get the CLI output (either text or xml).
dev_timeout: 30
   The NETCONF RPC timeout (in seconds).
dest
   Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion. To push the files to the Master, use cp.push.

CLI Example:

salt '*' napalm.junos_cli 'show lldp neighbors'

salt.modules.napalm_mod.junos_commit(**kwargs)

New in version 2019.2.0.
Commit the changes loaded in the candidate configuration.

dev_timeout: 30
   The NETCONF RPC timeout (in seconds).
comment
   Provide a comment for the commit.
confirm
   Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.
sync: False
   When True, on dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines.
force_sync: False
   When True, on dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.
full
   When True, requires all the daemons to check and evaluate the new configuration.
detail
   When True, return commit detail.

CLI Examples:
salt '*' napalm.junos_commit comment='Committing via Salt' detail=True
salt '*' napalm.junos_commit dev_timeout=60 confirm=10
salt '*' napalm.junos_commit sync=True dev_timeout=90
salt.modules.napalm_mod.junos_copy_file(src, dst, **kwargs)

New in version 2019.2.0.

Copies the file on the remote Junos device.
src
 The source file path. This argument accepts the usual Salt URIs (e.g., salt://, http://, https://, s3://, ftp://, etc.).
dst
 The destination path on the device where to copy the file.

CLI Example:

```
salt '*' napalm.junos_copy_file https://example.com/junos.cfg /var/tmp/→myjunos.cfg
```

salt.modules.napalm_mod.junos_facts(**kwargs)

New in version 2019.2.0.

The complete list of Junos facts collected by junos-eznc.

CLI Example:

```
salt '*' napalm.junos_facts
```

salt.modules.napalm_mod.junos_install_os(path=None, **kwargs)

New in version 2019.2.0.

Installs the given image on the device.
path
 The image file source. This argument supports the following URIs:
• Absolute path on the Minion.
• salt:// to fetch from the Salt fileserver.
• http:// and https://
• ftp://
• swift://
• s3://
debug_timeout: 30
 The NETCONF RPC timeout (in seconds)
reboot: False
 Whether to reboot the device after the installation is complete.
no_copy: False
 If True the software package will not be copied to the remote device.

CLI Example:

```
salt '*' napalm.junos_install_os salt://images/junos_16_1.tgz reboot=True
```

salt.modules.napalm_mod.junos_rpc(cmd=None, dest=None, format=None, **kwargs)

New in version 2019.2.0.

Execute an RPC request on the remote Junos device.
cmd
 The RPC request to the executed. To determine the RPC request, you can check the from the command line of the device, by executing the usual command followed by | display xml rpc, e.g., show lldp neighbors | display xml rpc.
dest
 Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion. To push the files to the Master, use cp.push Execution function.
format: **xml**
  The format in which the RPC reply is received from the device.

**dev_timeout**: **30**
  The NETCONF RPC timeout.

**filter**
  Used with the get-config RPC request to filter out the config tree.

**terse**: **False**
  Whether to return terse output.

**Note**: Some RPC requests may not support this argument.

interface_name
  Name of the interface to query.

**CLI Example:**

```
salt '*' napalm.junos_rpc get-lldp-neighbors-information
salt '*' napalm.junos_rpc get-config <configuration><system><ntp/></system></configuration>
```

**salt.modules.napalm_mod.netmiko_args(**kwargs**)**

New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the netmiko module.

When running in a non-native NAPALM driver (e.g., panos, f5, mos - either from https://github.com/napalm-automation-community or defined in user's own environment, one can specify the Netmiko device type (the device_type argument) via the netmiko_device_type_map configuration option / Pillar key, e.g.,

```
netmiko_device_type_map:
f5: f5_ltm
dellos10: dell_os10
```

The configuration above defines the mapping between the NAPALM os Grain and the Netmiko device_type, e.g., when the NAPALM Grain is f5, it would use the f5_ltm SSH Netmiko driver to execute commands over SSH on the remote network device.

**CLI Example:**

```
salt '*' napalm.netmiko_args
```

**salt.modules.napalm_mod.netmiko_call**(method, **args**, **kwargs**)

New in version 2019.2.0.

Execute an arbitrary Netmiko method, passing the authentication details from the existing NAPALM connection.

**method**
  The name of the Netmiko method to execute.

**args**
  List of arguments to send to the Netmiko method specified in method.

**kwargs**
  Key-value arguments to send to the execution function specified in method.

**CLI Example:**

```
salt '*' napalm.netmiko_call send_command 'show version'
```
salt.modules.napalm_mod.netmiko_commands(*commands, **kwargs)

New in version 2019.2.0.

Invoke one or more commands to be executed on the remote device, via Netmiko. Returns a list of strings, with the output from each command.

commands
   A list of commands to be executed.

expect_string
   Regular expression pattern to use for determining end of output. If left blank will default to being based on router prompt.

delay_factor: 1
   Multiplying factor used to adjust delays (default: 1).

max_loops: 500
   Controls wait time in conjunction with delay_factor. Will default to be based upon self.timeout.

auto_find_prompt: True
   Whether it should try to auto-detect the prompt (default: True).

strip_prompt: True
   Remove the trailing router prompt from the output (default: True).

strip_command: True
   Remove the echo of the command from the output (default: True).

normalize: True
   Ensure the proper enter is sent at end of command (default: True).

use_textfsm: False
   Process command output through TextFSM template (default: False).

CLI Example:

salt '*' napalm.netmiko_commands 'show version' 'show interfaces'

salt.modules.napalm_mod.netmiko_config(*config_commands, **kwargs)

New in version 2019.2.0.

Load a list of configuration commands on the remote device, via Netmiko.

Warning: Please remember that netmiko does not have any rollback safeguards and any configuration change will be directly loaded into the running config if the platform doesn't have the concept of candidate config.

On Junos, or other platforms that have this capability, the changes will not be loaded into the running config, and the user must set the commit argument to True to transfer the changes from the candidate into the running config before exiting.

config_commands
   A list of configuration commands to be loaded on the remote device.

config_file
   Read the configuration commands from a file. The file can equally be a template that can be rendered using the engine of choice (see template_engine).

   This can be specified using the absolute path to the file, or using one of the following URL schemes:
      • salt://, to fetch the file from the Salt fileserver.
      • http:// or https://
      • ftp://
      • s3://
      • swift://

exit_config_mode: True
   Determines whether or not to exit config mode after complete.
**delay_factor:** 1
  Factor to adjust delays.

**max_loops:** 150
  Controls wait time in conjunction with delay_factor (default: 150).

**strip_prompt:** False
  Determines whether or not to strip the prompt (default: False).

**strip_command:** False
  Determines whether or not to strip the command (default: False).

**config_mode_command**
  The command to enter into config mode.

**commit:** False
  Commit the configuration changes before exiting the config mode. This option is by default disabled, as many platforms don’t have this capability natively.

**CLI Example:**
```
salt '*' napalm.netmiko_config 'set system ntp peer 1.2.3.4' commit=True
```

salt.modules.napalm_mod.netmiko_fun(func, *args, **kwargs)
  New in version 2019.2.0.
  Call an arbitrary function from the Netmiko module, passing the authentication details from the existing NAPALM connection.

  - **fun**: The name of the function from the Netmiko to invoke.
  - **args**: List of arguments to send to the execution function specified in `fun`.
  - **kwargs**: Key-value arguments to send to the execution function specified in `fun`.

  **CLI Example:**
  ```
salt '*' napalm.netmiko_fun send_command 'show version'
```

salt.modules.napalm_mod.netmiko_multi_call(*methods, **kwargs)
  New in version 2019.2.0.
  Execute a list of arbitrary Netmiko methods, passing the authentication details from the existing NAPALM connection.

  - **methods**: List of dictionaries with the following keys:
    - **name**: the name of the Netmiko function to invoke.
    - **args**: list of arguments to send to the `name` method.
    - **kwargs**: key-value arguments to send to the `name` method.

  **CLI Example:**
  ```
salt '*' napalm.netmiko_multi_call [{'name': 'send_command', 'args': ['show version']}, {'name': 'send_command', 'args': ['show interfaces']}
```

salt.modules.napalm_mod.nxos_api_config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)
  New in version 2019.2.0.
  Configures the Nexus switch with the specified commands, via the NX-API.
commands
The list of configuration commands to load on the Nexus switch.

Note: This argument is ignored when config_file is specified.

config_file
The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:
- salt://
- https://
- ftp://
- s3://
- swift://

template_engine: jinja
The template engine to use when rendering the source file. Default: jinja. To simply fetch the file without attempting to render, set this argument to None.

context: None
Variables to add to the template context.

defaults: None
Default values of the context dict.
saltenv: base
Salt filesystem environment from which to retrieve the file. Ignored if config_file is not a salt:// URL.

CLI Example:

```bash
salt '*' napalm.nxos_api_config 'spanning-tree mode mstp'
salt '*' napalm.nxos_api_config config_file=https://bit.ly/2LGLcDy, context="{'servers': ['1.2.3.4']}"
```

salt.modules.napalm_mod.nxos_api_rpc(commands, method='cli', **kwargs)
New in version 2019.2.0.
Execute an arbitrary RPC request via the Nexus API.

commands
The RPC commands to be executed.

method: cli
The type of the response, i.e., raw text (cli_ascii) or structured document (cli). Defaults to cli (structured data).

CLI Example:

```bash
salt '*' napalm.nxos_api_rpc 'show version'
```

salt.modules.napalm_mod.nxos_api_show(commands, raw_text=True, **kwargs)
New in version 2019.2.0.
Execute one or more show (non-configuration) commands.

commands
The commands to be executed.

raw_text: True
Whether to return raw text or structured data.

CLI Example:
salt.modules.napalm_mod.pyeapi_call(method, *args, **kwargs)

New in version 2019.2.0.

Invoke an arbitrary method from the pyeapi library. This function forwards the existing connection details to the pyeapi.run_commands execution function.

**method**

The name of the pyeapi method to invoke.

**kwargs**

Key-value arguments to send to the pyeapi method.

CLI Example:

```
salt '*' napalm.pyeapi_call run_commands 'show version' encoding=text
salt '*' napalm.pyeapi_call get_config as_string=True
```

salt.modules.napalm_mod.pyeapi_config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)

New in version 2019.2.0.

Configures the Arista switch with the specified commands, via the pyeapi library. This function forwards the existing connection details to the pyeapi.run_commands execution function.

**commands**

The list of configuration commands to load on the Arista switch.

**config_file**

The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- salt://
- https://
- ftp://
- s3://
- swift://

**template_engine:** jinja

The template engine to use when rendering the source file. Default: jinja. To simply fetch the file without attempting to render, set this argument to None.

**context:** None

Variables to add to the template context.

**defaults:** None

Default values of the context dict.

**saltenv:** base

Salt fileserver environment from which to retrieve the file. Ignored if config_file is not a salt:// URL.

CLI Example:

```
salt '*' napalm.pyeapi_config 'ntp server 1.2.3.4'
```

salt.modules.napalm_mod.pyeapi_nxos_api_args(**prev_kwargs)
New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the pyeapi execution module.

CLI Example:

```
salt '*' napalm.pyeapi_nxos_api_args
```

```
salt.modules.napalm_mod.pyeapi_run_commands(*commands, **kwargs)
```

Execute a list of commands on the Arista switch, via the pyeapi library. This function forwards the existing connection details to the pyeapi.run_commands execution function.

**commands**
A list of commands to execute.

**encoding:** json
The requested encoding of the command output. Valid values for encoding are json (default) or text.

CLI Example:

```
salt '*' napalm.pyeapi_run_commands 'show version' encoding=text
salt '*' napalm.pyeapi_run_commands 'show ip bgp neighbors'
```

```
salt.modules.napalm_mod.reconnect(force=False, **kwargs)
```

Reconnect the NAPALM proxy when the connection is dropped by the network device. The connection can be forced to be restarted using the force argument.

**Note:** This function can be used only when running proxy minions.

CLI Example:

```
salt '*' napalm.reconnect
salt '*' napalm.reconnect force=True
```

```
salt.modules.napalm_mod.rpc(command, **kwargs)
```

New in version 2019.2.0.

This is a wrapper to execute RPC requests on various network operating systems supported by NAPALM, invoking the following functions for the NAPALM native drivers:

- napalm.junos_rpc for junos
- napalm.pyeapi_run_commands for eos
- napalm.nxos_api_rpc for nxos
- napalm.netmiko_commands for ios, iosxr, and nxos_ssh

**command**
The RPC command to execute. This depends on the nature of the operating system.

**kwargs**
Key-value arguments to be sent to the underlying Execution function.

The function capabilities are extensible in the user environment via the napalm_rpc_map configuration option / Pillar, e.g.,

```
napalm_rpc_map:
  f5: napalm.netmiko_commands
  panos: panos.call
```
The mapping above reads: when the NAPALM os Grain is f5, then call \texttt{napalm.netmiko\_commands} for RPC requests.

By default, if the user does not specify any map, non-native NAPALM drivers will invoke the \texttt{napalm.netmiko\_commands} Execution function.

CLI Example:

\begin{verbatim}
salt '*\' napalm.rpc 'show version'
salt '*\' napalm.rpc get-interfaces
\end{verbatim}

\texttt{salt\_modules.napalm\_mod.scp\_get}(\texttt{remote\_path}, \texttt{local\_path=''}, \texttt{recursive=False}, \texttt{preserve\_times=False},
\texttt{**kwargs})

New in version 2019.2.0.

Transfer files and directories from remote network device to the localhost of the Minion.

\textbf{Note:} This function is only available only when the underlying library \texttt{scp} is installed. See \texttt{scp module} for more details.

\begin{description}
\item[remote\_path] Path to retrieve from remote host. Since this is evaluated by scp on the remote host, shell wildcards and environment variables may be used.
\item[recursive] \texttt{False} Transfer files and directories recursively.
\item[preserve\_times] \texttt{False} Preserve mtime and atime of transferred files and directories.
\item[passphrase] Used for decrypting private keys.
\item[pkey] An optional private key to use for authentication.
\item[key\_filename] The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
\item[timeout] An optional timeout (in seconds) for the TCP connect.
\item[socket\_timeout] 10 The channel socket timeout in seconds.
\item[buf\_size] 16384 The size of the SCP send buffer.
\item[allow\_agent] \texttt{True} Set to \texttt{False} to disable connecting to the SSH agent.
\item[look\_for\_keys] \texttt{True} Set to \texttt{False} to disable searching for discoverable private key files in ~/.ssh/
\item[banner\_timeout] An optional timeout (in seconds) to wait for the SSH banner to be presented.
\item[auth\_timeout] An optional timeout (in seconds) to wait for an authentication response.
\item[auto\_add\_policy] \texttt{False} Automatically add the host to the known\_hosts.
\end{description}

CLI Example:

\begin{verbatim}
salt '*\' napalm.scp\_get /var/tmp/file /tmp/file auto\_add\_policy=True
\end{verbatim}

\texttt{salt\_modules.napalm\_mod.scp\_put}(\texttt{files}, \texttt{remote\_path=None}, \texttt{recursive=False}, \texttt{preserve\_times=False},
\texttt{saltenv='base'}, \texttt{**kwargs})
New in version 2019.2.0.

Transfer files and directories to remote network device.

**Note:** This function is only available only when the underlying library `scp` is installed. See [scp module](scp_module) for more details.

```python
files
A single path or a list of paths to be transferred.
```

```python
remote_path
The path on the remote device where to store the files.
```

```python
recursive: True
Transfer files and directories recursively.
```

```python
preserve_times: False
Preserve mtime and atime of transferred files and directories.
```

```python
saltenv: base
The name of the Salt environment. Ignored when files is not a salt:// URL.
```

```python
hostname
The hostname of the remote device.
```

```python
port: 22
The port of the remote device.
```

```python
username
The username required for SSH authentication on the device.
```

```python
password
Used for password authentication. It is also used for private key decryption if passphrase is not given.
```

```python
passphrase
Used for decrypting private keys.
```

```python
pkey
An optional private key to use for authentication.
```

```python
key_filename
The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
```

```python
timeout
An optional timeout (in seconds) for the TCP connect.
```

```python
socket_timeout: 10
The channel socket timeout in seconds.
```

```python
buff_size: 16384
The size of the SCP send buffer.
```

```python
allow_agent: True
Set to False to disable connecting to the SSH agent.
```

```python
look_for_keys: True
Set to False to disable searching for discoverable private key files in ~/.ssh/
```

```python
banner_timeout
An optional timeout (in seconds) to wait for the SSH banner to be presented.
```

```python
auth_timeout
An optional timeout (in seconds) to wait for an authentication response.
```

```python
auto_add_policy: False
Automatically add the host to the known_hosts.
```

CLI Example:

```bash
salt '*' napalm.scp_put /path/to/file /var/tmp/file auto_add_policy=True
```
26.6.283 salt.modules.napalm_netacl

NAPALM ACL

Generate and load ACL (firewall) configuration on network devices.
New in version 2017.7.0.

    codeauthor
        Mircea Ulinic <ping@mirceaulinic.net>

    maturity
        new

    depends
        capirca, napalm

    platform
        unix

Dependencies

The firewall configuration is generated by Capirca.
To install Capirca, execute: pip install capirca.

To be able to load configuration on network devices, it requires NAPALM library to be installed: pip install napalm. Please check Installation for complete details.

salt.modules.napalm_netacl.get_filter_pillar( filter_name, pillar_key='acl', pillarenv=None, saltenv=None )

    Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

    filter_name
        The name of the filter.

    pillar_key
        The root key of the whole policy config.

    pillarenv
        Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

    saltenv
        Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

salt.modules.napalm_netacl.get_term_pillar( filter_name, term_name, pillar_key='acl', pillarenv=None, saltenv=None )

    Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

    filter_name
        The name of the filter.

    term_name
        The name of the term.

    pillar_key: acl
        The root key of the whole policy config. Default: acl.

    pillarenv
        Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

    saltenv
        Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
salt.modules.napalm_netacl.load_filter_config(filter_name, filter_options=None, terms=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, **kwargs)

Generate and load the configuration of a policy filter.

Note: The order of the terms is very important. The configuration loaded on the device respects the order defined in the terms and/or inside the pillar.

When merging the terms with the pillar data, consider the prepend argument to make sure the order is correct!

filter_name
  The name of the policy filter.

filter_options
  Additional filter options. These options are platform-specific. See the complete list of options.

terms
  List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless merge_pillar is set as False.

prepend: True
  When merge_pillar is set as True, the final list of terms generated by merging the terms from terms with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to False.

pillar_key: acl
  The key in the pillar containing the default attributes values. Default: acl.

pillarenv
  Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv
  Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

merge_pillar: True
  Merge the CLI variables with the pillar. Default: True.

  The merge logic depends on the prepend argument and the CLI has higher priority than the pillar.

only_lower_merge: False
  Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: False. This option requires merge_pillar, otherwise it is ignored.

revision_id
  Add a comment in the filter config having the description for the changes applied.

revision_no
  The revision count.

revision_date: True
  Boolean flag: display the date when the filter configuration was generated. Default: True.

revision_date_format: %Y/%m/%d
  The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).

test: False
  Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

commit: True
  Commit? Default: True.
**debug**: *False*

Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

The output is a dictionary having the same form as `net.load_config`.

CLI Example:

```plaintext
class 'edge01.bjm01' netacl.load_filter_config my-filter pillar_key=netacl
  → debug=True
```

Output Example:

```plaintext
diff:
    [edit firewall]
    + family inet {
    +   /*
    +     ** $Date: 2017/03/22 $**
    +     */
    +     filter my-filter {
    +       interface-specific;
    +       term my-term {
    +         from {
    +           source-port [ 1234 1235 ];
    +         }
    +         then { reject; }
    +       }
    +     }
    +     term my-other-term {
    +       from {
    +         protocol tcp;
    +         source-port 5678-5680;
    +       }
    +       then accept;
    +     }
    +   }
  loaded_config:
    firewall {
      family inet {
        replace: /*
          ** $Date: 2017/03/22 $**
          */
        filter my-filter {
          interface-specific;
          term my-term {
```
The filter configuration has been loaded from the pillar, having the following structure:

```
netacl:
  - my-filter:
    terms:
      - my-term:
        source_port:
          - 1234
          - 1235
        action: reject
      - my-other-term:
        source_port:
          - 5678
          - 5680
        protocol: tcp
        action: accept
```

salt.modules.napalm_netacl.load_policy_config(filters=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, **kwargs)

Generate and load the configuration of the whole policy.

Note: The order of the filters and their terms is very important. The configuration loaded on the device respects the order defined in the filters and/or inside the pillar.

When merging the filters with the pillar data, consider the prepend argument to make sure the order is correct!
filters
List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless \code{merge_pillar} is set as \code{False}.

\code{prepend: True}
When \code{merge_pillar} is set as \code{True}, the final list of filters generated by merging the filters from \code{filters} with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to \code{False}.

\code{pillar_key: acl}
The key in the pillar containing the default attributes values. Default: \code{acl}.

\code{pillarenv}
Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

\code{saltenv}
Included only for compatibility with \code{pillarenv_from_saltenv}, and is otherwise ignored.

\code{merge_pillar: True}
Merge the CLI variables with the pillar. Default: \code{True}.

\code{only_lower_merge: False}
Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: \code{False}. This option requires \code{merge_pillar}, otherwise it is ignored.

\code{revision_id}
Add a comment in the policy config having the description for the changes applied.

\code{revision_no}
The revision count.

\code{revision_date: True}
Boolean flag: display the date when the policy configuration was generated. Default: \code{True}.

\code{revision_date_format: %Y/%m/%d}
The date format to be used when generating the perforce data. Default: \code{%Y/%m/%d} (\code{<year>/<month>/<day>}).

\code{test: False}
Dry run? If set as \code{True}, will apply the config, discard and return the changes. Default: \code{False} and will commit the changes on the device.

\code{commit: True}
Commit? Default: \code{True}.

\code{debug: False}
Debug mode. Will insert a new key under the output dictionary, as \code{loaded_config} containing the raw configuration loaded on the device.

The output is a dictionary having the same form as \code{net.load_config}.

CLI Example:

\begin{verbatim}
salt 'edge01.flw01' netacl.load_policy_config debug=True
\end{verbatim}

Output Example:

\begin{verbatim}
edge01.flw01:
       -------
 already_configured:  
           False
 comment:  
 diff:  

(continues on next page)
\end{verbatim}
The policy configuration has been loaded from the pillar, having the following structure:

```
acl:
  - my-filter:
    terms:
      - my-term:
        source_port:
        - 1234
        - 1235
        protocol:
          - tcp
          - udp
        source_address: 1.2.3.4
        action: reject
      - my-other-term:
```

source_port:  
    - [5678, 5680]  
protocol: tcp  
action: accept  
- block-icmp:  
  terms:  
  - first-term:  
    protocol: icmp  
    action: reject

salt.modules.napalm_netacl.load_term_config(filter_name, term_name, filter_options=None, 
pillar_key='acl', pillarenv=None, saltenv=None, 
merge_pillar=True, revision_id=None, 
revision_no=None, revision_date=True, 
revision_date_format='%Y/%m/%d', test=False, 
commit=True, debug=False, source_service=None, 
destination_service=None, **term_fields)

Generate and load the configuration of a policy term.  
filter_name  
The name of the policy filter.  
term_name  
The name of the term.  
filter_options  
Additional filter options. These options are platform-specific. See the complete list of options.  
pillar_key: acl  
The key in the pillar containing the default attributes values. Default: acl. If the pillar contains the following structure:

```
firewall:  
    - my-filter:  
      terms:  
      - my-term:  
        source_port: 1234  
        source_address:  
          - 1.2.3.4/32  
          - 5.6.7.8/32  
```

The pillar_key field would be specified as firewall.

pillarenv  
Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
saltenv  
Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
merge_pillar: True  
Merge the CLI variables with the pillar. Default: True.
revision_id  
Add a comment in the term config having the description for the changes applied.
revision_no  
The revision count.
revision_date: True
Boolean flag: display the date when the term configuration was generated. Default: True.

**revision_date_format:** %Y/%m/%d
The date format to be used when generating the perforce data. Default: %Y/%m/%d
(<year>/<month>/<day>).

**test:** False
Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

**commit:** True
Commit? Default: True.

**debug:** False
Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**source_service**
A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a source_port and protocol.

As this module is available on Unix platforms only, it reads the IANA port assignment from /etc/services.

If the user requires additional shortcuts to be referenced, they can add entries under /etc/services, which can be managed using the file state.

**destination_service**
A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as `source_service`.

**term_fields**
Term attributes. To see what fields are supported, please consult the list of supported keywords. Some platforms have a few other optional keywords.

---

**Note:** The following fields are accepted (some being platform-specific):
- action
- address
- address_exclude
- comment
- counter
- expiration
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- log_name
- loss_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol_except
- qos
- pan_application
- routing_instance
- source_address
- source_address_exclude
• source_port
• source_prefix
• verbatim
• packet_length
• fragment_offset
• hop_limit
• icmp_type
• ether_type
• traffic_class_count
• traffic_type
• translated
• dscp_set
• dscp_match
• dscp_except
• next_ip
• flexible_match_range
• source_prefix_except
• destination_prefix_except
• vpn
• source_tag
• destination_tag
• source_interface
• destination_interface
• flattened
• flattened_addr
• flattened_saddr
• flattened_daddr
• priority

**Note:** The following fields can be also a single value and a list of values:
• action
• address
• address_exclude
• comment
• destination_address
• destination_address_exclude
• destination_port
• destination_prefix
• forwarding_class
• forwarding_class_except
• logging
• option
• port
• precedence
• principals
• protocol
• protocol_except
• pan_application
• source_address
• source_address_exclude
• source_port
• source_prefix
• verbatim
• icmp_type
• ether_type
• traffic_type
• dscp_match
• dscp_except
• flexible_match_range
• source_prefix_except
• destination_prefix_except
• source_tag
• destination_tag
• source_service
• destination_service

Example: destination_address can be either defined as:

```markdown
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```markdown
destination_address:
- 172.17.17.1/24
- 172.17.19.1/24
```

or a list of services to be matched:

```markdown
source_service:
- ntp
- snmp
- ldap
- bgpd
```

Note: The port fields source_port and destination_port can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```markdown
source_port:
- - 1000
- - 2000
- - 3000
- - 4000
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

The output is a dictionary having the same form as `net.load_config`.

CLI Example:

```bash
salt 'edge01.bjm01' netacl.load_term_config filter-name term-name source_ →address=1.2.3.4 destination_address=5.6.7.8 action=accept test=True& →debug=True
```

Output Example:
edge01.bjm01:

----------

already_configured:
    False
comment:
    Configuration discarded.

diff:
    [edit firewall]
    + family inet {
      + /*
      + ** $Date: 2017/03/22 $**
      + **
      + */
      + filter filter-name {
        + interface-specific;
        + term term-name {
        +   from {
        +     source-address {
        +       1.2.3.4/32;
        +     }
        +     destination-address {
        +       5.6.7.8/32;
        +     }
        +   }
        +     then accept;
        +   }
      +   }
    }

loaded_config:

firewall {
  family inet {
    replace:
    /*
    ** $Date: 2017/03/22 $**
    **
    */
    filter filter-name {
      interface-specific;
      term term-name {
        from {
          source-address {
            1.2.3.4/32;
          }
          destination-address {
            5.6.7.8/32;
          }
        }
        then accept;
      }
    }
}

result:

(continues on next page)
26.6.284 salt.modules.napalm_network

**NAPALM Network**

Basic methods for interaction with the network device through the virtual proxy 'napalm'.

**codeauthor**

Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

**maturity**

new

**depends**

napalm

**platform**

unix

**Dependencies**

- *napalm proxy minion*

New in version 2016.11.0.

Changed in version 2017.7.0.

salt.modules.napalm_network.arp(

    *interface='', *ipaddr='', *macaddr='', **kwargs)

NAPALM returns a list of dictionaries with details of the ARP entries.

**Parameters**

- *interface* -- interface name to filter on
- *ipaddr* -- IP address to filter on
- *macaddr* -- MAC address to filter on

**Returns**

List of the entries in the ARP table

CLI Example:

```
salt '*' net.arp
salt '*' net.arp macaddr='5c:5e:ab:da:3c:f0'
```

Example output:

```
[
    {
        'interface': 'MgmtEth0/RSP0/CPU0/0',
        'mac': '5c:5e:ab:da:3c:f0',
        'ip': '172.17.17.1',
        'age': 1454496274.84
    },
    {
(continues on next page)
```
'interface': 'MgmtEth0/RSP0/CPU0/0',
'mac' : '66:0e:94:96:e0:ff',
'ip' : '172.17.17.2',
'age' : 1435641582.49
}

salt.modules.napalm_network.blockreplace(marker_start, marker_end, content='',
append_if_not_found=False,
prepend_if_not_found=False, show_changes=True,
append_newline=False, source='running', path=None,
test=False, commit=True, debug=False, replace=True)

New in version 2019.2.0.

Replace content of the configuration source, delimited by the line markers.

A block of content delimited by comments can help you manage several lines without worrying about old entries removal.

marker_start
The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output.

marker_end
The line content identifying a line as the end of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output.

content
The content to be used between the two lines identified by marker_start and marker_stop.

append_if_not_found: False
If markers are not found and set to True then, the markers and content will be appended to the file.

prepend_if_not_found: False
If markers are not found and set to True then, the markers and content will be prepended to the file.

append_newline: False
Controls whether or not a newline is appended to the content block. If the value of this argument is True then a newline will be added to the content block. If it is False, then a newline will not be added to the content block. If it is None then a newline will only be added to the content block if it does not already end in a newline.

show_changes: True
Controls how changes are presented. If True, this function will return the of the changes made. If False, then it will return a boolean (True if any changes were made, otherwise False).

source: running
The configuration source. Choose from: running, candidate, or startup. Default: running.

path: None
Save the temporary configuration to a specific path, then read from there. This argument is optional, can be used when you prefers a particular location of the temporary file.

test: False
Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

commit: True
Commit the configuration changes? Default: True.

debug: False
Debug mode. Will insert a new key in the output dictionary, as loaded_config containing the raw configuration loaded on the device.
replace: True
Load and replace the configuration. Default: True.
CLI Example:

```bash
salt '*' net.blockreplace 'ntp' 'interface' '
```

salt.modules.napalm_network.cancel_commit(jid)
New in version 2019.2.0.
Cancel a commit scheduled to be executed via the commit_in and commit_at arguments from the net.load_template or net.load_config execution functions. The commit ID is displayed when the commit is scheduled via the functions named above.
CLI Example:

```bash
salt '*' net.cancel_commit 20180726083540640360
```

salt.modules.napalm_network.cli(*commands, **kwargs)
Returns a dictionary with the raw output of all commands passed as arguments.

commands
List of commands to be executed on the device.

textfsm_parse: False
Try parsing the outputs using the TextFSM templates.
New in version 2018.3.0.

**Note:** This option can be also specified in the minion configuration file or pillar as napalm_cli_textfsm_parse.

textfsm_path
The path where the TextFSM templates can be found. This option implies the usage of the TextFSM index file. textfsm_path can be either absolute path on the server, either specified using the following URL schemes: file://, salt://, http://, https://, ftp://, s3://, swift://.
New in version 2018.3.0.

**Note:** This needs to be a directory with a flat structure, having an index file (whose name can be specified using the index_file option) and a number of TextFSM templates.

**Note:** This option can be also specified in the minion configuration file or pillar as textfsm_path.

textfsm_template
The path to a certain the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`
New in version 2018.3.0.

textfsm_template_dict
A dictionary with the mapping between a command and the corresponding TextFSM path to use to extract the data. The TextFSM paths can be specified as in textfsm_template.
platform_grain_name: os
The name of the grain used to identify the platform name in the TextFSM index file. Default: os.
New in version 2018.3.0.

platform_column_name: Platform
The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: Platform.
New in version 2018.3.0.

index_file: index
The name of the TextFSM index file, under the textfsm_path. Default: index.
New in version 2018.3.0.

Note: This is field is case sensitive, make sure to assign the correct value to this option, exactly as defined in the index file.

Note: This option can be also specified in the minion configuration file or pillar as textfsm_platform_column_name.

saltenv: base
Salt fileserver environment from which to retrieve the file. Ignored if textfsm_path is not a salt:// URL.
New in version 2018.3.0.

include_empty: False
Include empty files under the textfsm_path.
New in version 2018.3.0.

include_pat
Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.
New in version 2018.3.0.

exclude_pat
Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.
New in version 2018.3.0.
Note: If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

CLI Example:

```
salt '*' net.cli "show version" "show chassis fan"
```

CLI Example with TextFSM template:

```
salt '*' net.cli textfsm_parse=True textfsm_path=salt://textfsm/
```

Example output:

```
{
  'show version and haiku': "Hostname: re0.edge01.arn01
  Model: mx480
  Junos: 13.3R6.5
  Help me, Obi-Wan
  I just saw Episode Two
  You're my only hope",

  'show chassis fan': 'Item' Status RPM
  Measurement
  Top Rear Fan OK 3840
  Spinning at intermediate-speed
  Bottom Rear Fan OK 3840
  Spinning at intermediate-speed
  Top Middle Fan OK 3900
  Spinning at intermediate-speed
  Bottom Middle Fan OK 3840
  Spinning at intermediate-speed
  Top Front Fan OK 3810
  Spinning at intermediate-speed
  Bottom Front Fan OK 3840
  Spinning at intermediate-speed
}
```

Example output with TextFSM parsing:

```
{
  "comment": "",
  "result": true,
  "out": {
    "sh ver": [
      {
        "kernel": "9.1S3.5",
        "documentation": "9.1S3.5",
        "boot": "9.1S3.5",
        "crypto": "9.1S3.5",
        "chassis": "",
        "routing": "9.1S3.5",
        "base": "9.1S3.5",
        (continues on next page)
  }
}
"model": "mx960"

salt.modules.napalm_network.commit(inherit_napalm_device=None, **kwargs)
Commits the configuration changes made on the network device.

CLI Example:
```
salt '*' net.commit
```

salt.modules.napalm_network.compare_config(inherit_napalm_device=None, **kwargs)
Returns the difference between the running config and the candidate config.

CLI Example:
```
salt '*' net.compare_config
```

salt.modules.napalm_network.config(source=None, **kwargs)
New in version 2017.7.0.

Return the whole configuration of the network device. By default, it will return all possible configuration sources supported by the network device. At most, there will be:

- running config
- startup config
- candidate config

To return only one of the configurations, you can use the source argument.

source
Which configuration type you want to display, default is all of them.

Options:
- running
- candidate
- startup

Returns
The object returned is a dictionary with the following keys:

- running (string): Representation of the native running configuration.
- candidate (string): Representation of the native candidate configuration.
  If the device doesn’t differentiate between running and startup configuration this will an empty string.
- startup (string): Representation of the native startup configuration.
  If the device doesn’t differentiate between running and startup configuration this will an empty string.

CLI Example:
```
salt '*' net.config
salt '*' net.config source=candidate
```
salt.modules.napalm_network.config_changed(inherit_napalm_device=None, **kwargs)

Will prompt if the configuration has been changed.

Returns
A tuple with a boolean that specifies if the config was changed on the device. And a string that provides more details of the reason why the configuration was not changed.

CLI Example:
```
salt '*' net.config_changed
```

salt.modules.napalm_network.config_control(inherit_napalm_device=None, **kwargs)

Will check if the configuration was changed. If differences found, will try to commit. In case commit unsuccessful, will try to rollback.

Returns
A tuple with a boolean that specifies if the config was changed/committed/rollbacked on the device. And a string that provides more details of the reason why the configuration was not committed properly.

CLI Example:
```
salt '*' net.config_control
```

salt.modules.napalm_network.confirm_commit(jid)

New in version 2019.2.0.

Confirm a commit scheduled to be reverted via the revert_in and revert_at arguments from the net.load_template or net.load_config execution functions. The commit ID is displayed when the commit confirmed is scheduled via the functions named above.

CLI Example:
```
salt '*' net.confirm_commit 20180726083540640360
```

salt.modules.napalm_network.connected(**kwargs)

Specifies if the connection to the device succeeded.

CLI Example:
```
salt '*' net.connected
```

salt.modules.napalm_network.discard_config(inherit_napalm_device=None, **kwargs)

Discards the changes applied.

CLI Example:
```
salt '*' net.discard_config
```

salt.modules.napalm_network.environment(**kwargs)

Returns the environment of the device.

CLI Example:
```
salt '*' net.environment
```

Example output:
salt.modules.napalm_network.facts(**kwargs)

Returns characteristics of the network device. :return: a dictionary with the following keys:
  • uptime - Uptime of the device in seconds.
  • vendor - Manufacturer of the device.
  • model - Device model.
  • hostname - Hostname of the device
  • fqdn - Fqdn of the device
  • os_version - String with the OS version running on the device.
  • serial_number - Serial number of the device
  • interface_list - List of the interfaces of the device

CLI Example:
salt '*' net.facts

Example output:

```python
{
    'os_version': '13.3R6.5',
    'uptime': 10117140,
    'interface_list': [
        'lc-0/0/0',
        'pfe-0/0/0',
        'pfh-0/0/0',
        'xe-0/0/0',
        'xe-0/0/1',
        'xe-0/0/2',
        'xe-0/0/3',
        'gr-0/0/10',
        'ip-0/0/10'
    ],
    'vendor': 'Juniper',
    'serial_number': 'JN131356FBFA',
    'model': 'MX480',
    'hostname': 're0.edge05.syd01',
    'fqdn': 're0.edge05.syd01'
}
```

salt.modules.napalm_network.interfaces(**kwargs)

Returns details of the interfaces on the device.

**Returns**

Returns a dictionary of dictionaries. The keys for the first dictionary will be the interfaces in the devices.

CLI Example:

```
salt '*' net.interfaces
```

Example output:

```python
{
    'Management1': {
        'is_up': False,
        'is_enabled': False,
        'description': '',
        'last_flapped': -1,
        'speed': 1000,
        'mac_address': 'dead:beef:dead',
    },
    'Ethernet1':{
        'is_up': True,
        'is_enabled': True,
        'description': 'foo',
        'last_flapped': 1429978575.1554043,
        'speed': 1000,
        'mac_address': 'beef:dead:beef',
    }
}
```

(continues on next page)
salt.modules.napalm_network.ipaddrs(**kwargs)

Returns IP addresses configured on the device.

**Returns**
A dictionary with the IPv4 and IPv6 addresses of the interfaces. Returns all configured IP addresses on all interfaces as a dictionary of dictionaries. Keys of the main dictionary represent the name of the interface. Values of the main dictionary represent are dictionaries that may consist of two keys 'ipv4' and 'ipv6' (one, both or none) which are themselves dictionaries with the IP addresses as keys.

CLI Example:

```
salt '*' net.ipaddrs
```

Example output:

```
{
    'FastEthernet8': {
        'ipv4': {
            '10.66.43.169': {
                'prefix_length': 22
            }
        }
    },
    'Loopback555': {
        'ipv4': {
            '192.168.1.1': {
                'prefix_length': 24
            }
        },
        'ipv6': {
            '1::1': {
                'prefix_length': 64
            },
            '2001:DB8:1::1': {
                'prefix_length': 64
            },
            'FE80::3': {
                'prefix_length': 'N/A'
            }
        }
    }
}
```

salt.modules.napalm_network.lldp(interface='', **kwargs)

Returns a detailed view of the LLDP neighbors.

**Parameters**
- `interface` -- interface name to filter on

**Returns**
A dictionary with the LLDP neighbors. The keys are the interfaces with LLDP activated on.

CLI Example:
Example output:

```json
{
'TenGigE0/0/0/8': [
{
'parent_interface': 'Bundle-Ether8',
'interface_description': 'TenGigE0/0/0/8',
'remote_chassis_id': '8c60.4f69.e96c',
'remote_system_name': 'switch',
'remote_port': 'Eth2/2/1',
'remote_port_description': 'Ethernet2/2/1',
'remote_system_description': 'Cisco Nexus Operating System

←(NX-OS) Software 7.1(0)N1(1a)
TAC support: http://www.cisco.com/tac
Copyright (c) 2002–2015, Cisco Systems, Inc. All rights reserved.',
'remote_system_capab': 'B, R',
'remote_system_enable_capab': 'B'
}
]
}
```

`salt.modules.napalm_network.load_config`(*filename=None, text=None, test=False, commit=True, debug=False, replace=False, commit_at=None, revert_in=None, revert_at=None, commit_jid=None, inherit_napalm_device=None, saltenv='base', **kwargs*)

Applies configuration changes on the device. It can be loaded from a file or from inline string. If you send both a filename and a string containing the configuration, the file has higher precedence.

By default this function will commit the changes. If there are no changes, it does not commit and the flag `already_configured` will be set as `True` to point this out.

To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To keep the changes but not commit, set `commit` to `False`.

To replace the config, set `replace` to `True`.

**filename**

Path to the file containing the desired configuration. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

Changed in version 2018.3.0.

**text**

String containing the desired configuration. This argument is ignored when `filename` is specified.

**test**: `False`

Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.
commit: True
Commit? Default: True.

debug: False
Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

New in version 2016.11.2.

replace: False
Load and replace the configuration. Default: False.

New in version 2016.11.2.

commit_in: None
Commit the changes in a specific number of minutes / hours. Example of accepted formats: 5 (commit in 5 minutes), 2m (commit in 2 minutes), 1h (commit the changes in 1 hour), 5h30m (commit the changes in 5 hours and 30 minutes).

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the diff is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the net.cancel_commit execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

commit_at: None
Commit the changes at a specific time. Example of accepted formats: 1am (will commit the changes at the next 1AM), 13:20 (will commit at 13:20), 1:20am, etc.

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the diff is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the net.cancel_commit execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

revert_in: None
Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats:
5 (revert in 5 minutes), 2m (revert in 2 minutes), 1h (revert the changes in 1 hour), 5h30m (revert the changes in 5 hours and 30 minutes).

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

---

**Warning:** This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don’t have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**revert_at:** `None`
Commit and revert the changes at a specific time. Example of accepted formats: 1am (will commit and revert the changes at the next 1AM), 13:20 (will commit and revert at 13:20), 1:20am, etc.

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

---

**Warning:** This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don’t have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**saltenv:** `base`
Specifies the Salt environment name.

New in version 2018.3.0.

**Returns**

a dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- **comment** (str): a message for the user
• already_configured (bool): flag to check if there were no changes applied
• loaded_config (str): the configuration loaded on the device. Requires debug to be set as True
• diff (str): returns the config changes applied

CLI Example:

```
salt '*' net.load_config text='ntp peer 192.168.0.1'
salt '*' net.load_config filename='/absolute/path/to/your/file'
salt '*' net.load_config filename='/absolute/path/to/your/file' test=True  # commit=False

Example output:

```{json}
{
    'comment': 'Configuration discarded.',
    'already_configured': False,
    'result': True,
    'diff': '[:edit interfaces xe-0/0/5] += description

```

```{r}
salt.modules.napalm_network.load_template(
    template_name=None, template_source=None,
    context=None, defaults=None, template_engine='jinja',
    saltenv='base', template_hash=None, template_hash_name=None,
    skip_verify=False, test=False, commit=True, debug=False, replace=False,
    commit_in=None, commit_at=None, revert_in=None, revert_at=None, inherit_napalm_device=None,
    **template_vars)
```

Renders a configuration template (default: Jinja) and loads the result on the device.

By default this function will commit the changes. If there are no changes, it does not commit, discards the config and the flag already_configured will be set as True to point this out.

To avoid committing the configuration, set the argument test to True and will discard (dry run).

To preserve the changes, set commit to False. However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set replace to True.

**template_name**
Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the file_roots as specified in the master config file. For example, let’s suppose the file_roots is configured as:

```{yaml}
file_roots:
    base:
        - /etc/salt/states
```

Placing the template under /etc/salt/states/templates/example.jinja, it can be used as salt://templates/example.jinja. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via http, https or ftp.

Examples:
• salt://my_template.jinja
Changed in version 2019.2.0: This argument can now support a list of templates to be rendered. The resulting configuration text is loaded at once, as a single configuration chunk.

**template_source:** None

Inline config template to be rendered and loaded on the device.

**template_hash:** None

Hash of the template file. Format: \{hash_type: 'md5', 'hsum': <md5sum>\}

New in version 2016.11.2.

**context:** None

Overrides default context variables passed to the template.

New in version 2019.2.0.

**template_hash_name:** None

When template_hash refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.11.2.

**saltenv:** base

Specifies the template environment. This will influence the relative imports inside the templates.

New in version 2016.11.2.

**template_engine:** jinja

The following templates engines are supported:

- cheetah
- genshi
- jinja
- mako
- py
- wempy

New in version 2016.11.2.

**skip_verify:** True

If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the source_hash argument will be ignored.

New in version 2016.11.2.

**test:** False

Dry run? If set to True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

**commit:** True

Commit? (default: True)

**debug:** False

Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw result after the template was rendered.

New in version 2016.11.2.

**replace:** False

Load and replace the configuration.

New in version 2016.11.2.

**commit_in:** None

Commit the changes in a specific number of minutes / hours. Example of accepted formats: 5 (commit in 5 minutes), 2m (commit in 2 minutes), 1h (commit the changes in 1 hour), 5h30m (commit the changes in 5 hours and 30 minutes).
Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the diff is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**commit_at:** None
Commit the changes at a specific time. Example of accepted formats: `1am` (will commit the changes at the next 1AM), `13:20` (will commit at 13:20), `1:20am`, etc.

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the diff is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**revert_in:** None
Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats: `5` (revert in 5 minutes), `2m` (revert in 2 minutes), `1h` (revert the changes in 1 hour), `5h30m` (revert the changes in 5 hours and 30 minutes).

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt
will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**revert_at:** *None*

Commit and revert the changes at a specific time. Example of accepted formats: 1am (will commit and revert the changes at the next 1AM), 13:20 (will commit and revert at 13:20), 1:20am, etc.

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

**Warning:** This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don’t have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**defaults:** *None*

Default variables/context passed to the template.

New in version 2016.11.2.

**template_vars**

Dictionary with the arguments/context to be used when the template is rendered.

**Note:** Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see the examples below!

**Note:** It is more recommended to use the `context` argument to avoid conflicts between CLI arguments and template variables.

**Returns**

a dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- **comment** (str): a message for the user
- **already_configured** (bool): flag to check if there were no changes applied
- loaded_config (str): the configuration loaded on the device, after rendering the template. Requires debug to be set as True
- diff (str): returns the config changes applied

The template can use variables from the grains, pillar or opts, for example:

```jinja
{% set router_model = grains.get('model') -%}
{% set router_vendor = grains.get('vendor') -%}
{% set os_version = grains.get('version') -%}
{% set hostname = pillar.get('proxy', {}).get('host') -%}
{% if router_vendor|lower == 'juniper' %}
system {
    host-name {{hostname}};
}
{% elif router_vendor|lower == 'cisco' %}
hostname {{hostname}}
{% endif %}
```

**CLI Examples:**

```sh
salt '*' net.load_template set_ntp_peers peers=[192.168.0.1] # uses NAPALM default templates

# inline template:
salt -G 'os:junos' net.load_template template_source='system { host-name { host_name}}; host-name='MX480.lab'

# inline template using grains info:
salt -G 'os:junos' net.load_template template_source='system { host-name {{grains.model}}.lab; }' # if the device is a MX480, the command above will set the hostname as: MX480.lab

# inline template using pillar data:
salt -G 'os:junos' net.load_template template_source='system { host-name {{pillar.proxy.host}}; }'

salt '*' net.load_template https://bit.ly/2OhSgqP hostname=example # will commit
salt '*' net.load_template https://bit.ly/2OhSgqP hostname=example test=True # dry run

salt '*' net.load_template salt://templates/example.jinja debug=True # Using the salt:// URI

# render a mako template:
salt '*' net.load_template salt://templates/example.mako template_engine=mako debug=True

# render remote template
salt -G 'os:junos' net.load_template http://bit.ly/2fReJg7 test=True debug=True peers=['192.168.0.1']
```

(continues on next page)
# render multiple templates at once
salt '* net.load_template "[\'https://bit.ly/2OhSgqP\', \'salt://templates/\n→ example.jinja\']" context="\{'hostname': \'example\'}\""

Example output:

```json
{
    'comment': '',
    'already_configured': False,
    'result': True,
    'diff': '[:edit system]+  host-name edge01.bjm01',
    'loaded_config': 'system { host-name edge01.bjm01; }'
}
```

salt.modules.napalm_network.mac(address='', interface='', vlan=0, **kwargs)

Returns the MAC Address Table on the device.

Parameters

- **address** -- MAC address to filter on
- **interface** -- Interface name to filter on
- **vlan** -- VLAN identifier

Returns

A list of dictionaries representing the entries in the MAC Address Table

CLI Example:

```
salt '*' net.mac
salt '*' net.mac vlan=10
```

Example output:

```json
[
    {
        'mac': '00:1c:58:29:4a:71',
        'interface': 'xe-3/0/2',
        'static': False,
        'active': True,
        'moves': 1,
        'vlan': 10,
        'last_move': 1454417742.58
    },
    {
        'mac': '8c:60:4f:58:e1:c1',
        'interface': 'xe-1/0/1',
        'static': False,
        'active': True,
        'moves': 2,
        'vlan': 42,
        'last_move': 1453191948.11
    }
]
```
salt.modules.napalm_network.optics(**kwargs)

New in version 2017.7.0.

Fetches the power usage on the various transceivers installed on the network device (in dBm), and returns a view that conforms with the OpenConfig model openconfig-platform-transceiver.yang.

Returns

Returns a dictionary where the keys are as listed below:

- intf_name (unicode)
  - physical_channels
    • channels (list of dicts)
      • index (int)
      • state
        input_power
        instant (float)
        avg (float)
        min (float)
        max (float)
        output_power
        instant (float)
        avg (float)
        min (float)
        max (float)
        laser_bias_current
        instant (float)
        avg (float)
        min (float)
        max (float)

CLI Example:

```
salt '*' net.optics
```

salt.modules.napalm_network.patch(patchfile, options='', saltenv='base', source_hash=None, show_changes=True, source='running', path=None, test=False, commit=True, debug=False, replace=True)

New in version 2019.2.0.

Apply a patch to the configuration source, and load the result into the running config of the device.

patchfile
  A patch file to apply to the configuration source.

options
  Options to pass to patch.
source_hash
If the patch file (specified via the patchfile argument) is an HTTP(S) or FTP URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

show_changes: True
Controls how changes are presented. If True, this function will return the of the changes made. If False, then it will return a boolean (True if any changes were made, otherwise False).

source: running
The configuration source. Choose from: running, candidate, or startup. Default: running.

path: None
Save the temporary configuration to a specific path, then read from there. This argument is optional, can the user prefers a particular location of the temporary file.

test: False
Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

commit: True
Commit the configuration changes? Default: True.

debug: False
Debug mode. Will insert a new key in the output dictionary, as loaded_config containing the raw configuration loaded on the device.

replace: True
Load and replace the configuration. Default: True.

CLI Example:

```
salt '*' net.patch https://example.com/running_config.patch
```

salt.modules.napalm_network.ping(destination, source=None, ttl=None, timeout=None, size=None, count=None, vrf=None, **kwargs)

Executes a ping on the network device and returns a dictionary as a result.

destination
Hostname or IP address of remote host

source
Source address of echo request

ttl
IP time-to-live value (IPv6 hop-limit value) (1..255 hops)

timeout
Maximum wait time after sending final packet (seconds)

size
Size of request packets (0..65468 bytes)

count
Number of ping requests to send (1..2000000000 packets)

vrf
VRF (routing instance) for ping attempt

New in version 2016.11.4.

CLI Example:

```
salt '*' net.ping 8.8.8.8
salt '*' net.ping 8.8.8.8 ttl=3 size=65468
salt '*' net.ping 8.8.8.8 source=127.0.0.1 timeout=1 count=100
```
salt.modules.napalm_network.replace_pattern(pattern, repl, count=0, flags=8, bufsize=1, append_if_not_found=False, prepend_if_not_found=False, not_found_content=None, search_only=False, show_changes=True, backslash_literal=False, source=None, path=None, test=False, replace=True, debug=False, commit=True)

New in version 2019.2.0.

Replace occurrences of a pattern in the configuration source. If show_changes is True, then a diff of what changed will be returned, otherwise a True will be returned when changes are made, and False when no changes are made. This is a pure Python implementation that wraps Python's sub().

**pattern**
A regular expression, to be matched using Python's search().

**repl**
The replacement text.

**count:** 0
Maximum number of pattern occurrences to be replaced. If count is a positive integer n, only n occurrences will be replaced, otherwise all occurrences will be replaced.

**flags** (list or int): 8
A list of flags defined in the re module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., ['IGNORECASE', 'MULTILINE']. Optionally, flags may be an int, with a value corresponding to the XOR (|) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').

**bufsize** (int or str): 1
How much of the configuration to buffer into memory at once. The default value 1 processes one line at a time. The special value file may be specified which will read the entire file into memory before processing.

**append_if_not_found:** False
If set to True, and pattern is not found, then the content will be appended to the file.

**prepend_if_not_found:** False
If set to True and pattern is not found, then the content will be prepended to the file.

**not_found_content**
Content to use for append/prepend if not found. If None (default), uses repl. Useful when repl uses references to group in pattern.

**search_only:** False
If set to true, this no changes will be performed on the file, and this function will simply return True if the pattern was matched, and False if not.

**show_changes:** True
If True, return a diff of changes made. Otherwise, return True if changes were made, and False if not.

**backslash_literal:** False
Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

**source:** running
The configuration source. Choose from: running, candidate, or startup. Default: running.

**path**
Save the temporary configuration to a specific path, then read from there.

**test:** False
Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

**commit:** True
Commit the configuration changes? Default: True.
**debug:** *False*

Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace:** *True*

Load and replace the configuration. Default: True.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```python
salt '*' net.replace_pattern "bind-address\s*=\s*" "bind-address:"
```

**CLI Example:**

```bash
salt '*' net.replace_pattern PREFIX-LIST_NAME new-prefix-list-name
salt '*' net.replace_pattern bgp-group-name new-bgp-group-name count=1
```

```python
salt.modules.napalm_network.rollback(inherit_napalm_device=None, **kwargs)
```

Rollbacks the configuration.

**CLI Example:**

```bash
salt '*' net.rollback
```

```python
salt.modules.napalm_network.save_config(source=None, path=None)
```

New in version 2019.2.0.

Save the configuration to a file on the local file system.

**source:** *running*

**path**

Absolute path to file where to save the configuration. To push the files to the Master, use `cp.push` Execution function.

**CLI Example:**

```bash
salt '*' net.save_config source=running
```

```python
salt.modules.napalm_network.traceroute(destination, source=None, ttl=None, timeout=None, vrf=None, **kwargs)
```

Calls the method traceroute from the NAPALM driver object and returns a dictionary with the result of the traceroute command executed on the device.

**destination**

Hostname or address of remote host

**source**

Source address to use in outgoing traceroute packets

**ttl**

IP maximum time-to-live value (or IPv6 maximum hop-limit value)

**timeout**

Number of seconds to wait for response (seconds)

**vrf**

VRF (routing instance) for traceroute attempt

New in version 2016.11.4.

**CLI Example:**
26.6.285 salt.modules.napalm_ntp

NAPALM NTP

Manages NTP on network devices.

codeauthor
Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

new

depends
napalm

platform
unix

Dependencies

- NAPALM proxy minion
- NET basic features

See also:
NTP peers management state

New in version 2016.11.0.

salt.modules.napalm_ntp.delete_peers(*peers, **options)

Removes NTP peers configured on the device.

Parameters

- peers -- list of IP Addresses/Domain Names to be removed as NTP peers
- (bool) (commit) -- discard loaded config. By default test is False (will not discard the changes)
- (bool) -- commit loaded config. By default commit is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the commit option. For a dry run, use the test argument.

CLI Example:

```
salt '*' ntp.delete_peers 8.8.8.8 time.apple.com
salt '*' ntp.delete_peers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.delete_peers 192.168.0.1 commit=False # preserves the changes, but does not commit
```

salt.modules.napalm_ntp.delete_servers(*servers, **options)

Removes NTP servers configured on the device.

Parameters

- servers -- list of IP Addresses/Domain Names to be removed as NTP servers
- (bool) (commit) -- discard loaded config. By default test is False (will not discard the changes)
- (bool) -- commit loaded config. By default commit is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the commit option. For dry run use the test argument.

CLI Example:

```
salt '*' ntp.delete_servers 8.8.8.8 time.apple.com
salt '*' ntp.delete_servers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.delete_servers 192.168.0.1 commit=False  # preserves the changes, but does not commit
```

salt.modules.napalm_ntp.peers(**kwargs)

Returns a list the NTP peers configured on the network device.

**Returns**

configured NTP peers as list.

CLI Example:

```
salt '*' ntp.peers
```

Example output:

```
[
    '192.168.0.1',
    '172.17.17.1',
    '172.17.17.2',
    '2400:cb00:6:1024::c71b:840a'
]
```

salt.modules.napalm_ntp.servers(**kwargs)

Returns a list of the configured NTP servers on the device.

CLI Example:

```
salt '*' ntp.servers
```

Example output:

```
[
    '192.168.0.1',
    '172.17.17.1',
    '172.17.17.2',
    '2400:cb00:6:1024::c71b:840a'
]
```

salt.modules.napalm_ntp.set_peers(*peers, **options)

Configures a list of NTP peers on the device.

**Parameters**

- **peers** -- list of IP Addresses/Domain Names
- (bool) (test) -- discard loaded config. By default test is False (will not discard the changes)
Commit commit (bool)

commit loaded config. By default commit is True (will commit the changes). Useful when
the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the commit
option. For dry run use the test argument.

CLI Example:

```
salt '*' ntp.set_peers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_peers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.set_peers 192.168.0.1 commit=False # preserves the changes,
  → but does not commit
```

salt.modules.napalm_ntp.set_servers(*servers, **options)

Configures a list of NTP servers on the device.

Parameters

- servers -- list of IP Addresses/Domain Names
- (bool) (test) -- discard loaded config. By default test is False (will not discard
  the changes)

Commit commit (bool)

commit loaded config. By default commit is True (will commit the changes). Useful when
the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the commit
option. For dry run use the test argument.

CLI Example:

```
salt '*' ntp.set_servers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_servers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.set_servers 192.168.0.1 commit=False # preserves the changes,
  → but does not commit
```

salt.modules.napalm_ntp.stats(peer=None, **kwargs)

Returns a dictionary containing synchronization details of the NTP peers.

Parameters

- peer -- Returns only the details of a specific NTP peer.

Returns

a list of dictionaries, with the following keys:

- remote
- referenceid
- synchronized
- stratum
- type
- when
- hostpoll
- reachability
- delay
- offset
- jitter

CLI Example:

```
salt '*' ntp.stats
```

Example output:
26.6.286 salt.modules.napalm_probes

NAPALM Probes

Manages RPM/SLA probes on the network device.

codeauthor

Probes configuration management state

New in version 2016.11.0.

salt.modules.napalm_probes.config(**kwargs)

Returns the configuration of the RPM probes.

Returns
A dictionary containing the configuration of the RPM/SLA probes.

CLI Example:

```
salt '*' probes.config
```

Output Example:
salt.modules.napalm_probes.delete_probes(probes, test=False, commit=True, **kwargs)

Removes RPM/SLA probes from the network device. Calls the configuration template 'delete_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be removed from the configuration of the device.

Parameters

- **probes** -- Dictionary with a similar format as the output dictionary of the function config(), where the details are not necessary.
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises

- **MergeConfigException** -- If there is an error on the configuration sent.

Returns

A dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the already_configured flag (example below)
- **comment** (str): a message for the user
- **already_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

Input example:

```python
probes = {
    'existing_probe':{
        'existing_test1': {},
        'existing_test2': {}
    }
}
```

salt.modules.napalm_probes.results(**kwargs)
Provides the results of the measurements of the RPM/SLA probes.

:return a dictionary with the results of the probes.

CLI Example:

```
salt '*' probes.results
```

Output example:

```python
{
    'probe1': {
        'test1': {
            'last_test_min_delay': 63.120,
            'global_test_min_delay': 62.912,
            'current_test_avg_delay': 63.190,
            'global_test_max_delay': 177.349,
            'current_test_max_delay': 63.302,
            'global_test_avg_delay': 63.802,
            'last_test_avg_delay': 65.356,
            'probe_type': 'icmp-ping',
            'rtt': 63.138,
            'last_test_loss': 0,
            'round_trip_jitter': -59.0,
            'target': '192.168.0.1',
            'source': '192.168.0.2',
            'probe_count': 15,
            'current_test_min_delay': 63.138
        },
        'test2': {
            'last_test_min_delay': 176.384,
            'global_test_min_delay': 169.226,
            'current_test_avg_delay': 177.098,
            'global_test_max_delay': 292.628,
            'current_test_max_delay': 180.055,
            'global_test_avg_delay': 177.959,
            'last_test_avg_delay': 177.178,
            'last_test_max_delay': 184.671,
            'probe_type': 'icmp-ping',
            'rtt': 176.449,
            'last_test_loss': 0,
            'round_trip_jitter': -34.0,
            'target': '172.17.17.1',
            'source': '172.17.17.2',
            'probe_count': 15,
            'current_test_min_delay': 176.402
        }
    }
}
```

salt.modules.napalm_probes.schedule_probes(probes, test=False, commit=True, **kwargs)

Will schedule the probes. On Cisco devices, it is not enough to define the probes, it is also necessary to schedule them.
This function calls the configuration template `schedule_probes` from the NAPALM library, providing as input a rich formatted dictionary with the names of the probes and the tests to be scheduled.

**Parameters**

- **probes** -- Dictionary with a similar format as the output dictionary of the function `config()`, where the details are not necessary.
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

**Raises**

- **MergeConfigException** -- If there is an error on the configuration sent.

**Returns**

A dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- **comment** (str): a message for the user
- **already_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

**Input example:**

```python
probes = {
    'new_probe': {
        'new_test1': {},
        'new_test2': {}
    }
}
```

```
salt.modules.napalm_probes.set_probes(probes, test=False, commit=True, **kwargs)
```

Configures RPM/SLA probes on the device. Calls the configuration template 'set_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be configured.

**Parameters**

- **probes** -- Dictionary formatted as the output of the function `config()`
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

**Raises**

- **MergeConfigException** -- If there is an error on the configuration sent.

**Return**

A dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- **comment** (str): a message for the user
- **already_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied
Input example - via state/script:

```python
probes = {
    'new_probe':{
        'new_test1':{
            'probe_type': 'icmp-ping',
            'target': '192.168.0.1',
            'source': '192.168.0.2',
            'probe_count': 13,
            'test_interval': 3
        },
        'new_test2':{
            'probe_type': 'http-ping',
            'target': '172.17.17.1',
            'source': '192.17.17.2',
            'probe_count': 5,
            'test_interval': 60
        }
    }
}
set_probes(probes)
```

CLI Example - to push changes on the fly (not recommended):

```bash
salt 'junos_minion' probes.set_probes "{'new_probe': {'new_test1': {'probe_type': 'icmp-ping', 'target': '192.168.0.1', 'source': '192.168.0.2', 'probe_count': 13, 'test_interval': 3}}}" test=True
```

Output example - for the CLI example above:

```bash
junos_minion:
----------
already_configured: False
comment: Configuration discarded.
diff:
    [edit services rpm]
    probe transit { ... }
+    probe new_probe {
+        test new_test1 {
+            probe-type icmp-ping;
+            target address 192.168.0.1;
+            probe-count 13;
+            test-interval 3;
+            source-address 192.168.0.2;
+        }
    }
result: True
```
26.6.287  salt.modules.napalm_route

NAPALM Route

Retrieves route details from network devices.

codeauthor
   Mircea Ulinic <ping@mirceaulinic.net>
maturity
   new
depends
   napalm
platform
   unix

Dependencies

•  NAPALM proxy minion

New in version 2016.11.0.
salt.modules.napalm_route.show(destination, protocol=None, **kwargs)

Displays all details for a certain route learned via a specific protocol. If the protocol is not specified, will return all possible routes.

Note: This function return the routes from the RIB. In case the destination prefix is too short, there may be too many routes matched. Therefore in cases of devices having a very high number of routes it may be necessary to adjust the prefix length and request using a longer prefix.

destination
   destination prefix.

protocol (optional)
   protocol used to learn the routes to the destination.

Changed in version 2017.7.0.

CLI Example:

```
salt 'my_router' route.show 172.16.0.0/25
salt 'my_router' route.show 172.16.0.0/25 bgp
```

Output example:

```
{
   '172.16.0.0/25': [
   {
      'protocol': 'BGP',
      'last_active': True,
      'current_active': True,
      'age': 1178693,
      'routing_table': 'inet.0',
      'next_hop': '192.168.0.11',
```

(continues on next page)
'outgoing_interface': 'xe-1/1/1.100',
'preference': 170,
'selected_next_hop': False,
'protocol_attributes': {
    'remote_as': 65001,
    'metric': 5,
    'local_as': 13335,
    'as_path': '',
    'remote_address': '192.168.0.11',
    'metric2': 0,
    'local_preference': 0,
    'communities': [
        '0:2',
        'no-export'
    ],
    'preference2': -1
},
'inactive_reason': ''
},
{
    'protocol': 'BGP',
    'last_active': False,
    'current_active': False,
    'age': 2359429,
    'routing_table': 'inet.0',
    'next_hop': '192.168.0.17',
    'outgoing_interface': 'xe-1/1/1.100',

26.6.288  salt.modules.napalm_snmp

NAPALM SNMP

Manages SNMP on network devices.

codeauthor
Mircea Ulinic <ping@mirceaulinic.net>
maturity
new
depends
napalm
platform
unix

Dependencies

- NAPALM proxy minion
- NET basic features

See also:
SNMP configuration management state

New in version 2016.11.0.
salt.modules.napalm_snmp.config(**kwargs)
    Returns the SNMP configuration
    CLI Example:
salt '*' snmp.config

salt.modules.napalm_snmp.remove_config(chassis_id=None, community=None, contact=None, location=None, test=False, commit=True, **kwargs)

Removes a configuration element from the SNMP configuration.

Parameters
    - chassis_id -- (optional) Chassis ID
    - community -- (optional) A dictionary having the following optional keys:
        - acl (if any policy / ACL need to be set)
        - mode: rw or ro. Default: ro

Parameters
    - contact -- Contact details
    - location -- Location
    - test -- Dry run? If set as True, will apply the config, discard and return the changes.
        Default: False
    - commit -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.
Raises

**MergeConfigException** -- If there is an error on the configuration sent.

Returns

A dictionary having the following keys:

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the `already_configured` flag (example below)
- comment (str): a message for the user
- `already_configured` (bool): flag to check if there were no changes applied
- `diff` (str): returns the config changes applied

CLI Example:

```
salt '*' snmp.remove_config community='abcd'
```

salt.modules.napalm_snmp.update_config(
    chassis_id=None,
    community=None,
    contact=None,
    location=None,
    test=False,
    commit=True,
    **kwargs
)

Updates the SNMP configuration.

Parameters

- *chassis_id* -- (optional) Chassis ID
- *community* -- (optional) A dictionary having the following optional keys:
  - acl (if any policy / ACL need to be set)
  - mode: rw or ro. Default: ro

Parameters

- *contact* -- Contact details
- *location* -- Location
- *test* -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- *commit* -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises

**MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys:

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the `already_configured` flag (example below)
- comment (str): a message for the user
- `already_configured` (bool): flag to check if there were no changes applied
- `diff` (str): returns the config changes applied

CLI Example:

```
salt 'edge01.lon01' snmp.update_config location="Greenwich, UK" test=True
```

Output example (for the CLI example above):

```
edge01.lon01:
    ----------
    already_configured:
```

(continues on next page)
26.6.289 salt.modules.napalm_users

NAPALM Users

Manages the configuration of the users on network devices.

      v2JG58x+Kc3R62bd8QXQ98YtLXWz4dA742+D4wQXQH2cG4vO
      5aBkG5Un/3TQ==',
      'ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAABAQD4pFn+shPwTb2yELQyvFRdYiHJfrzU4
      w31j3Qk1I4XzhYtobRiCZK/B5+JkF7cVZ5i9QPNJ7P8dS5I4lZ3m3
      v2JG58x+Kc3R62bd8QXQ98YtLXWz4dA742+D4wQXQH2cG4vO
      5aBkG5Un/3TQ=='
    ],
  }
}
```

(continues on next page)
salt.modules.napalm_users.delete_users(users, test=False, commit=True, **kwargs)

Removes users from the configuration of network devices.

Parameters

- **users** -- Dictionary formatted as the output of the function config()
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises

**MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- **result** (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the already_configured flag (example below)
- **comment** (str): a message for the user
- **already_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

CLI Example:

```
salt '*' users.delete_users "{'mircea': {}}"
```

salt.modules.napalm_users.set_users(users, test=False, commit=True, **kwargs)

Configures users on network devices.

Parameters

- **users** -- Dictionary formatted as the output of the function config()
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises

**MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- **result** (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the...
already_configured flag (example below)
• comment (str): a message for the user
• already_configured (bool): flag to check if there were no changes applied
• diff (str): returns the config changes applied

CLI Example:
salt '*' users.set_users "{'mircea': {}}"

26.6.290 salt.modules.napalm_yang_mod

NAPALM YANG

NAPALM YANG basic operations.
New in version 2017.7.0.
salt.modules.napalm_yang_mod.compliance_report(data, *models, **kwargs)
   Return the compliance report using YANG objects.
   data
       Dictionary structured with respect to the models referenced.
   models
       A list of models to be used when generating the config.
   filepath
       The absolute path to the validation file.
   CLI Example:
salt '*' napalm_yang.compliance_report {} models.openconfig_interfaces
   → filepath=~/.validate.yml

   Output Example:

   ```
   {
       "skipped": [],
       "complies": true,
       "get_interfaces_ip": {
           "missing": [],
           "complies": true,
           "present": {
               "ge-0/0/0.0": {
                   "complies": true,
                   "nested": true
               }
           }
       },
       "extra": []
   }
   ```

salt.modules.napalm_yang_mod.diff(candidate, running, *models)
   Returns the difference between two configuration entities structured according to the YANG model.

   Note: This function is recommended to be used mostly as a state helper.
candidate
   First model to compare.
running
   Second model to compare.
models
   A list of models to be used when comparing.

CLI Example:

```
salt '*i napalm_yang.diff {} {} models.openconfig_interfaces
```

Output Example:

```
{
   "interfaces": {
      "interface": {
         "both": {
            "Port-Channel1": {
               "config": {
                  "mtu": {
                     "first": "0",
                     "second": "9000"
                  }
               }
            }
         },
         "first_only": ["Loopback0"],
         "second_only": ["Loopback1"
      }
      },
      "first_only": ["Loopback0"],
      "second_only": ["Loopback1"
   }
}
```

```
salt.modules.napalm_yang_mod.get_config(data, *models, **kwargs)
```

Return the native config.

data
   Dictionary structured with respect to the models referenced.
models
   A list of models to be used when generating the config.
profiles: None
   Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

CLI Example:

```
salt '*i napalm_yang.get_config {} models.openconfig_interfaces
```

Output Example:

```
interface et1
   ip address 192.168.1.1/24
description Uplink1
mtu 9000
```
(continues on next page)
salt.modules.napalm_yang_mod.load_config(data, *models, **kwargs)

Generate and load the config on the device using the OpenConfig or IETF models and device profiles.

data
Dictionary structured with respect to the models referenced.

models
A list of models to be used when generating the config.

profiles: None
Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

test: False
Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

commit: True
Commit? Default: True.

debag: False
Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

replace: False
Should replace the config with the new generate one?

CLI Example:

```
salt '*' napalm_yang.load_config {} models.openconfig_interfaces
->test=True debug=True
```

Output Example:

```
device1:
--------
  already_configured:
    False
  comment:
  diff:
    [edit interfaces ge-0/0/0]
      - mtu 1400;
    [edit interfaces ge-0/0/0 unit 0 family inet]
      - dhcp;
    [edit interfaces lo0]
      - unit 0 {
        - description lo0.0;
      }
      + unit 1 {
        + description "new loopback";
      }
  loaded_config:
    <configuration>
      <interfaces replace="replace">
        <interface>
          <name>ge-0/0/0</name>
```
<unit><name>0</name><family><inet/><description>ge-0/0/0.0</description></unit><description>management interface</description></interface><interface><name>ge-0/0/1</name><disable/><description>ge-0/0/1</description></interface><interface><name>ae0</name><unit><name>0</name><vlan-id>100</vlan-id><family><inet><address><name>192.168.100.1/24</name></address><address><name>172.20.100.1/24</name></address></inet><description>a description</description></unit><vlan-tagging/></unit><unit><name>1</name><vlan-id>1</vlan-id><family><inet><address><name>192.168.101.1/24</name></address><disable/><description>ae0.1</description></unit><vlan-tagging/></unit><unit><name>2</name><vlan-id>2</vlan-id><family><inet><address><name>192.168.102.1/24</name></address><disable/><description>ae0.2</description></unit><vlan-tagging/></unit>
<name>192.168.102.1/24</name>
</address>
</inet>
</family>
<description>ae0.2</description>
</unit>
<vlan-tagging/>
</interface>

<interface>
  <name>lo0</name>
  <unit>
    <name>1</name>
    <description>new loopback</description>
  </unit>
  <description>lo0</description>
</interface>
</interfaces>
</configuration>

result:
True

salt.modules.napalm_yang_mod.parse(*models, **kwargs)

Parse configuration from the device.

models
A list of models to be used when parsing.

config: False
Parse config.

state: False
Parse state.

profiles: None
Use certain profiles to parse. If not specified, will use the device default profile(s).

CLI Example:
salt '*' napalm_yang.parse models.openconfig_interfaces

Output Example:

```json
{
  "interfaces": {
    "interface": {
      ".local.": {
        "name": ".local.",
        "state": {
          "admin-status": "UP",
          "counters": {
            "in-discards": 0,
            "in-errors": 0,
            "out-errors": 0
          }
        },
        "enabled": True,
        "ifindex": 0,
        "last-change": 0,
```
"oper-status": "UP",
"type": "softwareLoopback"
},
"subinterfaces": {
    "subinterface": {
        ".local..0": {
            "index": ".local..0",
            "state": {
                "ifindex": 0,
                "name": ".local..0"
            }
        }
    }
},
"ae0": {
    "name": "ae0",
    "state": {
        "admin-status": "UP",
        "counters": {
            "in-discard": 0,
            "in-error": 0,
            "out-error": 0
        },
        "enabled": true,
        "ifindex": 531,
        "last-change": 255203,

26.6.291 salt.modules.netaddress

Module for getting information about network addresses.

New in version 2016.3.0.

depends
   netaddr

salt.modules.netaddress.cidr_broadcast(cidr)
   Get the broadcast address associated with a CIDR address.
   CLI Example:
   ```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
   ```

salt.modules.netaddress.cidr_netmask(cidr)
   Get the netmask address associated with a CIDR address.
   CLI Example:
   ```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
   ```

salt.modules.netaddress.list_cidr_ips(cidr)
   Get a list of IP addresses from a CIDR.
   CLI Example:
   ```
salt myminion netaddress.list_cidr_ips 192.168.0.0/20
   ```

salt.modules.netaddress.list_cidr_ips_ipv6(cidr)
   Get a list of IPv6 addresses from a CIDR.
   CLI Example:
   ```
salt myminion netaddress.list_cidr_ips_ipv6 192.168.0.0/20
   ```
26.6.292 salt.modules.netbox

NetBox

Module to query NetBox

codeauthor
Zach Moody <zmoody@do.co>

maturity
new

depends
pynetbox

The following config should be in the minion config file. In order to work with secrets you should provide a token and path to your private key file:

```
netbox:
  url: <NETBOX_URL>
  token: <NETBOX_USERNAME_API_TOKEN (OPTIONAL)>
  keyfile: </PATH/TO/NETBOX/KEY (OPTIONAL)>
```

New in version 2018.3.0.
salt.modules.netbox.create_circuit(name, provider_id, circuit_type, description=None)

New in version 2019.2.0.
Create a new Netbox circuit

name
Name of the circuit

provider_id
The netbox id of the circuit provider

circuit_type
The name of the circuit type

asn
The ASN of the circuit provider

description
The description of the circuit

CLI Example:

```
salt myminion netbox.create_circuit NEW_CIRCUIT_01 Telia Transit 1299
    → "New Telia circuit"
```

salt.modules.netbox.create_circuit_provider(name, asn=None)

New in version 2019.2.0.
Create a new Netbox circuit provider

name
The name of the circuit provider

asn
The ASN of the circuit provider

CLI Example:

```
salt myminion netbox.create_circuit_provider Telia 1299
```
salt.modules.netbox.create_circuit_termination(circuit, interface, device, speed, xconnect_id=None, term_side='A')

New in version 2019.2.0.
Terminate a circuit on an interface

- **circuit**: The name of the circuit
- **interface**: The name of the interface to terminate on
- **device**: The name of the device the interface belongs to
- **speed**: The speed of the circuit, in Kbps
- **xconnect_id**: The cross-connect identifier
- **term_side**: The side of the circuit termination

CLI Example:
```
salt myminion netbox.create_circuit_termination NEW_CIRCUIT_01 xe-0/0/1 xconnect_id=XCON01
```

salt.modules.netbox.create_circuit_type(name)

New in version 2019.2.0.
Create a new Netbox circuit type.

- **name**: The name of the circuit type

CLI Example:
```
salt myminion netbox.create_circuit_type Transit
```

salt.modules.netbox.create_device(name, role, model, manufacturer, site)

New in version 2019.2.0.
Create a new device with a name, role, model, manufacturer and site. All these components need to be already in Netbox.

- **name**: The name of the device, e.g., edge_router
- **role**: String of device role, e.g., router
- **model**: String of device model, e.g., MX480
- **manufacturer**: String of device manufacturer, e.g., Juniper
- **site**: String of device site, e.g., BRU

CLI Example:
```
salt myminion netbox.create_device edge_router router MX480 Juniper BRU
```

salt.modules.netbox.create_device_role(role, color)

New in version 2019.2.0.
Create a device role
role

  String of device role, e.g., router
CLI Example:

```
salt myminion netbox.create_device_role router
```

```
salt.modules.netbox.create_device_type(model, manufacturer)
```

New in version 2019.2.0.

Create a device type. If the manufacturer doesn’t exist, create a new manufacturer.

```
model

  String of device model, e.g., MX480
```

```
manufacturer

  String of device manufacturer, e.g., Juniper
```

CLI Example:

```
salt myminion netbox.create_device_type MX480 Juniper
```

```
salt.modules.netbox.create_interface(device_name, interface_name, mac_address=None,
  description=None, enabled=None, lag=None, lag_parent=None,
  form_factor=None)
```

New in version 2019.2.0.

Attach an interface to a device. If not all arguments are provided, they will default to Netbox defaults.

```
device_name

  The name of the device, e.g., edge_router
```

```
interface_name

  The name of the interface, e.g., TenGigE0/0/0/0
```

```
mac_address

  String of mac address, e.g., 50:87:89:73:92:C8
```

```
description

  String of interface description, e.g., NTT
```

```
enabled

  String of boolean interface status, e.g., True
```

```
lag:

  Boolean of interface lag status, e.g., True
```

```
lag_parent

  String of interface lag parent name, e.g., ae13
```

```
form_factor

  Integer of form factor id, obtained through _choices API endpoint, e.g., 200
```

CLI Example:

```
salt myminion netbox.create_interface edge_router ae13 description="Core\n  → uplink"
```

```
salt.modules.netbox.create_interface_connection(interface_a, interface_b)
```

New in version 2019.2.0.

Create an interface connection between 2 interfaces

```
interface_a

  Interface id for Side A
```

```
interface_b

  Interface id for Side B
```

CLI Example:
salt Documentation, Release 3007.1

salt myminion netbox.create_interface_connection 123 456

salt.modules.netbox.create_inventory_item(device_name, item_name, manufacturer_name=None, serial='', part_id='', description='')

New in version 2019.2.0.
Add an inventory item to an existing device.

device_name
The name of the device, e.g., edge_router.

item_name
String of inventory item name, e.g., Transceiver.

manufacturer_name
String of inventory item manufacturer, e.g., Fiberstore.

serial
String of inventory item serial, e.g., FS1238931.

part_id
String of inventory item part id, e.g., 740-01234.

description
String of inventory item description, e.g., SFP+-10G-LR.

CLI Example:
salt myminion netbox.create_inventory_item edge_router Transceiver part_id=id=740-01234

salt.modules.netbox.create_ipaddress(ip_address, family, device=None, interface=None)

New in version 2019.2.0.
Add an IP address, and optionally attach it to an interface.

ip_address
The IP address and CIDR, e.g., 192.168.1.1/24

family
Integer of IP family, e.g., 4

device
The name of the device to attach IP to, e.g., edge_router

interface
The name of the interface to attach IP to, e.g., ae13

CLI Example:
salt myminion netbox.create_ipaddress 192.168.1.1/24 4 device=edge_router\interface=ae13

salt.modules.netbox.create_manufacturer(name)

New in version 2019.2.0.
Create a device manufacturer.

name
The name of the manufacturer, e.g., Juniper

CLI Example:
salt myminion netbox.create_manufacturer Juniper

salt.modules.netbox.create_platform(platform)

New in version 2019.2.0.
Create a new device platform

26.6. execution modules
platform
  String of device platform, e.g., junos
CLI Example:

```
salt myminion netbox.create_platform junos
```

salt.modules.netbox.create_site(site)
  New in version 2019.2.0.
  Create a new device site
  site
    String of device site, e.g., BRU
  CLI Example:

```
salt myminion netbox.create_site BRU
```

salt.modules.netbox.delete_interface(device_name, interface_name)
  New in version 2019.2.0.
  Delete an interface from a device.
  device_name
    The name of the device, e.g., edge_router.
  interface_name
    The name of the interface, e.g., ae13
  CLI Example:

```
salt myminion netbox.delete_interface edge_router ae13
```

salt.modules.netbox.delete_inventory_item(item_id)
  New in version 2019.2.0.
  Remove an item from a devices inventory. Identified by the netbox id
  item_id
    Integer of item to be deleted
  CLI Example:

```
salt myminion netbox.delete_inventory_item 1354
```

salt.modules.netbox.delete_ipaddress(ipaddr_id)
  New in version 2019.2.0.
  Delete an IP address. IP addresses in Netbox are a combination of address and the interface it is assigned to.
  id
    The Netbox id for the IP address.
  CLI Example:

```
salt myminion netbox.delete_ipaddress 9002
```

salt.modules.netbox.filter_(app, endpoint, **kwargs)
  Get a list of items from NetBox.
  app
    String of netbox app, e.g., dcim, circuits, ipam
  endpoint
    String of app endpoint, e.g., sites, regions, devices
**kwargs
Optional arguments that can be used to filter. All filter keywords are available in Netbox, which can be found by surfing to the corresponding API endpoint, and clicking Filters. e.g., `role=router`

Returns a list of dictionaries

```
salt myminion netbox.filter dcim devices status=1 role=router
```

`salt.modules.netbox.get_(app, endpoint, id=None, **kwargs)`
Get a single item from NetBox.

- **app**
  String of netbox app, e.g., `dcim`, `circuits`, `ipam`
- **endpoint**
  String of app endpoint, e.g., `sites`, `regions`, `devices`

Returns a single dictionary

To get an item based on ID.

```
salt myminion netbox.get dcim devices id=123
```

Or using named arguments that correspond with accepted filters on the NetBox endpoint.

```
salt myminion netbox.get dcim devices name=my-router
```

`salt.modules.netbox.get_circuit_provider(name, asn=None)`
New in version 2019.2.0.
Get a circuit provider with a given name and optional ASN.

- **name**
  The name of the circuit provider
- **asn**
  The ASN of the circuit provider

CLI Example:

```
salt myminion netbox.get_circuit_provider Telia 1299
```

`salt.modules.netbox.get_interfaces(device_name=None, **kwargs)`
New in version 2019.2.0.
Returns interfaces for a specific device using arbitrary netbox filters

- **device_name**
  The name of the device, e.g., `edge_router`
- **kwargs**
  Optional arguments to be used for filtering

CLI Example:

```
salt myminion netbox.get_interfaces edge_router name="et-0/0/5"
```

`salt.modules.netbox.get_ipaddresses(device_name=None, **kwargs)`
New in version 2019.2.0.
Filters for an IP address using specified filters

- **device_name**
  The name of the device to check for the IP address
- **kwargs**
  Optional arguments that can be used to filter, e.g., `family=4`

CLI Example:
salt.myminion.netbox.get_ipaddresses(device_name, family=4)

salt.modules.netbox.make_interface_child(device_name, interface_name, parent_name)

New in version 2019.2.0.
Set an interface as part of a LAG.

device_name
  The name of the device, e.g., edge_router.

interface_name
  The name of the interface to be attached to LAG, e.g., xe-1/0/2.

parent_name
  The name of the LAG interface, e.g., ae13.

CLI Example:
salt.myminion.netbox.make_interface_child xe-1/0/2 ae13

salt.modules.netbox.make_interface_lag(device_name, interface_name)

New in version 2019.2.0.
Update an interface to be a LAG.

device_name
  The name of the device, e.g., edge_router.

interface_name
  The name of the interface, e.g., ae13.

CLI Example:
salt.myminion.netbox.make_interface_lag edge_router ae13

salt.modules.netbox.openconfig_interfaces(device_name=None)

New in version 2019.2.0.
Return a dictionary structured as standardised in the openconfig-interfaces YANG model, containing physical and configuration data available in Netbox, e.g., IP addresses, MTU, enabled / disabled, etc.

device_name: None
  The name of the device to query the interface data for. If not provided, will use the Minion ID.

CLI Example:
salt '*' netbox.openconfig_interfaces
salt '*' netbox.openconfig_interfaces device_name=cr1.thn.lon

salt.modules.netbox.openconfig_lacp(device_name=None)

New in version 2019.2.0.
Return a dictionary structured as standardised in the openconfig-lacp YANG model, with configuration data for Link Aggregation Control Protocol (LACP) for aggregate interfaces.

Note: The interval and lacp_mode keys have the values set as SLOW and ACTIVE respectively, as this data is not currently available in Netbox, therefore defaulting to the values defined in the standard. See interval and lacp-mode for further details.

device_name: None
  The name of the device to query the LACP information for. If not provided, will use the Minion ID.

CLI Example:
salt '*' netbox.openconfig_lacp
salt '*' netbox.openconfig_lacp device_name=cr1.thn.lon

salt.modules.netbox.slugify(value)
   ' Slugify given value. Credit to Djangoproject https://docs.djangoproject.com/en/2.0/_modules/django/utils/text/#slugify

salt.modules.netbox.update_device(name, **kwargs)
   New in version 2019.2.0.
   Add attributes to an existing device, identified by name.
   name
      The name of the device, e.g., edge_router
   kwargs
      Arguments to change in device, e.g., serial=JN2932930
   CLI Example:

      salt myminion netbox.update_device edge_router serial=JN2932920

salt.modules.netbox.update_interface(device_name, interface_name, **kwargs)
   New in version 2019.2.0.
   Update an existing interface with new attributes.
   device_name
      The name of the device, e.g., edge_router
   interface_name
      The name of the interface, e.g., ae13
   kwargs
      Arguments to change in interface, e.g., mac_address=50:87:69:53:32:D0
   CLI Example:

      salt myminion netbox.update_interface edge_router ae13 mac_address=50:87:69:53:32:D0

26.6.293 salt.modules.netbsd_sysctl

Module for viewing and modifying sysctl parameters

salt.modules.netbsd_sysctl.assign(name, value)
   Assign a single sysctl parameter for this minion
   CLI Example:

      salt '*' sysctl.assign net.inet.icmp.icmplim 50

salt.modules.netbsd_sysctl.get(name)
   Return a single sysctl parameter for this minion
   CLI Example:

      salt '*' sysctl.get hw.physmem
salt.modules.netbsd_sysctl.persist(name, value, config='/etc/sysctl.conf')

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```bash
salt '*' sysctl.persist net.inet.icmp.icmplim 50
```

salt.modules.netbsd_sysctl.show(config_file=False)

Return a list of sysctl parameters for this minion

- config: Pull the data from the system configuration file instead of the live data.

CLI Example:

```bash
salt '*' sysctl.show
```

26.6.294 salt.modules.netbsdservice

The service module for NetBSD

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

salt.modules.netbsdservice.available(name)

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```bash
salt '*' service.available sshd
```

salt.modules.netbsdservice.disable(name, **kwargs)

Disable the named service to start at boot

CLI Example:

```bash
salt '*' service.disable <service name>
```

salt.modules.netbsdservice.disabled(name)

Return True if the named service is enabled, false otherwise

CLI Example:

```bash
salt '*' service.disabled <service name>
```

salt.modules.netbsdservice.enable(name, **kwargs)

Enable the named service to start at boot

CLI Example:

```bash
salt '*' service.enable <service name>
```

salt.modules.netbsdservice.enabled(name, **kwargs)

Return True if the named service is enabled, false otherwise

CLI Example:
salt '*' service.enabled <service name>

salt.modules.netbsdservice.force_reload(name)
Force-reload the named service
CLI Example:
salt '*' service.force_reload <service name>

salt.modules.netbsdservice.get_all()
Return all available boot services
CLI Example:
salt '*' service.get_all

salt.modules.netbsdservice.get_disabled()
Return a set of services that are installed but disabled
CLI Example:
salt '*' service.get_disabled

salt.modules.netbsdservice.get_enabled()
Return a list of service that are enabled on boot
CLI Example:
salt '*' service.get_enabled

salt.modules.netbsdservice.missing(name)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
CLI Example:
salt '*' service.missing sshd

salt.modules.netbsdservice.reload_(name)
Reload the named service
CLI Example:
salt '*' service.reload <service name>

salt.modules.netbsdservice.restart(name)
Restart the named service
CLI Example:
salt '*' service.restart <service name>

salt.modules.netbsdservice.start(name)
Start the specified service
CLI Example:
```
salt '*' service.start <service name>
```

```
salt.modules.netbsdservice.status(name, sig=None)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters
- name (str) -- The name of the service to check
- sig (str) -- Signature to use to find the service via ps

Returns
True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type
bool

CLI Example:
```
salt '*' service.status <service name> [service signature]
```

```
salt.modules.netbsdservice.stop(name)

Stop the specified service

CLI Example:
```
salt '*' service.stop <service name>
```

26.6.295 salt.modules.netmiko_mod

Netmiko Execution Module

New in version 2019.2.0.

Execution module to interface the connection with a remote network device. It is flexible enough to execute the commands both when running under a Netmiko Proxy Minion, as well as running under a Regular Minion by specifying the connection arguments, i.e., device_type, ip, username, password etc.

- codeauthor
  - Mircea Ulinic <ping@mirceaulinic.net> & Kirk Byers <ktbyers@twb-tech.com>

- maturity
  - new

- depends
  - netmiko

- platform
  - unix
Dependencies

The `netmiko` proxy modules requires Netmiko to be installed: `pip install netmiko`.

Usage

This module can equally be used via the `netmiko` Proxy module (check documentation), or directly from an arbitrary (Proxy) Minion that is running on a server (computer) having access to the network device, and has the `netmiko` library installed.

When running outside of the `netmiko Proxy` (i.e., from another Proxy Minion type, or regular Minion), the `netmiko` connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the `netmiko` key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the `netmiko` Proxy Module:

- **device_type** - Class selection based on device type. Supported options:
  - `a10`: A10 Networks
  - `accedian`: Accedian Networks
  - `alcatel_aos`: Alcatel AOS
  - `alcatel_sros`: Alcatel SROS
  - `apresia_aeos`: Apresia AEOS
  - `arista_eos`: Arista EOS
  - `aruba_os`: Aruba
  - `avaya_ers`: Avaya ERS
  - `avaya_vsp`: Avaya VSP
  - `brocade_fastiron`: Brocade Fastiron
  - `brocade_netiron`: Brocade Netiron
  - `brocade_nos`: Brocade NOS
  - `brocade_vdx`: Brocade NOS
  - `brocade_vyos`: VyOS
  - `checkpoint_gaia`: Check Point GAiA
  - `calix_b6`: Calix B6
  - `ciena_saos`: Ciena SAOS
  - `cisco_asa`: Cisco SA
  - `cisco_ios`: Cisco IOS
  - `cisco_nxos`: Cisco NX-os
  - `cisco_s300`: Cisco S300
  - `cisco_tp`: Cisco TpTcCe
  - `cisco_wlc`: Cisco WLC
  - `cisco_xe`: Cisco IOS
  - `cisco_xr`: Cisco XR
- coriant: Coriant
- dell_force10: Dell Force10
- dell_os10: Dell OS10
- dell_powerconnect: Dell PowerConnect
- eltex: Eltex
- enterasys: Enterasys
- extreme: Extreme
- extreme_wing: Extreme Wing
- f5_ltm: F5 LTM
- fortinet: Fortinet
- generic_termserver: TerminalServer
- hp_comware: HP Comware
- hp_procurve: HP Procurve
- huawei: Huawei
- huawei_vrpv8: Huawei VRPV8
- juniper: Juniper Junos
- juniper_junos: Juniper Junos
- linux: Linux
- mellanox: Mellanox
- mrv_optiswitch: MrvOptiswitch

• `ip` - IP address of target device (not required if `host` is provided)
• `host` - Hostname of target device (not required if `ip` is provided)
• `username` - Username to authenticate against target device, if required
• `password` - Password to authenticate against target device, if required
• `secret` - The enable password if target device requires one
• `port` - The destination port used to connect to the target device
• `global_delay_factor` - Multiplication factor affecting Netmiko delays (default: 1)
• `use_keys` - Connect to target device using SSH keys (default: False)
• `key_file` - Filename path of the SSH key file to use
• `allow_agent` - Enable use of SSH key-agent
• `ssh_strict` - Automatically reject unknown SSH host keys (default: False, which means unknown SSH host keys will be accepted)
• `system_host_keys` - Load host keys from the user's "known_hosts" file (default: False)
• `alt_host_keys` - If True, host keys will be loaded from the file specified in `alt_key_file` (default: False)
• `alt_key_file` - SSH host key file to use (if `alt_host_keys=True`)
• `ssh_config_file` - File name of OpenSSH configuration file
• `timeout` - Connection timeout, in seconds (default: 90)
• `session_timeout` - Set a timeout for parallel requests, in seconds (default: 60)
• `keepalive` - Send SSH keepalive packets at a specific interval, in seconds. Currently defaults to 0, for backwards compatibility (it will not attempt to keep the connection alive using the KEEPALIVE packets).
• `default_enter` - Character(s) to send to correspond to enter key (default: \n)
• `response_return` - Character(s) to use in normalized return data to represent enter key (default: \n)

Example (when not running in a netmiko Proxy Minion):

```
netmiko:
  username: test
  password: test
```
In case the username and password are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a netmiko Proxy, e.g.:

```python
salt '*' netmiko.send_command 'show version' host=router1.example.com device_type=juniper
salt '*' netmiko.send_config https://bit.ly/2sgljCB host=sw2.example.com device_type=cisco_ios
```

**Note:** Remember that the above applies only when not running in a netmiko Proxy Minion. If you want to use the `<salt.proxy.netmiko_px>`, please follow the documentation notes for a proper setup.

```python
salt.modules.netmiko_mod.call(method, *args, **kwargs)
    Invoke an arbitrary Netmiko method.
    method
        The name of the Netmiko method to invoke.
    args
        A list of arguments to send to the method invoked.
    kwargs
        Key-value dictionary to send to the method invoked.

salt.modules.netmiko_mod.commit(**kwargs)
    Commit the configuration changes.

    **Warning:** This function is supported only on the platforms that support the commit operation.

    CLI Example:

    ```python
    salt '*' netmiko.commit
    ```

salt.modules.netmiko_mod.enter_config_mode(**kwargs)
    Enter into config mode.
    config_command
        Configuration command to send to the device.
    pattern
        Pattern to terminate reading of channel.

    CLI Example:

    ```python
    salt '*' netmiko.enter_config_mode
salt '*' netmiko.enter_config_mode device_type='juniper_junos' ip='192.168.0.1' username='example'
    ```

salt.modules.netmiko_mod.exit_config_mode(**kwargs)
    Exit from configuration mode.
    exit_config
        Command to exit configuration mode.
    pattern
        Pattern to terminate reading of channel.

    CLI Example:
salt.modules.netmiko_mod.get_connection(**kwargs)

Return the Netmiko connection object.

**Warning:** This function returns an unserializable object, hence it is not meant to be used on the CLI. This should mainly be used when invoked from other modules for the low level connection with the network device.

**kwargs**

Key-value dictionary with the authentication details.

**Usage Example:**

```python
conn = __salt__['netmiko.get_connection'](host='router1.example.com', username='example', password='example')
show_if = conn.send_command('show interfaces')
conn.disconnect()
```

salt.modules.netmiko_mod.multi_call(*methods, **kwargs)

Invoke multiple Netmiko methods at once, and return their output, as list.

**methods**

A list of dictionaries with the following keys:
- **name**: the name of the Netmiko method to be executed.
- **args**: list of arguments to be sent to the Netmiko method.
- **kwargs**: dictionary of arguments to be sent to the Netmiko method.

**kwargs**

Key-value dictionary with the connection details (when not running under a Proxy Minion).

salt.modules.netmiko_mod.send_command(command_string, **kwargs)

Execute command_string on the SSH channel using a pattern-based mechanism. Generally used for show commands. By default this method will keep waiting to receive data until the network device prompt is detected. The current network device prompt will be determined automatically.

**command_string**

The command to be executed on the remote device.

**expect_string**

Regular expression pattern to use for determining end of output. If left blank will default to being based on router prompt.

**delay_factor**: 1

Multiplying factor used to adjust delays (default: 1).

**max_loops**: 500

Controls wait time in conjunction with delay_factor. Will default to be based upon self.timeout.

**auto_find_prompt**: True

Whether it should try to auto-detect the prompt (default: True).

**strip_prompt**: True

Remove the trailing router prompt from the output (default: True).

**strip_command**: True

Remove the echo of the command from the output (default: True).

**normalize**: True

Ensure the proper enter is sent at end of command (default: True).
**use_textfsm:** **False**  
Process command output through TextFSM template (default: False).

CLI Example:
```
salt '*' netmiko.send_command 'show version'
salt '*' netmiko.send_command 'show_version' host='router1.example.com' username='example' device_type='cisco_ios'
```

**salt.modules.netmiko_mod.send_command_timing**(command_string, **kwargs)
Execute command_string on the SSH channel using a delay-based mechanism. Generally used for show commands.

- **command_string**  
The command to be executed on the remote device.

- **delay_factor:** **1**  
  Multiplying factor used to adjust delays (default: 1).

- **max_loops:** **500**  
  Controls wait time in conjunction with delay_factor. Will default to be based upon self.timeout.

- **strip_prompt:** **True**  
  Remove the trailing router prompt from the output (default: True).

- **strip_command:** **True**  
  Remove the echo of the command from the output (default: True).

- **normalize:** **True**  
  Ensure the proper enter is sent at end of command (default: True).

- **use_textfsm:** **False**  
  Process command output through TextFSM template (default: False).

CLI Example:
```
salt '*' netmiko.send_command_timing 'show version'
salt '*' netmiko.send_command_timing 'show version' host='router1.example.com' username='example' device_type='arista_eos'
```

**salt.modules.netmiko_mod.send_config**(config_file=None, config_commands=None, template_engine='jinja', commit=False, context=None, defaults=None, saltenv='base', **kwargs)
Send configuration commands down the SSH channel. Return the configuration lines sent to the device.

The function is flexible to send the configuration from a local or remote file, or simply the commands as list.

- **config_file**  
The source file with the configuration commands to be sent to the device.

  The file can also be a template that can be rendered using the template engine of choice.

  This can be specified using the absolute path to the file, or using one of the following URL schemes:
  - `salt://`, to fetch the file from the Salt fileserver.
  - `http://` or `https://`
  - `ftp://`
  - `s3://`
  - `swift://`

- **config_commands**  
  Multiple configuration commands to be sent to the device.

  Note: This argument is ignored when `config_file` is specified.

- **template_engine:** `jinja`  
The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file
without attempting to render, set this argument to None.

**commit**: `False`
Commit the configuration changes before exiting the config mode. This option is by default disabled, as many platforms don't have this capability natively.

**context**
Variables to add to the template context.

**defaults**
Default values of the context_dict.

**exit_config_mode**:
Determine whether or not to exit config mode after complete.

**delay_factor**: 1
Factor to adjust delays.

**max_loops**: 150
Controls wait time in conjunction with delay_factor (default: 150).

**strip_prompt**: `False`
Determine whether or not to strip the prompt (default: False).

**strip_command**: `False`
Determine whether or not to strip the command (default: False).

**config_mode_command**
The command to enter into config mode.

**CLI Example**:

```bash
salt '* netmiko.send_config config_commands="[\'interface GigabitEthernet3
    ->\', \'no ip address\']"'
salt '* netmiko.send_config config_commands="[\'snmp-server location {{
    ->grains.location }}\']"
salt '* netmiko.send_config config_file=salt://config.txt
    ->type=cisco_ios ip=1.2.3.4 username='example'
```

### 26.6.296 `salt.modules.netscaler`

Module to provide Citrix Netscaler compatibility to Salt (compatible with netscaler 9.2+)

New in version 2015.2.0.

**depends**
- nsnitro Python module

**Note**: You can install nsnitro using:

```bash
pip install nsnitro
```

**configuration**
This module accepts connection configuration details either as parameters, or as configuration settings in /etc/salt/minion on the relevant minions

```yaml
netscaler.host: 1.2.3.4
netscaler.user: user
netscaler.pass: password
```
This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

CLI Examples:

Calls relying on configuration passed using /etc/salt/minion, grains, or pillars:

```
salt-call netscaler.server_exists server_name
```

Calls passing configuration as opts

```
salt-call netscaler.server_exists server_name netscaler_host=1.2.3.4
→ netscaler_user=username netscaler_pass=password
salt-call netscaler.server_exists server_name netscaler_host=1.2.3.5
→ netscaler_user=username2 netscaler_pass=password2
salt-call netscaler.server_enable server_name2 netscaler_host=1.2.3.5
salt-call netscaler.server_up server_name3 netscaler_host=1.2.3.6
→ netscaler_useSSL=False
```

```
salt.modules.netscaler.server_add(s_name, s_ip, s_state=None, **connection_args)
```

Add a server
Note: The default server state is ENABLED

CLI Example:

```
salt '*' netscaler.server_add 'serverName' 'serverIpAddress'
salt '*' netscaler.server_add 'serverName' 'serverIpAddress' 'serverState'
```

```
salt.modules.netscaler.server_delete(s_name, **connection_args)
```

Delete a server

CLI Example:

```
salt '*' netscaler.server_delete 'serverName'
```

```
salt.modules.netscaler.server_disable(s_name, **connection_args)
```

Disable a server globally

CLI Example:

```
salt '*' netscaler.server_disable 'serverName'
```

```
salt.modules.netscaler.server_enable(s_name, **connection_args)
```

Enables a server globally

CLI Example:

```
salt '*' netscaler.server_enable 'serverName'
```

```
salt.modules.netscaler.server_enabled(s_name, **connection_args)
```

Check if a server is enabled globally

CLI Example:

```
salt '*' netscaler.server_enabled 'serverName'
```
salt.modules.netscaler.**server_exists**(s_name, ip=None, s_state=None, **connection_args)
Checks if a server exists
CLI Example:
salt '*' netscaler.server_exists 'serverName'

salt.modules.netscaler.**server_update**(s_name, s_ip, **connection_args)
Update a server's attributes
CLI Example:
salt '*' netscaler.server_update 'serverName' 'serverIP'

salt.modules.netscaler.**service_disable**(s_name, s_delay=None, **connection_args)
Disable a service
CLI Example:
salt '*' netscaler.service_disable 'serviceName'
salt '*' netscaler.service_disable 'serviceName' 'delayInSeconds'

salt.modules.netscaler.**service_enable**(s_name, **connection_args)
Enable a service
CLI Example:
salt '*' netscaler.service_enable 'serviceName'

salt.modules.netscaler.**service_exists**(s_name, **connection_args)
Checks if a service exists
CLI Example:
salt '*' netscaler.service_exists 'serviceName'

salt.modules.netscaler.**service_up**(s_name, **connection_args)
Checks if a service is UP
CLI Example:
salt '*' netscaler.service_up 'serviceName'

salt.modules.netscaler.**servicegroup_add**(sg_name, sg_type='HTTP', **connection_args)
Add a new service group If no service type is specified, HTTP will be used. Most common service types: HTTP, SSL, and SSL_BRIDGE
CLI Example:
salt '*' netscaler.servicegroup_add 'serviceGroupName'
salt '*' netscaler.servicegroup_add 'serviceGroupName' 'serviceGroupType'

salt.modules.netscaler.**servicegroup_delete**(sg_name, **connection_args)
Delete a new service group
CLI Example:
**salt.modules.netscaler.servicegroup_delete** (*serviceGroupName*)

Checks if a service group exists

**CLI Example:**
```
salt '*' netscaler.servicegroup_delete 'serviceGroupName'
```

**salt.modules.netscaler.servicegroup_exists** (*sg_name*, *sg_type=None*, **connection_args**)

Checks if a service group exists

**CLI Example:**
```
salt '*' netscaler.servicegroup_exists 'serviceGroupName'
```

**salt.modules.netscaler.servicegroup_server_add** (*sg_name*, *s_name*, *s_port*, **connection_args**)

Add a server:port member to a servicegroup

**CLI Example:**
```
salt '*' netscaler.servicegroup_server_add 'serviceGroupName' 'serverName' -> 'serverPort'
```

**salt.modules.netscaler.servicegroup_server_delete** (*sg_name*, *s_name*, *s_port*, **connection_args**)

Remove a server:port member from a servicegroup

**CLI Example:**
```
salt '*' netscaler.servicegroup_server_delete 'serviceGroupName' 'serverName' -> 'serverPort'
```

**salt.modules.netscaler.servicegroup_server_disable** (*sg_name*, *s_name*, *s_port*, **connection_args**)

Disable a server:port member of a servicegroup

**CLI Example:**
```
salt '*' netscaler.servicegroup_server_disable 'serviceGroupName' 'serverName' -> 'serverPort'
```

**salt.modules.netscaler.servicegroup_server_enable** (*sg_name*, *s_name*, *s_port*, **connection_args**)

Enable a server:port member of a servicegroup

**CLI Example:**
```
salt '*' netscaler.servicegroup_server_enable 'serviceGroupName' 'serverName' -> 'serverPort'
```

**salt.modules.netscaler.servicegroup_server_exists** (*sg_name*, *s_name*, *s_port=None*, **connection_args**)

Check if a server:port combination is a member of a servicegroup

**CLI Example:**
```
salt '*' netscaler.servicegroup_server_exists 'serviceGroupName' 'serverName' -> 'serverPort'
```

**salt.modules.netscaler.servicegroup_server_up** (*sg_name*, *s_name*, *s_port*, **connection_args**)

Check if a server:port combination is in state UP in a servicegroup

**CLI Example:**
```
salt '*' netscaler.servicegroup_server_up 'serviceGroupName' 'serverName' -> 'serverPort'
```
salt ['*'] netscaler.servicegroup_server_up 'serviceName' 'serverName' 'serverPort'

salt.modules.netscaler.vserver_add(v_name, v_ip, v_port, v_type, **connection_args)
Add a new lb vserver
   CLI Example:
   salt ['*'] netscaler.vserver_add 'vserverName' 'vserverIP' 'vserverPort' 'vserverType'
salt ['*'] netscaler.vserver_add 'alex.patate.chaude.443' '1.2.3.4' '443' 'SSL'

salt.modules.netscaler.vserver_delete(v_name, **connection_args)
Delete a lb vserver
   CLI Example:
   salt ['*'] netscaler.vserver_delete 'vserverName'

salt.modules.netscaler.vserver_exists(v_name, v_ip=None, v_port=None, v_type=None, **connection_args)
Checks if a vserver exists
   CLI Example:
   salt ['*'] netscaler.vserver_exists 'vserverName'

salt.modules.netscaler.vserver_servicegroup_add(v_name, sg_name, **connection_args)
Bind a servicegroup to a vserver
   CLI Example:
   salt ['*'] netscaler.vserver_servicegroup_add 'vserverName' 'serviceGroupName'

salt.modules.netscaler.vserver_servicegroup_delete(v_name, sg_name, **connection_args)
Unbind a servicegroup from a vserver
   CLI Example:
   salt ['*'] netscaler.vserver_servicegroup_delete 'vserverName' 'serviceGroupName'

salt.modules.netscaler.vserver_servicegroup_exists(v_name, sg_name, **connection_args)
Checks if a servicegroup is tied to a vserver
   CLI Example:
   salt ['*'] netscaler.vserver_servicegroup_exists 'vserverName' 'serviceGroupName'

salt.modules.netscaler.vserver_sslcert_add(v_name, sc_name, **connection_args)
Binds a SSL certificate to a vserver
   CLI Example:
**netscaler.vserver_sslcert_add**

```
salt '*' netscaler.vserver_sslcert_add 'vserverName' 'sslCertificateName'
```

This module binds a SSL certificate to a vserver.

CLI Example:
```
salt '*' netscaler.vserver_sslcert_add 'vserverName' 'sslCertificateName'
```

---

**netscaler.vserver_sslcert_delete**

```
salt.modules.netscaler.vserver_sslcert_delete(v_name, sc_name, **connection_args)
```

Unbinds a SSL certificate from a vserver.

CLI Example:
```
salt '*' netscaler.vserver_sslcert_delete 'vserverName' 'sslCertificateName'
```

---

**netscaler.vserver_sslcert_exists**

```
salt.modules.netscaler.vserver_sslcert_exists(v_name, sc_name, **connection_args)
```

Checks if a SSL certificate is tied to a vserver.

CLI Example:
```
salt '*' netscaler.vserver_sslcert_exists 'vserverName' 'sslCertificateName'
```

---

### 26.6.297 salt.modules.network

Module for gathering and managing network information

**netscaler.network.active_tcp**

```
salt.modules.network.active_tcp()
```

Return a dict containing information on all of the running TCP connections (currently linux and solaris only).

Changed in version 2015.8.4: Added support for SunOS

CLI Example:
```
salt '*' network.active_tcp
```

---

**netscaler.network.arp**

```
salt.modules.network.arp()
```

Return the arp table from the minion.

Changed in version 2015.8.0: Added support for SunOS

CLI Example:
```
salt '*' network.arp
```

---

**netscaler.network.calc_net**

```
salt.modules.network.calc_net(ip_addr, netmask=None)
```

Returns the CIDR of a subnet based on an IP address (CIDR notation supported) and optional netmask.

CLI Example:
```
salt '*' network.calc_net 172.17.0.5 255.255.255.240
salt '*' network.calc_net 2a02:f6e:a000:80:84d8:8332:7866:4e07/64
```

New in version 2015.8.0.

---

**netscaler.network.connect**

```
salt.modules.network.connect(host, port=None, **kwargs)
```

Test connectivity to a host using a particular port from the minion.

New in version 2014.7.0.

CLI Example:
Salt Documentation, Release 3007.1

```python
salt '!' network.connect archlinux.org 80
salt '!' network.connect archlinux.org 80 timeout=3
salt '!' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '!' network.connect google-public-dns-a.google.com port=53 proto=udp family=ipv4
```

salt.modules.network.convert_cidr(cidr)

returns the network address, subnet mask and broadcast address of a cidr address

New in version 2016.3.0.

CLI Example:

```python
salt '!' network.convert_cidr 172.31.0.0/16
```

salt.modules.network.default_route(family=None)

Return default route(s) from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '!' network.default_route
```

salt.modules.network.dig(host)

Performs a DNS lookup with dig

CLI Example:

```
salt '!' network.dig archlinux.org
```

salt.modules.network.fqdns()

Return all known FQDNs for the system by enumerating all interfaces and then trying to reverse resolve them (excluding 'lo' interface).

CLI Example:

```
salt '!' network.fqdns
```

salt.modules.network.get_bufsize(iface)

Return network buffer sizes as a dict (currently linux only)

CLI Example:

```
salt '!' network.get_bufsize eth0
```

salt.modules.network.get_fqdn()

Get fully qualified domain name

CLI Example:
salt '*' network.get_fqdn

salt.modules.network.get_hostname()
Get hostname
CLI Example:
salt '*' network.get_hostname

salt.modules.network.get_route(ip)
Return routing information for given destination ip
New in version 2015.5.3.
Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS) Added support for OpenBSD
Changed in version 2016.11.4: Added support for AIX
CLI Example:
salt '*' network.get_route 10.10.10.10

salt.modules.network.hw_addr(iface)
Return the hardware address (a.k.a. MAC address) for a given interface
CLI Example:
salt '*' network.hw_addr eth0

salt.modules.network.hwaddr(iface)
This function is an alias of hw_addr.
Return the hardware address (a.k.a. MAC address) for a given interface
CLI Example:
salt '*' network.hw_addr eth0

salt.modules.network.ifacestartswith(cidr)
Retrieve the interface name from a specific CIDR
New in version 2016.11.0.
CLI Example:
salt '*' network.ifacestartswith 10.0

salt.modules.network.in_subnet(cidr)
Returns True if host is within specified subnet, otherwise False.
CLI Example:
salt '*' network.in_subnet 10.0.0.0/16

salt.modules.network.interface(iface)
Return the inet address for a given interface
New in version 2014.7.0.
CLI Example:
salt '*' network.interface eth0

salt.modules.network.interface_ip(iface)
Return the inet address for a given interface
New in version 2014.7.0.
CLI Example:
salt '*' network.interface_ip eth0

salt.modules.network.interfaces()
Return a dictionary of information about all the interfaces on the minion
CLI Example:
salt '*' network.interfaces

salt.modules.network.ip_addrs(interface=None, include_loopback=False, cidr=None, type=None)
Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If 'type' is 'public', then only public addresses will be returned. Ditto for 'type'='private'.
Changed in version 3001: interface can now be a single interface name or a list of interfaces. Globbing is also supported.
CLI Example:
salt '*' network.ip_addrs

salt.modules.network.ip_addrs6(interface=None, include_loopback=False, cidr=None)
Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="2000::/3"' will return only the addresses which are within that subnet.
Changed in version 3001: interface can now be a single interface name or a list of interfaces. Globbing is also supported.
CLI Example:
salt '*' network.ip_addrs6

salt.modules.network.ip_in_subnet(ip_addr, cidr)
Returns True if given IP is within specified subnet, otherwise False.
CLI Example:
salt '*' network.ip_in_subnet 172.17.0.4 172.16.0.0/12

salt.modules.network.ip_neighs()
Return the ip neighbour (arp) table from the minion for IPv4 addresses
New in version 3007.0.
CLI Example:
salt '*' network.ip_neighs

salt.modules.network.ip_neighs6()

Return the ip neighbour (arp) table from the minion for IPv6 addresses

New in version 3007.0.

CLI Example:

```
salt '*' network.ip_neighs6
```

salt.modules.network.ip_networks(interface=None, include_loopback=False, verbose=False)

New in version 3001.

Returns a list of IPv4 networks to which the minion belongs.

interface

Restrict results to the specified interface(s). This value can be either a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_networks
salt '*' network.ip_networks interface=docker0
salt '*' network.ip_networks interface=docker0,enp*
salt '*' network.ip_networks interface=eth*
```

salt.modules.network.ip_networks6(interface=None, include_loopback=False, verbose=False)

New in version 3001.

Returns a list of IPv6 networks to which the minion belongs.

interface

Restrict results to the specified interface(s). This value can be either a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_networks6
salt '*' network.ip_networks6 interface=docker0
salt '*' network.ip_networks6 interface=docker0,enp*
salt '*' network.ip_networks6 interface=eth*
```

salt.modules.network.ip_addrs(interface=None, include_loopback=False, cidr=None, type=None)

This function is an alias of ip_addrs.

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If 'type' is 'public', then only public addresses will be returned. Ditto for 'type='private'.

Changed in version 3001: interface can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_addrs
```

salt.modules.network.ip_addrs6(interface=None, include_loopback=False, cidr=None)

This function is an alias of ip_addrs6.
Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="2000::/3"' will return only the addresses which are within that subnet.

Changed in version 3001: 'interface' can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```bash
salt '*' network.ip_addrs6
```

**salt.modules.network.iphexval(ip)**

Retrieve the hexadecimal representation of an IP address

New in version 2016.11.0.

CLI Example:

```bash
salt '*' network.iphexval 10.0.0.1
```

**salt.modules.network.ipneighs()**

This function is an alias of `ip_neighs`.

Return the ip neighbour (arp) table from the minion for IPv4 addresses

New in version 3007.0.

CLI Example:

```bash
salt '*' network.ip_neighs
```

**salt.modules.network.ipneighs6()**

This function is an alias of `ip_neighs6`.

Return the ip neighbour (arp) table from the minion for IPv6 addresses

New in version 3007.0.

CLI Example:

```bash
salt '*' network.ip_neighs6
```

**salt.modules.network.is_loopback(ip_addr)**

Check if the given IP address is a loopback address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```bash
salt '*' network.is_loopback 127.0.0.1
```

**salt.modules.network.is_private(ip_addr)**

Check if the given IP address is a private address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:
salt '*' network.is_private 10.0.0.3

salt.modules.network.mod bufsize(iface, *args, **kwargs)
    Modify network interface buffers (currently linux only)
    CLI Example:
    salt '*' network.mod bufsize tx=<val> rx=<val> rx-mini=<val> rx-jumbo=<val>

salt.modules.network.mod hostname(hostname)
    Modify hostname
    Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)
    CLI Example:
    salt '*' network.mod hostname master.saltstack.com

salt.modules.network.netstat()
    Return information on open ports and states
    Note: On BSD minions, the output contains PID info (where available) for each netstat entry, fetched from sockstat/fstat output.
    Changed in version 2014.1.4: Added support for OpenBSD, FreeBSD, and NetBSD
    Changed in version 2015.8.0: Added support for SunOS
    Changed in version 2016.11.4: Added support for AIX
    CLI Example:
    salt '*' network.netstat

salt.modules.network.ping(host, timeout=False, return_boolean=False)
    Performs an ICMP ping to a host
    Changed in version 2015.8.0: Added support for SunOS
    CLI Example:
    salt '*' network.ping archlinux.org
    New in version 2015.5.0.
    Return a True or False instead of ping output.
    salt '*' network.ping archlinux.org return_boolean=True
    Set the time to wait for a response in seconds.
    salt '*' network.ping archlinux.org timeout=3
salt.modules.network.reverse_ip(ip_addr)
Returns the reversed IP address
Changed in version 2015.8.0: IPv6 support
CLI Example:
```
salt '*' network.reverse_ip 172.17.0.4
```

salt.modules.network.routes(family=None)
Return currently configured routes from routing table
Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)
Changed in version 2016.11.4: Added support for AIX
CLI Example:
```
salt '*' network.routes
```

salt.modules.network.subnets(interfaces=None)
Returns a list of IPv4 subnets to which the host belongs
CLI Example:
```
salt '*' network.subnets
salt '*' network.subnets interfaces=eth1
```

salt.modules.network.subnets6()
Returns a list of IPv6 subnets to which the host belongs
CLI Example:
```
salt '*' network.subnets
```

salt.modules.network.traceroute(host)
Performs a traceroute to a 3rd party host
Changed in version 2015.8.0: Added support for SunOS
Changed in version 2016.11.4: Added support for AIX
CLI Example:
```
salt '*' network.traceroute archlinux.org
```

salt.modules.network.wol(mac, bcast='255.255.255.255', destport=9)
Send Wake On Lan packet to a host
CLI Example:
```
salt '*' network.wol 08-00-27-13-69-77
salt '*' network.wol 080027136977 255.255.255.255 7
salt '*' network.wol 08:00:27:13:69:77 255.255.255.255 7
```
26.6.298 salt.modules.neutron

Module for handling OpenStack Neutron calls

depends

- neutronclient Python module

configuration

This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```python
keystone.user: 'admin'
keystone.password: 'password'
keystone.tenant: 'admin'
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```python
openstack1:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'

openstack2:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'
```

With this configuration in place, any of the neutron functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' neutron.network_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the use_keystoneauth option in the pillar or minion config.

Note: this is required to use keystone v3 as for authentication.

```python
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'

Note: by default the neutron module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the `verify` option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own. (defaults to True)

salt.modules.neutron.add_gateway_router(router, ext_network, profile=None)
Adds an external network gateway to the specified router

CLI Example:
```
salt '*' neutron.add_gateway_router router-name ext-network-name
```

Parameters
- router -- ID or name of the router
- ext_network -- ID or name of the external network the gateway
- profile -- Profile to build on (Optional)

Returns
Added Gateway router information

salt.modules.neutron.add_interface_router(router, subnet, profile=None)
Adds an internal network interface to the specified router

CLI Example:
```
salt '*' neutron.add_interface_router router-name subnet-name
```

Parameters
- router -- ID or name of the router
- subnet -- ID or name of the subnet
- profile -- Profile to build on (Optional)

Returns
Added interface information

salt.modules.neutron.create_firewall_rule(protocol, action, profile=None, **kwargs)
Creates a new firewall rule

CLI Example:
```
salt '*' neutron.create_firewall_rule protocol action
  tenant_id=TENANT_ID name=NAME description=DESCRIPTION ip_
  version=IP_VERSION source_ip_address=SOURCE_IP_ADDRESS destination_ip_
  address=DESTINATION_IP_ADDRESS source_port=SOURCE_PORT
destination_port=DESTINATION_PORT shared=SHARED enabled=ENABLED
```

Parameters
- protocol -- Protocol for the firewall rule, choose "tcp", "udp", "icmp" or "None".
- action -- Action for the firewall rule, choose "allow" or "deny".
- tenant_id -- The owner tenant ID. (Optional)
- name -- Name for the firewall rule. (Optional)
- description -- Description for the firewall rule. (Optional)
- ip_version -- IP protocol version, default: 4. (Optional)
- **source_ip_address** -- Source IP address or subnet. (Optional)
- **destination_ip_address** -- Destination IP address or subnet. (Optional)
- **source_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)

```
salt.modules.neutron.create_floatingip(floating_network, port=None, profile=None)
```

Creates a new floatingIP

CLI Example:

```
salt '*' neutron.create_floatingip network-name port-name
```

Parameters

- **floating_network** -- Network name or ID to allocate floatingIP from
- **port** -- Of the port to be associated with the floatingIP (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created floatingIP information

```
salt.modules.neutron.create_ikepolicy(name, profile=None, **kwargs)
```

Creates a new IKEPolicy

CLI Example:

```
salt '*' neutron.create_ikepolicy ikepolicy-name
    phase1_negotiation_mode=main auth_algorithm=sha1
    encryption_algorithm=aes-128 pfs=group5
```

Parameters

- **name** -- Name of the IKE policy
- **phase1_negotiation_mode** -- IKE Phase1 negotiation mode in lowercase, default: main (Optional)
- **auth_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encryption_algorithm** -- Encryption algorithm in lowercase. default: aes-128 (Optional)
- **pfs** -- Prefect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IKE lifetime attribute. default: seconds (Optional)
- **value** -- IKE lifetime attribute. default: 3600 (Optional)
- **ike_version** -- IKE version in lowercase, default: v1 (Optional)
- **profile** -- Profile to build on (Optional)
- **kwargs** --

Returns

Created IKE policy information

```
salt.modules.neutron.create_ipsec_site_connection(name, ipsecpolicy, ikepolicy, vpnservice, peer_cidrs, peer_address, peer_id, psk, admin_state_up=True, profile=None, **kwargs)
```

Creates a new IPsecSiteConnection

CLI Example:
salt '*' neutron.show_ipsec_site_connection connection-name
           ipsec-policy-name ikepolicy-name vpnservice-name
192.168.XXX.XXX/24 192.168.XXX.XXX 192.168.XXX.XXX secret

Parameters

- **name** -- Set friendly name for the connection
- **ipsec_policy** -- IPSec policy ID or name associated with this connection
- **ikepolicy** -- IKE policy ID or name associated with this connection
- **vpnservice** -- VPN service instance ID or name associated with this connection
- **peer_cidrs** -- Remote subnet(s) in CIDR format
- **peer_address** -- Peer gateway public IPv4/IPv6 address or FQDN
- **peer_id** -- Peer router identity for authentication. Can be IPv4/IPv6 address, e-mail address, key id, or FQDN
- **psk** -- Pre-shared key string
- **initiator** -- Initiator state in lowercase, default: bi-directional
- **admin_state_up** -- Set admin state up to true or false, default: True (Optional)
- **mtu** -- size for the connection, default: 1500 (Optional)
- **dpd_action** -- Dead Peer Detection attribute: hold/clear/disabled/restart/restart-by-peer (Optional)
- **dpd_interval** -- Dead Peer Detection attribute (Optional)
- **dpd_timeout** -- Dead Peer Detection attribute (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created IPSec site connection information

salt.modules.neutron.create_ipsecpolicy(name, profile=None, **kwargs)

Creates a new IPsecPolicy

CLI Example:

salt '*' neutron.create_ipsecpolicy ipsecpolicy-name
          transform_protocol=esp auth_algorithm=sha1
          encapsulation_mode=tunnel encryption_algorithm=aes-128

Parameters

- **name** -- Name of the IPSec policy
- **transform_protocol** -- Transform protocol in lowercase, default: esp (Optional)
- **auth_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encapsulation_mode** -- Encapsulation mode in lowercase, default: tunnel (Optional)
- **encryption_algorithm** -- Encryption algorithm in lowercase, default: aes-128 (Optional)
- **pfs** -- Perfect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IPSec lifetime attribute. default: seconds (Optional)
- **value** -- IPSec lifetime attribute. default: 3600 (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created IPSec policy information

salt.modules.neutron.create_network(name, router_ext=None, admin_state_up=True, network_type=None, physical_network=None, segmentation_id=None, shared=None, profile=None)

Creates a new network
CLI Example:

```
salt '*' neutron.create_network network-name
salt '*' neutron.create_network network-name profile=openstack1
```

Parameters

- **name** -- Name of network to create
- **admin_state_up** -- should the state of the network be up? default: True (Optional)
- **router_ext** -- True then if create the external network (Optional)
- **network_type** -- the Type of network that the provider is such as GRE, VXLAN, VLAN, FLAT, or LOCAL (Optional)
- **physical_network** -- the name of the physical network as neutron knows it (Optional)
- **segmentation_id** -- the vlan id or GRE id (Optional)
- **shared** -- is the network shared or not (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created network information

```
salt.modules.neutron.create_port(name, network, device_id=None, admin_state_up=True, profile=None)
```

Creates a new port

CLI Example:

```
salt '*' neutron.create_port network-name port-name
```

Parameters

- **name** -- Name of port to create
- **network** -- Network name or ID
- **device_id** -- ID of device (Optional)
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created port information

```
salt.modules.neutron.create_router(name, ext_network=None, admin_state_up=True, profile=None)
```

Creates a new router

CLI Example:

```
salt '*' neutron.create_router new-router-name
```

Parameters

- **name** -- Name of router to create (must be first)
- **ext_network** -- ID or name of the external for the gateway (Optional)
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created router information

```
salt.modules.neutron.create_security_group(name=None, description=None, profile=None)
```

Creates a new security group

CLI Example:
salt '*'
neutron.create_security_group security-group-name
  " description='Security group for servers"

Parameters
- name -- Name of security group (Optional)
- description -- Description of security group (Optional)
- profile -- Profile to build on (Optional)

Returns
Created security group information

salt.modules.neutron.create_security_group_rule(
  security_group, remote_group_id=None,
  direction='ingress', protocol=None,
  port_range_min=None, port_range_max=None,
  ethertype='IPv4', profile=None)

Creates a new security group rule

CLI Example:
salt '*' neutron.show_security_group_rule security-group-rule-id

Parameters
- security_group -- Security group name or ID to add rule
- remote_group_id -- Remote security group name or ID to apply rule (Optional)
- direction -- Direction of traffic: ingress/egress, default: ingress (Optional)
- protocol -- Protocol of packet: null/icmp/tcp/udp, default: null (Optional)
- port_range_min -- Starting port range (Optional)
- port_range_max -- Ending port range (Optional)
- ethertype -- IPv4/IPv6, default: IPv4 (Optional)
- profile -- Profile to build on (Optional)

Returns
Created security group rule information

salt.modules.neutron.create_subnet(
  network, cidr, name=None, ip_version=4, profile=None)

Creates a new subnet

CLI Example:
salt '*' neutron.create_subnet network-name 192.168.1.0/24

Parameters
- network -- Network ID or name this subnet belongs to
- cidr -- CIDR of subnet to create (Ex. '192.168.1.0/24')
- name -- Name of the subnet to create (Optional)
- ip_version -- Version to use, default is 4(IPv4) (Optional)
- profile -- Profile to build on (Optional)

Returns
Created subnet information

salt.modules.neutron.create_vpnservice(
  subnet, router, name, admin_state_up=True, profile=None)

Creates a new VPN service

CLI Example:
salt '*' neutron.create_vpnservice router-name name
Parameters

- **subnet** -- Subnet unique identifier for the VPN service deployment
- **router** -- Router unique identifier for the VPN service
- **name** -- Set a name for the VPN service
- **admin_state_up** -- Set admin state up to true or false, default:True (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created VPN service information

salt.modules.neutron.delete_firewall_rule(firewall_rule, profile=None)

Deletes the specified firewall_rule

CLI Example:

```
salt '*' neutron.delete_firewall_rule firewall-rule
```

Parameters

- **firewall_rule** -- ID or name of firewall rule to delete
- **profile** -- Profile to build on (Optional)

Returns

True(Succeed) or False

salt.modules.neutron.delete_floatingip(floatingip_id, profile=None)

Deletes the specified floating IP

CLI Example:

```
salt '*' neutron.delete_floatingip floatingip-id
```

Parameters

- **floatingip_id** -- ID of floatingIP to delete
- **profile** -- Profile to build on (Optional)

Returns

True(Succeed) or False

salt.modules.neutron.delete_ikepolicy(ikepolicy, profile=None)

Deletes the specified IKEPolicy

CLI Example:

```
salt '*' neutron.delete_ikepolicy ikepolicy-name
```

Parameters

- **ikepolicy** -- ID or name of IKE policy to delete
- **profile** -- Profile to build on (Optional)

Returns

True(Succeed) or False

salt.modules.neutron.delete_ipsec_site_connection(ipsec_site_connection, profile=None)

Deletes the specified IPsecSiteConnection

CLI Example:

```
salt '*' neutron.delete_ipsec_site_connection connection-name
```

Parameters

- **ipsec_site_connection** -- ID or name of ipsec site connection to delete
- **profile** -- Profile to build on (Optional)
Returns
True(Succeed) or False

salt.modules.neutron.delete_ipsecpolicy(ipsecpolicy, profile=None)
Deletes the specified IPsecPolicy

CLI Example:
```
salt '*' neutron.delete_ipsecpolicy ipsecpolicy-name
```

Parameters
- ipsecpolicy -- ID or name of IPSec policy to delete
- profile -- Profile to build on (Optional)

Returns
True(Succeed) or False

salt.modules.neutron.delete_network(network, profile=None)
Deletes the specified network

CLI Example:
```
salt '*' neutron.delete_network network-name
salt '*' neutron.delete_network network-name profile=openstack1
```

Parameters
- network -- ID or name of network to delete
- profile -- Profile to build on (Optional)

Returns
True(Succeed) or False

salt.modules.neutron.delete_port(port, profile=None)
Deletes the specified port

CLI Example:
```
salt '*' neutron.delete_network port-name
salt '*' neutron.delete_network port-name profile=openstack1
```

Parameters
- port -- port name or ID
- profile -- Profile to build on (Optional)

Returns
True(Succeed) or False

salt.modules.neutron.delete_quota(tenant_id, profile=None)
Delete the specified tenant's quota value

CLI Example:
```
salt '*' neutron.update_quota tenant-id
salt '*' neutron.update_quota tenant-id profile=openstack1
```

Parameters
- tenant_id -- ID of tenant to quota delete
- profile -- Profile to build on (Optional)

Returns
True(Delete succeed) or False(Delete failed)
salt.modules.neutron.delete_router

Delete the specified router

CLI Example:

```
salt '*' neutron.delete_router router-name
```

Parameters

- **router** -- ID or name of router to delete
- **profile** -- Profile to build on (Optional)

Returns

True(Succeed) or False

salt.modules.neutron.delete_security_group

Deletes the specified security group

CLI Example:

```
salt '*' neutron.delete_security_group security-group-name
```

Parameters

- **security_group** -- ID or name of security group to delete
- **profile** -- Profile to build on (Optional)

Returns

True(Succeed) or False

salt.modules.neutron.delete_security_group_rule

Deletes the specified security group rule

CLI Example:

```
salt '*' neutron.delete_security_group_rule security-group-rule-id
```

Parameters

- **security_group_rule_id** -- ID of security group rule to delete
- **profile** -- Profile to build on (Optional)

Returns

True(Succeed) or False

salt.modules.neutron.delete_subnet

Deletes the specified subnet

CLI Example:

```
salt '*' neutron.delete_subnet subnet-name
salt '*' neutron.delete_subnet subnet-name profile=openstack1
```

Parameters

- **subnet** -- ID or name of subnet to delete
- **profile** -- Profile to build on (Optional)

Returns

True(Succeed) or False

salt.modules.neutron.delete_vpnservice

Deletes the specified VPN service

CLI Example:
Salt Documentation, Release 3007.1

salt '*' neutron.delete_vpnservice vpnservice-name

Parameters
- vpnservice -- ID or name of vpn service to delete
- profile -- Profile to build on (Optional)

Returns
True(Succeed) or False

salt.modules.neutron.get_quotas_tenant(profile=None)
Fetches tenant info in server's context for following quota operation

CLI Example:

salt '*' neutron.get_quotas_tenant
salt '*' neutron.get_quotas_tenant profile=openstack1

Parameters
- profile -- Profile to build on (Optional)

Returns
Quotas information

salt.modules.neutron.list_agents(profile=None)
List agents.

CLI Example:

salt '*' neutron.list_agents

Parameters
- profile -- Profile to build on (Optional)

Returns
agents message.

salt.modules.neutron.list_extensions(profile=None)
Fetches a list of all extensions on server side

CLI Example:

salt '*' neutron.list_extensions
salt '*' neutron.list_extensions profile=openstack1

Parameters
- profile -- Profile to build on (Optional)

Returns
List of extensions

salt.modules.neutron.list_firewall_rules(profile=None)
Fetches a list of all firewall rules for a tenant

CLI Example:

salt '*' neutron.list_firewall_rules

Parameters
- profile -- Profile to build on (Optional)

Returns
List of firewall rules

26.6. execution modules
salt.modules.neutron.list_firewalls(profile=None)
Fetches a list of all firewalls for a tenant
CLI Example:
```bash
salt '*' neutron.list_firewalls
```
Parameters

- **profile** -- Profile to build on (Optional)

Returns

List of firewalls

salt.modules.neutron.list_floatingips(profile=None)
Fetch a list of all floatingIPs for a tenant
CLI Example:
```bash
salt '*' neutron.list_floatingips
salt '*' neutron.list_floatingips profile=openstack1
```
Parameters

- **profile** -- Profile to build on (Optional)

Returns

List of floatingIP

salt.modules.neutron.list_ikepolicies(profile=None)
Fetches a list of all configured IKEPolicies for a tenant
CLI Example:
```bash
salt '*' neutron.list_ikepolicies
salt '*' neutron.list_ikepolicies profile=openstack1
```
Parameters

- **profile** -- Profile to build on (Optional)

Returns

List of IKE policy

salt.modules.neutron.list_ipsec_site_connections(profile=None)
Fetches all configured IPsec Site Connections for a tenant
CLI Example:
```bash
salt '*' neutron.list_ipsec_site_connections
salt '*' neutron.list_ipsec_site_connections profile=openstack1
```
Parameters

- **profile** -- Profile to build on (Optional)

Returns

List of IPSec site connection

salt.modules.neutron.list_ipsecpolicies(profile=None)
Fetches a list of all configured IPsecPolicies for a tenant
CLI Example:
```bash
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name profile=openstack1
```
Parameters

**profile** -- Profile to build on (Optional)

Returns

List of IPSec policy

```
salt.modules.neutron.list_l3_agent_hosting_routers(router, profile=None)
```

List L3 agents hosting a router.

CLI Example:

```
salt '*' neutron.list_l3_agent_hosting_routers router
```

: `param router`: router name or ID to query.
: `param profile`: Profile to build on (Optional)
: `return`: L3 agents message.

```
salt.modules.neutron.list_networks(profile=None)
```

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_networks
salt '*' neutron.list_networks profile=openstack1
```

Parameters

**profile** -- Profile to build on (Optional)

Returns

List of network

```
salt.modules.neutron.list_ports(profile=None)
```

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_ports
salt '*' neutron.list_ports profile=openstack1
```

Parameters

**profile** -- Profile to build on (Optional)

Returns

List of port

```
salt.modules.neutron.list_quotas(profile=None)
```

Fetches all tenants quotas

CLI Example:

```
salt '*' neutron.list_quotas
salt '*' neutron.list_quotas profile=openstack1
```

Parameters

**profile** -- Profile to build on (Optional)

Returns

List of quotas

```
salt.modules.neutron.list_routers(profile=None)
```

Fetches a list of all routers for a tenant

CLI Example:
salt '*' neutron.list_routers
salt '*' neutron.list_routers profile=openstack1

Parameters
profile -- Profile to build on (Optional)

Returns
List of router

salt.modules.neutron.list_security_group_rules(profile=None)
Fetches a list of all security group rules for a tenant

CLI Example:

salt '*' neutron.list_security_group_rules
salt '*' neutron.list_security_group_rules profile=openstack1

Parameters
profile -- Profile to build on (Optional)

Returns
List of security group rule

salt.modules.neutron.list_security_groups(profile=None)
Fetches a list of all security groups for a tenant

CLI Example:

salt '*' neutron.list_security_groups
salt '*' neutron.list_security_groups profile=openstack1

Parameters
profile -- Profile to build on (Optional)

Returns
List of security group

salt.modules.neutron.list_subnets(profile=None)
Fetches a list of all networks for a tenant

CLI Example:

salt '*' neutron.list_subnets
salt '*' neutron.list_subnets profile=openstack1

Parameters
profile -- Profile to build on (Optional)

Returns
List of subnet

salt.modules.neutron.list_vpnservices(retrieve_all=True, profile=None, **kwargs)
Fetches a list of all configured VPN services for a tenant

CLI Example:

salt '*' neutron.list_vpnservices

Parameters
retrieval_all -- True or False, default: True (Optional)
profile -- Profile to build on (Optional)
Returns
List of VPN service

```
salt.modules.neutron.remove_gateway_router(router, profile=None)
```
Removes an external network gateway from the specified router

CLI Example:
```
salt '*' neutron.remove_gateway_router router-name
```

Parameters
- **router** -- ID or name of router
- **profile** -- Profile to build on (Optional)

Returns
True (Succeed) or False

```
salt.modules.neutron.remove_interface_router(router, subnet, profile=None)
```
Removes an internal network interface from the specified router

CLI Example:
```
salt '*' neutron.remove_interface_router router-name subnet-name
```

Parameters
- **router** -- ID or name of the router
- **subnet** -- ID or name of the subnet
- **profile** -- Profile to build on (Optional)

Returns
True (Succeed) or False

```
salt.modules.neutron.show_firewall(firewall, profile=None)
```
Fetches information of a specific firewall rule

CLI Example:
```
salt '*' neutron.show_firewall firewall
```

Parameters
- **firewall** -- ID or name of firewall to look up
- **profile** -- Profile to build on (Optional)

Returns
firewall information

```
salt.modules.neutron.show_firewall_rule(firewall_rule, profile=None)
```
Fetches information of a specific firewall rule

CLI Example:
```
salt '*' neutron.show_firewall_rule firewall-rule-name
```

Parameters
- **ipsecpolicy** -- ID or name of firewall rule to look up
- **profile** -- Profile to build on (Optional)

Returns
firewall rule information
salt.modules.neutron.show_floatingip(floatingip_id, profile=None)
Fetches information of a certain floatingIP

CLI Example:
```
salt '*' neutron.show_floatingip floatingip-id
```

Parameters
- **floatingip_id** -- ID of floatingIP to look up
- **profile** -- Profile to build on (Optional)

Returns
Floating IP information

salt.modules.neutron.show_ikepolicy(ikepolicy, profile=None)
Fetches information of a specific IKEPolicy

CLI Example:
```
salt '*' neutron.show_ikepolicy ikepolicy-name
```

Parameters
- **ikepolicy** -- ID or name of ikepolicy to look up
- **profile** -- Profile to build on (Optional)

Returns
IKE policy information

salt.modules.neutron.show_ipsec_site_connection(ipsec_site_connection, profile=None)
Fetches information of a specific IPsecSiteConnection

CLI Example:
```
salt '*' neutron.show_ipsec_site_connection connection-name
```

Parameters
- **ipsec_site_connection** -- ID or name of ipsec site connection to look up
- **profile** -- Profile to build on (Optional)

Returns
IPSec site connection information

salt.modules.neutron.show_ipsecpolicy(ipsecpolicy, profile=None)
Fetches information of a specific IPsecPolicy

CLI Example:
```
salt '*' neutron.show_ipsecpolicy ipsecpolicy-name
```

Parameters
- **ipsecpolicy** -- ID or name of IPSec policy to look up
- **profile** -- Profile to build on (Optional)

Returns
IPSec policy information

salt.modules.neutron.show_network(network, profile=None)
Fetches information of a certain network

CLI Example:
salt '*' neutron.show_network network-name
salt '*' neutron.show_network network-name profile=openstack1

Parameters
- **network** -- ID or name of network to look up
- **profile** -- Profile to build on (Optional)

Returns
Network information

salt.modules.neutron.show_port(port, profile=None)
Fetches information of a certain port

CLI Example:

salt '*' neutron.show_port port-id
salt '*' neutron.show_port port-id profile=openstack1

Parameters
- **port** -- ID or name of port to look up
- **profile** -- Profile to build on (Optional)

Returns
Port information

salt.modules.neutron.show_quota(tenant_id, profile=None)
Fetches information of a certain tenant's quotas

CLI Example:

salt '*' neutron.show_quota tenant-id
salt '*' neutron.show_quota tenant-id profile=openstack1

Parameters
- **tenant_id** -- ID of tenant
- **profile** -- Profile to build on (Optional)

Returns
Quota information

salt.modules.neutron.show_router(router, profile=None)
Fetches information of a certain router

CLI Example:

salt '*' neutron.show_router router-name

Parameters
- **router** -- ID or name of router to look up
- **profile** -- Profile to build on (Optional)

Returns
Router information

salt.modules.neutron.show_security_group(security_group, profile=None)
Fetches information of a certain security group

CLI Example:

salt '*' neutron.show_security_group security-group-name
Parameters
- `security_group` -- ID or name of security group to look up
- `profile` -- Profile to build on (Optional)

Returns
Security group information

**salt.modules.neutron.show_security_group_rule**(*security_group_rule_id, profile=None*)
Fetches information of a certain security group rule

CLI Example:
```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

Parameters
- `security_group_rule_id` -- ID of security group rule to look up
- `profile` -- Profile to build on (Optional)

Returns
Security group rule information

**salt.modules.neutron.show_subnet**(*subnet, profile=None*)
Fetches information of a certain subnet

CLI Example:
```
salt '*' neutron.show_subnet subnet-name
```

Parameters
- `subnet` -- ID or name of subnet to look up
- `profile` -- Profile to build on (Optional)

Returns
Subnet information

**salt.modules.neutron.show_vpnservice**(*vpnservice, profile=None, **kwargs*)
Fetches information of a specific VPN service

CLI Example:
```
salt '*' neutron.show_vpnservice vpnservice-name
```

Parameters
- `vpnservice` -- ID or name of vpn service to look up
- `profile` -- Profile to build on (Optional)

Returns
VPN service information

**salt.modules.neutron.update_firewall_rule**(*firewall_rule, protocol=None, action=None,
name=None, description=None, ip_version=None,
source_ip_address=None,
destination_ip_address=None, source_port=None,
destination_port=None, shared=None, enabled=None,
profile=None*)
Update a firewall rule

CLI Example:
```
salt '*' neutron.update_firewall_rule firewall_rule protocol=PROTOCOL
    → action=ACTION
```

(continues on next page)
Parameters

- **firewall_rule** -- ID or name of firewall rule to update.
- **protocol** -- Protocol for the firewall rule, choose "tcp","udp","icmp" or "None". (Optional)
- **action** -- Action for the firewall rule, choose "allow" or "deny". (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip_version** -- IP protocol version, default: 4. (Optional)
- **source_ip_address** -- Source IP address or subnet. (Optional)
- **destination_ip_address** -- Destination IP address or subnet. (Optional)
- **source_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)
- **profile** -- Profile to build on (Optional)

salt.modules.neutron.update_floatingip(floatingip_id, port=None, profile=None)

Updates a floatingIP

CLI Example:

```
salt '*' neutron.update_floatingip network-name port-name
```

Parameters

- **floatingip_id** -- ID of floatingIP
- **port** -- ID or name of port, to associate floatingip to None or do not specify to disassociate the floatingip (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Value of updated floating IP information

salt.modules.neutron.update_network(network, name, profile=None)

Updates a network

CLI Example:

```
salt '*' neutron.update_network network-name new-network-name
```

Parameters

- **network** -- ID or name of network to update
- **name** -- Name of this network
- **profile** -- Profile to build on (Optional)

Returns

Value of updated network information

salt.modules.neutron.update_port(port, name, admin_state_up=True, profile=None)

Updates a port

CLI Example:
salt 'salt' neutron.update_port port-name network-name new-port-name

Parameters
- **port** -- Port name or ID
- **name** -- Name of this port
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

Returns
Value of updated port information

salt.modules.neutron.update_quota(tenant_id, subnet=None, router=None, network=None, floatingip=None, port=None, security_group=None, security_group_rule=None, profile=None)

Update a tenant's quota

CLI Example:
salt 'salt' neutron.update_quota tenant-id subnet=40 router=50 network=10 floatingip=30 port=30

Parameters
- **tenant_id** -- ID of tenant
- **subnet** -- Value of subnet quota (Optional)
- **router** -- Value of router quota (Optional)
- **network** -- Value of network quota (Optional)
- **floatingip** -- Value of floatingip quota (Optional)
- **port** -- Value of port quota (Optional)
- **security_group** -- Value of security group (Optional)
- **security_group_rule** -- Value of security group rule (Optional)
- **profile** -- Profile to build on (Optional)

Returns
Value of updated quota

salt.modules.neutron.update_router(router, name=None, admin_state_up=None, profile=None, **kwargs)

Updates a router

CLI Example:
salt 'salt' neutron.update_router router_id name=new-router-name admin_state_up=True

Parameters
- **router** -- ID or name of router to update
- **name** -- Name of this router
- **ext_network** -- ID or name of the external for the gateway (Optional)
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)
- **kwargs** --

Returns
Value of updated router information

salt.modules.neutron.update_security_group(security_group, name=None, description=None, profile=None)

Updates a security group
CLI Example:

```
salt '*' neutron.update_security_group security-group-name new-security-group-name
```

Parameters

- `security_group` -- ID or name of security group to update
- `name` -- Name of this security group (Optional)
- `description` -- Description of security group (Optional)
- `profile` -- Profile to build on (Optional)

Returns

Value of updated security group information

salt.modules.neutron.update_subnet(subnet, name, profile=None)

Updates a subnet

CLI Example:

```
salt '*' neutron.update_subnet subnet-name new-subnet-name
```

Parameters

- `subnet` -- ID or name of subnet to update
- `name` -- Name of this subnet
- `profile` -- Profile to build on (Optional)

Returns

Value of updated subnet information

salt.modules.neutron.update_vpnservice(vpnservice, desc, profile=None)

Updates a VPN service

CLI Example:

```
salt '*' neutron.update_vpnservice vpnservice-name desc='VPN Service1'
```

Parameters

- `vpnservice` -- ID or name of vpn service to update
- `desc` -- Set a description for the VPN service
- `profile` -- Profile to build on (Optional)

Returns

Value of updated VPN service information

26.6.299 salt.modules.neutronng

Neutron module for interacting with OpenStack Neutron

New in version 2018.3.0.

:depends: shade

Example configuration

```
neutron:
  cloud: default
```
**neutron:**

```yaml
auth:
  username: admin
  password: password123
  user_domain_name: mydomain
  project_name: myproject
  project_domain_name: myproject
  auth_url: https://example.org:5000/v3
  identity_api_version: 3
```

The `neutron` module provides the following functions:

- `salt.modules.neutronng.compare_changes(obj, **kwargs)`: Compare two dicts returning only keys that exist in the first dict and are different in the second one.
- `salt.modules.neutronng.get_openstack_cloud(auth=None)`: Return an openstack_cloud.
- `salt.modules.neutronng.get_operator_cloud(auth=None)`: Return an operator_cloud.
- `salt.modules.neutronng.list_networks(auth=None, **kwargs)`: List networks.
  - `filters`: A Python dictionary of filter conditions to push down.
  - CLI Example:
    ```
salt '*' neutronng.list_networks
salt '*' neutronng.list_networks filters='{"tenant_id": "1dcac318a83b4610b7a7f7ba01465548"}'
```
- `salt.modules.neutronng.list_subnets(auth=None, **kwargs)`: List subnets.
  - `filters`: A Python dictionary of filter conditions to push down.
  - CLI Example:
    ```
salt '*' neutronng.list_subnets
salt '*' neutronng.list_subnets filters='{"tenant_id": "1dcac318a83b4610b7a7f7ba01465548"}'
```
- `salt.modules.neutronng.network_create(auth=None, **kwargs)`: Create a network.
  - `name`: Name of the network being created.
  - `shared`: [False] If True, set the network as shared.
  - `admin_state_up`: [True] If True, Set the network administrative state to "up".
  - `external`: [False] Control whether or not this network is externally accessible.
  - `provider`: An optional Python dictionary of network provider options.
  - `project_id`: The project ID on which this network will be created.
  - CLI Example:
salt '*' neutronng.network_create name=network2  
    --admin_state_up=True  external=True

salt '*' neutronng.network_create name=network3  
    --project_id=1dcac318a83b4610b7a7f7ba01465548

salt.modules.neutronng.network_delete(auth=None, **kwargs)
Delete a network
name_or_id
Name or ID of the network being deleted
CLI Example:

salt '*' neutronng.network_delete name_or_id=network1
salt '*' neutronng.network_delete name_or_id=1dcac318a83b4610b7a7f7ba01465548

salt.modules.neutronng.network_get(auth=None, **kwargs)
Get a single network
filters
A Python dictionary of filter conditions to push down
CLI Example:

salt '*' neutronng.network_get name=XLB4

salt.modules.neutronng.security_group_create(auth=None, **kwargs)
Create a security group. Use security_group_get to create default.
project_id
The project ID on which this security group will be created
CLI Example:

salt '*' neutronng.security_group_create name=secgroup1
    --description="Very secure security group"
salt '*' neutronng.security_group_create name=secgroup1
    --description="Very secure security group"
    --project_id=1dcac318a83b4610b7a7f7ba01465548

salt.modules.neutronng.security_group_delete(auth=None, **kwargs)
Delete a security group
name_or_id
The name or unique ID of the security group
CLI Example:

salt '*' neutronng.security_group_delete name_or_id=secgroup1

salt.modules.neutronng.security_group_get(auth=None, **kwargs)
Get a single security group. This will create a default security group if one does not exist yet for a particular project id.
filters
A Python dictionary of filter conditions to push down
CLI Example:
salt '*' neutronng.security_group_get
  → name=1dcac318a83b4610b7a7f7ba01465548

salt '*' neutronng.security_group_get
  → name=default
  → filters='{"tenant_id":"2e778bb64ca64a199eb526b5958d8710"}'}

salt.modules.neutronng.security_group_rule_create(auth=None, **kwargs)

Create a rule in a security group

secgroup_name_or_id
  The security group name or ID to associate with this security group rule. If a non-unique group name is
given, an exception is raised.

port_range_min
  The minimum port number in the range that is matched by the security group rule. If the protocol is
TCP or UDP, this value must be less than or equal to the port_range_max attribute value. If nova is used
by the cloud provider for security groups, then a value of None will be transformed to -1.

port_range_max
  The maximum port number in the range that is matched by the security group rule. The port_range_min
attribute constrains the port_range_max attribute. If nova is used by the cloud provider for security
groups, then a value of None will be transformed to -1.

protocol
  The protocol that is matched by the security group rule. Valid values are None, tcp, udp, and icmp.

remote_ip_prefix
  The remote IP prefix to be associated with this security group rule. This attribute matches the specified
IP prefix as the source IP address of the IP packet.

remote_group_id
  The remote group ID to be associated with this security group rule
direction
  Either ingress or egress; the direction in which the security group rule is applied. For a compute
instance, an ingress security group rule is applied to incoming (ingress) traffic for that instance. An
egress rule is applied to traffic leaving the instance

ethertype
  Must be IPv4 or IPv6, and addresses represented in CIDR must match the ingress or egress rules

project_id
  Specify the project ID this security group will be created on (admin-only)

CLI Example:
salt '*' neutronng.security_group_rule_create
  → id=secgroup1

salt '*' neutronng.security_group_rule_create
  → id=secgroup2
  → port_range_min=8080
  → port_range_max=8080
  → direction='egress'

salt '*' neutronng.security_group_rule_create
  → id=c0e1d1ce-7296-405e-919d-1c08217be529
  → protocol=icmp
  → project_id=1dcac318a83b4610b7a7f7ba01465548

salt.modules.neutronng.security_group_rule_delete(auth=None, **kwargs)

Delete a security group

name_or_id
  The unique ID of the security group rule

CLI Example:
salt Documentation, Release 3007.1

salt '*
neutronng.security_group_rule_delete name_or_
→id=1dcac318a83b4610b7a7f7ba01465548

salt.modules.neutronng.security_group_update(secgroup=None, auth=None, **kwargs)

Update a security group
secgroup
  Name, ID or Raw Object of the security group to update
name
  New name for the security group
description
  New description for the security group

CLI Example:
salt '*
neutronng.security_group_update secgroup=secgroup1,
→description="Very secure security group"
salt '*
neutronng.security_group_update secgroup=secgroup1,
→description="Very secure security group"
→id=1dcac318a83b4610b7a7f7ba01465548

salt.modules.neutronng.setup_clouds(auth=None)

Call functions to create Shade cloud objects in __context__ to take advantage of Shade's in-memory caching across several states

salt.modules.neutronng.subnet_create(auth=None, **kwargs)

Create a subnet
network_name_or_id
  The unique name or ID of the attached network. If a non-unique name is supplied, an exception is raised.
cidr
  The CIDR
ip_version
  The IP version, which is 4 or 6.
enable_dhcp
  [False] Set to True if DHCP is enabled and False if disabled
subnet_name
  The name of the subnet
tenant_id
  The ID of the tenant who owns the network. Only administrative users can specify a tenant ID other than their own.
allocation_pools
  A list of dictionaries of the start and end addresses for the allocation pools.
gateway_ip
  The gateway IP address. When you specify both allocation_pools and gateway_ip, you must ensure that the gateway IP does not overlap with the specified allocation pools.
disable_gateway_ip
  [False] Set to True if gateway IP address is disabled and False if enabled. It is not allowed with gateway_ip.
dns_nameservers
  A list of DNS name servers for the subnet
host_routes
  A list of host route dictionaries for the subnet
ipv6_ra_mode
  IPv6 Router Advertisement mode. Valid values are dhcpv6-stateful, dhcpv6-stateless, or slaac.
ipv6_address_mode
IPv6 address mode. Valid values are dhcpv6-stateful, dhcpv6-stateless, or slaac.

use_default_subnetpool
If True, use the default subnetpool for ip_version to obtain a CIDR. It is required to pass None to the cidr argument when enabling this option.

CLI Example:

```python
salt '*' neutronng.subnet_create network_name_or_id=network1
    subnet_name=subnet1
salt '*' neutronng.subnet_create subnet_name=subnet2
    network_name_or_id=network2 enable_dhcp=True allocation_pools='[{
    "start": "192.168.199.2", "end": "192.168.199.254"}]' gateway_ip='192.168.199.1' cidr=192.168.199.0/24
salt '*' neutronng.subnet_create network_name_or_id=network1
    -subnet_name=subnet1 dns_nameservers='["8.8.8.8", "8.8.8.7"]'
```

salt.modules.neutronng.subnet_delete(auth=None, **kwargs)
Delete a subnet

name
Name or ID of the subnet to update

CLI Example:

```python
salt '*' neutronng.subnet_delete name=subnet1
salt '*' neutronng.subnet_delete
    name=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.subnet_get(auth=None, **kwargs)
Get a single subnet

filters
A Python dictionary of filter conditions to push down

CLI Example:

```python
salt '*' neutronng.subnet_get name=subnet1
```

salt.modules.neutronng.subnet_update(auth=None, **kwargs)
Update a subnet

name_or_id
Name or ID of the subnet to update

subnet_name
The new name of the subnet

enable_dhcp
Set to True if DHCP is enabled and False if disabled

gateway_ip
The gateway IP address. When you specify both allocation_pools and gateway_ip, you must ensure that the gateway IP does not overlap with the specified allocation pools.

disable_gateway_ip
[False] Set to True if gateway IP address is disabled and False if enabled. It is not allowed with gateway_ip.

allocation_pools
A list of dictionaries of the start and end addresses for the allocation pools.

dns_nameservers
A list of DNS name servers for the subnet
host_routes
A list of host route dictionaries for the subnet

```
salt '*' neutronngsubnet_update name=subnet1 subnet_name=subnet2
salt '*' neutronngsubnet_update name=subnet1 dns_nameservers=['8.8.8.8', '8.8.8.7']
```

26.6.300  salt.modules.nexus

Module for fetching artifacts from Nexus 3.x
New in version 2018.3.0.

```
salt.modules.nexus.get_latest_release(nexus_url, repository, group_id, artifact_id, packaging, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None)
```

Gets the latest release of the artifact

- **nexus_url**
  URL of nexus instance
- **repository**
  Release repository in nexus to retrieve artifact from, for example: libs-releases
- **group_id**
  Group Id of the artifact
- **artifact_id**
  Artifact Id of the artifact
- **packaging**
  Packaging type (jar, war, ear, etc)
- **target_dir**
  Target directory to download artifact to (default: /tmp)
- **target_file**
  Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)
- **classifier**
  Artifact classifier name (ex: sources, javadoc, etc). Optional parameter.
- **username**
  Nexus username. Optional parameter.
- **password**
  Nexus password. Optional parameter.

```
salt.modules.nexus.get_latest_snapshot(nexus_url, repository, group_id, artifact_id, packaging, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None)
```

Gets latest snapshot of the given artifact

- **nexus_url**
  URL of nexus instance
- **repository**
  Snapshot repository in nexus to retrieve artifact from, for example:libs-snapshots
- **group_id**
  Group Id of the artifact
- **artifact_id**
  Artifact Id of the artifact
- **packaging**
  Packaging type (jar, war, ear, etc)
- **target_dir**
  Target directory to download artifact to (default: /tmp)
target_file
Target file to download artifact to (by default it is target_dir/artifact_id-snapshot_version.packaging)
classifier
Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
username
nexus username. Optional parameter.
password
nexus password. Optional parameter.

```
salt.modules.nexus.get_release(nexus_url, repository, group_id, artifact_id, packaging, version,
target_dir='/tmp', target_file=None, classifier=None, username=None, password=None)
```

Gets the specified release of the artifact

```
nexus_url
  URL of nexus instance
repository
  Release repository in nexus to retrieve artifact from, for example: libs-releases
group_id
  Group Id of the artifact
artifact_id
  Artifact Id of the artifact
packaging
  Packaging type (jar,war,ear,etc)
version
  Version of the artifact
target_dir
  Target directory to download artifact to (default: /tmp)
target_file
  Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)
classifier
  Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
username
  nexus username. Optional parameter.
password
  nexus password. Optional parameter.
```

```
salt.modules.nexus.get_snapshot(nexus_url, repository, group_id, artifact_id, packaging, version,
snapshot_version=None, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None)
```

Gets snapshot of the desired version of the artifact

```
nexus_url
  URL of nexus instance
repository
  Snapshot repository in nexus to retrieve artifact from, for example: libs-snapshots
group_id
  Group Id of the artifact
artifact_id
  Artifact Id of the artifact
packaging
  Packaging type (jar,war,ear,etc)
version
  Version of the artifact
target_dir
  Target directory to download artifact to (default: /tmp)
```
target_file
   Target file to download artifact to (by default it is target_dir/artifact_id-snapshot_version.packaging)
classifier
   Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
username
   nexus username. Optional parameter.
password
   nexus password. Optional parameter.
salt.modules.nexus.get_snapshot_version_string(nexus_url, repository, group_id, artifact_id, packaging, version, classifier=None, username=None, password=None)

Gets the specific version string of a snapshot of the desired version of the artifact

nexus_url
   URL of nexus instance
repository
   Snapshot repository in nexus to retrieve artifact from, for example: libs-snapshots
group_id
   Group Id of the artifact
artifact_id
   Artifact Id of the artifact
packaging
   Packaging type (jar,war,ear,etc)
version
   Version of the artifact
classifier
   Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
username
   nexus username. Optional parameter.
password
   nexus password. Optional parameter.

exception salt.modules.nexus.nexusError(value)

26.6.301 salt.modules.nfs3

Module for managing NFS version 3.
salt.modules.nfs3.add_export(exports='*/etc/exports', path=None, hosts=None, options=None)
   Add an export
   CLI Example:
   ```
salt '*' nfs3.add_export path='/srv/test' hosts='127.0.0.1' options=['rw']
   ```
salt.modules.nfs3.del_export(exports='*/etc/exports', path=None)
   Remove an export
   CLI Example:
   ```
salt '*' nfs3.del_export /media/storage
   ```
salt.modules.nfs3.list_exports(exports='*/etc/exports')
   List configured exports
   CLI Example:
salt '*' nfs.list_exports

call.modules.nfs3.reload_exports()
    Trigger a reload of the exports file to apply changes
    CLI Example:
    ```
salt '*' nfs3.reload_exports
    ```

26.6.302 salt.modules.nftables

Support for nftables

call.modules.nftables.append(table='filter', chain=None, rule=None, family='ipv4')
    Append a rule to the specified table & chain.
    This function accepts a rule in a standard nftables command format,
    starting with the chain. Trying to force users to adapt to a new method of creating rules would be
    irritating at best, and we already have a parser that can handle it.
    CLI Example:
    ```
salt '*' nftables.append filter input \\
    rule='tcp dport 22 log accept'
    ```
    IPv6:
    ```
salt '*' nftables.append filter input \\
    rule='tcp dport 22 log accept' \\
    family=ipv6
    ```

call.modules.nftables.build_rule(table=None, chain=None, command=None, position='', full=None, family='ipv4', **kwargs)
    Build a well-formatted nftables rule based on kwargs. A table and chain are not required, unless full is True.
    If full is True, then table, chain and command are required. command may be specified as either insert, append,
    or delete. This will return the nftables command, exactly as it would be used from the command line.
    If a position is required (as with insert or delete), it may be specified as position. This will only be useful if full
    is True.
    If connstate is passed in, it will automatically be changed to state.
    CLI Examples:
    ```
salt '*' nftables.build_rule match=state \\
    connstate=RELATED,ESTABLISHED jump=ACCEPT
salt '*' nftables.build_rule filter input command=insert position=3 \\
    full=True match=state state=related,established jump=accept
    ```
    IPv6:
    ```
salt '*' nftables.build_rule match=state \\
    connstate=related,established jump=accept \\
    family=ipv6
    ```
    ```
salt '*' nftables.build_rule filter input command=insert position=3 \\
    full=True match=state state=related,established jump=accept \\
    family=ipv6
    ```
salt.modules.nftables.check(
    table='filter',
    chain=None,
    rule=None,
    family='ipv4'
)

Check for the existence of a rule in the table and chain
This function accepts a rule in a standard nftables command format,
starting with the chain. Trying to force users to adapt to a new method of creating rules would be
irritating at best, and we already have a parser that can handle it.

CLI Example:

```bash
salt '*' nftables.check filter input
    rule='tcp dport 22 log accept'
```

IPv6:

```bash
salt '*' nftables.check filter input
    rule='tcp dport 22 log accept'
    family=ipv6
```

salt.modules.nftables.check_chain(
    table='filter',
    chain=None,
    family='ipv4'
)

New in version 2014.7.0.
Check for the existence of a chain in the table

CLI Example:

```bash
salt '*' nftables.check_chain filter input
```

IPv6:

```bash
salt '*' nftables.check_chain filter input family=ipv6
```

salt.modules.nftables.check_table(
    table=None,
    family='ipv4'
)

Check for the existence of a table

CLI Example:

```bash
salt '*' nftables.check_table nat
```

salt.modules.nftables.delete(
    table, chain=None, position=None, rule=None, family='ipv4'
)

Delete a rule from the specified table & chain, specifying either the rule
in its entirety, or the rule's position in the chain.
This function accepts a rule in a standard nftables command format,
starting with the chain. Trying to force users to adapt to a new method of creating rules would be
irritating at best, and we already have a parser that can handle it.

CLI Examples:

```bash
salt '*' nftables.delete filter input position=3
salt '*' nftables.delete filter input
    rule='tcp dport 22 log accept'
```

IPv6:

```bash
salt '*' nftables.delete filter input position=3 family=ipv6
salt '*' nftables.delete filter input
    rule='tcp dport 22 log accept'
    family=ipv6
```
salt.modules.nftables.delete_chain<code>(table='filter', chain=None, family='ipv4')</code>

New in version 2014.7.0.
Delete the chain from the specified table.

CLI Example:

```
salt '*' nftables.delete_chain filter input
salt '*' nftables.delete_chain filter foo
IPv6:
salt '*' nftables.delete_chain filter input family=ipv6
salt '*' nftables.delete_chain filter foo family=ipv6
```

salt.modules.nftables.delete_table<code>(table, family='ipv4')</code>

New in version 2014.7.0.
Create new custom table.

CLI Example:

```
salt '*' nftables.delete_table filter
IPv6:
salt '*' nftables.delete_table filter family=ipv6
```

salt.modules.nftables.flush<code>(table='filter', chain='', family='ipv4')</code>

Flush the chain in the specified table, flush all chains in the specified table if chain is not specified.

CLI Example:

```
salt '*' nftables.flush filter
salt '*' nftables.flush filter input
IPv6:
salt '*' nftables.flush filter input family=ipv6
```

salt.modules.nftables.get_policy<code>(table='filter', chain=None, family='ipv4')</code>

New in version 3002.
Return the current policy for the specified table/chain

```
table
  Name of the table containing the chain to check
chain
  Name of the chain to get the policy for
family
  Networking family, either ipv4 or ipv6
```

CLI Example:

```
salt '*' nftables.get_policy filter input
IPv6:
salt '*' nftables.get_policy filter input family=ipv6
```
salt.modules.nftables.get_rule_handle(table='filter', chain=None, rule=None, family='ipv4')

Get the handle for a particular rule

This function accepts a rule in a standard nftables command format,
starting with the chain. Trying to force users to adapt to a new method of creating rules would be
irritating at best, and we already have a parser that can handle it.

CLI Example:
```
salt '*' nftables.get_rule_handle filter input \  
   rule='tcp dport 22 log accept'  
```

IPv6:
```
salt '*' nftables.get_rule_handle filter input \  
   rule='tcp dport 22 log accept' \  
   family=ipv6
```

salt.modules.nftables.get_rules(family='ipv4')

Return a data structure of the current, in-memory rules

CLI Example:
```
salt '*' nftables.get_rules
salt '*' nftables.get_rules family=ipv6
```

salt.modules.nftables.get_rules_json(family='ipv4')

New in version 3002.

Return a list of dictionaries comprising the current, in-memory rules

family

Networking family, either ipv4 or ipv6

CLI Example:
```
salt '*' nftables.get_rules_json
salt '*' nftables.get_rules_json family=ipv6
```

salt.modules.nftables.get_saved_rules(conf_file=None)

Return a data structure of the rules in the conf file

CLI Example:
```
salt '*' nftables.get_saved_rules
```

salt.modules.nftables.insert(table='filter', chain=None, position=None, rule=None, family='ipv4')

Insert a rule into the specified table & chain, at the specified position.

If position is not specified, rule will be inserted in first position.

This function accepts a rule in a standard nftables command format,
starting with the chain. Trying to force users to adapt to a new method of creating rules would be
irritating at best, and we already have a parser that can handle it.

CLI Examples:
```
salt '*' nftables.insert filter input \  
   rule='tcp dport 22 log accept'
```

(continues on next page)
`salt '*' nftables.insert filter input position=3 \
rule='tcp dport 22 log accept'`

IPv6:
`salt '*' nftables.insert filter input \
rule='tcp dport 22 log accept' \
family=ipv6`

`salt '*' nftables.insert filter input position=3 \
rule='tcp dport 22 log accept' \
family=ipv6`

**salt.modules.nftables.list_tables**(family=’ipv4’)

Return a data structure of the current, in-memory tables

CLI Example:

```
salt '*' nftables.list_tables
salt '*' nftables.list_tables family=ipv6
```

**salt.modules.nftables.new_chain**(table=’filter’, chain=None, table_type=None, hook=None, priority=None, family=’ipv4’)

New in version 2014.7.0.

Create new chain to the specified table.

CLI Example:

```
salt '*' nftables.new_chain filter input
salt '*' nftables.new_chain filter input \
table_type=filter hook=input priority=0
salt '*' nftables.new_chain filter foo
IPv6:
salt '*' nftables.new_chain filter input family=ipv6
salt '*' nftables.new_chain filter input \
table_type=filter hook=input priority=0 family=ipv6
salt '*' nftables.new_chain filter foo family=ipv6
```

**salt.modules.nftables.new_table**(table, family=’ipv4’)

New in version 2014.7.0.

Create new custom table.

CLI Example:

```
salt '*' nftables.new_table filter
IPv6:
salt '*' nftables.new_table filter family=ipv6
```
salt.modules.nftables.save(filename=None, family='ipv4')

Changed in version 3002.

Save the current in-memory rules to disk. On systems where /etc/nftables is a directory, a file named salt-all-in-one.nft will be dropped inside by default. The main nftables configuration will need to include this file.

CLI Example:
```
salt '*' nftables.save /etc/nftables
```

cmd.run

salt.modules.nftables.set_policy(table='filter', chain=None, policy=None, family='ipv4')

New in version 3002.

Set the current policy for the specified table/chain. This only works on chains with an existing base chain.

table
  Name of the table containing the chain to modify
chain
  Name of the chain to set the policy for
policy
  accept or drop
family
  Networking family, either ipv4 or ipv6

CLI Example:
```
salt '*' nftables.set_policy filter input accept
```

IPv6:
```
salt '*' nftables.set_policy filter input accept family=ipv6
```

cmd.run

salt.modules.nftables.version()

Return version from nftables --version

CLI Example:
```
salt '*' nftables.version
```

cmd.run

26.6.303 salt.modules.nginx

Support for nginx

salt.modules.nginx.build_info()

Return server and build arguments

CLI Example:
```
salt '*' nginx.build_info
```

cmd.run

salt.modules.nginx.configtest()

test configuration and exit

CLI Example:
```
salt '*' nginx.configtest
```

cmd.run
salt.modules.nginx.signal(signal=None)
    Signals nginx to start, reload, reopen or stop.
    CLI Example:
    ```
salt '*' nginx.signal reload
    ```

salt.modules.nginx.status(url='http://127.0.0.1/status')
    Return the data from an Nginx status page as a dictionary. http://wiki.nginx.org/HttpStubStatusModule
    The URL of the status page. Defaults to 'http://127.0.0.1/status'
    CLI Example:
    ```
salt '*' nginx.status
    ```

salt.modules.nginx.version()
    Return server version from nginx -v
    CLI Example:
    ```
salt '*' nginx.version
    ```

26.6.304 salt.modules.nilrt_ip
    The networking module for NI Linux Real-Time distro

salt.modules.nilrt_ip.apply_network_settings(**settings)
    Apply global network configuration.
    CLI Example:
    ```
salt '*' ip.apply_network_settings
    ```

salt.modules.nilrt_ip.build_interface(iface, iface_type, enabled, **settings)
    Build an interface script for a network interface.
    CLI Example:
    ```
salt '*' ip.build_interface eth0 eth <settings>
    ```

salt.modules.nilrt_ip.build_network_settings(**settings)
    Build the global network script.
    CLI Example:
    ```
salt '*' ip.build_network_settings <settings>
    ```

salt.modules.nilrt_ip.disable(interface)
    Disable the specified interface
    Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.
    Parameters
    ```
    interface (str) -- interface label
    ```
    Returns
    True if the service was disabled, otherwise an exception will be thrown.
Return type
bool

CLI Example:
salt '*' ip.enable interface-label

salt.modules.nilrt_ip.down(interface, iface_type=None)
Disable the specified interface
Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters

interface (str) -- interface label

Returns

True if the service was disabled, otherwise an exception will be thrown.

Return type
bool

CLI Example:
salt '*' ip.down interface-label

salt.modules.nilrt_ip.enable(interface)
Enable the specified interface
Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters

interface (str) -- interface label

Returns

True if the service was enabled, otherwise an exception will be thrown.

Return type
bool

CLI Example:
salt '*' ip.enable interface-label

salt.modules.nilrt_ip.get_interface(iface)
Returns details about given interface.

CLI Example:
salt '*' ip.get_interface eth0

salt.modules.nilrt_ip.get_interfaces_details()
Get details about all the interfaces on the minion

Returns

information about all interfaces omitting loopback

Return type
dictionary

CLI Example:
salt '*' ip.get_interfaces_details

salt.modules.nilrt_ip.get_network_settings()
Return the contents of the global network script.

CLI Example:
salt '*' ip.get_network_settings

salt.modules.nilrt_ip.set_dhcp_linklocal_all(interface)
Configure specified adapter to use DHCP with linklocal fallback
Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters
  interface (str) -- interface label
Returns
  True if the settings were applied, otherwise an exception will be thrown.
Return type
  bool
CLI Example:
salt '*' ip.set_dhcp_linklocal_all interface-label

salt.modules.nilrt_ip.set_dhcp_only_all(interface)
Configure specified adapter to use DHCP only
Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters
  interface (str) -- interface label
Returns
  True if the settings were applied, otherwise an exception will be thrown.
Return type
  bool
CLI Example:
salt '*' ip.dhcp_only_all interface-label

salt.modules.nilrt_ip.set_ethercat(interface, master_id)
Configure specified adapter to use EtherCAT adapter mode. If successful, the target will need reboot if it doesn't already use EtherCAT adapter mode, otherwise will return true.
Parameters
  • interface -- interface label
  • master_id -- EtherCAT Master ID
Returns
  True if the settings were applied, otherwise an exception will be thrown.
CLI Example:
salt '*' ip.set_ethercat interface-label master-id

salt.modules.nilrt_ip.set_linklocal_only_all(interface)
Configure specified adapter to use linklocal only
Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters
  interface (str) -- interface label
Returns
  True if the settings were applied, otherwise an exception will be thrown.
Return type
  bool
CLI Example:
salt '*' ip.linklocal_only_all interface-label

salt.modules.nilrt_ip.set_static_all(interface, address, netmask, gateway, nameservers=None)

Configure specified adapter to use ipv4 manual settings

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters

  - interface (str) -- interface label
  - address (str) -- ipv4 address
  - netmask (str) -- ipv4 netmask
  - gateway (str) -- ipv4 gateway
  - nameservers (str) -- list of nameservers servers separated by spaces (Optional)

Returns

  True if the settings were applied, otherwise an exception will be thrown.

Return type

  bool

CLI Example:

```
salt '*' ip.set_static_all_all interface-label address netmask gateway
```

salt.modules.nilrt_ip.up(interface, iface_type=None)

Enable the specified interface

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters

  - interface (str) -- interface label

Returns

  True if the service was enabled, otherwise an exception will be thrown.

Return type

  bool

CLI Example:

```
salt '*' ip.up interface-label
```

### 26.6.305 salt.modules.nix

Work with Nix packages

New in version 2017.7.0.

Does not require the machine to be Nixos, just have Nix installed and available to use for the user running this command. Their profile must be located in their home, under $HOME/.nix-profile/, and the nix store, unless specially set up, should be in /nix. To easily use this with multiple users or a root user, set up the nix-daemon.

This module exposes most of the common nix operations. Currently not meant to be run as a pkg module, but explicitly as nix.*.

For more information on nix, see the nix documentation.

salt.modules.nix.collect_garbage()

Completely removed all currently ‘uninstalled’ packages in the nix store.

Tells the user how many store paths were removed and how much space was freed.
Returns
How much space was freed and how many derivations were removed
Return type
str

Warning: This is a destructive action on the nix store.

```
salt '*/' nix.collect_garbage
```

salt.modules.nix.install(* pkgs, **kwargs)
Installs a single or multiple packages via nix

Parameters
- **pkgs**(list(str)) -- packages to update
- **attributes**(bool) -- Pass the list of packages or single package as attributes, not package names. default: False

Returns
Installed packages. Example element: gcc-3.3.2
Return type
list(str)

```
salt '*/' nix.install package [package2 ...]
salt '*/' nix.install attributes=True attr.name [attr.name2 ...]
```

salt.modules.nix.list_pkgs(* installed=True, attributes=True)
Lists installed packages. Due to how nix works, it defaults to just doing a nix-env -q.

Parameters
- **installed**(bool) -- list only installed packages. This can be a very long list (12,000+ elements), so caution is advised. Default: True
- **attributes**(bool) -- show the attributes of the packages when listing all packages. Default: True

Returns
Packages installed or available, along with their attributes.
Return type
list(list(str))

```
salt '*/' nix.list_pkgs
salt '*/' nix.list_pkgs installed=False
```

salt.modules.nix.uninstall(* pkgs)
Erases a package from the current nix profile. Nix uninstalls work differently than other package managers, and the symlinks in the profile are removed, while the actual package remains. There is also a nix.purge function, to clear the package cache of unused packages.

Parameters
- **pkgs**(list(str)) -- List, single package to uninstall

Returns
Packages that have been uninstalled
Return type
list(str)

```
salt '*/' nix.uninstall pkg1 [pkg2 ...]
```

salt.modules.nix.upgrade(* pkgs)
Runs an update operation on the specified packages, or all packages if none is specified.
Parameters

pkgs (list(str)) -- List of packages to update

Returns

The upgraded packages. Example element: ['libxslt-1.1.0', 'libxslt-1.1.10']

Return type

list(tuple(str, str))

```
salt '*/' nix.update
salt '*/' nix.update pkgs=one,two
```

### 26.6.306 salt.modules.nova

Module for handling OpenStack Nova calls

**depends**

- novaclient Python module

**configuration**

This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
# Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
```

```openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the nova functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*/' nova.flavor_list profile=openstack1
```

To use keystoneauth1 instead of keystonclient, include the use_keystoneauth option in the pillar or minion config.

**Note:** This is required to use keystone v3 as for authentication.
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'

Note: By default the nova module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the verify option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own. (defaults to True)

salt.modules.nova.boot(name, flavor_id=0, image_id=0, profile=None, timeout=300)
  Boot (create) a new instance
  name
    Name of the new instance (must be first)
  flavor_id
    Unique integer ID for the flavor
  image_id
    Unique integer ID for the image
  timeout
    How long to wait, after creating the instance, for the provider to return information about it (default 300 seconds).

  New in version 2014.1.0.

  CLI Example:

  salt '*' nova.boot myinstance flavor_id=4596 image_id=2

  The flavor_id and image_id are obtained from nova.flavor_list and nova.image_list

  salt '*' nova.flavor_list
  salt '*' nova.image_list

salt.modules.nova.delete(instance_id, profile=None)
  Delete an instance
  instance_id
    ID of the instance to be deleted

  CLI Example:

  salt '*' nova.delete 1138

salt.modules.nova.flavor_create(name, flavor_id=0, ram=0, disk=0, vcpus=1, profile=None)
  Add a flavor to nova (nova flavor-create). The following parameters are required:
  name
    Name of the new flavor (must be first)
  flavor_id
    Unique integer ID for the new flavor
  ram
    Memory size in MB
  disk
    Disk size in GB
vcpus
    Number of vcpus
    CLI Example:

    ```
salt '*' nova.flavor_create myflavor flavor_id=6 ram=4096 disk=10 vcpus=1
    ```

```
salt.modules.nova.flavor_delete(flavor_id, profile=None)
    Delete a flavor from nova by id (nova flavor-delete)
    CLI Example:

    ```
salt '*' nova.flavor_delete 7
    ```
```

```
salt.modules.nova.flavor_list(profile=None)
    Return a list of available flavors (nova flavor-list)
    CLI Example:

    ```
salt '*' nova.flavor_list
    ```
```

```
salt.modules.nova.image_list(name=None, profile=None)
    Return a list of available images (nova images-list + nova image-show) If a name is provided, only that image will be displayed.
    CLI Examples:

    ```
salt '*' nova.image_list
    salt '*' nova.image_list myimage
    ```
```

```
salt.modules.nova.image_meta_delete(image_id=None, name=None, keys=None, profile=None)
    Delete a key=value pair from the metadata for an image (nova image-meta set)
    CLI Examples:

    ```
salt '*' nova.image_meta_delete 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 keys=cheese
    salt '*' nova.image_meta_delete name=myimage keys=salad,beans
    ```
```

```
salt.modules.nova.image_meta_set(image_id=None, name=None, **kwargs)
    Sets a key=value pair in the metadata for an image (nova image-meta set)
    CLI Examples:

    ```
salt '*' nova.image_meta_set 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 cheese=gruyere
    ```
```

```
salt.modules.nova.keypair_add(name, pubfile=None, pubkey=None, profile=None)
    Add a keypair to nova (nova keypair-add)
    CLI Examples:

    ```
salt '*' nova.keypair_add mykey pubfile=/home/myuser/.ssh/id_rsa.pub
    salt '*' nova.keypair_add mykey pubkey='ssh-rsa <key> myuser@mybox'
    ```
**salt.modules.nova.keypair_delete**(*name, profile=None*)

Add a keypair to nova (nova keypair-delete)

CLI Example:

```bash
salt '*' nova.keypair_delete mykey
```

**salt.modules.nova.keypair_list**(*profile=None*)

Return a list of available keypairs (nova keypair-list)

CLI Example:

```bash
salt '*' nova.keypair_list
```

**salt.modules.nova.list_**(*profile=None*)

To maintain the feel of the nova command line, this function simply calls the server_list function.

CLI Example:

```bash
salt '*' nova.list
```

**salt.modules.nova.lock**(*instance_id, profile=None*)

Lock an instance

```
instance_id
```

ID of the instance to be locked

CLI Example:

```bash
salt '*' nova.lock 1138
```

**salt.modules.nova.resume**(*instance_id, profile=None*)

Resume an instance

```
instance_id
```

ID of the instance to be resumed

CLI Example:

```bash
salt '*' nova.resume 1138
```

**salt.modules.nova.secgROUP_CREATE**(*name, description, profile=None*)

Add a secgroup to nova (nova secgroup-create)

CLI Example:

```bash
salt '*' nova.secggroup_create mygroup 'This is my security group'
```

**salt.modules.nova.secgROUP_DELETE**(*name, profile=None*)

Delete a secgroup to nova (nova secgroup-delete)

CLI Example:

```bash
salt '*' nova.secgroup_delete mygroup
```

**salt.modules.nova.secgROUP_LIST**(*profile=None*)

Return a list of available security groups (nova items-list)

CLI Example:
salt '*' nova.secgroup_list

salt.modules.nova.server_by_name(name, profile=None)
    Return information about a server
    name
    Server Name
    CLI Example:
    
    salt '*' nova.server_by_name myserver profile=openstack

salt.modules.nova.server_list(profile=None)
    Return list of active servers
    CLI Example:
    
    salt '*' nova.server_list

salt.modules.nova.server_list_detailed(profile=None)
    Return detailed list of active servers
    CLI Example:
    
    salt '*' nova.server_list_detailed

salt.modules.nova.server_show(server_id, profile=None)
    Return detailed information for an active server
    CLI Example:
    
    salt '*' nova.server_show <server_id>

salt.modules.nova.show(server_id, profile=None)
    To maintain the feel of the nova command line, this function simply calls the server_show function.
    CLI Example:
    
    salt '*' nova.show

salt.modules.nova.suspend(instance_id, profile=None)
    Suspend an instance
    instance_id
    ID of the instance to be suspended
    CLI Example:
    
    salt '*' nova.suspend 1138

salt.modules.nova.volume_attach(name, server_name, device='/dev/xvdb', profile=None, timeout=300)
    Attach a block storage volume
    name
    Name of the new volume to attach
    server_name
    Name of the server to attach to
    device
    Name of the device on the server
profile
    Profile to build on
    
    CLI Example:

    ```
salt '*' nova.volume_attach myblock slice.example.com profile=openstack
salt '*' nova.volume_attach myblock server.example.com device='/dev/xvdb'

 ←profile=openstack
```

salt.modules.nova.volume_create(name, size=100, snapshot=None, voltype=None, profile=None)
    Create a block storage volume
    
    name
        Name of the new volume (must be first)
    size
        Volume size
    snapshot
        Block storage snapshot id
    voltype
        Type of storage
    profile
        Profile to build on
    
    CLI Example:

    ```
salt '*' nova.volume_create myblock size=300 profile=openstack
```

salt.modules.nova.volume_delete(name, profile=None)
    Destroy the volume
    
    name
        Name of the volume
    profile
        Profile to build on
    
    CLI Example:

    ```
salt '*' nova.volume_delete myblock profile=openstack
```

salt.modules.nova.volume_detach(name, profile=None, timeout=300)
    Attach a block storage volume
    
    name
        Name of the new volume to attach
    server_name
        Name of the server to detach from
    profile
        Profile to build on
    
    CLI Example:

    ```
salt '*' nova.volume_detach myblock profile=openstack
```

salt.modules.nova.volume_list(search_opts=None, profile=None)
    List storage volumes
    
    search_opts
        Dictionary of search options
    profile
        Profile to use
    
    CLI Example:
salt '*' nova.volume_list search_opts='{"display_name": "myblock"}'' → profile=openstack

```
salt.modules.nova.volume_show(name, profile=None)
```
Create a block storage volume

- **name**: Name of the volume
- **profile**: Profile to use

CLI Example:
```
salt '*' nova.volume_show myblock profile=openstack
```

### 26.6.307 salt.modules.npm

Manage and query NPM packages.

```
salt.modules.npm.cache_clean(path=None, runas=None, env=None, force=False)
```
Clean cached NPM packages.

- **path**: The cache subpath to delete, or None to clear the entire cache
- **runas**: The user to run NPM with
- **env**: Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.
- **force**: Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

CLI Example:
```
salt '*' npm.cache_clean force=True
```

```
salt.modules.npm.cache_list(path=None, runas=None, env=None)
```
List NPM cached packages.

- **path**: The cache subpath to list, or None to list the entire cache
- **runas**: The user to run NPM with
- **env**: Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:
```
salt '*' npm.cache_clean
```

```
salt.modules.npm.cache_path(runas=None, env=None)
```
List path of the NPM cache directory.
runas
   The user to run NPM with
env
   Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution
   function.
CLI Example:
```bash
salt '*' npm.cache_path
```

salt.modules.npm.install(pkg=None, pkgs=None, dir=None, runas=None, registry=None, env=None,
       dry_run=False, silent=True)

Install an NPM package.

If no directory is specified, the package will be installed globally. If no package is specified, the dependencies
(from package.json) of the package in the given directory will be installed.

pkg
   A package name in any format accepted by NPM, including a version identifier
pkgs
   A list of package names in the same format as the name parameter
   New in version 2014.7.0.
dir
   The target directory in which to install the package, or None for global installation
runas
   The user to run NPM with
registry
   The NPM registry to install the package from.
   New in version 2014.7.0.
env
   Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution
   function.
   New in version 2014.7.0.
silent
   Whether or not to run NPM install with --silent flag.
   New in version 2016.3.0.
dry_run
   Whether or not to run NPM install with --dry-run flag.
   New in version 2015.8.4.
silent
   Whether or not to run NPM install with --silent flag.
   New in version 2015.8.5.
CLI Example:
```bash
salt '*' npm.install coffee-script
salt '*' npm.install coffee-script@1.0.1
```

salt.modules.npm.list_(pkg=None, dir=None, runas=None, env=None, depth=None)

List installed NPM packages.

If no directory is specified, this will return the list of globally-installed packages.
pkg
   Limit package listing by name
**dir**
The directory whose packages will be listed, or None for global installation

**runas**
The user to run NPM with
New in version 2014.7.0.

**env**
Environment variables to set when invoking npm. Uses the same env format as the `cmd.run` execution function.
New in version 2014.7.0.

**depth**
Limit the depth of the packages listed
New in version 2016.11.6, 2017.7.0.

CLI Example:
```
salt '*' npm.list
```

```
salt.modules.npm.uninstall(pkg, dir=None, runas=None, env=None)
```
Uninstall an NPM package.

If no directory is specified, the package will be uninstalled globally.

**pkg**
A package name in any format accepted by NPM

**dir**
The target directory from which to uninstall the package, or None for global installation

**runas**
The user to run NPM with

**env**
Environment variables to set when invoking npm. Uses the same env format as the `cmd.run` execution function.
New in version 2015.5.3.

CLI Example:
```
salt '*' npm.uninstall coffee-script
```

### 26.6.308 salt.modules.nspawn

Manage nspawn containers

New in version 2015.8.0.

`systemd-nspawn(1)` is a tool used to manage lightweight namespace containers. This execution module provides several functions to help manage these containers.

Minions running systemd >= 219 will place new containers in `/var/lib/machines`, while those running systemd < 219 will place them in `/var/lib/container`.

```
salt.modules.nspawn.bootstrap_container(name, dist=None, version=None)
```
Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:
```
salt myminion nspawn.bootstrap_container <name>
```
salt.modules.nspawn.bootstrap_salt(name, config=None, approve_key=True, install=True, pub_key=None, priv_key=None, bootstrap_url=None, force_install=False, unconditional_install=False, bootstrap_delay=None, bootstrap_args=None, bootstrap_shell=None)

Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:
```
salt '*' nspawn.bootstrap_salt arch1
```

salt.modules.nspawn.copy_to(name, source, dest, overwrite=False, makedirs=False)

Copy a file from the host into a container

**name**
Container name

**source**
File to be copied to the container

**dest**
Destination on the container. Must be an absolute path.

**overwrite**
[False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.

**makedirs** : False
Create the parent directory on the container if it does not already exist.

CLI Example:
```
salt 'minion' nspawn.copy_to /tmp/foo /root/foo
```

salt.modules.nspawn.cp(name, source, dest, overwrite=False, makedirs=False)

This function is an alias of copy_to.

**name**
Container name

**source**
File to be copied to the container

**dest**
Destination on the container. Must be an absolute path.

**overwrite**
[False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.

**makedirs** : False
Create the parent directory on the container if it does not already exist.

CLI Example:
```
salt 'minion' nspawn.cp /tmp/foo /root/foo
```

salt.modules.nspawn.destroy(name, stop=False)

This function is an alias of remove.

Remove the named container
**Warning:** This function will remove all data associated with the container. It will not, however, remove the btrfs subvolumes created by pulling container images (`nspawn.pull_raw`, `nspawn.pull_tar`, `nspawn.pull_dkr`).

**stop**

[False] If True, the container will be destroyed even if it is running/frozen.

CLI Examples:

```bash
salt '*' nspawn.remove foo
salt '*' nspawn.remove foo stop=True
```

**salt.modules.nspawn.disable(name)**

Set the named container to not be launched at boot

CLI Example:

```bash
salt myminion nspawn.enable <name>
```

**salt.modules.nspawn.enable(name)**

Set the named container to be launched at boot

CLI Example:

```bash
salt myminion nspawn.enable <name>
```

**salt.modules.nspawn.exists(name)**

Returns true if the named container exists

CLI Example:

```bash
salt myminion nspawn.exists <name>
```

**salt.modules.nspawn.info(name, **kwargs)**

Return info about a container

**Note:** The container must be running for `machinectl` to gather information about it. If the container is stopped, then this function will start it.

**start**

[False] If True, then the container will be started to retrieve the info. A `Started` key will be in the return data if the container was started.

CLI Example:

```bash
salt myminion nspawn.info arch1
salt myminion nspawn.info arch1 force_start=False
```

**salt.modules.nspawn.list()**

This function is an alias of `list_running`. Lists running nspawn containers

**Note:** `nspawn.list` also works to list running containers
**CLI Example:**

```bash
salt myminion nspawn.list_running
salt myminion nspawn.list
```

`salt.modules.nspawn.list_all()`  
Lists all nspawn containers

**CLI Example:**

```bash
salt myminion nspawn.list_all
```

`salt.modules.nspawn.list_running()`  
Lists running nspawn containers

**Note:** `nspawn.list` also works to list running containers

**CLI Example:**

```bash
salt myminion nspawn.list_running
salt myminion nspawn.list
```

`salt.modules.nspawn.listStopped()`  
Lists stopped nspawn containers

**CLI Example:**

```bash
salt myminion nspawn.list_stopped
```

`salt.modules.nspawn.pid(name)`  
Returns the PID of a container

```bash
salt modules.nspawn.pid arch1
```

`salt.modules.nspawn.poweroff(name)`  
Issue a clean shutdown to the container. Equivalent to running `machinectl poweroff` on the named container.

For convenience, running `nspawn.stop` (as shown in the CLI examples below) is equivalent to running `\``nspawn.poweroff`.

**Note:** `machinectl poweroff` is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via `systemctl`.

**CLI Examples:**

```bash
salt myminion nspawn.poweroff arch1
salt myminion nspawn.stop arch1
```
salt.modules.nspawn.pull_dkr(url, name, index)

Execute a machinectl pull-dkr to download a docker image and add it to /var/lib/machines as a new container.

Note: Requires systemd >= 219

url
URL from which to download the container
name
Name for the new container
index
URL of the Docker index server from which to pull (must be an http:// or https:// URL).

CLI Examples:

```
salt myminion nspawn.pull_dkr centos/centos6 cent6 index=https://get.docker.com
salt myminion nspawn.pull_docker centos/centos6 cent6 index=https://get.docker.com
```

salt.modules.nspawn.pull_docker(url, name, index)

This function is an alias of pull_dkr.

Execute a machinectl pull-dkr to download a docker image and add it to /var/lib/machines as a new container.

Note: Requires systemd >= 219

url
URL from which to download the container
name
Name for the new container
index
URL of the Docker index server from which to pull (must be an http:// or https:// URL).

CLI Examples:

```
salt myminion nspawn.pull_dkr centos/centos6 cent6 index=https://get.docker.com
salt myminion nspawn.pull_docker centos/centos6 cent6 index=https://get.docker.com
```

salt.modules.nspawn.pull_raw(url, name, verify=False)

Execute a machinectl pull-raw to download a .qcow2 or raw disk image, and add it to /var/lib/machines as a new container.

Note: Requires systemd >= 219

url
URL from which to download the container
name
Name for the new container
verify

[False] Perform signature or checksum verification on the container. See the `machinectl(1)` man
page (section titled "Image Transfer Commands") for more information on requirements for image ver-
ification. To perform signature verification, use `verify=signature`. For checksum verification, use
`verify=checksum`. By default, no verification will be performed.

CLI Examples:

```
salt myminion nspawn.pull_raw http://ftp.halifax.rwth-aachen.de/fedora/
  → linux/releases/21/Cloud/Images/x86_64/Fedora-Cloud-Base-20141203-21.x86_64.raw.xz fedora21
```

```
salt.modules.nspawn.pull_tar(url, name, verify=False)
```

Execute a `machinectl pull-raw` to download a `.tar` container image, and add it to `/var/lib/machines` as
a new container.

Note: Requires systemd >= 219

```
url

URL from which to download the container
```

```
name

Name for the new container
```

```
verify

[False] Perform signature or checksum verification on the container. See the `machinectl(1)` man
page (section titled "Image Transfer Commands") for more information on requirements for image ver-
ification. To perform signature verification, use `verify=signature`. For checksum verification, use
`verify=checksum`. By default, no verification will be performed.
```

CLI Examples:

```
salt myminion nspawn.pull_tar http://foo.domain.tld/containers/archlinux-
  → 2015.02.01.tar.gz arch2
```

```
salt.modules.nspawn.reboot(name, kill=False)
```

Reboot the container by sending a SIGINT to its init process. Equivalent to running `machinectl reboot`
on the named container.

For convenience, running `nspawn.restart` (as shown in the CLI examples below) is equivalent to running
`nspawn.reboot`.

Note: `machinectl reboot` is only supported in systemd >= 219. On earlier systemd versions, running
this function will instead restart the container via `systemctl`.

CLI Examples:

```
salt myminion nspawn.reboot arch1
salt myminion nspawn.restart arch1
```

```
salt.modules.nspawn.remove(name, stop=False)
```

Remove the named container
**Warning:** This function will remove all data associated with the container. It will not, however, remove the btrfs subvolumes created by pulling container images (`nspawn.pull_raw`, `nspawn.pull_tar`, `nspawn.pull_dkr`).

```
stop
```

[False] If `True`, the container will be destroyed even if it is running/frozen.

**CLI Examples:**

```
salt '*' nspawn.remove foo
salt '*' nspawn.remove foo stop=True
```

**salt.modules.nspawn.restart**(name)

This is a compatibility function which simply calls nspawn.reboot.

**salt.modules.nspawn.retcode**(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run `cmd.retcode` within a container

```
name
```

Name of the container in which to run the command

```
cmd
```

Command to run

```
no_start
```

[False] If the container is not running, don't start it

```
preserve_state
```

[True] After running the command, return the container to its previous state

```
stdin
```

[None] Standard input to be used for the command

```
output_loglevel
```

[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

```
use_vt
```

[False] Use SaltStack's `utils.vt` to stream output to console. Assumes `output=all`.

```
keep_env
```

[None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

**CLI Example:**

```
salt myminion nspawn.retcode mycontainer 'ip addr show'
```

**salt.modules.nspawn.run**(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run `cmd.run` within a container

```
name
```

Name of the container in which to run the command

```
cmd
```

Command to run

```
no_start
```

[False] If the container is not running, don't start it

```
preserve_state
```

[True] After running the command, return the container to its previous state

```
stdin
```

[None] Standard input to be used for the command
output_loglevel
  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
use_vt
  [False] Use SaltStack’s utils.vt to stream output to console.
keep_env
  [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```bash
salt myminion nspawn.run mycontainer 'ip addr show'
```

salt.modules.nspawn.run_all(name, cmd, no_start=False, preserve_state=True, stdin=None,
  python_shell=True, output_loglevel='debug', use_vt=False,
  ignore_retcode=False, keep_env=None)

Run `cmd.run_all` within a container

Note: While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

name
  Name of the container in which to run the command
cmd
  Command to run
no_start
  [False] If the container is not running, don’t start it
preserve_state
  [True] After running the command, return the container to its previous state
stdin
  [None] Standard input to be used for the command
output_loglevel
  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
use_vt
  [False] Use SaltStack's utils.vt to stream output to console. Assumes output=all.
keep_env
  [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```bash
salt myminion nspawn.run_all mycontainer 'ip addr show'
```

salt.modules.nspawn.run_stderr(name, cmd, no_start=False, preserve_state=True, stdin=None,
  python_shell=True, output_loglevel='debug', use_vt=False,
  ignore_retcode=False, keep_env=None)

Run `cmd.run_stderr` within a container

name
  Name of the container in which to run the command
cmd
  Command to run
no_start
  [False] If the container is not running, don’t start it
**preserve_state**
- [True] After running the command, return the container to its previous state

**stdin**
- [None] Standard input to be used for the command

**output_loglevel**
- [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

**use_vt**
- [False] Use SaltStack's utils.vt to stream output to console. Assumes output=all.

**keep_env**
- [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stderr mycontainer 'ip addr show'
```

salt.modules.nspawn.run_stdout(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run `cmd.run_stdout` within a container

- **name**: Name of the container in which to run the command
- **cmd**: Command to run
- **no_start**: [False] If the container is not running, don't start it
- **preserve_state**: [True] After running the command, return the container to its previous state
- **stdin**: [None] Standard input to be used for the command
- **output_loglevel**: [debug] Level at which to log the output from the command. Set to quiet to suppress logging.
- **use_vt**: [False] Use SaltStack's utils.vt to stream output to console. Assumes output=all.
- **keep_env**: [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stdout mycontainer 'ip addr show'
```

salt.modules.nspawn.start(name)

Start the named container

CLI Example:

```
salt myminion nspawn.start <name>
```

salt.modules.nspawn.state(name)

Return state of container (running or stopped)

CLI Example:
salt.myminion nspawn.state <name>

`salt.modules.nspawn.stop(name, kill=False)`

This is a compatibility function which provides the logic for nspawn.poweroff and nspawn.terminate.

`salt.modules.nspawn.terminate(name)`

Kill all processes in the container without issuing a clean shutdown. Equivalent to running `machinectl terminate` on the named container.

For convenience, running `nspawn.stop and passing kill=True` (as shown in the CLI examples below) is equivalent to running `nspawn.terminate`.

**Note:** `machinectl terminate` is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via `systemctl`.

CLI Examples:

```
salt myminion nspawn.terminate arch1
salt myminion nspawn.stop arch1 kill=True
```

### 26.6.309 salt.modules.nxos

Execution module for Cisco NX OS Switches.

New in version 2016.11.0.

**This module supports execution using a Proxy Minion or Native Minion:**

1) Proxy Minion: Connect over SSH or NX-API HTTP(S). See `salt.proxy.nxos` for proxy minion setup details.
2) Native Minion: Connect over NX-API Unix Domain Socket (UDS). Install the minion inside the GuestShell running on the NX-OS device.

**maturity**

new

**platform**

nxos

**Note:** To use this module over remote NX-API the feature must be enabled on the NX-OS device by executing `feature nxapi` in configuration mode.

This is not required for NX-API over UDS.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```
Native minion configuration options:

```
nxos:
  cookie: 'username'
  save_config: False
```

**cookie**

Use the option to override the default cookie ‘admin:local’ when connecting over UDS and use ‘username:local’ instead. This is needed when running the salt-minion in the GuestShell using a non-admin user.

This option is ignored for SSH and NX-API Proxy minions.

**save_config**

If True, 'copy running-config starting-config' is issues for every configuration command. If False, Running config is not saved to startup config Default: True

The recommended approach is to use the `save_running_config` function instead of this option to improve performance. The default behavior controlled by this option is preserved for backwards compatibility.

The APIs defined in this execution module can also be executed using salt-call from the GuestShell environment as follows.

```
salt-call --local nxos.sendline 'show lldp neighbors' raw_text
```

**Note:** The functions in this module should be executed like so:

```
salt '*' nxos.<function> salt '*' nxos.get_user username=admin
```

For backwards compatibility, the following syntax will be supported until the 3001 release.

```
salt '*' nxos.cmd <function> salt '*' nxos.cmd get_user username=admin
```

```
salt.modules.nxos.add_config(lines, **kwargs)
    Add one or more config lines to the NX-OS device running config.
    lines
        Configuration lines to add
    save_config
        If False, don’t save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True
```

```
salt '*' nxos.add_config 'snmp-server community TESTSTRINGHERE group network-operator'
```

**Note:** For more than one config added per command, lines should be a list.

```
salt.modules.nxos.check_password(username, password, encrypted=False, **kwargs)
    Verify user password.
    username
        Username on which to perform password check
    password
        Password to check
    encrypted
        Whether or not the password is encrypted Default: False
```

26.6. execution modules
salt.modules.nxos.check_role(username, role, **kwargs)

Verify role assignment for user.

```
salt '*' nxos.check_role username=admin role=network-admin
```

salt.modules.nxos.cmd(command, *args, **kwargs)

NOTE: This function is preserved for backwards compatibility. This allows commands to be executed using either of the following syntactic forms.

```
salt '*' nxos.cmd <function>
```

or

```
salt '*' nxos.<function>
```

**command**

function from salt.modules.nxos to run

**args**

positional args to pass to command function

**kwargs**

key word arguments to pass to command function

```
salt '*' nxos.cmd sendline 'show ver'
salt '*' nxos.cmd show_run
salt '*' nxos.cmd check_password username=admin password='\$5\$lkjsdfoi
←$ blahblahblah' encrypted=True
```

salt.modules.nxos.config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)

Configures the Nexus switch with the specified commands.

This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

**Warning:** All the commands will be applied directly to the running-config.

**config_file**

The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**commands**

The commands to send to the switch in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

**Note:** This argument is ignored when config_file is specified.
**template_engine:** jinja
The template engine to use when rendering the source file. Default: jinja. To simply fetch the file without attempting to render, set this argument to None.

**context**
Variables to add to the template context.

**defaults**
Default values of the context_dict.

**save_config**
If False, don’t save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

CLI Example:
```
salt '*' nxos.config commands="['spanning-tree mode mstp']"
salt '*' nxos.config config_file=salt://config.txt
salt '*' nxos.config config_file=https://bit.ly/2LGLcDy context="{'servers←': ['1.2.3.4']}"
```

### salt.modules.nxos.delete_config(lines, **kwargs)
Delete one or more config lines to the switch running config.

**lines**
Configuration lines to remove.

**save_config**
If False, don’t save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.delete_config 'snmp-server community TESTSTRINGHERE group network-operator'
```

**Note:** For more than one config deleted per command, lines should be a list.

### salt.modules.nxos.find(pattern, **kwargs)
Find all instances where the pattern is in the running configuration.

```
salt '*' nxos.find '^snmp-server.*$'
```

**Note:** This uses the re.MULTILINE regex format for python, and runs the regex against the whole show_run output.

### salt.modules.nxos.get_roles(username, **kwargs)
Get roles assigned to a username.

### salt.modules.nxos.get_user(username, **kwargs)
Get username line from switch.

### salt.modules.nxos.grains(**kwargs)
Get grains for minion.

### salt.modules.nxos.grains_refresh(**kwargs)
Refresh the grains for the NX-OS device.
salt.modules.nxos.ping(**kwargs)

Ping the device on the other end of the connection.

salt.modules.nxos.remove_user(username, **kwargs)

Remove user from switch.

username
   Username to remove

save_config
   If False, don’t save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.remove_user username=daniel
```

salt.modules.nxos.replace(old_value, new_value, full_match=False, **kwargs)

Replace string or full line matches in switch’s running config.

If full_match is set to True, then the whole line will need to be matched as part of the old value.

```
salt '*' nxos.replace 'TESTSTRINGHERE' 'NEWTESTSTRINGHERE'
```

salt.modules.nxos.save_running_config(**kwargs)

Save the running configuration to startup configuration.

```
salt '*' nxos.save_running_config
```

salt.modules.nxos.sendline(command, method='cli_show_ascii', **kwargs)

Send arbitrary commands to the NX-OS device.

command
   The command or list of commands to be sent. ['cmd1', 'cmd2'] is converted to 'cmd1 ; cmd2'.

method:
   cli_show_ascii: Return raw test or unstructured output. cli_show: Return structured output. cli_conf: Send configuration commands to the device. Defaults to cli_show_ascii. NOTE: method is ignored for SSH proxy minion. All data is returned unstructured.

error_pattern
   Use the option to pass in a regular expression to search for in the returned output of the command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

salt.modules.nxos.set_password(username, password, encrypted=False, role=None, crypt_salt=None, algorithm='sha256', **kwargs)

Set users password on switch.

username
   Username to configure

password
   Password to configure for username

encrypted
   Whether or not to encrypt the password Default: False

role
   Configure role for the username Default: None

crypt_salt
   Configure crypt_salt setting Default: None

algorithm
   Encryption algorithm Default: sha256
**save_config**

If False, don’t save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```python
salt '*' nxos.set_password admin TestPass
salt '*' nxos.set_password admin \n  password='$$5$2fWwO2vK$s7.Hr3YltMNHuwywQQ3nf0d.gAPHgs3SOBYydGT3E.A' \n  encrypted=True
```

**salt.modules.nxos.set_role** *(username, role, **kwargs)*

Assign role to username.

- **username**
  Username for role configuration

- **role**
  Configure role for username

- **save_config**
  If False, don’t save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```python
salt '*' nxos.set_role username=daniel role=vdc-admin.
```

**salt.modules.nxos.show** *(commands, raw_text=True, **kwargs)*

Execute one or more show (non-configuration) commands.

- **commands**
  The commands to be executed.

- **raw_text**: *True*
  Whether to return raw text or structured data. NOTE: raw_text option is ignored for SSH proxy minion. Data is returned unstructured.

CLI Example:

```python
salt-call --local nxos.show 'show version'
salt '*' nxos.show 'show bgp sessions ; show processes' raw_text=False
salt 'regular-minion' nxos.show 'show interfaces' host=sw01.example.com\n  --username=test password=test
```

**salt.modules.nxos.show_run** *(**kwargs)*

Shortcut to run show running-config on the NX-OS device.

```python
salt '*' nxos.show_run
```

**salt.modules.nxos.show_ver** *(**kwargs)*

Shortcut to run show version on the NX-OS device.

```python
salt '*' nxos.show_ver
```

**salt.modules.nxos.system_info** *(**kwargs)*

Return system information for grains of the minion.

```python
salt '*' nxos.system_info
```

**salt.modules.nxos.unset_role** *(username, role, **kwargs)*

Remove role from username.

- **username**
  Username for role removal
Role to remove
save_config
If False, don’t save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.unset_role username=daniel role=vdc-admin
```

26.6.310 salt.modules.nxos_api

Execution module to manage Cisco Nexus Switches (NX-OS) over the NX-API

New in version 2019.2.0.

Execution module used to interface the interaction with a remote or local Nexus switch whether we're running in a Proxy Minion or regular Minion (or regular Minion running directly on the Nexus switch).

codeauthor
Mircea Ulinic <ping@mirceaulinic.net>
maturity
new
platform
any

Note: To be able to use this module you need to enable to NX-API on your switch, by executing `feature nxapi` in configuration mode.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

Note: NX-API requires modern NXOS distributions, typically at least 7.0 depending on the hardware. Due to reliability reasons it is recommended to run the most recent version.

Usage

This module can equally be used via the nxos_api Proxy module or directly from an arbitrary (Proxy) Minion that is running on a machine having access to the network device API. Given that there are no external dependencies, this module can very well used when using the regular Salt Minion directly installed on the switch.

When running outside of the nxos_api Proxy (i.e., from another Proxy Minion type, or regular Minion), the NX-API connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the nxos_api key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the nxos_api Proxy Module:

**transport:** https
Specifies the type of connection transport to use. Valid values for the connection are http, and https.

**host:** localhost
The IP address or DNS host name of the connection device.

**username:** admin
The username to pass to the device to authenticate the NX-API connection.

**password**
The password to pass to the device to authenticate the NX-API connection.

**port**
The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

**timeout:** 60
Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify:** True
Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

When there is no certificate configuration on the device and this option is set as True (default), the commands will fail with the following error: SSLError: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581). In this case, you either need to configure a proper certificate on the device (recommended), or bypass the checks setting this argument as False with all the security risks considered.

Example (when not running in a nxos_api Proxy Minion):

```
```
```
xos_api:
  username: test
  password: test
```
```
In case the username and password are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a nxos_api Proxy, e.g.:

```
salt-call --local nxos_api.show 'show lldp neighbors' raw_text
# The command above is available when running in a regular Minion where Salt is installed
```
```
salt '*' nxos_api.show 'show version' raw_text=False
```
```
```
salt.modules.nxos_api.config(
    commands=None,
    config_file=None,
    template_engine='jinja',
    context=None,
    defaults=None,
    saltenv='base', **kwargs)

Configures the Nexus switch with the specified commands.
This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

**Warning:** All the commands will be applied directly into the running-config.

**config_file**
The source file with the configuration commands to be sent to the device.
The file can also be a template that can be rendered using the template engine of choice.
This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**commands**
The commands to send to the switch in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

**Note:** This argument is ignored when `config_file` is specified.

**template_engine:** jinja
The template engine to use when rendering the source file. Default: jinja. To simply fetch the file without attempting to render, set this argument to `None`.

**context**
Variables to add to the template context.

**defaults**
Default values of the context_dict.

**transport:** https
Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

**host:** localhost
The IP address or DNS host name of the connection device.

**username:** admin
The username to pass to the device to authenticate the NX-API connection.

**password**
The password to pass to the device to authenticate the NX-API connection.

**port**
The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**timeout:** 60
Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify:** True
Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in
which case it must be a path to a CA bundle to use. Defaults to `True`.

CLI Example:

```bash
salt '*' nxos_api.config commands="["spanning-tree mode mstp"]"
salt '*' nxos_api.config config_file=salt://config.txt
salt '*' nxos_api.config config_file=https://bit.ly/2LGLcDy context="{'servers': ["1.2.3.4"]}"```

`salt.modules.nxos_api.rpc(commands, method='cli', **kwargs)`

Execute an arbitrary RPC request via the Nexus API.

- **commands**
  - The commands to be executed.
- **method:** `cli`
  - The type of the response, i.e., raw text (cli_ascii) or structured document (cli). Defaults to `cli` (structured data).
- **transport:** `https`
  - Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.
- **host:** `localhost`
  - The IP address or DNS host name of the connection device.
- **username:** `admin`
  - The username to pass to the device to authenticate the NX-API connection.
- **password**
  - The password to pass to the device to authenticate the NX-API connection.
- **port**
  - The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).
- **timeout:** `60`
  - Time in seconds to wait for the device to respond. Default: 60 seconds.
- **verify:** `True`
  - Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

CLI Example:

```bash
salt-call --local nxos_api.rpc 'show version'
```

`salt.modules.nxos_api.show(commands, raw_text=True, **kwargs)`

Execute one or more show (non-configuration) commands.

- **commands**
  - The commands to be executed. Multiple commands should be specified as a list.
- **raw_text:** `True`
  - Whether to return raw text or structured data.
- **transport:** `https`
  - Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.
- **host:** `localhost`
  - The IP address or DNS host name of the connection device.
- **username:** `admin`
  - The username to pass to the device to authenticate the NX-API connection.
- **password**
  - The password to pass to the device to authenticate the NX-API connection.
- **port**
  - The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).
- **timeout:** `60`
  - Time in seconds to wait for the device to respond. Default: 60 seconds.
verify: True
   Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in
   which case it must be a path to a CA bundle to use. Defaults to True.

CLI Example:

```
salt-call --local nxos_api.show 'show version'
salt '*' nxos_api.show "['show bgp sessions','show processes']" raw_
   ~text=False
salt 'regular-minion' nxos_api.show 'show interfaces' host=sw01.example.    
   ~com username=test password=test
```

26.6.311 salt.modules.nxos_upgrade

Execution module to upgrade Cisco NX-OS Switches.

New in version 3001.

This module supports execution using a Proxy Minion or Native Minion:

1) Proxy Minion: Connect over SSH or NX-API HTTP(S). See salt.proxy.nxos for proxy minion setup
details.

2) Native Minion: Connect over NX-API Unix Domain Socket (UDS). Install the minion inside the Guest-
Shell running on the NX-OS device.

maturity
   new

platform
   nxos

codeauthor
   Michael G Wiebe

Note:  To use this module over remote NX-API the feature must be enabled on the NX-OS device by executing
feature nxapi in configuration mode.

This is not required for NX-API over UDS.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute show nxapi.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

salt.modules.nxos_upgrade.check_upgrade_impact(system_image, kickstart_image=None,
   issu=True, **kwargs)

   Display upgrade impact information without actually upgrading the device.
system_image (Mandatory Option)
Path on bootflash: to system image upgrade file.

kickstart_image
Path on bootflash: to kickstart image upgrade file. (Not required if using combined system/kickstart image file) Default: None

issu
In Service Software Upgrade (non-disruptive). When True, the upgrade will abort if issu is not possible. When False: Force (disruptive) Upgrade/Downgrade. Default: True

timeout
Timeout in seconds for long running 'install all' impact command. Default: 900

error_pattern
Use the option to pass in a regular expression to search for in the output of the 'install all impact' command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

```
salt 'n9k' nxos.check_upgrade_impact system_image=nxos.9.2.1.bin
salt 'n7k' nxos.check_upgrade_impact system_image=n7000-s2-dk9.8.1.1.bin \ kickstart_image=n7000-s2-kickstart.8.1.1.bin issu=False
```

salt.modules.nxos_upgrade.upgrade(system_image, kickstart_image=None, issu=True, **kwargs)
Upgrade NX-OS switch.

system_image (Mandatory Option)
Path on bootflash: to system image upgrade file.

kickstart_image
Path on bootflash: to kickstart image upgrade file. (Not required if using combined system/kickstart image file) Default: None

issu
Set this option to True when an In Service Software Upgrade or non-disruptive upgrade is required. The upgrade will abort if issu is not possible. Default: True

timeout
Timeout in seconds for long running 'install all' upgrade command. Default: 900

error_pattern
Use the option to pass in a regular expression to search for in the output of the 'install all upgrade command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

```
salt 'n9k' nxos.upgrade system_image=nxos.9.2.1.bin
salt 'n7k' nxos.upgrade system_image=n7000-s2-dk9.8.1.1.bin \ kickstart_image=n7000-s2-kickstart.8.1.1.bin issu=False
```

26.6.312 salt.modules.omapi
This module interacts with an ISC DHCP Server via OMAPI. server_ip and server_port params may be set in the minion config or pillar:

```
omapi.server_ip: 127.0.0.1
omapi.server_port: 7991
```

depends
pypureomapi Python module

salt.modules.omapi.add_host(mac, name=None, ip=None, ddns=False, group=None, supersede_host=False)
Add a host object for the given mac.
CLI Example:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab name=host1
```

Add ddns-hostname and a fixed-ip statements:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab name=host1 ip=10.1.1.10 ddns=true
```

```
salt.modules.omapi.delete_host(mac=None, name=None)
```
Delete the host with the given mac or name.

CLI Examples:

```
salt dhcp-server omapi.delete_host name=host1
salt dhcp-server omapi.delete_host mac=ab:ab:ab:ab:ab
```

### 26.6.313 salt.modules.openbsd_sysctl

Module for viewing and modifying OpenBSD sysctl parameters

```
salt.modules.openbsd_sysctl.assign(name, value)
```
Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.ip.forwarding 1
```

```
salt.modules.openbsd_sysctl.get(name)
```
Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

```
salt.modules.openbsd_sysctl.persist(name, value, config='/etc/sysctl.conf')
```
Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.ip.forwarding 1
```

```
salt.modules.openbsd_sysctl.show(config_file=False)
```
Return a list of sysctl parameters for this minion

```
config: Pull the data from the system configuration file instead of the live data.
```

CLI Example:

```
salt '*' sysctl.show
```

---

Chapter 26. Salt Module Reference
26.6.314  salt.modules.openbsdpkg

Package support for OpenBSD

Note: The package repository is configured on each host using /etc/installurl from OpenBSD 6.1 onwards. Earlier releases relied on /etc/pkg.conf.

Changed in version 2016.3.5: Package versions on OpenBSD are not normally specified explicitly; instead packages may be available in multiple flavors, and branches which are specified by the format of the package name. This module allows you to use the same formatting as pkg_add(1), and will select the empty flavor and default branch by default. Examples:

- rsync
- vim--no_x11
- ruby%2.3

salt.modules.openbsdpkg.install(name=None, pkgs=None, sources=None, **kwargs)
Install the passed package

Return a dict containing the new package names and versions:

```python
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example, Install one package:

```
salt '*' pkg.install <package name>
```

CLI Example, Install more than one package:

```
salt '*' pkg.install pkgs='["<package name>", "<package name>"]'
```

CLI Example, Install more than one package from an alternate source (e.g. salt file-server, HTTP, FTP, local filesystem):

```
salt '*' pkg.install sources='["<pkg name>": "salt://pkgs/<pkg filename>←"]'
```

salt.modules.openbsdpkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
```

salt.modules.openbsdpkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed as a dict:

```python
{'<package_name>': '<version>'}
```

CLI Example:
salt '*' pkg.list_pkgs

salt.modules.openbsdpkg.purge(name=None, pkgs=None, **kwargs)
Remove a package and extra configuration files.

name
The name of the package to be deleted.

Multiple Package Options:
pkgs
A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'

salt.modules.openbsdpkg.remove(name=None, pkgs=None, purge=False, **kwargs)
Remove a single package with pkg_delete

Multiple Package Options:
pkgs
A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'

salt.modules.openbsdpkg.upgrade(name=None, pkgs=None, **kwargs)
Run a full package upgrade (pkg_add -u), or upgrade a specific package if name or pkgs is provided. name is ignored when pkgs is specified.

Returns a dictionary containing the changes:

New in version 2019.2.0.

```
{"<package>": {"old": '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:
salt '*' pkg.upgrade
salt '*' pkg.upgrade python%2.7

salt.modules.openbsdpkg.upgrade_available(name, **kwargs)
Check whether or not an upgrade is available for a given package

New in version 2019.2.0.
CLI Example:

```bash
salt '*' pkg.upgrade_available <package name>
```

```python
salt.modules.openbsdpkg.version(*names, **kwargs)
```

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```bash
salt '*' pkg.version <package name>
```

```bash
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 26.6.315 `salt.modules.openbsdrcctl_service.py`

The rcctl service module for OpenBSD

```python
salt.modules.openbsdrcctl_service.available(name)
```

Return True if the named service is available.

CLI Example:

```bash
salt '*' service.available sshd
```

```python
salt.modules.openbsdrcctl_service.disable(name, **kwargs)
```

Disable the named service to not start at boot.

CLI Example:

```bash
salt '*' service.disable <service name>
```

```python
salt.modules.openbsdrcctl_service.disabled(name)
```

Return True if the named service is disabled at boot, False otherwise.

CLI Example:

```bash
salt '*' service.disabled <service name>
```

```python
salt.modules.openbsdrcctl_service.enable(name, **kwargs)
```

Enable the named service to start at boot.

```python
flags
```

[None] Set optional flags to run the service with.

service.flags can be used to change the default flags.

CLI Example:

```bash
salt '*' service.enable <service name>
```

```bash
salt '*' service.enable <service name> flags=<flags>
```

```python
salt.modules.openbsdrcctl_service.enabled(name, **kwargs)
```

Return True if the named service is enabled at boot and the provided flags match the configured ones (if any). Return False otherwise.

```python
name
```

Service name

CLI Example:
salt 'service.enabled <service name>
salt 'service.enabled <service name> flags=<flags>

salt.modules.openbsdrcctl_service.get_all()
Return all installed services.
CLI Example:
salt 'service.get_all

salt.modules.openbsdrcctl_service.get_disabled()
Return what services are available but not enabled to start at boot.
CLI Example:
salt 'service.get_disabled

salt.modules.openbsdrcctl_service.get_enabled()
Return what services are set to run on boot.
CLI Example:
salt 'service.get_enabled

salt.modules.openbsdrcctl_service.missing(name)
The inverse of service.available. Return True if the named service is not available.
CLI Example:
salt 'service.missing sshd

salt.modules.openbsdrcctl_service.reload_(name)
Reload the named service.
CLI Example:
salt 'service.reload <service name>

salt.modules.openbsdrcctl_service.restart(name)
Restart the named service.
CLI Example:
salt 'service.restart <service name>

salt.modules.openbsdrcctl_service.start(name)
Start the named service.
CLI Example:
salt 'service.start <service name>

salt.modules.openbsdrcctl_service.status(name, sig=None)
Return the status for a service, returns a bool whether the service is running.
CLI Example:
salt '*' service.status <service name>

```python
salt.modules.openbsdrcctl_service.stop(name)
Stop the named service.
CLI Example:
salt '*' service.stop <service name>
```

26.6.316 salt.modules.openbsdservice

The service module for OpenBSD

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start is not available'), see [here](#).

```python
salt.modules.openbsdservice.available(name)
New in version 2014.7.0.
Returns True if the specified service is available, otherwise returns False.
CLI Example:
salt '*' service.available sshd
```

```python
salt.modules.openbsdservice.disabled(name)
New in version 2014.7.0.
Return True if the named service is disabled, false otherwise
CLI Example:
salt '*' service.disabled <service name>
```

```python
salt.modules.openbsdservice.enabled(name, **kwargs)
New in version 2014.7.0.
Return True if the named service is enabled, false otherwise
CLI Example:
salt '*' service.enabled <service name>
```

```python
salt.modules.openbsdservice.get_all()
New in version 2014.7.0.
Return all available boot services
CLI Example:
salt '*' service.get_all
```
salt.modules.openbsdservice.get_disabled()
    New in version 2014.7.0.
    Return a set of services that are installed but disabled
    CLI Example:
    ```
    salt '*' service.get_disabled
    ```

salt.modules.openbsdservice.get_enabled()
    New in version 2014.7.0.
    Return a list of service that are enabled on boot
    CLI Example:
    ```
    salt '*' service.get_enabled
    ```

salt.modules.openbsdservice.missing(name)
    New in version 2014.7.0.
    The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
    CLI Example:
    ```
    salt '*' service.missing sshd
    ```

salt.modules.openbsdservice.reload_(name)
    New in version 2014.7.0.
    Reload the named service
    CLI Example:
    ```
    salt '*' service.reload <service name>
    ```

salt.modules.openbsdservice.restart(name)
    Restart the named service
    CLI Example:
    ```
    salt '*' service.restart <service name>
    ```

salt.modules.openbsdservice.start(name)
    Start the specified service
    CLI Example:
    ```
    salt '*' service.start <service name>
    ```

salt.modules.openbsdservice.status(name, sig=None)
    Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.
    Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
    Parameters
    - **name** *(str)* -- The name of the service to check
    - **sig** *(str)* -- Signature to use to find the service via ps
Returns
True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type
bool

CLI Example:
salt '*' service.status <service name> [service signature]

salt.modules.openbsdservice.stop(name)
Stop the specified service

CLI Example:
salt '*' service.stop <service name>

26.6.317 salt.modules.openscap

Module for OpenSCAP Management

salt.modules.openscap.xccdf(params)
Run oscap xccdf commands on minions. It uses cp.push_dir to upload the generated files to the salt master in the master's minion files cachedir (defaults to /var/cache/salt/master/minions/minion-id/files)

It needs file_recv set to True in the master configuration file.

CLI Example:
salt '*' openscap.xccdf "eval --profile Default /usr/share/openscap/scap-→yast2sec-xccdf.xml"

salt.modules.openscap.xccdf_eval(xccdf_file, ovalfiles=None, profile=None, rule=None, oval_results=None, results=None, report=None, fetch_remote_resources=None, tailoring_file=None, tailoring_id=None, remediate=None)

Run oscap xccdf eval commands on minions.

New in version 3007.0.

It uses cp.push_dir to upload the generated files to the salt master in the master's minion files cachedir (defaults to /var/cache/salt/master/minions/minion-id/files)

It needs file_recv set to True in the master configuration file.

xccdf_file
the path to the xccdf file to evaluate

ovalfiles
additional oval definition files

profile
the name of Profile to be evaluated

rule
the name of a single rule to be evaluated

oval_results
save OVAL results as well (True or False)

results
write XCCDF Results into given file

26.6. execution modules
report
  write HTML report into given file
fetch_remote_resources
  download remote content referenced by XCCDF (True or False)
tailoring_file
  use given XCCDF Tailoring file
tailoring_id
  use given DS component as XCCDF Tailoring file
remediate
  automatically execute XCCDF fix elements for failed rules. Use of this option is always at your own risk. (True or False)

CLI Example:

```bash
salt '*' openscap.xccdf_eval /usr/share/openscap/scap-yast2sec-xccdf.xml
  → profile=Default
```

### 26.6.318 salt.modules.openstack_config

Modify, retrieve, or delete values from OpenStack configuration files.

**maintainer**

Jeffrey C. Ollie <jeff@ocjtech.us>

**maturity**

new

**depends**

platform:
linux

**salt.module**: openstack_config

#### salt.modules.openstack_config.delete(filename, section, parameter)

Delete a value from an OpenStack configuration file.

**filename**

The full path to the configuration file

**section**

The section from which to delete the parameter

**parameter**

The parameter to delete

CLI Example:

```bash
salt-call openstack_config.delete /etc/keystone/keystone.conf sql
  → connection
```

#### salt.modules.openstack_config.get(filename, section, parameter)

Get a value from an OpenStack configuration file.

**filename**

The full path to the configuration file

**section**

The section from which to search for the parameter

**parameter**

The parameter to return

CLI Example:

```bash
salt-call openstack_config.get /etc/keystone/keystone.conf sql connection
```
salt.modules.openstack_config.set_(filename, section, parameter, value)

Set a value in an OpenStack configuration file.

filename
The full path to the configuration file

section
The section in which the parameter will be set

parameter
The parameter to change

value
The value to set

CLI Example:

```
salt-call openstack_config.set /etc/keystone/keystone.conf sql connectionfoo
```

26.6.319 salt.modules.openstack_mng

Module for OpenStack Management

codeauthor
Konrad Mosoń <mosonkonrad@gmail.com>

maturity
new

depends
openstack-utils

platform
linux

salt.modules.openstack_mng.restart_service(service_name, minimum_running_time=None)

Restart OpenStack service immediately, or only if it’s running longer than specified value

CLI Example:

```
salt '*' openstack_mng.restart_service neutron
salt '*' openstack_mng.restart_service neutron minimum_running_time=600
```

salt.modules.openstack_mng.start_service(service_name)

Start OpenStack service immediately

CLI Example:

```
salt '*' openstack_mng.start_service neutron
```

salt.modules.openstack_mng.stop_service(service_name)

Stop OpenStack service immediately

CLI Example:

```
salt '*' openstack_mng.stop_service neutron
```
26.6.320 salt.modules.openvswitch

Support for Open vSwitch - module with basic Open vSwitch commands.
Suitable for setting up Openstack Neutron.

codeauthor
Jiri Kotlin <jiri.kotlin@ultimum.io>
salt.modules.openvswitch.

bridge_create(br, may_exist=True, parent=None, vlan=None)

Creates a new bridge.

Parameters
• br -- string bridge name
• may_exist -- bool if False - attempting to create a bridge that exists returns False.
• parent -- string name of the parent bridge (if the bridge shall be created as a fake bridge). If specified, vlan must also be specified.
• versionadded: (..) -- 3006.0:
• vlan -- int VLAN ID of the bridge (if the bridge shall be created as a fake bridge). If specified, parent must also be specified.
• versionadded: -- 3006.0:

Returns
True on success, else False.

New in version 2016.3.0.

CLI Example:
salt '*' openvswitch.bridge_create br0

bridge_delete(br, if_exists=True)

Deletes bridge and all of its ports.

Parameters
• br -- A string - bridge name
• if_exists -- Bool, if False - attempting to delete a bridge that does not exist returns False.

Returns
True on success, else False.

New in version 2016.3.0.

CLI Example:
salt '*' openvswitch.bridge_delete br0

bridge_exists(br)

Tests whether bridge exists as a real or fake bridge.

Returns
True if Bridge exists, else False.

New in version 2016.3.0.

CLI Example:
salt '*' openvswitch.bridge_exists br0

bridge_list()

Lists all existing real and fake bridges.

Returns
List of bridges (or empty list), False on failure.
New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.bridge_list
```

salt.modules.openvswitch.bridge_to_parent(br)

New in version 3006.0.

Returns the parent bridge of a bridge.

Parameters

- `br` -- string bridge name

Returns

Name of the parent bridge. This is the same as the bridge name if the bridge is not a fake bridge. If the bridge does not exist, False is returned.

CLI Example:

```
salt '*' openvswitch.bridge_to_parent br0
```

salt.modules.openvswitch.bridge_to_vlan(br)

New in version 3006.0.

Returns the VLAN ID of a bridge.

Parameters

- `br` -- string bridge name

Returns

VLAN ID of the bridge. The VLAN ID is 0 if the bridge is not a fake bridge. If the bridge does not exist, False is returned.

CLI Example:

```
salt '*' openvswitch.bridge_to_parent br0
```

salt.modules.openvswitch.db_get(table, record, column, if_exists=False)

New in version 3006.0.

Gets a column's value for a specific record.

Parameters

- `table` -- string name of the database table
- `record` -- string identifier of the record
- `column` -- string name of the column
- `if_exists` -- boolean if True, it is not an error if the record does not exist.

Returns

The column's value.

CLI Example:

```
salt '*' openvswitch.db_get Port br0 vlan_mode
```

salt.modules.openvswitch.db_set(table, record, column, value, if_exists=False)

New in version 3006.0.

Sets a column's value for a specific record.

Parameters

- `table` -- string name of the database table
- `record` -- string identifier of the record
- `column` -- string name of the column
- `value` -- string the value to be set
Salt Documentation, Release 3007.1

- **if_exists** -- boolean if True, it is not an error if the record does not exist.

  Returns
  None on success and an error message on failure.

  CLI Example:
  ```
  salt '*' openvswitch.db_set Interface br0 mac 02:03:04:05:06:07
  ```

salt.modules.openvswitch.**interface_get_options**(port)
Port's interface's optional parameters.

  Parameters
  **port** -- A string - port name.

  Returns
  String containing optional parameters of port's interface, False on failure.

  New in version 2016.3.0.

  CLI Example:
  ```
  salt '*' openvswitch.interface_get_options tap0
  ```

salt.modules.openvswitch.**interface_get_type**(port)
Type of port's interface.

  Parameters
  **port** -- A string - port name.

  Returns
  String - type of interface or empty string, False on failure.

  New in version 2016.3.0.

  CLI Example:
  ```
  salt '*' openvswitch.interface_get_type tap0
  ```

salt.modules.openvswitch.**port_add**(br, port, may_exist=False, internal=False)
Creates on bridge a new port named port.

  Returns
  True on success, else False.

  Parameters
  • **br** -- A string - bridge name
  • **port** -- A string - port name
  • **may_exist** -- Bool, if False - attempting to create a port that exists returns False.
  • **internal** -- A boolean to create an internal interface if one does not exist.

  New in version 2016.3.0.

  CLI Example:
  ```
  salt '*' openvswitch.port_add br0 8080
  ```

salt.modules.openvswitch.**port_create_gre**(br, port, id, remote)
Generic Routing Encapsulation - creates GRE tunnel between endpoints.

  Parameters
  • **br** -- A string - bridge name.
  • **port** -- A string - port name.
  • **id** -- An integer - unsigned 32-bit number, tunnel's key.
  • **remote** -- A string - remote endpoint's IP address.

  Returns
  True on success, else False.
New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_create_gre br0 grel 5001 192.168.1.10
```

```
salt.modules.openvswitch.port_create_vlan(br, port, id, internal=False)
```

Isolate VM traffic using VLANs.

**Parameters**
- `br` -- A string - bridge name.
- `port` -- A string - port name.
- `id` -- An integer in the valid range 0 to 4095 (inclusive), name of VLAN.
- `internal` -- A boolean to create an internal interface if one does not exist.

**Returns**
True on success, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_create_vlan br0 tap0 100
```

```
salt.modules.openvswitch.port_create_vxlan(br, port, id, remote, dst_port=None)
```

Virtual eXtensible Local Area Network - creates VXLAN tunnel between endpoints.

**Parameters**
- `br` -- A string - bridge name.
- `port` -- A string - port name.
- `id` -- An integer - unsigned 64-bit number, tunnel's key.
- `remote` -- A string - remote endpoint's IP address.
- `dst_port` -- An integer - port to use when creating tunnelport in the switch.

**Returns**
True on success, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_create_vxlan br0 vx1 5001 192.168.1.10 8472
```

```
salt.modules.openvswitch.port_get_tag(port)
```

Lists tags of the port.

**Parameters**
- `port` -- A string - port name.

**Returns**
List of tags (or empty list), False on failure.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_get_tag tap0
```

```
salt.modules.openvswitch.port_list(br)
```

Lists all of the ports within bridge.

**Parameters**
- `br` -- A string - bridge name.

**Returns**
List of bridges (or empty list), False on failure.
New in version 2016.3.0.

CLI Example:

```
salt '!' openvswitch.port_list br0
```

```
salt.modules.openvswitch.port_remove (br, port, if_exists=True)
```

Deletes port.

**Parameters**

- **br** -- A string - bridge name (If bridge is None, port is removed from whatever bridge contains it)
- **port** -- A string - port name.
- **if_exists** -- Bool, if False - attempting to delete a por that does not exist returns False. (Default True)

**Returns**

True on success, else False.

New in version 2016.3.0.

CLI Example:

```
salt '!' openvswitch.port_remove br0 8080
```

---

### 26.6.321 salt.modules.opkg

Support for Opkg

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

New in version 2016.3.0.

**Note:** For version comparison support on opkg < 0.3.4, the opkg-utils package must be installed.

```
salt.modules.opkg.available_version(*names, **kwargs)
```

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

**CLI Example:**

```
salt '!' pkg.latest_version <package name>
salt '!' pkg.latest_version <package name>
salt '!' pkg.latest_version <package1> <package2> <package3> ...
```

```
salt.modules.opkg.check_extra_requirements(pkgname, pkgver)
```

Check if the installed package already has the given requirements. There's nothing do to here for nipkg.py, therefore it will always return True.
salt.modules.opkg.del_repo(repo, **kwargs)
Delete a repo from /etc/opkg/*/conf
If the file does not contain any other repo configuration, the file itself will be deleted.
CLI Examples:
```
salt '*' pkg.del_repo repo
```

salt.modules.opkg.file_dict(*packages, **kwargs)
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).
CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.opkg.file_list(*packages, **kwargs)
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).
CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.opkg.get_repo(repo, **kwargs)
Display a repo from the /etc/opkg/*/conf
CLI Examples:
```
salt '*' pkg.get_repo repo
```

salt.modules.opkg.hold(name=None, pkgs=None, sources=None, **kwargs)
Set package in 'hold' state, meaning it will not be upgraded.
name
The name of the package, e.g., 'tmux'
CLI Example:
```
salt '*' pkg.hold <package name>
```
pkgs
A list of packages to hold. Must be passed as a python list.
CLI Example:
```
salt '*' pkg.hold pkgs=["foo", "bar"]
```

salt.modules.opkg.info_installed(*names, **kwargs)
Return the information of the named package(s), installed on the system.
New in version 2017.7.0.
Parameters
- **names** -- Names of the packages to get information about. If none are specified, will return information for all installed packages.
- **attr** -- Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.

Valid attributes are:
- arch
- conffiles
- conflicts
- depends
- description
- filename
- group
- install_date_time_t
- md5sum
- packager
- provides
- recommends
- replaces
- size
- source
- suggests
- url
- version

CLI Example:
```
salt '*' pkg.info_installed
salt '*' pkg.info_installed attr=version,packager
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> attr=version,packager
```

salt.modules.opkg.install(name=None, refresh=False, pkgs=None, sources=None, reinstall=False, **kwargs)

Install the passed package, add refresh=True to update the opkg database.

**name**
The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

CLI Example:
```
salt '*' pkg.install <package name>
```

**refresh**
Whether or not to refresh the package database before installing.

**version**
Install a specific version of the package, e.g. 1.2.3-0ubuntu0. Ignored if "pkgs" or "sources" is passed.

New in version 2017.7.0.

**reinstall**
[False] Specifying reinstall=True will use opkg install --force-reinstall rather than simply opkg install for requested packages that are already installed.

If a version is specified with the requested package, then opkg install --force-reinstall will only be used if the installed version matches the requested version.

New in version 2017.7.0.

Multiple Package Installation Options:

**pkgs**
A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:
```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-0ubuntu0"}]'
```

**sources**
A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.
CLI Example:

```
salt '* pkg.install sources='["foo": "salt://foo.deb"],"bar": "salt://bar.deb"]'
```

**install_recommends**

Whether to install the packages marked as recommended. Default is True.

**only_upgrade**

Only upgrade the packages (disallow downgrades), if they are already installed. Default is False.

New in version 2017.7.0.

Returns a dict containing the new package names and versions:

```json
{
'<package>': {
'old': '<old-version>',
'new': '<new-version>'
}
}
```

salt.modules.opkg.latest_version(names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.opkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed in a dict:

```json
{
'<package_name>': '<version>'
}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.opkg.list_repos(**kwargs)

Lists all repos on /etc/opkg/*.conf

CLI Example:

```
salt '*' pkg.list_repos
```

salt.modules.opkg.list_upgrades(refresh=True, **kwargs)

List all available package upgrades.

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.opkg.mod_repo(repo, **kwargs)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as uri is defined.

The following options are available to modify a repo definition:

**repo**

alias by which opkg refers to the repo.
uri
    the URI to the repo.
compressed
    defines (True or False) if the index file is compressed
enabled
    enable or disable (True or False) repository but do not remove if disabled.
refresh
    enable or disable (True or False) auto-refresh of the repositories

CLI Examples:
salt '*' pkg.mod_repo repo uri=http://new/uri
salt '*' pkg.mod_repo repo enabled=False

salt.modules.opkg.owner("paths", **kwargs)
    Return the name of the package that owns the file. Multiple file paths can be passed. Like pkg.version
    <salt.modules.opkg.version>, if a single path is passed, a string will be returned, and if multiple paths
    are passed, a dictionary of file/package name pairs will be returned.

    If the file is not owned by a package, or is not present on the minion, then an empty string will be returned
    for that path.

    CLI Example:
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename

salt.modules.opkg.purge(name=None, pkgs=None, **kwargs)
    Package purges are not supported by opkg, this function is identical to pkg.remove.

    name
        The name of the package to be deleted.

    Multiple Package Options:
    pkgs
        A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this
        option is passed.

    Returns a dict containing the changes.

    CLI Example:
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'

salt.modules.opkg.refresh_db(failhard=False, **kwargs)
    Updates the opkg database to latest packages based upon repositories

    Returns a dict, with the keys being package databases and the values being the result of the update attempt.
    Values can be one of the following:
    • True: Database updated successfully
    • False: Problem updating database

    failhard
        If False, return results of failed lines as False for the package database that encountered the error. If
        True, raise an error with a list of the package databases that encountered errors.

        New in version 2018.3.0.

    CLI Example:
salt '* pkg.refresh_db

salt.modules.opkg.remove(name=None, pkgs=None, **kwargs)

Remove packages using opkg remove.

name
The name of the package to be deleted.

Multiple Package Options:
pkgs
A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

remove_dependencies
Remove package and all dependencies

New in version 2019.2.0.

auto_remove_deps
Remove packages that were installed automatically to satisfy dependencies

New in version 2019.2.0.

Returns a dict containing the changes.

CLI Example:

salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['"foo", "bar"]!
salt '*' pkg.remove pkgs=['"foo", "bar"] remove_dependencies=True auto_remove_deps=True

salt.modules.opkg.unhold(name=None, pkgs=None, sources=None, **kwargs)

Set package current in 'hold' state to install state, meaning it will be upgraded.

name
The name of the package, e.g., 'tmux'

CLI Example:

salt '*' pkg.unhold <package name>

pkgs
A list of packages to hold. Must be passed as a python list.

CLI Example:

salt '*' pkg.unhold pkgs=['"foo", "bar"]'

salt.modules.opkg.upgrade(refresh=True, **kwargs)

Upgrades all packages via opkg upgrade

Returns a dictionary containing the changes:

{"<package>": {"old": '<old-version>', 'new': '<new-version>'}}

CLI Example:

salt '*' pkg.upgrade
salt.modules.opkg.**upgrade_available**(name, **kwargs)

Check whether or not an upgrade is available for a given package

CLI Example:

```bash
salt '*' pkg.upgrade_available <package name>
```

salt.modules.opkg.**version**(names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```bash
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

salt.modules.opkg.**version_clean**(version)

Clean the version string removing extra data. There's nothing do to here for nipkg.py, therefore it will always return the given version.

salt.modules.opkg.**version_cmp**(pkg1, pkg2, ignore_epoch=False, **kwargs)

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

**ignore_epoch**

[False] Set to True to ignore the epoch when comparing versions

New in version 2016.3.4.

CLI Example:

```bash
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```

26.6.322 salt.modules.opsgenie

Module for sending data to OpsGenie

New in version 2018.3.0.

**configuration**

This module can be used in Reactor System for posting data to OpsGenie as a remote-execution function.

For example:

```json
opsgenie_event_poster:
  local.opsgenie.post_data:
    - tgt: 'salt-minion'
    - kwarg:
      name: event.reactor
      api_key: XXXXXXXXX-XXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
      reason: {{ data['data'][['reason'] ]
    action_type: Create
```

salt.modules.opsgenie.**post_data**(api_key=None, name='OpsGenie Execution Module', reason=None, action_type=None)

Post data to OpsGenie. It’s designed for Salt’s Event Reactor.
After configuring the sls reaction file as shown above, you can trigger the module with your designated tag (og-tag in this case).

CLI Example:

```
salt-call event.send 'og-tag' '{"reason" : "Overheating CPU!"}"
```

Required parameters:
- **api_key**
  It's the API Key you've copied while adding integration in OpsGenie.
- **reason**
  It will be used as alert's default message in OpsGenie.
- **action_type**
  OpsGenie supports the default values Create/Close for action_type. You can customize this field with OpsGenie's custom actions for other purposes like adding notes or acknowledging alerts.

Optional parameters:
- **name**
  It will be used as alert's alias. If you want to use the close functionality you must provide name field for both states like in this case.

### 26.6.323 salt.modules.oracle

Oracle DataBase connection module

- **maintainer**
  Vladimir Bormotov <bormotov@gmail.com>

- **maturity**
  new

- **depends**
  cx_Oracle

- **platform**
  all

- **configuration**
  module provide connections for multiple Oracle DB instances.

**OS Environment**

- **ORACLE_HOME**: path to oracle product
- **PATH**: path to Oracle Client libs need to be in PATH

**pillar**

```yaml
oracle:
  dbs:
    <db>:
      uri: connection credentials in format:
      user/password@host[:port]/sid[ service_name as
      →{sysdba|sysoper}]
      optional keyword service_name will determine whether it is
      →a sid or service_name
    <db>:
      uri: ........
```

### 26.6. execution modules
salt.modules.oracle.client_version()
Oracle Client Version
CLI Example:
```
salt '*' oracle.client_version
```

salt.modules.oracle.run_query(db, query)
Run SQL query and return result
CLI Example:
```
salt '*' oracle.run_query my_db "select * from my_table"
```

salt.modules.oracle.show_dbs(*dbs)
Show databases configuration from pillar. Filter by "args"
CLI Example:
```
salt '*' oracle.show_dbs
salt '*' oracle.show_dbs my_db
```

salt.modules.oracle.show_env()
Show Environment used by Oracle Client
CLI Example:
```
salt '*' oracle.show_env
```

Note: at first _connect() NLS_LANG will forced to '.AL32UTF8'

salt.modules.oracle.show_pillar(item=None)
Show Pillar segment oracle.* and subitem with notation "item:subitem"
CLI Example:
```
salt '*' oracle.show_pillar
salt '*' oracle.show_pillar dbs:my_db
```

salt.modules.oracle.version(*dbs)
Server Version (select banner from v$version)
CLI Example:
```
salt '*' oracle.version
salt '*' oracle.version my_db
```
26.6.324 salt.modules.osquery

New in version 2015.8.0.

salt.modules.osquery.acpi_tables(attrs=None, where=None)
   Return acpi_tables information from osquery
   CLI Example:
   ```
salt '*' osquery.acpi_tables
   ```

salt.modules.osquery.alf(attrs=None, where=None)
   Return alf information from osquery
   CLI Example:
   ```
salt '*' osquery.alf
   ```

salt.modules.osquery.alf_exceptions(attrs=None, where=None)
   Return alf_exceptions information from osquery
   CLI Example:
   ```
salt '*' osquery.alf_exceptions
   ```

salt.modules.osquery.alf_explicit_auths(attrs=None, where=None)
   Return alf_explicit_auths information from osquery
   CLI Example:
   ```
salt '*' osquery.alf_explicit_auths
   ```

salt.modules.osquery.alf_services(attrs=None, where=None)
   Return alf_services information from osquery
   CLI Example:
   ```
salt '*' osquery.alf_services
   ```

salt.modules.osquery.apps(attrs=None, where=None)
   Return apps information from osquery
   CLI Example:
   ```
salt '*' osquery.apps
   ```

salt.modules.osquery.apt_sources(attrs=None, where=None)
   Return apt_sources information from osquery
   CLI Example:
   ```
salt '*' osquery.apt_sources
   ```

salt.modules.osquery.arp_cache(attrs=None, where=None)
   Return arp_cache information from osquery
   CLI Example:
salt '*' osquery.arp_cache

certificates

salt.modules.osquery.block_devices(attrs=None, where=None)

Return block_devices information from osquery

CLI Example:
salt '*' osquery.block_devices

certificates

salt.modules.osquery.certificates(attrs=None, where=None)

Return certificates information from osquery

CLI Example:
salt '*' osquery.certificates

certificates

salt.modules.osquery.chrome_extensions(attrs=None, where=None)

Return chrome_extensions information from osquery

CLI Example:
salt '*' osquery.chrome_extensions

certificates

salt.modules.osquery.cpuid(attrs=None, where=None)

Return cpuid information from osquery

CLI Example:
salt '*' osquery.cpuid

certificates

salt.modules.osquery.crontab(attrs=None, where=None)

Return crontab information from osquery

CLI Example:
salt '*' osquery.crontab

certificates

salt.modules.osquery.deb_packages(attrs=None, where=None)

Return deb_packages information from osquery

CLI Example:
salt '*' osquery.deb_packages

certificates

salt.modules.osquery.etc_hosts(attrs=None, where=None)

Return etc_hosts information from osquery

CLI Example:
salt '*' osquery.etc_hosts

certificates

salt.modules.osquery.etc_services(attrs=None, where=None)

Return etc_services information from osquery

CLI Example:
salt '*' osquery.etc_services

salt.modules.osquery.file_(attrs=None, where=None)
Return file information from osquery
CLI Example:
salt '*' osquery.file

salt.modules.osquery.file_changes(attrs=None, where=None)
Return file_changes information from osquery
CLI Example:
salt '*' osquery.file_changes

salt.modules.osquery.firefox_addons(attrs=None, where=None)
Return firefox_addons information from osquery
CLI Example:
salt '*' osquery.firefox_addons

salt.modules.osquery.groups(attrs=None, where=None)
Return groups information from osquery
CLI Example:
salt '*' osquery.groups

salt.modules.osquery.hardware_events(attrs=None, where=None)
Return hardware_events information from osquery
CLI Example:
salt '*' osquery.hardware_events

salt.modules.osquery.hash_(attrs=None, where=None)
Return hash information from osquery
CLI Example:
salt '*' osquery.hash

salt.modules.osquery.homebrew_packages(attrs=None, where=None)
Return homebrew_packages information from osquery
CLI Example:
salt '*' osquery.homebrew_packages

salt.modules.osquery.interface_addresses(attrs=None, where=None)
Return interface_addresses information from osquery
CLI Example:
salt '*' osquery.interface_addresses

salt.modules.osquery.\texttt{interface_details}(\texttt{attrs=None, where=None})

Return interface_details information from osquery

CLI Example:

\begin{verbatim}
salt '*' osquery.interface_details
\end{verbatim}

salt.modules.osquery.\texttt{iokit_devicetree}(\texttt{attrs=None, where=None})

Return iokit_devicetree information from osquery

CLI Example:

\begin{verbatim}
salt '*' osquery.iokit_devicetree
\end{verbatim}

salt.modules.osquery.\texttt{iokit_registry}(\texttt{attrs=None, where=None})

Return iokit_registry information from osquery

CLI Example:

\begin{verbatim}
salt '*' osquery.iokit_registry
\end{verbatim}

salt.modules.osquery.\texttt{kernel_extensions}(\texttt{attrs=None, where=None})

Return kernel_extensions information from osquery

CLI Example:

\begin{verbatim}
salt '*' osquery.kernel_extensions
\end{verbatim}

salt.modules.osquery.\texttt{kernel_info}(\texttt{attrs=None, where=None})

Return kernel_info information from osquery

CLI Example:

\begin{verbatim}
salt '*' osquery.kernel_info
\end{verbatim}

salt.modules.osquery.\texttt{kernel_integrity}(\texttt{attrs=None, where=None})

Return kernel_integrity information from osquery

CLI Example:

\begin{verbatim}
salt '*' osquery.kernel_integrity
\end{verbatim}

salt.modules.osquery.\texttt{kernel_modules}(\texttt{attrs=None, where=None})

Return kernel_modules information from osquery

CLI Example:

\begin{verbatim}
salt '*' osquery.kernel_modules
\end{verbatim}

salt.modules.osquery.\texttt{keychain_items}(\texttt{attrs=None, where=None})

Return keychain_items information from osquery

CLI Example:
salt '*' osquery.keychain_items

salt.modules.osquery.last\(attrs=None, \text{where}=None\)
Return last information from osquery

CLI Example:
salt '*' osquery.last

salt.modules.osquery.launchd\(attrs=None, \text{where}=None\)
Return launchd information from osquery

CLI Example:
salt '*' osquery.launchd

salt.modules.osquery.listening_ports\(attrs=None, \text{where}=None\)
Return listening_ports information from osquery

CLI Example:
salt '*' osquery.listening_ports

salt.modules.osquery.logged_in_users\(attrs=None, \text{where}=None\)
Return logged_in_users information from osquery

CLI Example:
salt '*' osquery.logged_in_users

salt.modules.osquery.memory_map\(attrs=None, \text{where}=None\)
Return memory_map information from osquery

CLI Example:
salt '*' osquery.memory_map

salt.modules.osquery.mounts\(attrs=None, \text{where}=None\)
Return mounts information from osquery

CLI Example:
salt '*' osquery.mounts

salt.modules.osquery.nfs_shares\(attrs=None, \text{where}=None\)
Return nfs_shares information from osquery

CLI Example:
salt '*' osquery.nfs_shares

salt.modules.osquery.nvram\(attrs=None, \text{where}=None\)
Return nvram information from osquery

CLI Example:
salt '*' osquery.nvram

salt.modules.osquery.os_version(attrs=None, where=None)
    Return os_version information from osquery
    CLI Example:
    salt '*' osquery.os_version

salt.modules.osquery.osquery_extensions(attrs=None, where=None)
    Return osquery_extensions information from osquery
    CLI Example:
    salt '*' osquery.osquery_extensions

salt.modules.osquery.osquery_flags(attrs=None, where=None)
    Return osquery_flags information from osquery
    CLI Example:
    salt '*' osquery.osquery_flags

salt.modules.osquery.osquery_info(attrs=None, where=None)
    Return osquery_info information from osquery
    CLI Example:
    salt '*' osquery.osquery_info

salt.modules.osquery.osquery_registry(attrs=None, where=None)
    Return osquery_registry information from osquery
    CLI Example:
    salt '*' osquery.osquery_registry

salt.modules.osquery.passwd_changes(attrs=None, where=None)
    Return passwd_changes information from osquery
    CLI Example:
    salt '*' osquery.passwd_changes

salt.modules.osquery.pci_devices(attrs=None, where=None)
    Return pci_devices information from osquery
    CLI Example:
    salt '*' osquery.pci_devices

salt.modules.osquery.preferences(attrs=None, where=None)
    Return preferences information from osquery
    CLI Example:
salt '*' osquery.preferences

salt.modules.osquery.process_envs(attrs=None, where=None)
  Return process_envs information from osquery
  CLI Example:
salt '*' osquery.process_envs

salt.modules.osquery.process_memory_map(attrs=None, where=None)
  Return process_memory_map information from osquery
  CLI Example:
salt '*' osquery.process_memory_map

salt.modules.osquery.process_open_files(attrs=None, where=None)
  Return process_open_files information from osquery
  CLI Example:
salt '*' osquery.process_open_files

salt.modules.osquery.process_open_sockets(attrs=None, where=None)
  Return process_open_sockets information from osquery
  CLI Example:
salt '*' osquery.process_open_sockets

salt.modules.osquery.processes(attrs=None, where=None)
  Return processes information from osquery
  CLI Example:
salt '*' osquery.processes

salt.modules.osquery.quarantine(attrs=None, where=None)
  Return quarantine information from osquery
  CLI Example:
salt '*' osquery.quarantine

salt.modules.osquery.query(sql=None)
  Return time information from osquery
  CLI Example:
salt '*' osquery.query "select * from users;"

salt.modules.osquery.routes(attrs=None, where=None)
  Return routes information from osquery
  CLI Example:
salt '*' osquery.routes

salt.modules.osquery.rpm_packages(attrs=None, where=None)
Return cpuid information from osquery
CLI Example:
salt '*' osquery.rpm_packages

salt.modules.osquery.safari_extensions(attrs=None, where=None)
Return safari_extensions information from osquery
CLI Example:
salt '*' osquery.safari_extensions

salt.modules.osquery.shared_memory(attrs=None, where=None)
Return shared_memory information from osquery
CLI Example:
salt '*' osquery.shared_memory

salt.modules.osquery.shell_history(attrs=None, where=None)
Return shell_history information from osquery
CLI Example:
salt '*' osquery.shell_history

salt.modules.osquery.smbios_tables(attrs=None, where=None)
Return smbios_tables information from osquery
CLI Example:
salt '*' osquery.smbios_tables

salt.modules.osquery.startup_items(attrs=None, where=None)
Return startup_items information from osquery
CLI Example:
salt '*' osquery.startup_items

salt.modules.osquery.suid_bin(attrs=None, where=None)
Return suid_bin information from osquery
CLI Example:
salt '*' osquery.suid_bin

salt.modules.osquery.system_controls(attrs=None, where=None)
Return system_controls information from osquery
CLI Example:
## 26.6. execution modules

- `salt '*' osquery.system_controls`

  **salt.modules.osquery.time_(attrs=None)**
  
  Return time information from osquery
  
  CLI Example:
  ```
salt '*' osquery.time
  ```

- `salt '*' osquery.usb_devices(attrs=None, where=None)`

  Return usb_devices information from osquery
  
  CLI Example:
  ```
salt '*' osquery.usb_devices
  ```

- `salt '*' osquery.users(attrs=None, where=None)`

  Return users information from osquery
  
  CLI Example:
  ```
salt '*' osquery.users
  ```

- `salt '*' osquery.version()`

  Return version of osquery
  
  CLI Example:
  ```
salt '*' osquery.version
  ```

- `salt '*' osquery.xattr_where_from(attrs=None, where=None)`

  Return xattr_where_from information from osquery
  
  CLI Example:
  ```
salt '*' osquery.xattr_where_from
  ```

- `salt '*' osquery.xprotect_entries(attrs=None, where=None)`

  Return xprotect_entries information from osquery
  
  CLI Example:
  ```
salt '*' osquery.xprotect_entries
  ```

- `salt '*' osquery.xprotect_reports(attrs=None, where=None)`

  Return xprotect_reports information from osquery
  
  CLI Example:
  ```
salt '*' osquery.xprotect_reports
  ```
26.6.325 salt.modules.out

Output Module

New in version 2018.3.0.

Execution module that processes JSON serializable data and returns string having the format as processed by the
outputters.

Although this does not bring much value on the CLI, it turns very handy in applications that require human readable
data rather than Python objects.

For example, inside a Jinja template:

```
{{ salt.out.string_format(complex_object, out='highstate') }}
```

```python
salt.modules.out.html_format(data, out='nested', opts=None, **kwargs)
```
Return the formatted string as HTML.

- `data`: The JSON serializable object.
- `out`: The name of the output to use to transform the data. Default: `nested`.
- `kwargs`: Arguments to sent to the outputter module.

CLI Example:

```bash
cat >test.html
{{ salt.out.string_format(complex_object, out='highstate') }}
cats test.html
```

```python
salt.modules.out.out_format(data, out='nested', opts=None, **kwargs)
```
Return the formatted outputter string for the Python object.

- `data`: The JSON serializable object.
- `out`: The name of the output to use to transform the data. Default: `nested`.
- `kwargs`: Arguments to sent to the outputter module.

CLI Example:

```bash
cat >test.html
{{ salt.out.string_format(complex_object, out='highstate') }}
cats test.html
```

```python
salt.modules.out.string_format(data, out='nested', opts=None, **kwargs)
```
Return the outputter formatted string, removing the ANSI escape sequences.

- `data`: The JSON serializable object.
- `out`: The name of the output to use to transform the data. Default: `nested`.
- `kwargs`: Arguments to sent to the outputter module.

CLI Example:
26.6.326  salt.modules.pacmanpkg

A module to wrap pacman calls, since Arch is the best (https://wiki.archlinux.org/index.php/Arch_is_the_best)

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a
different module (or gives an error similar to ‘pkg.install’ is not available), see here.

salt.modules.pacmanpkg.available_version(*names, **kwargs)

This function is an alias of latest_version.

Return the latest version of the named package available for upgrade or installation. If more than
one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for
that package.

CLI Example:

```text
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.pacmanpkg.file_dict(*packages, **kwargs)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of
_every_ file on the system's package database (not generally recommended).

CLI Examples:

```text
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.pacmanpkg.file_list(*packages, **kwargs)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the
system's package database (not generally recommended).

CLI Examples:

```text
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.pacmanpkg.group_diff(name)

New in version 2016.11.0.

Lists which of a group's packages are installed and which are not installed

Compatible with yumpkg.group_diff for easy support of state.pkg.group_installed

CLI Example:

```text
salt '*' pkg.group_diff 'xorg'
```
salt.modules.pacmanpkg.group_info(name)

New in version 2016.11.0.
Lists all packages in the specified group

CLI Example:

```
salt '*' pkg.group_info 'xorg'
```

salt.modules.pacmanpkg.group_list()

New in version 2016.11.0.
Lists all groups known by pacman on this system

CLI Example:

```
salt '*' pkg.group_list
```

salt.modules.pacmanpkg.install(name=None, refresh=False, sysupgrade=None, pkgs=None, sources=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Install (pacman -S) the specified package(s). Add refresh=True to install with -y, add sysupgrade=True to install with -u.

name

The name of the package to be installed. Note that this parameter is ignored if either pkgs or sources is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the sources option.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh

Whether or not to refresh the package database before installing.

sysupgrade

Whether or not to upgrade the system packages before installing. If refresh is set to True but sysupgrade is not specified, -u will be applied

Multiple Package Installation Options:

pkgs

A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the version parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-4"}]'
salt '*' pkg.install pkgs='["foo", {"bar": "<1.2.3-4"}]'
```

sources

A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.
CLI Example:

```
salt '*' pkg.install
   sources='["foo": "salt://foo.
pkg.tar.xz"],
       {"bar": "salt://bar.pkg.tar.xz"]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
       'new': '<new-version>'}}
```

```
salt.modules.pacmanpkg.latest_version(*names, **kwargs)
```

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

```
salt.modules.pacmanpkg.list_pkgs(versions_as_list=False, **kwargs)
```

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

```
salt.modules.pacmanpkg.list_repo_pkgs(*args, **kwargs)
```

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
   'bash': ['4.4.005-2'],
   'nginx': ['1.10.2-2']
}
```

```
# With byrepo=True
{
   'core': {
      'bash': ['4.4.005-2']
   },
   'extra': {
      'nginx': ['1.10.2-2']
   }
}
```

fromrepo
[None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

**byrepo**

[False] When True, the return data for each package will be organized by repository.

**refresh**

[False] When True, the package database will be refreshed (i.e. `pacman -Sy`) before checking for available versions.

CLI Examples:

```bash
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

**salt.modules.pacmanpkg.list_upgrades**(refresh=False, root=None, **kwargs)

List all available package upgrades on this system

CLI Example:

```bash
salt '*' pkg.list_upgrades
```

**salt.modules.pacmanpkg.owner**(paths, **kwargs)

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```bash
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/zsh
```

**salt.modules.pacmanpkg.purge**(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of False (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a `pacman -Rsc`

**name**

The name of the package to be deleted.

**Multiple Package Options:**

**pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt documentation, release 3007.1

salt documentation, release 3007.1

salt '* pkg.purge <package name>
salt '* pkg.purge <package1>,<package2>,<package3>
salt '* pkg.purge pkgs='["foo", "bar"]'

salt.modules.pacmanpkg.refresh_db(root=None, **kwargs)

Just run a pacman -Sy, return a dict:

{'<database name>': Bool}

CLI Example:
salt '*' pkg.refresh_db

salt.modules.pacmanpkg.remove(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Remove packages with pacman -R.

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'

salt.modules.pacmanpkg.upgrade(refresh=False, root=None, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Run a full system upgrade, a pacman -Syu

refresh

Whether or not to refresh the package database before installing.

Returns a dictionary containing the changes:

{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}

CLI Example:
Salt Documentation, Release 3007.1

```bash
salt '*' pkg.upgrade
```

```python
salt.modules.pacmanpkg.upgrade_available(name, **kwargs)
```
Check whether or not an upgrade is available for a given package

CLI Example:

```bash
salt '*' pkg.upgrade_available <package name>
```

```python
salt.modules.pacmanpkg.version(*names, **kwargs)
```
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```bash
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

26.6.327 salt.modules.pagerduty

Module for Firing Events via PagerDuty

New in version 2014.1.0.

configuration
This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```yaml
my-pagerduty-account:
    pagerduty.api_key: F3Rbyjbve43rfFWf2214
    pagerduty.subdomain: mysubdomain
```

```python
salt.modules.pagerduty.create_event(service_key=None, description=None, details=None, incident_key=None, profile=None)
```
Create an event in PagerDuty. Designed for use in states.

CLI Example:

```bash
salt myminion pagerduty.create_event <service_key> <description> <details>
    → profile=my-pagerduty-account
```

The following parameters are required:

- **service_key**
  This key can be found by using pagerduty.list_services.

- **description**
  This is a short description of the event.

- **details**
  This can be a more detailed description of the event.

- **profile**
  This refers to the configuration profile to use to connect to the PagerDuty service.

```python
salt.modules.pagerduty.list_escalation_policies(profile=None, api_key=None)
```
This function is an alias of list_policies.
List escalation policies belonging to this account

CLI Example:

```bash
salt myminion pagerduty.list_policies my-pagerduty-account
salt myminion pagerduty.list_escalation_policies my-pagerduty-account
```

salt.modules.pagerduty.list_incidents(profile=None, api_key=None)
List incidents belonging to this account

CLI Example:

```bash
salt myminion pagerduty.list_incidents my-pagerduty-account
```

salt.modules.pagerduty.list_maintenance_windows(profile=None, api_key=None)
This function is an alias of list_windows.
List maintenance windows belonging to this account

CLI Example:

```bash
salt myminion pagerduty.list_windows my-pagerduty-account
salt myminion pagerduty.list_maintenance_windows my-pagerduty-account
```

salt.modules.pagerduty.list_policies(profile=None, api_key=None)
List escalation policies belonging to this account

CLI Example:

```bash
salt myminion pagerduty.list_policies my-pagerduty-account
salt myminion pagerduty.list_escalation_policies my-pagerduty-account
```

salt.modules.pagerduty.list_schedules(profile=None, api_key=None)
List schedules belonging to this account

CLI Example:

```bash
salt myminion pagerduty.list_schedules my-pagerduty-account
```

salt.modules.pagerduty.list_services(profile=None, api_key=None)
List services belonging to this account

CLI Example:

```bash
salt myminion pagerduty.list_services my-pagerduty-account
```

salt.modules.pagerduty.list_users(profile=None, api_key=None)
List users belonging to this account

CLI Example:

```bash
salt myminion pagerduty.list_users my-pagerduty-account
```

salt.modules.pagerduty.list_windows(profile=None, api_key=None)
List maintenance windows belonging to this account

CLI Example:
Module for managing PagerDuty resource

configuration
This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The default configuration profile name is 'pagerduty.'

For example:

```
pagerduty:
  pagerduty.api_key: F3Rbyjbve43rfWf2214
  pagerduty.subdomain: mysubdomain
```

For PagerDuty API details, see [https://developer.pagerduty.com/documentation/rest](https://developer.pagerduty.com/documentation/rest)

salt.modules.pagerduty_util.create_or_update_resource(resource_name, identifier_fields, data, diff=None, profile='pagerduty', subdomain=None, api_key=None)

create or update any pagerduty resource Helper method for present().

Determining if two resources are the same is different for different PD resource, so this method accepts a diff function. The diff function will be invoked as diff(state_information, object_returned_from_pagerduty), and should return a dict of data to pass to the PagerDuty update API method, or None if no update is to be performed. If no diff method is provided, the default behavior is to scan the keys in the state_information, comparing the matching values in the object_returned_from_pagerduty, and update any values that differ.

Examples

```
create_or_update_resource("user", ["id","name","email"], diff=my_diff_function)
create_or_update_resource("escalation_policies", ["id","name"], diff=my_diff_function)
```

delete any pagerduty resource

Helper method for absent()

Example

```
delete_resource("users", key, ["id","name","email"], key, ["id","name","email"]]) # delete by id or name or email
```

salt.modules.pagerduty_util.get_escalation_policies(profile='pagerduty', subdomain=None, api_key=None)

List escalation_policies belonging to this account

CLI Example:

```
salt myminion pagerduty.get_escalation_policies
```
salt.modules.pagerduty_util.get_resource(resource_name, key, identifier_fields, profile='pagerduty', subdomain=None, api_key=None)

Get any single pagerduty resource by key.
We allow flexible lookup by any of a list of identifier_fields. So, for example, you can look up users by email address or name by calling:
    get_resource('users', key, ['name', 'email'], ...)
This method is mainly used to translate state sls into pagerduty id's for dependent objects. For example, a pagerduty escalation policy contains one or more schedules, which must be passed by their pagerduty id. We look up the schedules by name (using this method), and then translate the names into id's.
This method is implemented by getting all objects of the resource type (cached into __context__), then brute force searching through the list and trying to match any of the identifier_fields. The __context__ cache is purged after any create, update or delete to the resource.
salt.modules.pagerduty_util.get_schedules(profile='pagerduty', subdomain=None, api_key=None)
List schedules belonging to this account
CLI Example:
    salt myminion pagerduty.get_schedules
salt.modules.pagerduty_util.get_services(profile='pagerduty', subdomain=None, api_key=None)
List services belonging to this account
CLI Example:
    salt myminion pagerduty.get_services
salt.modules.pagerduty_util.get_users(profile='pagerduty', subdomain=None, api_key=None)
List users belonging to this account
CLI Example:
    salt myminion pagerduty.get_users
salt.modules.pagerduty_util.resource_absent(resource, identifier_fields, profile='pagerduty', subdomain=None, api_key=None, **kwargs)
Generic resource.absent state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.
This method calls delete_resource() and formats the result as a salt state return value.

Example
    resource_absent("users", ["id","name","email"])
salt.modules.pagerduty_util.resource_present(resource, identifier_fields, diff=None, profile='pagerduty', subdomain=None, api_key=None, **kwargs)
Generic resource.present state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.
This method calls create_or_update_resource() and formats the result as a salt state return value.
Example

resource_present("users", ["id","name","email"])  

26.6.329 salt.modules.pam

Support for pam

salt.modules.pam.read_file(file_name)

This is just a test function, to make sure parsing works

CLI Example:

salt '*' pam.read_file /etc/pam.d/login

26.6.330 salt.modules.panos

Module to provide Palo Alto compatibility to Salt

codeauthor

Spencer Ervin <spencer_ervin@hotmail.com>

maturity

new

depends

none

platform

unix

New in version 2018.3.0.

Configuration

This module accepts connection configuration details either as parameters, or as configuration settings in pillar as a
Salt proxy. Options passed into opts will be ignored if options are passed into pillar.

See also:

Palo Alto Proxy Module

About

This execution module was designed to handle connections to a Palo Alto based firewall. This module adds support
to send connections directly to the device through the XML API or through a brokered connection to Panorama.

salt.modules.panos.add_config_lock()

Prevent other users from changing configuration until the lock is released.

CLI Example:

salt '*' panos.add_config_lock
salt.modules.panos.check_antivirus()
    Get anti-virus information from PaloAlto Networks server
    CLI Example:
    ```
salt '*' panos.check_antivirus
    ```

salt.modules.panos.check_software()
    Get software information from PaloAlto Networks server.
    CLI Example:
    ```
salt '*' panos.check_software
    ```

salt.modules.panos.clear_commit_tasks()
    Clear all commit tasks.
    CLI Example:
    ```
salt '*' panos.clear_commit_tasks
    ```

salt.modules.panos.commit()
    Commits the candidate configuration to the running configuration.
    CLI Example:
    ```
salt '*' panos.commit
    ```

salt.modules.panos.deactivate_license(key_name=None)
    Deactivates an installed license. Required version 7.0.0 or greater.
    key_name(str): The file name of the license key installed.
    CLI Example:
    ```
salt '*' panos.deactivate_license key_name=License_File_Name.key
    ```

salt.modules.panos.delete_license(key_name=None)
    Remove license keys on disk.
    key_name(str): The file name of the license key to be deleted.
    CLI Example:
    ```
salt '*' panos.delete_license key_name=License_File_Name.key
    ```

salt.modules.panos.download_antivirus()
    Download the most recent anti-virus package.
    CLI Example:
    ```
salt '*' panos.download_antivirus
    ```

salt.modules.panos.download_software_file(filename=None, synch=False)
    Download software packages by filename.
    Parameters
    - **filename**(str) -- The filename of the PANOS file to download.
    - **synch**(bool) -- If true then the file will synch to the peer unit.
CLI Example:

```
salt '*' panos.download_software_file PanOS_5000-8.0.0
salt '*' panos.download_software_file PanOS_5000-8.0.0 True
```

salt.modules.panos.download_software_version(\texttt{version=None, synch=False})

Download software packages by version number.

\textbf{Parameters}

- \texttt{version (str)} -- The version of the PANOS file to download.
- \texttt{synch (bool)} -- If true then the file will synch to the peer unit.

CLI Example:

```
salt '*' panos.download_software_version 8.0.0
salt '*' panos.download_software_version 8.0.0 True
```

salt.modules.panos.fetch_license(\texttt{auth_code=None})

Get new license(s) using from the Palo Alto Network Server.

\textbf{auth_code}

The license authorization code.

CLI Example:

```
salt '*' panos.fetch_license
salt '*' panos.fetch_license auth_code=foobar
```

salt.modules.panos.get_address(\texttt{address=None, vsys='1'})

Get the candidate configuration for the specified get_address object. This will not return address objects that are marked as pre-defined objects.

\textbf{address(str)}: The name of the address object.
\textbf{vsys(str)}: The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_address myhost
salt '*' panos.get_address myhost 3
```

salt.modules.panos.get_address_group(\texttt{addressgroup=None, vsys='1'})

Get the candidate configuration for the specified address group. This will not return address groups that are marked as pre-defined objects.

\textbf{addressgroup(str)}: The name of the address group.
\textbf{vsys(str)}: The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_address_group foobar
salt '*' panos.get_address_group foobar 3
```

salt.modules.panos.get_admins_active()

Show active administrators.

CLI Example:

```
salt '*' panos.get_admins_active
```
salt.modules.panos.get_admins_all()  
Show all administrators.  
CLI Example:
```
salt '*' panos.get_admins_all
```

salt.modules.panos.get_antivirus_info()  
Show information about available anti-virus packages.  
CLI Example:
```
salt '*' panos.get_antivirus_info
```

salt.modules.panos.get_arp()  
Show ARP information.  
CLI Example:
```
salt '*' panos.get_arp
```

salt.modules.panos.get_cli_idle_timeout()  
Show timeout information for this administrative session.  
CLI Example:
```
salt '*' panos.get_cli_idle_timeout
```

salt.modules.panos.get_cli_permissions()  
Show cli administrative permissions.  
CLI Example:
```
salt '*' panos.get_cli_permissions
```

salt.modules.panos.get_disk_usage()  
Report filesystem disk space usage.  
CLI Example:
```
salt '*' panos.get_disk_usage
```

salt.modules.panos.get_dns_server_config()  
Get the DNS server configuration from the candidate configuration.  
CLI Example:
```
salt '*' panos.get_dns_server_config
```

salt.modules.panos.get_domain_config()  
Get the domain name configuration from the candidate configuration.  
CLI Example:
```
salt '*' panos.get_domain_config
```
salt.modules.panos.get_dos_blocks()
Show the DoS block-ip table.
CLI Example:
```
salt '*' panos.get_dos_blocks
```

salt.modules.panos.get_fqdn_cache()
Print FQDNs used in rules and their IPs.
CLI Example:
```
salt '*' panos.get_fqdn_cache
```

salt.modules.panos.get_ha_config()
Get the high availability configuration.
CLI Example:
```
salt '*' panos.get_ha_config
```

salt.modules.panos.get_ha_link()
Show high-availability link-monitoring state.
CLI Example:
```
salt '*' panos.get_ha_link
```

salt.modules.panos.get_ha_path()
Show high-availability path-monitoring state.
CLI Example:
```
salt '*' panos.get_ha_path
```

salt.modules.panos.get_ha_state()
Show high-availability state information.
CLI Example:
```
salt '*' panos.get_ha_state
```

salt.modules.panos.get_ha.transitions()
Show high-availability transition statistic information.
CLI Example:
```
salt '*' panos.get_ha.transitions
```

salt.modules.panos.get_hostname()
Get the hostname of the device.
CLI Example:
```
salt '*' panos.get_hostname
```
salt.modules.panos.get_interface_counters(name='all')

Get the counter statistics for interfaces.

Parameters

   name (str) -- The name of the interface to view. By default, all interface statistics are viewed.

CLI Example:

```
salt '*' panos.get_interface_counters
salt '*' panos.get_interface_counters ethernet1/1
```

salt.modules.panos.get_interfaces(name='all')

Show interface information.

Parameters

   name (str) -- The name of the interface to view. By default, all interface statistics are viewed.

CLI Example:

```
salt '*' panos.get_interfaces
sicl '*' panos.get_interfaces ethernet1/1
```

salt.modules.panos.get_job(jid=None)

List all a single job by ID.

   jid

   The ID of the job to retrieve.

CLI Example:

```
salt '*' panos.get_job jid=15
```

salt.modules.panos.get_jobs(state='all')

List all jobs on the device.

   state

   The state of the jobs to display. Valid options are all, pending, or processed. Pending jobs are jobs that are currently in a running or waiting state. Processed jobs are jobs that have completed execution.

CLI Example:

```
salt '*' panos.get_jobs
salt '*' panos.get_jobs state=pending
```

salt.modules.panos.get_lacp()

Show LACP state.

CLI Example:

```
salt '*' panos.get_lacp
```

salt.modules.panos.get_license_info()

Show information about owned license(s).

CLI Example:

```
salt '*' panos.get_license_info
```

salt.modules.panos.get_license_tokens()

Show license token files for manual license deactivation.

CLI Example:
salt '*' panos.get_license_tokens

salt.modules.panos.get_lldp_config()
Show lldp config for interfaces.
CLI Example:
salt '*' panos.get_lldp_config

salt.modules.panos.get_lldp_counters()
Show lldp counters for interfaces.
CLI Example:
salt '*' panos.get_lldp_counters

salt.modules.panos.get_lldp_local()
Show lldp local info for interfaces.
CLI Example:
salt '*' panos.get_lldp_local

salt.modules.panos.get_lldp_neighbors()
Show lldp neighbors info for interfaces.
CLI Example:
salt '*' panos.get_lldp_neighbors

salt.modules.panos.get_local_admins()
Show all local administrator accounts.
CLI Example:
salt '*' panos.get_local_admins

salt.modules.panos.get_logdb_quota()
Report the logdb quotas.
CLI Example:
salt '*' panos.get_logdb_quota

salt.modules.panos.get_master_key()
Get the master key properties.
CLI Example:
salt '*' panos.get_master_key

salt.modules.panos.get_ntp_config()
Get the NTP configuration from the candidate configuration.
CLI Example:
salt.modules.panos.get_ntp_servers()

    Get list of configured NTP servers.

    CLI Example:
    ```
    salt '*' panos.get_ntp_servers
    ```

salt.modules.panos.get_operational_mode()

    Show device operational mode setting.

    CLI Example:
    ```
    salt '*' panos.get_operational_mode
    ```

salt.modules.panos.get_panorama_status()

    Show panorama connection status.

    CLI Example:
    ```
    salt '*' panos.get_panorama_status
    ```

salt.modules.panos.get_permitted_ips()

    Get the IP addresses that are permitted to establish management connections to the device.

    CLI Example:
    ```
    salt '*' panos.get_permitted_ips
    ```

salt.modules.panos.get_platform()

    Get the platform model information and limitations.

    CLI Example:
    ```
    salt '*' panos.get_platform
    ```

salt.modules.panos.get_predefined_application(application=None)

    Get the configuration for the specified pre-defined application object. This will only return pre-defined application objects.

    application(str): The name of the pre-defined application object.

    CLI Example:
    ```
    salt '*' panos.get_predefined_application saltstack
    ```

salt.modules.panos.get_security_rule(rulename=None, vsys='1')

    Get the candidate configuration for the specified security rule.

    rulename(str): The name of the security rule.

    vsys(str): The string representation of the VSYS ID.

    CLI Example:
    ```
    salt '*' panos.get_security_rule rule01
    salt '*' panos.get_security_rule rule01 3
    ```

26.6. execution modules
salt.modules.panos.get_service

Get the candidate configuration for the specified service object. This will not return services that are marked as pre-defined objects.

| service(str) | The name of the service object. |
| vsys(str) | The string representation of the VSYS ID. |

CLI Example:
```
salt '*' panos.get_service tcp-443
salt '*' panos.get_service tcp-443
```

salt.modules.panos.get_service_group

Get the candidate configuration for the specified service group. This will not return service groups that are marked as pre-defined objects.

| servicegroup(str) | The name of the service group. |
| vsys(str) | The string representation of the VSYS ID. |

CLI Example:
```
salt '*' panos.get_service_group foobar
salt '*' panos.get_service_group foobar
```

salt.modules.panos.get_session_info

Show device session statistics.

CLI Example:
```
salt '*' panos.get_session_info
```

salt.modules.panos.get_snmp_config

Get the SNMP configuration from the device.

CLI Example:
```
salt '*' panos.get_snmp_config
```

salt.modules.panos.get_software_info

Show information about available software packages.

CLI Example:
```
salt '*' panos.get_software_info
```

salt.modules.panos.get_system_date_time

Get the system date/time.

CLI Example:
```
salt '*' panos.get_system_date_time
```

salt.modules.panos.get_system_files

List important files in the system.

CLI Example:
salt.modules.panos.get_system_info()
Get the system information.
CLI Example:
```
salt '*' panos.get_system_info
```

salt.modules.panos.get_system_services()
Show system services.
CLI Example:
```
salt '*' panos.get_system_services
```

salt.modules.panos.get_system_state(mask=None)
Show the system state variables.
```
mask
Filters by a subtree or a wildcard.
```
CLI Example:
```
salt '*' panos.get_system_state
salt '*' panos.get_system_state mask=cfg.ha.config.enabled
salt '*' panos.get_system_state mask=cfg.ha.*
```

salt.modules.panos.get_uncommitted_changes()
Retrieve a list of all uncommitted changes on the device. Requires PANOS version 8.0.0 or greater.
CLI Example:
```
salt '*' panos.get_uncommitted_changes
```

salt.modules.panos.get_users_config()
Get the local administrative user account configuration.
CLI Example:
```
salt '*' panos.get_users_config
```

salt.modules.panos.get_vlans()
Show all VLAN information.
CLI Example:
```
salt '*' panos.get_vlans
```

salt.modules.panos.get_xpath(xpath='')
Retrieve a specified xpath from the candidate configuration.
```
xpath(str): The specified xpath in the candidate configuration.
```
CLI Example:
```
salt '*' panos.get_xpath /config/shared/service
```
salt.modules.panos.get_zone\(\text{zone}='', \text{vsys}'1'\)
Get the candidate configuration for the specified zone.

\text{zone} (str): The name of the zone.
\text{vsys} (str): The string representation of the VSYS ID.

CLI Example:

```python
salt '*' panos.get_zone trust
salt '*' panos.get_zone trust 2
```

salt.modules.panos.get_zones\(\text{vsys}'1'\)
Get all the zones in the candidate configuration.

\text{vsys} (str): The string representation of the VSYS ID.

CLI Example:

```python
salt '*' panos.get_zones
salt '*' panos.get_zones 2
```

salt.modules.panos.install_antivirus\(\text{version}=	ext{None}, \text{latest}=	ext{False}, \text{synch}=	ext{False}, \text{skip_commit}=	ext{False}\)
Install anti-virus packages.

Parameters

- \text{version} (str) -- The version of the PANOS file to install.
- \text{latest} (bool) -- If true, the latest anti-virus file will be installed. The specified version option will be ignored.
- \text{synch} (bool) -- If true, the anti-virus will synch to the peer unit.
- \text{skip_commit} (bool) -- If true, the install will skip committing to the device.

CLI Example:

```python
salt '*' panos.install_antivirus 8.0.0
```

salt.modules.panos.install_license()
Install the license key(s).

CLI Example:

```python
salt '*' panos.install_license
```

salt.modules.panos.install_software\(\text{version}=	ext{None}\)
Upgrade to a software package by version.

Parameters

- \text{version} (str) -- The version of the PANOS file to install.

CLI Example:

```python
salt '*' panos.install_license 8.0.0
```

salt.modules.panos.reboot()
Reboot a running system.

CLI Example:

```python
salt '*' panos.reboot
```
salt.modules.panos.refresh_fqdn_cache(force=False)

Force refreshes all FQDNs used in rules.

- force
  Forces all fqdn refresh

CLI Example:

```
salt '*' panos.refresh_fqdn_cache
salt '*' panos.refresh_fqdn_cache force=True
```

salt.modules.panos.remove_config_lock()

Release config lock previously held.

CLI Example:

```
salt '*' panos.remove_config_lock
```

salt.modules.panos.resolve_address(address=None, vsys=None)

Resolve address to ip address. Required version 7.0.0 or greater.

- address
  Address name you want to resolve.

- vsys
  The vsys name.

CLI Example:

```
salt '*' panos.resolve_address foo.bar.com
salt '*' panos.resolve_address foo.bar.com vsys=2
```

salt.modules.panos.save_device_config(filename=None)

Save device configuration to a named file.

- filename
  The filename to save the configuration to.

CLI Example:

```
salt '*' panos.save_device_config foo.xml
```

salt.modules.panos.save_device_state()

Save files needed to restore device to local disk.

CLI Example:

```
salt '*' panos.save_device_state
```

salt.modules.panos.set_authentication_profile(profile=None, deploy=False)

Set the authentication profile of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

```
Parameters

- profile (str) -- The name of the authentication profile to set.
- deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

salt '*' panos.set_authentication_profile foo
salt '*' panos.set_authentication_profile foo deploy=True
```
salt.modules.panos.set_hostname

Set the hostname of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

```python
Parameters
- hostname (str) -- The hostname to set
- deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

salt '*' panos.set_hostname newhostname
deploy=True
```

salt.modules.panos.set_management_http

Enables or disables the HTTP management service on the device.

CLI Example:

```python
Parameters
- enabled (bool) -- If true the service will be enabled. If false the service will be disabled.
- deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

salt '*' panos.set_management_http enabled=False deploy=True
```

salt.modules.panos.set_management_https

Enables or disables the HTTPS management service on the device.

CLI Example:

```python
Parameters
- enabled (bool) -- If true the service will be enabled. If false the service will be disabled.
- deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

salt '*' panos.set_management_https enabled=False deploy=True
```

salt.modules.panos.set_management_icmp

Enables or disables the ICMP management service on the device.

CLI Example:

```python
Parameters
- enabled (bool) -- If true the service will be enabled. If false the service will be disabled.
- deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

salt '*' panos.set_management_icmp enabled=False deploy=True
```

salt.modules.panos.set_management_ocsp

Enables or disables the HTTP OCSP management service on the device.

CLI Example:
Salt Documentation, Release 3007.1

- **enabled (bool)** -- If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** -- If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_management_ocsp
salt '*' panos.set_management_ocsp enabled=False deploy=True
```

**salt.modules.panos.set_management_snmp (enabled=True, deploy=False)**

Enables or disables the SNMP management service on the device.

CLI Example:

```
Parameters
- **enabled (bool)** -- If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** -- If true then commit the full candidate configuration, if false only set pending change.
```

```python
salt '*' panos.set_management_snmp
salt '*' panos.set_management_snmp enabled=False deploy=True
```

**salt.modules.panos.set_management_ssh (enabled=True, deploy=False)**

Enables or disables the SSH management service on the device.

CLI Example:

```
Parameters
- **enabled (bool)** -- If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** -- If true then commit the full candidate configuration, if false only set pending change.
```

```python
salt '*' panos.set_management_ssh
salt '*' panos.set_management_ssh enabled=False deploy=True
```

**salt.modules.panos.set_management_telnet (enabled=True, deploy=False)**

Enables or disables the Telnet management service on the device.

CLI Example:

```
Parameters
- **enabled (bool)** -- If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** -- If true then commit the full candidate configuration, if false only set pending change.
```

```python
salt '*' panos.set_management_telnet
salt '*' panos.set_management_telnet enabled=False deploy=True
```

**salt.modules.panos.set_ntp_authentication (target=None, authentication_type=None, key_id=None, authentication_key=None, algorithm=None, deploy=False)**

Set the NTP authentication of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

```
Parameters
- **target (str)** -- Determines the target of the authentication. Valid options are primary, secondary, or both.
```
• **authentication_type** (*str*) -- The authentication type to be used. Valid options are symmetric, autokey, and none.
• **key_id** (*int*) -- The NTP authentication key ID.
• **authentication_key** (*str*) -- The authentication key.
• **algorithm** (*str*) -- The algorithm type to be used for a symmetric key. Valid options are md5 and sha1.
• **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' ntp.set_authentication target=both authentication_type=autokey
salt '*' ntp.set_authentication target=primary authentication_type=none
  → key_id=15 authentication_key=mykey algorithm=md5
salt '*' ntp.set_authentication target=both authentication_type=symmetric
  → key_id=15 authentication_key=mykey algorithm=md5 deploy=True
```

**salt.modules.panos.set_ntp_servers** (*primary_server=None, secondary_server=None, deploy=False*)

Set the NTP servers of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

• **primary_server** (*str*) -- The primary NTP server IP address or FQDN.
• **secondary_server** (*str*) -- The secondary NTP server IP address or FQDN.
• **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' ntp.set_servers 0.pool.ntp.org 1.pool.ntp.org
salt '*' ntp.set_servers primary_server=0.pool.ntp.org secondary_server=1.pool.ntp.org
salt '*' ntp.set_servers 0.pool.ntp.org 1.pool.ntp.org deploy=True
```

**salt.modules.panos.set_permitted_ip** (*address=None, deploy=False*)

Add an IPv4 address or network to the permitted IP list.

CLI Example:

Parameters

• **address** (*str*) -- The IPv4 address or network to allow access to add to the Palo Alto device.
• **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_permitted_ip 10.0.0.1
salt '*' panos.set_permitted_ip 10.0.0.0/24
salt '*' panos.set_permitted_ip 10.0.0.1 deploy=True
```

**salt.modules.panos.set_timezone** (*tz=None, deploy=False*)

Set the timezone of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

• **tz** (*str*) -- The name of the timezone to set.
• **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.
salt.modules.panos.set_timezone(UTC)

'*

salt.modules.panos.set_timezone(UTC deploy=True)

salt.modules.panos.shutdown()

Shutdown a running system.

CLI Example:

salt '*' panos.shutdown

salt.modules.panos.test_fib_route(ip=None, vr='vr1')

Perform a route lookup within active route table (fib).

ip (str): The destination IP address to test.

vr (str): The name of the virtual router to test.

CLI Example:

salt '*' panos.test_fib_route 4.2.2.2
salt '*' panos.test_fib_route 4.2.2.2 my-vr

salt.modules.panos.test_security_policy(sourcezone=None, destinationzone=None, source=None, destination=None, protocol=None, port=None, application=None, category=None, vsys='1', allrules=False)

Checks which security policy as connection will match on the device.

sourcezone (str): The source zone matched against the connection.

destinationzone (str): The destination zone matched against the connection.

source (str): The source address. This must be a single IP address.

destination (str): The destination address. This must be a single IP address.

protocol (int): The protocol number for the connection. This is the numerical representation of the protocol.

port (int): The port number for the connection.

application (str): The application that should be matched.

category (str): The category that should be matched.

vsys (int): The numerical representation of the VSYS ID.

allrules (bool): Show all potential match rules until first allow rule.

CLI Example:

salt '*' panos.test_security_policy sourcezone=trust
  destinationzone=untrust protocol=6 port=22
salt '*' panos.test_security_policy sourcezone=trust
  destinationzone=untrust protocol=6 port=22 vsys=2

salt.modules.panos.unlock_admin(username=None)

Unlocks a locked administrator account.

username

Username of the administrator.

CLI Example:
salt '*' panos.unlock_admin username=bob

26.6.331 salt.modules.parallels

Manage Parallels Desktop VMs with prlctl and prlsrvctl. Only some of the prlctl commands implemented so far. Of those that have been implemented, not all of the options may have been provided yet. For a complete reference, see the Parallels Desktop Reference Guide.

This module requires the prlctl binary to be installed to run most functions. To run parallels.prlsrvctl, the prlsrvctl binary is required.

What has not been implemented yet can be accessed through parallels.prlctl and parallels.prlsrvctl (note the preceding double dash -- as necessary):

salt '*' parallels.prlctl installtools macvm runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev

New in version 2016.3.0.

salt.modules.parallels.clone(name, new_name, linked=False, template=False, runas=None)
Clone a VM

New in version 2016.11.0.

Parameters
- name (str) -- Name/ID of VM to clone
- new_name (str) -- Name of the new VM
- linked (bool) -- Create a linked virtual machine.
- template (bool) -- Create a virtual machine template instead of a real virtual machine.
- runas (str) -- The user that the prlctl command will be run as

Example:

salt '*' parallels.clone macvm macvm_new runas=macdev
salt '*' parallels.clone macvm macvm_templ template=True runas=macdev

salt.modules.parallels.delete(name, runas=None)
Delete a VM

New in version 2016.11.0.

Parameters
- name (str) -- Name/ID of VM to clone
- runas (str) -- The user that the prlctl command will be run as

Example:

salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev

salt.modules.parallels.delete_snapshot(name, snap_name, runas=None, all=False)
Delete a snapshot

Note: Deleting a snapshot from which other snapshots are derivied will not delete the derived snapshots
Parameters

- **name (str)** -- Name/ID of VM whose snapshot will be deleted
- **snap_name (str)** -- Name/ID of snapshot to delete
- **runas (str)** -- The user that the prlctl command will be run as
- **all (bool)** -- Delete all snapshots having the name given

New in version 2016.11.0.

Example:

```bash
salt '*' parallels.delete_snapshot macvm 'unneeded snapshot' runas=macdev
salt '*' parallels.delete_snapshot macvm 'Snapshot for linked clone' runas=macdev
```

salt.modules.parallels.exec_ (*name*, *command*, *runas=None*)

Run a command on a VM

Parameters

- **name (str)** -- Name/ID of VM whose exec will be returned
- **command (str)** -- Command to run on the VM
- **runas (str)** -- The user that the prlctl command will be run as

Example:

```bash
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

salt.modules.parallels.exists (*name*, *runas=None*)

Query whether a VM exists

New in version 2016.11.0.

Parameters

- **name (str)** -- Name/ID of VM
- **runas (str)** -- The user that the prlctl command will be run as

Example:

```bash
salt '*' parallels.exists macvm runas=macdev
```

salt.modules.parallels.list_snapshots (*name*, *snap_name=None*, *tree=False*, *names=False*, *runas=None*)

List the snapshots

Parameters

- **name (str)** -- Name/ID of VM whose snapshots will be listed
- **snap_id (str)** -- Name/ID of snapshot to display information about. If tree=True is also specified, display the snapshot subtree having this snapshot as the root snapshot
- **tree (bool)** -- List snapshots in tree format rather than tabular format
- **names (bool)** -- List snapshots as ID, name pairs
- **runas (str)** -- The user that the prlctl command will be run as

Example:

```bash
salt '*' parallels.list_snapshots macvm runas=macdev
salt '*' parallels.list_snapshots macvm tree=True runas=macdev
salt '*' parallels.list_snapshots macvm snap_name=original runas=macdev
salt '*' parallels.list_snapshots macvm names=True runas=macdev
```

salt.modules.parallels.list_vms (*name=None*, *info=False*, *all=False*, *args=None*, *runas=None*, *template=False*)

26.6. execution modules
List information about the VMs

Parameters

• **name** *(str)* -- Name/ID of VM to list
  Changed in version 2016.11.0: No longer implies info=True
• **info** *(str)* -- List extra information
• **all** *(bool)* -- List all non-template VMs
• **args** *(tuple)* -- Additional arguments given to prctl list
• **runas** *(str)* -- The user that the prlctl command will be run as
• **template** *(bool)* -- List the available virtual machine templates. The real virtual machines will not be included in the output

New in version 2016.11.0.

Example:

```bash
salt '*' parallels.list_vms runas=macdev
salt '*' parallels.list_vms name=macvm info=True runas=macdev
salt '*' parallels.list_vms info=True runas=macdev
salt '*' parallels.list_vms -o uuid,status all=True runas=macdev
```

salt.modules.parallels.prlctl *(sub_cmd, args=None, runas=None)*

Execute a prlctl command

Parameters

• **sub_cmd** *(str)* -- prlctl subcommand to execute
• **args** *(str)* -- The arguments supplied to prlctl <sub_cmd>
• **runas** *(str)* -- The user that the prlctl command will be run as

Example:

```bash
salt '*' parallels.prlctl user list runas=macdev
salt '*' parallels.prlctl exec 'macvm uname' runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev
```

salt.modules.parallels.prlsrvctl *(sub_cmd, args=None, runas=None)*

Execute a prlsrvctl command

New in version 2016.11.0.

Parameters

• **sub_cmd** *(str)* -- prlsrvctl subcommand to execute
• **args** *(str)* -- The arguments supplied to prlsrvctl <sub_cmd>
• **runas** *(str)* -- The user that the prlsrvctl command will be run as

Example:

```bash
salt '*' parallels.prlsrvctl info runas=macdev
salt '*' parallels.prlsrvctl usb list runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev
```

salt.modules.parallels.reset *(name, runas=None)*

Reset a VM by performing a hard shutdown and then a restart

Parameters

• **name** *(str)* -- Name/ID of VM to reset
• **runas** *(str)* -- The user that the prlctl command will be run as

Example:
Salt Documentation, Release 3007.1

```python
salt '*' parallels.reset macvm runas=macdev
```

salt.modules.parallels.restart(name, runas=None)

Restart a VM by gracefully shutting it down and then restarting it

Parameters

- **name** *(str)* -- Name/ID of VM to restart
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:

```python
salt '*' parallels.restart macvm runas=macdev
```

salt.modules.parallels.revert_snapshot(name, snap_name, runas=None)

Revert a VM to a snapshot

Parameters

- **name** *(str)* -- Name/ID of VM to revert to a snapshot
- **snap_name** *(str)* -- Name/ID of snapshot to revert to
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:

```python
salt '*' parallels.revert_snapshot macvm base-with-updates runas=macdev
```

salt.modules.parallels.snapshot(name, snap_name=None, desc=None, runas=None)

Create a snapshot

Parameters

- **name** *(str)* -- Name/ID of VM to take a snapshot of
- **snap_name** *(str)* -- Name of snapshot
- **desc** *(str)* -- Description of snapshot
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:

```python
salt '*' parallels.create_snapshot macvm snap_name=macvm-original runas=macdev
salt '*' parallels.create_snapshot macvm snap_name=macvm-updates desc='clean install with updates' runas=macdev
```

salt.modules.parallels.snapshot_id_to_name(name, snap_id, strict=False, runas=None)

Attempt to convert a snapshot ID to a snapshot name. If the snapshot has no name or if the ID is not found or invalid, an empty string will be returned

Parameters

- **name** *(str)* -- Name/ID of VM whose snapshots are inspected
- **snap_id** *(str)* -- ID of the snapshot
- **strict** *(bool)* -- Raise an exception if a name cannot be found for the given snap_id
- **runas** *(str)* -- The user that the prlctl command will be run as

Example data

```
ID: a5b8999f-5d95-4aff-82de-e515b0101b66
Name: original
Date: 2016-03-04 10:50:34
Current: yes
State: poweroff
Description: original state
```

CLI Example:
salt '*' parallels.snapshot_id_to_name macvm a5b8999f-5d95-4aff-82de-e515b0101b66 runas=macdev

salt.modules.parallels.snapshot_name_to_id(name, snap_name, strict=False, runas=None)

Attempt to convert a snapshot name to a snapshot ID. If the name is not found an empty string is returned. If multiple snapshots share the same name, a list will be returned

Parameters
- name (str) -- Name/ID of VM whose snapshots are inspected
- snap_name (str) -- Name of the snapshot
- strict (bool) -- Raise an exception if multiple snapshot IDs are found
- runas (str) -- The user that the prlctl command will be run as

CLI Example:

salt '*' parallels.snapshot_id_to_name macvm original runas=macdev

salt.modules.parallels.start(name, runas=None)

Start a VM

Parameters
- name (str) -- Name/ID of VM to start
- runas (str) -- The user that the prlctl command will be run as

Example:

salt '*' parallels.start macvm runas=macdev

salt.modules.parallels.status(name, runas=None)

Status of a VM

Parameters
- name (str) -- Name/ID of VM whose status will be returned
- runas (str) -- The user that the prlctl command will be run as

Example:

salt '*' parallels.status macvm runas=macdev

salt.modules.parallels.stop(name, kill=False, runas=None)

Stop a VM

Parameters
- name (str) -- Name/ID of VM to stop
- kill (bool) -- Perform a hard shutdown
- runas (str) -- The user that the prlctl command will be run as

Example:

salt '*' parallels.stop macvm runas=macdev
salt '*' parallels.stop macvm kill=True runas=macdev
26.6.332  **salt.modules.parted_partition**

Module for managing partitions on POSIX-like systems.

    depends
    • parted, partprobe, lsblk (usually parted and util-linux packages)

Some functions may not be available, depending on your version of parted.

Check the manpage for **parted(8)** for more information, or the online docs at:

In light of parted not directly supporting partition IDs, some of this module has been written to utilize sfdisk instead. For further information, please reference the man page for **sfdisk(8)**.

**salt.modules.parted_partition.**

    align_check
    (device, part_type, partition)

Check if partition satisfies the alignment constraint of part_type. Type must be "minimal" or "optimal".

    CLI Example:
    
    salt '*' partition.align_check /dev/sda minimal 1

**salt.modules.parted_partition.**

    check
    (device, minor)

Checks if the file system on partition <minor> has any errors.

    CLI Example:
    
    salt '*' partition.check 1

**salt.modules.parted_partition.**

    cp
    (device, from_minor, to_minor)

Copies the file system on the partition <from-minor> to partition <to-minor>, deleting the original contents of the destination partition.

    CLI Example:
    
    salt '*' partition.cp /dev/sda 2 3

**salt.modules.parted_partition.**

    disk_set
    (device, flag, state)

Changes a flag on selected device.

    A flag can be either "on" or "off" (make sure to use proper quoting, see YAML Idiosyncrasies). Some or all of these flags will be available, depending on what disk label you are using.

    Valid flags are:
    • cylinder_alignment
    • pmbr_boot
    • implicit_partition_table

    CLI Example:
    
    salt '*' partition.disk_set /dev/sda pmbr_boot "on"

**salt.modules.parted_partition.**

    disk_toggle
    (device, flag)

Toggle the state of <flag> on <device>. Valid flags are the same as the disk_set command.

    CLI Example:
    
    salt '*' partition.disk_toggle /dev/sda pmbr_boot
salt.modules.parted_partition.exists(device='')

Check to see if the partition exists

CLI Example:

```
salt '*' partition.exists /dev/sdb1
```

salt.modules.parted_partition.get_block_device()

Retrieve a list of disk devices

New in version 2014.7.0.

CLI Example:

```
salt '*' partition.get_block_device
```

salt.modules.parted_partition.get_id(device, minor)

Prints the system ID for the partition. Some typical values are:

- b: FAT32 (vfat)
- 7: HPFS/NTFS
- 82: Linux Swap
- 83: Linux
- 8e: Linux LVM
- fd: Linux RAID Auto

CLI Example:

```
salt '*' partition.get_id /dev/sda 1
```

salt.modules.parted_partition.list_(device, unit=None)

Prints partition information of given <device>

CLI Examples:

```
salt '*' partition.list /dev/sda
salt '*' partition.list /dev/sda unit=s
salt '*' partition.list /dev/sda unit=kB
```

salt.modules.parted_partition.mkfs(device, fs_type)

Makes a file system <fs_type> on partition <device>, destroying all data that resides on that partition. <fs_type> must be one of "ext2", "fat32", "fat16", "linux-swap" or "reiserfs" (if libreiserfs is installed)

CLI Example:

```
salt '*' partition.mkfs /dev/sda2 fat32
```

salt.modules.parted_partition.mklabel(device, label_type)

Create a new disklabel (partition table) of label_type.

Type should be one of "aix", "amiga", "bsd", "dvh", "gpt", "loop", "mac", "msdos", "pc98", or "sun".

CLI Example:

```
salt '*' partition.mklabel /dev/sda msdos
```
salt.modules.parted_partition.mkpart(device, part_type, fs_type=None, start=None, end=None)
Make a part_type partition for filesystem fs_type, beginning at start and ending at end (by default in megabytes). part_type should be one of "primary", "logical", or "extended".

CLI Examples:
```
salt '*' partition.mkpart /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpart /dev/sda primary start=0 end=639
```

salt.modules.parted_partition.mkpartfs(device, part_type, fs_type=None, start=None, end=None)
The mkpartfs actually is an alias to mkpart and is kept for compatibility. To know the valid options and usage syntax read mkpart documentation.

CLI Examples:
```
salt '*' partition.mkpartfs /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpartfs /dev/sda primary start=0 end=639
```

salt.modules.parted_partition.name(device, partition, name)
Set the name of partition to name. This option works only on Mac, PC98, and GPT disklabels. The name can be placed in quotes, if necessary.

CLI Example:
```
salt '*' partition.name /dev/sda 1 'My Documents'
```

salt.modules.parted_partition.probe(*devices)
Ask the kernel to update its local partition data. When no args are specified all block devices are tried.

cau: Generally only works on devices with no mounted partitions and may take a long time to return if specified devices are in use.

CLI Examples:
```
salt '*' partition.probe
salt '*' partition.probe /dev/sda
salt '*' partition.probe /dev/sda /dev/sdb
```

salt.modules.parted_partition.rescue(device, start, end)
Rescue a lost partition that was located somewhere between start and end. If a partition is found, parted will ask if you want to create an entry for it in the partition table.

CLI Example:
```
salt '*' partition.rescue /dev/sda 0 8056
```

salt.modules.parted_partition.resize(device, minor, start, end)
Resizes the partition with number <minor>.
The partition will start <start> from the beginning of the disk, and end <end> from the beginning of the disk. resize never changes the minor number. Extended partitions can be resized, so long as the new extended partition completely contains all logical partitions.

CLI Example:
```
salt '*' partition.resize /dev/sda 3 200 850
```
salt.modules.parted_partition.rm(device, minor)

Removes the partition with number <minor>.

CLI Example:

```
salt '*' partition.rm /dev/sda 5
```

salt.modules.parted_partition.set_(device, minor, flag, state)

Changes a flag on the partition with number <minor>.

A flag can be either "on" or "off" (make sure to use proper quoting, see YAML Idiosyncrasies). Some or all of these flags will be available, depending on what disk label you are using.

Valid flags are:

- boot
- root
- swap
- hidden
- raid
- lvm
- lba
- hp-service
- palo
- prep
- msftres
- bios_grub
- atvrecv
- diag
- legacy_boot
- msftdata
- irst
- esp
- type

CLI Example:

```
salt '*' partition.set /dev/sda 1 boot "on"
```

salt.modules.parted_partition.set_id(device, minor, system_id)

Sets the system ID for the partition. Some typical values are:

```
b: FAT32 (vfat)
7: HPFS/NTFS
82: Linux Swap
83: Linux
8e: Linux LVM
fd: Linux RAID Auto
```

CLI Example:

```
salt '*' partition.set_id /dev/sda 1 83
```

salt.modules.parted_partition.system_types()

List the system types that are supported by the installed version of sfdisk

CLI Example:
salt '*' partition.system_types

salt.modules.parted_partition.toggle(device, partition, flag)

Toggle the state of <flag> on <partition>. Valid flags are the same as
the set command.

CLI Example:

salt '*' partition.toggle /dev/sda 1 boot

26.6.333  salt.modules.pcs

Configure a Pacemaker/Corosync cluster with PCS

Configure Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

depends
   pcs

New in version 2016.3.0.

salt.modules.pcs.auth(nodes, pcsuser='hacluster', pcspasswd='hacluster', extra_args=None)

Authorize nodes to the cluster

nodes
   a list of nodes which should be authorized to the cluster

pcsuser
   user for communication with PCS (default: hacluster)

pcspasswd
   password for pcsuser (default: hacluster)

extra_args
   list of extra option for the 'pcs cluster auth' command. The newer cluster host command has no extra
   args and so will ignore it.

CLI Example:

salt '*' pcs.auth nodes=['node1.example.org, node2.example.org']
   pcsuser=hacluster pcspasswd=hoonetorg extra_args=['--force']

salt.modules.pcs.cib_create(cibfile, scope='configuration', extra_args=None)

Create a CIB-file from the current CIB of the cluster

cibfile
   name/path of the file containing the CIB

scope
   specific section of the CIB (default: configuration)

extra_args
   additional options for creating the CIB-file

CLI Example:

salt '*' pcs.cib_create cibfile='/tmp/VIP_apache_1.cib' scope=False

salt.modules.pcs.cib_push(cibfile, scope='configuration', extra_args=None)

Push a CIB-file as the new CIB to the cluster

cibfile
   name/path of the file containing the CIB

26.6. execution modules
scope
    specific section of the CIB (default: configuration)
extra_args
    additional options for creating the CIB-file

CLI Example:
```
salt '*' pcs.cib_push cibfile='/tmp/VIP_apache_1.cib' scope=False
```

salt.modules.pcs.cluster_destroy(extra_args=None)
    Destroy corosync cluster using the pcs command
extra_args
    list of extra option for the 'pcs cluster destroy' command (only really --all)

CLI Example:
```
salt '*' pcs.cluster_destroy extra_args='--all'
```

salt.modules.pcs.cluster_node_add(node, extra_args=None)
    Add a node to the pacemaker cluster via pcs command
node
    node that should be added
额外_args
    list of extra option for the 'pcs cluster node add' command

CLI Example:
```
salt '*' pcs.cluster_node_add node=node2.example.org
```

salt.modules.pcs.cluster_setup(nodes, pcsclustername='pcscluster', extra_args=None)
    Setup pacemaker cluster via pcs command
nodes
    a list of nodes which should be setup
pcsclustername
    Name of the Pacemaker cluster (default: pcscluster)
extra_args
    list of extra option for the 'pcs cluster setup' command

CLI Example:
```
salt '*' pcs.cluster_setup nodes='[ node1.example.org, node2.example.org ]' pcsclustername=pcscluster
```

salt.modules.pcs.config_show(cibfile=None)
    Show config of cluster
cibfile
    name/path of the file containing the CIB

CLI Example:
```
salt '*' pcs.config_show cibfile='/tmp/cib_for_galera'
```

salt.modules.pcs.is_auth(nodes, pcsuser='hacluster', pcspasswd='hacluster')
    Check if nodes are already authorized
nodes
    a list of nodes to be checked for authorization to the cluster
pcsuser
    user for communication with PCS (default: hacluster)
**pcspasswd**

password for pcsuser (default: hacluster)

CLI Example:

```
salt '*' pcs.is_auth nodes='[node1.example.org, node2.example.org]'
-|pcsuser=hacluster pcspasswd=hoonetorg
```

salt.modules.pcs.item_create(*item*, *item_id*, *item_type*, create='create', *extra_args*=None, *cibfile*=None)

Create an item via pcs command (mainly for use with the pcs state module)

- *item*
  - config, property, resource, constraint etc.
- *item_id*
  - id of the item
- *item_type*
  - item type
- *create*
  - create command (create or set f.e., default: create)
- *extra_args*
  - additional options for the pcs command
- *cibfile*
  - use cibfile instead of the live CIB

salt.modules.pcs.item_show(*item*, *item_id*=None, *item_type*=None, *show*='show', *extra_args*=None, *cibfile*=None)

Show an item via pcs command (mainly for use with the pcs state module)

- *item*
  - config, property, resource, constraint etc.
- *item_id*
  - id of the item
- *item_type*
  - item type
- *show*
  - show command (probably None, default: show or status for newer implementation)
- *extra_args*
  - additional options for the pcs command
- *cibfile*
  - use cibfile instead of the live CIB

salt.modules.pcs.prop_set(*prop*, *value*, *extra_args*=None, *cibfile*=None)

Set the value of a cluster property

- *prop*
  - name of the property
- *value*
  - value of the property prop
- *extra_args*
  - additional options for the pcs property command
- *cibfile*
  - use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.prop_set prop='no-quorum-policy' value='ignore' cibfile='/'
-|tmp/2_node_cluster.cib
```

salt.modules.pcs.prop_show(*prop*, *extra_args*=None, *cibfile*=None)

Show the value of a cluster property
prop
  name of the property

extra_args
  additional options for the pcs property command

cibfile
  use cibfile instead of the live CIB

CLI Example:

```bash
salt '*' pcs.prop_show cibfile='/tmp/2_node_cluster.cib' prop='no-quorum-policy' cibfile='/tmp/2_node_cluster.cib'
```

salt.modules.pcs.resource_create(resource_id, resource_type, resource_options=None, cibfile=None)

Create a resource via pcs command

resource_id
  name for the resource

resource_type
  resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)

resource_options
  additional options for creating the resource

cibfile
  use cibfile instead of the live CIB for manipulation

CLI Example:

```bash
salt '*' pcs.resource_create resource_id='galera' resource_type='ocf:heartbeat:galera' resource_options="['wsrep_cluster_address=gcomm:/node1.example.org,node2.example.org,node3.example.org', '--master']" cibfile='/tmp/cib_for_galera.cib'
```

salt.modules.pcs.resource_show(resource_id, extra_args=None, cibfile=None)

Show a resource via pcs command

resource_id
  name of the resource

extra_args
  additional options for the pcs command

cibfile
  use cibfile instead of the live CIB

CLI Example:

```bash
salt '*' pcs.resource_show resource_id='galera' cibfile='/tmp/cib_for_galera.cib'
```

salt.modules.pcs.stonith_create(stonith_id, stonith_device_type, stonith_device_options=None, cibfile=None)

Create a stonith resource via pcs command

stonith_id
  name for the stonith resource

stonith_device_type
  name of the stonith agent fence_eps, fence_xvm f.e.

stonith_device_options
  additional options for creating the stonith resource

cibfile
  use cibfile instead of the live CIB for manipulation

CLI Example:
salt '/*' pcs.stonith_create stonith_id='eps_fence' stonith_device_type='fence_eps'
  stonith_device_options="['pcmk_host_map=node1.example.org:01;node2.example.org:02', 'ipaddr=myepsdevice.example.org',
  'action=reboot', 'power_wait=5', 'verbose=1', 'debug=/var/log/pcsd/eps_fence.log', 'login=hidden', 'passwd=hoonetorg']"
cibfile='/tmp/cib_for_stonith.cib'

salt.modules.pcs.stonith_show(stonith_id, extra_args=None, cibfile=None)
  Show the value of a cluster stonith
  stonith_id
    name for the stonith resource
  extra_args
    additional options for the pcs stonith command
  cibfile
    use cibfile instead of the live CIB

CLI Example:
salt '/*' pcs.stonith_show stonith_id='eps_fence' cibfile='/tmp/2_node_cluster.cib'

26.6.334 salt.modules.pdbedit

Manage accounts in Samba's passdb using pdbedit

  maintainer
    Jorge Schrauwen <sjorge@blackdot.be>

  maturity
    new

  platform
    posix

New in version 2017.7.0.

salt.modules.pdbedit.create(login, password, password_hashed=False, machine_account=False)
  Create user account
  login
    [string] login name
  password
    [string] password
  password_hashed
    [boolean] set if password is a nt hash instead of plain text
  machine_account
    [boolean] set to create a machine trust account instead

CLI Example:
salt '/*' pdbedit.create zoe 9764951149F84E770889011E1DC4A927 nthash
salt '/*' pdbedit.create river 1sw4ll0w3d4bug

salt.modules.pdbedit.delete(login)
  Delete user account
login
    [string] login name
CLI Example:

    salt '*' pdbedit.delete wash

salt.modules.pdbedit.generate_nt_hash(password)
    Generate a NT HASH
CLI Example:

    salt '*' pdbedit.generate_nt_hash my_passwd

salt.modules.pdbedit.get_user(login, hashes=False)
    Get user account details
    login
        [string] login name
    hashes
        [boolean] include NTHASH and LMHASH in verbose output
CLI Example:

    salt '*' pdbedit.get kaylee

salt.modules.pdbedit.list_users(ostream=True, hashes=False)
    List user accounts
    verbose
        [boolean] return all information
    hashes
        [boolean] include NT HASH and LM HASH in verbose output
CLI Example:

    salt '*' pdbedit.list

salt.modules.pdbedit.modify(login, password=None, password_hashed=False, domain=None, profile=None, script=None, drive=None, homedir=None, fullname=None, account_desc=None, account_control=None, machine_sid=None, user_sid=None, reset_login_hours=False, reset_bad_password_count=False)
    Modify user account
    login
        [string] login name
    password
        [string] password
    password_hashed
        [boolean] set if password is a nt hash instead of plain text
    domain
        [string] users domain
    profile
        [string] profile path
    script
        [string] logon script
    drive
        [string] home drive
    homedir
        [string] home directory
fullname
    [string] full name
account_desc
    [string] account description
machine_sid
    [string] specify the machines new primary group SID or rid
user_sid
    [string] specify the users new primary group SID or rid
account_control
    [string] specify user account control properties

Note: Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire

reset_login_hours
    [boolean] reset the users allowed logon hours
reset_bad_password_count
    [boolean] reset the stored bad login counter

Note: if user is absent and password is provided, the user will be created

CLI Example:

```
salt '*' pdbedit.modify inara fullname='Inara Serra'
salt '*' pdbedit.modify simon password=r1v3r
salt '*' pdbedit.modify jane drive='V:' homedir='\serenity\jane\profile'
salt '*' pdbedit.modify mal account_control='NX'
```

26.6.335 salt.modules.pecl

Manage PHP pecl extensions.

```
salt.modules.pecl.install(pecls, defaults=False, force=False, preferred_state='stable')
```

New in version 0.17.0.

Installs one or several pecl extensions.

```
pecls
    The pecl extensions to install.
defaults
    Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.
force
    Whether to force the installed version or not
```

CLI Example:

```
salt '*' pecl.install fuse
```

```
salt.modules.pecl.list_(channel=None)
```

List installed pecl extensions.

CLI Example:
salt '*' pecl.list

salt.modules.pecl.uninstall(pecls)
  Uninstall one or several pecl extensions.
  pecls
    The pecl extensions to uninstall.
  CLI Example:
    salt '*' pecl.uninstall fuse

salt.modules.pecl.update(pecls)
  Update one or several pecl extensions.
  pecls
    The pecl extensions to update.
  CLI Example:
    salt '*' pecl.update fuse

26.6.336 salt.modules.peeringdb

PeeringDB Module

New in version 2019.2.0.

Execution module for the basic interaction with the PeeringDB API.

While for GET operations (the functions prefixed by get_) the credentials are optional, there are some specific details that are visible only to authenticated users. Moreover, the credentials are required when adding or updating information. That means, the module can equally work out of the box without any further configuration with the limitations imposed by the PeeringDB API.

For complete API documentation, please refer to https://www.peeringdb.com/apidocs/.

Configuration (in the opts or Pillar):

    peeringdb:
      username: salt
      password: 5@1t

salt.modules.peeringdb.get_fac(**kwargs)
  Return the details of the facility identified using the search filters specified in the query.

  Note: If no id or filter arguments are specified, it will return all the possible facilities registered in PeeringDB.
  The available filters are documented at: https://www.peeringdb.com/apidocs/#/netfac/netfac_list

  CLI Example:
    salt '*' peeringdb.get_fac id=1774
    salt '*' peeringdb.get_fac state=UT
salt.modules.peeringdb.get_ix(**kwargs)
Return the details of an IX (Internet Exchange) using the search filters specified in the query.

**Note:** If no `id` or filter arguments are specified, it will return all the possible IXs registered in PeeringDB.
The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ix/ix_list

**CLI Example:**
```
salt '*' peeringdb.get_ix id=1
salt '*' peeringdb.get_ix city='Milwaukee'
```

salt.modules.peeringdb.get_ifac(**kwargs)
Return the details of an IX (Internet Exchange) facility using the search filters specified in the query.

**Note:** If no `id` or filter arguments are specified, it will return all the possible IX facilities registered in PeeringDB.
The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ixfac/ixfac_list

**CLI Example:**
```
salt '*' peeringdb.get_ifac id=1
salt '*' peeringdb.get_ifac city='Milwaukee'
```

salt.modules.peeringdb.get_ixlan(**kwargs)
Return the details of an IX (Internet Exchange) together with the networks available in this location (and their details), using the search filters specified in the query.

**Note:** If no `id` or filter arguments are specified, it will return all the possible IX LAN facilities registered in PeeringDB.
The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ixlan/ixlan_list

**CLI Example:**
```
salt '*' peeringdb.get_ixlan id=780
salt '*' peeringdb.get_ixlan city='Milwaukee'
```

salt.modules.peeringdb.get_ixpfx(**kwargs)
Return the details of an IX (Internet Exchange) together with the PeeringDB IDs of the networks available in this location, using the search filters specified in the query.

**Note:** If no `id` or filter arguments are specified, it will return all the possible IX LAN facilities registered in PeeringDB.
The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ixpfx/ixpfx_list

**CLI Example:**
```
salt '*' peeringdb.get_ixpfx id=780
salt '*' peeringdb.get_ixpfx city='Milwaukee'
```
salt.modules.peeringdb.get_net(**kwargs)

Return the details of a network identified using the search filters specified in the query.

Note: If no id or filter arguments are specified, it will return all the possible networks registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/net/net_list

CLI Example:

```
salt '*' peeringdb.get_net id=4224
salt '*' peeringdb.get_net asn=13335
salt '*' peeringdb.get_net city='Salt Lake City'
salt '*' peeringdb.get_net name__startswith=GTT
```

salt.modules.peeringdb.get_netfac(**kwargs)

Return the list of facilities used by a particular network, given the id or other filters specified in the query.

Note: If no id or filter arguments are specified, it will return all the possible network facilities registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/netfac/netfac_list

CLI Example:

```
salt '*' peeringdb.get_netfac id=780
salt '*' peeringdb.get_netfac city='Milwaukee'
```

salt.modules.peeringdb.get_netixlan(**kwargs)

Return the IP addresses used by a particular network at all the IXs where it is available. The network is selected either via the id argument or the other filters specified in the query.

Note: If no id or filter arguments are specified, it will return all the possible IP addresses, of all networks, at all IXs, registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/netixlan/netixlan_list

CLI Example:

```
salt '*' peeringdb.get_netixlan asn=13335
salt '*' peeringdb.get_netixlan ipaddr4=185.1.114.25
```

salt.modules.peeringdb.get_org(**kwargs)

Return the details of an organisation together with the networks available in this location, using the search filters specified in the query.

Note: If no id or filter arguments are specified, it will return all the possible organisations registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/org/org_list

CLI Example:
salt modules.peeringdb.get_poc(**kwargs)
Return the details of a person of contact together using the search filters specified in the query.

Note: If no id or filter arguments are specified, it will return all the possible contacts registered in PeeringDB.
The available filters are documented at: https://www.peeringdb.com/apidocs/#/poc/poc_list

CLI Example:

salt '*' peeringdb.get_poc id=6721
salt '*' peeringdb.get_poc email__contains='@cloudflare.com'

26.6.337 salt.modules.pf

Control the OpenBSD packet filter (PF).

codeauthor
Jasper Lievisse Adriaanse <j@jasper.la>

New in version 2019.2.0.
salt.modules.pf.disable()
Disable the Packet Filter.

CLI Example:

salt '*' pf.disable

salt.modules.pf.enable()
Enable the Packet Filter.

CLI Example:

salt '*' pf.enable

salt.modules.pf.flush(modifier)
Flush the specified packet filter parameters.

modifier:
Should be one of the following:
• all
• info
• osfp
• rules
• sources
• states
• tables

Please refer to the OpenBSD pfctl(8) documentation for a detailed explanation of each command.

CLI Example:

salt '*' pf.flush states
salt.modules.pf.load(file='/etc/pf.conf', noop=False)

Load a ruleset from the specific file, overwriting the currently loaded ruleset.

**file:**
Full path to the file containing the ruleset.

**noop:**
Don't actually load the rules, just parse them.

CLI Example:
```
salt '*' pf.load /etc/pf.conf.d/lockdown.conf
```

salt.modules.pf.loglevel(level)

Set the debug level which limits the severity of log messages printed by pf(4).

**level:**
Log level. Should be one of the following: emerg, alert, crit, err, warning, notice, info or debug (OpenBSD); or none, urgent, misc, loud (FreeBSD).

CLI Example:
```
salt '*' pf.loglevel emerg
```

salt.modules.pf.show(modifier)

Show filter parameters.

**modifier:**
Modifier to apply for filtering. Only a useful subset of what pfctl supports can be used with Salt.

- rules
- states
- tables

CLI Example:
```
salt '*' pf.show rules
```

salt.modules.pf.table(command, table, **kwargs)

Apply a command on the specified table.

**table:**
Name of the table.

**command:**
Command to apply to the table. Supported commands are:

- add
- delete
- expire
- flush
- kill
- replace
- show
- test
- zero

Please refer to the OpenBSD pfctl(8) documentation for a detailed explanation of each command.

CLI Example:
```
salt '*' pf.table expire table=spam_hosts number=300
salt '*' pf.table add table=local_hosts addresses='["127.0.0.1", "::1"]'
```
### 26.6.338 salt.modules.philips_hue

Philips HUE lamps module for proxy.
New in version 2015.8.3.

### 26.6.339 salt.modules.pillar

Extract the pillar data for this minion

```python
salt.modules.pillar.data(*args, pillar=None, pillar_enc=None, pillarenv=None, saltenv=None)
```

- **pillar**: If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. These pillar variables will also override any variables of the same name in pillar or ext_pillar.
- **pillar_enc**: If specified, the data passed in the `pillar` argument will be passed through this renderer to decrypt it.

**Note**: This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the [Pillar Encryption](https://docs.saltstack.com/en/latest/ref/module/salt.modules.pillar.html) documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext_pillar rendering.

- **pillarenv**: Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion’s `pillarenv` option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.
- **saltenv**: Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**CLI Examples**:

```bash
salt '*' pillar.data
```

**salt.modules.pillar.ext(external, pillar~None)**

Changed in version 2016.3.6, 2016.11.3, 2017.7.0: The supported ext_pillar types are now tunable using the `on_demand_ext_pillar` config option. Earlier releases used a hard-coded default.

Generate the pillar and apply an explicit external pillar

- **external**: A single ext_pillar to add to the ext_pillar configuration. This must be passed as a single section from the ext_pillar configuration (see CLI examples below). For more complicated ext_pillar configurations, it can be helpful to use the Python shell to load YAML configuration into a dictionary, and figure out

```python
>>> import salt.utils.yaml
>>> ext_pillar = salt.utils.yaml.safe_load("""
... ext_pillar:
...  - git:
...    - issue38440 https://github.com/terminalmage/git_pillar:
...      - env: base
...    ")
>>> ext_pillar
{'ext_pillar': [{'git': [{'mybranch https://github.com/myuser/myrepo
(continues on next page)\n```
In the above example, the value to pass would be `{git: [{mybranch https://github.com/myuser/myrepo': [{env: 'base'}]}]}. Note that this would need to be quoted when passing on the CLI (as in the CLI examples below).

pillar

[None] If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. These pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

CLI Examples:

salt '*' pillar.ext '{libvirt: _}'
salt '*' pillar.ext "{'git': ['master https://github.com/myuser/myrepo']}"
salt '*' pillar.ext "{'git': [{mybranch https://github.com/myuser/myrepo
→': [{env: 'base'}]}]}"

salt.modules.pillar.fetch(key, default=<Constant.NOT_SET>, merge=False, merge_nested_lists=None, delimeter=':', pillarenv=None, saltenv=None)

New in version 0.14.0.

Attempt to retrieve the named value from in-memory pillar data. If the pillar key is not present in the in-memory pillar, then the value specified in the default option (described below) will be returned.

If the merge parameter is set to True, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed as:

```
pkg:apache
```

key

The pillar key to get value from

default

The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is not specified, then it will be an empty string, unless pillarenv is set to True, in which case an error will be raised.

merge

[False] If True, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7, 2016.11.4, 2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

merge_nested_lists

If set to False, lists nested within the retrieved pillar dictionary will overwrite lists in default. If set
to True, nested lists will be merged into lists in default. If unspecified (the default), this option is inherited from the pillar_merge_lists minion config option.

Note: This option is ignored when merge is set to False.

New in version 2016.11.6.

delimiter
Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

pillarenv
If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

saltenv
Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```bash
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

salt.modules.pillar.file_exists(path, saltenv=None)

New in version 2016.3.0.

This is a master-only function. Calling from the minion is not supported.

Use the given path and search relative to the pillar environments to see if a file exists at that path.

If the saltenv argument is given, restrict search to that environment only.

Will only work with pillar_roots, not external pillars.

Returns True if the file is found, and False otherwise.

path
The path to the file in question. Will be treated as a relative path

saltenv
Optional argument to restrict the search to a specific saltenv

CLI Example:

```bash
salt '*' pillar.file_exists foo/bar.sls
```

salt.modules.pillar.filter_by(lookup_dict, pillar, merge=None, default='default', base=None)

New in version 2017.7.0.

Look up the given pillar in a given dictionary and return the result

Parameters
• **lookup_dict** -- A dictionary, keyed by a pillar, containing a value or values relevant to systems matching that pillar. For example, a key could be a pillar for a role and the value could the name of a package on that particular OS.

The dictionary key can be a globbing pattern. The function will return the corresponding **lookup_dict** value where the pillar value matches the pattern. For example:

```
# this will render 'got some salt' if ``role`` begins with 'salt'
salt '*' pillar.filter_by '{salt*: got some salt,\n  default: salt is not here}' role
```

• **pillar** -- The name of a pillar to match with the system's pillar. For example, the value of the "role" pillar could be used to pull values from the **lookup_dict** dictionary.

The pillar value can be a list. The function will return the **lookup_dict** value for a first found item in the list matching one of the **lookup_dict** keys.

• **merge** -- A dictionary to merge with the results of the pillar selection from **lookup_dict**. This allows another dictionary to override the values in the **lookup_dict**.

• **default** -- default **lookup_dict**'s key used if the pillar does not exist or if the pillar value has no match on **lookup_dict**. If unspecified the value is "default".

• **base** -- A **lookup_dict** key to use for a base dictionary. The pillar-selected **lookup_dict** is merged over this and then finally the **merge** dictionary is merged. This allows common values for each case to be collected in the base and overridden by the pillar selection dictionary and the merge dictionary. Default is unset.

CLI Example:

```
salt '*' pillar.filter_by '{web: Serve it up, db: I query, default: x_x}' role
```

salt.modules.pillar.get(key, default=<Constant.NOT_SET>, merge=False, merge_nested_lists=None, delimiter=':', pillarenv=None, saltenv=None)

New in version 0.14.0.

Attempt to retrieve the named value from in-memory pillar data. If the pillar key is not present in the in-memory pillar, then the value specified in the **default** option (described below) will be returned.

If the merge parameter is set to **True**, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{"pkg": {"apache": 'httpd'}}
```

To retrieve the value associated with the **apache** key in the **pkg** dict this key can be passed as:

```
 pkg:apache
```

key

The pillar key to get value from

default

The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is not specified, then it will be an empty string, unless **pillar_raise_on_missing** is set to **True**, in which case an error will be raised.
merge
   [False] If True, the retrieved values will be merged into the passed default. When the default and
   the retrieved value are both dictionaries, the dictionaries will be recursively merged.

   New in version 2014.7.0.

   Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same
   type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an
   error in these cases.

merge_nested_lists
   If set to False, lists nested within the retrieved pillar dictionary will overwrite lists in default. If set
   to True, nested lists will be merged into lists in default. If unspecified (the default), this option is
   inherited from the pillar_merge_lists minion config option.

   Note: This option is ignored when merge is set to False.

   New in version 2016.11.6.

delimiter
   Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired
   key contains a colon. See CLI example below for usage.

   New in version 2014.7.0.

pillarenv
   If specified, this function will query the master to generate fresh pillar data on the fly, specifically from
   the requested pillar environment. Note that this can produce different pillar data than executing this
   function without an environment, as its normal behavior is just to return a value from minion’s pillar
   data in memory (which can be sourced from more than one pillar environment).

   Using this argument will not affect the pillar data in memory. It will however be slightly slower and
   use more resources on the master due to the need for the master to generate and send the minion fresh
   pillar data. This tradeoff in performance however allows for the use case where pillar data is desired
   only from a single environment.

   New in version 2017.7.0.

saltenv
   Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

   New in version 2017.7.0.

   CLI Example:

   ```
   salt '*' pillar.get pkg:apache
   salt '*' pillar.get abc::def|ghi delimiter='|'
   ```

   salt.modules.pillar.item(*args, default=None, delimiter=None, pillarenv=None, saltenv=None)

   New in version 0.16.2.

   Return one or more pillar entries from the in-memory pillar data.

delimiter
   Delimiter used to traverse nested dictionaries.

   Note: This is different from pillar.get in that no default value can be specified. pillar.get
   should probably still be used in most cases to retrieve nested pillar values, as it is a bit more flexible.
   One reason to use this function instead of pillar.get however is when it is desirable to retrieve the
   values of more than one key, since pillar.get can only retrieve one key at a time.
New in version 2015.8.0.

**pillarenv**
If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.6,2018.3.1.

**saltenv**
Included only for compatibility with **pillarenv_from_saltenv**, and is otherwise ignored.

New in version 2017.7.6,2018.3.1.

**CLI Examples:**

```bash
salt '*' pillar.item foo
salt '*' pillar.item foo:bar
salt '*' pillar.item foo bar baz
```

**salt.modules.pillar.items** *(args, pillar=None, pillar_enc=None, pillarenv=None, saltenv=None)*
Calls the master for a fresh pillar and generates the pillar data on the fly

Contrast with **raw()** which returns the pillar data that is currently loaded into the minion.

**pillar**
If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. these pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

**pillar_enc**
If specified, the data passed in the **pillar** argument will be passed through this renderer to decrypt it.

---

**Note:** This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the **Pillar Encryption** documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext_pillar rendering.

New in version 2017.7.0.

**pillarenv**
Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion’s **pillarenv** option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

New in version 2016.11.2.

**saltenv**
Included only for compatibility with **pillarenv_from_saltenv**, and is otherwise ignored.

**CLI Example:**

```
salt '*' pillar.items
```

**salt.modules.pillar.keys** *(key, delimiter='')*
New in version 2015.8.0.
Attempt to retrieve a list of keys from the named value from the pillar.

The value can also represent a value in a nested dict using a ":" delimiter for the dict, similar to how pillar.get works.

delimiter

Specify an alternate delimiter to use when traversing a nested dict

CLI Example:

```sh
salt 'web:sites' pillar.keys
```

salt.modules.pillar.ls(*args, pillar=None, pillar_enc=None, pillarenv=None, saltenv=None)

New in version 2015.8.0.

Calls the master for a fresh pillar, generates the pillar data on the fly (same as items()), but only shows the available main keys.

pillar

If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. These pillar variables will also override any variables of the same name in pillar or ext_pillar.

pillar_enc

If specified, the data passed in the pillar argument will be passed through this renderer to decrypt it.

**Note:** This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the Pillar Encryption documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext_pillar rendering.

pillarenv

Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion’s pillarenv option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

saltenv

Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

CLI Examples:

```sh
salt 'pillar.ls'
```

salt.modules.pillar.obfuscate(*args, pillar=None, pillar_enc=None, pillarenv=None, saltenv=None)

New in version 2015.8.0.

Same as items(), but replace pillar values with a simple type indication.

This is useful to avoid displaying sensitive information on console or flooding the console with long output, such as certificates. For many debug or control purposes, the stakes lie more in dispatching than in actual values.

In case the value is itself a collection type, obfuscation occurs within the value. For mapping types, keys are not obfuscated. Here are some examples:

- 'secret password' becomes '<str>'
- ['secret', 1] becomes ['<str>', '<int>']
- {'login': 'somelogin', 'pwd': 'secret'} becomes {'login': '<str>', 'pwd': '<str>'}

CLI Examples:

```sh
salt 'pillar.obfuscate'
```
salt.modules.pillar.raw(key=None)

Return the raw pillar data that is currently loaded into the minion.

Contrast with items() which calls the master to fetch the most up-to-date Pillar.

CLI Example:
```
salt '*' pillar.raw
```

With the optional key argument, you can select a subtree of the pillar raw data:
```
salt '*' pillar.raw key='roles'
```

26.6.340 salt.modules.pip

Install Python packages with pip to either the system or a virtualenv

Windows Support

New in version 2014.7.4.

Salt now uses a portable python. As a result the entire pip module is now functional on the salt installation itself. You can pip install dependencies for your custom modules. You can even upgrade salt itself using pip. For this to work properly, you must specify the Current Working Directory (cwd) and the Pip Binary (bin_env) salt should use. The variable pip_bin can be either a virtualenv path or the path to the pip binary itself.

For example, the following command will list all software installed using pip to your current salt environment:
```
salt <minion> pip.list cwd='C:\salt\bin\Scripts' bin_env='C:\salt\bin\Scripts\pip.exe'
```

Specifying the cwd and bin_env options ensures you're modifying the salt environment. If these are omitted, it will default to the local installation of python. If python is not installed locally it will fail saying it couldn’t find pip.

State File Support

This functionality works in states as well. If you need to pip install colorama with a state, for example, the following will work:
```
install_colorama:
  pip.installed:
    - name: colorama
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - upgrade: True
```
Upgrading Salt using Pip

You can now update salt using pip to any version from the 2014.7 branch forward. Previous version require recompiling some of the dependencies which is painful in windows.

To do this you just use pip with git to update to the version you want and then restart the service. Here is a sample state file that upgrades salt to the head of the 2015.5 branch:

```
install_salt:
  pip.installed:
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - editable: git+https://github.com/saltstack/salt@2015.5#egg=salt
    - upgrade: True

restart_service:
  service.running:
    - name: salt-minion
    - enable: True
    - watch:
      - pip: install_salt
```

Note: If you're having problems, you might try doubling the back slashes. For example, cwd: 'C:salt\bin\scripts'. Sometimes python thinks the single back slash is an escape character.

There is a known incompatibility between Python2 pip>=10.* and Salt <=2018.3.0. The issue is described here: https://github.com/saltstack/salt/issues/46163

```
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

- **bin_env**
  Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.

- **user**
  The user under which to run pip

- **cwd**
  Directory from which to run pip

Note: If the version of pip available is older than 8.0.3, the list will not include the packages pip, wheel, setuptools, or distribute even if they are installed.

CLI Example:

```
salt '*' pip.freeze bin_env=/home/code/path/to/virtualenv
```
salt.modules.pip.install(pkgs=None, requirements=None, bin_env=None, use_wheel=False, no_use_wheel=False, log=None, proxy=None, timeout=None, editable=None, find_links=None, index_url=None, extra_index_url=None, no_index=False, mirrors=None, build=None, target=None, download=None, download_cache=None, source=None, upgrade=False, force_reinstall=False, ignore_installed=False, exists_action=None, no_deps=False, no_install=False, no_download=False, global_options=None, install_options=None, user=None, cwd=None, pre_releases=False, cert=None, allow_all_external=False, allow_external=None, allow_unverified=None, process_dependency_links=False, saltenv='base', env_vars=None, use_vt=False, trusted_host=None, no_cache_dir=False, extra_args=None, cache_dir=None, no_binary=None, disable_version_check=False, **kwargs)

Install packages with pip

Install packages individually or from a pip requirements file. Install packages globally or to a virtualenv.

**pkgs**
Comma separated list of packages to install

**requirements**
Path to requirements

**bin_env**
Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.

**Note:** For Windows, if the pip module is being used to upgrade the pip package, bin_env should be the path to the virtualenv or to the python binary that should be used. The pip command is unable to upgrade itself in Windows.

**use_wheel**
Prefer wheel archives (requires pip>=1.4)

**no_use_wheel**
Force to not use wheel archives (requires pip>=1.4,<10.0.0)

**no_binary**
Force to not use binary packages (requires pip >= 7.0.0) Accepts either: all: to disable all binary packages, :none: to empty the set, or one or more package names with commas between them

**log**
Log file where a complete (maximum verbosity) record will be kept. If this file doesn't exist and the parent directory is writeable, it will be created.

**proxy**
Specify a proxy in the form user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

**Note:** If the Minion has a globally configured proxy - it will be used even if no proxy was set here. To explicitly disable proxy for pip you should pass False as a value.

**timeout**
Set the socket timeout (default 15 seconds)

**editable**
Install something editable (e.g. git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed)

**find_links**
URL to search for packages
index_url
   Base URL of Python Package Index
extra_index_url
   Extra URLs of package indexes to use in addition to index_url
no_index
   Ignore package index
mirrors
   Specific mirror URL(s) to query (automatically adds --use-mirrors)

Warning: This option has been deprecated and removed in pip version 7.0.0. Please use index_url and/or extra_index_url instead.

build
   Unpack packages into build dir
target
   Install packages into target dir
download
   Download packages into download instead of installing them
download_cache | cache_dir
   Cache downloaded packages in download_cache or cache_dir dir
source
   Check out editable packages into source dir
upgrade
   Upgrade all packages to the newest available version
force_reinstall
   When upgrading, reinstall all packages even if they are already up-to-date.
ignore_installed
   Ignore the installed packages (reinstalling instead)
exists_action
   Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup
no_deps
   Ignore package dependencies
no_install
   Download and unpack all packages, but don’t actually install them
no_download
   Don’t download any packages, just install the ones already downloaded (completes an install run with --no-install)
install_options
   Extra arguments to be supplied to the setup.py install command (e.g. like --install-option='--install-scripts=/usr/local/bin'). Use multiple --install-option options to pass multiple options to setup.py install. If you are using an option with a directory path, be sure to use absolute path.
global_options
   Extra global options to be supplied to the setup.py call before the install command.
user
   The user under which to run pip
cwd
   Directory from which to run pip
pre_releases
   Include pre-releases in the available versions
cert
   Provide a path to an alternate CA bundle
allow_all_external
Allow the installation of all externally hosted files

**allow_external**
Allow the installation of externally hosted files (comma separated list)

**allow_unverified**
Allow the installation of insecure and unverifiable files (comma separated list)

**process_dependency_links**
Enable the processing of dependency links

**env_vars**
Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs INCLUDE_PATH set to pick up a header file while compiling. This must be in the form of a dictionary or a mapping.

Example:

```
salt '*' pip.install django_app env_vars="{'CUSTOM_PATH': '/opt/django_app'}"
```

**trusted_host**
Mark this host as trusted, even though it does not have valid or any HTTPS.

**use_vt**
Use VT terminal emulation (see output while installing)

**no_cache_dir**
Disable the cache.

**extra_args**
pip keyword and positional arguments not yet implemented in salt

Example:

```
salt '*' pip.install pandas extra_args="[{'--latest-pip-kwarg':'param'}, '--latest-pip-arg']"
```

**Warning:** If unsupported options are passed here that are not supported in a minion's version of pip, a *No such option error* will be thrown.

Will be translated into the following pip command:

```
pip install pandas --latest-pip-kwarg param --latest-pip-arg
```

**disable_version_check**
Pip may periodically check PyPI to determine whether a new version of pip is available to download. Passing True for this option disables that check.

CLI Example:

```
salt '*' pip.install <package name>,<package2 name>
salt '*' pip.install requirements=/path/to/requirements.txt
salt '*' pip.install <package name> bin_env=/path/to/virtualenv
salt '*' pip.install <package name> bin_env=/path/to/pip_bin
```

Complicated CLI Example:

```
salt '*' pip.install markdown,django editable=git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed upgrade=True no_deps=True
```

salt.modules.pip.is_installed(*pkgname*, *bin_env=*, *user=*, *cwd=*)

New in version 2018.3.0.
Changed in version 3006.0.
Filter list of installed modules and return True if `pkgname` exists in the list of packages installed.

CLI Example:
```
salt '*' pip.is_installed salt
```

```
salt.modules.pip.list_ (prefix=None, bin_env=None, user=None, cwd=None, env_vars=None, **kwargs)
```

Changed in version 3006.0.

Output list of installed apps from `pip list` in JSON format and check to see if `prefix` exists in the list of packages installed.

Note: If the version of pip available is older than 9.0.0, parsing the `freeze` function output will be used to determine the name and version of installed modules.

CLI Example:
```
salt '*' pip.list salt
```

```
salt.modules.pip.list_all_versions (pkg, bin_env=None, include_alpha=False, include_beta=False, include_rc=False, user=None, cwd=None, index_url=None, extra_index_url=None)
```

New in version 2017.7.3.
List all available versions of a pip package

```
pkg
```
The package to check

```
bin_env
```
Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.

```
include_alpha
```
Include alpha versions in the list

```
include_beta
```
Include beta versions in the list

```
include_rc
```
Include release candidates versions in the list

```
user
```
The user under which to run pip

```
cwd
```
Directory from which to run pip

```
index_url
```
Base URL of Python Package Index .. versionadded:: 2019.2.0

```
extra_index_url
```
Additional URL of Python Package Index .. versionadded:: 2019.2.0

CLI Example:
```
salt '*' pip.list_all_versions <package name>
```

```
salt.modules.pip.list_freeze_parse (prefix=None, bin_env=None, user=None, cwd=None, env_vars=None, **kwargs)
```

New in version 3006.0.
Filter list of installed apps from **freeze** and check to see if **prefix** exists in the list of packages installed.

**Note:** If the version of pip available is older than 8.0.3, the packages **wheel**, **setuptools**, and **distribute** will not be reported by this function even if they are installed. Unlike **pip.freeze**, this function always reports the version of pip which is installed.

CLI Example:

```
salt '*' pip.list_freeze_parse salt
```

**salt.modules.pip.list_upgrades** *(bin_env=None, user=None, cwd=None)*

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pip.list_upgrades
```

**salt.modules.pip.uninstall** *(pkgs=None, requirements=None, bin_env=None, log=None, proxy=None, timeout=None, user=None, cwd=None, saltenv='base', use_vt=False)*

Uninstall packages individually or from a pip requirements file

- **pkgs**
  - comma separated list of packages to install

- **requirements**
  - Path to requirements file

- **bin_env**
  - Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`). If a directory path is specified, it is assumed to be a virtualenv.

- **log**
  - Log file where a complete (maximum verbosity) record will be kept

- **proxy**
  - Specify a proxy in the format `user:passwd@proxy.server:port`. Note that the `user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.

**Note:** If the Minion has a globally configured proxy - it will be used even if no proxy was set here. To explicitly disable proxy for pip you should pass `False` as a value.

- **timeout**
  - Set the socket timeout (default 15 seconds)

- **user**
  - The user under which to run pip

- **cwd**
  - Directory from which to run pip

- **use_vt**
  - Use VT terminal emulation (see output while installing)

CLI Example:

```
salt '*' pip.uninstall <package name>,<package2 name>
salt '*' pip.uninstall requirements=/path/to/requirements.txt
salt '*' pip.uninstall <package name> bin_env=/path/to/virtualenv
salt '*' pip.uninstall <package name> bin_env=/path/to/pip_bin
```
**salt.modules.pip.upgrade** *(bin_env=None, user=None, cwd=None, use_vt=False)*

New in version 2015.5.0.

Upgrades outdated pip packages.

**Note:** On Windows you can't update salt from pip using salt, so salt will be skipped

Returns a dict containing the changes.

```
{'<package>': {'old': '<old-version>',
    'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pip.upgrade
```

**salt.modules.pip.upgrade_available** *(pkg, bin_env=None, user=None, cwd=None)*

New in version 2015.5.0.

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pip.upgrade_available <package name>
```

**salt.modules.pip.version** *(bin_env=None, cwd=None, user=None)*

New in version 0.17.0.

Returns the version of pip. Use `bin_env` to specify the path to a virtualenv and get the version of pip in that virtualenv.

If unable to detect the pip version, returns `None`.

Changed in version 3001.1: The `user` parameter was added, to allow specifying the user who runs the version command.

CLI Example:

```
salt '*' pip.version
```

### 26.6.341 salt.modules.pkg_resource

Resources needed by pkg providers

**salt.modules.pkg_resource.add_pkg** *(pkgs, name, pkgver)*

Add a package to a dict of installed packages.

CLI Example:

```
salt '*' pkg_resource.add_pkg '{}' bind 9
```

**salt.modules.pkg_resource.check_extra_requirements** *(pkgname, pkgver)*

Check if the installed package already has the given requirements. This function will return the result of `pkg.check_extra_requirements` if this function exists for the minion, otherwise it will return `True`.

CLI Example:
salt '*/' pkg_resource.check_extra_requirements <pkgname> <extra_requirements>

```
salt.modules.pkg_resource.format_pkg_list(packages, versions_as_list, attr)
Formats packages according to parameters for list_pkgs.
```

```
salt.modules.pkg_resource.format_version(epoch, version, release)
Formats a version string for list_pkgs.
```

```
salt.modules.pkg_resource.pack_sources(sources, normalize=True)
Accepts list of dicts (or a string representing a list of dicts) and packs the key/value pairs into a single dict.
'
[["foo": "salt://foo.rpm"],{"bar": "salt://bar.rpm"}]'
would become {{"foo": "salt://foo.rpm", "bar": "salt://bar.rpm"}}

normalize
[True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

CLI Example:
```
salt '*/' pkg_resource.pack_sources '[["foo": "salt://foo.rpm"],{"bar": "salt://bar.rpm"}]'
```

```
salt.modules.pkg_resource.parse_targets(name=None, pkgs=None, sources=None, saltenv='base', normalize=True, **kwargs)
Parses the input to pkg.install and returns back the package(s) to be installed. Returns a list of packages, as well as a string noting whether the packages are to come from a repository or a binary package.

CLI Example:
```
salt '*/' pkg_resource.parse_targets
```

```
salt.modules.pkg_resource.sort_pkglist(pkgs)
Accepts a dict obtained from pkg.list_pkgs() and sorts in place the list of versions for any packages that have multiple versions installed, so that two package lists can be compared to one another.

CLI Example:
```
salt '*/' pkg_resource.sort_pkglist '[[3.45", "2.13"]'
```

```
salt.modules.pkg_resource.stringify(pkgs)
Takes a dict of package name/version information and joins each list of installed versions into a string.

CLI Example:
```
salt '*/' pkg_resource.stringify 'vim: 7.127'
```

```
salt.modules.pkg_resource.version(*names, **kwargs)
Common interface for obtaining the version of installed packages.

CLI Example:
```
salt '*' pkg_resource.version vim
salt '*' pkg_resource.version foo bar baz
salt '*' pkg_resource.version 'python*'

salt.modules.pkg_resource.version_clean(verstr)
Clean the version string removing extra data. This function will simply try to call pkg.version_clean.

CLI Example:
salt '*' pkg_resource.version_clean <version_string>

salt.modules.pkg_resource.version_compare(ver1, oper, ver2, ignore_epoch=False)
New in version 3001.
Perform a version comparison, using (where available) platform-specific version comparison tools to make the comparison.

ver1
The first version to be compared

oper
One of ==, !=, >=, <=, >, <

ver2
The second version to be compared

Note: To avoid shell interpretation, each of the above values should be quoted when this function is used on the CLI.

ignore_epoch
[False] If True, both package versions will have their epoch prefix stripped before comparison.

This function is useful in Jinja templates, to perform specific actions when a package's version meets certain criteria. For example:

{% set postfix_version = salt.pkg.version('postfix') %}
{% if postfix_version and salt.pkg_resource.version_compare(postfix_version, '>=', '3.3', ignore_epoch=True) %}
{#- do stuff #-}
{% endif %}

CLI Examples:
salt myminion pkg_resource.version_compare '3.5' '!=' '2.4'
salt myminion pkg_resource.version_compare '3.5' '<=' '2.4' ignore_epoch=True
26.6.342 salt.modules.pkgin

Package support for pkgin based systems, inspired from freebsdpkg module

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

salt.modules.pkgin.available_version(*names, **kwargs)

This function is an alias of latest_version.
Changed in version 2016.3.0.

Return the latest version of the named package available for upgrade or installation.
If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

salt.modules.pkgin.file_dict(*packages, **kwargs)

Changed in version 2016.3.0.

List the files that belong to a package.

CLI Examples:

```bash
salt '*' pkg.file_dict nginx
salt '*' pkg.file_dict nginx varnish
```

salt.modules.pkgin.file_list(package, **kwargs)

List the files that belong to a package.

CLI Examples:

```bash
salt '*' pkg.file_list nginx
```

salt.modules.pkgin.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)

Install the passed package

name
The name of the package to be installed.

refresh
Whether or not to refresh the package database before installing.

fromrepo
Specify a package repository to install from.

Multiple Package Installation Options:

pkgs
A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```bash
salt '*' pkg.install pkgs='["foo","bar"]'
```
Salt Documentation, Release 3007.1

sources
A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and
the values being the source URI or local path to the package.
CLI Example:
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar":
,→"salt://bar.deb"}]'
Return a dict containing the new package names and versions:
{'<package>': {'old': '<old-version>',
'new': '<new-version>'}}
CLI Example:
salt '*' pkg.install <package name>
salt.modules.pkgin.latest_version(*names, **kwargs)
Changed in version 2016.3.0.
Return the latest version of the named package available for upgrade or installation.
If the latest version of a given package is already installed, an empty string will be returned for that package.
CLI Example:
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
salt.modules.pkgin.list_pkgs(versions_as_list=False, **kwargs)
Changed in version 2016.3.0.
List the packages currently installed as a dict:
{'<package_name>': '<version>'}
CLI Example:
salt '*' pkg.list_pkgs
salt.modules.pkgin.list_upgrades(refresh=True, **kwargs)
List all available package upgrades.
New in version 2018.3.0.
refresh
Whether or not to refresh the package database before installing.
CLI Example:
salt '*' pkg.list_upgrades
salt.modules.pkgin.normalize_name(pkgs, **kwargs)
Normalize package names
Note: Nothing special to do to normalize, just return the original. (We do need it to be compatible with the
pkg_resource provider.)

26.6. execution modules

2707


salt.modules.pkgin.purge(name=None, pkgs=None, **kwargs)

Package purges are not supported, this function is identical to remove().

name
The name of the package to be deleted.

Multiple Package Options:

pkgs
A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.pkgin.refresh_db(force=False, **kwargs)

Use pkg update to get latest pkg_summary

force
Pass -f so that the cache is always refreshed.

New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.pkgin.remove(name=None, pkgs=None, **kwargs)

name
The name of the package to be deleted.

Multiple Package Options:

pkgs
A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.pkgin.search(pkg_name, **kwargs)

Searches for an exact match using pkgin ^package$

CLI Example:

```
salt '*' pkg.search 'mysql-server'
```

salt.modules.pkgin.upgrade(refresh=True, pkgs=None, **kwargs)

Run pkg upgrade, if pkgin used. Otherwise do nothing

refresh
Whether or not to refresh the package database before installing.

Multiple Package Upgrade Options:
pkgs
A list of packages to upgrade from a software repository. Must be passed as a python list.

CLI Example:
```
salt '*' pkg.upgrade pkgs='["foo","bar"]'
```

Returns a dictionary containing the changes:
```

{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example:
```
salt '*' pkg.upgrade
```

---

salt.modules.pkgin.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

---

26.6.343 salt.modules.pkgng

Support for pkgng, the new package manager for FreeBSD

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

---

**Warning:** This module has been completely rewritten. Up to and including version 0.17.x, it was available as the pkgng module, (pkgng.install, pkgng.delete, etc.), but moving forward this module will no longer be available as pkgng, as it will behave like a normal Salt pkg provider. The documentation below should not be considered to apply to this module in versions <= 0.17.x. If your minion is running a 0.17.x release or older, then the documentation for this module can be viewed using the `sys.doc` function:
```
salt bsdminion sys.doc pkgng
```

This module provides an interface to pkg(8). It acts as the default package provider for FreeBSD 10 and newer. For FreeBSD hosts which have been upgraded to use pkgng, you will need to override the pkg provider by setting the `providers` parameter in your Minion config file, in order to use this module to manage packages, like so:

```
providers:
  pkg: pkgng
```

salt.modules.pkgng.audit(jail=None, chroot=None, root=None)

Audits installed packages against known vulnerabilities

CLI Example:
salt '*' pkg.audit

**jail**  
Audit packages within the specified jail  
CLI Example:  
```salt '*' pkg.audit jail=<jail name or id>```

**chroot**  
Audit packages within the specified chroot (ignored if jail is specified)

**root**  
Audit packages within the specified root (ignored if jail is specified)

CLI Example:  
```salt '*' pkg.audit chroot=/path/to/chroot```

**salt.modules.pkgng.autoremove** *(jail=None, chroot=None, root=None, dryrun=False)*  
Delete packages which were automatically installed as dependencies and are not required anymore.  
**dryrun**  
Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.  
CLI Example:

```salt '*' pkg.autoremove  
salt '*' pkg.autoremove jail=<jail name or id>  
salt '*' pkg.autoremove dryrun=True  
salt '*' pkg.autoremove jail=<jail name or id> dryrun=True```

**salt.modules.pkgng.available_version** *(\*names, **kwargs)*  
This function is an alias of latest_version.  
Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.  
If the latest version of a given package is already installed, an empty string will be returned for that package.  
CLI Example:

```salt '*' pkg.latest_version <package name>  
salt '*' pkg.latest_version <package name> jail=<jail name or id>  
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot```

**salt.modules.pkgng.backup** *(file_name, jail=None, chroot=None, root=None)*  
Export installed packages into yaml+mtree file  
CLI Example:  
```salt '*' pkg.backup /tmp/pkg```

**jail**  
Backup packages from the specified jail. Note that this will run the command within the jail, and so the path to the backup file will be relative to the root of the jail  
CLI Example:
### Salt Documentation, Release 3007.1

**salt '•' pkg.backup /tmp/pkg jail=<jail name or id>

**chroot**
Backup packages from the specified chroot (ignored if jail is specified). Note that this will run the command within the chroot, and so the path to the backup file will be relative to the root of the chroot.

**root**
Backup packages from the specified root (ignored if jail is specified). Note that this will run the command within the root, and so the path to the backup file will be relative to the root of the root.

CLI Example:

```bash
salt '•' pkg.backup /tmp/pkg chroot=/path/to/chroot
```

**salt.modules.pkgng.check**(jail=None, chroot=None, root=None, depends=False, recompute=False, checksum=False, checklibs=False)

Sanity checks installed packages

**jail**
Perform the sanity check in the specified jail

CLI Example:

```bash
salt '•' pkg.check jail=<jail name or id>
```

**chroot**
Perform the sanity check in the specified chroot (ignored if jail is specified)

**root**
Perform the sanity check in the specified root (ignored if jail is specified)

CLI Example:

```bash
salt '•' pkg.check chroot=/path/to/chroot
```

Of the below, at least one must be set to True.

**depends**
Check for and install missing dependencies.

CLI Example:

```bash
salt '•' pkg.check depends=True
```

**recompute**
Recompute sizes and checksums of installed packages.

CLI Example:

```bash
salt '•' pkg.check recompute=True
```

**checksum**
Find invalid checksums for installed packages.

CLI Example:

```bash
salt '•' pkg.check checksum=True
```

**checklibs**
Regenerates the library dependency metadata for a package.

CLI Example:

```bash
salt '•' pkg.check checklibs=True
```
salt.modules.pkgng.clean(Jail=None, chroot=None, root=None, clean_all=False, dryrun=False)

Cleans the local cache of fetched remote packages

CLI Example:

```
salt '*' pkg.clean
```

**jail**

Cleans the package cache in the specified jail

CLI Example:

```
salt '*' pkg.clean jail=<jail name or id>
```

**chroot**

Cleans the package cache in the specified chroot (ignored if jail is specified)

**root**

Cleans the package cache in the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.clean chroot=/path/to/chroot
```

**clean_all**

Clean all packages from the local cache (not just those that have been superseded by newer versions).

CLI Example:

```
salt '*' pkg.clean clean_all=True
```

**dryrun**

Dry-run mode. This list of changes to the local cache is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.clean dryrun=True
```

salt.modules.pkgng.delete(name=None, pkgs=None, jail=None, chroot=None, root=None, all_installed=False, force=False, glob=False, dryrun=False, recurse=False, regex=False, pcre=False, **kwargs)

This function is an alias of remove.

Remove a package from the database and system

**Note:** This function can accessed using pkg.delete in addition to pkg.remove, to more closely match the CLI usage of pkg(8).

**name**

The package to remove

CLI Example:

```
salt '*' pkg.remove <package name>
```

**jail**

Delete the package from the specified jail
chroot
Delete the package from the specified chroot (ignored if jail is specified)

root
Delete the package from the specified root (ignored if jail is specified)

all_installed
Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:
```
salt '*' pkg.remove all all_installed=True force=True
```

force
Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:
```
salt '*' pkg.remove <package name> force=True
```

glob
Treat the package names as shell glob patterns.

CLI Example:
```
salt '*' pkg.remove <package name> glob=True
```

dryrun
Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:
```
salt '*' pkg.remove <package name> dryrun=True
```

recurse
Delete all packages that require the listed package as well.

CLI Example:
```
salt '*' pkg.remove <package name> recurse=True
```

regex
Treat the package names as regular expressions.

CLI Example:
```
salt '*' pkg.remove <regular expression> regex=True
```

pcre
Treat the package names as extended regular expressions.

CLI Example:
```
salt '*' pkg.remove <extended regular expression> pcre=True
```

salt.modules.pkgng.fetch(name, jail=None, chroot=None, root=None, fetch_all=False, quiet=False, fromrepo=None, glob=True, regex=False, pcre=False, local=False, depends=False)

Fetches remote packages

CLI Example:
Salt Documentation, Release 3007.1

```
salt '*' pkg.fetch <package name>
```

**jail**
Fetch package in the specified jail

CLI Example:
```
salt '*' pkg.fetch <package name> jail=<jail name or id>
```

**chroot**
Fetch package in the specified chroot (ignored if jail is specified)

**root**
Fetch package in the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.fetch <package name> chroot=/path/to/chroot
```

**fetch_all**
Fetch all packages.

CLI Example:
```
salt '*' pkg.fetch <package name> fetch_all=True
```

**quiet**
Quiet mode. Show less output.

CLI Example:
```
salt '*' pkg.fetch <package name> quiet=True
```

**fromrepo**
Fetches packages from the given repo if multiple repo support is enabled. See pkg.conf(5).

CLI Example:
```
salt '*' pkg.fetch <package name> fromrepo=repo
```

**glob**
Treat pkg_name as a shell glob pattern.

CLI Example:
```
salt '*' pkg.fetch <package name> glob=True
```

**regex**
Treat pkg_name as a regular expression.

CLI Example:
```
salt '*' pkg.fetch <regular expression> regex=True
```

**pcre**
Treat pkg_name as an extended regular expression.

CLI Example:
```
salt '*' pkg.fetch <extended regular expression> pcre=True
```

**local**
Skip updating the repository catalogs with pkg-update(8). Use the local cache only.

CLI Example:
salt '...' pkg.fetch <package name> local=True

depends
Fetch the package and its dependencies as well.

CLI Example:
salt '...' pkg.fetch <package name> depends=True

salt.modules.pkgng.hold(name=None, pkgs=None, **kwargs)
Version-lock packages

Note: This function is provided primarily for compatibility with some parts of states.pkg. Consider using pkg.lock instead.

name
The name of the package to be held.

Multiple Package Options:

pkgs
A list of packages to hold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:
salt '...' pkg.hold <package name>
salt '...' pkg.hold pkgs='["foo", "bar"]'

salt.modules.pkgng.info(names, **kwargs)
This function is an alias of version.
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Note: This function can accessed using pkg.info in addition to pkg.version, to more closely match the CLI usage of pkg(8).

jail
Get package version information for the specified jail

chroot
Get package version information for the specified chroot (ignored if jail is specified)

root
Get package version information for the specified root (ignored if jail is specified)

with_origin
[False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:
salt '...' pkg.version <package name>
salt '...' pkg.version <package name> jail=<jail name or id>
salt '...' pkg.version <package1> <package2> <package3> ...
salt.modules.pkgng.install(name=None, fromrepo=None, pkgs=None, sources=None, jail=None, chroot=None, root=None, orphan=False, force=False, globs=False, local=False, dryrun=False, quiet=False, reinstall_requires=False, regex=False, pcre=False, batch=False, **kwargs)

Install package(s) from a repository

name
The name of the package to install

CLI Example:

```
salt '*' pkg.install <package name>
```

jail
Install the package into the specified jail

chroot
Install the package into the specified chroot (ignored if jail is specified)

root
Install the package into the specified root (ignored if jail is specified)

orphan
Mark the installed package as orphan. Will be automatically removed if no other packages depend on them. For more information please refer to pkg-autoremove(8).

CLI Example:

```
salt '*' pkg.install <package name> orphan=True
```

force
Force the reinstallation of the package if already installed.

CLI Example:

```
salt '*' pkg.install <package name> force=True
```

glob
Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.install <package name> glob=True
```

local
Do not update the repository catalogs with pkg-update(8). A value of True here is equivalent to using the -U flag with pkg install.

CLI Example:

```
salt '*' pkg.install <package name> local=True
```

dryrun
Dru-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.install <package name> dryrun=True
```

quiet
Force quiet output, except when dryrun is used, where pkg install will always show packages to be installed, upgraded or deleted.

CLI Example:
salt '*' pkg.install <package name> quiet=True

reinstall_requires
When used with force, reinstalls any packages that require the given package.

CLI Example:
salt '*' pkg.install <package name> reinstall_requires=True
    force=True

Changed in version 2014.7.0: require kwarg renamed to reinstall_requires

fromrepo
In multi-repo mode, override the pkg.conf ordering and only attempt to download packages from the
named repository.

CLI Example:
salt '*' pkg.install <package name> fromrepo=repo

regex
Treat the package names as a regular expression

CLI Example:
salt '*' pkg.install <regular expression> regex=True

pcre
Treat the package names as extended regular expressions.

CLI Example:

batch
Use BATCH=true for pkg install, skipping all questions. Be careful when using in production.

CLI Example:
salt '*' pkg.install <package name> batch=True

salt.modules.pkgng.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation. If more than one package
name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot

salt.modules.pkgng.list_locked(**kwargs)
Query the package database those packages which are locked against reinstallation, modification or deletion.

Returns returns a list of package names with version strings

CLI Example:
salt '*' pkg.list_locked
Salt Documentation, Release 3007.1

jail
List locked packages within the specified jail
CLI Example:
salt '*' pkg.list_locked jail=<jail name or id>

chroot
List locked packages within the specified chroot (ignored if jail is specified)
CLI Example:
salt '*' pkg.list_locked chroot=/path/to/chroot

root
List locked packages within the specified root (ignored if jail is specified)
CLI Example:
salt '*' pkg.list_locked root=/path/to/chroot

salt.modules.pkgng.list_pkgs (versions_as_list=False, jail=None, chroot=None, root=None, with_origin=False, **kwargs)
List the packages currently installed as a dict:
{
'<package_name>': '<version>'
}

jail
List the packages in the specified jail
chroot
List the packages in the specified chroot (ignored if jail is specified)
root
List the packages in the specified root (ignored if jail is specified)
with_origin
[False] Return a nested dictionary containing both the origin name and version for each installed package.
New in version 2014.1.0.
CLI Example:
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs jail=<jail name or id>
salt '*' pkg.list_pkgs chroot=/path/to/chroot

salt.modules.pkgng.list_upgrades (refresh=True, **kwargs)
List those packages for which an upgrade is available
The fromrepo argument is also supported, as used in pkg states.
CLI Example:
salt '*' pkg.list_upgrades

jail
List upgrades within the specified jail
CLI Example:
salt '*' pkg.list_upgrades jail=<jail name or id>

**chroot**
List upgrades within the specified chroot (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.list_upgrades chroot=/path/to/chroot
```

**root**
List upgrades within the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.list_upgrades root=/path/to/chroot
```

salt.modules.pkgng.lock(name, **kwargs)
Lock the named package against reinstallation, modification or deletion.
Returns True if the named package was successfully locked.

CLI Example:

```
salt '*' pkg.lock <package name>
```

**jail**
Lock packages within the specified jail

CLI Example:

```
salt '*' pkg.lock <package name> jail=<jail name or id>
```

**chroot**
Lock packages within the specified chroot (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.lock <package name> chroot=/path/to/chroot
```

**root**
Lock packages within the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.lock <package name> root=/path/to/chroot
```

salt.modules.pkgng.locked(name, **kwargs)
Query the package database to determine if the named package is locked against reinstallation, modification or deletion.
Returns True if the named package is locked, False otherwise.

CLI Example:

```
salt '*' pkg.locked <package name>
```

**jail**
Test if a package is locked within the specified jail

CLI Example:
chroot
Test if a package is locked within the specified chroot (ignored if jail is specified)
CLI Example:
```
salt '*' pkg.locked <package name> chroot=/path/to/chroot
```

root
Test if a package is locked within the specified root (ignored if jail is specified)
CLI Example:
```
salt '*' pkg.locked <package name> root=/path/to/chroot
```

 był
Return dict of uncommented global variables.
CLI Example:
```
salt '*' pkg.parse_config
```

NOTE: not working properly right now

salt.modules.pkgng.purge
(name=None, pkgs=None, jail=None, chroot=None, root=None, all_installed=False, force=False, glob=False, dryrun=False, recurse=False, regex=False, pcre=False, **kwargs)
This function is an alias of remove.
Remove a package from the database and system

name
The package to remove
CLI Example:
```
salt '*' pkg.remove <package name>
```

jail
Delete the package from the specified jail

chroot
Delete the package from the specified chroot (ignored if jail is specified)

root
Delete the package from the specified root (ignored if jail is specified)

all_installed
Deletes all installed packages from the system and empties the database. USE WITH CAU-
TION!
CLI Example:
```
salt '*' pkg.remove all all_installed=True force=True
```

force
Forces packages to be removed despite leaving unresolved dependencies.
CLI Example:
glob
Treat the package names as shell glob patterns.
CLI Example:
```
salt '*' pkg.remove <package name> glob=True
```

dryrun
Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.
CLI Example:
```
salt '*' pkg.remove <package name> dryrun=True
```

recurse
Delete all packages that require the listed package as well.
CLI Example:
```
salt '*' pkg.remove <package name> recurse=True
```

regex
Treat the package names as regular expressions.
CLI Example:
```
salt '*' pkg.remove <regular expression> regex=True
```

pcre
Treat the package names as extended regular expressions.
CLI Example:
```
salt '*' pkg.remove <extended regular expression> pcre=True
```

salt.modules.pkgng.refresh_db(jail=None, chroot=None, root=None, force=False, **kwargs)
Refresh PACKAGESITE contents

**Note:** This function can be accessed using pkg.update in addition to pkg.refresh_db, to more closely match the CLI usage of pkg(8).

CLI Example:
```
salt '*' pkg.refresh_db
```

jail
Refresh the pkg database within the specified jail

chroot
Refresh the pkg database within the specified chroot (ignored if jail is specified)

root
Refresh the pkg database within the specified root (ignored if jail is specified)

force
Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

CLI Example:
salt '*' pkg.refresh_db force=True

salt.modules.pkgng.remove(name=None, pkgs=None, jail=None, chroot=None, root=None, all_installed=False, force=False, glob=False, dryrun=False, recurse=False, regex=False, pcre=False, **kwargs)

Remove a package from the database and system

Note: This function can accessed using pkg.delete in addition to pkg.remove, to more closely match the CLI usage of pkg(8).

name
   The package to remove
   CLI Example:

   salt '*' pkg.remove <package name>

jail
   Delete the package from the specified jail

chroot
   Delete the package from the specified chroot (ignored if jail is specified)

root
   Delete the package from the specified root (ignored if jail is specified)

all_installed
   Deletes all installed packages from the system and empties the database. USE WITH CAUTION!
   CLI Example:

   salt '*' pkg.remove all all_installed=True force=True

force
   Forces packages to be removed despite leaving unresolved dependencies.
   CLI Example:

   salt '*' pkg.remove <package name> force=True

glob
   Treat the package names as shell glob patterns.
   CLI Example:

   salt '*' pkg.remove <package name> glob=True

dryrun
   Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.
   CLI Example:

   salt '*' pkg.remove <package name> dryrun=True

recurse
   Delete all packages that require the listed package as well.
   CLI Example:

   salt '*' pkg.remove <package name> recurse=True
**regex**

Treat the package names as regular expressions.

CLI Example:

```bash
salt '*' pkg.remove <regular expression> regex=True
```

**pcre**

Treat the package names as extended regular expressions.

CLI Example:

```bash
salt '*' pkg.remove <extended regular expression> pcre=True
```

---

**salt.modules.pkgng.restore**

```bash
def file_name, jail=None, chroot=None, root=None):
    # Reads archive created by pkg backup -d and recreates the database.
    CLI Example:
    ```bash
    salt '*' pkg.restore /tmp/pkg
    ```
    ```bash
    jail
    ```
    Restore database to the specified jail. Note that this will run the command within the jail, and so the path to the file from which the pkg database will be restored is relative to the root of the jail.
    
    CLI Example:
    ```bash
    salt '*' pkg.restore /tmp/pkg jail=<jail name or id>
    ```
    ```bash
    chroot
    ```
    Restore database to the specified chroot (ignored if jail is specified). Note that this will run the command within the chroot, and so the path to the file from which the pkg database will be restored is relative to the root of the chroot.
    
    CLI Example:
    ```bash
    salt '*' pkg.restore /tmp/pkg chroot=/path/to/chroot
    ```
    ```bash
    root
    ```
    Restore database to the specified root (ignored if jail is specified). Note that this will run the command within the root, and so the path to the file from which the pkg database will be restored is relative to the root of the root.
    
    CLI Example:
    ```bash
    salt '*' pkg.restore /tmp/pkg root=<root name or id>
    ```
    ```bash
    salt.modules.pkgng.search**

Searches in remote package repositories

CLI Example:

```bash
salt '*' pkg.search pattern
```

**jail**

Perform the search using the pkg.conf(5) from the specified jail

CLI Example:

```bash
salt '*' pkg.search pattern jail=<jail name or id>
```

**chroot**

Perform the search using the pkg.conf(5) from the specified chroot (ignored if jail is specified)
root
Perform the search using the `pkg.conf(5)` from the specified root (ignored if `jail` is specified)
CLI Example:
```
salt '*' pkg.search pattern chroot=/path/to/chroot
```

exact
Treat pattern as exact pattern.
CLI Example:
```
salt '*' pkg.search pattern exact=True
```

glob
Treat pattern as a shell glob pattern.
CLI Example:
```
salt '*' pkg.search pattern glob=True
```

regex
Treat pattern as a regular expression.
CLI Example:
```
salt '*' pkg.search pattern regex=True
```

pcre
Treat pattern as an extended regular expression.
CLI Example:
```
salt '*' pkg.search pattern pcre=True
```

comment
Search for pattern in the package comment one-line description.
CLI Example:
```
salt '*' pkg.search pattern comment=True
```

desc
Search for pattern in the package description.
CLI Example:
```
salt '*' pkg.search pattern desc=True
```

full
Displays full information about the matching packages.
CLI Example:
```
salt '*' pkg.search pattern full=True
```

depends
Displays the dependencies of pattern.
CLI Example:
```
salt '*' pkg.search pattern depends=True
```

size
Displays the size of the package
CLI Example:
```
salt '*' pkg.search pattern size=True
```

**quiet**
Be quiet. Prints only the requested information without displaying many hints.
CLI Example:
```
salt '*' pkg.search pattern quiet=True
```

**origin**
Displays pattern origin.
CLI Example:
```
salt '*' pkg.search pattern origin=True
```

**prefix**
Displays the installation prefix for each package matching pattern.
CLI Example:
```
salt '*' pkg.search pattern prefix=True
```

salt.modules.pkgng.stats(
local=False, remote=False, jail=None, chroot=None, root=None, bytes=False)
Return pkgng stats.
CLI Example:
```
salt '*' pkg.stats
```

**local**
Display stats only for the local package database.
CLI Example:
```
salt '*' pkg.stats local=True
```

**remote**
Display stats only for the remote package database(s).
CLI Example:
```
salt '*' pkg.stats remote=True
```

**bytes**
Display disk space usage in bytes only.
CLI Example:
```
salt '*' pkg.stats bytes=True
```

**jail**
Retrieve stats from the specified jail.
CLI Example:
```
salt '*' pkg.stats jail=<jail name or id>
salt '*' pkg.stats jail=<jail name or id> local=True
salt '*' pkg.stats jail=<jail name or id> remote=True
```
chroot

Retrieve stats from the specified chroot (ignored if jail is specified).

root

Retrieve stats from the specified root (ignored if jail is specified).

CLI Example:

```
salt '*' pkg.stats chroot=/path/to/chroot
salt '*' pkg.stats chroot=/path/to/chroot local=True
salt '*' pkg.stats chroot=/path/to/chroot remote=True
```

**salt.modules.pkgng.unhold**(*name=*/None, *pkgs=*/None, **kwargs*)

Remove version locks

Note: This function is provided primarily for compatibility with some parts of *states.pkg*. Consider using *pkg.unlock* instead.

**name**

The name of the package to be unheld

**pkgs**

A list of packages to unhold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

**salt.modules.pkgng.unlock**(*name, **kwargs*)

Unlock the named package against reinstallation, modification or deletion.

Returns True if the named package was successfully unlocked.

CLI Example:

```
salt '*' pkg.unlock <package name>
```

**jail**

Unlock packages within the specified jail

CLI Example:

```
salt '*' pkg.unlock <package name> jail=<jail name or id>
```

**chroot**

Unlock packages within the specified chroot (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.unlock <package name> chroot=/path/to/chroot
```

**root**

Unlock packages within the specified root (ignored if jail is specified)

CLI Example:
salt '*' pkg.unlock <package name> root=/path/to/chroot

salt.modules.pkgng.update(jail=None, chroot=None, root=None, force=False, **kwargs)

This function is an alias of refresh_db.
Refresh PACKAGESITE contents

CLI Example:
salt '*' pkg.refresh_db

jail
Refresh the pkg database within the specified jail

chroot
Refresh the pkg database within the specified chroot (ignored if jail is specified)

root
Refresh the pkg database within the specified root (ignored if jail is specified)

force
Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

CLI Example:
salt '*' pkg.refresh_db force=True

salt.modules.pkgng.update_package_site(new_url)

Updates remote package repo URL, PACKAGESITE var to be exact.

Must use http://, ftp://, or https:// protocol

CLI Example:
salt '*' pkg.update_package_site http://127.0.0.1/

salt.modules.pkgng.updating(name, jail=None, chroot=None, root=None, filedate=None, filename=None)

Displays UPDATING entries of software packages

CLI Example:
salt '*' pkg.updating foo

jail
Perform the action in the specified jail

CLI Example:
salt '*' pkg.updating foo jail=<jail name or id>

chroot
Perform the action in the specified chroot (ignored if jail is specified)

root
Perform the action in the specified root (ignored if jail is specified)

CLI Example:
salt '*/' pkg.updating foo chroot=/path/to/chroot

**filedate**

Only entries newer than date are shown. Use a YYYYMMDD date format.

CLI Example:
```
salt '*/' pkg.updating foo filedate=20130101
```

**filename**

Defines an alternative location of the UPDATING file.

CLI Example:
```
salt '*/' pkg.updating foo filename=/tmp/UPDATING
```

**salt.modules.pkgng.upgrade**(*names, **kwargs*)

Upgrade named or all packages (run a `pkg upgrade`). If `<package name>` is omitted, the operation is executed on all packages.

Returns a dictionary containing the changes:
```
{
'<package>':
    {'old': '<old-version>',
     'new': '<new-version>'
}
```

CLI Example:
```
salt '*/' pkg.upgrade <package name>
```

**jail**

Audit packages within the specified jail

CLI Example:
```
salt '*/' pkg.upgrade <package name> jail=<jail name or id>
```

**chroot**

Audit packages within the specified chroot (ignored if `jail` is specified)

**root**

Audit packages within the specified root (ignored if `jail` is specified)

CLI Example:
```
salt '*/' pkg.upgrade <package name> chroot=/path/to/chroot
```

Any of the below options can also be used with `jail` or `chroot`.

**force**

Force reinstalling/upgrading the whole set of packages.

CLI Example:
```
salt '*/' pkg.upgrade <package name> force=True
```

**local**

Do not update the repository catalogs with `pkg-update(8)`. A value of `True` here is equivalent to using the `-U` flag with `pkg upgrade`.

CLI Example:
**Dry-runn**

Dry-run mode: show what packages have updates available, but do not perform any upgrades. Repository catalogs will be updated as usual unless the local option is also given.

CLI Example:

```shell
salt '*' pkg.upgrade <package name> local=True
dryrun=True
```

**fromrepo**

In multi-repo mode, override the pkg.conf ordering and only attempt to upgrade packages from the named repository.

CLI Example:

```shell
salt '*' pkg.upgrade <package name> fromrepo=repo
```

**fetchonly**

Do not perform installation of packages, merely fetch packages that should be upgraded and detect possible conflicts.

CLI Example:

```shell
salt '*' pkg.upgrade <package name> fetchonly=True
```

---

**salt.modules.pkgng.version**(*names, **kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**Note:** This function can be accessed using `pkg.info` in addition to `pkg.version`, to more closely match the CLI usage of `pkg(8)`.

**jail**

Get package version information for the specified jail

**chroot**

Get package version information for the specified chroot (ignored if `jail` is specified)

**root**

Get package version information for the specified root (ignored if `jail` is specified)

**with_origin**

[False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```shell
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ...
```

**salt.modules.pkgng.version_cmp**(*pkg1, pkg2, ignore_epoch=False, **kwargs*)

Do a cmp-style comparison on two packages. Return -1 if `pkg1 < pkg2`, 0 if `pkg1 == pkg2`, and 1 if `pkg1 > pkg2`. Return None if there was a problem making the comparison.

CLI Example:
```python
salt '*' pkg.version_cmp '2.1.11' '2.1.12'
```

salt.modules.pkgng.which(path, jail=None, chroot=None, root=None, origin=False, quiet=False)

Displays which package installed a specific file

CLI Example:
```bash
salt '*' pkg.which <file name>
```

jail

Perform the check in the specified jail

CLI Example:
```bash
salt '*' pkg.which <file name> jail=<jail name or id>
```

chroot

Perform the check in the specified chroot (ignored if jail is specified)

root

Perform the check in the specified root (ignored if jail is specified)

CLI Example:
```bash
salt '*' pkg.which <file name> chroot=/path/to/chroot
```

origin

Shows the origin of the package instead of name-version.

CLI Example:
```bash
salt '*' pkg.which <file name> origin=True
```

quiet

Quiet output.

CLI Example:
```bash
salt '*' pkg.which <file name> quiet=True
```

---

### 26.6.344 salt.modules.pkgutil

Pkgutil support for Solaris

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

```python
salt.modules.pkgutil.available_version(*names, **kwargs)
```

This function is an alias of latest_version.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:
salt.modules.pkgutil.install(name=None, refresh=False, version=None, pkgs=None, **kwargs)
Install packages using the pkgutil tool.

CLI Example:
```bash
salt '*' pkg.install <package_name>
salt '*' pkg.install SMClgcc346
```

Multiple Package Installation Options:
pkgs
A list of packages to install from OpenCSW. Must be passed as a python list.

CLI Example:
```bash
salt '*' pkg.install pkgs=["foo", "bar"]
salt '*' pkg.install pkgs=["foo", {"bar": "1.2.3"}]
```

Returns a dict containing the new package names and versions:
```json
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

salt.modules.pkgutil.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:
```bash
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3> ...
```

salt.modules.pkgutil.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed as a dict:
```json
{'<package_name>': '<version>'}
```

CLI Example:
```bash
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.pkgutil.list_upgrades(refresh=True, **kwargs)
List all available package upgrades on this system

CLI Example:
```bash
salt '*' pkgutil.list_upgrades
```

salt.modules.pkgutil.purge(name=None, pkgs=None, **kwargs)
Package purges are not supported, this function is identical to remove().
name
The name of the package to be deleted.

Multiple Package Options:

pkgs
A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.pkgutil.refresh_db()
Updates the pkgutil repo database (pkgutil -U)

CLI Example:

```
salt '*' pkgutil.refresh_db
```

salt.modules.pkgutil.remove(name=None, pkgs=None, **kwargs)
Remove a package and all its dependencies which are not in use by other packages.

name
The name of the package to be deleted.

Multiple Package Options:

pkgs
A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.pkgutil.upgrade(refresh=True)
Upgrade all of the packages to the latest available version.

Returns a dict containing the changes:

```
{"<package">: {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkgutil.upgrade
```

salt.modules.pkgutil.upgrade_available(name)
Check if there is an upgrade available for a certain package

CLI Example:
salt modules.pkgutil.version(names, **kwargs)
Returns a version if the package is installed, else returns an empty string
CLI Example:
salt '*' pkgutil.version CSWpython

26.6.345 salt.modules.portage_config
Configure portage(5)
salt.modules.portage_config.append_to_package_conf(conf, atom='', flags=None, string='', overwrite=False)
Append a string or a list of flags for a given package or DEPEND atom to a given configuration file.
CLI Example:
salt '*' portage_config.append_to_package_conf use string="app-admin/salt\nldap -libvirt"
salt '*' portage_config.append_to_package_conf use atom">= app-admin/\nsalt-0.14.1" flags="[\'ldap', \'-libvirt\']"
salt.modules.portage_config.append_use_flags(atom, uses=None, overwrite=False)
Append a list of use flags for a given package or DEPEND atom
CLI Example:
salt '*' portage_config.append_use_flags "app-admin/salt\ldap, -libvirt]"
salt '*' portage_config.append_use_flags ">=app-admin/salt-0.14.1" "[\'ldap\n<-', \'-libvirt\']"
salt.modules.portage_config.enforce_nice_config()
Enforce a nice tree structure for /etc/portage/package.* configuration files.
See also:
salt.modules.ebuild.ex_mod_init()
for information on automatically running this when pkg is used.
CLI Example:
salt '*' portage_config.enforce_nice_config
salt.modules.portage_config.filter_flags(use, use_expand_hidden, usemasked, useforced)
New in version 2015.8.0.
Filter function to remove hidden or otherwise not normally visible USE flags from a list.
@type use: list @param use: the USE flag list to be filtered. @type use_expand_hidden: list @param
use_expand_hidden: list of flags hidden. @type usemasked: list @param usemasked: list of masked USE
flags. @type useforced: list @param useforced: the forced USE flags. @rtype: list @return the filtered USE
flags.
salt.modules.portage_config.get_all_cpv_use(cp)
New in version 2015.8.0.
Uses portage to determine final USE flags and settings for an emerge.
@type cp: string @param cp: eg cat/pkg @rtype: lists @return use, use_expand_hidden, usemask, useforce

salt.modules.portage_config.get_cleared_flags(cp)
New in version 2015.8.0.
Uses portage for compare use flags which is used for installing package and use flags which now exist int /etc/portage/package.use/
@type cp: string @param cp: eg cat/pkg @rtype: tuple @rparam: tuple with two lists - list of used flags and list of flags which will be used

salt.modules.portage_config.get_flags_from_package_conf(conf, atom)
Get flags for a given package or DEPEND atom. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```
salt '*' portage_config.get_flags_from_package_conf license salt
```

salt.modules.portage_config.get_installed_use(cp, use='USE')
New in version 2015.8.0.
Gets the installed USE flags from the VARDB.
@type: cp: string @param cp: cat/pkg @type use: string @param use: 1 of ["USE", "PKGUSE"] @rtype list @returns [] or the list of IUSE flags

salt.modules.portage_config.get_iuse(cp)
New in version 2015.8.0.
Gets the current IUSE flags from the tree.
@type: cpv: string @param cpv: cat/pkg @rtype list @returns [] or the list of IUSE flags

salt.modules.portage_config.get_missing_flags(conf, atom, flags)
Find out which of the given flags are currently not set.

CLI Example:
```
salt '*' portage_config.get_missing_flags use salt "['ldap', '-libvirt', 'openssl']"
```

salt.modules.portage_config.has_flag(conf, atom, flag)
Verify if the given package or DEPEND atom has the given flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```
salt '*' portage_config.has_flag license salt Apache-2.0
```

salt.modules.portage_config.has_use(atom, use)
Verify if the given package or DEPEND atom has the given use flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
salt '*' portage_config.has_use salt libvirt

salt.modules.portage_config.is_changed_uses(cp)
New in version 2015.8.0.
Uses portage for determine if the use flags of installed package is compatible with use flags in portage configs.
@type cp: string @param cp: eg cat/pkg

salt.modules.portage_config.is_present(conf, atom)
Tell if a given package or DEPEND atom is present in the configuration files tree. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
salt '*' portage_config.is_present unmask salt

26.6.346 salt.modules.postfix

Support for Postfix
This module is currently little more than a config file viewer and editor. It is able to read the master.cf file (which is one style) and files in the style of main.cf (which is a different style, that is used in multiple postfix configuration files).

The design of this module is such that when files are edited, a minimum of changes are made to them. Each file should look as if it has been edited by hand; order, comments and whitespace are all preserved.

salt.modules.postfix.delete(queue_id)
Delete message(s) from the mail queue

CLI Example:
salt '*' postfix.delete 5C33CA0DEA
salt '*' postfix.delete ALL

salt.modules.postfix.hold(queue_id)
Put message(s) on hold from the mail queue

CLI Example:
salt '*' postfix.hold 5C33CA0DEA
salt '*' postfix.hold ALL

salt.modules.postfix.requeue(queue_id)
Requeue message(s) in the mail queue

CLI Example:
salt '*' postfix.requeue 5C33CA0DEA
salt '*' postfix.requeue ALL
salt.modules.postfix.set_main(key, value, path='/etc/postfix/main.cf')

Set a single config value in the main.cf file. If the value does not already exist, it will be appended to the end.

CLI Example:
salt <minion> postfix.set_main mailq_path /usr/bin/mailq

salt.modules.postfix.set_master(service, conn_type, private='y', unpriv='y', chroot='y', wakeup='n', maxproc='100', command='', write_conf=True, path='/etc/postfix/master.cf')

Set a single config value in the master.cf file. If the value does not already exist, it will be appended to the end.

Because of shell parsing issues, '-' cannot be set as a value, as is normal in the master.cf file; either 'y', 'n' or a number should be used when calling this function from the command line. If the value used matches the default, it will internally be converted to a '-'. Calling this function from the Python API is not affected by this limitation.

The settings and their default values, in order, are: service (required), conn_type (required), private (y), unpriv (y), chroot (y), wakeup (n), maxproc (100), command (required).

By default, this function will write out the changes to the master.cf file, and then returns the full contents of the file. By setting the write_conf option to False, it will skip writing the file.

CLI Example:
salt <minion> postfix.set_master smtp inet n y n n 100 smtpd

salt.modules.postfix.show_main(path='/etc/postfix/main.cf')

Return a dict of active config values. This does not include comments, spacing or order. Bear in mind that order is functionally important in the main.cf file, since keys can be referred to as variables. This means that the data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:
salt <minion> postfix.show_main
salt <minion> postfix.show_main path=/path/to/main.cf

salt.modules.postfix.show_master(path='/etc/postfix/master.cf')

Return a dict of active config values. This does not include comments, spacing or order.

The data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:
salt <minion> postfix.show_master
salt <minion> postfix.show_master path=/path/to/master.cf

salt.modules.postfix.show_queue()

Show contents of the mail queue

CLI Example:
salt '*' postfix.show_queue
salt.modules.postfix.unhold(queue_id)

Set held message(s) in the mail queue to unheld

CLI Example:

```python
salt '*' postfix.unhold 5C33CA0DEA
salt '*' postfix.unhold ALL
```

**26.6.347 salt.modules.postgres**

Module to provide Postgres compatibility to salt.

**configuration**

In order to connect to Postgres, certain configuration is required in `/etc/salt/minion` on the relevant minions. Some sample configs might look like:

```yaml
postgres.host: 'localhost'
postgres.port: '5432'
postgres.user: 'postgres' -> db user
postgres.pass: ''
postgres.maintenance_db: 'postgres'
```

The default for the `maintenance_db` is 'postgres' and in most cases it can be left at the default setting. This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar.

To prevent Postgres commands from running arbitrarily long, a timeout (in seconds) can be set

```yaml
postgres.timeout: 60
```

New in version 3006.0.

**note**

This module uses MD5 hashing which may not be compliant with certain security audits.

**note**

When installing postgres from the official postgres repos, on certain linux distributions, either the `psql` or the `initdb` binary is *not* automatically placed on the path. Add a configuration to the location of the postgres bin's path to the relevant minion for this module:

```yaml
postgres.bins_dir: '/usr/pgsql-9.5/bin/
```

salt.modules.postgres.available_extensions(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

List available postgresql extensions

CLI Example:

```python
salt '*' postgres.available_extensions
```

salt.modules.postgres.create_extension(name, if_not_exists=None, schema=None, ext_version=None, from_version=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
Install a postgresql extension

CLI Example:

```
salt '*' postgres.create_extension 'adminpack'
```

```
salt.modules.postgres.create_metadata(name, ext_version=None, schema=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Get lifecycle information about an extension

CLI Example:

```
salt '*' postgres.create_metadata adminpack
```

```
salt.modules.postgres.datadir_exists(name)
```

New in version 2016.3.0.

Checks if postgres data directory has been initialized

CLI Example:

```
salt '*' postgres.datadir_exists '/var/lib/pgsql/data'
```

```
salt.modules.postgres.datadir_init(name, auth='password', user=None, password=None, encoding='UTF8', locale=None, waldir=None, checksums=False, runas=None)
```

New in version 2016.3.0.

Initializes a postgres data directory

CLI Example:

```
salt '*' postgres.datadir_init '/var/lib/pgsql/data'
```

```
name
   Name of the directory to check
```

```
salt.modules.postgres.datadir_init(name, auth='password', user=None, password=None, encoding='UTF8', locale=None, waldir=None, checksums=False, runas=None)
```

New in version 2016.3.0.

```
name
   The name of the directory to initialize
```

```
auth
   The default authentication method for local connections
```

```
password
   The password to set for the postgres user
```

```
user
   The database superuser name
```

```
encoding
   The default encoding for new databases
```

```
locale
   The default locale for new databases
```

```
waldir
   The transaction log (WAL) directory (default is to keep WAL inside the data directory)
   New in version 2019.2.0.
```

```
checksums
   If True, the cluster will be created with data page checksums.
```
Note: Data page checksums are supported since PostgreSQL 9.3.

New in version 2019.2.0.

runas

The system user the operation should be performed on behalf of

```python
salt.modules.postgres.db_alter(name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, owner=None, owner_recurse=False, runas=None)
```

Change tablespace or/and owner of database.

CLI Example:

```
salt '*' postgres.db_alter dbname owner=otheruser
```

```python
salt.modules.postgres.db_create(name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, encoding=None, lc_collate=None, lc_ctype=None, owner=None, template=None, runas=None)
```

Adds a databases to the Postgres server.

CLI Example:

```
salt '*' postgres.db_create 'dbname'
salt '*' postgres.db_create 'dbname' template=template_postgis
```

```python
salt.modules.postgres.db_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Checks if a database exists on the Postgres server.

CLI Example:

```
salt '*' postgres.db_exists 'dbname'
```

```python
salt.modules.postgres.db_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Return dictionary with information about databases of a Postgres server.

CLI Example:

```
salt '*' postgres.db_list
```

```python
salt.modules.postgres.db_remove(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Removes a databases from the Postgres server.

CLI Example:

```
salt '*' postgres.db_remove 'dbname'
```

```python
salt.modules.postgres.drop_extension(name, if_exists=None, restrict=None, cascade=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Drop an installed postgresql extension

CLI Example:
salt '*' postgres.drop_extension 'adminpack'

```
salt.modules.postgres.get_available_extension(name, user=None, host=None, port=None, 
maintenance_db=None, password=None, 
runas=None)
```

Get info about an available postgresql extension

CLI Example:

```
salt '*' postgres.get_available_extension plpgsql
```

```
salt.modules.postgres.get_installed_extension(name, user=None, host=None, port=None, 
maintenance_db=None, password=None, 
runas=None)
```

Get info about an installed postgresql extension

CLI Example:

```
salt '*' postgres.get_installed_extension plpgsql
```

```
salt.modules.postgres.group_create(groupname, user=None, host=None, port=None, 
maintenance_db=None, password=None, createdb=None, 
createroles=None, encrypted=None, login=None, inherit=None, 
superuser=None, replication=None, rolepassword=None, 
groups=None, runas=None)
```

Creates a Postgres group. A group is postgres is similar to a user, but cannot login.

CLI Example:

```
salt '*' postgres.group_create 'groupname' user='user' \ 
 host='hostname' port='port' password='password' \ 
 rolepassword='rolepassword'
```

```
salt.modules.postgres.group_remove(groupname, user=None, host=None, port=None, 
maintenance_db=None, password=None, runas=None)
```

Removes a group from the Postgres server.

CLI Example:

```
salt '*' postgres.group_remove 'groupname'
```

```
salt.modules.postgres.group_update(groupname, user=None, host=None, port=None, 
maintenance_db=None, password=None, createdb=None, 
createroles=None, encrypted=None, inherit=None, login=None, 
superuser=None, replication=None, rolepassword=None, 
groups=None, runas=None)
```

Updates a postgres group

CLI Examples:

```
salt '*' postgres.group_update 'username' user='user' \ 
 host='hostname' port='port' password='password' \ 
 rolepassword='rolepassword'
```
salt.modules.postgres.has_privileges(name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.

Check if a role has the specified privileges on an object

CLI Example:

```
salt '*' postgres.has_privileges user_name table_name table \SELECT,INSERT maintenance_db=db_name
```

name
Name of the role whose privileges should be checked on object_type

object_name
Name of the object on which the check is to be performed

object_type
The object type, which can be one of the following:
- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

privileges
Comma separated list of privileges to check, from the list below:
- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

grant_option
If grant_option is set to True, the grant option check is performed

prepend
Table and Sequence object types live under a schema so this should be provided if the object is not under the default public schema

maintenance_db
The database to connect to

user
database username if different from config or default

password
user password if any password for a specified user

host
Database host if different from config or default
**port**
Database port if different from config or default

**runas**
System user all operations should be performed on behalf of

`salt.modules.postgres.installed_extensions`(*user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

List installed postgresql extensions

**CLI Example:**
```
salt '*' postgres.installed_extensions
```

`salt.modules.postgres.is_available_extension`(*name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Test if a specific extension is available

**CLI Example:**
```
salt '*' postgres.is_available_extension
```

`salt.modules.postgres.is_installed_extension`(*name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Test if a specific extension is installed

**CLI Example:**
```
salt '*' postgres.is_installed_extension
```

`salt.modules.postgres.language_create`(*name, maintenance_db, user=None, host=None, port=None, password=None, runas=None*)

New in version 2016.3.0.
Installs a language into a database

**CLI Example:**
```
salt '*' postgres.language_create plpgsql dbname
```

**name**
Language to install

**maintenance_db**
The database to install the language in

**user**
database username if different from config or default

**password**
user password if any password for a specified user

**host**
Database host if different from config or default

**port**
Database port if different from config or default

**runas**
System user all operations should be performed on behalf of
salt.modules.postgres.language_exists(name, maintenance_db, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.
Checks if language exists in a database.
CLI Example:

```
salt '*' postgres.language_exists plpgsql dbname
```

name
Language to check for
maintenance_db
The database to check in
user
database username if different from config or default
password
user password if any password for a specified user
host
Database host if different from config or default
port
Database port if different from config or default
runas
System user all operations should be performed on behalf of

salt.modules.postgres.language_list(maintenance_db, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.
Return a list of languages in a database.
CLI Example:

```
salt '*' postgres.language_list dbname
```

maintenance_db
The database to check
user
database username if different from config or default
password
user password if any password for a specified user
host
Database host if different from config or default
port
Database port if different from config or default
runas
System user all operations should be performed on behalf of

salt.modules.postgres.language_remove(name, maintenance_db, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.
Removes a language from a database
CLI Example:
salt '*' postgres.language_remove plpgsql dbname

name
Language to remove

maintenance_db
The database to install the language in

user
database username if different from config or default

password
user password if any password for a specified user

host
Database host if different from config or default

port
Database port if different from config or default

runas
System user all operations should be performed on behalf of

salt.modules.postgres.owner_to(dbname, ownername, user=None, host=None, port=None, password=None, runas=None)

Set the owner of all schemas, functions, tables, views and sequences to the given username.

CLI Example:
salt '*' postgres.owner_to 'dbname' 'username'

salt.modules.postgres.privileges_grant(name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.

Grant privileges on a postgres object

CLI Example:
salt '*' postgres.privileges_grant user_name table_name table \ SELECT,UPDATE maintenance_db=db_name

name
Name of the role to which privileges should be granted

object_name
Name of the object on which the grant is to be performed

object_type
The object type, which can be one of the following:
  • table
  • sequence
  • schema
  • tablespace
  • language
  • database
  • group
  • function

privileges
Comma separated list of privileges to grant, from the list below:
  • INSERT
grant_option
    If grant_option is set to True, the recipient of the privilege can in turn grant it to others

prepend
    Table and Sequence object types live under a schema so this should be provided if the object is not under
    the default public schema

maintenance_db
    The database to connect to

user
    database username if different from config or default

password
    user password if any password for a specified user

host
    Database host if different from config or default

port
    Database port if different from config or default

runas
    System user all operations should be performed on behalf of

salt.modules.postgres.privileges_list(name, object_type, prepend='public', maintenance_db=None,
    user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.
Return a list of privileges for the specified object.

CLI Example:

```
salt '*' postgres.privileges_list table_name table maintenance_db=db_name
```

name
    Name of the object for which the permissions should be returned

object_type
    The object type, which can be one of the following:
    •  table
    •  sequence
    •  schema
    •  tablespace
    •  language
    •  database
    •  group
    •  function

prepend
    Table and Sequence object types live under a schema so this should be provided if the object is not under
the default `public` schema

**maintenance_db**
The database to connect to

**user**
database username if different from config or default

**password**
user password if any password for a specified user

**host**
Database host if different from config or default

**port**
Database port if different from config or default

**runas**
System user all operations should be performed on behalf of

```
salt.modules.postgres.privileges_revoke(name, object_name, object_type, privileges=None, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)
```

New in version 2016.3.0.

Revoke privileges on a postgres object

CLI Example:

```
salt '*1 postgres.privileges_revoke user_name table_name table \nSELECT,UPDATE maintenance_db=db_name
```

**name**
Name of the role whose privileges should be revoked

**object_name**
Name of the object on which the revoke is to be performed

**object_type**
The object type, which can be one of the following:
- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**privileges**
Comma separated list of privileges to revoke, from the list below:
- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL
maintenance_db
    The database to connect to
user
    database username if different from config or default
password
    user password if any password for a specified user
host
    Database host if different from config or default
port
    Database port if different from config or default
runas
    System user all operations should be performed on behalf of

salt.modules.postgres.psql_query(query, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, write=False)

Run an SQL-Query and return the results as a list. This command only supports SELECT statements. This limitation can be worked around with a query like this:

WITH updated AS (UPDATE pg_authid SET rolconnlimit = 2000 WHERE rolname = 'rolename' RETURNING rolconnlimit) SELECT * FROM updated;

query
    The query string.
user
    Database username, if different from config or default.
host
    Database host, if different from config or default.
port
    Database port, if different from the config or default.
maintenance_db
    The database to run the query against.
password
    User password, if different from the config or default.
runas
    User to run the command as.
write
    Mark query as READ WRITE transaction.

CLI Example:
salt '*' postgres.psql_query 'select * from pg_stat_activity'

salt.modules.postgres.role_get(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, return_password=False)

Return a dict with information about users of a Postgres server.
Set return_password to True to get password hash in the result.

CLI Example:
salt '*' postgres.role_get postgres

salt.modules.postgres.schema_create(dbname, name, owner=None, user=None, db_user=None, db_password=None, db_host=None, db_port=None)

Creates a Postgres schema.

CLI Example:
salt '*' postgres.schema_create dbname name owner='owner' \ 
    user='user' \ 
    db_user='user' db_password='password' 
    db_host='hostname' db_port='port'

`salt.modules.postgres.schema_exists(dbname, name, user=None, db_user=None, db_password=None, db_host=None, db_port=None)`

Checks if a schema exists on the Postgres server.

CLI Example:

```
salt '*' postgres.schema_exists dbname schemaname
```

- `dbname`: Database name we query on
- `name`: Schema name we look for
- `user`: The system user the operation should be performed on behalf of
- `db_user`: database username if different from config or default
- `db_password`: user password if any password for a specified user
- `db_host`: Database host if different from config or default
- `db_port`: Database port if different from config or default

`salt.modules.postgres.schema_get(dbname, name, user=None, db_user=None, db_password=None, db_host=None, db_port=None)`

Return a dict with information about schemas in a database.

CLI Example:

```
salt '*' postgres.schema_get dbname name
```

- `dbname`: Database name we query on
- `name`: Schema name we look for
- `user`: The system user the operation should be performed on behalf of
- `db_user`: database username if different from config or default
- `db_password`: user password if any password for a specified user
- `db_host`: Database host if different from config or default
- `db_port`: Database port if different from config or default

`salt.modules.postgres.schema_list(dbname, user=None, db_user=None, db_password=None, db_host=None, db_port=None)`

Return a dict with information about schemas in a Postgres database.

CLI Example:
**salt.modules.postgres.schema_remove**

```python
dbname
    Database name we query on
user
    The system user the operation should be performed on behalf of
db_user
    database username if different from config or default
db_password
    user password if any password for a specified user
db_host
    Database host if different from config or default
db_port
    Database port if different from config or default
```

```python
salt.modules.postgres.schema_remove(dbname, name, user=None, db_user=None, db_password=None, db_host=None, db_port=None)
```

Removes a schema from the Postgres server.

**CLI Example:**

```bash
salt '*' postgres.schema_remove dbname schemaname
```

**salt.modules.postgres.tablespace_alter**

```python
dbname
    Database name we work on
schema
    The schema's name we'll remove
user
    System user all operations should be performed on behalf of
db_user
    database username if different from config or default
db_password
    user password if any password for a specified user
db_host
    Database host if different from config or default
db_port
    Database port if different from config or default
```

```python
salt.modules.postgres.tablespace_alter(name, user=None, host=None, port=None, maintenance_db=None, password=None, new_name=None, new_owner=None, set_option=None, reset_option=None, runas=None)
```

Change tablespace name, owner, or options.

**CLI Example:**

```bash
salt '*' postgres.tablespace_alter tsname new_owner=otheruser
salt '*' postgres.tablespace_alter index_space new_name=fast_raid
salt '*' postgres.tablespace_alter test set_option="{'seq_page_cost': '1.1
salt '*' postgres.tablespace_alter tsname reset_option=seq_page_cost
```

New in version 2015.8.0.

**salt.modules.postgres.tablespace_create**

```python
name
    Name of the new tablespace
location
    Location of the new tablespace
tablespace
    Tablespace to be created from the new tablespace
user
    System user all operations should be performed on behalf of
host
    Database host if different from config or default
port
    Database port if different from config or default
password
    user password if any password for a specified user
runas
    Run as user
```

```python
salt.modules.postgres.tablespace_create(name, location, options=None, owner=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

26.6. execution modules
 Adds a tablespace to the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_create tablespacename '/path/datadir'
```

New in version 2015.8.0.

salt.modules.postgres.tablespace_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Checks if a tablespace exists on the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_exists 'dbname'
```

New in version 2015.8.0.

salt.modules.postgres.tablespace_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Return dictionary with information about tablespaces of a Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_list
```

New in version 2015.8.0.

salt.modules.postgres.tablespace_remove(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Removes a tablespace from the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_remove tsname
```

New in version 2015.8.0.

salt.modules.postgres.user_create(username, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, inherit=None, login=None, connlimit=None, encrypted=None, superuser=None, replication=None, rolepassword=None, valid_until=None, groups=None, runas=None)

Creates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_create 'username' user='user' "host='hostname' port='port' password='password' \" rolepassword='rolepassword' valid_until='valid_until'
```

salt.modules.postgres.user_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Checks if a user exists on the Postgres server.

CLI Example:
salt '*' postgres.user_exists 'username'

salt.modules.postgres.user_list(  
    user=None, host=None, port=None, maintenance_db=None,  
    password=None, runas=None, return_password=False)

Return a dict with information about users of a Postgres server.  
Set return_password to True to get password hash in the result.

CLI Example:

salt '*' postgres.user_list

salt.modules.postgres.user_remove(  
    username, user=None, host=None, port=None,  
    maintenance_db=None, password=None, runas=None)

Removes a user from the Postgres server.

CLI Example:

salt '*' postgres.user_remove 'username'

salt.modules.postgres.user_update(  
    username, user=None, host=None, port=None,  
    maintenance_db=None, password=None,  
    createdb=None, createroles=None, encrypted=None, superuser=None, inherit=None,  
    login=None, connlimit=None, replication=None,  
    rolepassword=None, valid_until=None, groups=None, runas=None)

Updates a Postgres user.

CLI Examples:

salt '*' postgres.user_update 'username' user='user'  
host='hostname' port='port' password='password'  
rolepassword='rolepassword' valid_until='valid_until'

salt.modules.postgres.version(  
    user=None, host=None, port=None, maintenance_db=None,  
    password=None, runas=None)

Return the version of a Postgres server.

CLI Example:

salt '*' postgres.version

26.6.348 salt.modules.poudriere

Support for poudriere

salt.modules.poudriere.bulk_build(jail, pkg_file, keep=False)

Run bulk build on poudriere server.

Return number of pkg builds, failures, and errors, on error dump to CLI

CLI Example:

salt -N buildbox_group poudriere.bulk_build 90amd64 /root/pkg_list

26.6. execution modules
salt.modules.poudriere.create_jail(name, arch, version='9.0-RELEASE')
Creates a new poudriere jail if one does not exist

NOTE creating a new jail will take some time the master is not hanging

CLI Example:
```
salt '*' poudriere.create_jail 90amd64 amd64
```

salt.modules.poudriere.create_ports_tree()
Not working need to run portfetch non interactive

salt.modules.poudriere.delete_jail(name)
Deletes poudriere jail with name

CLI Example:
```
salt '*' poudriere.delete_jail 90amd64
```

salt.modules.poudriere.info_jail(name)
Show information on name poudriere jail

CLI Example:
```
salt '*' poudriere.info_jail head-amd64
```

salt.modules.poudriere.is_jail(name)
Return True if jail exists False if not

CLI Example:
```
salt '*' poudriere.is_jail <jail name>
```

salt.modules.poudriere.list_jails()
Return a list of current jails managed by poudriere

CLI Example:
```
salt '*' poudriere.list_jails
```

salt.modules.poudriere.list_ports()
Return a list of current port trees managed by poudriere

CLI Example:
```
salt '*' poudriere.list_ports
```

salt.modules.poudriere.make_pkgng_aware(jname)
Make jail jname pkgng aware

CLI Example:
```
salt '*' poudriere.make_pkgng_aware <jail name>
```

salt.modules.poudriere.parse_config(config_file=None)
Returns a dict of poudriere main configuration definitions

CLI Example:
Salt Documentation, Release 3007.1

```
salt '*' poudriere.parse_config
```

```
salt.modules.poudriere.update_jail(name)
Run freebsd-update on name poudriere jail

CLI Example:
```
salt '*' poudriere.update_jail freebsd:10:x86:64
```

```
salt.modules.poudriere.update_ports_tree(ports_tree)
Updates the ports tree, either the default or the ports_tree specified

CLI Example:
```
salt '*' poudriere.update_ports_tree staging
```

```
salt.modules.poudriere.version()
Return poudriere version

CLI Example:
```
salt '*' poudriere.version
```

26.6.349 salt.modules.powerpath

powerpath support.

Assumes RedHat

```
salt.modules.powerpath.add_license(key)
Add a license
```

```
salt.modules.powerpath.has_powerpath()
```

```
salt.modules.powerpath.list_licenses()
returns a list of applied powerpath license keys
```

```
salt.modules.powerpath.remove_license(key)
Remove a license
```

26.6.350 salt.modules.proxy

This module allows you to manage proxy settings

```
salt '*' network.get_http_proxy
```

```
salt.modules.proxy.get_ftp_proxy(network_service='Ethernet')
Returns the current ftp proxy settings

network_service
The network service to apply the changes to, this only necessary on macOS

CLI Example:
```
salt '*' proxy.get_ftp_proxy Ethernet
```

26.6. execution modules
salt.modules.proxy.get_http_proxy(network_service='Ethernet')

Returns the current http proxy settings

**network_service**

The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.get_http_proxy Ethernet
```

salt.modules.proxy.get_https_proxy(network_service='Ethernet')

Returns the current https proxy settings

**network_service**

The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.get_https_proxy Ethernet
```

salt.modules.proxy.get_proxy_bypass(network_service='Ethernet')

Returns the current domains that can bypass the proxy

**network_service**

The network service to get the bypass domains from, this is only necessary on macOS

CLI Example:

```
salt '*' proxy.get_proxy_bypass
```

salt.modules.proxy.get_proxy_win()

Gets all of the proxy settings in one call, only available on Windows

CLI Example:

```
salt '*' proxy.get_proxy_win
```

salt.modules.proxy.set_ftp_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)

Sets the ftp proxy settings

**server**

The proxy server to use

**port**

The port used by the proxy server

**user**

The username to use for the proxy server if required

**password**

The password to use if required by the server

**network_service**

The network service to apply the changes to, this only necessary on macOS

**bypass_hosts**

The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use set_proxy_bypass to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_ftp_proxy example.com 1080 user=proxy_user password=proxy_pass network_service=Ethernet
```

salt.modules.proxy.set_http_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)

Sets the http proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using set_proxy.

server
   The proxy server to use
port
   The port used by the proxy server
user
   The username to use for the proxy server if required
password
   The password to use if required by the server
network_service
   The network service to apply the changes to, this only necessary on macOS
bypass_hosts
   The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use set_proxy_bypass to edit the bypass hosts.

CLI Example:
```bash
salt '*' proxy.set_http_proxy example.com 1080 user=proxy_user
                                 password=proxy_pass network_service=Ethernet
```

salt.modules.proxy.set_https_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)

Sets the https proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using set_proxy.

server
   The proxy server to use
port
   The port used by the proxy server
user
   The username to use for the proxy server if required
password
   The password to use if required by the server
network_service
   The network service to apply the changes to, this only necessary on macOS
bypass_hosts
   The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use set_proxy_bypass to edit the bypass hosts.

CLI Example:
```bash
salt '*' proxy.set_https_proxy example.com 1080 user=proxy_user
                                 password=proxy_pass network_service=Ethernet
```

salt.modules.proxy.set_proxy_bypass(domains, network_service='Ethernet')

Sets the domains that can bypass the proxy

domains
   An array of domains allowed to bypass the proxy
network_service
   The network service to apply the changes to, this only necessary on macOS

CLI Example:
```bash
salt '*' proxy.set_proxy_bypass "['127.0.0.1', 'localhost']"
```

salt.modules.proxy.set_proxy_win(server, port, types=None, bypass_hosts=None)
Sets the http proxy settings, only works with Windows.

**server**

The proxy server to use

**password**

The password to use if required by the server

**types**

The types of proxy connections should be setup with this server. Valid types are:

- http
- https
- ftp

**bypass_hosts**

The hosts that are allowed to by pass the proxy.

CLI Example:

```
 salt '*' proxy.set_http_proxy example.com 1080 types="[http, https]"
```

### 26.6.351 salt.modules.ps

A salt interface to psutil, a system and process library. See [http://code.google.com/p/psutil](http://code.google.com/p/psutil).

**depends**

- python-utmp package (optional)

#### salt.modules.ps.boot_time(time_format=None)

Return the boot time in number of seconds since the epoch began.

CLI Example:

```
 time_format
```

Optionally specify a `strftime` format string. Use `time_format='%c'` to get a nicely-formatted locale specific date and time (i.e. Fri May 2 19:08:32 2014).

New in version 2014.1.4.

```
 salt ' '* ps.boot_time
```

#### salt.modules.ps.cpu_percent(interval=0.1, per_cpu=False)

Return the percent of time the CPU is busy.

**interval**

the number of seconds to sample CPU usage over

**per_cpu**

if True return an array of CPU percent busy for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
 salt ' '* ps.cpu_percent
```

#### salt.modules.ps.cpu_times(per_cpu=False)

Return the percent of time the CPU spends in each state, e.g. user, system, idle, nice, iowait, irq, softirq.

**per_cpu**

if True return an array of percents for each CPU, otherwise aggregate all percents into one number

CLI Example:
salt 'minion' ps.kill_pid

pid

PID of process to kill.

26.6. execution modules

2757
signal

Signal to send to the process. See manpage entry for kill for possible values. Default: 15 (SIGTERM).

Example:
Send SIGKILL to process with PID 2000:

```
salt 'minion' ps.kill_pid 2000 signal=9
```

salt.modules.ps.lsof(name)

Retrieve the lsof information of the given process name.

CLI Example:
```
salt '*' ps.lsof apache2
```

salt.modules.ps.netstat(name)

Retrieve the netstat information of the given process name.

CLI Example:
```
salt '*' ps.netstat apache2
```

salt.modules.ps.network_io_counters(interface=None)

Return network I/O statistics.

CLI Example:
```
salt '*' ps.network_io_counters
salt '*' ps.network_io_counters interface=eth0
```

salt.modules.ps.num_cpus()

Return the number of CPUs.

CLI Example:
```
salt '*' ps.num_cpus
```

salt.modules.ps.pgrep(pattern, user=None, full=False, pattern_is_regex=False)

Return the pids for processes matching a pattern.

If full is true, the full command line is searched for a match, otherwise only the name of the command is searched.

```
salt '*' ps.pgrep pattern [user=username] [full=(true|false)]
```

pattern

Pattern to search for in the process list.

user

Limit matches to the given username. Default: All users.

full

A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

pattern_is_regex

This flag enables ps.pgrep to mirror the regex search functionality found in the pgrep command line utility.
New in version 3001.

Examples:

Find all httpd processes on all 'www' minions:

```sh
salt 'www.*' ps.pgrep httpd
```

Find all bash processes owned by user 'tom':

```sh
salt ',*' ps.pgrep bash user=tom
```

```py
salt.modules.ps.pkill(pattern, user=None, signal=15, full=False)
```

Kill processes matching a pattern.

```sh
salt ',*' ps.pkill pattern [user=username] [signal=signal_number] \ [full=(true|false)]
```

<table>
<thead>
<tr>
<th>pattern</th>
<th>Pattern to search for in the process list.</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>Limit matches to the given username. Default: All users.</td>
</tr>
<tr>
<td>signal</td>
<td>Signal to send to the process(es). See manpage entry for kill for possible values. Default: 15 (SIGTERM).</td>
</tr>
<tr>
<td>full</td>
<td>A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.</td>
</tr>
</tbody>
</table>

Examples:

Send SIGHUP to all httpd processes on all 'www' minions:

```sh
salt 'www.*' ps.pkill httpd signal=1
```

Send SIGKILL to all bash processes owned by user 'tom':

```sh
salt ',*' ps.pkill bash signal=9 user=tom
```

```py
salt.modules.ps.proc_info(pid, attrs=None)
```

Return a dictionary of information for a process id (PID).

CLI Example:

```sh
salt ',*' ps.proc_info 2322
salt ',*' ps.proc_info 2322 attrs='["pid", "name"]'
```

<table>
<thead>
<tr>
<th>pid</th>
<th>PID of process to query.</th>
</tr>
</thead>
<tbody>
<tr>
<td>attrs</td>
<td>Optional list of desired process attributes. The list of possible attributes can be found here: <a href="https://psutil.readthedocs.io/en/latest/#processes">https://psutil.readthedocs.io/en/latest/#processes</a></td>
</tr>
</tbody>
</table>

```py
salt.modules.ps.psaux(name)
```

Retrieve information corresponding to a "ps aux" filtered with the given pattern. It could be just a name or a regular expression (using python search from "re" module).

CLI Example:
salt '★' ps.psaux www-data.+apache2

salt.modules.ps.ss(name)
Retrieve the ss information of the given process name.
CLI Example:
salt '★' ps.ss apache2

New in version 2016.11.6.

salt.modules.ps.status(status)
Returns a list of processes according to their state.
CLI Example:
salt '★' ps.status STATUS

where STATUS is one of
- running
- sleeping
- disk_sleep
- stopped
- tracing_stop
- zombie
- dead
- wake_kill
- waking
- parked (Linux)
- idle (Linux, macOS, FreeBSD)
- locked (FreeBSD)
- waiting (FreeBSD)
- suspended (NetBSD)

salt.modules.ps.swap_memory()
Returns a dict that describes swap memory statistics.

Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:
salt '★' ps.swap_memory

salt.modules.ps.top(num_processes=5, interval=3)
Return a list of top CPU consuming processes during the interval. num_processes = return the top N CPU consuming processes interval = the number of seconds to sample CPU usage over

CLI Examples:
salt.modules.ps.total_physical_memory()
Return the total number of bytes of physical memory.
CLI Example:
salt '*' ps.total_physical_memory

salt.modules.ps.virtual_memory()
New in version 2014.7.0.
Return a dict that describes statistics about system memory usage.

Note: This function is only available in psutil version 0.6.0 and above.
CLI Example:
salt '*' ps.virtual_memory

26.6.352 salt.modules.publish
Publish a command from a minion to a target
salt.modules.publish.full_data(tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5)
Return the full data about the publication, this is invoked in the same way as the publish function
CLI Example:
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'

Attention
If you need to pass a value to a function argument and that value contains an equal sign, you must include the argument name. For example:
salt '*' publish.full_data test.kwarg arg='cheese=spam'

salt.modules.publish.publish(tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5, via_master=None)
Publish a command from the minion out to other minions.
Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.
The tgt_type argument is used to pass a target other than a glob into the execution, the available options are:
• glob
• pcre
• grain
• grain_pcre
• pillar
• pillar_pcre
• ipcidr
• range
• compound

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Note that for pillar matches must be exact, both in the pillar matcher and the compound matcher. No globbing is supported.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '* user.add *foo,1020,1020'
```

```
salt system.example.com publish.publish 'os:Fedora' network.interfaces 'grain
```

CLI Example:

```
salt system.example.com publish.publish '* cmd.run *ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you must include the argument name. For example:

```
salt '* publish.publish test.kwarg arg=cheese=spam'
```

Multiple keyword arguments should be passed as a list.

```
salt '* publish.publish test.kwarg arg=[cheese=spam,'spam=cheese]
```

When running via salt-call, the `via_master` flag may be set to specific which master the publication should be sent to. Only one master may be specified. If unset, the publication will be sent only to the first master in minion configuration.

```
salt.modules.publish.run.runner(fun, arg=None, timeout=5)
```

Execute a runner on the master and return the data from the runner function

CLI Example:

```
salt publish.runner manage.down
```
26.6.353 salt.modules.puppet

Execute puppet routines

salt.modules.puppet.disable(message=None)

New in version 2014.7.0.

Disable the puppet agent

message

New in version 2015.5.2.

Disable message to send to puppet

CLI Example:

```
salt '*' puppet.disable
salt '*' puppet.disable 'Disabled, contact XYZ before enabling'
```

salt.modules.puppet.enable()

New in version 2014.7.0.

Enable the puppet agent

CLI Example:

```
salt '*' puppet.enable
```

salt.modules.puppet.fact(name, puppet=False)

Run facter for a specific fact

CLI Example:

```
salt '*' puppet.fact kernel
```

salt.modules.puppet.facts(puppet=False)

Run facter and return the results

CLI Example:

```
salt '*' puppet.facts
```

salt.modules.puppet.noop(*args, **kwargs)

Execute a puppet noop run and return a dict with the stderr, stdout, return code, etc. Usage is the same as for puppet.run.

CLI Example:

```
salt '*' puppet.noop
salt '*' puppet.noop tags=basefiles::edit,apache::server
salt '*' puppet.noop debug
salt '*' puppet.noop apply /a/b/manifest.pp modulepath=/a/b/modules
salt '*' puppet.noop apply /a/b/manifest.pp modulepath=/a/b/modules
  --tags=basefiles::edit,apache::server
```

salt.modules.puppet.plugin_sync()

Runs a plugin sync between the puppet master and agent

CLI Example:
Salt Documentation, Release 3007.1

**salt '*' puppet.plugin_sync**

**salt.modules.puppet.run(**args, **kwargs)**

Execute a puppet run and return a dict with the stderr, stdout, return code, etc. The first positional argument given is checked as a subcommand. Following positional arguments should be ordered with arguments required by the subcommand first, followed by non-keyword arguments. Tags are specified by a tag keyword and comma separated list of values. -- http://docs.puppetlabs.com/puppet/latest/reference/lang_tags.html

CLI Examples:

```
salt '*' puppet.run
salt '*' puppet.run tags=basefiles::edit,apache::server
salt '*' puppet.run agent onetime no-daemonize no-usecacheonfailure no-
  splay ignorecache
salt '*' puppet.run debug
salt '*' puppet.run apply /a/b/manifest.pp modulepath=/a/b/modules
tag=basefiles::edit,apache::server
```

**salt.modules.puppet.status()**

New in version 2014.7.0.

Display puppet agent status

CLI Example:

```
salt '*' puppet.status
```

**salt.modules.puppet.summary()**

New in version 2014.7.0.

Show a summary of the last puppet agent run

CLI Example:

```
salt '*' puppet.summary
```

### 26.6.354 salt.modules.purefa

Management of Pure Storage FlashArray

#### Installation Prerequisites

- You will need the purestorage python package in your python installation path that is running salt.

```
pip install purestorage
```

- Configure Pure Storage FlashArray authentication. Use one of the following three methods.

  1) From the minion config

```
pure_tags:
  fa:
    san_ip: management vip or hostname for the FlashArray
    api_token: A valid api token for the FlashArray being managed
```
2) From environment (PUREFA_IP and PUREFA_API)
3) From the pillar (PUREFA_IP and PUREFA_API)

**maintainer**
Simon Dodsley (simon@purestorage.com)

**maturity**
new

**requires**
purestorage

**platform**
all

New in version 2018.3.0.

**salt.modules.purefa.hg_create**(name, host=None, volume=None)
Create a hostgroup on a Pure Storage FlashArray.
Will return False if hostgroup already exists, or if named host or volume do not exist.
New in version 2018.3.0.

- **name** [string] name of hostgroup (truncated to 63 characters)
- **host** [string] name of host to add to hostgroup
- **volume** [string] name of volume to add to hostgroup

CLI Example:
```
salt '*' purefa.hg_create foo host=bar volume=vol
```

**salt.modules.purefa.hg_delete**(name)
Delete a hostgroup on a Pure Storage FlashArray (removes all volumes and hosts).
Will return False is hostgroup is already in a deleted state.
New in version 2018.3.0.

- **name** [string] name of hostgroup

CLI Example:
```
salt '*' purefa.hg_delete foo
```

**salt.modules.purefa.hg_remove**(name, volume=None, host=None)
Remove a host and/or volume from a hostgroup on a Pure Storage FlashArray.
Will return False is hostgroup does not exist, or named host or volume are not in the hostgroup.
New in version 2018.3.0.

- **name** [string] name of hostgroup
- **volume** [string] name of volume to remove from hostgroup
- **host** [string] name of host to remove from hostgroup

CLI Example:
salt 'purefa.hg_remove foo volume=test host=bar'

```
salt.modules.purefa.hg_update(name, host=None, volume=None)
```

Adds entries to a hostgroup on a Pure Storage FlashArray.

Will return False is hostgroup doesn't exist, or host or volume do not exist.

New in version 2018.3.0.

```python
name
    [string] name of hostgroup
host
    [string] name of host to add to hostgroup
volume
    [string] name of volume to add to hostgroup
```

CLI Example:

```
salt '*' purefa.hg_update foo host=bar volume=vol
```

```
salt.modules.purefa.host_create(name, iqn=None, wwn=None, nqn=None)
```

Add a host on a Pure Storage FlashArray.

Will return False if host already exists, or the iSCSI or Fibre Channel parameters are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.

```python
name
    [string] name of host (truncated to 63 characters)
iqn
    [string] iSCSI IQN of host
nqn
    [string] NVMeF NQN of host .. versionadded:: 3006.0
wwn
    [string] Fibre Channel WWN of host
```

CLI Example:

```
salt '*' purefa.host_create foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>' nqn='<Valid NQN>'
```

```
salt.modules.purefa.host_delete(name)
```

Delete a host on a Pure Storage FlashArray (detaches all volumes).

Will return False if the host doesn't exist.

New in version 2018.3.0.

```python
name
    [string] name of host
```

CLI Example:

```
salt '*' purefa.host_delete foo
```

```
salt.modules.purefa.host_update(name, iqn=None, wwn=None, nqn=None)
```

Update a hosts port definitions on a Pure Storage FlashArray.

Will return False if new port definitions are already in use by another host, or are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.
name
  [string] name of host
nqn
  [string] Additional NVMeF NQN of host .. versionadded:: 3006.0
iqn
  [string] Additional iSCSI IQN of host
wwn
  [string] Additional Fibre Channel WWN of host

CLI Example:
salt '*' purefa.host_update foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>'
 nqn='<Valid NQN>'

salt.modules.purefa.pg_create(name, hostgroup=None, host=None, volume=None, enabled=True)
Create a protection group on a Pure Storage FlashArray.
Will return False in the following cases:
  • Protection Group already exists
  • Protection Group in a deleted state
  • More than one type is specified - protection groups are for only hostgroups, hosts or volumes
  • Name type for protection group does not exist
New in version 2018.3.0.

name
  [string] name of protection group
hostgroup
  [string] name of hostgroup to add to protection group
host
  [string] name of host to add to protection group
volume
  [string] name of volume to add to protection group

CLI Example:
salt '*' purefa.pg_create foo [hostgroup=foo | host=bar | volume=vol]
 enabled=[true | false]

salt.modules.purefa.pg_delete(name, eradicate=False)
Delete a protection group on a Pure Storage FlashArray.
Will return False if protection group is already in a deleted state.
New in version 2018.3.0.

name
  [string] name of protection group

CLI Example:
salt '*' purefa.pg_delete foo

salt.modules.purefa.pg_eradicate(name)
Eradicate a deleted protection group on a Pure Storage FlashArray.
Will return False if protection group is not in a deleted state.
New in version 2018.3.0.

name
  [string] name of protection group

CLI Example:
salt '*' purefa.pg_remove foo

salt.modules.purefa.pg_remove(name, hostgroup=None, host=None, volume=None)
Remove a hostgroup, host or volume from a protection group on a Pure Storage FlashArray.

Will return False in the following cases:
- Protection group does not exist
- Specified type is not currently associated with the protection group

New in version 2018.3.0.

name
[string] name of hostgroup
hostgroup
[string] name of hostgroup to remove from protection group
host
[string] name of host to remove from hostgroup
volume
[string] name of volume to remove from hostgroup

CLI Example:
salt '*' purefa.pg_remove foo [hostgroup=bar | host=test | volume=bar]

salt.modules.purefa.pg_update(name, hostgroup=None, host=None, volume=None)
Update a protection group on a Pure Storage FlashArray.

Will return False in the following cases:
- Protection group does not exist
- Incorrect type selected for current protection group type
- Specified type does not exist

New in version 2018.3.0.

name
[string] name of protection group
hostgroup
[string] name of hostgroup to add to protection group
host
[string] name of host to add to protection group
volume
[string] name of volume to add to protection group

CLI Example:
salt '*' purefa.pg_update foo [hostgroup=foo | host=bar | volume=vol]

salt.modules.purefa.snap_create(name, suffix=None)
Create a volume snapshot on a Pure Storage FlashArray.

Will return False is volume selected to snap does not exist.

New in version 2018.3.0.

name
[string] name of volume to snapshot
suffix
[string] if specified forces snapshot name suffix. If not specified defaults to timestamp.

CLI Example:
salt '*' purefa.snap_create foo
salt '*' purefa.snap_create foo suffix=bar
salt.modules.purefa.snap_delete(name, suffix=None, eradicate=False)
Delete a volume snapshot on a Pure Storage FlashArray.
Will return False if selected snapshot does not exist.
New in version 2018.3.0.

name
[string] name of volume

suffix
[string] name of snapshot

eradicate
[boolean] Eradicate snapshot after deletion if True. Default is False

CLI Example:

```
salt '*' purefa.snap_delete foo suffix=snap eradicate=True
```

salt.modules.purefa.snap_eradicate(name, suffix=None)
Eradicate a deleted volume snapshot on a Pure Storage FlashArray.
Will return False if snapshot is not in a deleted state.
New in version 2018.3.0.

name
[string] name of volume

suffix
[string] name of snapshot

CLI Example:

```
salt '*' purefa.snap_eradicate foo suffix=snap
```

salt.modules.purefa.snap_volume_create(name, target, overwrite=False)
Create R/W volume from snapshot on a Pure Storage FlashArray.
Will return False if target volume already exists and overwrite is not specified, or selected snapshot doesn't exist.
New in version 2018.3.0.

name
[string] name of volume snapshot

target
[string] name of clone volume

overwrite
[boolean] overwrite clone if already exists (default: False)

CLI Example:

```
salt '*' purefa.snap_volume_create foo.bar clone overwrite=True
```

salt.modules.purefa.volume_attach(name, host)
Attach a volume to a host on a Pure Storage FlashArray.
Host and volume must exist or else will return False.
New in version 2018.3.0.

name
[string] name of volume

host
[string] name of host

CLI Example:
salt '*' purefa.volume_attach foo bar

```python
salt.modules.purefa.volume_clone(name, target, overwrite=False)
```

Clone an existing volume on a Pure Storage FlashArray.

Will return False if source volume doesn't exist, or target volume already exists and overwrite not specified.

New in version 2018.3.0.

- **name**
  - [string] name of volume

- **target**
  - [string] name of clone volume

- **overwrite**
  - [boolean] overwrite clone if already exists (default: False)

```python
salt '*' purefa.volume_clone foo bar overwrite=True
```

```python
salt.modules.purefa.volume_create(name, size=None)
```

Create a volume on a Pure Storage FlashArray.

Will return False if volume already exists.

New in version 2018.3.0.

- **name**
  - [string] name of volume (truncated to 63 characters)

- **size**
  - [string] if specified capacity of volume. If not specified default to 1G. Refer to Pure Storage documentation for formatting rules.

```python
salt '*' purefa.volume_create foo
salt '*' purefa.volume_create foo size=10T
```

```python
salt.modules.purefa.volume_delete(name, eradicate=False)
```

Delete a volume on a Pure Storage FlashArray.

Will return False if volume doesn't exist is already in a deleted state.

New in version 2018.3.0.

- **name**
  - [string] name of volume

- **eradicate**
  - [boolean] Eradicate volume after deletion if True. Default is False

```python
salt '*' purefa.volume_delete foo eradicate=True
```

```python
salt.modules.purefa.volume_detach(name, host)
```

Detach a volume from a host on a Pure Storage FlashArray.

Will return False if either host or volume do not exist, or if selected volume isn't already connected to the host.

New in version 2018.3.0.

- **name**
  - [string] name of volume
host
    [string] name of host
    CLI Example:

    salt '*' purefa.volume_detach foo bar

salt.modules.purefa.volume_eradicate(name)
    Eradicate a deleted volume on a Pure Storage FlashArray.
    Will return False is volume is not in a deleted state.
    New in version 2018.3.0.
    name
        [string] name of volume
    CLI Example:

    salt '*' purefa.volume_eradicate foo

salt.modules.purefa.volume_extend(name, size)
    Extend an existing volume on a Pure Storage FlashArray.
    Will return False if new size is less than or equal to existing size.
    New in version 2018.3.0.
    name
        [string] name of volume
    size
        [string] New capacity of volume. Refer to Pure Storage documentation for formatting rules.
    CLI Example:

    salt '*' purefa.volume_extend foo 10T

26.6.355 salt.modules.purefb

Management of Pure Storage FlashBlade

Installation Prerequisites

- You will need the purity_fb python package in your python installation path that is running salt.

    pip install purity_fb

- Configure Pure Storage FlashBlade authentication. Use one of the following three methods.

  1) From the minion config

    **pure_tags:***
    
    **fb:**
    
    **san_ip:** management vip or hostname for the FlashBlade
    **api_token:** A valid api token for the FlashBlade being managed

  2) From environment (PUREFB_IP and PUREFB_API)

  3) From the pillar (PUREFB_IP and PUREFB_API)
salt.modules.purefb.fs_create(name, size=None, proto='NFS', nfs_rules='*(rw,no_root_squash)', snapshot=False)

Create a filesystem on a Pure Storage FlashBlade.
Will return False if filesystem already exists.

New in version 2019.2.0.

name [string] name of filesystem (truncated to 63 characters)
proto [string] (Optional) Sharing protocol (NFS, CIFS or HTTP). If not specified default is NFS
snapshot: boolean (Optional) Are snapshots enabled on the filesystem. Default is False
nfs_rules [string] (Optional) export rules for NFS. If not specified default is *(rw,no_root_squash). Refer to Pure Storage documentation for formatting rules.
size [string] if specified capacity of filesystem. If not specified default to 32G. Refer to Pure Storage documentation for formatting rules.

CLI Example:
salt '*' purefb.fs_create foo proto=CIFS
salt '*' purefb.fs_create foo size=10T

salt.modules.purefb.fs_delete(name, eradicate=False)

Delete a share on a Pure Storage FlashBlade.
Will return False if filesystem doesn't exist or is already in a deleted state.

New in version 2019.2.0.

name [string] name of filesystem
eradicate [boolean] (Optional) Eradicate filesystem after deletion if True. Default is False

CLI Example:
salt '*' purefb.fs_delete foo eradicate=True

salt.modules.purefb.fs_eradicate(name)

Eradicate a deleted filesystem on a Pure Storage FlashBlade.
Will return False is filesystem is not in a deleted state.

New in version 2019.2.0.
name
  [string] name of filesystem
CLI Example:

```bash
salt '.*' purefb.fs_eradicate foo
```

```python
salt.modules.purefb.fs_extend(name, size)
  Resize an existing filesystem on a Pure Storage FlashBlade.
  Will return False if new size is less than or equal to existing size.
  New in version 2019.2.0.
name
  [string] name of filesystem
size
  [string] New capacity of filesystem. Refer to Pure Storage documentation for formatting rules.
CLI Example:

```bash
salt '.*' purefb.fs_extend foo 10T
```

```python
salt.modules.purefb.fs_update(name, rules, snapshot=False)
  Update filesystem on a Pure Storage FlashBlade.
  Allows for change of NFS export rules and enabling/disabled of snapshotting capability.
  New in version 2019.2.0.
name
  [string] name of filesystem
rules
  [string] NFS export rules for filesystem Refer to Pure Storage documentation for formatting rules.
snapshot: boolean
  (Optional) Enable/Disable snapshots on the filesystem. Default is False
CLI Example:

```bash
salt '.*' purefb.fs_nfs_update foo rules='10.234.112.23(ro), 10.234.112.24(rw)' snapshot=True
```

```python
salt.modules.purefb.snap_create(name, suffix=None)
  Create a filesystem snapshot on a Pure Storage FlashBlade.
  Will return False if filesystem selected to snap does not exist.
  New in version 2019.2.0.
name
  [string] name of filesystem to snapshot
suffix
  [string] if specified forces snapshot name suffix. If not specified defaults to timestamp.
CLI Example:

```bash
salt '.*' purefb.snap_create foo
salt '.*' purefb.snap_create foo suffix=bar
```

```python
salt.modules.purefb.snap_delete(name, suffix=None, eradicate=False)
  Delete a filesystem snapshot on a Pure Storage FlashBlade.
  Will return False if selected snapshot does not exist.
  New in version 2019.2.0.
```
name
    [string] name of filesystem
suffix
    [string] name of snapshot
eradicate
    [boolean] Eradicate snapshot after deletion if True. Default is False

CLI Example:

```
salt '* ' purefb.snap_delete foo suffix=snap eradicate=True
```

salt.modules.purefb.snap_eradicate(name, suffix=None)

Eradicate a deleted filesystem snapshot on a Pure Storage FlashBlade.
Will return False if snapshot is not in a deleted state.
New in version 2019.2.0.

name
    [string] name of filesystem
suffix
    [string] name of snapshot

CLI Example:

```
salt '* ' purefb.snap_eradicate foo suffix=snap
```

26.6.356 salt.modules.pushbullet

Module for sending messages to Pushbullet (https://www.pushbullet.com)
New in version 2015.8.0.
Requires an api_key in /etc/salt/minion:

```
pushbullet:
    api_key: 'ABC123abc123ABC123abc123ABC123ab'
```

For example:

```
pushbullet:
    device: "Chrome"
    title: "Example push message"
    body: "Message body."
```

salt.modules.pushbullet.push_note(device=None, title=None, body=None)

Pushing a text note.

Parameters
    • device -- Pushbullet target device
    • title -- Note title
    • body -- Note body

Returns
    Boolean if message was sent successfully.

CLI Example:

```
salt "*" pushbullet.push_note device="Chrome" title="Example title" body="Example body."
```
26.6.357 salt.modules.pushover_notify

**Warning:** This module will be removed from Salt in version 3009 in favor of the pushover Salt Extension.

Module for sending messages to Pushover (https://www.pushover.net)

New in version 2016.3.0.

**configuration**

This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
pushover:
  token: abAHuZyCLtdH8P4zhmFZmgUHUsv1ei8
```

salt.modules.pushover_notify.post_message(user=None, device=None, message=None, title=None, priority=None, expire=None, retry=None, sound=None, api_version=1, token=None)

Send a message to a Pushover user or group.

**Parameters**

- `user` -- The user or group to send to, must be key of user or group not email address.
- `message` -- The message to send to the PushOver user or group.
- `title` -- Specify who the message is from.
- `priority` -- The priority of the message, defaults to 0.
- `expire` -- The message should expire after N number of seconds.
- `retry` -- The number of times the message should be retried.
- `sound` -- The sound to associate with the message.
- `api_version` -- The PushOver API version, if not specified in the configuration.
- `token` -- The PushOver token, if not specified in the configuration.

**Returns**

Boolean if message was sent successfully.

**CLI Example:**

```
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title='Message from Salt' message='Build is done'
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title='Message from Salt' message='Build is done' priority='2' expire=720 retry='5'
```

26.6.358 salt.modules.pw_group

Manage groups on FreeBSD

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to ‘group.info’ is not available), see here.

salt.modules.pw_group.add(name, gid=None, **kwargs)

Changed in version 3006.0.
Add the specified group

name
Name of the new group
gid
Use GID for the new group

CLI Example:

```
salt '*' group.add foo 3456
```

salt.modules.pw_group.adduser(name, username)
Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

salt.modules.pw_group.chgid(name, gid)
Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

salt.modules.pw_group.delete(name)
Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

salt.modules.pw_group.deluser(name, username)
Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

salt.modules.pw_group.getent(refresh=False)
Return info on all groups

CLI Example:

```
salt '*' group.getent
```

salt.modules.pw_group.info(name)
Return information about a group

CLI Example:

```
salt '*' group.info foo
```
salt.modules.pw_group.members(name, members_list)

Replaces members of the group with a provided list.

New in version 2015.5.4.

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3,....'
```

Replaces a membership list for a local group 'foo'.

foo:x:1234:user1,user2,user3,....

---

26.6.359 salt.modules.pw_user

Manage users with the pw command

**Important**: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info' is not available`), see here.

salt.modules.pw_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname='', roomnumber='', workphone='', homephone='', createhome=True, loginclass=None, **kwargs)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

salt.modules.pw_user.chfullname(name, fullname)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

salt.modules.pw_user.chgid(name, gid)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

salt.modules.pw_user.chgroups(name, groups, append=False)

Change the groups to which a user belongs

name

Username to modify

groups

List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

append

[False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:
salt '*' user.chgroups foo wheel,root True

salt.modules.pw_user.chhome(name, home, persist=False)
Set a new home directory for an existing user
name
Username to modify
home
New home directory to set
persist
[False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.
CLI Example:
salt '*' user.chhome foo /home/users/foo True

salt.modules.pw_user.chhomephone(name, homephone)
Change the user's Home Phone
CLI Example:
salt '*' user.chhomephone foo "7735551234"

salt.modules.pw_user.chloginclass(name, loginclass, root=None)
Change the default login class of the user
New in version 2016.3.5.
CLI Example:
salt '*' user.chloginclass foo staff

salt.modules.pw_user.chroomnumber(name, roomnumber)
Change the user's Room Number
CLI Example:
salt '*' user.chroomnumber foo 123

salt.modules.pw_user.chshell(name, shell)
Change the default shell of the user
CLI Example:
salt '*' user.chshell foo /bin/zsh

salt.modules.pw_user.chuid(name, uid)
Change the uid for a named user
CLI Example:
salt '*' user.chuid foo 4376

salt.modules.pw_user.chworkphone(name, workphone)
Change the user's Work Phone
CLI Example:
salt 'user.chworkphone foo "7735550123"

salt.modules.pw_user.delete(name, remove=False, force=False)
    Remove a user from the minion
    CLI Example:
    salt '*' user.delete name remove=True force=True

salt.modules.pw_user.get_loginclass(name)
    Get the login class of the user
    New in version 2016.3.0.
    CLI Example:
    salt '*' user.get_loginclass foo

salt.modules.pw_user.getent(refresh=False)
    Return the list of all info for all users
    CLI Example:
    salt '*' user.getent

salt.modules.pw_user.info(name)
    Return user information
    CLI Example:
    salt '*' user.info root

salt.modules.pw_user.list_groups(name)
    Return a list of groups the named user belongs to
    CLI Example:
    salt '*' user.list_groups foo

salt.modules.pw_user.list_users()
    Return a list of all users
    CLI Example:
    salt '*' user.list_users

salt.modules.pw_user.rename(name, new_name)
    Change the username for a named user
    CLI Example:
    salt '*' user.rename name new_name
**26.6.360 salt.modules.pyenv**

Manage python installations with pyenv.

**Note:** Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

New in version 2014.4.0.

**salt.modules.pyenv.default**(python=None, runas=None)

Returns or sets the currently defined default python.

- **python=None**
  - The version to set as the default. Should match one of the versions listed by `pyenv.versions`. Leave blank to return the current default.

  CLI Example:

  ```
  salt '*' pyenv.default
  salt '*' pyenv.default 2.0.0-p0
  ```

**salt.modules.pyenv.do**(cmdline=None, runas=None)

Execute a python command with pyenv's shims from the user or the system.

  CLI Example:

  ```
  salt '*' pyenv.do 'gem list bundler'
  salt '*' pyenv.do 'gem list bundler' deploy
  ```

**salt.modules.pyenv.do_with_python**(python, cmdline, runas=None)

Execute a python command with pyenv's shims using a specific python version.

  CLI Example:

  ```
  salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler'
  salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler' deploy
  ```

**salt.modules.pyenv.install**(runas=None, path=None)

Install pyenv systemwide

  CLI Example:

  ```
  salt '*' pyenv.install
  ```

**salt.modules.pyenv.install_python**(python, runas=None)

Install a python implementation.

- **python**
  - The version of python to install, should match one of the versions listed by `pyenv.list`

  CLI Example:

  ```
  salt '*' pyenv.install_python 2.0.0-p0
  ```

**salt.modules.pyenv.is_installed**(runas=None)

Check if pyenv is installed.

  CLI Example:
salt '*' pyenv.is_installed

salt.modules.pyenv.list_(runas=None)
List the installable versions of python.

CLI Example:
salt '*' pyenv.list

salt.modules.pyenv.rehash(runas=None)
Run pyenv rehash to update the installed shims.

CLI Example:
salt '*' pyenv.rehash

salt.modules.pyenv.uninstall_python(python, runas=None)
Uninstall a python implementation.

```python
def pyenv.uninstall_python(python, runas=None):
``` 

CLI Example:
salt '*' pyenv.uninstall_python 2.0.0-p0

salt.modules.pyenv.update(runas=None, path=None)
Updates the current versions of pyenv and python-Build

CLI Example:
salt '*' pyenv.update

salt.modules.pyenv.versions(runas=None)
List the installed versions of python.

CLI Example:
salt '*' pyenv.versions

26.6.361 salt.modules.qemu_img

Qemu-img Command Wrapper

The qemu img command is wrapped for specific functions

```python
def qemu_img.convert(orig, dest, fmt):
``` 

CLI Example:
salt '*' qemu_img.convert /path/to/original.img /path/to/new.img qcow2

26.6. execution modules
salt.modules.qemu_img.make_image\(\text{location, size, fmt}\)  
Create a blank virtual machine image file of the specified size in megabytes. The image can be created in any format supported by qemu  
CLI Example:  
```
salt '*' qemu_img.make_image /tmp/image.qcow 2048 qcow2  
salt '*' qemu_img.make_image /tmp/image.raw 10240 raw
```  

26.6.362  salt.modules.qemu_nbd  
Qemu Command Wrapper  
The qemu system comes with powerful tools, such as qemu-img and qemu-nbd which are used here to build up kvm images.  
salt.modules.qemu_nbd.clear\(\text{mnt}\)  
Pass in the mnt dict returned from nbd_mount to unmount and disconnect the image from nbd. If all of the partitions are unmounted return an empty dict, otherwise return a dict containing the still mounted partitions  
CLI Example:  
```
salt '*' qemu_nbd.clear '{"/mnt/foo": "/dev/nbd0p1"}'
```  
salt.modules.qemu_nbd.connect\(\text{image}\)  
Activate nbd for an image file.  
CLI Example:  
```
salt '*' qemu_nbd.connect /tmp/image.raw
```  
salt.modules.qemu_nbd.init\(\text{image, root=None}\)  
Mount the named image via qemu-nbd and return the mounted roots  
CLI Example:  
```
salt '*' qemu_nbd.init /srv/image.qcow2
```  
salt.modules.qemu_nbd.mount\(\text{nbd, root=None}\)  
Pass in the nbd connection device location, mount all partitions and return a dict of mount points  
CLI Example:  
```
salt '*' qemu_nbd.mount /dev/nbd0
```  

26.6.363  salt.modules.quota  
Module for managing quotas on POSIX-like systems.  
salt.modules.quota.get_mode\(\text{device}\)  
Report whether the quota system for this device is on or off  
CLI Example:
salt.modules.quota.off(device)

Turns off the quota system

CLI Example:

```
salt '*' quota.off
```

salt.modules.quota.on(device)

Turns on the quota system

CLI Example:

```
salt '*' quota.on
```

salt.modules.quota.report(mount)

Report on quotas for a specific volume

CLI Example:

```
salt '*' quota.report /media/data
```

salt.modules.quota.set_(device, **kwargs)

Calls out to setquota, for a specific user or group

CLI Example:

```
salt '*' quota.set /media/data user=larry block-soft-limit=1048576
salt '*' quota.set /media/data group=painters file-hard-limit=1000
```

salt.modules.quota.stats()

Runs the quotastats command, and returns the parsed output

CLI Example:

```
salt '*' quota.stats
```

salt.modules.quota.warn()

Runs the warnquota command, to send warning emails to users who are over their quota limit.

CLI Example:

```
salt '*' quota.warn
```

26.6.3.64 salt.modules.rabbitmq

Module to provide RabbitMQ compatibility to Salt. Todo: A lot, need to add cluster support, logging, and minion configuration data.

salt.modules.rabbitmq.add_user(name, password=None, runas=None)

Add a rabbitMQ user via rabbitmqctl user_add <user> <password>

CLI Example:
salt `*' rabbitmq.add_user rabbit_user password

salt.modules.rabbitmq.add_vhost(vhost, runas=None)
    Adds a vhost via rabbitmqctl add_vhost.
    CLI Example:
    salt `*' rabbitmq add_vhost '<vhost_name>'

salt.modules.rabbitmq.change_password(name, password, runas=None)
    Changes a user's password.
    CLI Example:
    salt `*' rabbitmq.change_password rabbit_user password

salt.modules.rabbitmq.check_password(name, password, runas=None)
    New in version 2016.3.0.
    Checks if a user's password is valid.
    CLI Example:
    salt `*' rabbitmq.check_password rabbit_user password

salt.modules.rabbitmq.clear_password(name, runas=None)
    Removes a user's password.
    CLI Example:
    salt `*' rabbitmq.clear_password rabbit_user

salt.modules.rabbitmq.cluster_status(runas=None)
    return rabbitmq cluster_status
    CLI Example:
    salt `*' rabbitmq.cluster_status

salt.modules.rabbitmq.delete_policy(vhost, name, runas=None)
    Delete a policy based on rabbitmqctl clear_policy.
    Reference: http://www.rabbitmq.com/ha.html
    CLI Example:
    salt `*' rabbitmq.delete_policy / HA

salt.modules.rabbitmq.delete_upstream(name, runas=None)
    Deletes an upstream via rabbitmqctl clear_parameter.
    Parameters
        • name (str) -- The name of the upstream to delete.
        • runas (str) -- The name of the user to run the command as.
    CLI Example:
    salt `*' rabbitmq.delete_upstream upstream_name
New in version 3000.

```
salt.modules.rabbitmq.delete_user(name, runas=None)
```
Deletes a user via rabbitmqctl delete_user.

CLI Example:
```
salt '*' rabbitmq.delete_user rabbit_user
```

```
salt.modules.rabbitmq.delete_vhost(vhost, runas=None)
```
Deletes a vhost rabbitmqctl delete_vhost.

CLI Example:
```
salt '*' rabbitmq.delete_vhost '<vhost_name>'
```

```
salt.modules.rabbitmq.disable_plugin(name, runas=None)
```
Disable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:
```
salt '*' rabbitmq.disable_plugin foo
```

```
salt.modules.rabbitmq.enable_plugin(name, runas=None)
```
Enable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:
```
salt '*' rabbitmq.enable_plugin foo
```

```
salt.modules.rabbitmq.force_reset(runas=None)
```
Forcefully Return a RabbitMQ node to its virgin state

CLI Example:
```
salt '*' rabbitmq.force_reset
```

```
salt.modules.rabbitmq.join_cluster(host, user='rabbit', ram_node=None, runas=None)
```
Join a rabbit cluster

CLI Example:
```
salt '*' rabbitmq.join_cluster rabbit.example.com rabbit
```

```
salt.modules.rabbitmq.list_available_plugins(runas=None)
```
Returns a list of the names of all available plugins (enabled and disabled).

CLI Example:
```
salt '*' rabbitmq.list_available_plugins
```

```
salt.modules.rabbitmq.list_enabled_plugins(runas=None)
```
Returns a list of the names of the enabled plugins.

CLI Example:
```
salt '*' rabbitmq.list_enabled_plugins
```
salt.modules.rabbitmq.list_permissions(vhost, runas=None)
Lists permissions for vhost via rabbitmqctl list_permissions
CLI Example:
```
salt '*' rabbitmq.list_permissions /myvhost
```

salt.modules.rabbitmq.list_policies(vhost='/', runas=None)
Return a dictionary of policies nested by vhost and name based on the data returned from rabbitmqctl list_policies.
Reference: http://www.rabbitmq.com/ha.html
CLI Example:
```
salt '*' rabbitmq.list_policies
```

salt.modules.rabbitmq.list_queues(runas=None, *args)
Returns queue details of the / virtual host
CLI Example:
```
salt '*' rabbitmq.list_queues messages consumers
```

salt.modules.rabbitmq.list_queues_vhost(vhost, runas=None, *args)
Returns queue details of specified virtual host. This command will consider first parameter as the vhost name and rest will be treated as queueinfoitem. For getting details on vhost /, use list_queues instead).
CLI Example:
```
salt '*' rabbitmq.list_queues messages consumers
```

salt.modules.rabbitmq.list_upstreams(runas=None)
Returns a dict of upstreams based on rabbitmqctl list_parameters.
Parameters
- **runas** (str) -- The name of the user to run this command as.
CLI Example:
```
salt '*' rabbitmq.list_upstreams
```

New in version 3000.
salt.modules.rabbitmq.list_user_permissions(name, runas=None)
List permissions for a user via rabbitmqctl list_user_permissions
CLI Example:
```
salt '*' rabbitmq.list_user_permissions user
```

salt.modules.rabbitmq.list_users(runas=None)
Return a list of users based off of rabbitmqctl user_list.
CLI Example:
```
salt '*' rabbitmq.list_users
```
salt.modules.rabbitmq.list_vhosts(runas=None)
Return a list of vhost based on rabbitmqctl list_vhosts.

CLI Example:
```python
salt '*' rabbitmq.list_vhosts
```

salt.modules.rabbitmq.plugin_is_enabled(name, runas=None)
Return whether the plugin is enabled.

CLI Example:
```python
salt '*' rabbitmq.plugin_is_enabled rabbitmq_plugin_name
```

salt.modules.rabbitmq.policy_exists(vhost, name, runas=None)
Return whether the policy exists based on rabbitmqctl list_policies.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:
```python
salt '*' rabbitmq.policy_exists / HA
```

salt.modules.rabbitmq.reset(runas=None)
Return a RabbitMQ node to its virgin state

CLI Example:
```python
salt '*' rabbitmq.reset
```

salt.modules.rabbitmq.set_permissions(vhost, user, conf='.*', write='.*', read='.*', runas=None)
Sets permissions for vhost via rabbitmqctl set_permissions

CLI Example:
```python
salt '*' rabbitmq.set_permissions myvhost myuser
```

salt.modules.rabbitmq.set_policy(vhost, name, pattern, definition, priority=None, runas=None, apply_to=None)
Set a policy based on rabbitmqctl set_policy.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:
```python
salt '*' rabbitmq.set_policy / HA '.' '{"ha-mode":"all"}'
```

salt.modules.rabbitmq.set_upstream(name, uri, prefetch_count=None, reconnect_delay=None, ack_mode=None, trust_user_id=None, exchange=None, max_hops=None, expires=None, message_ttl=None, ha_policy=None, queue=None, runas=None)
Configures an upstream via rabbitmqctl set_parameter. This can be an exchange-upstream, a queue-upstream or both.

Parameters
- **name** (str) -- The name of the upstream to configure.

The following parameters apply to federated exchanges and federated queues:

Parameters
- **uri (str)** -- The AMQP URI(s) for the upstream.
- **prefetch_count (int)** -- The maximum number of unacknowledged messages copied over a link at any one time. Default: 1000
- **reconnect_delay (int)** -- The duration (in seconds) to wait before reconnecting to the broker after being disconnected. Default: 1
- **ack_mode (str)** -- Determines how the link should acknowledge messages. If set to `on-confirm` (the default), messages are acknowledged to the upstream broker after they have been confirmed downstream. This handles network errors and broker failures without losing messages, and is the slowest option. If set to `on-publish`, messages are acknowledged to the upstream broker after they have been published downstream. This handles network errors without losing messages, but may lose messages in the event of broker failures. If set to `no-ack`, message acknowledgements are not used. This is the fastest option, but may lose messages in the event of network or broker failures.
- **trust_user_id (bool)** -- Determines how federation should interact with the validated user-id feature. If set to `true`, federation will pass through any validated user-id from the upstream, even though it cannot validate it itself. If set to `false` or not set, it will clear any validated user-id it encounters. You should only set this to `true` if you trust the upstream server (and by extension, all its upstreams) not to forge user-ids.

The following parameters apply to federated exchanges only:

**Parameters**

- **exchange (str)** -- The name of the upstream exchange. Default is to use the same name as the federated exchange.
- **max_hops (int)** -- The maximum number of federation links that a message published to a federated exchange can traverse before it is discarded. Default is 1. Note that even if max-hops is set to a value greater than 1, messages will never visit the same node twice due to travelling in a loop. However, messages may still be duplicated if it is possible for them to travel from the source to the destination via multiple routes.
- **expires (int)** -- The expiry time (in milliseconds) after which an upstream queue for a federated exchange may be deleted, if a connection to the upstream broker is lost. The default is 'none', meaning the queue should never expire. This setting controls how long the upstream queue will last before it is eligible for deletion if the connection is lost. This value is used to set the "x-expires" argument for the upstream queue.
- **message_ttl (int)** -- The expiry time for messages in the upstream queue for a federated exchange (see expires), in milliseconds. Default is `None`, meaning messages should never expire. This does not apply to federated queues. This value is used to set the "x-message-ttl" argument for the upstream queue.
- **ha_policy (str)** -- Determines the "x-ha-policy" argument for the upstream queue for a federated exchange (see expires). This is only of interest when connecting to old brokers which determine queue HA mode using this argument. Default is `None`, meaning the queue is not HA.

The following parameter applies to federated queues only:

**Parameters**

- **queue (str)** -- The name of the upstream queue. Default is to use the same name as the federated queue.
- **runas (str)** -- The name of the user to run the command as.

**CLI Example:**

```
salt '*' rabbitmq.set_upstream upstream_name ack_mode=on-confirm max_hops=1 trust_user_id=True uri=amqp://hostname
```

New in version 3000.
salt.modules.rabbitmq.set_user_tags(name, tags, runas=None)
   Add user tags via rabbitmqctl set_user_tags
   CLI Example:
   ```
   salt '*' rabbitmq.set_user_tags myadmin administrator
   ```

salt.modules.rabbitmq.start_app(runas=None)
   Start the RabbitMQ application.
   CLI Example:
   ```
   salt '*' rabbitmq.start_app
   ```

salt.modules.rabbitmq.status(runas=None)
   return rabbitmq status
   CLI Example:
   ```
   salt '*' rabbitmq.status
   ```

salt.modules.rabbitmq.stop_app(runas=None)
   Stops the RabbitMQ application, leaving the Erlang node running.
   CLI Example:
   ```
   salt '*' rabbitmq.stop_app
   ```

salt.modules.rabbitmq.upstream_exists(name, runas=None)
   Return whether the upstream exists based on rabbitmqctl list_parameters.
   Parameters
   - name (str) -- The name of the upstream to check for.
   - runas (str) -- The name of the user to run the command as.
   CLI Example:
   ```
   salt '*' rabbitmq.upstream_exists rabbit_upstream
   ```

New in version 3000.

salt.modules.rabbitmq.user_exists(name, runas=None)
   Return whether the user exists based on rabbitmqctl list_users.
   CLI Example:
   ```
   salt '*' rabbitmq.user_exists rabbit_user
   ```

salt.modules.rabbitmq.vhost_exists(name, runas=None)
   Return whether the vhost exists based on rabbitmqctl list_vhosts.
   CLI Example:
   ```
   salt '*' rabbitmq.vhost_exists rabbit_host
   ```
26.6.365 salt.modules.rallydev

Support for RallyDev

New in version 2015.8.0.

Requires a username and a password in /etc/salt/minion:

```yaml
rallydev:
    username: myuser@example.com
    password: 123pass
```

salt.modules.rallydev.list_items(name)

List items of a particular type

CLI Examples:

```bash
salt myminion rallydev.list_<item name>s
salt myminion rallydev.list_users
salt myminion rallydev.list_artifacts
```

salt.modules.rallydev.list_users()

List the users

CLI Example:

```bash
salt myminion rallydev.list_users
```

salt.modules.rallydev.query_item(name, query_string, order='Rank')

Query a type of record for one or more items. Requires a valid query string. See https://rally1.rallydev.com/slm/doc/webservice/introduction.jsp for information on query syntax.

CLI Example:

```bash
salt myminion rallydev.query_<item name> <query string> [order=Rank]
salt myminion rallydev.query_task '(Name contains github)' Rank
salt myminion rallydev.query_task '(Name contains reactor)' Rank
```

salt.modules.rallydev.query_user(query_string, order='UserName')

Update a user

CLI Example:

```bash
salt myminion rallydev.query_user '(Name contains Jo)'
```

salt.modules.rallydev.show_artifact(id_

Show an artifact

CLI Example:

```bash
salt myminion rallydev.show_artifact <artifact id>
```

salt.modules.rallydev.show_item(name, id_

Show an item

CLI Example:
salt myminion rallydev.show_<item name> <item id>

salt.modules.rallydev.show_user(id_)
    Show a user
    CLI Example:
    salt myminion rallydev.show_user <user id>

salt.modules.rallydev.update_item(name, id_, field=..., value=..., postdata=...)
    Update an item. Either a field and a value, or a chunk of POST data, may be used, but not both.
    CLI Example:
    salt myminion rallydev.update_<item name> <item id> field=<field> value=<value>
salt myminion rallydev.update_<item name> <item id> postdata=<post data>

salt.modules.rallydev.update_user(id_, field, value)
    Update a user
    CLI Example:
    salt myminion rallydev.update_user <user id> <field> <new value>

26.6.366 salt.modules.random_org

Module for retrieving random information from Random.org
New in version 2015.5.0.

configuration
    This module can be used by either passing an api key and version directly or by specifying both
    in a configuration profile in the salt master/minion config.

For example:

random_org:
    api_key: 7be1402d-5719-5bd3-a306-3def9f135da5
    api_version: 1

salt.modules.random_org.generateBlobs(api_key=..., api_version=..., **kwargs)
    List all Slack users.

Parameters
    • api_key -- The Random.org api key.
    • api_version -- The Random.org api version.
    • format -- Specifies the format in which the blobs will be returned. Values allowed
      are base64 and hex.

Returns
    The user list.

CLI Example:

salt '*' get_integers number=5 min=1 max=6
salt '*' get_integers number=5 min=1 max=6
salt.modules.random_org.generateDecimalFractions

Generates true random decimal fractions

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random decimal fractions you need. Must be within the [1,1e4] range.
- **decimalPlaces** -- The number of decimal places to use. Must be within the [1,20] range.
- **replacement** -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.

Returns

A list of decimal fraction

CLI Example:

```bash
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
replacement=True
```

salt.modules.random_org.generateGaussians

This method generates true random numbers from a Gaussian distribution (also known as a normal distribution).

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random numbers you need. Must be within the [1,1e4] range.
- **mean** -- The distribution's mean. Must be within the [-1e6,1e6] range.
- **standardDeviation** -- The distribution's standard deviation. Must be within the [-1e6,1e6] range.
- **significantDigits** -- The number of significant digits to use. Must be within the [2,20] range.

Returns

The user list.

CLI Example:

```bash
salt '*' random_org.generateGaussians number=10 mean=0.00
standardDeviation=1.0 significantDigits=8
```

salt.modules.random_org.generateIntegers

Generate random integers

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- The number of integers to generate
- **minimum** -- The lower boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **maximum** -- The upper boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
• **replacement** -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.

• **base** -- Specifies the base that will be used to display the numbers. Values allowed are 2, 8, 10 and 16. This affects the JSON types and formatting of the resulting data as discussed below.

**Returns**
A list of integers.

**CLI Example:**

```
salt '*' random_org.generateIntegers number=5 minimum=1 maximum=6
salt '*' random_org.generateIntegers number=5 minimum=2 maximum=255 base=2
```

class **random_org**

salt.modules.random_org.generateStrings

Generate random strings.

**Parameters**

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- The number of strings to generate.
- **length** -- The length of each string. Must be within the [1,20] range. All strings will be of the same length.
- **characters** -- A string that contains the set of characters that are allowed to occur in the random strings. The maximum number of characters is 80.
- **replacement** -- Specifies whether the random strings should be picked with replacement. The default (true) will cause the strings to be picked with replacement, i.e., the resulting list of strings may contain duplicates (like a series of dice rolls). If you want the strings to be unique (like raffle tickets drawn from a container), set this value to false.

**Returns**
A list of strings.

**CLI Example:**

```
salt '*' random_org.generateStrings number=5 length=8 characters='abcdefghijklmnopqrstuvwxyz'
salt '*' random_org.generateStrings number=10 length=16 characters='abcdefghijklmnopqrstuvwxyz'
```

class **random_org**

salt.modules.random_org.generateUUIDs

Generate a list of random UUIDs

**Parameters**

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random UUIDs you need. Must be within the [1,1e3] range.

**Returns**
A list of UUIDs

**CLI Example:**

```
salt '*' random_org.generateUUIDs number=5
```

class **random_org**

salt.modules.random_org.getUsage

Get usage information

**Parameters**

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.

**Returns**
A list of usage information.
Show current usages statistics

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.

Returns

The current usage statistics.

CLI Example:

```bash
salt '*' random_org.getUsage
salt '*' random_org.getUsage api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_version=1
```

---

### 26.6.367 salt.modules.rbac_solaris

Module for Solaris' Role-Based Access Control

salt.modules.rbac_solaris.auth_add(**user**, **auth**)

Add authorization to user

- **user** [string] username
- **auth** [string] authorization name

CLI Example:

```bash
salt '*' rbac.auth_add martine solaris.zone.manage
salt '*' rbac.auth_add martine solaris.zone.manage,solaris.mail.mailq
```

salt.modules.rbac_solaris.auth_get(**user**, **computed=True**)

List authorization for user

- **user** [string] username
- **computed** [boolean] merge results from auths command into data from user_attr

CLI Example:

```bash
salt '*' rbac.auth_get leo
```

salt.modules.rbac_solaris.auth_list()

List all available authorization

CLI Example:

```bash
salt '*' rbac.auth_list
```

salt.modules.rbac_solaris.auth_rm(**user**, **auth**)

Remove authorization from user

- **user** [string] username
- **auth** [string] authorization name

CLI Example:
salt.modules.rbac_solaris.profile_add(user, profile)

Add profile to user

user

  [string] username

profile

  [string] profile name

CLI Example:

salt '*' rbac.profile_add martine 'Primary Administrator'
salt '*' rbac.profile_add martine 'User Management,User Security'

salt.modules.rbac_solaris.profile_get(user, default_hidden=True)

List profiles for user

user

  [string] username

default_hidden

  [boolean] hide default profiles

CLI Example:

salt '*' rbac.profile_get leo
salt '*' rbac.profile_get leo default_hidden=False

salt.modules.rbac_solaris.profile_list(default_only=False)

List all available profiles

default_only

  [boolean] return only default profile

CLI Example:

salt '*' rbac.profile_list

salt.modules.rbac_solaris.profile_rm(user, profile)

Remove profile from user

user

  [string] username

profile

  [string] profile name

CLI Example:

salt '*' rbac.profile_rm jorge 'Primary Administrator'
salt '*' rbac.profile_rm jorge 'User Management,User Security'

salt.modules.rbac_solaris.role_add(user, role)

Add role to user

user

  [string] username

role

  [string] role name

CLI Example:
salt '*' rbac.role_add martine netcfg
salt '*' rbac.role_add martine netcfg,zfssnap

salt.modules.rbac_solaris.role_get(user)
List roles for user

user
[string] username

CLI Example:

salt '*' rbac.role_get leo

salt.modules.rbac_solaris.role_list()
List all available roles

CLI Example:

salt '*' rbac.role_list

salt.modules.rbac_solaris.role_rm(user, role)
Remove role from user

user
[string] username

role
[string] role name

CLI Example:

salt '*' rbac.role_rm jorge netcfg
salt '*' rbac.role_rm jorge netcfg,zfssnap

26.6.368 salt.modules.rbenv

Manage ruby installations with rbenv. rbenv is supported on Linux and macOS. rbenv doesn't work on Windows (and isn't really necessary on Windows as there is no system Ruby on Windows). On Windows, the RubyInstaller and/or Pik are both good alternatives to work with multiple versions of Ruby on the same box.

http://misheska.com/blog/2013/06/15/using-rbenv-to-manage-multiple-versions-of-ruby/

New in version 0.16.0.

salt.modules.rbenv.default(ruby=None, runas=None)
Returns or sets the currently defined default ruby

ruby
The version to set as the default. Should match one of the versions listed by rbenv.versions. Leave blank to return the current default.

CLI Example:

salt '*' rbenv.default
salt '*' rbenv.default 2.0.0-p0

salt.modules.rbenv.do(cmdline, runas=None, env=None)
Execute a ruby command with rbenv's shims from the user or the system

CLI Example:
salt.modules.rbenv.do_with_ruby(ruby, cmdline, runas=None)

Execute a ruby command with rbenv's shims using a specific ruby version

CLI Example:

```
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler'
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler' runas=deploy
```

salt.modules.rbenv.install(runas=None, path=None)

Install rbenv systemwide

CLI Example:

```
salt '*' rbenv.install
```

salt.modules.rbenv.install_ruby(ruby, runas=None)

Install a ruby implementation.

`ruby`

The version of Ruby to install, should match one of the versions listed by `rbenv.list`

`runas`

The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

Additional environment variables can be configured in pillar / grains / master:

```
rbenv:
  build_env: "'CONFIGURE_OPTS="--no-tcmalloc" CFLAGS="-fno-tree-dce"'
```

CLI Example:

```
salt '*' rbenv.install_ruby 2.0.0-p0
```

salt.modules.rbenv.is_installed(runas=None)

Check if rbenv is installed

CLI Example:

```
salt '*' rbenv.is_installed
```

salt.modules.rbenv.list_(runas=None)

List the installable versions of ruby

`runas`

The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.list
```

salt.modules.rbenv.rehash(runas=None)

Run rbenv rehash to update the installed shims

`runas`

The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.
Salt Documentation, Release 3007.1

CLI Example:

```bash
salt '*' rbenv.rehash
```

**salt.modules.rbenv.uninstall_ruby** *(ruby, runas=None)*

Uninstall a ruby implementation.

**ruby**

The version of ruby to uninstall. Should match one of the versions listed by `rbenv.versions`.

**runas**

The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```bash
salt '*' rbenv.uninstall_ruby 2.0.0-p0
```

**salt.modules.rbenv.update** *(runas=None, path=None)*

Updates the current versions of rbenv and ruby-build

**runas**

The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```bash
salt '*' rbenv.update
```

**salt.modules.rbenv.versions** *(runas=None)*

List the installed versions of ruby

CLI Example:

```bash
salt '*' rbenv.versions
```

26.6.369 **salt.modules.rdp**

Manage RDP Service on Windows servers

**salt.modules.rdp.disable()**

Disable RDP the service on the server

CLI Example:

```bash
salt '*' rdp.disable
```

**salt.modules.rdp.disconnect_session**(session_id)

Disconnect a session.

New in version 2016.11.0.

**Parameters**

**session_id** -- The numeric Id of the session.

**Returns**

A boolean representing whether the disconnect succeeded.

CLI Example:

```bash
salt '*' rdp.disconnect_session session_id
salt '*' rdp.disconnect_session 99
```
salt.modules.rdp.enable()

Enable RDP the service on the server

CLI Example:

```
salt '*' rdp.enable
```

salt.modules.rdp.get_session(session_id)

Get information about a session.

New in version 2016.11.0.

Parameters

- `session_id` -- The numeric Id of the session.

Returns

A dictionary of session information.

CLI Example:

```
salt '*' rdp.get_session session_id
salt '*' rdp.get_session 99
```

salt.modules.rdp.list_sessions(logged_in_users_only=False)

List information about the sessions.

New in version 2016.11.0.

Parameters

- `logged_in_users_only` -- If True, only return sessions with users logged in.

Returns

A list containing dictionaries of session information.

CLI Example:

```
salt '*' rdp.list_sessions
```

salt.modules.rdp.logoff_session(session_id)

Initiate the logoff of a session.

New in version 2016.11.0.

Parameters

- `session_id` -- The numeric Id of the session.

Returns

A boolean representing whether the logoff succeeded.

CLI Example:

```
salt '*' rdp.logoff_session session_id
salt '*' rdp.logoff_session 99
```

salt.modules.rdp.status()

Show if rdp is enabled on the server

CLI Example:

```
salt '*' rdp.status
```

26.6. execution modules
26.6.370 salt.modules.rebootmgr module

Module for rebootmgr :maintainer: Alberto Planas <aplanas@suse.com> :maturity: new :depends: None :platform: Linux

New in version 3004.

salt.modules.rebootmgr.cancel()

Cancels an already running reboot.

CLI Example:

```
salt microos rebootmgr cancel
```

salt.modules.rebootmgr.get_group()

The currently set lock group for etcd.

CLI Example:

```
salt microos rebootmgr get_group
```

salt.modules.rebootmgr.get_strategy()

The currently used reboot strategy of rebootmgrd will be printed.

CLI Example:

```
salt microos rebootmgr get_strategy
```

salt.modules.rebootmgr.get_window()

The currently set maintenance window will be printed.

CLI Example:

```
salt microos rebootmgr get_window
```

salt.modules.rebootmgr.is_active()

Check if the rebootmgrd is running and active or not.

CLI Example:

```
salt microos rebootmgr is_active
```

salt.modules.rebootmgr.lock(machine_id=None, group=None)

Lock a machine. If no group is specified, the local default group will be used. If no machine-id is specified, the local machine will be locked.

machine_id

The machine-id is a network wide, unique ID. Per default the ID from /etc/machine-id is used.

group

Group name

CLI Example:

```
salt microos rebootmgr lock group=group1
```

salt.modules.rebootmgr.reboot(order=None)

Tells rebootmgr to schedule a reboot.
With the [now] option, a forced reboot is done, no lock from etcd is requested and a set maintenance window is ignored. With the [fast] option, a lock from etcd is requested if needed, but a defined maintenance window is ignored.

**order**

If specified, can be "now" or "fast"

CLI Example:
```
salt microos rebootmgr reboot
salt microos rebootmgt reboot order=now
```

**salt.modules.rebootmgr.set_group(group)**

Set the group, to which this machine belongs to get a reboot lock from etcd.

**group**

Group name

CLI Example:
```
salt microos rebootmgr set_group group=group_1
```

**salt.modules.rebootmgr.set_max(max_locks, group=None)**

Set the maximal number of hosts in a group, which are allowed to reboot at the same time.

**number**

Maximal number of hosts in a group

**group**

Group name

CLI Example:
```
salt microos rebootmgr set_max 4
```

**salt.modules.rebootmgr.set_strategy(strategy=None)**

A new strategy to reboot the machine is set and written into /etc/rebootmgr.conf.

**strategy**

If specified, must be one of those options:

- **best-effort** - This is the default strategy. If etcd is running, etcd-lock is used. If no etcd is running, but a maintenance window is specified, the strategy will be maint-window. If no maintenance window is specified, the machine is immediately rebooted (instantly).

- **etcd-lock** - A lock at etcd for the specified lock-group will be acquired before reboot. If a maintenance window is specified, the lock is only acquired during this window.

- **maint-window** - Reboot does happen only during a specified maintenance window. If no window is specified, the instantly strategy is followed.

- **instantly** - Other services will be informed that a reboot will happen. Reboot will be done without getting any locks or waiting for a maintenance window.

- **off** - Reboot requests are temporary ignored. /etc/rebootmgr.conf is not modified.

CLI Example:
```
salt microos rebootmgr set_strategy strategy=off
```

**salt.modules.rebootmgr.set_window(time, duration)**

Set's the maintenance window.
time
The format of time is the same as described in systemd.time(7).

duration
The format of duration is "[XXh][YYm]".

CLI Example:
```bash
salt microos rebootmgr set_window time="Thu,Fri 2020-**-1,5 11:12:13" duration=1h
```

`salt.modules.rebootmgr.status()`
Returns the current status of rebootmgr.
Valid returned values are:
- 0 - No reboot requested
- 1 - Reboot requested
- 2 - Reboot requested, waiting for maintenance window
- 3 - Reboot requested, waiting for etcd lock.

CLI Example:
```bash
salt microos rebootmgr status
```

`salt.modules.rebootmgr.unlock(machine_id=None, group=None)`
Unlock a machine. If no group is specified, the local default group will be used. If no machine-id is specified, the local machine will be locked.

**machine_id**
The machine-id is a network wide, unique ID. Per default the ID from /etc/machine-id is used.

**group**
Group name

CLI Example:
```bash
salt microos rebootmgr unlock group=group1
```

`salt.modules.rebootmgr.version()`
Return the version of rebootmgrd

CLI Example:
```bash
salt microos rebootmgr version
```

26.6.371 `salt.modules.redis`
Module to provide redis functionality to Salt
New in version 2014.7.0.

**configuration**
This module requires the redis python module and uses the following defaults which may be overridden in the minion configuration:

```yaml
redis.host: 'salt'
redis.port: 6379
redis.db: 0
redis.password: None
```

`salt.modules.redismod.bgrewriteaof(host=None, port=None, db=None, password=None)`
Asynchronously rewrite the append-only file

CLI Example:
salt '*' redis.bgrewriteaof

```
salt.modules.redismod.bgsave(host=None, port=None, db=None, password=None)
```
Asynchronously save the dataset to disk

CLI Example:
```
salt '*' redis.bgsave
```

```
salt.modules.redismod.config_get(pattern='*', host=None, port=None, db=None, password=None)
```
Get redis server configuration values

CLI Example:
```
salt '*' redis.config_get
salt '*' redis.config_get_port
```

```
salt.modules.redismod.config_set(name, value, host=None, port=None, db=None, password=None)
```
Set redis server configuration values

CLI Example:
```
salt '*' redis.config_set masterauth luv_kittens
```

```
salt.modules.redismod.dbsize(host=None, port=None, db=None, password=None)
```
Return the number of keys in the selected database

CLI Example:
```
salt '*' redis.dbsize
```

```
salt.modules.redismod.delete(*keys, **connection_args)
```
Deletes the keys from redis, returns number of keys deleted

CLI Example:
```
salt '*' redis.delete foo
```

```
salt.modules.redismod.exists(key, host=None, port=None, db=None, password=None)
```
Return true if the key exists in redis

CLI Example:
```
salt '*' redis.exists foo
```

```
salt.modules.redismod.expire(key, seconds, host=None, port=None, db=None, password=None)
```
Set a keys time to live in seconds

CLI Example:
```
salt '*' redis.expire foo 300
```

```
salt.modules.redismod.expireat(key, timestamp, host=None, port=None, db=None, password=None)
```
Set a keys expire at given UNIX time

CLI Example:
salt '.*' redis.expireat foo 1400000000

```python
salt.modules.redismod.flushall(host=None, port=None, db=None, password=None)
```

Remove all keys from all databases

CLI Example:
```
salt '.*' redis.flushall
```

```python
salt.modules.redismod.flushdb(host=None, port=None, db=None, password=None)
```

Remove all keys from the selected database

CLI Example:
```
salt '.*' redis.flushdb
```

```python
salt.modules.redismod.get_key(key, host=None, port=None, db=None, password=None)
```

Get redis key value

CLI Example:
```
salt '.*' redis.get_key foo
```

```python
salt.modules.redismod.get_master_ip(host=None, port=None, password=None)
```

Get host information about slave

New in version 2016.3.0.

CLI Example:
```
salt '.*' redis.get_master_ip
```

```python
salt.modules.redismod.hdel(key, *fields, **options)
```

Delete one of more hash fields.

New in version 2017.7.0.

CLI Example:
```
salt '.*' redis.hdel foo_hash bar_field1 bar_field2
```

```python
salt.modules.redismod.hexists(key, field, host=None, port=None, db=None, password=None)
```

Determine if a hash fields exists.

New in version 2017.7.0.

CLI Example:
```
salt '.*' redis.hexists foo_hash bar_field
```

```python
salt.modules.redismod.hget(key, field, host=None, port=None, db=None, password=None)
```

Get specific field value from a redis hash, returns dict

CLI Example:
```
salt '.*' redis.hget foo_hash bar_field
```
**salt.modules.redismod.hgetall**(*key, host=None, port=None, db=None, password=None*)

Get all fields and values from a redis hash, returns dict

CLI Example:

```
salt '*' redis.hgetall foo_hash
```

**salt.modules.redismod.hincrby**(*key, field, increment=1, host=None, port=None, db=None, password=None*)

Increment the integer value of a hash field by the given number.
New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hincrby foo_hash bar_field 5
```

**salt.modules.redismod.hincrbyfloat**(*key, field, increment=1.0, host=None, port=None, db=None, password=None*)

Increment the float value of a hash field by the given number.
New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hincrbyfloat foo_hash bar_field 5.17
```

**salt.modules.redismod.hlen**(*key, host=None, port=None, db=None, password=None*)

Returns number of fields of a hash.
New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hlen foo_hash
```

**salt.modules.redismod.hmget**(*key, *fields, **options*)

Returns the values of all the given hash fields.
New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hmget foo_hash bar_field1 bar_field2
```

**salt.modules.redismod.hmset**(*key, **fieldsvals*)

Sets multiple hash fields to multiple values.
New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hmset foo_hash bar_field1=bar_value1 bar_field2=bar_value2
```

**salt.modules.redismod.hscan**(*key, cursor=0, match=None, count=None, host=None, port=None, db=None, password=None*)

Incrementally iterate hash fields and associated values.
New in version 2017.7.0.
CLI Example:

```
salt '*' redis.hscan foo_hash match='field_prefix_*' count=1
```

salt.modules.redismod.hset(key, field, value, host=None, port=None, db=None, password=None)

Set the value of a hash field.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hset foo_hash bar_field bar_value
```
salt.modules.redismod.hsetnx(key, field, value, host=None, port=None, db=None, password=None)

Set the value of a hash field only if the field does not exist.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hsetnx foo_hash bar_field bar_value
```
salt.modules.redismod.hvals(key, host=None, port=None, db=None, password=None)

Return all the values in a hash.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hvals foo_hash bar_field1 bar_value1
```
salt.modules.redismod.info(host=None, port=None, db=None, password=None)

Get information and statistics about the server

CLI Example:

```
salt '*' redis.info
```
salt.modules.redismod.key_type(key, host=None, port=None, db=None, password=None)

Get redis key type

CLI Example:

```
salt '*' redis.type foo
```
salt.modules.redismod.keys(pattern='*', host=None, port=None, db=None, password=None)

Get redis keys, supports glob style patterns

CLI Example:

```
salt '*' redis.keys
salt '*' redis.keys test*
```
salt.modules.redismod.lastsave(host=None, port=None, db=None, password=None)

Get the UNIX time in seconds of the last successful save to disk

CLI Example:
salt '*' redis.lastsave

salt.modules.redismod.**llen**(key, host=None, port=None, db=None, password=None)
Get the length of a list in Redis
CLI Example:
salt '*' redis.llen foo_list

salt.modules.redismod.**lrange**(key, start, stop, host=None, port=None, db=None, password=None)
Get a range of values from a list in Redis
CLI Example:
salt '*' redis.lrange foo_list 0 10

salt.modules.redismod.**ping**(host=None, port=None, db=None, password=None)
Ping the server, returns False on connection errors
CLI Example:
salt '*' redis.ping

salt.modules.redismod.**save**(host=None, port=None, db=None, password=None)
Synchronously save the dataset to disk
CLI Example:
salt '*' redis.save

salt.modules.redismod.**sentinel_get_master_ip**(master, host=None, port=None, password=None)
Get ip for sentinel master
New in version 2016.3.0.
CLI Example:
salt '*' redis.sentinel_get_master_ip 'mymaster'

salt.modules.redismod.**set_key**(key, value, host=None, port=None, db=None, password=None)
Set redis key value
CLI Example:
salt '*' redis.set_key foo bar

salt.modules.redismod.**shutdown**(host=None, port=None, db=None, password=None)
Synchronously save the dataset to disk and then shut down the server
CLI Example:
salt '*' redis.shutdown

salt.modules.redismod.**slaveof**(master_host=None, master_port=None, host=None, port=None, db=None, password=None)
Make the server a slave of another instance, or promote it as master
CLI Example:
salt.modules.redismod.smembers(key, host=None, port=None, db=None, password=None)

Get members in a Redis set

CLI Example:
salt '*' redis.smembers foo_set

salt.modules.redismod.time(host=None, port=None, db=None, password=None)

Return the current server UNIX time in seconds

CLI Example:
salt '*' redis.time

salt.modules.redismod.zcard(key, host=None, port=None, db=None, password=None)

Get the length of a sorted set in Redis

CLI Example:
salt '*' redis.zcard foo_sorted

salt.modules.redismod.zrange(key, start, stop, host=None, port=None, db=None, password=None)

Get a range of values from a sorted set in Redis by index

CLI Example:
salt '*' redis.zrange foo_sorted 0 10

26.6.372 salt.modules.reg

Manage the Windows registry

Hives

Hives are the main sections of the registry and all begin with the word HKEY.

- HKEY_LOCAL_MACHINE
- HKEY_CURRENT_USER
- HKEY_USER
Keys

Keys are the folders in the registry. Keys can have many nested subkeys. Keys can have a value assigned to them under the (Default)

When passing a key on the CLI it must be quoted correctly depending on the backslashes being used (\ vs \). The following are valid methods of passing the key on the CLI:

Using single backslashes:
"SOFTWARE\Python" 'SOFTWARE\Python' (will not work on a Windows Master)

Using double backslashes:
SOFTWARE\Python

Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is (Default) with a displayed value of (value not set). The actual value is Null.

Example

The following example is an export from the Windows startup portion of the registry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"="C:\Program Files\Realtek\Audio\HDA\RtkNGUI64.exe" -s
"NvBackend"="C:\Program Files (x86)\NVIDIA Corporation\Update Core\NvBackend.exe"
"BTMTrayAgent"="rundll32.exe "C:\Program Files (x86)\Intel\Bluetooth\btmshellex.dll",TrayApp"
```

In this example these are the values for each:

Hive:
HKEY_LOCAL_MACHINE

Key and subkeys:
SOFTWARE\Microsoft\Windows\CurrentVersion\Run

Value:

- There are 3 value names:
  - RTHDVCPL
  - NvBackend
  - BTMTrayAgent

- Each value name has a corresponding value

    depends
    salt.utils.win_reg

    salt.modules.reg.broadcast_change()

    Refresh the windows environment.
Note: This will only effect new processes and windows. Services will not see the change until the system restarts.

Returns
True if successful, otherwise False
Return type
bool

CLI Example:
```bash
salt '*' reg.broadcast_change
```

salt.modules.reg.delete_key_recursive(hive, key, use_32bit_registry=False)

New in version 2015.5.4.
Delete a registry key to include all subkeys and value/data pairs.

Parameters
- **hive** *(str)* -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** *(str)*: The key to remove (looks like a path)
- **use_32bit_registry** *(bool)*: Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

Returns
A dictionary listing the keys that deleted successfully as well as those that failed to delete.

Return type
dict

CLI Example:
The following example will remove delete_me and all its subkeys from the SOFTWARE key in HKEY_LOCAL_MACHINE:
```bash
salt '*' reg.delete_key_recursive HKLM SOFTWARE\\delete_me
```

salt.modules.reg.delete_value(hive, key, vname=None, use_32bit_registry=False)
Delete a registry value entry or the default value for a key.

Parameters
- **hive** *(str)* -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** *(str)* -- The key (looks like a path) to the value name.
- **vname** *(str)* -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be deleted.
- **use_32bit_registry** *(bool)* -- Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
Returns
True if successful, otherwise False
Return type
bool

CLI Example:

```
salt '*' reg.delete_value HKEY_CURRENT_USER 'SOFTWARE\Salt' → 'version'
```

\texttt{salt.modules.reg.import\_file}(source, use\_32bit\_registry=False)

Import registry settings from a Windows REG file by invoking \texttt{REG.EXE}.

New in version 2018.3.0.

Parameters
- \texttt{source (str)} -- The full path of the REG file. This can be either a local file path or a URL type supported by salt (e.g. salt://salt_master_path)
- \texttt{use\_32bit\_registry (bool)} -- If the value of this parameter is True then the REG file will be imported into the Windows 32 bit registry. Otherwise the Windows 64 bit registry will be used.

Returns
True if successful, otherwise an error is raised
Return type
bool

Raising
- \texttt{ValueError} -- If the value of source is an invalid path or otherwise causes cp. cache\_file to return False
- \texttt{CommandExecutionError} -- If reg.exe exits with a non-0 exit code

CLI Example:

```
salt machine1 reg.import\_file salt://win/printer\_config/110_–Canon/postinstall\_config.reg
```

\texttt{salt.modules.reg.key\_exists}(hive, key, use\_32bit\_registry=False)

Check that the key is found in the registry. This refers to keys and not value/data pairs.

Parameters
- \texttt{hive (str)} -- The hive to connect to
- \texttt{key (str)} -- The key to check
- \texttt{use\_32bit\_registry (bool)} -- Look in the 32bit portion of the registry

Returns
True if exists, otherwise False
Return type
bool

CLI Example:

```
salt '*' reg.key_exists HKLM SOFTWARE\Microsoft
```

\texttt{salt.modules.reg.list\_keys}(hive, key=None, use\_32bit\_registry=False)

Enumerates the subkeys in a registry key or hive.

Parameters
- \texttt{hive (str)} -- The name of the hive. Can be one of the following:
  - HKEY\_LOCAL\_MACHINE or HKLM
  - HKEY\_CURRENT\_USER or HKCU
  - HKEY\_USER or HKU
  - HKEY\_CLASSES\_ROOT or HKCR
- HKEY_CURRENT_CONFIG or HKCC
  - key (str) -- The key (looks like a path) to the value name. If a key is not passed, the keys under the hive will be returned.
  - use_32bit_registry (bool) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

Returns
A list of keys/subkeys under the hive or key.

Return type
list

CLI Example:
```
salt '*' reg.list_keys HKLM 'SOFTWARE'
```

salt.modules.reg.list_values (hive, key=None, use_32bit_registry=False)
Enumerates the values in a registry key or hive.

Note: The (Default) value will only be returned if it is set, otherwise it will not be returned in the list of values.

Parameters
- hive (str) -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- key (str) -- The key (looks like a path) to the value name. If a key is not passed, the values under the hive will be returned.
- use_32bit_registry (bool) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

Returns
A list of values under the hive or key.

Return type
list

CLI Example:
```
salt '*' reg.list_values HKLM 'SYSTEM\CurrentControlSet\Services\Tcpip'
```

salt.modules.reg.read_value (hive, key, vname=None, use_32bit_registry=False)
Reads a registry value entry or the default value for a key. To read the default value, don't pass vname

Parameters
- hive (str) -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- key (str) -- The key (looks like a path) to the value name.
- vname (str) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be returned.
- use_32bit_registry (bool) -- Accesses the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
Returns

A dictionary containing the passed settings as well as the value_data if successful. If unsuccessful, sets success to False.

bool: Returns False if the key is not found

If vname is not passed:
• Returns the first unnamed value (Default) as a string.
• Returns none if first unnamed value is empty.

Return type
dict

CLI Example:
The following will get the value of the *version* value name in the HKEY_LOCAL_MACHINE\SOFTWARE\Salt key

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' --'version'
```

CLI Example:
The following will get the default value of the HKEY_LOCAL_MACHINE\SOFTWARE\Salt key

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt'
```

salt.modules.reg.set_value(hive, key, vname=None, vdata=None, vtype='REG_SZ', use_32bit_registry=False, volatile=False)

Sets a value in the registry. If vname is passed, it will be the value for that value name, otherwise it will be the default value for the specified key.

Parameters

- **hive** (str) -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY>User or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** (str) -- The key (looks like a path) to the value name.
- **vname** (str) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be set.
- **vdata** (str, int, list, bytes) -- The value you'd like to set. If a value name (vname) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type of data this parameter expects is determined by the value type specified in vtype. The correspondence is as follows:
- REG_BINARY: Binary data (str in Py2, bytes in Py3)
- REG_DWORD: int
- REG_EXPAND_SZ: str
- REG_MULTI_SZ: list of str
- REG_QWORD: int
- REG_SZ: str

Note: When setting REG_BINARY, string data will be converted to binary.
Note: The type for the (Default) value is always REG_SZ and cannot be changed.

Note: This parameter is optional. If vdata is not passed, the Key will be created with no associated item/value pairs.

- **vtype** *(str)* -- The value type. The possible values of the vtype parameter are indicated above in the description of the vdata parameter.
- **use_32bit_registry** *(bool)* -- Sets the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
- **volatile** *(bool)* -- When this parameter has a value of True, the registry key will be made volatile (i.e. it will not persist beyond a system reset or shutdown). This parameter only has an effect when a key is being created and at no other time.

**Returns**

True if successful, otherwise False

**Return type**

bool

**CLI Example:**

This will set the version value to 2015.5.2 in the SOFTWARESalt key in the HKEY_LOCAL_MACHINE hive

```bash
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' → 'version' '2015.5.2'
```

**CLI Example:**

This function is strict about the type of vdata. For instance this example will fail because vtype has a value of REG_SZ and vdata has a type of int (as opposed to str as expected).

```bash
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_→data' 1.2
```

**CLI Example:**

In this next example vdata is properly quoted and should succeed.

```bash
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_→data' vtype=REG_SZ vdata="\'1.2\'"
```

**CLI Example:**

This is an example of using vtype REG_BINARY.

```bash
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'bin_→data' vtype=REG_BINARY vdata='Salty Data'
```

**CLI Example:**

An example of using vtype REG_MULTI_SZ is as follows:

```bash
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'list_→data' vtype=REG_MULTI_SZ vdata=['\"Salt\", \"is\", \"great\"]'
```

salt.modules.reg.value_exists *(hive, key, vname, use_32bit_registry=False)*

Check that the value/data pair is found in the registry.

New in version 3000.

**Parameters**

- **hive** *(str)* -- The hive to connect to
- **key** *(str)* -- The key to check in
- **vname** *(str)* -- The name of the value/data pair you're checking
- **use_32bit_registry** *(bool)* -- Look in the 32bit portion of the registry

**Returns**
True if exists, otherwise False

**Return type**
bool

**CLI Example:**
```
salt '*' reg.value_exists HKLM SOFTWARE\Microsoft\Windows\CurrentVersion CommonFilesDir
```
26.6.375  salt.modules.rest_service

Provide the service module for the proxy-minion REST sample

salt.modules.rest_service.enabled(name, sig=None)
  Only the 'redbull' service is 'enabled' in the test

salt.modules.rest_service.get_all()
  Return a list of all available services
  New in version 2015.8.0.
  CLI Example:

  ```
salt '*' service.get_all
  ```

salt.modules.rest_service.list_()
  Return a list of all available services.
  CLI Example:

  ```
salt '*' service.list
  ```

salt.modules.rest_service.restart(name, sig=None)
  Restart the specified service with rest_sample
  New in version 2015.8.0.
  CLI Example:

  ```
salt '*' service.restart <service name>
  ```

salt.modules.rest_service.running(name, sig=None)
  Return whether this service is running.
  New in version 2015.8.0.

salt.modules.rest_service.start(name, sig=None)
  Start the specified service on the rest_sample
  New in version 2015.8.0.
  CLI Example:

  ```
salt '*' service.start <service name>
  ```

salt.modules.rest_service.status(name, sig=None)
  Return the status for a service via rest_sample. If the name contains globbing, a dict mapping service name to True/False values is returned.
  New in version 2015.8.0.
  Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

  Parameters
  - name(str) -- The name of the service to check
  - sig(str) -- Not implemented
Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.rest_service.stop(name, sig=None)

Stop the specified service on the rest_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.stop <service name>
```

26.6.376 salt.modules.restartcheck

checkrestart functionality for Debian and Red Hat Based systems

Identifies services (processes) that are linked against deleted files (for example after downloading an updated binary of a shared library).

Based on checkrestart script from debian-goodies (written by Matt Zimmerman for the Debian GNU/Linux distribution, https://packages.debian.org/debian-goodies) and psdel by Sam Morris.

codeauthor

Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.modules.restartcheck.restartcheck(ignorelist=None, blacklist=None, excludepid=None, **kwargs)

Analyzes files opened by running processes and seeks for packages which need to be restarted.

Parameters

- **ignorelist** -- string or list of packages to be ignored.
- **blacklist** -- string or list of file paths to be ignored.
- **excludepid** -- string or list of process IDs to be ignored.
- **verbose** -- boolean, enables extensive output.
- **timeout** -- int, timeout in minute.

Returns

{ 'result': False, 'comment': '<reason>' }. String with checkrestart output if some package seems to need to be restarted or if no packages need restarting.

Return type

Dict on error

New in version 2015.8.3.

CLI Example:

```
salt '*' restartcheck.restartcheck
```
26.6.377 salt.modules.restconf

Execution module for RESTCONF Proxy minions

codeauthor
Jamie (Bear) Murphy <jamiemurphyit@gmail.com>
maturity
new
platform
any

salt.modules.restconf.get_data(path)
Returns an object containing the content of the request path with a GET request. Data returned will contain a dict with at minimum a key of "status" containing the http status code Other keys that should be available error (if http error), body, dict (parsed json to dict)

CLI Example:

```
salt '*' restconf.get_data restconf/yang-library-version
```

salt.modules.restconf.info()
Returns the RESTCONF capabilities PATH

CLI Example:

```
salt '*' restconf.info
```

salt.modules.restconf.path_check(primary_path, init_path)
Used to check which path responds with a 200 status Returns an array of True/False and a dict with keys path + path_method + response data, used in states code.

CLI Example:

```
salt '*' restconf.path_check restconf/yang-library-version/specific_item
```

salt.modules.restconf.set_data(path, method, dict_payload)
Sends a post/patch/other type of rest method to a specified path with the specified method with specified payload

CLI Example:

```
salt '*' restconf.set_data restconf/yang-library-version method=PATCH dict_payload=""
```

26.6.378 salt.modules.ret

Module to integrate with the returner system and retrieve data sent to a salt returner

salt.modules.ret.get_fun(returner, fun)
Return info about last time fun was called on each minion

CLI Example:
salt '*' ret.get_fun mysql network.interfaces

salt.modules.ret.get_jid(returer, jid)
Return the information for a specified job id

CLI Example:
salt '*' ret.get_jid redis 20421104181954700505

salt.modules.ret.get_jids(returer)
Return a list of all job ids

CLI Example:
salt '*' ret.get_jids mysql

salt.modules.ret.get_minions(returer)
Return a list of all minions

CLI Example:
salt '*' ret.get_minions mysql

26.6.379 salt.modules.rh_ip

The networking module for RHEL/Fedora based distros
salt.modules.rh_ip.apply_network_settings(**settings)
Apply global network configuration.

CLI Example:
salt '*' ip.apply_network_settings

salt.modules.rh_ip.build_interface(iface, iface_type, enabled, **settings)
Build an interface script for a network interface.

CLI Example:
salt '*' ip.build_interface eth0 eth <settings>

salt.modules.rh_ip.build_network_settings(**settings)
Build the global network script.

CLI Example:
salt '*' ip.build_network_settings <settings>

salt.modules.rh_ip.build_routes(iface, **settings)
Build a route script for a network interface.

CLI Example:
salt '*' ip.build_routes eth0 <settings>
salt.modules.rh_ip.down(iface, iface_type)
    Shutdown a network interface
    CLI Example:
    ```
salt '*' ip.down eth0
    ```

salt.modules.rh_ip.get_interface(iface)
    Return the contents of an interface script
    CLI Example:
    ```
salt '*' ip.get_interface eth0
    ```

salt.modules.rh_ip.get_network_settings()
    Return the contents of the global network script.
    CLI Example:
    ```
salt '*' ip.get_network_settings
    ```

salt.modules.rh_ip.get_routes(iface)
    Return the contents of the interface routes script.
    CLI Example:
    ```
salt '*' ip.get_routes eth0
    ```

salt.modules.rh_ip.up(iface, iface_type)
    Start up a network interface
    CLI Example:
    ```
salt '*' ip.up eth0
    ```

### 26.6.380 salt.modules.rh_service

Service support for RHEL-based systems, including support for both upstart and sysvinit

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see [here](#).

salt.modules.rh_service.available(name, limit="")
    Return True if the named service is available. Use the limit param to restrict results to services of that type.
    CLI Examples:
    ```
salt '*' service.available sshd
salt '*' service.available sshd limit=upstart
salt '*' service.available sshd limit=sysvinit
```
salt.modules.rh_service.delete(name, **kwargs)
Delete the named service
New in version 2016.3.0.
CLI Example:
```python
salt '*' service.delete <service name>
```

salt.modules.rh_service.disable(name, **kwargs)
Disable the named service to start at boot
CLI Example:
```python
salt '*' service.disable <service name>
```

salt.modules.rh_service.disabled(name)
Check to see if the named service is disabled to start on boot
CLI Example:
```python
salt '*' service.disabled <service name>
```

salt.modules.rh_service.enable(name, **kwargs)
Enable the named service to start at boot
CLI Example:
```python
salt '*' service.enable <service name>
```

salt.modules.rh_service.enabled(name, **kwargs)
Check to see if the named service is enabled to start on boot
CLI Example:
```python
salt '*' service.enabled <service name>
```

salt.modules.rh_service.get_all(limit='')
Return all installed services. Use the limit param to restrict results to services of that type.
CLI Example:
```python
salt '*' service.get_all
salt '*' service.get_all limit=upstart
salt '*' service.get_all limit=sysvinit
```

salt.modules.rh_service.get_disabled(limit='')
Return the disabled services. Use the limit param to restrict results to services of that type.
CLI Example:
```python
salt '*' service.get_disabled
salt '*' service.get_disabled limit=upstart
salt '*' service.get_disabled limit=sysvinit
```
Salt Documentation, Release 3007.1

salt.modules.rh_service.get_enabled

Return the enabled services. Use the limit param to restrict results to services of that type.

CLI Examples:

```sh
salt '*' service.get_enabled
salt '*' service.get_enabled limit=upstart
salt '*' service.get_enabled limit=sysvinit
```

salt.modules.rh_service.missing

The inverse of service.available. Return True if the named service is not available. Use the limit param to restrict results to services of that type.

CLI Examples:

```sh
salt '*' service.missing sshd
salt '*' service.missing sshd limit=upstart
salt '*' service.missing sshd limit=sysvinit
```

salt.modules.rh_service.reload_

Reload the named service

CLI Example:

```sh
salt '*' service.reload <service name>
```

salt.modules.rh_service.restart

Restart the named service

CLI Example:

```sh
salt '*' service.restart <service name>
```

salt.modules.rh_service.start

Start the specified service

CLI Example:

```sh
salt '*' service.start <service name>
```

salt.modules.rh_service.status

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

- **name** (str) -- The name of the service to check
- **sig** (str) -- Signature to use to find the service via ps

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```sh
salt '*' service.status <service name> [service signature]
```
salt.modules.rh_service.stop(name)
    Stop the specified service
    CLI Example:

    salt '*' service.stop <service name>

26.6.381 salt.modules.riak

Riak Salt Module

salt.modules.riak.cluster_commit()
    Commit Cluster Changes
    Changed in version 2015.8.0.
    CLI Example:

    salt '*' riak.cluster_commit

salt.modules.riak.cluster_join(username, hostname)
    Join a Riak cluster
    Changed in version 2015.8.0.
    CLI Example:

    salt '*' riak.cluster_join <user> <host>

    username - The riak username to join the cluster
    hostname - The riak hostname you are connecting to

salt.modules.riak.cluster_leave(username, hostname)
    Leave a Riak cluster
    New in version 2015.8.0.
    CLI Example:

    salt '*' riak.cluster_leave <username> <host>

    username - The riak username to join the cluster
    hostname - The riak hostname you are connecting to

salt.modules.riak.cluster_plan()
    Review Cluster Plan
    Changed in version 2015.8.0.
    CLI Example:

    salt '*' riak.cluster_plan

salt.modules.riak.member_status()
    Get cluster member status
    Changed in version 2015.8.0.
    CLI Example:
salt '*' riak.member_status

salt.modules.riak.services()
List available services on a node
New in version 2015.8.0.
CLI Example:
salt '*' riak.services

salt.modules.riak.start()
Start Riak
CLI Example:
salt '*' riak.start

salt.modules.riak.status()
Current node status
New in version 2015.8.0.
CLI Example:
salt '*' riak.status

salt.modules.riak.stop()
Stop Riak
Changed in version 2015.8.0.
CLI Example:
salt '*' riak.stop

salt.modules.riak.test()
Runs a test of a few standard Riak operations
New in version 2015.8.0.
CLI Example:
salt '*' riak.test

26.6.382 salt.modules.rpm_lowpkg

Support for rpm

salt.modules.rpm_lowpkg.bin_pkg_info(path, saltenv='base')
New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

path
Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. salt://path/to/file.rpm). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.
saltenv

[base] Salt fileserver environment from which to retrieve the package. Ignored if path is a local file path on the minion.

CLI Example:

```
salt '!' lowpkg.bin_pkg_info /root/salt-2015.5.1-2.el7.noarch.rpm
salt '!' lowpkg.bin_pkg_info salt://salt-2015.5.1-2.el7.noarch.rpm
```

salt.modules.rpm_lowpkg.checksum(*paths, **kwargs)

Return if the signature of a RPM file is valid.

root

use root as top level directory (default: "/")

CLI Example:

```
salt '!' lowpkg.checksum /path/to/package1.rpm
salt '!' lowpkg.checksum /path/to/package1.rpm /path/to/package2.rpm
```

salt.modules.rpm_lowpkg.diff(package_path, path)

Return a formatted diff between current file and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters

- **package** -- Full pack of the RPM file
- **path** -- Full path to the installed file

Returns

Difference or empty string. For binary files only a notification.

CLI Example:

```
salt '!' lowpkg.diff /path/to/apache2.rpm /etc/apache2/httpd.conf
```

salt.modules.rpm_lowpkg.file_dict(*packages, **kwargs)

List the files that belong to a package, sorted by group. Not specifying any packages will return a list of _every_ file on the system's rpm database (not generally recommended).

root

use root as top level directory (default: "/")

CLI Examples:

```
salt '!' lowpkg.file_dict httpd
salt '!' lowpkg.file_dict httpd postfix
salt '!' lowpkg.file_dict
```

salt.modules.rpm_lowpkg.file_list(*packages, **kwargs)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's rpm database (not generally recommended).

root

use root as top level directory (default: "/")

CLI Examples:

```
salt '!' lowpkg.file_list httpd
salt '!' lowpkg.file_list httpd postfix
salt '!' lowpkg.file_list
```

salt.modules.rpm_lowpkg.info(*packages, **kwargs)

Return a detailed package(s) summary information. If no packages specified, all packages will be returned.

Parameters
• **packages**
  • **attr** -- Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.

  **Valid attributes are:**
  version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.

• **all_versions** -- Return information for all installed versions of the packages

• **root** -- use root as top level directory (default: "/")

**Returns**

**CLI Example:**

```
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info apache2 bash attr=version
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size all_versions=True
```

salt.modules.rpm_lowpkg.list_pkgs(*packages, **kwargs)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

**root**

use root as top level directory (default: "/")

**CLI Example:**

```
salt '*' lowpkg.list_pkgs
```

salt.modules.rpm_lowpkg.modified(*packages, **flags)

List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system's RPM database.

New in version 2015.5.0.

**root**

use root as top level directory (default: "/")

**CLI Examples:**

```
salt '*' lowpkg.modified httpd
salt '*' lowpkg.modified httpd postfix
salt '*' lowpkg.modified
```

salt.modules.rpm_lowpkg.owner(*paths, **kwargs)

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

**root**

use root as top level directory (default: "/")

**CLI Examples:**

```
salt '*' lowpkg.owner /usr/bin/apachectl
salt '*' lowpkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```
salt.modules.rpm_lowpkg.verify(*packages, **kwargs)

Runs an rpm -Va on a system, and returns the results in a dict

root

use root as top level directory (default: "/")

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the ignore_types keyword argument

CLI Example:

```
salt '*' lowpkg.verify
salt '*' lowpkg.verify httpd
salt '*' lowpkg.verify httpd postfix
salt '*' lowpkg.verify httpd postfix ignore_types=['config', 'doc']
```

salt.modules.rpm_lowpkg.version_cmp(ver1, ver2, ignore_epoch=False)

New in version 2015.8.9.

Do a cmp-style comparison on two packages. Return -1 if ver1 < ver2, 0 if ver1 == ver2, and 1 if ver1 > ver2. Return None if there was a problem making the comparison.

ignore_epoch

[False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10, 2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

26.6.383 salt.modules.rpmbuild_pkgbuilder

RPM Package builder system

New in version 2015.8.0.

This system allows for all of the components to build rpms safely in chrooted environments. This also provides a function to generate yum repositories.

This module implements the pkgbuilder interface

salt.modules.rpmbuild_pkgbuilder.build(runas, tgt, dest_dir, spec, sources, deps, env, template, saltenv='base', log_dir='/var/log/salt/pkgbuilder')

Given the package destination directory, the spec file source and package sources, use mock to safely build the rpm defined in the spec file

CLI Example:

```
salt '*' pkgbuilder.build mock epel-7-x86_64 /var/www/html
https://raw.githubusercontent.com/saltstack/libnacl/master/
pkg/rpm/python-libnacl.spec
5.tar.gz
```

This example command should build the libnacl package for rhel 7 using user mock and place it in /var/www/html/ on the minion

salt.modules.rpmbuild_pkgbuilder.make_repo(repodir, keyid=None, env=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='root', timeout=15.0)
Make a package repository and optionally sign packages present

Given the repodir, create a `yum` repository out of the rpms therein and optionally sign it and packages present, the name is directory to turn into a repo. This state is best used with `onchanges` linked to your package building states.

**repodir**

The directory to find packages that will be in the repository.

**keyid**

Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion’s Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```plaintext
[gpg_pkg_priv_key]
-----BEGIN PGP PRIVATE KEY BLOCK-----
Version: GnuPG v1

lQ0+BFCeiFQBCADAPCtzx7I5RL32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
w82PCE8Y1jF/9Uk2m3RKVWp3YcLlC7Ap3gj6VO4ysVz28UbhnPXsIk0lf2c88qc
.

inNqW9c=
=s1CX
-----END PGP PUBLIC KEY BLOCK-----

[gpg_pkg_pub_keyname]: gpg_pkg_key.pub
```

**env**

Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

**Note:** This parameter is not used for making `yum` repositories.

**use_passphrase**

[False] New in version 2016.3.0.
Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter.

```
pillar='{"gpg_passphrase" : "my_passphrase" }'
```

New in version 3001.1.

RHEL 8 and above leverages gpg-agent and gpg-preset-passphrase for caching keys, etc.

**gnupghome**

`[/etc/salt/gpgkeys]` New in version 2016.3.0.

Location where GPG related files are stored, used with `keyid`.

**runas**

User to create the repository as, and optionally sign packages.

---

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

**timeout**

`[15.0]` New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html/
```

salt.modules.rpmbuild_pkgbuild.make_src_pkg(`dest_dir`, `spec`, `sources`, `env=None`, `template=None`, `saltenv='base'`, runas='root')

Create a source rpm from the given spec file and sources

CLI Example:

```
salt '*' pkgbuild.make_src_pkg /var/www/html/  
  https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/
  rpm/python-libnacl.spec  
  https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.  
  tar.gz
```

This example command should build the libnacl SOURCE package and place it in `/var/www/html/` on the minion

Changed in version 2017.7.0.

**dest_dir**

The directory on the minion to place the built package(s)

**spec**

The location of the spec file (used for rpms)

**sources**

The list of package sources

**env**

A dictionary of environment variables to be set prior to execution.

**template**

Run the spec file through a templating engine Optional argument, allows for no templating engine used to be if none is desired.

**saltenv**

The saltenv to use for files downloaded from the salt filesever
runas

The user to run the build process as

New in version 2018.3.3.

Note: using SHA256 as digest and minimum level dist el6

26.6.384 salt.modules.rsync

Wrapper for rsync

New in version 2014.1.0.

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

salt.modules.rsync.config

```
salt.modules.rsync.config(conf_path='/etc/rsyncd.conf')
```

Changed in version 2016.3.0: Return data now contains just the contents of the rsyncd.conf as a string, instead of a dictionary as returned from cmd.run_all.

Returns the contents of the rsync config file

```
conf_path

[/etc/rsyncd.conf] Path to the config file
```

CLI Example:

```
salt '*' rsync.config
```

salt.modules.rsync.rsync

```
salt.modules.rsync.rsync(src, dst, delete=False, force=False, update=False, passwordfile=None, exclude=None, excludefrom=None, dryrun=False, rsh=None, additional_opts=None, saltenv='base')
```

Changed in version 2016.3.0: Return data now contains just the output of the rsync command, instead of a dictionary as returned from cmd.run_all.

Rsync files from src to dst

```
src

The source location where files will be rsynced from.
```

```
dst

The destination location where files will be rsynced to.
```

```
delete

[False] Whether to enable the rsync --delete flag, which will delete extraneous files from dest dirs
```

```
force

[False] Whether to enable the rsync --force flag, which will force deletion of dirs even if not empty.
```

```
update

[False] Whether to enable the rsync --update flag, which forces rsync to skip any files which exist on the destination and have a modified time that is newer than the source file.
```

```
passwordfile

A file that contains a password for accessing an rsync daemon. The file should contain just the password.
```

```
exclude

Whether to enable the rsync --exclude flag, which will exclude files matching a PATTERN.
```

```
excludelfrom

Whether to enable the rsync --excludelfrom flag, which will read exclude patterns from a file.
```

```
drynun

[False] Whether to enable the rsync --dry-run flag, which will perform a trial run with no changes made.
```

```
rsh

Whether to enable the rsync --rsh flag, to specify the remote shell to use.
```
additional_opts

Any additional rsync options, should be specified as a list.
saltenv

Specify a salt fileserver environment to be used.

CLI Example:

```bash
salt '*' rsync.rsync /path/to/src /path/to/dest delete=True update=True
    -passwordfile=/etc/pass.crt exclude=exclude/dir
salt '*' rsync.rsync /path/to/src delete=True excludefrom=/xx.ini
salt '*' rsync.rsync /path/to/src delete=True exclude='[exclude1/dir,
   -exclude2/dir]' additional_opts=['"--partial", "--bwlimit=5000"]
```

**salt.modules.rsync.version()**

Changed in version 2016.3.0: Return data now contains just the version number as a string, instead of a dictionary as returned from `cmd.run_all`.

Returns rsync version

CLI Example:

```bash
salt '*' rsync.version
```

---

**26.6.385 salt.modules.runit**

runit service module (http://smarden.org/runit)

This module is compatible with the `service` states, so it can be used to maintain services using the `provider` argument:

```bash
myservice:
    service:
        - running
        - provider: runit
```

Provides virtual `service` module on systems using runit as init.

Service management rules (`sv` command):

- Service $n is ENABLED if file `SERVICE_DIR/$n/run` exists service $n is AVAILABLE if ENABLED or if file `AVAIL_SVR_DIR/$n/run` exists service $n is DISABLED if AVAILABLE but not ENABLED

- `SERVICE_DIR/$n` is normally a symlink to a `AVAIL_SVR_DIR/$n` folder

Service auto-start/stop mechanism:

- `sv` (auto)starts/stops service as soon as `SERVICE_DIR/<service>` is created/deleted, both on service creation or a boot time.

- Autostart feature is disabled if file `SERVICE_DIR/<n>/down` exists. This does not affect the current's service status (if already running) nor manual service management.

Service's alias:

- Service `sva` is an alias of service `svc` when `AVAIL_SVR_DIR/sva` symlinks to folder `AVAIL_SVR_DIR/svc`. `svc` can't be enabled if it is already enabled through an alias already enabled, since `sv` files are stored in folder `SERVICE_DIR/svc/`.

- XBPS package management uses a service's alias to provides service alternative(s), such as chrony and `openntpd` both aliased to `ntpd`.

---

26.6. execution modules
salt.modules.runit.add_svc_avail_path(path)
Add a path that may contain available services. Return True if added (or already present), False on error.
path
directory to add to AVAIL_SVR_DIRS

salt.modules.runit.available(name)
Returns True if the specified service is available, otherwise returns False.
name
the service's name

CLI Example:
salt '*' runit.available <service name>

salt.modules.runit.disable(name, stop=False, **kwargs)
Don't start service name at boot Returns True if operation is successful.
name
the service's name
stop
if True, also stops the service

CLI Example:
salt '*' service.disable <name> [stop=True]

salt.modules.runit.disabled(name)
Return True if the named service is disabled, False otherwise.
name
the service's name

CLI Example:
salt '*' service.disabled <service name>

salt.modules.runit.enable(name, start=False, **kwargs)
Start service name at boot. Returns True if operation is successful.
name
the service's name
start
[False] If True, start the service once enabled.

CLI Example:
salt '*' service.enable <name> [start=True]

salt.modules.runit.enabled(name)
Return True if the named service is enabled, False otherwise.
name
the service's name

CLI Example:
salt '*' service.enabled <service name>

salt.modules.runit.full_restart(name)
Calls runit.restart()
name
the service's name

CLI Example:
salt modules.runit.full_restart <service name>

salt.modules.runit.get_all()
Return a list of all available services
CLI Example:
```
salt '*' runit.get_all
```

salt.modules.runit.get_disabled()
Return a list of all disabled services
CLI Example:
```
salt '*' service.get_disabled
```

salt.modules.runit.get_enabled()
Return a list of all enabled services
CLI Example:
```
salt '*' service.get_enabled
```

salt.modules.runit.get_svc_alias()
Returns the list of service's name that are aliased and their alias path(s)

salt.modules.runit.get_svc_avail_path()
Return list of paths that may contain available services

salt.modules.runit.get_svc_broken_path(name='*')
Return list of broken path(s) in SERVICE_DIR that match name
A path is broken if it is a broken symlink or can not be a runit service
name
a glob for service name. default is '*'
CLI Example:
```
salt '*' runit.get_svc_broken_path <service name>
```

salt.modules.runit.missing(name)
The inverse of runit.available. Returns True if the specified service is not available, otherwise returns False.
name
the service's name
CLI Example:
```
salt '*' runit.missing <service name>
```

salt.modules.runit.reload_(name)
Reload service
name
the service's name
CLI Example:
```
salt '*' runit.reload <service name>
```
salt.modules.runit.remove(name)
Remove the service <name> from system. Returns True if operation is successful. The service will be also stopped.

name
the service's name

CLI Example:
```
salt '*' service.remove <name>
```

salt.modules.runit.restart(name)
Restart service

name
the service's name

CLI Example:
```
salt '*' runit.restart <service name>
```

salt.modules.runit.show(name)
Show properties of one or more units/jobs or the manager

name
the service's name

CLI Example:
```
salt '*' service.show <service name>
```

salt.modules.runit.start(name)
Start service

name
the service's name

CLI Example:
```
salt '*' runit.start <service name>
```

salt.modules.runit.status(name, sig=None)
Return True if service is running

name
the service's name

sig
signature to identify with ps

CLI Example:
```
salt '*' runit.status <service name>
```

salt.modules.runit.status_autostart(name)
Return True if service <name> is autostarted by sv (file $service_folder/down does not exist) NB: return False if the service is not enabled.

name
the service's name

CLI Example:
```
salt '*' runit.status_autostart <service name>
```

salt.modules.runit.stop(name)
Stop service
name
  the service's name
CLI Example:

    salt '*' runit.stop <service name>

26.6.386 salt.modules.rvm

Manage ruby installations and gemsets with RVM, the Ruby Version Manager.

salt.modules.rvm.do(ruby, command, runas=None, cwd=None, env=None)
  Execute a command in an RVM controlled environment.
    ruby
      Which ruby to use
    command
      The rvm command to execute
    runas
      The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
    cwd
      The directory from which to run the rvm command. Defaults to the user's home directory.
CLI Example:

    salt '*' rvm.do 2.0.0 <command>

salt.modules.rvm.gemset_copy(source, destination, runas=None)
  Copy all gems from one gemset to another.
    source
      The name of the gemset to copy, complete with ruby version
    destination
      The destination gemset
    runas
      The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
CLI Example:

    salt '*' rvm.gemset_copy foobar bazquo

salt.modules.rvm.gemset_create(ruby, gemset, runas=None)
  Creates a gemset.
    ruby
      The ruby version for which to create the gemset
    gemset
      The name of the gemset to create
    runas
      The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
CLI Example:

    salt '*' rvm.gemset_create 2.0.0 foobar

salt.modules.rvm.gemset_delete(ruby, gemset, runas=None)
  Delete a gemset
ruby
   The ruby version to which the gemset belongs

gemset
   The gemset to delete

runas
   The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_delete 2.0.0 foobar
```

salt.modules.rvm.gemset_empty(ruby, gemset, runas=None)
Remove all gems from a gemset.

ruby
   The ruby version to which the gemset belongs

gemset
   The gemset to empty

runas
   The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_empty 2.0.0 foobar
```

salt.modules.rvm.gemset_list(ruby='default', runas=None)
List all gemsets for the given ruby.

ruby
   [default] The ruby version for which to list the gemsets

runas
   The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_list
```

salt.modules.rvm.gemset_list_all(runas=None)
List all gemsets for all installed rubies.

Note that you must have set a default ruby before this can work.

runas
   The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_list_all
```

salt.modules.rvm.get(version='stable', runas=None)
Update RVM

version
   [stable] Which version of RVM to install, (e.g. stable or head)

CLI Example:

```
salt '*' rvm.get
```
salt.modules.rvm.install(runas=None)
    Install RVM system-wide
    runas
        The user under which to run the rvm installer script. If not specified, then it be run as the user under which Salt is running.
    CLI Example:
    ```
salt '*' rvm.install
```  
salt.modules.rvm.install_ruby(ruby, runas=None, opts=None, env=None)
    Install a ruby implementation.
    ruby
        The version of ruby to install
    runas
        The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
    env
        Environment to set for the install command. Useful for exporting compilation flags such as RUBY_CONFIGURE_OPTS
    opts
        List of options to pass to the RVM installer (ie -C, --patch, etc)
    CLI Example:
    ```
salt '*' rvm.install_ruby 1.9.3-p385
```  
salt.modules.rvm.is_installed(runas=None)
    Check if RVM is installed.
    CLI Example:
    ```
salt '*' rvm.is_installed
```  
salt.modules.rvm.list_(runas=None)
    List all rvm-installed rubies
    runas
        The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
    CLI Example:
    ```
salt '*' rvm.list
```  
salt.modules.rvm.reinstall_ruby(ruby, runas=None, env=None)
    Reinstall a ruby implementation
    ruby
        The version of ruby to reinstall
    runas
        The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
    CLI Example:
    ```
salt '*' rvm.reinstall_ruby 1.9.3-p385
```  
salt.modules.rvm.rubygems(ruby, version, runas=None)
    Installs a specific rubygems version in the given ruby
Ruby

The ruby for which to install rubygems

Version

The version of rubygems to install, or 'remove' to use the version that ships with 1.9

Runas

The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.rubygems 2.0.0 1.8.24
```

salt.modules.rvm.set_default(ruby, runas=None)

Set the default ruby

Ruby

The version of ruby to make the default

Runas

The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.set_default 2.0.0
```

salt.modules.rvm.wrapper(ruby_string, wrapper_prefix, runas=None, *binaries)

Install RVM wrapper scripts

Ruby String

Ruby/gemset to install wrappers for

Wrapper Prefix

What to prepend to the name of the generated wrapper binaries

Runas

The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

Binaries

[None] The names of the binaries to create wrappers for. When nothing is given, wrappers for ruby, gem, rake, irb, rdoc, ri and testrb are generated.

CLI Example:

```
salt '*' rvm.wrapper <ruby_string> <wrapper_prefix>
```

26.6.387 salt.modules.s3

Connection module for Amazon S3

Configuration

This module accepts explicit s3 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```bash
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfkjghWupUjasdflkdfklgjsdfjajkghs
```
Warning: This is literally the pillar key `s3.keyid` or the config option `s3.keyid`, not:

```yaml
s3:
  keyid: blah
```

A `service_url` may also be specified in the configuration:

```yaml
s3.service_url: s3.amazonaws.com
```

A `role_arn` may also be specified in the configuration:

```yaml
s3.role_arn: arn:aws:iam::111111111111:role/my-role-to-assume
```

If a `service_url` is not specified, the default is `s3.amazonaws.com`. This may appear in various documentation as an "endpoint". A comprehensive list for Amazon S3 may be found at:

http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region

The `service_url` will form the basis for the final endpoint that is used to query the service.

Path style can be enabled:

```yaml
s3.path_style: True
```

This can be useful if you need to use Salt with a proxy for a S3 compatible storage.

You can use either HTTPS protocol or HTTP protocol:

```yaml
s3.https_enable: True
```

SSL verification may also be turned off in the configuration:

```yaml
s3.verify_ssl: False
```

This is required if using S3 bucket names that contain a period, as these will not match Amazon's S3 wildcard certificates. Certificate verification is enabled by default.

AWS region may be specified in the configuration:

```yaml
s3.location: eu-central-1
```

Default is `us-east-1`.

This module should be usable to query other S3-like services, such as Eucalyptus.

depends
requests

```python
salt.modules.s3.delete(bucke, path=None, action=None, key=None, keyid=None, service_url=None,
  verify_ssl=None, kms_keyid=None, location=None, role_arn=None,
  path_style=None, https_enable=None)
```

Delete a bucket, or delete an object from a bucket.

CLI Example to delete a bucket:

```bash
salt myminion s3.delete mybucket
```

CLI Example to delete an object from a bucket:
salt myminion s3.delete mybucket remoteobject

salt.modules.s3.get( bucket='', path='', return_bin=False, action=None, local_file=None, key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)

List the contents of a bucket, or return an object from a bucket. Set return_bin to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list buckets:
  salt myminion s3.get

CLI Example to list the contents of a bucket:
  salt myminion s3.get mybucket

CLI Example to return the binary contents of an object:
  salt myminion s3.get mybucket myfile.png return_bin=True

CLI Example to save the binary contents of an object to a local file:
  salt myminion s3.get mybucket myfile.png local_file=/tmp/myfile.png

It is also possible to perform an action on a bucket. Currently, S3 supports the following actions:

  acl
cors
lifecycle
policy
location
logging
notification
tagging
versions
requestPayment
versioning
website

To perform an action on a bucket:
  salt myminion s3.get mybucket myfile.png action=acl

salt.modules.s3.head( bucket, path='', key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)

Return the metadata for a bucket, or an object in a bucket.

CLI Examples:

  salt myminion s3.head mybucket
  salt myminion s3.head mybucket myfile.png

salt.modules.s3.put( bucket, path=None, return_bin=False, action=None, local_file=None, key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)

Create a new bucket, or upload an object to a bucket.

CLI Example to create a bucket:
  salt myminion s3.put mybucket

CLI Example to upload an object to a bucket:
  salt myminion s3.put mybucket remotepath local_file=/path/to/file
26.6.388 salt.modules.s6

s6 service module

This module is compatible with the service states, so it can be used to maintain services using the provider argument:

```
myservice:
    service:
        - running
        - provider: s6
```

Note that the enabled argument is not available with this provider.

codeauthor
Marek Skrobacki <skrobul@skrobul.com>

salt.modules.s6.available(name)

Returns True if the specified service is available, otherwise returns False.

CLI Example:
```
salt '*' s6.available foo
```

salt.modules.s6.full_restart(name)

Calls s6.restart() function

CLI Example:
```
salt '*' s6.full_restart <service name>
```

salt.modules.s6.get_all()

Return a list of all available services

CLI Example:
```
salt '*' s6.get_all
```

salt.modules.s6.missing(name)

The inverse of s6.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:
```
salt '*' s6.missing foo
```

salt.modules.s6.reload_(name)

Send a HUP to service via s6

CLI Example:
```
salt '*' s6.reload <service name>
```

salt.modules.s6.restart(name)

Restart service via s6. This will stop/start service

CLI Example:
salt '*' s6.restart <service name>

salt.modules.s6.start(name)
    Starts service via s6
    CLI Example:
    
    salt '*' s6.start <service name>

salt.modules.s6.status(name, sig=None)
    Return the status for a service via s6, return pid if running
    CLI Example:
    
    salt '*' s6.status <service name>

salt.modules.s6.stop(name)
    Stops service via s6
    CLI Example:
    
    salt '*' s6.stop <service name>

salt.modules.s6.term(name)
    Send a TERM to service via s6
    CLI Example:
    
    salt '*' s6.term <service name>

26.6.389 salt.modules.salt_proxy

Salt proxy module
New in version 2015.8.3.
Module to deploy and manage salt-proxy processes on a minion.
salt.modules.salt_proxy.configure_proxy(proxyname, start=True)
    Create the salt proxy file and start the proxy process if required
    Parameters
        • proxynamed -- Name to be used for this proxy (should match entries in pillar)
        • start -- Boolean indicating if the process should be started default = True
    CLI Example:
    
    salt deviceminion salt_proxy.configure_proxy p8000

salt.modules.salt_proxy.is_running(proxyname)
    Check if the salt-proxy process associated with this proxy (name) is running.
    Returns True if the process is running False otherwise
    Parameters
        • proxynamed -- String name of the proxy (p8000 for example)
    CLI Example:
26.6.390  `salt.modules.salt_version`

Access Salt’s elemental release code-names.
New in version 3000.

Salt's feature release schedule is based on the Periodic Table, as described in the Version Numbers documentation.

When a feature was added (or removed) in a specific release, it can be difficult to build out future-proof functionality that is dependent on a naming scheme that moves.

For example, a state syntax needs to change to support an option that will be removed in the future, but there are many Minion versions in use across an infrastructure. It would be handy to use some Jinja syntax to check for these instances to perform one state syntax over another.

A simple example might be something like the following:

```jinja
{% set option_deprecated = salt['salt_version.less_than']('Sodium') %}
{% if option_deprecated %}
<use old syntax>
{% else %}
<use new syntax>
{% endif %}
```

`salt.modules.salt_version.equal(name)`

Returns a boolean (True) if the minion's current version code name matches the named version.

name
The release code name to check the version against.

CLI Example:

```
salt '*' salt_version.equal 'Oxygen'
```

`salt.modules.salt_version.get_release_number(name)`

Returns the release number of a given release code name in a `MAJOR.PATCH` format (for Salt versions < 3000) or `MAJOR` for newer Salt versions.

If the release name has not been given an assigned release number, the function returns a string. If the release cannot be found, it returns `None`.

name
The release code name for which to find a release number.

CLI Example:

```
salt '*' salt_version.get_release_number 'Oxygen'
```

`salt.modules.salt_version.greater_than(name)`

Returns a boolean (True) if the minion's current version code name is greater than the named version.

name
The release code name to check the version against.

CLI Example:
salt '!' salt_version.greater_than 'Oxygen'

salt.modules.salt_version.less_than(name)

Returns a boolean (True) if the minion's current version code name is less than the named version.

name

The release code name to check the version against.

CLI Example:
salt '!' salt_version.less_than 'Oxygen'

26.6.391 salt.modules.saltcheck

A module for testing the logic of states and highstates on salt minions

codeauthor
William Cannon <william.cannon@gmail.com>
maturity
new

Saltcheck provides unittest like functionality requiring only the knowledge of salt module execution and yaml. Saltcheck uses salt modules to return data, then runs an assertion against that return. This allows for testing with all the features included in salt modules.

In order to run state and highstate saltcheck tests, a sub-folder in the state directory must be created and named saltcheck-tests. Tests for a state should be created in files ending in *.tst and placed in the saltcheck-tests folder. tst files are run through the salt rendering system, enabling tests to be written in yaml (or renderer of choice), and include jinja, as well as the usual grain and pillar information. Like states, multiple tests can be specified in a tst file. Multiple tst files can be created in the saltcheck-tests folder, and should be named the same as the associated state. The id of a test works in the same manner as in salt state files and should be unique and descriptive.

New in version 3000: The saltcheck-tests folder can be customized using the saltcheck_test_location minion configuration setting. This setting is a relative path from the formula's salt:// path to the test files.

Usage

Example Default file system layout:

```
/srv/salt/apache/
  init.sls
  config.sls
  saltcheck-tests/
    init.tst
    config.tst
    deployment_validation.tst
```

Alternative example file system layout with custom saltcheck_test_location:
Minion configuration:

```
saltcheck_test_location: tests/integration/saltcheck
```

Filesystem layout:

```
/srv/salt/apache/
  init.sls
  config.sls
  tests/integration/saltcheck/
    init.tst
    config.tst
    deployment_validation.tst
```

Tests can be run for each state by name, for all apache/saltcheck/*.tst files, or for all states assigned to the minion in top.sls. Tests may also be created with no associated state. These tests will be run through the use of `saltcheck.run_state_tests`, but will not be automatically run by `saltcheck.run_highstate_tests`.

```
salt '*' saltcheck.run_state_tests apache,apache.config
salt '*' saltcheck.run_state_tests apache check_all=True
salt '*' saltcheck.run_highstate_tests
salt '*' saltcheck.run_state_tests apache.deployment_validation
```

Saltcheck Keywords

**module_and_function:**

(str) This is the salt module which will be run locally, the same as `salt-call --local <module>`. The `saltcheck.state_apply` module name is special as it bypasses the local option in order to resolve state names when run in a master/minion environment.

**args:**

(list) Optional arguments passed to the salt module

**kwargs:**

(dict) Optional keyword arguments to be passed to the salt module

**assertion:**

(str) One of the supported assertions and required except for `saltcheck.state_apply` Tests which fail the assertion and `expected_return`, cause saltcheck to exit which a non-zero exit code.

**expected_return:**

(str) Required except by `assertEmpty`, `assertNotEmpty`, `assertTrue`, `assertFalse`. The return of `module_and_function` is compared to this value in the assertion.

**assertion_section:**

(str) Optional keyword used to parse the `module_and_function` return. If a salt module returns a dictionary as a result, the `assertion_section` value is used to lookup a specific value in that return for the assertion comparison.

**assertion_section_delimiter:**

(str) Optional delimiter to use when splitting a nested structure. Defaults to `' '`. 

26.6. execution modules
print_result:
    (bool) Optional keyword to show results in the `assertEqual`, `assertNotEqual`, `assertIn`, and `assertNotIn` output. Defaults to True.

output_details:
    (bool) Optional keyword to display `module_and_function`, `args`, `assertion_section`, and assertion results text in the output. If `print_result` is False, assertion results will be hidden. This is a per test setting, but can be set globally for all tests by adding `saltcheck_output_details: True` in the minion configuration file. Defaults to False

pillar_data:
    (dict) Optional keyword for passing in pillar data. Intended for use in potential test setup or teardown with the `saltcheck.state_apply` function.

skip:
    (bool) Optional keyword to skip running the individual test

New in version 3000: Multiple assertions can be run against the output of a single `module_and_function` call. The `assertion`, `expected_return`, `assertion_section`, and `assertion_section_delimiter` keys can be placed in a list under an `assertions` key. See the multiple assertions example below.

Sample Cases/Examples

Basic Example

```python
echo_test_hello:
    module_and_function: test.echo
    args:
        - "hello"
    kwargs:
    assertion: assertEqual
    expected_return: 'hello'
```

Example with jinja

```jinja
{% for package in ['apache2', 'openssh'] %}
    # or another example #
    test_{% for package in salt['pillar.get']('packages') %}{{ package }}_latest:
        module_and_function: pkg.upgrade_available
        args:
            - {{ package }}
        assertion: assertFalse
{% endfor %}
```
Example with setup state including pillar

```yaml
setup_test_environment:
  module_and_function: saltcheck.state_apply
  args:
    - common
  pillar_data:
    data: value

verify_vim:
  module_and_function: pkg.version
  args:
    - vim
  assertion: assertNotEmpty
```

Example with jinja

```jinja
{% for package in ["apache2", "openssh"] %}
{%# or another example #}
{%# for package in salt['pillar.get']('packages') %}
test_{{ package }}_latest:
  module_and_function: pkg.upgrade_available
  args:
    - {{ package }}
  assertion: assertFalse
{% endfor %}
```

Example with setup state including pillar

```yaml
setup_test_environment:
  module_and_function: saltcheck.state_apply
  args:
    - common
  pillar_data:
    data: value

verify_vim:
  module_and_function: pkg.version
  args:
    - vim
  assertion: assertNotEmpty
```
Example with skip

```python
package_latest:
    module_and_function: pkg.upgrade_available
    args:
        - apache2
    assertion: assertFalse
    skip: True
```

Example with assertion_section

```python
validate_shell:
    module_and_function: user.info
    args:
        - root
    assertion: assertEqual
    expected_return: /bin/bash
    assertion_section: shell
```

Example with a nested assertion_section

```python
validate_smb_signing:
    module_and_function: lgpo.get
    args:
        - 'Machine'
    kwargs:
        return_full_policy_names: True
    assertion: assertEqual
    expected_return: Enabled
    assertion_section: 'Computer Configuration|Microsoft network client:Digitally sign communications (always)'
    assertion_section_delimiter: '|
```

Example suppressing print results

```python
validate_env_nameNode:
    module_and_function: hadoop.dfs
    args:
        - text
        - /oozie/common/env.properties
    expected_return: nameNode = hdfs://nameservice2
    assertion: assertNotIn
    print_result: False
```
Example with multiple assertions and output_details

```yaml
multiple_validations:
  module_and_function: network.netstat
  assertions:
    - assertion: assertEqual
      assertion_section: "0:program"
      expected_return: "systemd-resolve"
    - assertion: assertEqual
      assertion_section: "0:proto"
      expected_return: "udp"
  output_details: True
```

Supported assertions

- `assertEqual`
- `assertNotEqual`
- `assertTrue`
- `assertFalse`
- `assertFalse`
- `assertIn`
- `assertNotIn`
- `assertGreater`
- `assertGreaterEqual`
- `assertLess`
- `assertLessEqual`
- `assertEmpty`
- `assertNotEmpty`

**Warning:** The `saltcheck.state_apply` function is an alias for `state.apply`. If using the `ACL system saltcheck.*` might provide more capability than intended if only `saltcheck.run_state_tests` and `saltcheck.run_highstate_tests` are needed.

class salt.modules.saltcheck.SaltCheck(saltenv='base')
This class validates and runs the saltchecks

```python
def run_test(test_dict):
    Run a single saltcheck test
```

class salt.modules.saltcheck.StateTestLoader(saltenv='base')
Class loads in test files for a state e.g. state_dir/saltcheck-tests/[1.tst, 2.tst, 3.tst]

```python
def add_test_files_for_sls(sls_name, check_all=False):
    Detects states used, caches needed files, and adds to test list

def load_test_suite()
    Load tests either from one file, or a set of files
```
salt.modules.saltcheck.parallel_scheck(data)
triggers salt-call in parallel

salt.modules.saltcheck.report_highstate_tests(saltenv=None)
Report on tests for states assigned to the minion through highstate. Quits with the exit code for the number of missing tests.

CLI Example:

```
salt '*' saltcheck.report_highstate_tests
```

New in version 3000.

salt.modules.saltcheck.run_highstate_tests(saltenv=None, only_fails=False, junit=False)
Execute all tests for states assigned to the minion through highstate and return results

Parameters

- **saltenv** (str) -- optional saltenv. Defaults to base
- **only_fails** (bool) -- boolean to only print failure results
- **junit** (bool) -- boolean to print results in junit format .. versionadded:: 3007.0

CLI Example:

```
salt '*' saltcheck.run_highstate_tests
```

salt.modules.saltcheck.run_state_tests(state, saltenv=None, check_all=False, only_fails=False, junit=False)
Execute tests for a salt state and return results Nested states will also be tested

Parameters

- **state** (str) -- state name for which to run associated .tst test files
- **saltenv** (str) -- optional saltenv. Defaults to base
- **check_all** (bool) -- boolean to run all tests in state/saltcheck-tests directory
- **only_fails** (bool) -- boolean to only print failure results
- **junit** (bool) -- boolean to print results in junit format .. versionadded:: 3007.0

CLI Example:

```
salt '*' saltcheck.run_state_tests postfix,common
```

Tests will be run in parallel by adding "saltcheck_parallel: True" in minion config. When enabled, saltcheck will use up to the number of cores detected. This can be limited by setting the "saltcheck_processes" value to an integer to set the maximum number of parallel processes.

salt.modules.saltcheck.run_state_tests_ssh(state, saltenv=None, check_all=False, only_fails=False, junit=False)
This function is an alias of run_state_tests.
Execute tests for a salt state and return results Nested states will also be tested

param str state
    state name for which to run associated .tst test files

param str saltenv
    optional saltenv. Defaults to base

param bool check_all
    boolean to run all tests in state/saltcheck-tests directory

param bool only_fails
    boolean to only print failure results

param bool junit
    boolean to print results in junit format .. versionadded:: 3007.0

CLI Example:
saltcheck.run_state_tests

Tests will be run in parallel by adding "saltcheck_parallel: True" in minion config. When enabled, saltcheck will use up to the number of cores detected. This can be limited by setting the "saltcheck_processes" value to an integer to set the maximum number of parallel processes.

salt.modules.saltcheck.run_test(**kwargs)

Execute one saltcheck test and return result

Parameters

test (keyword arg) --

CLI Example:

```sh
salt '*' saltcheck.run_test
test='{"module_and_function": "test.echo", "assertion": "assertEqual", "expected_return": "This works!", "args": ["This works!"]}'
```

salt.modules.saltcheck.state_apply(state_name, **kwargs)

Runs state.apply with given options to set up test data. Intended to be used for optional test setup or teardown

Reference the state.apply module documentation for arguments and usage options

CLI Example:

```sh
salt '*' saltcheck.state_apply postfix
```

### 26.6.392 salt.modules.saltcloudmod

Control a salt cloud system

salt.modules.saltcloudmod.create(name, profile)

Create the named vm

CLI Example:

```sh
salt <minion-id> saltcloud.create webserver rackspace_centos_512
```

### 26.6.393 salt.modules.saltutil

The Saltutil module is used to manage the state of the salt minion itself. It is used to manage minion modules as well as automate updates to the salt minion.

depends

- esky Python module for update functionality

salt.modules.saltutil.clear_cache()

Forcibly removes all caches on a minion.

New in version 2014.7.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.
CLI Example:

```bash
salt '*' saltutil.clear_cache
```

`salt.modules.saltutil.clear_job_cache(hours=24)`
Forcibly removes job cache folders and files on a minion.

New in version 2018.3.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```bash
salt '*' saltutil.clear_job_cache hours=12
```

`salt.modules.saltutil.cmd(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, ssh=False, **kwargs)`

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Assuming this minion is a master, execute a salt command

CLI Example:

```bash
salt '*' saltutil.cmd
```

`salt.modules.saltutil.cmd_iter(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, ssh=False, **kwargs)`

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Assuming this minion is a master, execute a salt command

CLI Example:

```bash
salt '*' saltutil.cmd_iter
```

`salt.modules.saltutil.find_cached_job(jid)`

Return the data for a specific cached job id. Note this only works if cache_jobs has previously been set to True on the minion.

CLI Example:

```bash
salt '*' saltutil.find_cached_job <job id>
```

`salt.modules.saltutil.find_job(jid)`

Return the data for a specific job id that is currently running.

The job id to search for and return data.

CLI Example:

```bash
salt '*' saltutil.find_job <job id>
```

Note that the find_job function only returns job information when the job is still running. If the job is currently running, the output looks something like this:
If the job has already completed, the job cannot be found and therefore the function returns an empty dictionary, which looks like this on the CLI:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:  
    ----------
    arg: 
        - 30
    fun: 
        test.sleep
    jid: 
        20160503150049487736
    pid: 
        9601
    ret: 
    tgt: 
        my-minion
    tgt_type: 
        glob
    user: 
        root
```

salt.modules.saltutil.is_running(fun)

If the named function is running return the data associated with it/them. The argument can be a glob

CLI Example:

```
salt '*' saltutil.is_running state.highstate
```

salt.modules.saltutil.kill_all_jobs()

Sends a kill signal (SIGKILL 9) to all currently running jobs

CLI Example:

```
salt '*' saltutil.kill_all_jobs
```

salt.modules.saltutil.kill_job(jid)

Sends a kill signal (SIGKILL 9) to the named salt job's process

CLI Example:

```
salt '*' saltutil.kill_job <job id>
```

salt.modules.saltutil.list_extmods()

New in version 2017.7.0.

List Salt modules which have been synced externally

CLI Examples:

```
salt '*' saltutil.list_extmods
```

26.6. execution modules

**salt.modules.saltutil.mmodule** *(saltenv, fun, *args, **kwargs)*

Loads minion modules from an environment so that they can be used in pillars for that environment.

**CLI Example:**

```
salt '*' saltutil.mmodule base test.ping
```

**salt.modules.saltutil.pillar_refresh** *(wait=False, timeout=30, clean_cache=True)*

This function is an alias of refresh_pillar.

Signal the minion to refresh the in-memory pillar data. See *In-Memory Pillar Data vs. On-Demand Pillar Data*.

- **param wait**
  - Wait for pillar refresh to complete, defaults to False.
- **type wait**
  - bool, optional
- **param timeout**
  - How long to wait in seconds, only used when wait is True, defaults to 30.
- **type timeout**
  - int, optional
- **param clean_cache**
  - Clean the pillar cache, only used when pillar_cache is True. Defaults to True
- **type clean_cache**
  - bool, optional .. versionadded:: 3005

**return**

Boolean status, True when the pillar_refresh event was fired successfully.

**CLI Example:**

```
salt '*' saltutil.refresh_pillar
salt '*' saltutil.refresh_pillar wait=True timeout=60
```

**salt.modules.saltutil.refresh_beacons** *

Signal the minion to refresh the beacons.

**CLI Example:**

```
salt '*' saltutil.refresh_beacons
```

**salt.modules.saltutil.refresh_grains** *(**kwargs)*

New in version 2016.3.6,2016.11.4,2017.7.0.

Refresh the minion’s grains without syncing custom grains modules from salt://_grains.

**Note:** The available execution modules will be reloaded as part of this process, as grains can affect which modules are available.

- **refresh_pillar**
  - [True] Set to False to keep pillar data from being refreshed.
- **clean_pillar_cache**
  - [False] Set to True to refresh pillar cache.

**CLI Examples:**

```
salt '*' saltutil.refresh_grains
```
salt.modules.saltutil.refresh_matchers()
Signal the minion to refresh its matchers.

CLI Example:
```
salt '*' saltutil.refresh_matchers
```

salt.modules.saltutil.refresh_modules(**kwargs)
Signal the minion to refresh the module and grain data.
The default is to refresh module asynchronously. To block until the module refresh is complete, set the 'async' flag to False.

CLI Example:
```
salt '*' saltutil.refresh_modules
```

salt.modules.saltutil.refresh_pillar(wait=False, timeout=30, clean_cache=True)
Signal the minion to refresh the in-memory pillar data. See In-Memory Pillar Data vs. On-Demand Pillar Data.

Parameters
- **wait** (bool, optional) -- Wait for pillar refresh to complete, defaults to False.
- **timeout** (int, optional) -- How long to wait in seconds, only used when wait is True, defaults to 30.
- **clean_cache** (bool, optional -- versionadded:: 3005) -- Clean the pillar cache, only used when pillar_cache is True. Defaults to True.

Returns
- Boolean status, True when the pillar_refresh event was fired successfully.

CLI Example:
```
salt '*' saltutil.refresh_pillar
salt '*' saltutil.refresh_pillar wait=True timeout=60
```

salt.modules.saltutil.regen_keys()
Used to regenerate the minion keys.

CLI Example:
```
salt '*' saltutil.regen_keys
```

salt.modules.saltutil.revoke_auth(preserve_minion_cache=False)
The minion sends a request to the master to revoke its own key. Note that the minion session will be revoked and the minion may not be able to return the result of this command back to the master.

If the 'preserve_minion_cache' flag is set to True, the master cache for this minion will not be removed.

CLI Example:
```
salt '*' saltutil.revoke_auth
```

salt.modules.saltutil.runner(name, arg=None, kwarg=None, full_return=False, saltenv='base', jid=None, **kwargs)
Execute a runner function. This function must be run on the master, either by targeting a minion running on a master or by using salt-call on a master.

New in version 2014.7.0.

name
- The name of the function to run

26.6. execution modules
**kwargs

Any keyword arguments to pass to the runner function

CLI Example:

In this example, assume that `master_minion` is a minion running on a master.

```
salt master_minion saltutil.runner jobs.list_jobs
salt master_minion saltutil.runner test.arg arg="['baz']" kwarg="{'foo': 'bar'}"
```

salt.modules.saltutil.running()

Return the data on all running salt processes on the minion

CLI Example:

```
salt '*' saltutil.running
```

salt.modules.saltutil.signal_job(jid, sig)

Sends a signal to the named salt job's process

CLI Example:

```
salt '*' saltutil.signal_job <job id> 15
```

salt.modules.saltutil.sync_all(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None, clean_pillar_cache=False)

Changed in version 3007.0: On masterless minions, master top modules are now synced as well. When `refresh` is set to `True`, this module's cache containing the environments from which extension modules are synced when `saltenv` is not specified will be refreshed.

Changed in version 2015.8.11, 2016.3.2: On masterless minions, pillar modules are now synced, and refreshed when `refresh` is set to `True`.

Sync down all of the dynamic modules from the file server for a specific environment. This function synchronizes custom modules, states, beacons, grains, returners, output modules, renderers, and utils.

**refresh**

[True] Also refresh the execution modules and recompile pillar data available to the minion. If this is a masterless minion, also refresh the environments from which extension modules are synced after syncing master tops. This refresh will be performed even if no new dynamic modules are synced. Set to `False` to prevent this refresh.

**Important:** If this function is executed using a `module.run` state, the SLS file will not have access to newly synced execution modules unless a `refresh` argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_all
      - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

**extmod_whitelist**

[None] dictionary of modules to sync based on type

**extmod_blacklist**

[None] dictionary of modules to blacklist based on type
clean_pillar_cache
[False] Set to True to refresh pillar cache.

CLI Examples:

```
salt '*' saltutil.sync_all
salt '*' saltutil.sync_all saltenv=dev
salt '*' saltutil.sync_all saltenv=base,dev
salt '*' saltutil.sync_all extmod_whitelist={"modules": ["custom_module"]}
```

salt.modules.saltutil.sync_beacons(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.5.1.

Sync beacons from salt://_beacons to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for beacons to sync. If no top files are found, then the base environment will be synced.

**refresh**

[True] If True, refresh the available beacons on the minion. This refresh will be performed even if no new beacons are synced. Set to False to prevent this refresh.

**extmod_whitelist**

[None] comma-separated list of modules to sync

**extmod_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_beacons
salt '*' saltutil.sync_beacons saltenv=dev
salt '*' saltutil.sync_beacons saltenv=base,dev
```

salt.modules.saltutil.sync_clouds(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2017.7.0.

Sync cloud modules from salt://_cloud to the minion

**saltenv**

[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**refresh**

[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.

**extmod_whitelist**

[None] comma-separated list of modules to sync

**extmod_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_clouds
salt '*' saltutil.sync_clouds saltenv=dev
salt '*' saltutil.sync_clouds saltenv=base,dev
```

salt.modules.saltutil.sync_engines(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)

26.6. execution modules
New in version 2016.3.0.

Sync engine modules from `salt://_engines` to the minion

saltenv
   The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

   If not passed, then all environments configured in the `top files` will be checked for engines to sync. If no top files are found, then the `base` environment will be synced.

refresh
   `[True]` If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new engine modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist
   `[None]` comma-separated list of modules to sync

extmod_blacklist
   `[None]` comma-separated list of modules to blacklist based on type

CLI Examples:

```bash
salt '*' saltutil.sync_engines
salt '*' saltutil.sync_engines saltenv=base,dev
```

salt.modules.saltutil.sync_executors(`saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None`)  

New in version 3000.

Sync executors from `salt://_executors` to the minion

saltenv
   The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

   If not passed, then all environments configured in the `top files` will be checked for log handlers to sync. If no top files are found, then the `base` environment will be synced.

refresh
   `[True]` If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to `False` to prevent this refresh.

extmod_whitelist
   `[None]` comma-separated list of modules to sync

extmod_blacklist
   `[None]` comma-separated list of modules to blacklist based on type

CLI Examples:

```bash
salt '*' saltutil.sync_executors
salt '*' saltutil.sync_executors saltenv=dev
salt '*' saltutil.sync_executors saltenv=base,dev
```

salt.modules.saltutil.sync_grains(`saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None, clean_pillar_cache=False`)  

New in version 0.10.0.

Sync grains modules from `salt://_grains` to the minion

saltenv
   The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

   If not passed, then all environments configured in the `top files` will be checked for grains modules to sync. If no top files are found, then the `base` environment will be synced.
refresh
[True] If True, refresh the available execution modules and recompile pillar data for the minion. This refresh will be performed even if no new grains modules are synced. Set to False to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

clean_pillar_cache
[False] Set to True to refresh pillar cache.

CLI Examples:

```
salt '*' saltutil.sync_grains
salt '*' saltutil.sync_grains saltenv=dev
salt '*' saltutil.sync_grains saltenv=base,dev
```

salt.modules.saltutil.sync_log_handlers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.8.0.

Sync log handlers from salt://_log_handlers to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for log handlers to sync. If no top files are found, then the base environment will be synced.

refresh
[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to False to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_log_handlers
salt '*' saltutil.sync_log_handlers saltenv=dev
salt '*' saltutil.sync_log_handlers saltenv=base,dev
```

salt.modules.saltutil.sync_matchers(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)

New in version 2019.2.0.

Sync engine modules from salt://_matchers to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for engines to sync. If no top files are found, then the base environment will be synced.

refresh
[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new matcher modules are synced. Set to False to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync
extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*! saltutil.sync_matchers
salt '*! saltutil.sync_matchers saltenv=base,dev
```

salt.modules.saltutil.sync_modules(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.

Sync execution modules from salt://_modules to the minion

saltenv
The filesrver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for execution modules to sync. If no top files are found, then the base environment will be synced.

refresh
[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new execution modules are synced. Set to False to prevent this refresh.

**Important:** If this function is executed using a module.run state, the SLS file will not have access to newly synced execution modules unless a refresh argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_modules
    - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*! saltutil.sync_modules
salt '*! saltutil.sync_modules saltenv=dev
salt '*! saltutil.sync_modules saltenv=base,dev
```

salt.modules.saltutil.sync_output(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

Sync outputters from salt://_output to the minion

saltenv
The filesrver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for outputters to sync. If no top files are found, then the base environment will be synced.

refresh
[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.
extmod_whitelist
  [None] comma-separated list of modules to sync

extmod_blacklist
  [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

salt.modules.saltutil.sync_outputters(
  saltenv=None, refresh=True, extmod_whitelist=None,
  extmod_blacklist=None)

This function is an alias of `sync_output`.
Sync outputters from `salt://_output` to the minion

- **saltenv**
  - The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
  - If not passed, then all environments configured in the top files will be checked for outputters to sync. If no top files are found, then the base environment will be synced.

- **refresh**
  - [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

- **extmod_whitelist**
  - [None] comma-separated list of modules to sync

- **extmod_blacklist**
  - [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

salt.modules.saltutil.sync_pillar(
  saltenv=None, refresh=True, extmod_whitelist=None,
  extmod_blacklist=None, clean_pillar_cache=False)

New in version 2015.8.11,2016.3.2.
Sync pillar modules from the `salt://_pillar` directory on the Salt fileserver. This function is environment-aware, pass the desired environment to grab the contents of the _pillar directory from that environment. The default environment, if none is specified, is base.

- **refresh**
  - [True] Also refresh the execution modules available to the minion, and refresh pillar data.

- **extmod_whitelist**
  - [None] comma-separated list of modules to sync

- **extmod_blacklist**
  - [None] comma-separated list of modules to blacklist based on type

- **clean_pillar_cache**
  - [False] Set to True to refresh pillar cache.

Note: This function will raise an error if executed on a traditional (i.e. not masterless) minion

CLI Examples:
salt.modules.saltutil.sync_proxymodules\n\nNew in version 2015.8.2.
Sync proxy modules from salt://_proxy to the minion

\n**saltenv**
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
If not passed, then all environments configured in the top files will be checked for proxy modules to sync. If no top files are found, then the base environment will be synced.

**refresh**
[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new proxy modules are synced. Set to False to prevent this refresh.

**extmod_whitelist**
[None] comma-separated list of modules to sync

**extmod_blacklist**
[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_proxymodules
salt '*' saltutil.sync_proxymodules saltenv=dev
salt '*' saltutil.sync_proxymodules saltenv=base,dev
```

---

salt.modules.saltutil.sync_renderers\n
New in version 0.10.0.
Sync renderers from salt://_renderers to the minion

**saltenv**
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
If not passed, then all environments configured in the top files will be checked for renderers to sync. If no top files are found, then the base environment will be synced.

**refresh**
[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new renderers are synced. Set to False to prevent this refresh.

**extmod_whitelist**
[None] comma-separated list of modules to sync

**extmod_blacklist**
[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_renderers
salt '*' saltutil.sync_renderers saltenv=dev
salt '*' saltutil.sync_renderers saltenv=base,dev
```

---

salt.modules.saltutil.sync_returners\n
New in version 0.10.0.
Sync returners from salt://_returners to the minion

---

2862 Chapter 26. Salt Module Reference
saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a
comma-separated list.
If not passed, then all environments configured in the top files will be checked for returners to sync. If
no top files are found, then the base environment will be synced.

refresh
[True] If True, refresh the available execution modules on the minion. This refresh will be performed
even if no new returners are synced. Set to False to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_returners
salt '*' saltutil.sync_returners saltenv=dev
```

salt.modules.saltutil.sync_sdb

New in version 2015.5.8, 2015.8.3.
Sync sdb modules from salt://_sdb to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a
comma-separated list.
If not passed, then all environments configured in the top files will be checked for sdb modules to sync.
If no top files are found, then the base environment will be synced.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_sdb
salt '*' saltutil.sync_sdb saltenv=dev
salt '*' saltutil.sync_sdb saltenv=base,dev
```

salt.modules.saltutil.sync_serializers

New in version 2019.2.0.
Sync serializers from salt://_serializers to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a
comma-separated list.
If not passed, then all environments configured in the top files will be checked for serializer modules to
copy. If no top files are found, then the base environment will be synced.

refresh
[True] If True, refresh the available execution modules on the minion. This refresh will be performed
even if no new serializer modules are synced. Set to False to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type
CLI Examples:

```bash
salt '*' saltutil.sync_serializers
salt '*' saltutil.sync_serializers saltenv=dev
salt '*' saltutil.sync_serializers saltenv=base,dev
```

```bash
salt.modules.saltutil.sync_states(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 0.10.0.

Sync state modules from `salt://_states` to the minion

**saltenv**

The filesserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for state modules to sync. If no top files are found, then the base environment will be synced.

**refresh**

[True] If True, refresh the available states on the minion. This refresh will be performed even if no new state modules are synced. Set to False to prevent this refresh.

**extmod_whitelist**

[None] comma-separated list of modules to sync

**extmod_blacklist**

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```bash
salt '*' saltutil.sync_states
salt '*' saltutil.sync_states saltenv=dev
salt '*' saltutil.sync_states saltenv=base,dev
```

```bash
salt.modules.saltutil.sync_thorium(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 2018.3.0.

Sync Thorium modules from `salt://_thorium` to the minion

**saltenv**

The filesserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for engines to sync. If no top files are found, then the base environment will be synced.

**refresh**

True

If True, refresh the available execution modules on the minion. This refresh will be performed even if no new Thorium modules are synced. Set to False to prevent this refresh.

**extmod_whitelist**

comma-separated list of modules to sync

**extmod_blacklist**

comma-separated list of modules to blacklist based on type

CLI Examples:

```bash
salt '*' saltutil.sync_thorium
salt '*' saltutil.sync_thorium saltenv=base,dev
```

```bash
salt.modules.saltutil.sync_tops(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 3007.0.
Sync master tops from `salt://_tops` to the minion.

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for master tops to sync. If no top files are found, then the *base* environment will be synced.

**refresh**

[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.

**extmod_whitelist**

[None] comma-separated list of modules to sync

**extmod_blacklist**

[None] comma-separated list of modules to blacklist based on type

**Note:** This function will raise an error if executed on a traditional (i.e. not masterless) minion

**CLI Examples:**

```bash
salt '*' saltutil.sync_tops
salt '*' saltutil.sync_tops saltenv=dev
```

**salt.modules.saltutil.sync_utils** (*saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None*)

New in version 2014.7.0.

Sync utility modules from `salt://_utils` to the minion

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for utility modules to sync. If no top files are found, then the *base* environment will be synced.

**refresh**

[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.

**extmod_whitelist**

[None] comma-separated list of modules to sync

**extmod_blacklist**

[None] comma-separated list of modules to blacklist based on type

**CLI Examples:**

```bash
salt '*' saltutil.sync_utils
salt '*' saltutil.sync_utils saltenv=dev
salt '*' saltutil.sync_utils saltenv=base,dev
```

**salt.modules.saltutil.sync_wrapper** (*saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None*)

New in version 3007.0.

Sync salt-ssh wrapper modules from `salt://_wrapper` to the minion.

**saltenv**

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

26.6. execution modules
If not passed, then all environments configured in the *top files* will be checked for wrappers to sync. If no top files are found, then the *base* environment will be synced.

**refresh**

[True] If True, refresh the available wrapper modules on the minion. This refresh will be performed even if no wrappers are synced. Set to False to prevent this refresh.

**extmod_whitelist**

[None] comma-separated list of modules to sync

**extmod_blacklist**

[None] comma-separated list of modules to blacklist based on type

**Note:** This function will raise an error if executed on a traditional (i.e. not masterless) minion.

- **CLI Examples:**

  ```
  salt '*' saltutil.sync_wrapper
  salt '*' saltutil.sync_wrapper saltenv=dev
  salt '*' saltutil.sync_wrapper saltenv=base,dev
  ```

salt.modules.saltutil.**term_all_jobs**()

Sends a termination signal (SIGTERM 15) to all currently running jobs

- **CLI Example:**

  ```
  salt '*' saltutil.term_all_jobs
  ```

salt.modules.saltutil.**term_job**(jid)

Sends a termination signal (SIGTERM 15) to the named salt job's process

- **CLI Example:**

  ```
  salt '*' saltutil.term_job <job id>
  ```

salt.modules.saltutil.**update**(version=None)

Update the salt minion from the URL defined in opts['update_url'] VMware, Inc provides the latest builds here: update_url: https://repo.saltproject.io/windows/

Be aware that as of 2014-8-11 there's a bug in esky such that only the latest version available in the update_url can be downloaded and installed.

This feature requires the minion to be running a bdist_esky build.

The version number is optional and will default to the most recent version available at opts['update_url'].

Returns details about the transaction upon completion.

- **CLI Examples:**

  ```
  salt '*' saltutil.update
  salt '*' saltutil.update 0.10.3
  ```

salt.modules.saltutil.**wheel**(name, *args, **kwargs)

Execute a wheel module and function. This function must be run against a minion that is local to the master.

- **New in version 2014.7.0.**

  **name**

  The name of the function to run
**Salt Documentation, Release 3007.1**

**26.6.394 salt.modules.schedule**

Module for managing the Salt schedule on a minion

Requires that python-dateutil is installed on the minion.

New in version 2014.7.0.

```python
salt.modules.schedule.add(name, **kwargs)
```

Add a job to the schedule

CLI Example:

```bash
salt '*' schedule.add job1 function='test.ping' seconds=3600
# If function have some arguments, use job_args
salt '*' schedule.add job2 function='cmd.run' job_args="['date >> /tmp/date.log']" seconds=60

# Add job to Salt minion when the Salt minion is not running
salt '*' schedule.add job1 function='test.ping' seconds=3600 offline=True
```

```python
salt.modules.schedule.build_schedule_item(name, **kwargs)
```

Build a schedule job

CLI Example:

```bash
salt '*' schedule.build_schedule_item job1 function='test.ping' seconds=3600
```

```python
salt.modules.schedule.copy(name, target, **kwargs)
```

Copy scheduled job to another minion or minions.

CLI Example:

```bash
salt '*' schedule.copy jobname target
```

**args**

Any positional arguments to pass to the wheel function. A common example of this would be the match arg needed for key functions.

New in version 2015.8.11.

**kwargs**

Any keyword arguments to pass to the wheel function

CLI Example:

```bash
salt my-local-minion saltutil.wheel key.accept jerry
salt my-local-minion saltutil.wheel minions.connected
```

**Note:** Since this function must be run against a minion that is running locally on the master in order to get accurate returns, if this function is run against minions that are not local to the master, "empty" returns are expected. The remote minion does not have access to wheel functions and their return data.
salt.modules.schedule.delete(name, **kwargs)
Delete a job from the minion's schedule

CLI Example:

```
salt '*' schedule.delete job1
```

盐子分机删除 Scheduled Job

salt.modules.schedule.disable(**kwargs)
Disable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.disable
```

禁用所有计划的作业

salt.modules.schedule.disable_job(name, **kwargs)
Disable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.disable_job job1
```

禁用指定的计划作业

salt.modules.schedule.enable(**kwargs)
Enable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.enable
```

启用所有计划的作业

salt.modules.schedule.enable_job(name, **kwargs)
Enable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.enable_job job1
```

启用指定的计划作业

salt.modules.schedule.is_enabled(name=None)
List a Job only if its enabled

If job is not specified, indicate if the scheduler is enabled or disabled.

New in version 2015.5.3.

CLI Example:

```
salt '*' schedule.is_enabled name=job_name
salt '*' schedule.is_enabled
```

查询指定的计划作业或所有计划的作业是否启用

salt.modules.schedule.job_status(name, time_fmt='%Y-%m-%dT%H:%M:%S')
Show the information for a particular job.

CLI Example:

```
salt '*' schedule.job_status job_name
```
salt.modules.schedule.list_(show_all=False, show_disabled=True, where=None, return_yaml=True, offline=False)

List the jobs currently scheduled on the minion

CLI Example:

```python
salt '*' schedule.list

# Show all jobs including hidden internal jobs
salt '*' schedule.list show_all=True

# Hide disabled jobs from list of jobs
salt '*' schedule.list show_disabled=False
```

salt.modules.schedule.modify(name, **kwargs)

Modify an existing job in the schedule

CLI Example:

```python
salt '*' schedule.modify job1 function='test.ping' seconds=3600

# Modify job on Salt minion when the Salt minion is not running
salt '*' schedule.modify job1 function='test.ping' seconds=3600 offline=True
```

salt.modules.schedule.move(name, target, **kwargs)

Move scheduled job to another minion or minions.

CLI Example:

```python
salt '*' schedule.move jobname target
```

salt.modules.schedule.postpone_job(name, current_time, new_time, **kwargs)

Postpone a job in the minion’s schedule

Current time and new time should be in date string format, default value is %Y-%m-%dT%H:%M:%S.

New in version 2018.3.0.

CLI Example:

```python
salt '*' schedule.postpone_job job current_time new_time

salt '*' schedule.postpone_job job current_time new_time time_fmt='%Y-%m-%dT%H:%M:%S'
```

salt.modules.schedule.purge(**kwargs)

Purge all the jobs currently scheduled on the minion

CLI Example:

```python
salt '*' schedule.purge

# Purge jobs on Salt minion
salt '*' schedule.purge
```
salt.modules.schedule.reload()  
Reload saved scheduled jobs on the minion  
CLI Example:  
salt '*' schedule.reload

salt.modules.schedule.run_job(name, force=False)  
Run a scheduled job on the minion immediately  
CLI Example:  
salt '*' schedule.run_job job1  
salt '*' schedule.run_job job1 force=True  
Force the job to run even if it is disabled.

salt.modules.schedule.save(**kwargs)  
Save all scheduled jobs on the minion  
CLI Example:  
salt '*' schedule.save

salt.modules.schedule.show_next_fire_time(name, **kwargs)  
Show the next fire time for scheduled job  
New in version 2018.3.0.  
CLI Example:  
salt '*' schedule.show_next_fire_time job_name

salt.modules.schedule.skip_job(name, current_time, **kwargs)  
Skip a job in the minion's schedule at specified time.  
Time to skip should be specified as date string format, default value is %Y-%m-%dT%H:%M:%S.  
New in version 2018.3.0.  
CLI Example:  
salt '*' schedule.skip_job job time

26.6.395 salt.modules.scp

SCP Module  
New in version 2019.2.0.  
Module to copy files via SCP  
salt.modules.scp_mod.get(remote_path, local_path='', recursive=False, preserve_times=False, **kwargs)  
Transfer files and directories from remote host to the localhost of the Minion.  
remote_path  
Path to retrieve from remote host. Since this is evaluated by scp on the remote host, shell wildcards and environment variables may be used.
recursive: **False**
Transfer files and directories recursively.

**preserve_times: False**
Preserve mtime and atime of transferred files and directories.

**hostname**
The hostname of the remote device.

**port:** 22
The port of the remote device.

**username**
The username required for SSH authentication on the device.

**password**
Used for password authentication. It is also used for private key decryption if passphrase is not given.

**passphrase**
Used for decrypting private keys.

**pkey**
An optional private key to use for authentication.

**key_filename**
The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

**timeout**
An optional timeout (in seconds) for the TCP connect.

**socket_timeout:** 10
The channel socket timeout in seconds.

**buff_size:** 16384
The size of the SCP send buffer.

**allow_agent:** True
Set to False to disable connecting to the SSH agent.

**look_for_keys:** True
Set to False to disable searching for discoverable private key files in ~/.ssh/

**banner_timeout**
An optional timeout (in seconds) to wait for the SSH banner to be presented.

**auth_timeout**
An optional timeout (in seconds) to wait for an authentication response.

**auto_add_policy:** False
Automatically add the host to the known_hosts.

CLI Example:

```bash
salt '*' scp.get /var/tmp/file /tmp/file hostname=10.10.10.1 auto_add_policy=True
```

```python
salt.modules.scp_mod.put(files, remote_path=None, recursive=False, preserve_times=False, saltenv='base', **kwargs)
```

Transfer files and directories to remote host.

**files**
A single path or a list of paths to be transferred.

**remote_path**
The path on the remote device where to store the files.

**recursive:** True
Transfer files and directories recursively.

**preserve_times:** False
Preserve mtime and atime of transferred files and directories.

**hostname**
The hostname of the remote device.

**port:** 22
The port of the remote device.

username
The username required for SSH authentication on the device.

password
Used for password authentication. It is also used for private key decryption if passphrase is not given.

passphrase
Used for decrypting private keys.

pkey
An optional private key to use for authentication.

key_filename
The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

timeout
An optional timeout (in seconds) for the TCP connect.

socket_timeout: 10
The channel socket timeout in seconds.

buff_size: 16384
The size of the SCP send buffer.

allow_agent: True
Set to False to disable connecting to the SSH agent.

look_for_keys: True
Set to False to disable searching for discoverable private key files in ~/.ssh/

banner_timeout
An optional timeout (in seconds) to wait for the SSH banner to be presented.

auth_timeout
An optional timeout (in seconds) to wait for an authentication response.

auto_add_policy: False
Automatically add the host to the known_hosts.

CLI Example:

```
salt '*' scp.put /path/to/file /var/tmp/file hostname=server1 auto_add_policy=True
```

26.6.396 salt.modules.scsi

SCSI administration module

salt.modules.scsi.ls_ (get_size=True)
List SCSI devices, with details

CLI Examples:

```
salt '*' scsi.ls
salt '*' scsi.ls get_size=False
```

get_size
[True] Get the size information for scsi devices. This option should be set to False for older OS distributions (RHEL6 and older) due to lack of support for the `-s` option in lsscsi.

New in version 2015.5.10.

salt.modules.scsi.rescan_all (host)
List scsi devices

CLI Example:
26.6.397 salt.modules.sdb

Module for Manipulating Data via the Salt DB API

salt.modules.sdb.delete(uri)

Delete a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb:// or the value is not successfully deleted, return False.

CLI Example:

```
salt '*' sdb.delete sdb://mymemcached/foo
```

salt.modules.sdb.get(uri, strict=False)

Get a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided is not valid, then it will be returned as-is, unless strict=True was passed.

CLI Example:

```
salt '*' sdb.get sdb://mymemcached/foo strict=True
```

salt.modules.sdb.get_or_set_hash(uri, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+)')

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

State Example:

```
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: '{% salt["sdb.get_or_set_hash"]("sdb://mymemcached/some_user_pass") %}'
```

CLI Example:

```
salt '*' sdb.get_or_set_hash 'sdb://mymemcached/SECRET_KEY' 50
```

Warning: This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

salt.modules.sdb.set_(uri, value)

Set a value in a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb:// or the value is not successfully set, return False.

CLI Example:
salt Documentation, Release 3007.1

26.6.398 salt.modules.seed

Virtual machine image management tools

salt.modules.seed.apply(path, id_=None, config=None, approve_key=True, install=True,
                      prep_install=False, pub_key=None, priv_key=None, mount_point=None)

Seed a location (disk image, directory, or block device) with the minion config, approve the minion's key, and/or install salt-minion.

CLI Example:

```
salt 'minion' seed.apply path id [config=config_data] \ 
    [gen_key=(true|false)] [approve_key=(true|false)] \ 
    [install=(true|false)]
```

**path**
Full path to the directory, device, or disk image on the target minion's file system.

**id**
Minion id with which to seed the path.

**config**
Minion configuration options. By default, the 'master' option is set to the target host's 'master'.

**approve_key**
Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: true.

**install**
Install salt-minion, if absent. Default: true.

**prep_install**
Prepare the bootstrap script, but don't run it. Default: false

salt.modules.seed.mkconfig(config=None, tmp=None, id_=None, approve_key=True, pub_key=None,
                           priv_key=None)

Generate keys and config and put them in a tmp directory.

**pub_key**
absolute path or file content of an optional preseeded salt key

**priv_key**
absolute path or file content of an optional preseeded salt key

CLI Example:

```
salt 'minion' seed.mkconfig [config=config_data] [tmp=tmp_dir] \ 
    [id_=minion_id] [approve_key=(true|false)]
```

salt.modules.seed.prep_bootstrap(mpt)

Update and get the random script to a random place

CLI Example:

```
salt '*' seed.prep_bootstrap /tmp
```
26.6.399 salt.modules.selinux

Execute calls on selinux

Note: This module requires the `semanage`, `setsebool`, and `semodule` commands to be available on the minion. On RHEL-based distributions, ensure that the `policycoreutils` and `policycoreutils-python` packages are installed. If not on a Fedora or RHEL-based distribution, consult the selinux documentation for your distribution to ensure that the proper packages are installed.

**salt.modules.selinux.fcontext_add_policy**

```python
salt.modules.selinux.fcontext_add_policy(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)
```

New in version 2019.2.0.

Adds the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

- **name**
  - filespec of the file or directory. Regex syntax is allowed.

- **file_type**
  - The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also man `semanage-fcontext`. Defaults to 'a' (all files).

- **sel_type**
  - SELinux context type. There are many.

- **sel_user**
  - SELinux user. Use `semanage login -l` to determine which ones are available to you.

- **sel_level**
  - The MLS range of the SELinux context.

CLI Example:

```
salt '*' selinux.fcontext_add_policy my-policy
```

**salt.modules.selinux.fcontext_apply_policy**

```python
salt.modules.selinux.fcontext_apply_policy(name, recursive=False)
```

New in version 2017.7.0.

Applies SELinux policies to filespec using `restorecon [-R] filespec`. Returns dict with changes if successful, the output of the restorecon command otherwise.

- **name**
  - filespec of the file or directory. Regex syntax is allowed.

- **recursive**
  - Recursively apply SELinux policies.

CLI Example:

```
salt '*' selinux.fcontext_apply_policy my-policy
```

**salt.modules.selinux.fcontext_delete_policy**

```python
salt.modules.selinux.fcontext_delete_policy(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)
```

New in version 2019.2.0.

Deletes the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.
Note that you don’t have to remove an entry before setting a new one for a given filespec and filetype, as adding one with `semanage` automatically overwrites a previously configured SELinux context.

**name**
filespec of the file or directory. Regex syntax is allowed.

**file_type**
The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to ‘a’ (all files).

**sel_type**
SELinux context type. There are many.

**sel_user**
SELinux user. Use `semanage login -l` to determine which ones are available to you.

**sel_level**
The MLS range of the SELinux context.

CLI Example:
```
salt '*' selinux.fcontext_delete_policy my-policy
```

### salt.modules.selinux.fcontext_get_policy(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)

New in version 2017.7.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:
- `filespec` (the name supplied and matched)
- `filetype` (the descriptive name of the filetype supplied)
- `sel_user`, `sel_role`, `sel_type`, `sel_level` (the selinux context)

**name**
filespec of the file or directory. Regex syntax is allowed.

**filetype**
The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to ‘a’ (all files).

CLI Example:
```
salt '*' selinux.fcontext_get_policy my-policy
```

### salt.modules.selinux.fcontext_policy_is_applied(name, recursive=False)

New in version 2017.7.0.

Returns an empty string if the SELinux policy for a given filespec is applied, returns string with differences in policy and actual situation otherwise.

**name**
filespec of the file or directory. Regex syntax is allowed.

CLI Example:
```
salt '*' selinux.fcontext_policy_is_applied my-policy
```

### salt.modules.selinux.filetype_id_to_string(filetype='a')

New in version 2017.7.0.

Translates SELinux filetype single-letter representation to a more human-readable version (which is also used in `semanage fcontext -l`).
salt.modules.selinux.getconfig()
    Return the selinux mode from the config file
    CLI Example:
    ```
salt '*' selinux.getconfig
    ```

salt.modules.selinux.getenforce()
    Return the mode selinux is running in
    CLI Example:
    ```
salt '*' selinux.getenforce
    ```

salt.modules.selinux.getsebool(boolean)
    Return the information on a specific selinux boolean
    CLI Example:
    ```
salt '*' selinux.getsebool virt_use_usb
    ```

salt.modules.selinux.getsemod(module)
    Return the information on a specific selinux module
    CLI Example:
    ```
salt '*' selinux.getsemod mysql
    ```
    New in version 2016.3.0.

salt.modules.selinux.install_semod(module_path)
    Install custom SELinux module from file
    CLI Example:
    ```
salt '*' selinux.install_semod [salt://]path/to/module.pp
    ```
    New in version 2016.11.6.

salt.modules.selinux.list_sebool()
    Return a structure listing all of the selinux booleans on the system and what state they are in
    CLI Example:
    ```
salt '*' selinux.list_sebool
    ```

salt.modules.selinux.list_semod()
    Return a structure listing all of the selinux modules on the system and what state they are in
    CLI Example:
    ```
salt '*' selinux.list_semod
    ```
    New in version 2016.3.0.

salt.modules.selinux.port_add_policy(name, sel_type=None, protocol=None, port=None, sel_range=None)
New in version 2019.2.0.
Add the SELinux policy for a given protocol and port.
Returns the result of the call to semanage.

```
name
| The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

sel_type
| The SELinux Type. Required.

protocol
| The protocol for the port, tcp or udp. Required if name is not formatted.

port
| The port or port range. Required if name is not formatted.

sel_range
| The SELinux MLS/MCS Security Range.
```

CLI Example:

```
salt '*' selinux.port_add_policy tcp/8080 http_port_t
salt '*' selinux.port_add_policy foobar http_port_t protocol=tcp port=8091
```

salt.modules.selinux.\texttt{port_delete_policy}(\textit{name, protocol=None, port=None})
New in version 2019.2.0.
Deletes the SELinux policy for a given protocol and port.
Returns the result of the call to semanage.

```
name
| The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

protocol
| The protocol for the port, tcp or udp. Required if name is not formatted.

port
| The port or port range. Required if name is not formatted.
```

CLI Example:

```
salt '*' selinux.port_delete_policy tcp/8080
salt '*' selinux.port_delete_policy foobar protocol=tcp port=8091
```

salt.modules.selinux.\texttt{port_get_policy}(\textit{name, sel_type=None, protocol=None, port=None})
New in version 2019.2.0.
Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:
- sel_type (the selinux type)
- protocol (the protocol)
- port (the port(s) and/or port range(s))

```
name
| The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

sel_type
| The SELinux Type.

protocol
| The protocol for the port, tcp or udp. Required if name is not formatted.

port
| The port or port range. Required if name is not formatted.
```

CLI Example:
salt.modules.selinux.port_modify_policy(name, sel_type=None, protocol=None, port=None, sel_range=None)

New in version 2019.2.0.
Modifies the SELinux policy for a given protocol and port.
Returns the result of the call to semanage.

name
The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

sel_type
The SELinux Type. Required.

protocol
The protocol for the port, tcp or udp. Required if name is not formatted.

port
The port or port range. Required if name is not formatted.

sel_range
The SELinux MLS/MCS Security Range.

CLI Example:

```
salt '*' selinux.port_modify_policy tcp/80 http_port_t
salt '*' selinux.port_modify_policy foobar http_port_t protocol=tcp port=80
```

salt.modules.selinux.remove_semod(module)
Remove SELinux module

CLI Example:

```
salt '*' selinux.remove_semod module_name
```

New in version 2016.11.6.

salt.modules.selinux.selinux_fs_path()
Return the location of the SELinux VFS directory

CLI Example:

```
salt '*' selinux.selinux_fs_path
```

salt.modules.selinux.setenforce(mode)
Set the SELinux enforcing mode

CLI Example:

```
salt '*' selinux.setenforce enforcing
```

salt.modules.selinux.setsebool(boolean, value, persist=False)
Set the value for a boolean

CLI Example:

```
salt '*' selinux.setsebool virt_use_usb off
```
salt.modules.selinux.setsebools(pairs, persist=False)
   Set the value of multiple booleans
   CLI Example:
   ``
salt '*' selinux.setsebools '{virt_use_usb: on, squid_use_tproxy: off}'
``
salt.modules.selinux.setsemod(module, state)
   Enable or disable an SELinux module.
   CLI Example:
   ``
salt '*' selinux.setsemod nagios Enabled
``
New in version 2016.3.0.

26.6.400  salt.modules.sensehat
Module for controlling the LED matrix or reading environment data on the SenseHat of a Raspberry Pi.
New in version 2017.7.0.
   maintainer
      Benedikt Werner <1benediktwerner@gmail.com>, Joachim Werner <joe@suse.com>
   maturity
      new
   depends
      sense_hat Python module
The rotation of the Pi can be specified in a pillar. This is useful if the Pi is used upside down or sideways to correct the orientation of the image being shown.
   Example:
   ``
sensehat:
   rotation: 90
``
salt.modules.sensehat.clear(color=None)
   Sets the LED matrix to a single color or turns all LEDs off.
   CLI Example:
   ``
salt 'raspberry' sensehat.clear
salt 'raspberry' sensehat.clear '[255, 0, 0]'
``
salt.modules.sensehat.get_humidity()
   Get the percentage of relative humidity from the humidity sensor.
salt.modules.sensehat.get_pixel(x, y)
   Returns the color of a single pixel on the LED matrix.
      x
         The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.
      y
         The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.
Note: Please read the note for `get_pixels`

`salt.modules.sensehat.get_pixels()`
Returns a list of 64 smaller lists of \([R, G, B]\) pixels representing the currently displayed image on the LED matrix.

**Note:** When using `set_pixels` the pixel values can sometimes change when you read them again using `get_pixels`. This is because we specify each pixel element as 8 bit numbers (0 to 255) but when they're passed into the Linux frame buffer for the LED matrix the numbers are bit shifted down to fit into RGB 565. 5 bits for red, 6 bits for green and 5 bits for blue. The loss of binary precision when performing this conversion (3 bits lost for red, 2 for green and 3 for blue) accounts for the discrepancies you see.

The `get_pixels` method provides an accurate representation of how the pixels end up in frame buffer memory after you have called `set_pixels`.

`salt.modules.sensehat.get_pressure()`
Gets the current pressure in Millibars from the pressure sensor.

`salt.modules.sensehat.get_temperature()`
Gets the temperature in degrees Celsius from the humidity sensor. Equivalent to calling `get_temperature_from_humidity`.

If you get strange results try using `get_temperature_from_pressure`.

`salt.modules.sensehat.get_temperature_from_humidity()`
Gets the temperature in degrees Celsius from the humidity sensor.

`salt.modules.sensehat.get_temperature_from_pressure()`
Gets the temperature in degrees Celsius from the pressure sensor.

`salt.modules.sensehat.low_light(low_light=True)`
Sets the LED matrix to low light mode. Useful in a dark environment.

CLI Example:
```
salt 'raspberry' sensehat.low_light
salt 'raspberry' sensehat.low_light False
```

`salt.modules.sensehat.set_pixel(x, y, color)`
Sets a single pixel on the LED matrix to a specified color.

- **x**
  The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.

- **y**
  The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.

- **color**
  The new color of the pixel as a list of \([R, G, B]\) values.

CLI Example:
```
salt 'raspberry' sensehat.set_pixel 0 0 '[255, 0, 0]'
```

`salt.modules.sensehat.set_pixels(pixels)`
Sets the entire LED matrix based on a list of 64 pixel values.

- **pixels**
  A list of 64 \([R, G, B]\) color values.
salt.modules.sensehat.show_image(image)
Displays an 8 x 8 image on the LED matrix.

image
The path to the image to display. The image must be 8 x 8 pixels in size.

CLI Example:
```
salt 'raspberry' sensehat.show_image /tmp/my_image.png
```

salt.modules.sensehat.show_letter(letter, text_color=None, back_color=None)
Displays a single letter on the LED matrix.

letter
The letter to display

text_color
The color in which the letter is shown. Defaults to '[255, 255, 255]' (white).

back_color
The background color of the display. Defaults to '[0, 0, 0]' (black).

CLI Example:
```
salt 'raspberry' sensehat.show_letter O
salt 'raspberry' sensehat.show_letter X '[255, 0, 0]'
salt 'raspberry' sensehat.show_letter B '[0, 0, 255]' '[255, 255, 0]'
```

salt.modules.sensehat.show_message(message, msg_type=None, text_color=None, back_color=None, scroll_speed=0.1)
Displays a message on the LED matrix.

message
The message to display

msg_type
The type of the message. Changes the appearance of the message.

Available types are:
```
error: red text
warning: orange text
success: green text
info: blue text
```

scroll_speed
The speed at which the message moves over the LED matrix. This value represents the time paused for between shifting the text to the left by one column of pixels. Defaults to '0.1'.

text_color
The color in which the message is shown. Defaults to '[255, 255, 255]' (white).

back_color
The background color of the display. Defaults to '[0, 0, 0]' (black).

CLI Example:
```
salt 'raspberry' sensehat.show_message 'Status ok'
salt 'raspberry' sensehat.show_message 'Something went wrong' error
salt 'raspberry' sensehat.show_message 'Red' text_color='[255, 0, 0]'
salt 'raspberry' sensehat.show_message 'Hello world' None '[0, 0, 255]' -> '[255, 255, 0]' 0.2
```
26.6.401 salt.modules.sensors

Read lm-sensors
New in version 2014.1.3.

salt.modules.sensors.sense(chip, fahrenheit=False)
Gather lm-sensors data from a given chip

To determine the chip to query, use the 'sensors' command and see the leading line in the block.

Example:
/usr/bin/sensors

coretemp-isa-0000 Adapter: ISA adapter Physical id 0: +56.0℃ (high = +87.0℃, crit = +105.0℃) Core 0: +52.0℃ (high = +87.0℃, crit = +105.0℃) Core 1: +50.0℃ (high = +87.0℃, crit = +105.0℃) Core 2: +56.0℃ (high = +87.0℃, crit = +105.0℃) Core 3: +53.0℃ (high = +87.0℃, crit = +105.0℃)

Given the above, the chip is 'coretemp-isa-0000'.

26.6.402 salt.modules.serverdensity_device

Wrapper around Server Density API
New in version 2014.7.0.

salt.modules.serverdensity_device.create(name, **params)
Function to create device in Server Density. For more info, see the API docs.

CLI Example:
salt '*' serverdensity_device.create lama
salt '*' serverdensity_device.create rich_lama group=lama_band
        → installedRAM=32768

salt.modules.serverdensity_device.delete(device_id)
Delete a device from Server Density. For more information, see the API docs.

CLI Example:
salt '*' serverdensity_device.delete 51f7eafcba4bb35e000ae4

salt.modules.serverdensity_device.get_sd_auth(val, sd_auth_pillar_name='serverdensity')
Returns requested Server Density authentication value from pillar.

CLI Example:
salt '*' serverdensity_device.get_sd_auth <val>

salt.modules.serverdensity_device.install_agent(agent_key, agent_version=1)
Function downloads Server Density installation agent, and installs sd-agent with agent_key. Optionally the agent_version would select the series to use (defaults on the v1 one).

CLI Example:
salt.modules.serverdensity_device.install_agent

salt '[*]' serverdensity_device.install_agent

    → c2bbdd6689ff46282bd4a07555641498
salt '[*]' serverdensity_device.install_agent

    → c2bbdd6689ff46282bd4a07555641498

salt.modules.serverdensity_device.ls(**params)

List devices in Server Density

Results will be filtered by any params passed to this function. For more information, see the API docs on listing and searching.

CLI Example:

salt '[*]' serverdensity_device.ls
salt '[*]' serverdensity_device.ls name=lama
salt '[*]' serverdensity_device.ls name=lama group=lama_band

    → installedRAM=32768

salt.modules.serverdensity_device.update(device_id, **params)

Updates device information in Server Density. For more information see the API docs.

CLI Example:

salt '[*]' serverdensity_device.update 51f7eafcd4bb235e000ae4 name=lama

    → group=lama_band
salt '[*]' serverdensity_device.update 51f7eafcd4bb235e000ae4 name=better_lama

    → lama  group=rock_lamas  swapSpace=512

26.6.403  salt.modules.servicenow

Module for execution of ServiceNow CI (configuration items)

New in version 2016.11.0.

depends

servicenow_rest python module

configuration

Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'servicenow' key by default, if defined.

For example:

```
  servicenow:
    instance_name: ''
    username: ''
    password: ''
```

salt.modules.servicenow.delete_record(table, sys_id)

Delete an existing record

Parameters

- **table** (str) -- The table name, e.g. sys_user
- **sys_id** (str) -- The unique ID of the record

CLI Example:
salt myminion servicenow.delete_record sys_computer 2134566

salt.modules.servicenow.non_structured_query(table, query=None, **kwargs)
Run a non-structured (not a dict) query on a servicenow table. See http://wiki.servicenow.com/index.php?title=Encoded_Query_Strings#gsc.tab=0 for help on constructing a non-structured query string.

Parameters
- **table** (str) -- The table name, e.g. sys_user
- **query** (str) -- The query to run (or use keyword arguments to filter data)

CLI Example:
salt myminion servicenow.non_structured_query sys_computer 'role=web'
salt myminion servicenow.non_structured_query sys_computer role=web
\(\rightarrow\) type=computer

salt.modules.servicenow.set_change_request_state(change_id, state='approved')
Set the approval state of a change request/record

Parameters
- **change_id** (str) -- The ID of the change request, e.g. CHG123545
- **state** (str) -- The target state, e.g. approved

CLI Example:
salt myminion servicenow.set_change_request_state CHG000123 declined
salt myminion servicenow.set_change_request_state CHG000123 approved

salt.modules.servicenow.update_record_field(table, sys_id, field, value)
Update the value of a record's field in a servicenow table

Parameters
- **table** (str) -- The table name, e.g. sys_user
- **sys_id** (str) -- The unique ID of the record
- **field** (str) -- The new value
- **value** (str) -- The new value

CLI Example:
salt myminion servicenow.update_record_field sys_user 2348234 first_name=\{jimmy\}

26.6.404 salt.modules.slack_notify

Module for sending messages to Slack

New in version 2015.5.0.

configuration
This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.call_hook(message, attachment=None, color='good', short=False,
identifier=None, channel=None, username=None, icon_emoji=None)
Send message to Slack incoming webhook.

**Parameters**

- **message** -- The topic of message.
- **attachment** -- The message to send to the Slack WebHook.
- **color** -- The color of border of left side
- **short** -- An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
- **identifier** -- The identifier of WebHook.
- **channel** -- The channel to use instead of the WebHook default.
- **username** -- Username to use instead of WebHook default.
- **icon_emoji** -- Icon to use instead of WebHook default.

**Returns**

Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.call_hook message='Hello, from SaltStack'
```

salt.modules.slack_notify.find_room(name, api_key=None)

Find a room by name and return it.

**Parameters**

- **name** -- The room name.
- **api_key** -- The Slack admin api key.

**Returns**

The room object.

CLI Example:

```
salt '*' slack.find_room name="random"
salt '*' slack.find_room name="random" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.find_user(name, api_key=None)

Find a user by name and return it.

**Parameters**

- **name** -- The user name.
- **api_key** -- The Slack admin api key.

**Returns**

The user object.

CLI Example:

```
salt '*' slack.find_user name="ThomasHatch"
salt '*' slack.find_user name="ThomasHatch" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.list_rooms(api_key=None)

List all Slack rooms.

**Parameters**

- **api_key** -- The Slack admin api key.

**Returns**

The room list.

CLI Example:
salt '*' slack.list_rooms
salt '*' slack.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15

salt.modules.slack_notify.list_users(api_key=None)
List all Slack users.

Parameters
    api_key -- The Slack admin api key.

Returns
    The user list.

CLI Example:
salt '*' slack.list_users
salt '*' slack.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15

salt.modules.slack_notify.post_message(channel, message, from_name, api_key=None, icon=None, attachments=None, blocks=None)
Send a message to a Slack channel.

Changed in version 3003: Added attachments and blocks kwargs

Parameters
    • channel -- The channel name, either will work.
    • message -- The message to send to the Slack channel.
    • from_name -- Specify who the message is from.
    • api_key -- The Slack api key, if not specified in the configuration.
    • icon -- URL to an image to use as the icon for this message
    • attachments -- Any attachments to be sent with the message.
    • blocks -- Any blocks to be sent with the message.

Returns
    Boolean if message was sent successfully.

CLI Example:
salt '*' slack.post_message channel="Development Room" message="Build is\n\t\tdone" from_name="Build Server"

26.6.405 salt.modules.slackware_service

The service module for Slackware

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

salt.modules.slackware_service.available(name)
    Returns True if the specified service is available, otherwise returns False.

    New in version 3002.

    CLI Example:
salt '*' service.available sshd
salt.modules.slackware_service.disable(name, **kwargs)
  Disable the named service to start at boot
  New in version 3002.
  CLI Example:

  ```
  salt '*' service.disable <service name>
  ```

salt.modules.slackware_service.disabled(name)
  Return True if the named service is enabled, false otherwise
  New in version 3002.
  CLI Example:

  ```
  salt '*' service.disabled <service name>
  ```

salt.modules.slackware_service.enable(name, **kwargs)
  Enable the named service to start at boot
  New in version 3002.
  CLI Example:

  ```
  salt '*' service.enable <service name>
  ```

salt.modules.slackware_service.enabled(name, **kwargs)
  Return True if the named service is enabled, false otherwise
  New in version 3002.
  CLI Example:

  ```
  salt '*' service.enabled <service name>
  ```

salt.modules.slackware_service.force_reload(name)
  Force-reload the named service
  New in version 3002.
  CLI Example:

  ```
  salt '*' service.force_reload <service name>
  ```

salt.modules.slackware_service.get_all()
  Return all available boot services
  New in version 3002.
  CLI Example:

  ```
  salt '*' service.get_all
  ```

salt.modules.slackware_service.get_disabled()
  Return a set of services that are installed but disabled
  New in version 3002.
  CLI Example:
Salt Documentation, Release 3007.1

```
salt '*' service.get_disabled
```

**salt.modules.slackware_service.get_enabled()**

Return a list of service that are enabled on boot

New in version 3002.

CLI Example:

```
salt '*' service.get_enabled
```

**salt.modules.slackware_service.missing(name)**

The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

New in version 3002.

CLI Example:

```
salt '*' service.missing sshd
```

**salt.modules.slackware_service.reload_(name)**

Reload the named service

New in version 3002.

CLI Example:

```
salt '*' service.reload <service name>
```

**salt.modules.slackware_service.restart(name)**

Restart the named service

New in version 3002.

CLI Example:

```
salt '*' service.restart <service name>
```

**salt.modules.slackware_service.start(name)**

Start the specified service

New in version 3002.

CLI Example:

```
salt '*' service.start <service name>
```

**salt.modules.slackware_service.status(name, sig=None)**

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

New in version 3002.

Parameters

- **name (str)** -- The name of the service to check
- **sig (str)** -- Signature to use to find the service via ps

Returns

True if running, False otherwise. Dict: Maps service name to True if running, False otherwise

26.6. execution modules 2889
Return type

bool

CLI Example:

```bash
salt '*' service.status <service name> [service signature]
```

`salt.modules.slackware_service.stop(name)`

Stop the specified service

New in version 3002.

CLI Example:

```bash
salt '*' service.stop <service name>
```

### 26.6.406 salt.modules.slsutil

Utility functions for use with or in SLS files

`salt.modules.slsutil.banner(width=72, commentchar='#', borderchar='#', blockstart=None, blockend=None, title=None, text=None, newline=False)`

Create a standardized comment block to include in a templated file.

A common technique in configuration management is to include a comment block in managed files, warning users not to modify the file. This function simplifies and standardizes those comment blocks.

**Parameters**

- `width` -- The width, in characters, of the banner. Default is 72.
- `commentchar` -- The character to be used in the starting position of each line. This value should be set to a valid line comment character for the syntax of the file in which the banner is being inserted. Multiple character sequences, like '//', are supported. If the file's syntax does not support line comments (such as XML), use the `blockstart` and `blockend` options.
- `borderchar` -- The character to use in the top and bottom border of the comment box. Must be a single character.
- `blockstart` -- The character sequence to use at the beginning of a block comment. Should be used in conjunction with `blockend`
- `blockend` -- The character sequence to use at the end of a block comment. Should be used in conjunction with `blockstart`
- `title` -- The first field of the comment block. This field appears centered at the top of the box.
- `text` -- The second field of the comment block. This field appears left-justified at the bottom of the box.
- `newline` -- Boolean value to indicate whether the comment block should end with a newline. Default is False.

**Example 1 - the default banner:**

```bash
{{ salt['slsutil.banner']() }}
```

```
########################################################################
# #
# THIS FILE IS MANAGED BY SALT - DO NOT EDIT #
# # The contents of this file are managed by Salt. Any changes to this #
(continues on next page)
```
Example 2 - a Javadoc-style banner:

```plaintext
{{ salt['slsutil.banner'](commentchar=' *', borderchar='*', blockstart='/
 →**', blockend=' */) }}
```

Example 3 - custom text:

```plaintext
{{ set copyright='This file may not be copied or distributed without
 →permission of VMware, Inc.' }}
{{ salt['slsutil.banner'](title='Copyright 2019 VMware, Inc.',
 →text=copyright, width=60) }}
```

```plaintext
salt.modules.slsutil.boolstr(value, true='true', false='false')
```

Convert a boolean value into a string. This function is intended to be used from within file templates to provide an easy way to take boolean values stored in Pillars or Grains, and write them out in the appropriate syntax for a particular file template.

Parameters

- `value` -- The boolean value to be converted
- `true` -- The value to return if `value` is `True`
- `false` -- The value to return if `value` is `False`

In this example, a pillar named `smtp:encrypted` stores a boolean value, but the template that uses that value needs `yes` or `no` to be written, based on the boolean value.

Note: this is written on two lines for clarity. The same result could be achieved in one line.

```plaintext
[% set encrypted = salt[pillar.get]('smtp:encrypted', false) %]
use_tls: {{ salt['slsutil.boolstr'](encrypted, 'yes', 'no') }}
```

Result (assuming the value is `True`):

```plaintext
use_tls: yes
```
salt.modules.slsutil.deserialize(serializer, stream_or_string, **mod_kwargs)

Deserialize a Python object using one of the available serializer modules.

CLI Example:

```bash
classroom '*' slsutil.deserialize 'json' '{"foo": "Foo!"}"
classroom '*' --no-parse=stream_or_string slsutil.deserialize 'json' \
    stream_or_string='{"foo": "Foo!"}"
```

Jinja Example:

```jinja
{% set python_object = salt.slsutil.deserialize('json', \'{"foo": "Foo!"}\) %}
```

salt.modules.slsutil.dir_exists(path, saltenv='base')

Return True if a directory exists in the state tree, False otherwise.

Parameters

- **path** (str) -- The fully qualified path to a directory in the state tree.
- **saltenv** (str) -- The fileserver environment to search. Default: base

New in version 3004.

CLI Example:

```bash
classroom '*' slsutil.dir_exists nginx/files
```

salt.modules.slsutil.file_exists(path, saltenv='base')

Return True if a file exists in the state tree, False otherwise.

New in version 3004.

Parameters

- **path** (str) -- The fully qualified path to a file in the state tree.
- **saltenv** (str) -- The fileserver environment to search. Default: base

CLI Example:

```bash
classroom '*' slsutil.file_exists nginx/defaults.yaml
```

salt.modules.slsutil.findup(startpath, filenames, saltenv='base')

Find the first path matching a filename or list of filenames in a specified directory or the nearest ancestor directory. Returns the full path to the first file found.

New in version 3004.

Parameters

- **startpath** (str) -- The fileserver path from which to begin the search. An empty string refers to the state tree root.
- **filenames** -- A filename or list of filenames to search for. Searching for directory names is also supported.
- **saltenv** (str) -- The fileserver environment to search. Default: base

Example: return the path to defaults.yaml, walking up the tree from the state file currently being processed.

```jinja
{{ salt["slsutil.findup"](tplfile, "defaults.yaml") }}
```

CLI Example:

```bash
classroom '*' slsutil.findup formulas/shared/nginx map.jinja
```
salt.modules.slsutil.merge(obj_a, obj_b, strategy='smart', renderer='yaml', merge_lists=False)

Merge a data structure into another by choosing a merge strategy

Strategies:
• aggregate
• list
• overwrite
• recurse
• smart

CLI Example:
```
salt '*' slsutil.merge '{foo: Foo}' '{bar: Bar}'
```

salt.modules.slsutil.merge_all(lst, strategy='smart', renderer='yaml', merge_lists=False)

New in version 2019.2.0.

Merge a list of objects into each other in order

Parameters
• lst (Iterable) -- List of objects to be merged.
• strategy (String) -- Merge strategy. See utils.dictupdate.
• renderer (String) -- Renderer type. Used to determine strategy when strategy is 'smart'.
• merge_lists (Bool) -- Defines whether to merge embedded object lists.

CLI Example:
```
$ salt-call --output=txt slsutil.merge_all '[[{foo: Foo}, {foo: Bar}]]'
local: {u'foo': u'Bar'}
```

salt.modules.slsutil.path_exists(path, saltenv='base')

Return True if a path exists in the state tree, False otherwise. The path could refer to a file or directory.

New in version 3004.

Parameters
• path (str) -- The fully qualified path to a file or directory in the state tree.
• saltenv (str) -- The fileserver environment to search. Default: base

CLI Example:
```
salt '*' slsutil.path_exists nginx/defaults.yaml
```

salt.modules.slsutil.renderer(path=None, string=None, default_renderer='jinja|yaml', **kwargs)

Parse a string or file through Salt's renderer system

Changed in version 2018.3.0: Add support for Salt fileserver URIs.

This is an open-ended function and can be used for a variety of tasks. It makes use of Salt's "renderer pipes" system to run a string or file through a pipe of any of the loaded renderer modules.

Parameters
• path -- The path to a file on Salt's fileserver (any URIs supported by cp.get_url) or on the local file system.
• string -- An inline string to be used as the file to send through the renderer system. Note, not all renderer modules can work with strings; the 'py' renderer requires a file, for example.
• default_renderer -- The renderer pipe to send the file through; this is overridden by a "she-bang" at the top of the file.
• kwargs -- Keyword args to pass to Salt's compile_template() function.
Keep in mind the goal of each renderer when choosing a render-pipe; for example, the Jinja renderer processes a text file and produces a string, however the YAML renderer processes a text file and produces a data structure.

One possible use is to allow writing "map files", as are commonly seen in Salt formulas, but without tying the renderer of the map file to the renderer used in the other sls files. In other words, a map file could use the Python renderer and still be included and used by an sls file that uses the default 'jinja|yaml' renderer.

For example, the two following map files produce identical results but one is written using the normal 'jinja|yaml' and the other is using 'py':

```python
#!py
def run():
    apache = __salt__.grains.filter_by({
        ...normal map here but as a python dict...
    }, merge=__salt__.pillar.get('apache:lookup'))
    return apache
```

Regardless of which of the above map files is used, it can be accessed from any other sls file by calling this function. The following is a usage example in Jinja:

```jinja
{% set apache = salt.slsutil.renderer('map.sls') %}
```

**CLI Example:**

```
salt '*' slsutil.renderer salt://path/to/file
salt '*' slsutil.renderer /path/to/file
salt '*' slsutil.renderer /path/to/file.jinja default_renderer='jinja'
salt '*' slsutil.renderer /path/to/file.sls default_renderer='jinja|yaml'
salt '*' slsutil.renderer string='Inline template! {{ saltenv }}'
```

**salt.modules.slsutil.serialize** (serializer, obj, **mod_kwargs)

Serialize a Python object using one of the available serializer modules.

**CLI Example:**

```
salt '*' --no-parse=obj slsutil.serialize 'json' obj="{'foo': 'Foo!'}"
```

**Jinja Example:**

```
{% set json_string = salt.slsutil.serialize('json',
    {'foo': 'Foo!'}) %}
```

**salt.modules.slsutil.update** (dest, upd, recursive_update=True, merge_lists=False)

Merge upd recursively into dest

If merge_lists=True, will aggregate list object types instead of replacing. This behavior is only activated when recursive_update=True.

**CLI Example:**
26.6.407 salt.modules.smartos_imgadm

Module for running imgadm command on SmartOS

salt.modules.smartos_imgadmavail(search=None, verbose=False)

Return a list of available images

cli example:

```
salt '*' imgadm.avail [percona]
salt '*' imgadm.avail verbose=True
```

salt.modules.smartos_imgadmdelte(uuid)

Remove an installed image

cli example:

```
salt '*' imgadm.delete e42f8c84-bbea-11e2-b920-078fab2aab1f
```

salt.modules.smartos_imgadm.docker_to_uuid(uuid)

Get the image uuid from an imported docker image

New in version 2019.2.0.

salt.modules.smartos_imgadm.get(uuid)

Return info on an installed image

cli example:

```
salt '*' imgadm.get e42f8c84-bbea-11e2-b920-078fab2aab1f
salt '*' imgadm.get plexinc/pms-docker:plexpass
```

salt.modules.smartos_imgadm.import_image(uuid, verbose=False)

Import an image from the repository

cli example:

```
salt '*' imgadm.import e42f8c84-bbea-11e2-b920-078fab2aab1f [verbose=True]
```

salt.modules.smartos_imgadm.list_installed( verbose=False)

Return a list of installed images

cli example:

```
```
Changed in version 2019.2.0: Docker images are now also listed

CLI Example:

```
salt '*' imgadm.list
salt '*' imgadm.list docker=True
salt '*' imgadm.list verbose=True
```

salt.modules.smartos_imgadm.show(uuid)
Show manifest of a given image

```
uuid
    [string] uuid of image
```

CLI Example:

```
salt '*' imgadm.show e42f8c84-bbea-11e2-b920-078fab2aab1f
salt '*' imgadm.show plexinc/pms-docker:plexpass
```

salt.modules.smartos_imgadm.source_add(source, source_type='imgapi')
Add a new source

```
source
    [string] source url to add
source_type
    [string (imgapi)] source type, either imgapi or docker
```

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.source_add https://updates.joyent.com
salt '*' imgadm.source_add https://docker.io docker
```

salt.modules.smartos_imgadm.source_delete(source)
Delete a source

```
source
    [string] source url to delete
```

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.source_delete https://updates.joyent.com
```

salt.modules.smartos_imgadm.sources(verbos=False)
Return a list of available sources

```
verbose
    [boolean (False)] toggle verbose output
```

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.sources
```

salt.modules.smartos_imgadm.update_installed(uuid='')
Gather info on unknown image(s) (locally installed)

```
uuid
    [string] optional uuid of image
```

CLI Example:
salt modules.smartos_imgadm.vacuum(verbosetrue=False)

Remove unused images

verbosetrue
[boolean (False)] toggle verbose output

CLI Example:

```bash
salt '*' imgadm.vacuum [verbosetrue=True]
```

salt modules.smartos_imgadm.version()

Return imgadm version

CLI Example:

```bash
salt '*' imgadm.version
```

26.6.408 salt modules.smartos_nictagadm

Module for running nictagadm command on SmartOS :maintainer: Jorge Schrauwen <sjorge@blackdot.be> :maturity: new :depends: nictagadm binary, dladm binary :platform: smartos

New in version 2016.11.0.

salt modules.smartos_nictagadm.add(name, mac, mtu=1500)

Add a new nictag

name
[string] name of new nictag

mac
[string] mac of parent interface or 'etherstub' to create a ether stub

mtu
[int] MTU (ignored for etherstubs)

CLI Example:

```bash
salt '*' nictagadm.add storage0 etherstub
salt '*' nictagadm.add trunk0 'DE:AD:00:00:BE:EF' 9000
```

salt modules.smartos_nictagadm.delete(name, forcingrue=False)

Delete nictag

name
[string] nictag to delete

force
[boolean] force delete even if vms attached

CLI Example:

```bash
salt '*' nictagadm.exists admin
```

salt modules.smartos_nictagadm.exists(*nictag, **kwargs)

Check if nictags exists

nictag
[string] one or more nictags to check

verbose
[boolean] return list of nictags
CLI Example:
```
salt '*' nictagadm.exists admin
```

```
salt.modules.smartos_nictagadm.list_nictags(include_etherstubs=True)
```

List all nictags
```
include_etherstubs
```
[boolean] toggle include of etherstubs

CLI Example:
```
salt '*' nictagadm.list
```

```
salt.modules.smartos_nictagadm.update(name, mac=None, mtu=None)
```

Update a nictag
```
name
```
[string] name of nictag
```
mac
```
[string] optional new mac for nictag
```
```
mtu
```
[int] optional new MTU for nictag

CLI Example:
```
salt '*' nictagadm.update trunk mtu=9000
```

```
salt.modules.smartos_nictagadm.vms(nictag)
```

List all vms connect to nictag
```
nictag
```
[string] name of nictag

CLI Example:
```
salt '*' nictagadm.vms admin
```

26.6.409 salt.modules.smartos_virt

virst compatibility module for managing VMs on SmartOS

```
salt.modules.smartos_virt.get_macs(domain)
```

Return a list off MAC addresses from the named VM

CLI Example:
```
salt '*' virt.get_macs <domain>
```

```
salt.modules.smartos_virt.init(**kwargs)
```

Initialize a new VM

CLI Example:
```
salt '*' virt.init image_uuid='...' alias='...' [...]
```

```
salt.modules.smartos_virt.list_active_vms()
```

Return a list of uuids for active virtual machine on the minion

CLI Example:
salt '*' virt.list_active_vms

```python
salt.modules.smartos_virt.list_domains()
```

Return a list of virtual machine names on the minion

CLI Example:

```python
salt '*' virt.list_domains
```

salt.modules.smartos_virt.list_inactive_vms()

Return a list of uuids for inactive virtual machine on the minion

CLI Example:

```python
salt '*' virt.list_inactive_vms
```

salt.modules.smartos_virt.reboot(domain)

Reboot a domain via ACPI request

CLI Example:

```python
salt '*' virt.reboot <domain>
```

salt.modules.smartos_virt.setmem(domain, memory)

Change the amount of memory allocated to VM. `<memory>` is to be specified in MB.

Note for KVM: this would require a restart of the VM.

CLI Example:

```python
salt '*' virt.setmem <domain> 512
```

salt.modules.smartos_virt.shutdown(domain)

Send a soft shutdown signal to the named vm

CLI Example:

```python
salt '*' virt.shutdown <domain>
```

salt.modules.smartos_virt.start(domain)

Start a defined domain

CLI Example:

```python
salt '*' virt.start <domain>
```

salt.modules.smartos_virt.stop(domain)

Hard power down the virtual machine, this is equivalent to powering off the hardware.

CLI Example:

```python
salt '*' virt.destroy <domain>
```

salt.modules.smartos_virt.vm_info(domain)

Return a dict with information about the specified VM on this CN

CLI Example:
salt '*' virt.vm_info <domain>

salt.modules.smartos_virt.vm_virt_type(domain)
Return VM virtualization type: OS or KVM

CLI Example:
salt '*' virt.vm_virt_type <domain>

26.6.410 salt.modules.smartos_vmadm

Module for running vmadm command on SmartOS

salt.modules.smartos_vmadm.create(from_file=None, **kwargs)
Create a new vm

from_file
[string] json file to create the vm from -- if present, all other options will be ignored

kwargs
[string|int|...] options to set for the vm

CLI Example:
salt '*' vmadm.create from_file="/tmp/new_vm.json"
salt '*' vmadm.create image_uuid='...' alias='...' nics=['{"nic_tag": "admin", "ip": "198.51.100.123", ...}, {...}]'

salt.modules.smartos_vmadm.create_snapshot(vm, name, key='uuid')
Create snapshot of a vm

vm
[string] vm to be targeted

name
[string]

snapshot name
The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_:.] to comply with ZFS restrictions.

key
[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:
salt '*' vmadm.create_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.create_snapshot nacl baseline key=alias

salt.modules.smartos_vmadm.delete(vm, key='uuid')
Delete a vm

vm
[string] vm to be deleted

key
[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:
salt '*' vmadm.delete 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.delete nacl key=alias
salt.modules.smartos_vmadm.delete_snapshot(vm, name, key='uuid')

Delete snapshot of a vm
vm [string] vm to be targeted
name [string]

snapshot name
The snapshot name must be 64 characters or less and must only contain alphanumeric characters and characters in the set [\-_:] to comply with ZFS restrictions.

key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.delete_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.delete_snapshot nacl baseline key=alias
```

salt.modules.smartos_vmadm.get(vm, key='uuid')

Output the JSON object describing a VM
vm [string] vm to be targeted
key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.get 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.get nacl key=alias
```

salt.modules.smartos_vmadm.info(vm, info_type='all', key='uuid')

Lookup info on running kvm
vm [string] vm to be targeted
info_type [string [all|block|blockstats|chardev|cpus|kvm|pci|spice|version|vnc]] info type to return
key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543 vnc
salt '*' vmadm.info nacl key=alias
salt '*' vmadm.info nacl vnc key=alias
```

salt.modules.smartos_vmadm.list_vms(search=None, sort=None, order='uuid,type,ram,state,alias', keyed=True)

Return a list of VMs
search [string] vmadm filter property
sort [string] vmadm sort (-s) property
order [string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias
keyed [boolean]
specified if the output should be an array (False) or dict (True)
For a dict the key is the first item from the order parameter. Note: If key is not unique last vm wins.

CLI Example:

```
salt '*' vmadm.list
salt '*' vmadm.list order=alias,ram,cpu_cap sort=-ram,-cpu_cap
salt '*' vmadm.list search='type=KVM'
```

```
salt.modules.smartos_vmadm.lookup(search=None, order=None, one=False)
```

Return a list of VMs using lookup

```
salt '*' vmadm.list
salt '*' vmadm.list order=alias,ram,cpu_cap sort=-ram,-cpu_cap
salt '*' vmadm.list search='type=KVM'
```

```
salt.modules.smartos_vmadm.reboot(vm, force=False, key='uuid')
```

Reboot a vm

```
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.reboot vm=nacl key=alias
salt '*' vmadm.reboot vm=nina.example.org key=hostname
```

```
salt.modules.smartos_vmadm.receive(uuid, source)
```

Receive a vm from a directory

```
salt '*' vmadm.receive 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
```

```
salt.modules.smartos_vmadm.reprovision(vm, image, key='uuid')
```

Reprovision a vm

```
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.reboot vm=nacl key=alias
salt '*' vmadm.reboot vm=nina.example.org key=hostname
```

```
salt.modules.smartos_vmadm.receive(uuid, source)
```

Receive a vm from a directory

```
salt '*' vmadm.receive 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
```

```
salt.modules.smartos_vmadm.reprovision(vm, image, key='uuid')
```

Reprovision a vm

```
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.reboot vm=nacl key=alias
salt '*' vmadm.reboot vm=nina.example.org key=hostname
```
key
  [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```bash
salt '*' vmadm.reprovision 186da9ab-7392-4f55-91a5-b8f1fe770543 c02a2044-→c1bd-11e4-bd8c-dfc1db8b0182
salt '*' vmadm.reprovision nacl c02a2044-c1bd-11e4-bd8c-dfc1db8b0182
  →key=alias
```

salt.modules.smartos_vmadm.rollback_snapshot(vm, name, key='uuid')
Rollback snapshot of a vm

```bash
vm
  [string] vm to be targeted
name
  [string]
  snapshot name
  The snapname must be 64 characters or less and must only contain alphanumeric
  characters and characters in the set [-_.:%] to comply with ZFS restrictions.
key
  [string [uuid|alias|hostname]] value type of 'vm' parameter
```

CLI Example:

```bash
salt '*' vmadm.rollback_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543
  →baseline
salt '*' vmadm.rollback_snapshot nacl baseline key=alias
```

salt.modules.smartos_vmadm.send(vm, target, key='uuid')
Send a vm to a directory

```bash
vm
  [string] vm to be sent
target
  [string] target directory
key
  [string [uuid|alias|hostname]] value type of 'vm' parameter
```

CLI Example:

```bash
salt '*' vmadm.send 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
salt '*' vmadm.send vm=nacl target=/opt/backups key=alias
```

salt.modules.smartos_vmadm.start(vm, options=None, key='uuid')
Start a vm

```bash
vm
  [string] vm to be started
options
  [string] optional additional options
key
  [string [uuid|alias|hostname]] value type of 'vm' parameter
```

CLI Example:

```bash
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543 'order=c,once=d'→cdrom=/path/to/image.iso,ide'
salt '*' vmadm.start vm=nacl key=alias
salt '*' vmadm.start vm=nina.example.org key=hostname
```

26.6. execution modules
salt.modules.smartos_vmadm.stop(vm, force=False, key='uuid')

Stop a vm

vm [string] vm to be stopped
force [boolean] force stop of vm if true
key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```bash
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.stop vm=nacl key=alias
salt '*' vmadm.stop vm=nina.example.org key=hostname
```

salt.modules.smartos_vmadm.sysrq(vm, action='nmi', key='uuid')

Send non-maskable interrupt to vm or capture a screenshot

vm [string] vm to be targeted
action [string] nmi or screenshot -- Default: nmi
key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```bash
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 nmi
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 screenshot
salt '*' vmadm.sysrq nacl nmi key=alias
```

salt.modules.smartos_vmadm.update(vm, from_file=None, key='uuid', **kwargs)

Update a new vm

vm [string] vm to be updated
from_file [string] json file to update the vm with -- if present, all other options will be ignored
key [string [uuid|alias|hostname]] value type of 'vm' parameter
kwargs [string|int|...] options to update for the vm

CLI Example:

```bash
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 from_file=/tmp/new_vm.json
salt '*' vmadm.update vm=nacl key=alias from_file=/tmp/new_vm.json
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 max_
   →physical_memory=1024
```
26.6.411 salt.modules.smbios

Interface to SMBIOS/DMI
(Parsing through dmidecode)

External References

Desktop Management Interface (DMI)
System Management BIOS
DMIdecode

salt.modules.smbios.get(string, clean=True)

Get an individual DMI string from SMBIOS info
string

The string to fetch. DMIdecode supports:
- bios-vendor
- bios-version
- bios-release-date
- system-manufacturer
- system-product-name
- system-version
- system-serial-number
- system-uuid
- baseboard-manufacturer
- baseboard-product-name
- baseboard-version
- baseboard-serial-number
- baseboard-asset-tag
- chassis-manufacturer
- chassis-type
- chassis-version
- chassis-serial-number
- chassis-asset-tag
- processor-family
- processor-manufacturer
- processor-version
- processor-frequency

clean

Don't return well-known false information
(invalid UUID's, serial 00000000's, etcetera)
Defaults to True

CLI Example:

```
salt '*' smbios.get system-uuid clean=False
```

salt.modules.smbios.records(rec_type=None, fields=None, clean=True)

Return DMI records from SMBIOS

Return only records of type(s) The SMBIOS specification defines the following DMI types:
<table>
<thead>
<tr>
<th>Type</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>BIOS</td>
</tr>

clean

Don’t return well-known false information
(invalid UUID’s, serial 000000000’s, etcetera)
Defaults to True

CLI Example:
Service support for Solaris 10 and 11, should work with other systems that use SMF also. (e.g. SmartOS)

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

salt.modules.smf_service.available(name)
    Returns True if the specified service is available, otherwise returns False.
    We look up the name with the svcs command to get back the FMRI. This allows users to use simpler service names.
    CLI Example:
      salt '*' service.available net-snmp

salt.modules.smf_service.disable(name, **kwargs)
    Disable the named service to start at boot.
    CLI Example:
      salt '*' service.disable <service name>

salt.modules.smf_service.disabled(name)
    Check to see if the named service is disabled to start on boot.
    CLI Example:
      salt '*' service.disabled <service name>

salt.modules.smf_service.enable(name, **kwargs)
    Enable the named service to start at boot.
    CLI Example:
      salt '*' service.enable <service name>

salt.modules.smf_service.enabled(name, **kwargs)
    Check to see if the named service is enabled to start on boot.
    CLI Example:
      salt '*' service.enabled <service name>

salt.modules.smf_service.get_all()
    Return all installed services.
    CLI Example:
salt '*' service.get_all

salt.modules.smf_service.get_disabled()
Return the disabled services
CLI Example:
salt '*' service.get_disabled

salt.modules.smf_service.get_enabled()
Return the enabled services
CLI Example:
salt '*' service.get_enabled

salt.modules.smf_service.get_running()
Return the running services
CLI Example:
salt '*' service.get_running

salt.modules.smf_service.get_stopped()
Return the stopped services
CLI Example:
salt '*' service.get_stopped

salt.modules.smf_service.missing(name)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
CLI Example:
salt '*' service.missing net-snmp

salt.modules.smf_service.reload_(name)
Reload the named service
CLI Example:
salt '*' service.reload <service name>

salt.modules.smf_service.restart(name)
Restart the named service
CLI Example:
salt '*' service.restart <service name>

salt.modules.smf_service.start(name)
Start the specified service
CLI Example:
salt 'service.start <service name>

salt.modules.smf_service.status(name, sig=None)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters
- name (str) -- The name of the service to check
- sig (str) -- Not implemented

Returns
True if running, False otherwise
dict: Maps service name to True if running, False otherwise

Return type
bool

CLI Example:
salt 'service.status <service name>

salt.modules.smf_service.stop(name)

Stop the specified service

CLI Example:
salt 'service.stop <service name>

26.6.413 salt.modules.smtp

Module for Sending Messages via SMTP

New in version 2014.7.0.

depends
- smtplib python module

configuration
This module can be used by either passing a jid and password directly to send_message, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```yaml
my-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
  smtp.username: myuser
  smtp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```yaml
my-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
```
salt.modules.smtp.send_msg(recipient, message, subject='Message from Salt', sender=None, server=None, use_ssl='True', username=None, password=None, profile=None, attachments=None)

Send a message to an SMTP recipient. To send a message to multiple recipients, the recipients should be in a comma-separated Python string. Designed for use in states.

CLI Examples:

salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test'
salt '*' smtp.send_msg 'admin@example.com,admin2@example.com' 'This is a salt module test for multiple recipients'

salt.modules.snapper

Module to manage filesystem snapshots with snapper

New in version 2016.11.0.

codeauthor
   Duncan Mac-Vicar P. <dmacvicar@suse.de>

codeauthor
   Pablo Suárez Hernández <psuarezhernandez@suse.de>

depends
dbus Python module.

depends
   snapper http://snapper.io, available in most distros

maturity
class new

platform
   Linux

salt.modules.snapper.changed_files(config='root', num_pre=None, num_post=None)

Returns the files changed between two snapshots
**config**

Configuration name.

**num_pre**

First snapshot ID to compare. Default is last snapshot.

**num_post**

Last snapshot ID to compare. Default is 0 (current state).

**CLI Example:**

```python
salt '*' snapper.changed_files
salt '*' snapper.changed_files num_pre=19 num_post=20
```

**salt.modules.snapper.create_baseline** *(tag='baseline', config='root')*

Creates a snapshot marked as baseline.

- **tag**
  
  Tag name for the baseline.

- **config**
  
  Configuration name.

**CLI Example:**

```python
salt '*' snapper.create_baseline
salt '*' snapper.create_baseline my_custom_baseline
```

**salt.modules.snapper.create_config** *(name=None, subvolume=None, fstype=None, template=None, extra_opts=None)*

Creates a new Snapper configuration.

- **name**
  
  Name of the new Snapper configuration.

- **subvolume**
  
  Path to the related subvolume.

- **fstype**
  
  Filesystem type of the subvolume.

- **template**
  
  Configuration template to use. (Default: default)

- **extra_opts**
  
  Extra Snapper configuration opts dictionary. It will override the values provided by the given template (if any).

**CLI Example:**

```python
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/
  -fstype=btrfs
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/
  -fstype=btrfs template="default"
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/
  -fstype=btrfs extra_opts='{"NUMBER_CLEANUP": False}"
```

**salt.modules.snapper.create_snapshot** *(config='root', snapshot_type='single', pre_number=None, description=None, cleanup_algorithm='number', userdata=None, **kwargs)*

Creates an snapshot.

- **config**
  
  Configuration name.

- **snapshot_type**
  
  Specifies the type of the new snapshot. Possible values are single, pre and post.
pre_number
For post snapshots the number of the pre snapshot must be provided.
description
Description for the snapshot. If not given, the salt job will be used.
cleanup_algorithm
Set the cleanup algorithm for the snapshot.
number
Deletes old snapshots when a certain number of snapshots is reached.
timeline
Deletes old snapshots but keeps a number of hourly, daily, weekly, monthly and yearly snapshots.
empty-pre-post
Deletes pre/post snapshot pairs with empty diffs.
userdata
Set userdata for the snapshot (key-value pairs).

Returns the number of the created snapshot.

CLI Example:
```
salt '*' snapper.create_snapshot
```

salt.modules.snapper.delete_snapshot(snapshots_ids=None, config='root')

Deletes an snapshot

config
Configuration name. (Default: root)
snapshots_ids
List of the snapshots IDs to be deleted.

CLI Example:
```
salt '*' snapper.delete_snapshot 54
salt '*' snapper.delete_snapshot config=root 54
salt '*' snapper.delete_snapshot config=root snapshots_ids=[54,55,56]
```

salt.modules.snapper.diff(config='root', filename=None, num_pre=None, num_post=None)

Returns the differences between two snapshots

config
Configuration name.
filename
if not provided the showing differences between snapshots for all "text" files
num_pre
first snapshot ID to compare. Default is last snapshot
num_post
last snapshot ID to compare. Default is 0 (current state)

CLI Example:
```
salt '*' snapper.diff
salt '*' snapper.diff filename=/var/log/snapper.log num_pre=19 num_post=20
```

salt.modules.snapper.diff_jid(jid, config='root')

Returns the changes applied by a jid

jid
The job id to lookup
config
Configuration name.

CLI Example:
salt.modules.snapper.get_config(name='root')

Retrieves all values from a given configuration

CLI Example:
salt '*' snapper.get_config

salt.modules.snapper.get_snapshot(number=0, config='root')

Get detailed information about a given snapshot

CLI Example:
salt '*' snapper.get_snapshot 1

salt.modules.snapper.list_configs()

List all available configs

CLI Example:
salt '*' snapper.list_configs

salt.modules.snapper.list_snapshots(config='root')

List available snapshots

CLI Example:
salt '*' snapper.list_snapshots config=myconfig

salt.modules.snapper.modify_snapshot(snapshot_id=None, description=None, userdata=None, cleanup=None, config='root')

Modify attributes of an existing snapshot.

config
    Configuration name. (Default: root)

snapshot_id
    ID of the snapshot to be modified.

cleanup
    Change the cleanup method of the snapshot. (str)

description
    Change the description of the snapshot. (str)

userdata
    Change the userdata dictionary of the snapshot. (dict)

CLI Example:
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 userdata='{"foo": "bar"}'
salt '*' snapper.modify_snapshot snapshot_id=54 cleanup="number"

salt.modules.snapper.run(function, *args, **kwargs)

Runs a function from an execution module creating pre and post snapshots and associating the salt job id with those snapshots for easy undo and cleanup.

function
    Salt function to call.
config
  Configuration name. (default: "root")

description
  A description for the snapshots. (default: None)

userdata
  Data to include in the snapshot metadata. (default: None)

cleanup_algorithm
  Snapper cleanup algorithm. (default: "number")

*args
  args for the function to call. (default: None)

**kwargs
  kwargs for the function to call (default: None)

This would run append text to /etc/motd using the file.append module, and will create two snapshots, pre and post with the associated metadata. The jid will be available as salt_jid in the userdata of the snapshot.

You can immediately see the changes

CLI Example:

```
salt '*' snapper.run file.append args='"/etc/motd", "some text"'
```

salt.modules.snapper.set_config(name='root', **kwargs)

Set configuration values

CLI Example:

```
salt '*' snapper.set_config SYNC_ACL=True
```

Keys are case insensitive as they will be always uppercased to snapper convention. The above example is equivalent to:

```
salt '*' snapper.set_config sync_acl=True
```

salt.modules.snapper.status(config='root', num_pre=None, num_post=None)

Returns a comparison between two snapshots

config
  Configuration name.

num_pre
  first snapshot ID to compare. Default is last snapshot

num_post
  last snapshot ID to compare. Default is 0 (current state)

CLI Example:

```
salt '*' snapper.status
salt '*' snapper.status num_pre=19 num_post=20
```

salt.modules.snapper.status_to_string(dbus_status)

Converts a numeric dbus snapper status into a string

CLI Example:

```
salt '*' snapper.status_to_string <dbus_status>
```

salt.modules.snapper.undo(config='root', files=None, num_pre=None, num_post=None)

Undo all file changes that happened between num_pre and num_post, leaving the files into the state of num_pre.
Warning: If one of the files has changes after num_post, they will be overwritten. The snapshots are used to determine the file list, but the current version of the files will be overwritten by the versions in num_pre. You need to undo changes between num_pre and the current version of the files using num_post=0.

CLI Example:
```
salt '*' snapper.undo
```

```
salt.modules.snapper.undo_jid(jid, config='root')
```

Undo the changes applied by a salt job

- **jid**: The job id to lookup
- **config**: Configuration name.

CLI Example:
```
salt '*' snapper.undo_jid jid=20160607130930720112
```

### 26.6.415 salt.modules.solaris_fmadm

Module for running fmadm and fmdump on Solaris

- **maintainer**: Jorge Schrauwen <sjorge@blackdot.be>
- **maturity**: new
- **platform**: solaris, illumos

New in version 2016.3.0.

```
salt.modules.solaris_fmadm.acquit(fmri)
```

Acquit resource or acquit case

- **fmri**: string
  - fmri or uuid

CLI Example:
```
salt '*' fmadm.acquit fmri | uuid
```

```
salt.modules.solaris_fmadm.config()
```

Display fault manager configuration

CLI Example:
```
salt '*' fmadm.config
```

```
salt.modules.solaris_fmadm.faulty()
```

Display list of faulty resources

CLI Example:
```python
salt '*' fmadm.flush

salt.modules.solaris_fmadm.flush(fmri)

Flush cached state for resource

fmri: string

CLI Example:

salt '*' fmadm.flush fmri

salt.modules.solaris_fmadm.healthy()

Return whether fmadm is reporting faults

CLI Example:

salt '*' fmadm.healthy

salt.modules.solaris_fmadm.list_records(after=None, before=None)

Display fault management logs

after

[string] filter events after time, see man fmdump for format

before

[string] filter events before time, see man fmdump for format

CLI Example:

salt '*' fmadm.list

salt.modules.solaris_fmadm.load(path)

Load specified fault manager module

path: string

path of fault manager module

CLI Example:

salt '*' fmadm.load /module/path

salt.modules.solaris_fmadm.repaired(fmri)

Notify fault manager that resource has been repaired

fmri: string

CLI Example:

salt '*' fmadm.repaired fmri

salt.modules.solaris_fmadm.replaced(fmri)

Notify fault manager that resource has been replaced

fmri: string

CLI Example:

salt '*' fmadm.repaired fmri

salt.modules.solaris_fmadm.reset(module, serd=None)

Reset module or sub-component
module: string
    module to unload

serd
    [string] serd sub module
CLi Example:
    salt '*' fmadm.reset software-response

salt.modules.solaris_fmadm.show(uuid)
    Display log details
    uuid: string
        uuid of fault
    CLi Example:
    salt '*' fmadm.show 11b4070f-4358-62fa-9e1e-998f485977e1

salt.modules.solaris_fmadm.unload(module)
    Unload specified fault manager module
    module: string
        module to unload
    CLi Example:
    salt '*' fmadm.unload software-response

26.6.416 salt.modules.solaris_group

Manage groups on Solaris

**Important**: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info is not available), see [here](#).

salt.modules.solaris_group.add(name, gid=None, **kwargs)
    Add the specified group
    CLi Example:
    salt '*' group.add foo 3456

salt.modules.solaris_group.chgid(name, gid)
    Change the gid for a named group
    CLi Example:
    salt '*' group.chgid foo 4376

salt.modules.solaris_group.delete(name)
    Remove the named group
    CLi Example:
    salt '*' group.delete foo
salt.modules.solaris_group.getent(refresh=False)

Return info on all groups

CLI Example:

```python
salt '*' group.getent
```

salt.modules.solaris_group.info(name)

Return information about a group

CLI Example:

```python
salt '*' group.info foo
```

26.6.417 salt.modules.solaris_shadow

Manage the password database on Solaris systems

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to 'shadow.info' is not available), see [here](#).

salt.modules.solaris_shadow.default_hash()

Returns the default hash used for unset passwords

CLI Example:

```python
salt '*' shadow.default_hash
```

salt.modules.solaris_shadow.del_password(name)

Delete the password from name user

CLI Example:

```python
salt '*' shadow.del_password username
```

salt.modules.solaris_shadow.gen_password(password, crypt_salt=None, algorithm='sha512')

Generate hashed password

**Note:** When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

**password**

Plaintext password to be hashed.

**crypt_salt**

Cryptographic salt. If not given, a random 8-character salt will be generated.

**algorithm**

The following hash algorithms are supported:

- md5
- blowfish (not in mainline glibc, only available in distros that add it)
- sha256
- sha512 (default)

CLI Example:
```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt' algorithm=sha256
```

**salt.modules.solaris_shadow.info(name)**
Return information for the specified user

CLI Example:
```
salt '*' shadow.info root
```

**salt.modules.solaris_shadow.set_maxdays(name, maxdays)**
Set the maximum number of days during which a password is valid. See man passwd.

CLI Example:
```
salt '*' shadow.set_maxdays username 90
```

**salt.modules.solaris_shadow.set_mindays(name, mindays)**
Set the minimum number of days between password changes. See man passwd.

CLI Example:
```
salt '*' shadow.set_mindays username 7
```

**salt.modules.solaris_shadow.set_password(name, password)**
Set the password for a named user. The password must be a properly defined hash, the password hash can be generated with this command: openssl passwd -1 <plaintext password>

CLI Example:
```
salt '*' shadow.set_password root $1$UYCIxa628.9qXjpQCjM4a..
```

**salt.modules.solaris_shadow.set_warndays(name, warndays)**
Set the number of days of warning before a password change is required. See man passwd.

CLI Example:
```
salt '*' shadow.set_warndays username 7
```

### 26.6.418 salt.modules.solaris_system

Support for reboot, shutdown, etc

This module is assumes we are using solaris-like shutdown

New in version 2016.3.0.

**salt.modules.solaris_system.halt()**
Halt a running system

CLI Example:
salt '*' system.halt

salt.module.solaris_system.init(state)
  Change the system runlevel on sysV compatible systems
  CLI Example:
  
  state
  [string] Init state
  salt '*' system.init 3

salt.module.solaris_system.poweroff()
  Poweroff a running system
  CLI Example:
  salt '*' system.poweroff

salt.module.solaris_system.reboot(delay=0, message=None)
  Reboot the system
  delay
  [int] Optional wait time in seconds before the system will be rebooted.
  message
  [string] Optional message to broadcast before rebooting.
  CLI Example:
  salt '*' system.reboot
  salt '*' system.reboot 60 "=== system upgraded ==="

salt.module.solaris_system.shutdown(delay=0, message=None)
  Shutdown a running system
  delay
  [int] Optional wait time in seconds before the system will be shutdown.
  message
  [string] Optional message to broadcast before rebooting.
  CLI Example:
  salt '*' system.shutdown
  salt '*' system.shutdown 60 "=== disk replacement ==="

26.6.419 salt.module.solaris_user

Manage users with the useradd command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info is not available'), see here.

salt.module.solaris_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname='', roomnumber='', workphone='', homephone='', createhome=True, **kwargs)
  Add a user to the minion
  CLI Example:
salt '/*' user.add name <uid> <gid> <groups> <home> <shell>

salt.modules.solaris_user.chfullname(name, fullname)
    Change the user's Full Name
    CLI Example:
    salt '/*' user.chfullname foo "Foo Bar"

salt.modules.solaris_user.chgid(name, gid)
    Change the default group of the user
    CLI Example:
    salt '/*' user.chgid foo 4376

salt.modules.solaris_user.chgroups(name, groups, append=False)
    Change the groups to which a user belongs
    name
        Username to modify
    groups
        List of groups to set for the user. Can be passed as a comma-separated list or a Python list.
    append
        [False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.
    CLI Example:
    salt '/*' user.chgroups foo wheel,root True

salt.modules.solaris_user.chhome(name, home, persist=False)
    Set a new home directory for an existing user
    name
        Username to modify
    home
        New home directory to set
    persist
        [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.
    CLI Example:
    salt '/*' user.chhome foo /home/users/foo True

salt.modules.solaris_user.chhomephone(name, homephone)
    Change the user's Home Phone
    CLI Example:
    salt '/*' user.chhomephone foo "7735551234"

salt.modules.solaris_user.chroomnumber(name, roomnumber)
    Change the user's Room Number
    CLI Example:
salt '*' user.chroomnumber foo 123

salt.modules.solaris_user.chshell(name, shell)
    Change the default shell of the user
    CLI Example:
    salt '*' user.chshell foo /bin/zsh

salt.modules.solaris_user.chuid(name, uid)
    Change the uid for a named user
    CLI Example:
    salt '*' user.chuid foo 4376

salt.modules.solaris_user.chworkphone(name, workphone)
    Change the user's Work Phone
    CLI Example:
    salt '*' user.chworkphone foo "7735550123"

salt.modules.solaris_user.delete(name, remove=False, force=False)
    Remove a user from the minion
    CLI Example:
    salt '*' user.delete name remove=True force=True

salt.modules.solaris_user.getent(refresh=False)
    Return the list of all info for all users
    CLI Example:
    salt '*' user.getent

salt.modules.solaris_user.info(name)
    Return user information
    CLI Example:
    salt '*' user.info root

salt.modules.solaris_user.list_groups(name)
    Return a list of groups the named user belongs to
    CLI Example:
    salt '*' user.list_groups foo

salt.modules.solaris_user.list_users()
    Return a list of all users
    CLI Example:
salt '*' user.list_users

salt.modules.solaris_user.rename(name, new_name)

Change the username for a named user

CLI Example:
salt '*' user.rename name new_name

26.6.420 salt.modules.solarisipspkg

IPS pkg support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

This module provides support for Solaris 11 new package management - IPS (Image Packaging System). This is the default pkg module for Solaris 11 (and later).

If you want to use also other packaging module (e.g. pkgutil) together with IPS, you need to override the pkg provider in sls for each package:

```yaml
mypackage:
  pkg.installed:
    - provider: pkgutil
```

Or you can override it globally by setting the `providers` parameter in your Minion config file like this:

```yaml
providers:
  pkg: pkgutil
```

salt.modules.solarisipspkg.available_version(*names, **kwargs)

This function is an alias of latest_version.
The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use pkg.latest_version as pkg.available_version is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:

```bash
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail
```
salt.modules.solarisipspkg.get_fmri(name, **kwargs)

Returns FMRI from partial name. Returns empty string ('') if not found. In case of multiple match, the function returns list of all matched packages.

CLI Example:

```
salt '*' pkg.get_fmri bash
```

salt.modules.solarisipspkg.install(name=None, refresh=False, pkgs=None, version=None, test=False, **kwargs)

Install the named package using the IPS pkg command. Accepts full or partial FMRI.

Returns a dict containing the new package names and versions:

```
{
'<package>': {
'old': '<old-version>',
'new': '<new-version>'
}
```

Multiple Package Installation Options:

- **pkgs**
  A list of packages to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install vim
salt '*' pkg.install pkg://solaris/editor/vim
salt '*' pkg.install pkg://solaris/editor/vim refresh=True
salt '*' pkg.install pkgs='["foo", "bar"]'
```

salt.modules.solarisipspkg.is_installed(name, **kwargs)

Returns True if the package is installed. Otherwise returns False. Name can be full or partial FMRI. In case of multiple match from partial FMRI name, it returns True.

CLI Example:

```
salt '*' pkg.is_installed bash
```

salt.modules.solarisipspkg.latest_version(*names, **kwargs)

The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use pkg.latest_version as pkg.available_version is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:

```
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail
```

salt.modules.solarisipspkg.list_pkgs(versions_as_list=False, **kwargs)

List the currently installed packages as a dict:

```
[['<package_name>': '<version>']
```

CLI Example:
salt '*' pkg.list_pkgs

```
salt.modules.solarisipspkg.list_upgrades(refresh=True, **kwargs)
```

Lists all packages available for update.

When run in global zone, it reports only upgradable packages for the global zone.

When run in non-global zone, it can report more upgradable packages than `pkg update -vn`, because `pkg update` hides packages that require newer version of `pkg://solaris/entire` (which means that they can be upgraded only from the global zone). If `pkg://solaris/entire` is found in the list of upgrades, then the global zone should be updated to get all possible updates. Use `refresh=True` to refresh the package database.

```python
refresh
```

[True] Runs a full package database refresh before listing. Set to False to disable running the refresh.

Changed in version 2017.7.0.

In previous versions of Salt, `refresh` defaulted to False. This was changed to default to True in the 2017.7.0 release to make the behavior more consistent with the other package modules, which all default to True.

CLI Example:

```
salt '*' pkg.list_upgrades
salt '*' pkg.list_upgrades refresh=False
```

```
salt.modules.solarisipspkg.normalize_name(name, **kwargs)
```

Internal function. Normalizes pkg name to full FMRI before running `pkg.install`. In case of multiple matches or no match, it returns the name without modifications.

CLI Example:

```
salt '*' pkg.normalize_name vim
```

```
salt.modules.solarisipspkg.purge(name, **kwargs)
```

Remove specified package. Accepts full or partial FMRI.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.purge <package name>
```

```
salt.modules.solarisipspkg.refresh_db(full=False, **kwargs)
```

Updates the remote repos database.

```python
full : False
```

Set to True to force a refresh of the pkg DB from all publishers, regardless of the last refresh time.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db full=True
```

```
salt.modules.solarisipspkg.remove(name=None, pkgs=None, **kwargs)
```

Remove specified package. Accepts full or partial FMRI. In case of multiple match, the command fails and won't modify the OS.

```python
name
```

The name of the package to be deleted.
Multiple Package Options:

**pkgs**
A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove tcsh
salt '*' pkg.remove pkg://solaris/shell/tcsh
salt '*' pkg.remove pkgs=['"foo","bar"]
```

**salt.modules.solarisipspkg.search**(name, versions_as_list=False, **kwargs)
Searches the repository for given pkg name. The name can be full or partial FMRI. All matches are printed. Globs are also supported.

CLI Example:

```
salt '*' pkg.search bash
```

**salt.modules.solarisipspkg.upgrade**(refresh=False, **kwargs)
Upgrade all packages to the latest possible version. When run in global zone, it updates also all non-global zones. In non-global zones upgrade is limited by dependency constrains linked to the version of pkg://solaris/entire.

Returns a dictionary containing the changes:

```
{
'<package>': {
'old': '<old-version>',
'new': '<new-version>'
}
```

When there is a failure, an explanation is also included in the error message, based on the return code of the pkg upgrade command.

CLI Example:

```
salt '*' pkg.upgrade
```

**salt.modules.solarisipspkg.upgrade_available**(name, **kwargs)
Check if there is an upgrade available for a certain package Accepts full or partial FMRI. Returns all matches found.

CLI Example:

```
salt '*' pkg.upgrade_available apache-22
```

**salt.modules.solarisipspkg.version**(names, **kwargs)
Common interface for obtaining the version of installed packages. Accepts full or partial FMRI. If called using pkg_resource, full FMRI is required. Partial FMRI is returned if the package is not installed.

CLI Example:

```
salt '*' pkg.version vim
salt '*' pkg.version foo bar baz
salt '*' pkg_resource.version pkg://solaris/entire
```
26.6.421 salt.modules.solarispkg

Package support for Solaris

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

```python
salt.modules.solarispkg.available_version(*names, **kwargs)
```

This function is an alias of `latest_version`. Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

```python
salt.modules.solarispkg.install(name=None, sources=None, saltenv='base', **kwargs)
```

Install the passed package. Can install packages from the following sources:

- Locally (package already exists on the minion)
- HTTP/HTTPS server
- FTP server
- Salt master

Returns a dict containing the new package names and versions:

```json
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Examples:

**# Installing a data stream pkg that already exists on the minion**

```bash
salt '*' pkg.install sources='["<pkg name>: /dir/on/minion/<pkg filename>"]'
salt '*' pkg.install sources='["SMClgcc346: /var/spool/pkg/gcc-3.4.6-sol10-sparc-local.pkg"]'
```

**# Installing a data stream pkg that exists on the salt master**

```bash
salt '*' pkg.install sources='["<pkg name>: salt://pkgs/<pkg filename>"]'
salt '*' pkg.install sources='["SMClgcc346: salt://pkgs/gcc-3.4.6-sol10-sparc-local.pkg"]'
```

CLI Example:

**# Installing a data stream pkg that exists on a HTTP server**

```bash
salt '*' pkg.install sources='["<pkg name>: http://packages.server.com/
```

(continues on next page)
If working with solaris zones and you want to install a package only in the global zone you can pass 'current_zone_only=True' to salt to have the package only installed in the global zone. (Behind the scenes this is passing '-G' to the pkgadd command.) Solaris default when installing a package in the global zone is to install it in all zones. This overrides that and installs the package only in the global.

CLI Example:

```
# Installing a data stream package only in the global zone:
salt 'global_zone' pkg.install sources='["SMClgcc346": "/var/spool/pkg/gcc-3.4.6-sol10-sparc-local.pkg"]' current_zone_only=True
```

By default salt automatically provides an adminfile, to automate package installation, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

CLI Example:

```
# Overriding the 'instance' adminfile option when calling the module directly
salt '* pkg.install sources='["<pkg name>": "salt://pkgs/<pkg filename>"]' instance="overwrite"
```

SLS Example:

```
# Overriding the 'instance' adminfile option when used in a state
SMClgcc346: pkg.installed:
  - sources:
    - SMClgcc346: salt://srv/salt/pkgs/gcc-3.4.6-sol10-sparc-local.pkg
  - instance: overwrite
```
Note: The ID declaration is ignored, as the package name is read from the sources parameter.

CLI Example:

```bash
# Providing your own adminfile when calling the module directly
salt '*' pkg.install sources='["<pkg name>": "salt://pkgs/<pkg filename> ←"]]' admin_source='salt://pkgs/<adminfile filename>'

# Providing your own adminfile when using states
<pkg name>:
  pkg.installed:
    - sources:
      - <pkg name>: salt://pkgs/<pkg filename>
      - admin_source: salt://pkgs/<adminfile filename>
```

Note: The ID declaration is ignored, as the package name is read from the sources parameter.

**salt.modules.solarispkg.latest_version**(*names*, **kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

**salt.modules.solarispkg.list_pkgs**(*versions_as_list=False*, **kwargs*)

List the packages currently installed as a dict:

```python
{'<package_name>': '<version>'}
```

CLI Example:

```bash
salt '*' pkg.list_pkgs
```

**salt.modules.solarispkg.purge**(*name=None*, *pkgs=None*, **kwargs*)

Package purges are not supported, this function is identical to remove().

name

The name of the package to be deleted

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.
CLI Example:

```bash
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.solarispkg.remove(name=None, pkgs=None, saltenv='base', **kwargs)`

Remove packages with pkgrm

- `name`: The name of the package to be deleted

By default, Salt automatically provides an adminfile, to automate package removal, with these options set:

```python
e-mail=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First, you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the `admin_source` option providing your own adminfile to the minions.

**Note:** You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

Multiple Package Options:

- `pkgs`: A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove SUNWgit
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.solarispkg.upgrade_available(name, **kwargs)`

Check whether or not an upgrade is available for a given package

CLI Example:

```bash
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.solarispkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.
### CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 26.6.422  `salt.modules.solr`

Apache Solr Salt Module

Author: Jed Glazner  Version: 0.2.1  Modified: 12/09/2011

This module uses HTTP requests to talk to the apache solr request handlers to gather information and report errors. Because of this the minion doesn't necessarily need to reside on the actual slave. However if you want to use the signal function the minion must reside on the physical solr host.

This module supports multi-core and standard setups. Certain methods are master/slave specific. Make sure you set the solr.type. If you have questions or want a feature request please ask.

### Coming Features in 0.3

1. Add command for checking for replication failures on slaves
2. Improve match_index_versions since it’s pointless on busy solr masters
3. Add additional local fs checks for backups to make sure they succeeded

### Override these in the minion config

- **solr.cores**
  A list of core names e.g. ['core1','core2']. An empty list indicates non-multicore setup.

- **solr.baseurl**
  The root level URL to access solr via HTTP

- **solr.request_timeout**
  The number of seconds before timing out an HTTP/HTTPS/FTP request. If nothing is specified then the python global timeout setting is used.

- **solr.type**
  Possible values are 'master' or 'slave'

- **solr.backup_path**
  The path to store your backups. If you are using cores and you can specify to append the core name to the path in the backup method.

- **solr.num_backups**
  For versions of solr >= 3.5. Indicates the number of backups to keep. This option is ignored if your version is less.

- **solr.init_script**
  The full path to your init script with start/stop options

- **solr.dih.options**
  A list of options to pass to the DIH.

---

**26.6. execution modules**
Required Options for DIH

**clean**

[False] Clear the index before importing

**commit**

[True] Commit the documents to the index upon completion

**optimize**

[True] Optimize the index after commit is complete

**verbose**

[True] Get verbose output

---

```
salt.modules.solr.abort_import(handler, host=None, core_name=None, verbose=False)
```

MASTER ONLY Aborts an existing import command to the specified handler. This command can only be run if the minion is configured with solr.type=master

- **handler**
  - [str] The name of the data import handler.
- **host**
  - [str (None)] The solr host to query. __opts__['host'] is default.
- **core**
  - [str (None)] The core the handler belongs to.
- **verbose**
  - [boolean (False)] Run the command with verbose output.

Return: dict<str,obj>:

```
{ 'success':boolean, 'data':dict, 'errors':list, 'warnings':list }
```

CLI Example:

```
salt '*' solr.abort_import dataimport None music {'clean':True}
```

---

```
salt.modules.solr.backup(host=None, core_name=None, append_core_to_path=False)
```

Tell solr make a backup. This method can be mis-leading since it uses the backup API. If an error happens during the backup you are not notified. The status: 'OK' in the response simply means that solr received the request successfully.

- **host**
  - [str (None)] The solr host to query. __opts__['host'] is default.
- **core_name**
  - [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
- **append_core_to_path**
  - [boolean (False)] If True add the name of the core to the backup path. Assumes that minion backup path is not None.

Return: dict<str,obj>:

```
{ 'success':boolean, 'data':dict, 'errors':list, 'warnings':list }
```

CLI Example:

```
salt '*' solr.backup music
```

---

```
salt.modules.solr.core_status(host=None, core_name=None)
```

MULTI-CORE HOSTS ONLY Get the status for a given core or all cores if no core is specified
host
  [str (None)] The solr host to query. __opts__['host'] is default.
core_name
  [str] The name of the core to reload
Return : dict<str,obj>:

```json
{
'success': boolean, 'data': dict, 'errors': list, 'warnings': list
}
```

CLI Example:
```
salt '*' solr.core_status None music
```

salt.modules.solr.delta_import

```python
salt.modules.solr.delta_import(handler, host=None, core_name=None, options=None, extra=None)
```
Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type=master

handler
  [str] The name of the data import handler.
host
  [str (None)] The solr host to query. __opts__['host'] is default.
core
  [str (None)] The core the handler belongs to.
options
  [dict (__opts__)] A list of options such as clean, optimize commit, verbose, and pause_replication. leave blank to use __opts__ defaults. options will be merged with __opts__
extra
  [dict ({}]) Extra name value pairs to pass to the handler. e.g. ["name=value"]
Return : dict<str,obj>:

```json
{
'success': boolean, 'data': dict, 'errors': list, 'warnings': list
}
```

CLI Example:
```
salt '*' solr.delta_import dataimport None music {'clean':True}
```

salt.modules.solr.full_import

```python
salt.modules.solr.full_import(handler, host=None, core_name=None, options=None, extra=None)
```
MASTER ONLY Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type=master

handler
  [str] The name of the data import handler.
host
  [str (None)] The solr host to query. __opts__['host'] is default.
core
  [str (None)] The core the handler belongs to.
options
  [dict (__opts__)] A list of options such as clean, optimize commit, verbose, and pause_replication. leave blank to use __opts__ defaults. options will be merged with __opts__
extra
  [dict ({}]) Extra name value pairs to pass to the handler. e.g. ["name=value"]
Return : dict<str,obj>:

```json
{
'success': boolean, 'data': dict, 'errors': list, 'warnings': list
}
```

CLI Example:
salt '*' solr.full_import dataimport None music {'clean':True}

salt.modules.solr.import_status(handler, host=None, core_name=None, verbose=False)
Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type: 'master'

handler
[ str ] The name of the data import handler.

host
[ str (None) ] The solr host to query. __opts__['host'] is default.

core
[ str (None) ] The core the handler belongs to.

verbose
[ boolean (False) ] Specifies verbose output

Return : dict<str,obj>:

{ 'success': boolean, 'data': dict, 'errors': list, 'warnings': list }

CLI Example:
salt '*' solr.import_status dataimport None music False

salt.modules.solr.is_replication_enabled(host=None, core_name=None)
SLAVE CALL Check for errors, and determine if a slave is replicating or not.

host
[ str (None) ] The solr host to query. __opts__['host'] is default.

core_name
[ str (None) ] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

{ 'success': boolean, 'data': dict, 'errors': list, 'warnings': list }

CLI Example:
salt '*' solr.is_replication_enabled music

salt.modules.solr.lucene_version(core_name=None)
Gets the lucene version that solr is using. If you are running a multi-core setup you should specify a core name since all the cores run under the same servlet container, they will all have the same version.

core_name
[ str (None) ] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict<str,obj>:

{ 'success': boolean, 'data': dict, 'errors': list, 'warnings': list }

CLI Example:
salt '*' solr.lucene_version

salt.modules.solr.match_index_versions(host=None, core_name=None)
SLAVE CALL Verifies that the master and the slave versions are in sync by comparing the index version. If you are constantly pushing updates the index the master and slave versions will seldom match. A solution to
this is pause indexing every so often to allow the slave to replicate and then call this method before allowing indexing to resume.

```
host
  [str (None)] The solr host to query. __opts__['host'] is default.
core_name
  [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
```

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.match_index_versions music
```

salt.modules.solr.optimize( *host=None, core_name=None* )

Search queries fast, but it is a very expensive operation. The ideal process is to run this with a master/slave configuration. Then you can optimize the master, and push the optimized index to the slaves. If you are running a single solr instance, or if you are going to run this on a slave be aware than search performance will be horrible while this command is being run. Additionally it can take a LONG time to run and your HTTP request may timeout. If that happens adjust your timeout settings.

```
host
  [str (None)] The solr host to query. __opts__['host'] is default.
core_name
  [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
```

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.optimize music
```

salt.modules.solr.ping( *host=None, core_name=None* )

Does a health check on solr, makes sure solr can talk to the indexes.

```
host
  [str (None)] The solr host to query. __opts__['host'] is default.
core_name
  [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
```

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.ping music
```

salt.modules.solr.reload_core( *host=None, core_name=None* )

MULTI-CORE HOSTS ONLY Load a new core from the same configuration as an existing registered core. While the "new" core is initializing, the "old" one will continue to accept requests. Once it has finished, all new request will go to the "new" core, and the "old" core will be unloaded.

```
host
  [str (None)] The solr host to query. __opts__['host'] is default.
```

26.6. execution modules
**core_name**

[**str**] The name of the core to reload

Return : dict<str,obj>:

```
{ 'success': boolean, 'data': dict, 'errors': list, 'warnings': list }
```

CLI Example:

```
salt '*' solr.reload_core None music
```

Return data is in the following format:

```
{ 'success': bool, 'data': dict, 'errors': list, 'warnings': list }
```

**salt.modules.solr.reload_import_config**(*handler*, *host=None*, *core_name=None*, *verbose=False*)

MASTER ONLY re-loads the handler config XML file. This command can only be run if the minion is a 'master' type

**handler**

[**str**] The name of the data import handler.

**host**

[**str** (None)] The solr host to query. __opts__['host'] is default.

**core**

[**str** (None)] The core the handler belongs to.

**verbose**

[**boolean** (False)] Run the command with verbose output.

Return : dict<str,obj>:

```
{ 'success': boolean, 'data': dict, 'errors': list, 'warnings': list }
```

CLI Example:

```
salt '*' solr.reload_import_config dataimport None music {'clean': True}
```

**salt.modules.solr.replication_details**(*host=None*, *core_name=None*)

Get the full replication details.

**host**

[**str** (None)] The solr host to query. __opts__['host'] is default.

**core_name**

[**str** (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{ 'success': boolean, 'data': dict, 'errors': list, 'warnings': list }
```

CLI Example:

```
salt '*' solr.replication_details music
```

**salt.modules.solr.set_is_polling**(*polling*, *host=None*, *core_name=None*)

SLAVE CALL Prevent the slaves from polling the master for updates.

**polling**

[**boolean**] True will enable polling. False will disable it.

**host**

[**str** (None)] The solr host to query. __opts__['host'] is default.
core_name

[ str (None) ] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_is_polling False
```

salt.modules.solr.set_replication_enabled

```
salt.modules.solr.set_replication_enabled(status, host=None, core_name=None)
```

MASTER ONLY Sets the master to ignore poll requests from the slaves. Useful when you don't want the slaves replicating during indexing or when clearing the index.

status

[ boolean ] Sets the replication status to the specified state.

host

[ str (None) ] The solr host to query. __opts__['host'] is default.

core_name

[ str (None) ] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to set the status on all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_replication_enabled false, None, music
```

salt.modules.solr.signal

```
salt.modules.solr.signal(signal=None)
```

Signals Apache Solr to start, stop, or restart. Obviously this is only going to work if the minion resides on the solr host. Additionally Solr doesn't ship with an init script so one must be created.

signal

[ str (None) ] The command to pass to the apache solr init valid values are 'start', 'stop', and 'restart'

CLI Example:

```
salt '*' solr.signal restart
```

salt.modules.solr.version

```
salt.modules.solr.version(core_name=None)
```

Gets the solr version for the core specified. You should specify a core here as all the cores will run under the same servlet container and so will all have the same version.

core_name

[ str (None) ] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.version
```
26.6.423 salt.modules.solrcloud

Module for solrcloud configuration

New in version 2017.7.0.

For now, module is limited to http-exposed API. It doesn’t implement config upload via Solr zkCli

```python
salt.modules.solrcloud.BOOL_PROPS_LIST = ['transient', 'loadOnStartup']
```

Collections options type definition Reference: https://cwiki.apache.org/confluence/display/solr/Collections+API#Collections-API-api1

```python
salt.modules.solrcloud.DICT_OPTIONS_LIST = ['properties']
```

Collection unmodifiable options Reference: https://cwiki.apache.org/confluence/display/solr/Collections+API#Collections-API-modifycoll

```python
salt.modules.solrcloud.alias_exists(alias_name, **kwargs)
```

Check alias existence

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```bash
class '*' solrcloud.alias_exists my_alias
```

```python
salt.modules.solrcloud.alias_get_collections(alias_name, **kwargs)
```

Get collection list for an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```bash
class '*' solrcloud.alias_get my_alias
```

```python
salt.modules.solrcloud.alias_set_collections(alias_name, collections=None, **kwargs)
```

Define an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```bash
class '*' solrcloud.alias_set my_alias collections=[collection1,]
```

```python
sicl.clrcloud.cluster_status(**kwargs)
```

Get cluster status

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```bash
class '*' solrcloud.cluster_status
```

```python
sicl.clrcloud.collection_backup(collection_name, location, backup_name=None, **kwargs)
```

Create a backup for a collection

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
Salt Documentation, Release 3007.1

```
salt '*' solrcloud.core_backup collection_name /mnt/nfs_backup
```

**salt.modules.solrcloud.collection_backup_all**(*location, backup_name=None, **kwargs*)

Create a backup for all collection present on the server.

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
```
salt '*' solrcloud.core_backup /mnt/nfs_backup
```

**salt.modules.solrcloud.collection_check_options**(*options*)

Check collections options

CLI Example:
```
salt '*' solrcloud.collection_check_options '{{"replicationFactor":4}}'
```

**salt.modules.solrcloud.collection_create**(*collection_name, options=None, **kwargs*)

Create a collection,

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
```
salt '*' solrcloud.collection_create collection_name
```

Collection creation options may be passed using the "options" parameter. Do not include option "name" since it already specified by the mandatory parameter "collection_name"

```
salt '*' solrcloud.collection_create collection_name options={
  "replicationFactor":2, "numShards":3
}
```

Cores options may be passed using the "properties" key in options. Do not include property "name"

```
salt '*' solrcloud.collection_create collection_name options={
  "replicationFactor":2, "numShards":3, 
  "properties":{"dataDir":/srv/solr/hugePartitionSlection"}}
```

**salt.modules.solrcloud.collection_creation_options()**

Get collection option list that can only be defined at creation

CLI Example:
```
salt '*' solrcloud.collection_creation_options
```

**salt.modules.solrcloud.collection_exists**(*collection_name, **kwargs*)

Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
```
salt '*' solrcloud.collection_exists collection_name
```
salt.modules.solrcloud.collection_get_options(collection_name, **kwargs)

Get collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
```
salt '*' solrcloud.collection_get_options collection_name
```

salt.modules.solrcloud.collection_list(**kwargs)

List all collections

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
```
salt '*' solrcloud.collection_list
```

salt.modules.solrcloud.collection_reload(collection, **kwargs)

Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
```
salt '*' solrcloud.collection_reload collection_name
```

salt.modules.solrcloud.collection_set_options(collection_name, options, **kwargs)

Change collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

Note that not every parameter can be changed after collection creation

CLI Example:
```
salt '*' solrcloud.collection_set_options collection_name options={
  "replicationFactor":4}
```

salt.modules.solrcloud.log = <SaltLoggingClass salt.modules.solrcloud (GARBAGE)>

Core properties type definition. Reference: https://cwiki.apache.org/confluence/display/solr/Defining+core.properties

26.6.424 salt.modules.splunk

Module for interop with the Splunk API

New in version 2016.3.0.

depends

- splunk-sdk python module

configuration

Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:
salt.modules.splunk.create_user(email, profile='splunk', **kwargs)
    create a splunk user by name/email
    CLI Example:
    salt myminion splunk.create_user user@example.com roles=['user'] realname="Test User" name=testuser

salt.modules.splunk.delete_user(email, profile='splunk')
    Delete a splunk user by email
    CLI Example:
    salt myminion splunk_user.delete user@example.com

salt.modules.splunk.get_user(email, profile='splunk', **kwargs)
    Get a splunk user by name/email
    CLI Example:
    salt myminion splunk.get_user user@example.com user_details=False
    salt myminion splunk.get_user user@example.com user_details=True

salt.modules.splunk.list_users(profile='splunk')
    List all users in the splunk DB
    CLI Example:
    salt myminion splunk.list_users

salt.modules.splunk.update_user(email, profile='splunk', **kwargs)
    Create a splunk user by email
    CLI Example:
    salt myminion splunk.update_user example@domain.com roles=['user'] realname="Test User"

26.6.425 salt.modules.splunk_search

Module for interop with the Splunk API
New in version 2015.5.0.

depends

- splunk-sdk python module
configuration
Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:

```
splunk:
  username: alice
  password: abc123
  host: example.splunkcloud.com
  port: 8080
```

```
salt.modules.splunk_search.create(name, profile='splunk', **kwargs)
Create a splunk search

CLI Example:
splunk_search.create 'my search name' search='error msg'
```

```
salt.modules.splunk_search.delete(name, profile='splunk')
Delete a splunk search

CLI Example:
splunk_search.delete 'my search name'
```

```
salt.modules.splunk_search.get(name, profile='splunk')
Get a splunk search

CLI Example:
splunk_search.get 'my search name'
```

```
salt.modules.splunk_search.list_(profile='splunk')
List splunk searches (names only)

CLI Example:
splunk_search.list
```

```
salt.modules.splunk_search.list_all(profile='splunk')
Get all splunk search details. Produces results that can be used to create an sls file.

if app or owner are specified, results will be limited to matching saved searches.
if description_contains is specified, results will be limited to those where "description_contains in description"
 is true if name_not_contains is specified, results will be limited to those where "name_not_contains not in
 name" is true.

If prefix parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the
prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

CLI Example:
1. Make a "backup" of all existing searches
   $ salt-call splunk_search.list_all --out=txt | sed "s/local: //" > legacy_searches.sls
2. Get all searches with new prefixed names
   $ salt-call splunk_search.list_all "prefix="MANAGED BY SALT"" --out=txt | sed "s/local: //" >
   managed_searches.sls
3. Insert the managed searches into splunk
   $ salt-call state.sls managed_searches.sls
4. Manually verify that the new searches look right
```
5. Delete the original searches $ sed s/present/absent/ legacy_searches.sls > remove_legacy_searches.sls $ salt-call state.sls remove_legacy_searches.sls

6. Get all searches again, verify no changes $ salt-call splunk_search.list_all --out=txt | sed "s/local: /" > final_searches.sls $ diff final_searches.sls managed_searches.sls

salt.modules.splunk_search.update(name, profile='splunk', **kwargs)
Update a splunk search

  CLI Example:
  splunk_search.update 'my search name' sharing=app

26.6.426 salt.modules.sqlite3
Support for SQLite3

salt.modules.sqlite3.fetch(db=None, sql=None)
Retrieve data from an sqlite3 db (returns all rows, be careful!)

  CLI Example:
  salt '*' sqlite3.fetch /root/test.db 'SELECT * FROM test;'

salt.modules.sqlite3.indexes(db=None)
Show all indices in the database, for people with poor spelling skills

  CLI Example:
  salt '*' sqlite3.indexes /root/test.db

salt.modules.sqlite3.indices(db=None)
Show all indices in the database

  CLI Example:
  salt '*' sqlite3.indices /root/test.db

salt.modules.sqlite3.modify(db=None, sql=None)
Issue an SQL query to sqlite3 (with no return data), usually used to modify the database in some way (insert, delete, create, etc)

  CLI Example:
  salt '*' sqlite3.modify /root/test.db 'CREATE TABLE test(id INT, testdata TEXT);'

salt.modules.sqlite3.sqlite_version()
Return version of sqlite

  CLI Example:
  salt '*' sqlite3.sqlite_version

salt.modules.sqlite3.tables(db=None)
Show all tables in the database

  CLI Example:
salt '*' sqlite3.tables /root/test.db

salt.modules.sqlite3.version()
Return version of pysqlite
CLI Example:
salt '*' sqlite3.version

26.6.427 salt.modules.ssh
Manage client ssh components

Note: This module requires the use of MD5 hashing. Certain security audits may not permit the use of MD5. For those cases, this module should be disabled or removed.

salt.modules.ssh.auth_keys(user=None, config='.ssh/authorized_keys', fingerprint_hash_type=None)
Return the authorized keys for users
CLI Example:
salt '*' ssh.auth_keys
salt '*' ssh.auth_keys root
salt '*' ssh.auth_keys user=root
salt '*' ssh.auth_keys user="[user1, user2]"

salt.modules.ssh.check_key(user, key, enc, comment, options, config='.ssh/authorized_keys', cache_keys=None, fingerprint_hash_type=None)
Check to see if a key needs updating, returns "update", "add" or "exists"
CLI Example:
salt '*' ssh.check_key <user> <key> <enc> <comment> <options>

salt.modules.ssh.check_key_file(user, source, config='.ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)
Check a keyfile from a source destination against the local keys and return the keys to change
CLI Example:
salt '*' ssh.check_key_file root salt://ssh/keyfile

salt.modules.ssh.check_known_host(user=None, hostname=None, key=None, fingerprint=None, config=None, port=None, fingerprint_hash_type=None)
Check the record in known_hosts file, either by its value or by fingerprint (it's enough to set up either key or fingerprint, you don't need to set up both).
If provided key or fingerprint doesn't match with stored value, return "update", if no value is found for a given host, return "add", otherwise return "exists".
If neither key, nor fingerprint is defined, then additional validation is not performed.
CLI Example:
salt '*' ssh.check_known_host <user> <hostname> key='AAAA...FAaQ=='

salt.modules.ssh.get_known_host_entries(user, hostname, config=None, port=None, fingerprint_hash_type=None)

New in version 2018.3.0.
Return information about known host entries from the config file, if any. If there are no entries for a matching hostname, return None.
CLI Example:
salt '*' ssh.get_known_host_entries <user> <hostname>

salt.modules.ssh.hash_known_hosts(user=None, config=None)

Hash all the hostnames in the known hosts file.
New in version 2014.7.0.
user
hash known hosts of this user
config
path to known hosts file: can be absolute or relative to user's home directory
CLI Example:
salt '*' ssh.hash_known_hosts

salt.modules.ssh.host_keys(keydir=None, private=True, certs=True)

Return the minion's host keys
CLI Example:
salt '*' ssh.host_keys
salt '*' ssh.host_keys keydir=/etc/ssh
salt '*' ssh.host_keys keydir=/etc/ssh private=False
salt '*' ssh.host_keys keydir=/etc/ssh certs=False

salt.modules.ssh.key_is_encrypted(key)

New in version 2015.8.7.
Function to determine whether or not a private key is encrypted with a passphrase.
Checks key for a Proc-Type header with ENCRYPTED in the value. If found, returns True, otherwise returns False.
CLI Example:
salt '*' ssh.key_is_encrypted /root/id_rsa

salt.modules.ssh.recv_known_host_entries(hostname, enc=None, port=None, hash_known_hosts=True, timeout=5, fingerprint_hash_type=None)

New in version 2018.3.0.
Retrieve information about host public keys from remote server
hostname
The name of the remote host (e.g. "github.com")
enc
Defines what type of key is being used, can be ed25519, ecdsa, ssh-rsa, ssh-dss or any other type as of
openssh server version 8.7.

port
Optional parameter, denoting the port of the remote host on which an SSH daemon is running. By
default the port 22 is used.

hash_known_hosts
[True] Hash all hostnames and addresses in the known hosts file.

timeout
[int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was
initiated to a host or since the last time anything was read from that host, then the connection is closed
and the host in question considered unavailable. Default is 5 seconds.

fingerprint_hash_type
The fingerprint hash type that the public key fingerprints were originally hashed with. This defaults to
sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from md5 to sha256

CLI Example:
```bash
salt '*' ssh.recv_known_host_entries <hostname> enc=<enc> port=<port>
```

salt.modules.ssh.rm_auth_key(user, key, config='ssh/authorized_keys', fingerprint_hash_type=None)
Remove an authorized key from the specified user's authorized key file

CLI Example:
```bash
salt '*' ssh.rm_auth_key <user> <key>
```

salt.modules.ssh.rm_auth_key_from_file(user, source, config='ssh/authorized_keys', saltenv='base',
                                                   fingerprint_hash_type=None)
Remove an authorized key from the specified user's authorized key file, using a file as source

CLI Example:
```bash
salt '*' ssh.rm_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.
    → pub
```

salt.modules.ssh.rm_known_host(user=None, hostname=None, config=None, port=None)
Remove all keys belonging to hostname from a known_hosts file.

CLI Example:
```bash
salt '*' ssh.rm_known_host <user> <hostname>
```

salt.modules.ssh.set_auth_key(user, key, config='ssh/authorized_keys', enc='ssh-rsa', comment='', options=None,
                           config='ssh/authorized_keys', cache_keys=None,
                           fingerprint_hash_type=None)
Add a key to the authorized_keys file. The "key" parameter must only be the string of text that is the encoded
key. If the key begins with "ssh-rsa" or ends with user@host, remove those from the key before passing it to
this function.

CLI Example:
```bash
salt '*' ssh.set_auth_key <user> '<key>' enc='dsa'
```
salt.modules.ssh.set_auth_key_from_file(user, source, config='ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)

Add a key to the authorized_keys file, using a file as the source.

CLI Example:
```
salt '*' ssh.set_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

salt.modules.ssh.set_known_host(user=None, hostname=None, fingerprint=None, key=None, port=None, enc=None, config=None, hash_known_hosts=True, timeout=5, fingerprint_hash_type=None)

Download SSH public key from remote host "hostname", optionally validate its fingerprint against "fingerprint" variable and save the record in the known_hosts file.

If such a record does already exists in there, do nothing.

user
The user who owns the ssh authorized keys file to modify

hostname
The name of the remote host (e.g. "github.com")

fingerprint
The fingerprint of the key which must be present in the known_hosts file (optional if key specified)

key
The public key which must be presented in the known_hosts file (optional if fingerprint specified)

port
optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.

c
Defines what type of key is being used, can be ed25519, ecdsa, ssh-rsa, ssh-dss or any other type as of openssh server version 8.7.

cfg
The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.

hash_known_hosts
[True] Hash all hostnames and addresses in the known hosts file.

timeout
[int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

fingerprint_hash_type
The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from md5 to sha256

CLI Example:
```
salt '*' ssh.set_known_host <user> fingerprint='xx:xx:..:xx' enc='ssh-rsa' config='/.ssh/known_hosts'
```

salt.modules.ssh.user_keys(user=None, pubfile=None, prvfile=None)

Return the user's ssh keys on the minion.
New in version 2014.7.0.

CLI Example:

```python
salt '*' ssh.user_keys
salt '*' ssh.user_keys user=user1
salt '*' ssh.user_keys user=user1 pubfile=/home/user1/.ssh/id_rsa.pub
    → prvfile=/home/user1/.ssh/id_rsa
salt '*' ssh.user_keys user=user1 prvfile=False
salt '*' ssh.user_keys user=['user1','user2'] pubfile=id_rsa.pub
    → prvfile=id_rsa
```

As you can see you can tell Salt not to read from the user's private (or public) key file by setting the file path to `False`. This can be useful to prevent Salt from publishing private data via Salt Mine or others.

### 26.6.428 salt.modules.ssh_pkg

Service support for the REST example

salt.modules.ssh_pkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)

salt.modules.ssh_pkg.list_pkgs(versions_as_list=False, **kwargs)

salt.modules.ssh_pkg.remove(name=None, pkgs=None, **kwargs)

### 26.6.429 salt.modules.ssh_service

Provide the service module for the proxy-minion SSH sample .. versionadded:: 2015.8.2

salt.modules.ssh_service.enabled(name, sig=None)

Only the 'redbull' service is 'enabled' in the test

salt.modules.ssh_service.get_all()

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.ssh_service.list_()

Return a list of all available services.

CLI Example:

```
salt '*' service.list
```

salt.modules.ssh_service.restart(name, sig=None)

Restart the specified service with rest_sample

CLI Example:

```
salt '*' service.restart <service name>
```
salt.modules.ssh_service.<code>running</code>(name, sig=None)

Return whether this service is running.

salt.modules.ssh_service.<code>start</code>(name, sig=None)

Start the specified service on the ssh_sample

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.ssh_service.<code>status</code>(name, sig=None)

Return the status for a service via ssh_sample. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

- <code>name</code> (str) -- The name of the service to check
- <code>sig</code> (str) -- Not implemented

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.ssh_service.<code>stop</code>(name, sig=None)

Stop the specified service on the rest_sample

CLI Example:

```
salt '*' service.stop <service name>
```

26.6.430 salt.modules.state

Control the state system on the minion.

State Caching

When a highstate is called, the minion automatically caches a copy of the last high data. If you then run a highstate with cache=True it will use that cached highdata and won’t hit the fileserver except for salt:// links in the states themselves.

salt.modules.state.<code>apply_</code>(mods=None, **kwargs)

New in version 2015.5.0.

This function will call <code>state.highstate</code> or <code>state.sls</code> based on the arguments passed to this function. It exists as a more intuitive way of applying states.
APPLYING ALL STATES CONFIGURED IN TOP.SLS (A.K.A. HIGHSTATE)

To apply all configured states, simply run `state.apply` with no SLS targets, like so:

```
salt '*' state.apply
```

The following additional arguments are also accepted when applying all states configured in top.sls:

**test**
Run states in test-only (dry-run) mode

**mock**
The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

**pillar**
Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply stuff pillar='{"foo": "bar"}'}
```

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

**exclude**
Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.apply exclude=bar,baz
salt '*' state.apply exclude=foo*

salt '*' state.apply exclude="[{"id": 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]]"
```

**queue**
[False] Instead of failing immediately when another state run is in progress, a value of True will queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

**localconfig**
Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

```
salt '*' state.apply localconfig=/path/to/minion.yml
```

**state_events**
The state_events option sends progress events as each function in a state run completes execution.

New in version 3006.0.
APPLYING INDIVIDUAL SLS FILES (A.K.A. STATE. SLS)

To apply individual SLS files, pass them as a comma-separated list:

```
# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
salt '*' state.apply stuff

# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
# and salt://pkgs.sls (or salt://pkgs/init.sls).
salt '*' state.apply stuff,pkgs

# Run the states configured in a more deeply nested directory such as:
salt://my/organized/stuff.sls (or salt://my/organized/stuff/init.sls)
salt '*' state.apply my.organized.stuff
```

The following additional arguments are also accepted when applying individual SLS files:

- **test**
  - Run states in test-only (dry-run) mode

- **mock**
  - The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.
  
  New in version 2015.8.4.

- **pillar**
  - Custom Pillar values, passed as a dictionary of key-value pairs

  ```
salt '*' state.apply stuff pillar='{"foo": "bar"}'
  ```

  Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

- **queue**
  - [False] Instead of failing immediately when another state run is in progress, a value of True will queue the new state run to begin running once the other has finished.

  This option starts a new thread for each queued state run, so use this option sparingly.

  Changed in version 3006.0: This parameter can also be set via the state_queue configuration option.

  Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

- **concurrent**
  - [False] Execute state runs concurrently instead of serially

  Warning: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do not use this flag for performance optimization.

- **saltenv**
  - Specify a salt fileserver environment to be used when applying states

  Changed in version 0.17.0: Argument name changed from env to saltenv

  Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an environment parameter and if found, it will be used. If none is found, base will be used. In prior
releases, the minion config was not checked and `base` would always be assumed when the `saltenv` was not explicitly set.

**pillarenv**
Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**localconfig**
Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

```
salt '*' state.apply stuff localconfig=/path/to/minion.yml
```

**sync_mods**
If specified, the desired custom module types will be synced prior to running the SLS files:

```
salt '*' state.apply stuff sync_mods=states,modules
salt '*' state.apply stuff sync_mods=all
```

**Note:** This option is ignored when no SLS files are specified, as a `highstate` automatically syncs all custom module types.

New in version 2017.7.8,2018.3.3,2019.2.0.

**state_events**
The `state_events` option sends progress events as each function in a state run completes execution.

New in version 3006.0.

```
salt.modules.state.check_request(name=None)
```

New in version 2015.5.0.

Return the state request information, if any

CLI Example:
```
salt '*' state.check_request
```

```
salt.modules.state.clear_cache()
```

Clear out cached state files, forcing even cache runs to refresh the cache on the next state execution.

Remember that the state cache is completely disabled by default, this execution only applies if `cache=True` is used in states

CLI Example:
```
salt '*' state.clear_cache
```

```
salt.modules.state.clear_request(name=None)
```

New in version 2015.5.0.

Clear out the state execution request without executing it

CLI Example:
```
salt '*' state.clear_request
```
salt.modules.state.disable(states)
Disable state runs.

CLI Example:
```
salt '*' state.disable highstate
salt '*' state.disable highstate,test.succeed_without_changes
```

Note: To disable a state file from running provide the same name that would be passed in a state.sls call.
salt '*' state.disable bind.config

salt.modules.state.enable(states)
Enable state function or sls run

CLI Example:
```
salt '*' state.enable highstate
salt '*' state.enable test.succeed_without_changes
```

Note: To enable a state file from running provide the same name that would be passed in a state.sls call.
salt '*' state.enable bind.config

salt.modules.state.event(tagmatch='*', count=-1, quiet=False, sock_dir=None, pretty=False, node='minion')
Watch Salt’s event bus and block until the given tag is matched

New in version 2016.3.0.
Changed in version 2019.2.0: tagmatch can now be either a glob or regular expression.
This is useful for utilizing Salt’s event bus from shell scripts or for taking simple actions directly from the CLI.
Enable debug logging to see ignored events.

Parameters
- **tagmatch** -- the event is written to stdout for each tag that matches this glob or regular expression.
- **count** -- this number is decremented for each event that matches the tagmatch parameter; pass -1 to listen forever.
- **quiet** -- do not print to stdout; just block
- **sock_dir** -- path to the Salt master’s event socket file.
- **pretty** -- Output the JSON all on a single line if False (useful for shell tools); pretty-print the JSON output if True.
- **node** -- Watch the minion-side or master-side event bus.

CLI Example:
```
salt-call --local state.event pretty=True
```

salt.modules.state.get_pauses(jid=None)
Get a report on all of the currently paused state runs and pause run settings. Optionally send in a jid if you only desire to see a single pause data set.
salt.modules.state.high
data, test=None, queue=None, **kwargs)
Execute the compound calls stored in a single set of high data
This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.
CLI Example:
salt '*' state.high '{"vim": {"pkg": ["installed"]}}'

salt.modules.state.highstate
test=None, queue=None, state_events=None, **kwargs)
Retrieve the state data from the salt master for this minion and execute it
test
Run states in test-only (dry-run) mode
pillar
Custom Pillar values, passed as a dictionary of key-value pairs
pillar_enc
Specify which renderer to use to decrypt encrypted data located within the pillar value. Currently, only gpg is supported.
New in version 2016.3.0.
exclude
Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.
saltenv
Specify a salt fileserver environment to be used when applying states
pillarenv
Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.
queue
[False] Instead of failing immediately when another state run is in progress, a value of True will queue the new state run to begin running once the other has finished.
This option starts a new thread for each queued state run, so use this option sparingly.

Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See here for details.
Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

**concurrent**

[False] Execute state runs concurrently instead of serially

**Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do not use this flag for performance optimization.

**localconfig**

Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

**mock**

The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

**state_events**

The `state_events` option sends progress events as each function in a state run completes execution.

New in version 3006.0.

CLI Examples:

```
salt '*' state.highstate
salt '*' state.highstate whitelist=sls1_to_run,sls2_to_run
salt '*' state.highstate exclude=sls_to_exclude
salt '*' state.highstate exclude=[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]
```

salt.modules.state.id_exists(ids, mods, test=None, queue=None, **kwargs)

Tests for the existence of a specific ID or list of IDs within the specified SLS file(s). Similar to `state.sls_exists`, returns True or False. The default environment is base, use `saltenv` to specify a different environment.

New in version 2019.2.0.

**saltenv**

Specify a salt fileserver environment from which to look for the SLS files specified in the `mods` argument

CLI Example:

```
salt '*' state.id_exists create_myfile,update_template filestate saltenv=dev
```

salt.modules.state.list_disabled()

List the states which are currently disabled

CLI Example:

```
salt '*' state.list_disabled
```
salt.modules.state.low(data, queue=None, **kwargs)

Execute a single low data call

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.low ['"state": "pkg", "fun": "installed", "name": "vi"]'
```

salt.modules.state.orchestrate(mods, saltenv='base', test=None, exclude=None, pillar=None, pillarenv=None)

New in version 2016.11.0.

Execute the orchestrate runner from a masterless minion.

See also:

More Orchestrate documentation

- Full Orchestrate Tutorial
- Docs for the salt state module salt.states.saltmod

CLI Examples:

```
salt-call --local state.orchestrate webserver
salt-call --local state.orchestrate webserver saltenv=dev test=True
salt-call --local state.orchestrate webserver saltenv=dev pillarenv=aws
```

salt.modules.state.pause(jid, state_id=None, duration=None)

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid
of the running state and can optionally pass in a duration in seconds. If a state_id is not passed then the jid
referenced will be paused at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```
vim:
    pkg.installed: []
```

The state_id to pass to pause is vim

CLI Examples:

```
salt '*' state.pause 20171130110407769519
salt '*' state.pause 20171130110407769519 vim
salt '*' state.pause 20171130110407769519 vim 20
```

salt.modules.state.pkg(pkg_path, pkg_sum, hash_type, test=None, **kwargs)

Execute a packaged state run, the packaged state run will exist in a tarball available locally. This packaged
state can be generated using salt-ssh.

CLI Example:

```
salt '*' state.pkg /tmp/salt_state.tgz 760a9353810e36f6d81416366fc426dc8
```

salt.modules.state.request(mods=None, **kwargs)

New in version 2015.5.0.

Request that the local admin execute a state run via salt-call state.run_request. All arguments match those of
state.apply.
salt.modules.state.resume(jid, state_id=None)

Remove a pause from a jid, allowing it to continue. If the state_id is not specified then the a general pause will be resumed.

The given state_id is the id got a given state execution, so given a state that looks like this:

```
vim:
  pkg.installed: []
```

The state_id to pass to `rm_pause` is `vim`

CLI Examples:

```
salt '*' state.resume 20171130110407769519
salt '*' state.resume 20171130110407769519 vim
```

salt.modules.state.run_request(name='default', **kwargs)

New in version 2015.5.0.

Execute the pending state request

CLI Example:

```
salt '*' state.run_request
```

salt.modules.state.running(concurrent=False)

Return a list of strings that contain state return data if a state function is already running. This function is used to prevent multiple state calls from being run at the same time.

CLI Example:

```
salt '*' state.running
```

salt.modules.state.show_highstate(queue=None, **kwargs)

Retrieve the highstate data from the salt master and display it

Custom Pillar data can be passed with the `pillar` kwarg.

CLI Example:

```
salt '*' state.show_highstate
```

salt.modules.state.show_low_sls(mods, test=None, queue=None, **kwargs)

Display the low data from a specific sls. The default environment is `base`, use `saltenv` to specify a different environment.

```
saltenv
```

Specify a salt fileserver environment to be used when applying states

```
pillar
```

Custom Pillar values, passed as a dictionary of key-value pairs
salt '('* state.show_low_sls stuff pillar='{"foo": "bar"}')

Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

pillarenv
Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:
salt '*' state.show_low_sls foo
salt '*' state.show_low_sls foo saltenv=dev

salt.modules.state.show_lowstate(queue=None, **kwargs)
List out the low data that will be applied to this minion

CLI Example:
salt '*' state.show_lowstate

salt.modules.state.show_sls(mods, test=None, queue=None, **kwargs)
Display the state data from a specific sls or list of sls files on the master. The default environment is base, use saltenv to specify a different environment.

This function does not support topfiles. For top.sls please use show_top instead.

Custom Pillar data can be passed with the pillar kwarg.

saltenv
Specify a salt fileserver environment to be used when applying states

pillarenv
Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:
salt '*' state.show_sls core,edit.vim saltenv=dev

salt.modules.state.show_state_usage(queue=None, **kwargs)
Retrieve the highstate data from the salt master to analyse used and unused states

Custom Pillar data can be passed with the pillar kwarg.

CLI Example:
salt '*' state.show_state_usage

salt.modules.state.show_states(queue=None, **kwargs)
Returns the list of states that will be applied on highstate.

CLI Example:
salt '*' state.show_states

New in version 2019.2.0.
salt.modules.state.show_top(queue=None, **kwargs)

Return the top data that the minion will use for a highstate

CLI Example:

```bash
salt '*' state.show_top
```

salt.modules.state.single(fun, name, test=None, queue=None, **kwargs)

Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

CLI Example:

```bash
salt '*' state.single pkg.installed name=vim
```

salt.modules.state.sls(mods, test=None, exclude=None, queue=None, sync_mods=None, state_events=None, **kwargs)

Execute the states in one or more SLS files

- **test**
  Run states in test-only (dry-run) mode

- **pillar**
  Custom Pillar values, passed as a dictionary of key-value pairs

```bash
salt '*' state.sls stuff pillar='{"foo": "bar"}'
```

- **Note:** Values passed this way will override existing Pillar values set via pillar_roots or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.

- **pillar_enc**
  Specify which renderer to use to decrypt encrypted data located within the pillar value. Currently, only gpg is supported.

  New in version 2016.3.0.

- **exclude**
  Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

```bash
salt '*' state.sls foo,bar,baz exclude=bar,baz
salt '*' state.sls foo,bar,baz exclude=ba*
salt '*' state.sls foo,bar,baz exclude="["id": 'id_to_exclude'], { 'sls': 'sls_to_exclude']"
```

- **queue**
  [False] Instead of failing immediately when another state run is in progress, a value of True will queue the new state run to begin running once the other has finished.

  This option starts a new thread for each queued state run, so use this option sparingly.

  Changed in version 3006.0: This parameter can also be set via the state_queue configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained.
before the state runs will fail to be queued. This can prevent runaway conditions where new threads are
started until system performance is hampered.

**concurrent**

[False] Execute state runs concurrently instead of serially

**Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can
safely be run at the same time. Do not use this flag for performance optimization.

**saltenv**

Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an
environment parameter and if found, it will be used. If none is found, base will be used. In prior
releases, the minion config was not checked and base would always be assumed when the saltenv was
not explicitly set.

**pillarenv**

Specify a Pillar environment to be used when applying states. This can also be set in the minion config
file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI
argument is used, all Pillar environments will be merged together.

**localconfig**

Optionally, instead of using the minion config, load minion opts from the file specified by this argument,
and then merge them with the options from the minion config. This functionality allows for specific
states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

**mock**

The mock option allows for the state run to execute without actually calling any states. This then returns
a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

**sync_mods**

If specified, the desired custom module types will be synced prior to running the SLS files:

```
salt '*' state.sls stuff sync_mods=states,modules
salt '*' state.sls stuff sync_mods=all
```

**state_events**

The state_events option sends progress events as each function in a state run completes execution.

New in version 3006.0.

CLI Example:

```
# Run the states configured in salt://example.sls (or salt://example/init.sls)
salt '*' state.apply example

# Run the states configured in salt://core.sls (or salt://core/init.sls)
# and salt://edit/vim.sls (or salt://edit/vim/init.sls)
salt '*' state.sls core,edit.vim

# Run the states configured in a more deeply nested directory such as
# salt://my/nested/state.sls (or salt://my/nested/state/init.sls)
salt '*' state.sls my.nested.state
```

(continues on next page)
salt.modules.state.sls_exists(
    mods, test=None, queue=None, **kwargs)
Tests for the existence the of a specific SLS or list of SLS files on the master. Similar to state.show_sls,
rather than returning state details, returns True or False. The default environment is base, use saltenv to
specify a different environment.

New in version 2019.2.0.
saltenv
    Specify a salt fileserver environment from which to look for the SLS files specified in the mods argument

CLI Example:
salt '*' state.sls_exists core,edit.vim saltenv=dev

salt.modules.state.sls_id(
    id_, mods, test=None, queue=None, state_events=None, **kwargs)
Call a single ID from the named module(s) and handle all requisites
The state ID comes before the module ID(s) on the command line.

id
    ID to call
mods
    Comma-delimited list of modules to search for given id and its requisites

New in version 2014.7.0.
saltenv
    [base] Specify a salt fileserver environment to be used when applying states
pillarenv
    Specify a Pillar environment to be used when applying states. This can also be set in the minion config
    file using the pillarenv option. When neither the pillarenv minion config option nor this CLI
    argument is used, all Pillar environments will be merged together.

pillar
    Custom Pillar values, passed as a dictionary of key-value pairs

Note: Values passed this way will override existing Pillar values set via pillar_roots or an external
Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

New in version 2018.3.0.

CLI Example:
salt '*' state.sls_id my_state my_module
salt '*' state.sls_id my_state my_module,a_common_module

salt.modules.state.soft_kill(
    jid, state_id=None)
Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given
state id. This needs to pass in the jid of the running state. If a state_id is not passed then the jid referenced
will be safely exited at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:
vim:
  pkg.installed: []

The state_id to pass to `soft_kill` is `vim`

CLI Examples:

```
salt '*' state.soft_kill 20171130110407769519
salt '*' state.soft_kill 20171130110407769519 vim
```

```
salt '*' state.template 'Path to template on the minion'
```

```
salt '*' state.template_str 'Template String'
```

```
salt '*' state.test 'args' 'kwargs'
```

```
salt '*' state.top ('topfn', 'test=None', 'queue=None', 'kwargs')
```

salt.modules.state.template

Execute the information stored in a template file on the minion.

This function does not ask a master for a SLS file to render but instead directly processes the file at the provided path on the minion.

CLI Example:

```
salt '*' state.template 'Path to template on the minion'
```

salt.modules.state.template_str

Execute the information stored in a string from an sls template

CLI Example:

```
salt '*' state.template_str 'Template String'
```

salt.modules.state.test

New in version 3001.

Alias for `state.apply` with the kwarg `test` forced to `True`.

This is a nicety to avoid the need to type out `test=True` and the possibility of a typo causing changes you do not intend.

salt.modules.state.top

Execute a specific top file instead of the default. This is useful to apply configurations from a different environment (for example, dev or prod), without modifying the default top file.

```
queue
  [False] Instead of failing immediately when another state run is in progress, a value of `True` will queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

saltenv
  Specify a salt filesaver environment to be used when applying states

pillarenv
  Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2017.7.0.

CLI Example:
26.6.431 salt.modules.status

Module for returning various status data about a minion. These data can be useful for compiling into stats later.

salt.modules.status.all_status()

Return a composite of all status data and info for this minion. Warning: There is a LOT here!

CLI Example:

```
salt '*' status.all_status
```

salt.modules.status.cpuinfo()

Changed in version 2016.3.2: Return the CPU info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for NetBSD and OpenBSD

CLI Example:

```
salt '*' status.cpuinfo
```

salt.modules.status.cpustats()

Return the CPU stats for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.cpustats
```

salt.modules.status.custom()

Return a custom composite of status data and info for this minion, based on the minion config file. An example config like might be:

```
status.cpustats.custom: [ cpu, ctxt, btime, processes ]
```

Where status refers to status.py, cpustats is the function where we get our data, and custom is this function It is followed by a list of keys that we want returned.

This function is meant to replace all_status(), which returns anything and everything, which we probably don't want.

By default, nothing is returned. Warning: Depending on what you include, there can be a LOT here!

CLI Example:

```
salt '*' status.custom
```
salt/modules/status\_.diskstats()  
Changed in version 2016.3.2: Return the disk stats for this minion  
Changed in version 2016.11.4: Added support for AIX  
CLI Example:

    salt '*' status.diskstats

salt/modules/status\_.diskusage(*args)  
Return the disk usage for this minion  
Usage:

    salt '*' status.diskusage [paths and/or filesystem types]

CLI Example:

    salt '*' status.diskusage  
    salt '*' status.diskusage /tmp  
    salt '*' status.diskusage ext?  
    salt '*' status.diskusage / ext?  

salt/modules/status\_.loadavg()  
Return the load averages for this minion  
Changed in version 2016.11.4: Added support for AIX  
CLI Example:

    salt '*' status.loadavg

:raises CommandExecutionError: If the system cannot report loadaverages\_
\_
to Python

salt/modules/status\_.master(master=None, connected=True)  
New in version 2014.7.0.  
Return the connection status with master. Fire an event if the connection to master is not as expected. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.  
Changed in version 2016.11.4: Added support for AIX  
CLI Example:

    salt '*' status.master

salt/modules/status\_.meminfo()  
Return the memory info for this minion  
Changed in version 2016.11.4: Added support for AIX  
Changed in version 2018.3.0: Added support for OpenBSD  
CLI Example:

    salt '*' status.meminfo
salt.modules.status.netdev()
     Changed in version 2016.3.2: Return the network device stats for this minion
     Changed in version 2016.11.4: Added support for AIX
     CLI Example:
     ```
     salt '*' status.netdev
     ```

salt.modules.status.netstats()
     Return the network stats for this minion
     Changed in version 2016.11.4: Added support for AIX
     Changed in version 2018.3.0: Added support for OpenBSD
     CLI Example:
     ```
     salt '*' status.netstats
     ```

salt.modules.status.nproc()
     Return the number of processing units available on this system
     Changed in version 2016.11.4: Added support for AIX
     Changed in version 2018.3.0: Added support for Darwin, FreeBSD and OpenBSD
     CLI Example:
     ```
     salt '*' status.nproc
     ```

salt.modules.status.pid(sig)
     Return the PID or an empty string if the process is running or not. Pass a signature to use to find the process
     via ps. Note you can pass a Python-compatible regular expression to return all pids of processes matching the
     regexp.
     Changed in version 2016.11.4: Added support for AIX
     CLI Example:
     ```
     salt '*' status.pid <sig>
     ```

salt.modules.status.ping_master(master)
     New in version 2016.3.0.
     Sends ping request to the given master. Fires '__master_failback' event on success. Returns bool result.
     CLI Example:
     ```
     salt '*' status.ping_master localhost
     ```

salt.modules.status.procs()
     Return the process data
     Changed in version 2016.11.4: Added support for AIX
     CLI Example:
     ```
     salt '*' status.procs
     ```
salt.modules.status.proxy_reconnect(proxy_name, opts=None)

Forces proxy minion reconnection when not alive.

proxy_name
    The virtual name of the proxy module.

opts: None

CLI Example:

    salt '*' status.proxy_reconnect rest_sample

salt.modules.status.time_(format='%A, %d. %B %Y %I:%M%p')

New in version 2016.3.0.

Return the current time on the minion, formatted based on the format parameter.

Default date format: Monday, 27. July 2015 07:55AM

CLI Example:

    salt '*' status.time
    salt '*' status.time '%s'

salt.modules.status.uptime()

Return the uptime for this system.

Changed in version 2015.8.9: The uptime function was changed to return a dictionary of easy-to-read key/value pairs containing uptime information, instead of the output from a cmd.run call.

Changed in version 2016.11.0: Support for OpenBSD, FreeBSD, NetBSD, MacOS, and Solaris

Changed in version 2016.11.4: Added support for AIX

CLI Example:

    salt '*' status.uptime

salt.modules.status.version()

Return the system version for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

    salt '*' status.version

salt.modules.status.vmstats()

Changed in version 2016.3.2: Return the virtual memory stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

    salt '*' status.vmstats
salt.modules.status.w()
Return a list of logged in users for this minion, using the w command

CLI Example:

```bash
salt '*' status.w
```

### 26.6.432 salt.modules.statuspage

**StatusPage**

Handle requests for the StatusPage API.

In the minion configuration file, the following block is required:

```yaml
statuspage:
  api_key: <API_KEY>
  page_id: <PAGE_ID>
```

New in version 2017.7.0.

salt.modules.statuspage.create(endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=1, **kwargs)

Insert a new entry under a specific endpoint.

- **endpoint**: incidents
  - Insert under this specific endpoint.
- **page_id**: Page ID. Can also be specified in the config file.
- **api_key**: API key. Can also be specified in the config file.
- **api_version**: 1
  - API version. Can also be specified in the config file.
- **api_url**: Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```bash
salt 'minion' statuspage.create endpoint='components' name='my component' --group_id='993vgplshj12'
```

Example output:

```yaml
minion:
  ---------
  comment:
  out:
    ---------
    created_at:
      2017-01-05T19:35:27.135Z
    description:
      None
    group_id:
      993vgplshj12
    id:
```
(continues on next page)
mjkmtt5lhdgc
name: my component
page_id: ksdhgfyiuhaa
position: 7
status: operational
updated_at: 2017-01-05T19:35:27.135Z
result: True

salt.modules.statuspage.delete(endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None)

Remove an entry from an endpoint.
**endpoint:** incidents
  Request a specific endpoint.
**page_id**
  Page ID. Can also be specified in the config file.
**api_key**
  API key. Can also be specified in the config file.
**api_version:** 1
  API version. Can also be specified in the config file.
**api_url**
  Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:
```
salt 'minion' statuspage.delete endpoint='components' id='ftgks51sfs2d'
```

Example output:
```
minion: ----------
  comment: 
  out: None
  result: True
```

salt.modules.statuspage.retrieve(endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None)

Retrieve a specific endpoint from the Statuspage API.
**endpoint:** incidents
  Request a specific endpoint.
**page_id**
  Page ID. Can also be specified in the config file.
**api_key**
  API key. Can also be specified in the config file.
**api_version:** 1
  API version. Can also be specified in the config file.
api_url

Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.retrieve components
```

Example output:

```
minion: 
    comment: 
        out: 
            |_ 
            backfilled: 
                False 
            created_at: 
                2015-01-26T20:25:02.702Z 
            id: 
                kh2qwjbheqdc36 
            impact: 
                major 
            impact_override: 
                None 
            incident_updates: 
                |_ 
                    affected_components: 
                        None 
                    body: 
                        We are currently investigating this issue. 
                    created_at: 
                        2015-01-26T20:25:02.849Z 
                    display_at: 
                        2015-01-26T20:25:02.849Z 
                    id: 
                        zvx7xz2z5skr 
                    incident_id: 
                        kh2qwjbheqdc36 
                    status:

                    wants_twitter_update: 
                        False 
                    monitoring_at: 
                        None 
                    name: 
                        just testing some stuff 
                    page_id: 
                        ksdhgfyiuhaa 
                    postmortem_body: 
```

(continues on next page)
Update attribute(s) of a specific endpoint.

id

The unique ID of the endpoint entry.

endpoint: incidents

Endpoint name.

page_id

Page ID. Can also be specified in the config file.

api_key

API key. Can also be specified in the config file.

api_version: 1

API version. Can also be specified in the config file.

api_url

Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:
Example output:

```
minion:  
    comment:  
        out:  
            created_at:  
                2017-01-03T15:25:30.718Z
            description:

            result:  
                True
```

### 26.6.433 `salt.modules.supervisord`

Provide the service module for system supervisord or supervisord in a virtualenv

```
salt.modules.supervisord.add(name, user=None, conf_file=None, bin_env=None)
```

Activates any updates in config for process/group.

- **user**
  - user to run supervisorctl as
- **conf_file**
  - path to supervisord config file
- **bin_env**
  - path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.add <name>
```

```
salt.modules.supervisord.custom(command, user=None, conf_file=None, bin_env=None)
```

Run any custom supervisord command

- **user**
  - user to run supervisorctl as
- **conf_file**
  - path to supervisord config file
bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:
```
salt '*' supervisord.custom "mstop '*gunicorn*'"
```

**salt.modules.supervisord.options** *(name, conf_file=None)*

New in version 2014.1.0.

Read the config file and return the config options for a given process

- name
  Name of the configured process
- conf_file
  path to supervisord config file

CLI Example:
```
salt '*' supervisord.options foo
```

**salt.modules.supervisord.remove** *(name, user=None, conf_file=None, bin_env=None)*

Removes process/group from active config

- user
  user to run supervisorctl as
- conf_file
  path to supervisord config file
- bin_env
  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:
```
salt '*' supervisord.remove <name>
```

**salt.modules.supervisord.reread** *(user=None, conf_file=None, bin_env=None)*

Reload the daemon's configuration files

- user
  user to run supervisorctl as
- conf_file
  path to supervisord config file
- bin_env
  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:
```
salt '*' supervisord.reread
```

**salt.modules.supervisord.restart** *(name='all', user=None, conf_file=None, bin_env=None)*

Restart the named service. Process group names should not include a trailing asterisk.

- user
  user to run supervisorctl as
- conf_file
  path to supervisord config file
- bin_env
  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:
```
salt '*' supervisord.restart <service>
salt '*' supervisord.restart <group>:
```
salt.modules.supervisord.start(name='all', user=None, conf_file=None, bin_env=None)
Start the named service. Process group names should not include a trailing asterisk.
user
user to run supervisorctl as
conf_file
path to supervisord config file
bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:
```
salt '*' supervisord.start <service>
salt '*' supervisord.start <group>:
```

salt.modules.supervisord.status(name=None, user=None, conf_file=None, bin_env=None)
List programs and its state
user
user to run supervisorctl as
conf_file
path to supervisord config file
bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:
```
salt '*' supervisord.status
```

salt.modules.supervisord.status_bool(name, expected_state=None, user=None, conf_file=None, bin_env=None)
Check for status of a specific supervisord process and return boolean result.
name
name of the process to check
expected_state
search for a specific process state. If set to None - any process state will match.
user
user to run supervisorctl as
conf_file
path to supervisord config file
bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:
```
salt '*' supervisord.status_bool nginx expected_state='RUNNING'
```

salt.modules.supervisord.status_raw(name=None, user=None, conf_file=None, bin_env=None)
Display the raw output of status
user
user to run supervisorctl as
conf_file
path to supervisord config file
bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:
```
salt '*' supervisord.status_raw
```

26.6. execution modules
salt.modules.supervisord.stop(name='all', user=None, conf_file=None, bin_env=None)

Stop the named service. Process group names should not include a trailing asterisk.

- user: user to run supervisorctl as
- conf_file: path to supervisord config file
- bin_env: path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:
```
salt '*' supervisord.stop <service>
salt '*' supervisord.stop <group>:
```

salt.modules.supervisord.update(user=None, conf_file=None, bin_env=None, name=None)

Reload config and add/remove/update as necessary

- user: user to run supervisorctl as
- conf_file: path to supervisord config file
- bin_env: path to supervisorctl bin or path to virtualenv with supervisor installed
- name: name of the process group to update. If none then update any process group that has changes

CLI Example:
```
salt '*' supervisord.update
```

26.6.434 salt.modules.suse_apache

**Warning:** This module will be removed from Salt in version 3009 in favor of the [apache Salt Extension](https://docs.saltstack.com/en/latest/topics/extensions/salt-apache.html).

Support for Apache

Please note: The functions in here are SUSE-specific. Placing them in this separate file will allow them to load only on SUSE systems, while still loading under the `apache` namespace.

salt.modules.suse_apache.a2dismod(mod)

Runs a2dismod for the given mod.

CLI Example:
```
salt '*' apache.a2dismod vhost_alias
```

salt.modules.suse_apache.a2enmod(mod)

Runs a2enmod for the given mod.

CLI Example:
```
salt '*' apache.a2enmod vhost_alias
```

salt.modules.suse_apache.check_mod_enabled(mod)

Checks to see if the specific apache mod is enabled.
This will only be functional on operating systems that support `a2enmod -l` to list the enabled mods.

CLI Example:

```plaintext
salt '*' apache.check_mod_enabled status
```

### 26.6.435 `salt.modules.suse_ip`

The networking module for SUSE based distros

New in version 3005.

```python
salt.modules.suse_ip.apply_network_settings(**settings)
```

Apply global network configuration.

- **param**
  - [param settings:] The network settings to apply

- **Returns**
  - The result of `service.reload` for network service

CLI Example:

```plaintext
salt '*' ip.apply_network_settings
```

```python
salt.modules.suse_ip.build_interface(iface, iface_type, enabled, **settings)
```

Build an interface script for a network interface.

- **param**
  - [param iface:] The name of the interface to build the configuration for

- **param**
  - [param iface_type:]
    - The type of the interface. The following types are possible:
      - `eth`
      - `bond`
      - `alias`
      - `clone`
      - `ipsec`
      - `dialup`
      - `bridge`
      - `slave`
      - `vlan`
      - `ippip`
      - `ib`

- **param**
  - [param enabled:] Build the interface enabled or disabled

- **param**
  - [param settings:] The settings for the interface

- **Returns**
  - A dictionary of file/content

- **Return type**
  - `dict`

CLI Example:

```plaintext
salt '*' ip.build_interface eth0 eth <settings>
```
salt.modules.suse_ip.build_network_settings(**settings)

Build the global network script.

:param [param settings:] The network settings

:returns A dictionary of file/content

:return_type dict

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

salt.modules.suse_ip.build_routes(iface, **settings)

Build a route script for a network interface.

:param [param iface:] The name of the interface to build the routes for

:param [param settings:] The settings for the routes

:returns A dictionary of file/content

:return_type dict

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

salt.modules.suse_ip.down(iface, iface_type=None)

Shutdown a network interface

:param [param iface:] The name of the interface to shutdown

:param [param iface_type:] The type of the interface If slave is specified, no any action is performing Default is None

:returns The result of ifdown command or None if slave iface_type was specified

:return_type str

CLI Example:

```
salt '*' ip.down eth0
```

salt.modules.suse_ip.get_interface(iface)

Return the contents of an interface script

:param [param iface:] The name of the interface to get settings for

:returns A dictionary of file/content

:return_type dict

CLI Example:
salt '*' ip.get_interface eth0

salt.modules.suse_ip.get_network_settings()  
Return the contents of the global network script.  
:doc:`param iface <param_description> 
:doc:`param iface_type <param_description> 

Returns  
A dictionary of file/content  

Return type  
dict  

CLI Example:

salt '*' ip.get_network_settings

salt.modules.suse_ip.get_routes(iface)  
Return the contents of the interface routes script.  
:doc:`param iface <param_description> 

Returns  
A dictionary of file/content  

Return type  
dict  

CLI Example:

salt '*' ip.get_routes eth0

salt.modules.suse_ip.up(iface, iface_type=None)  
Start up a network interface  
:doc:`param iface <param_description> 
:doc:`param iface_type <param_description> 

Returns  
The result of ifup command or None if slave iface_type was specified  

Return type  
str  

CLI Example:

salt '*' ip.up eth0
26.6.436 salt.modules.svn

Subversion SCM

salt.modules.svn.add(cwd, targets, user=None, username=None, password=None, *opts)

Add files to be tracked by the Subversion working-copy checkout

cwd
The path to the Subversion repository

targets
[None] files and directories to pass to the command as arguments

user
[None] Run svn as a user other than what the minion runs as

username
[None] Connect to the Subversion server as another user

password
[None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:
salt '*' svn.add /path/to/repo /path/to/new/file

salt.modules.svn.checkout(cwd, remote, target=None, user=None, username=None, password=None, *opts)

Download a working copy of the remote Subversion repository directory or file

cwd
The path to the Subversion repository

remote
[None] URL to checkout

target
[None] The name to give the file or directory working copy Default: svn uses the remote basename

user
[None] Run svn as a user other than what the minion runs as

username
[None] Connect to the Subversion server as another user

password
[None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:
salt '*' svn.checkout /path/to/repo svn://remote/repo

salt.modules.svn.commit(cwd, targets=None, msg=None, user=None, username=None, password=None, *opts)

Commit the current directory, files, or directories to the remote Subversion repository

cwd
The path to the Subversion repository

targets
[None] files and directories to pass to the command as arguments Default: svn uses ' '

msg
[None] Message to attach to the commit log

user
[None] Run svn as a user other than what the minion runs as

username
[None] Connect to the Subversion server as another user
password

[None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.commit /path/to/repo
```

salt.modules.svn.diff(cwd, targets=None, user=None, username=None, password=None, *opts)

Return the diff of the current directory, files, or directories from the remote Subversion repository.

- **cwd**
  - The path to the Subversion repository.

- **targets**
  - [None] files and directories to pass to the command as arguments. Default: svn uses ".".

- **user**
  - [None] Run svn as a user other than what the minion runs as.

- **username**
  - [None] Connect to the Subversion server as another user.

- **password**
  - [None] Connect to the Subversion server with this password.

New in version 0.17.0.

CLI Example:

```
salt '*' svn.diff /path/to/repo
```

salt.modules.svn.export(cwd, remote, target=None, user=None, username=None, password=None,
revision='HEAD', *opts)

Create an unversioned copy of a tree.

- **cwd**
  - The path to the Subversion repository.

- **remote**
  - [None] URL and path to file or directory checkout.

- **target**
  - [None] The name to give the file or directory working copy. Default: svn uses the remote basename.

- **user**
  - [None] Run svn as a user other than what the minion runs as.

- **username**
  - [None] Connect to the Subversion server as another user.

- **password**
  - [None] Connect to the Subversion server with this password.

New in version 0.17.0.

CLI Example:

```
salt '*' svn.export /path/to/repo svn://remote/repo
```

salt.modules.svn.info(cwd, targets=None, user=None, username=None, password=None, fmt='str')

Display the Subversion information from the checkout.

- **cwd**
  - The path to the Subversion repository.

- **targets**
  - [None] files, directories, and URLs to pass to the command as arguments. svn uses "." by default.

- **user**
  - [None] Run svn as a user other than what the minion runs as.
username
[None] Connect to the Subversion server as another user

password
[None] Connect to the Subversion server with this password

New in version 0.17.0.

fmt
[str] How to fmt the output from info. (str, xml, list, dict)

CLI Example:
```shell
salt '*' svn.info /path/to/svn/repo
```

**salt.modules.svn.remove**
(cwd, targets, msg=None, user=None, username=None, password=None, *opts)

Remove files and directories from the Subversion repository

cwd
The path to the Subversion repository

targets
[None] files, directories, and URLs to pass to the command as arguments

msg
[None] Message to attach to the commit log

user
[None] Run svn as a user other than what the minion runs as

username
[None] Connect to the Subversion server as another user

password
[None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:
```shell
salt '*' svn.remove /path/to/repo /path/to/repo/remove
```

**salt.modules.svn.status**
(cwd, targets=None, user=None, username=None, password=None, *opts)

Display the status of the current directory, files, or directories in the Subversion repository

cwd
The path to the Subversion repository

targets
[None] files, directories, and URLs to pass to the command as arguments Default: svn uses ‘.’

user
[None] Run svn as a user other than what the minion runs as

username
[None] Connect to the Subversion server as another user

password
[None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:
```shell
salt '*' svn.status /path/to/repo
```

**salt.modules.svn.switch**
(cwd, remote, target=None, user=None, username=None, password=None, *opts)

New in version 2014.1.0.

Switch a working copy of a remote Subversion repository directory

cwd
The path to the Subversion repository
remote
  [None] URL to switch

target
  [None] The name to give the file or directory working copy Default: svn uses the remote basename

target
  [None] URL to switch

target
  [None] The name to give the file or directory working copy Default: svn uses the remote basename

user
  [None] Run svn as a user other than what the minion runs as

target
  [None] The name to give the file or directory working copy Default: svn uses the remote basename

username
  [None] Connect to the Subversion server as another user

target
  [None] The name to give the file or directory working copy Default: svn uses the remote basename

user
  [None] Run svn as a user other than what the minion runs as

password
  [None] Connect to the Subversion server with this password

CLI Example:

```
salt 'salt/' svn.switch /path/to/repo svn://remote/repo
```

salt.modules.svn.update(cwd, targets=None, user=None, username=None, password=None, *opts)

Update the current directory, files, or directories from the remote Subversion repository

- **cwd**
  - The path to the Subversion repository

- **targets**
  - [None] files and directories to pass to the command as arguments Default: svn uses '.'

- **user**
  - [None] Run svn as a user other than what the minion runs as

- **password**
  - [None] Connect to the Subversion server with this password

  New in version 0.17.0.

- **username**
  - [None] Connect to the Subversion server as another user

CLI Example:

```
salt 'salt/' svn.update /path/to/repo
```

---

26.6.437 salt.modules.swarm

**Docker Swarm Module using Docker's Python SDK**

**codeauthor**

Tyler Jones <jonestyler806@gmail.com>

New in version 2018.3.0.

The Docker Swarm Module is used to manage and create Docker Swarms.

**Dependencies**

- Docker installed on the host
- Docker python sdk >= 2.5.1
Docker Python SDK

```
pip install -U docker
```

**salt.modules.swarm.joinswarm**

```python
salt.modules.swarm.joinswarm(remote_addr=<class 'int'>, listen_addr=<class 'int'>, token=<class 'str'>)
```

Join a Swarm Worker to the cluster

- **remote_addr**
  The manager node you want to connect to for the swarm

- **listen_addr**
  Listen address used for inter-manager communication if the node gets promoted to manager, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP)

- **token**
  Either the manager join token or the worker join token. You can get the worker or manager token via `salt '*' swarm.swarm_tokens`

**CLI Example:**

```
salt '*' swarm.joinswarm remote_addr=192.168.50.10 listen_addr='0.0.0.0' token='SWMTKN-1-
-64tux2g0701r84ofg93zpccih0pe081akq45owe9ts61f30x4t-
-06trjugdu7x2z47j938s54il'
```

**salt.modules.swarm.leave_swarm**

```python
salt.modules.swarm.leave_swarm(force=<class 'bool'>)
```

Force the minion to leave the swarm

- **force**
  Will force the minion/worker/manager to leave the swarm

**CLI Example:**

```
salt '*' swarm.leave_swarm force=False
```

**salt.modules.swarm.node_ls**

```python
salt.modules.swarm.node_ls(server=<class 'str'>)
```

Displays Information about Swarm Nodes with passing in the server

- **server**
  The minion/server name

**CLI Example:**

```
salt '*' swarm.node_ls server=minion1
```

**salt.modules.swarm.remove_node**

```python
salt.modules.swarm.remove_node(node_id=<class 'str'>, force=<class 'bool'>)
```

Remove a node from a swarm and the target needs to be a swarm manager

- **node_id**
  The node id from the return of swarm.node_ls

- **force**
  Forcefully remove the node/minion from the service

**CLI Example:**

```
salt '*' swarm.remove_node node_id=z4gjbe9rwmqahc2a91snvolm5 force=false
```

**salt.modules.swarm.remove_service**

```python
salt.modules.swarm.remove_service(service=<class 'str'>)
```

Remove Swarm Service

- **service**
  The name of the service

**CLI Example:**
salt '*' swarm.remove_service service=Test_Service

salt.modules.swarm.service_create(image=<class 'str'>, name=<class 'str'>, command=<class 'str'>, hostname=<class 'str'>, replicas=<class 'int'>, target_port=<class 'int'>, published_port=<class 'int'>)

Create Docker Swarm Service Create
image
   The docker image
name
   Is the service name
command
   The docker command to run in the container at launch
hostname
   The hostname of the containers
replicas
   How many replicas you want running in the swarm
target_port
   The target port on the container
published_port
   port that's published on the host/os

CLI Example:
salt '*' swarm.service_create image=httpd name=Test_Service command=None hostname=salthttpd replicas=6 target_port=80 published_port=80

salt.modules.swarm.swarm_init(advertise_addr=<class 'str'>, listen_addr=<class 'int'>, force_new_cluster=<class 'bool'>)

Initialize Docker on Minion as a Swarm Manager
advertise_addr
   The ip of the manager
listen_addr
   Listen address used for inter-manager communication, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP). This can either be an address/port combination in the form 192.168.1.1:4567, or an interface followed by a port number, like eth0:4567
force_new_cluster
   Force a new cluster if True is passed

CLI Example:
salt '*' swarm.swarm_init advertise_addr='192.168.50.10' listen_addr='0.0.0.0' force_new_cluster=False

salt.modules.swarm.swarm_service_info(service_name=<class 'str'>)

Swarm Service Information
service_name
   The name of the service that you want information on about the service

CLI Example:
salt '*' swarm.swarm_service_info service_name=Test_Service

salt.modules.swarm.swarm_tokens()

Get the Docker Swarm Manager or Worker join tokens

CLI Example:
salt ',*' swarm.swarm_tokens

salt.modules.swarm.update_node(availability=<class 'str'>, node_name=<class 'str'>, role=<class 'str'>, node_id=<class 'str'>, version=<class 'int'>)

Updates docker swarm nodes/needs to target a manager node/minion
availability
    Drain or Active
node_name
    minion/node
role
    role of manager or worker
node_id
    The Id and that can be obtained via swarm.node_ls
version
    Is obtained by swarm.node_ls

CLI Example:
salt ',*' swarm.update_node availability=drain node_name=minion2 role=worker node_id=3k9x7t8m4pel9c0nqr3iajnzp version=19

26.6.438 salt.modules.swift

Module for handling OpenStack Swift calls Author: Anthony Stanton <anthony.stanton@gmail.com>
Inspired by the S3 and Nova modules

depends
    • swiftclient Python module

configuration
    This module is not usable until the user, tenant, auth URL, and password or auth_key are specified either in a pillar or in the minion’s config file. For example:

```python
keystone.user: admin
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
keystone.password: verybadpass
# or
keystone.auth_key: 203802934809284k2j34lkj2l3kj43k
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```python
openstack1:
    keystone.user: admin
    keystone.tenant: admin
    keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
    keystone.password: verybadpass
    # or
    keystone.auth_key: 203802934809284k2j34lkj2l3kj43k
openstack2:
```

(continues on next page)
With this configuration in place, any of the swift functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' swift.get mycontainer myfile /tmp/file
   → profile=openstack1
```

NOTE: For Rackspace cloud files setting keystone.auth_version = 1 is recommended.

```
salt.modules.swift.delete(cont, path=None, profile=None)
Delete a container, or delete an object from a container.
```

CLI Example to delete a container:
```
salt myminion swift.delete mycontainer
```

CLI Example to delete an object from a container:
```
salt myminion swift.delete mycontainer remoteobject
```

```
salt.modules.swift.get(cont=None, path=None, local_file=None, return_bin=False, profile=None)
List the contents of a container, or return an object from a container. Set return_bin to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.
```

CLI Example to list containers:
```
salt myminion swift.get
```

CLI Example to list the contents of a container:
```
salt myminion swift.get mycontainer
```

CLI Example to return the binary contents of an object:
```
salt myminion swift.get mycontainer myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:
```
salt myminion swift.get mycontainer myfile.png local_file=/tmp/myfile.png
```

```
salt.modules.swift.head()
```

```
salt.modules.swift.put(cont, path=None, local_file=None, profile=None)
Create a new container, or upload an object to a container.
```

CLI Example to create a container:
```
salt myminion swift.put mycontainer
```

CLI Example to upload an object to a container:
```
salt myminion swift.put mycontainer remoteobject
```
The 'sysbench' module is used to analyze the performance of the minions, right from the master! It measures various system parameters such as CPU, Memory, File I/O, Threads and Mutex.

salt.modules.sysbench.cpu()
Tests for the CPU performance of minions.

CLI Examples:
```
salt '*' sysbench.cpu
```

salt.modules.sysbench.fileio()
This tests for the file read and write operations. Various modes of operations are
- sequential write
- sequential rewrite
- sequential read
- random read
- random write
- random read and write

The test works with 32 files with each file being 1Gb in size. The test consumes a lot of time. Be patient!

CLI Examples:
```
salt '*' sysbench.fileio
```

salt.modules.sysbench.memory()
This tests the memory for read and write operations.

CLI Examples:
```
salt '*' sysbench.memory
```

salt.modules.sysbench.mutex()
Tests the implementation of mutex

CLI Examples:
```
salt '*' sysbench.mutex
```

salt.modules.sysbench.ping()

salt.modules.sysbench.threads()
This tests the performance of the processor's scheduler

CLI Example:
```
salt '*' sysbench.threads
```
26.6.440 salt.modules.sysfs

Module for interfacing with SysFS

See also:
https://www.kernel.org/doc/Documentation/filesystems/sysfs.txt

New in version 2016.3.0.

**salt.modules.sysfs.attr(key, value=None)**

Access/write a SysFS attribute. If the attribute is a symlink, its destination is returned

**Returns**
value or bool

CLI Example:
```
salt '*' sysfs.attr block/sda/queue/logical_block_size
```

**salt.modules.sysfs.interfaces(root)**

Generate a dictionary with all available interfaces relative to root. Symlinks are not followed.

CLI Example:
```
salt '*' sysfs.interfaces block/bcache0/bcache
```

Output example:

```
{
    "r": [
        "state",
        "partial_stripes_expensive",
        "writeback_rate_debug",
        "stripe_size",
        "dirty_data",
        "stats_total/cache_hits",
        "stats_total/cache_bypass_misses",
        "stats_total/bypassed",
        "stats_total/cache_readaheads",
        "stats_total/cache_hit_ratio",
        "stats_total/cache_miss_collisions",
        "stats_total/cache_misses",
        "stats_total/cache_bypass_hits",
    ],
    "rw": [
        "writeback_rate",
        "writeback_rate_update_seconds",
        "cache_mode",
        "writeback_delay",
        "label",
        "writeback_running",
        "writeback_metadata",
        "running",
        "writeback_rate_p_term_inverse",
        "sequential_cutoff",
        "writeback_percent",
        "writeback_rate_d_term",
        ...
    ]
}
```

(continues on next page)
"readahead",
"w": [
  "stop",
  "clear_stats",
  "attach",
  "detach"
]}

Note:
- 'r' interfaces are read-only
- 'w' interfaces are write-only (e.g. actions)
- 'rw' are interfaces that can both be read or written

salt.modules.sysfs.read(key, root='')
Read from SysFS
Parameters
  key -- file or path in SysFS; if key is a list then root will be prefixed on each key
Returns
  the full (tree of) SysFS attributes under key
CLI Example:
```bash
salt '*' sysfs.read class/net/em1/statistics
```

salt.modules.sysfs.target(key, full=True)
Return the basename of a SysFS key path
Parameters
  - key -- the location to resolve within SysFS
  - full -- full path instead of basename
Returns
  fullpath or basename of path
CLI Example:
```bash
salt '*' sysfs.read class/ttyS0
```

salt.modules.sysfs.write(key, value)
Write a SysFS attribute/action
CLI Example:
```bash
salt '*' sysfs.write devices/system/cpu/cpu0/cpufreq/scaling_governor 'performance'
```
26.6.441 salt.modules.syslog_ng

Module for getting information about syslog-ng

    maintainer
    Tibor Benke <btibi@sch.bme.hu>

    maturity
    new

    depends
    cmd

    platform
    all

This module is capable of managing syslog-ng instances which were installed via a package manager or from source. Users can use a directory as a parameter in the case of most functions, which contains the syslog-ng and syslog-ng-ctl binaries.

Syslog-ng can be installed via a package manager or from source. In the latter case, the syslog-ng and syslog-ng-ctl binaries are not available from the PATH, so users should set location of the sbin directory with 

**syslog_ng.set_binary_path.**

Similarly, users can specify the location of the configuration file with 

**syslog_ng.set_config_file**, then the module will use it. If it is not set, syslog-ng uses the default configuration file.

**class salt.modules.syslog_ng.Argument**(value='''

A TypedParameterValue has one or more Arguments. For example this can be the value of key_file.

Does not need examples.

**build()**

**class salt.modules.syslog_ng.Buildable**(iterable, join_body_on='', append_extra_newline=True)

Base class of most classes, which have a build method.

It contains a common build function.

Does not need examples.

**build()**

    Builds the textual representation of the whole configuration object with its children.

**build_body()**

    Builds the body of a syslog-ng configuration object.

**build_header()**

    Builds the header of a syslog-ng configuration object.

**build_tail()**

    Builds the tail of a syslog-ng configuration object.

**class salt.modules.syslog_ng.GivenStatement**(value, add_newline=True)

This statement returns a string without modification. It can be used to use existing configuration snippets.

Does not need examples.

**build()**

    Builds the textual representation of the whole configuration object with its children.
class salt.modules.syslog_ng.NamedStatement(type, id='', options=None)
    It represents a configuration statement, which has a name, e.g. a source.
    Does not need examples.

class salt.modules.syslog_ng.Option(type='', params=None)
    A Statement class contains Option instances.
    An instance of Option can represent a file(), tcp(), udp(), etc. option.
    Does not need examples.
    add_parameter(param)
    build()
        Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.Parameter(iterable=None, join_body_on='')
    An Option has one or more Parameter instances.
    Does not need examples.

class salt.modules.syslog_ng.ParameterValue(iterable=None, join_body_on='')
    A TypedParameter can have one or more values.
    Does not need examples.

class salt.modules.syslog_ng.SimpleParameter(value='')
    A Parameter is a SimpleParameter, if it's just a simple type, like a string.
    For example:
    
    ```
    destination d_file {
        file(''/var/log/messages';
    };
    ```
    /var/log/messages is a SimpleParameter.
    Does not need examples.
    build()
        Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.SimpleParameterValue(value='')
    A ParameterValue which holds a simple type, like a string or a number.
    For example in ip(127.0.0.1) 127.0.0.1 is a SimpleParameterValue.
    Does not need examples.
    build()
        Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.Statement(type, id='', options=None, has_name=True)
    It represents a syslog-ng configuration statement, e.g. source, destination, filter.
    Does not need examples.
    add_child(option)
**build_header()**
Builds the header of a syslog-ng configuration object.

**build_tail()**
Builds the tail of a syslog-ng configuration object.

**exception** salt.modules.syslog_ng.SyslogNgError

**class** salt.modules.syslog_ng.TypedParameter(type='', values=None)
A Parameter, which has a type:

```python
destination d_tcp {
    tcp(
        ip(127.0.0.1)
    )
};
```

`ip(127.0.0.1)` is a TypedParameter.
Does not need examples.

**add_value(value)**

**build()**
Builds the textual representation of the whole configuration object with its children.

**class** salt.modules.syslog_ng.TypedParameterValue(type='', arguments=None)
We have to go deeper...
A TypedParameter can have a 'parameter', which also have a type. For example key_file and cert_file:

```python
source demo_tls_source {
    tcp(
        ip(0.0.0.0)
        port(1999)
        tls(
            key_file('/opt/syslog-ng/etc/syslog-ng/key.d/syslog-ng.key')
            cert_file('/opt/syslog-ng/etc/syslog-ng/cert.d/syslog-ng.cert')
        )
    );
};
```

Does not need examples.

**add_argument(arg)**

**build()**
Builds the textual representation of the whole configuration object with its children.

**class** salt.modules.syslog_ng.UnnamedStatement(type, options=None)
It represents a configuration statement, which doesn't have a name, e.g. a log path.
Does not need examples.

**salt.modules.syslog_ng.config(name, config, write=True)**
Builds syslog-ng configuration. This function is intended to be used from the state module, users should not use it directly!
name : the id of the Salt document or it is the format of <statement name>.id
config : the parsed YAML code
write : if True, it writes the config into the configuration file, otherwise just returns it

CLI Example:

```bash
salt '*' syslog_ng.config name='s_local' config="[{tcp:[{"ip':'127.0.0.1"}],"port':1233}]]"
```

```
salt.modules.syslog_ng.config_test(syslog_ng_sbin_dir=None, cfgfile=None)
```

Runs syntax check against cfgfile. If syslog_ng_sbin_dir is specified, it is added to the PATH during the test.

CLI Example:

```bash
salt '*' syslog_ng.config_test
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin
```

```
salt.modules.syslog_ng.get_config_file()
```

Returns the configuration directory, which contains syslog-ng.conf.

CLI Example:

```bash
salt '*' syslog_ng.get_config_file
```

```
salt.modules.syslog_ng.modules(syslog_ng_sbin_dir=None)
```

Returns the available modules. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng.

CLI Example:

```bash
salt '*' syslog_ng.modules
salt '*' syslog_ng.modules /home/user/install/syslog-ng/sbin
```

```
salt.modules.syslog_ng.reload_(name)
```

Reloads syslog-ng. This function is intended to be used from states.

If syslog_ng.set_config_file, is called before, this function will use the set binary path.

CLI Example:

```bash
salt '*' syslog_ng.reload
```

```
salt.modules.syslog_ng.set_binary_path(name)
```

Sets the path, where the syslog-ng binary can be found. This function is intended to be used from states.

If syslog-ng is installed via a package manager, users don't need to use this function.

CLI Example:

```bash
salt '*' syslog_ng.set_binary_path name=/usr/sbin
```

```
salt.modules.syslog_ng.set_config_file(name)
```

Sets the configuration's name. This function is intended to be used from states.

CLI Example:
salt '*' syslog_ng.set_config_file name=/etc/syslog-ng

salt.modules.syslog_ng.set_parameters(version=None, binary_path=None, config_file=None, *args, **kwargs)

Sets variables.

CLI Example:

salt '*' syslog_ng.set_parameters version='3.6'

salt '*' syslog_ng.set_parameters binary_path=/home/user/install/syslog-ng/sbin/config_file=/home/user/install/syslog-ng/etc/syslog-ng.conf

salt.modules.syslog_ng.start(name=None, user=None, group=None, chroot=None, caps=None, no_caps=False, pidfile=None, enable_core=False, fd_limit=None, verbose=False, debug=False, trace=False, yydebug=False, persist_file=None, control=None, worker_threads=None)

Ensures, that syslog-ng is started via the given parameters. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If syslog_ng.set_config_file, is called before, this function will use the set binary path.

CLI Example:

salt '*' syslog_ng.start

salt.modules.syslog_ng.stats(syslog_ng_sbin_dir=None)

Returns statistics from the running syslog-ng instance. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng-ctl.

CLI Example:

salt '*' syslog_ng.stats

salt '*' syslog_ng.stats /home/user/install/syslog-ng/sbin

salt.modules.syslog_ng.stop(name=None)

Kills syslog-ng. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If syslog_ng.set_config_file is called before, this function will use the set binary path.

CLI Example:

salt '*' syslog_ng.stop

salt.modules.syslog_ng.version(syslog_ng_sbin_dir=None)

Returns the version of the installed syslog-ng. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng.

CLI Example:

salt '*' syslog_ng.version

salt '*' syslog_ng.version /home/user/install/syslog-ng/sbin
salt.modules.syslog_ng.write_config(config=newlines=2)

Writes the given parameter config into the config file. This function is intended to be used from states.

If `syslog_ng.set_config_file` is called before, this function will use the set config file.

CLI Example:

```bash
salt '*' syslog_ng.write_config config='# comment'
```

salt.modules.syslog_ng.write_version(name)

Removes the previous configuration file, then creates a new one and writes the name line. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set config file.

CLI Example:

```bash
salt '*' syslog_ng.write_version name="3.6"
```

### 26.6.442 salt.modules.sysmod

The `sys` module provides information about the available functions on the minion

salt.modules.sysmod.argspec(module="")

Return the argument specification of functions in Salt execution modules.

CLI Example:

```bash
salt '*' sys.argspec pkg.install
salt '*' sys.argspec sys
salt '*' sys.argspec
```

Module names can be specified as globs.

New in version 2015.5.0.

```bash
salt '*' sys.argspec 'pkg.*'
```

salt.modules.sysmod.doc(args)

Return the docstrings for all modules. Optionally, specify a module or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple modules/functions can be specified.

CLI Example:

```bash
salt '*' sys.doc
salt '*' sys.doc sys
salt '*' sys.doc sys.doc
salt '*' sys.doc network.traceroute user.info
```

Modules can be specified as globs.

New in version 2015.5.0.

```bash
salt '*' sys.doc 'sys.*'
salt '*' sys.doc 'sys.list_*'
```
**salt.modules.sysmod.list_functions**(*args, **kwargs*)

List the functions for all modules. Optionally, specify a module or modules from which to list.

CLI Example:

```shell
salt '*' sys.list_functions
salt '*' sys.list_functions sys
salt '*' sys.list_functions sys user
```

New in version 0.12.0.

```shell
salt '*' sys.list_functions 'module.specific_function'
```

Function names can be specified as globs.

New in version 2015.5.0.

```shell
salt '*' sys.list_functions 'sys.list_*'
```

**salt.modules.sysmod.list_modules**(*args*)

List the modules loaded on the minion

New in version 2015.5.0.

CLI Example:

```shell
salt '*' sys.list_modules
```

Module names can be specified as globs.

```shell
salt '*' sys.list_modules 's*'
```

**salt.modules.sysmod.list_renderers**(*args*)

List the renderers loaded on the minion

New in version 2015.5.0.

CLI Example:

```shell
salt '*' sys.list_renderers
```

Render names can be specified as globs.

```shell
salt '*' sys.list_renderers 'yaml*'
```

**salt.modules.sysmod.list_returner_functions**(*args, **kwargs*)

List the functions for all returner modules. Optionally, specify a returner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```shell
salt '*' sys.list_returner_functions
salt '*' sys.list_returner_functions mysql
salt '*' sys.list_returner_functions mysql etcd
```

Returner names can be specified as globs.

New in version 2015.5.0.
salt '*' sys.list_returner_functions 'sqlite3.get_***'

salt.modules.sysmod.list_returners(*args)
List the returners loaded on the minion
New in version 2014.7.0.

CLI Example:

```bash
salt '*' sys.list_returners
```

Returner names can be specified as globs.
New in version 2015.5.0.

```bash
salt '*' sys.list_returners 's*'
```

salt.modules.sysmod.list_runner_functions(*args, **kwargs)
List the functions for all runner modules. Optionally, specify a runner module or modules from which to list.
New in version 2014.7.0.

CLI Example:

```bash
salt '*' sys.list_runner_functions
salt '*' sys.list_runner_functions state
salt '*' sys.list_runner_functions state virt
```

Runner function names can be specified as globs.
New in version 2015.5.0.

```bash
salt '*' sys.list_runner_functions 'state.*' 'virt.*'
```

salt.modules.sysmod.list_runners(*args)
List the runners loaded on the minion
New in version 2014.7.0.

CLI Example:

```bash
salt '*' sys.list_runners
```

Runner names can be specified as globs.
New in version 2015.5.0.

```bash
salt '*' sys.list_runners 'm*'
```

salt.modules.sysmod.list_state_functions(*args, **kwargs)
List the functions for all state modules. Optionally, specify a state module or modules from which to list.
New in version 2014.7.0.

CLI Example:

```bash
salt '*' sys.list_state_functions
salt '*' sys.list_state_functions file
salt '*' sys.list_state_functions pkg user
```
State function names can be specified as globs.
New in version 2015.5.0.

```
salt '_salt '*' sys.list_state_functions 'file.*'
salt '_salt '*' sys.list_state_functions 'file.s*' 
```

New in version 2016.9.0.

```
salt '_salt '*' sys.list_state_functions 'module.specific_function'
```

```
salt.modules.sysmod.list_state_modules('args')
List the modules loaded on the minion
New in version 2014.7.0.

CLI Example:
```
salt '_salt '*' sys.list_state_modules
```

State module names can be specified as globs.
New in version 2015.5.0.

```
salt '_salt '*' sys.list_state_modules 'mysql_*'
```

```
salt.modules.sysmod.reload_modules()
Tell the minion to reload the execution modules
CLI Example:
```
salt '_salt '*' sys.reload_modules
```

```
salt.modules.sysmod.renderer_doc('args)
Return the docstrings for all renderers. Optionally, specify a renderer or a function to narrow the selection.
The strings are aggregated into a single document on the master for easy reading.
Multiple renderers can be specified.
New in version 2015.5.0.

CLI Example:
```
salt '_salt '*' sys.renderer_doc
salt '_salt '*' sys.renderer_doc cheetah
salt '_salt '*' sys.renderer_doc jinja json
```

Renderer names can be specified as globs.

```
salt '_salt '*' sys.renderer_doc 'c*' 'j*' 
```

```
salt.modules.sysmod.returner_argspec(module='')
Return the argument specification of functions in Salt returner modules.
New in version 2015.5.0.

CLI Example:
```
Returner names can be specified as globs.

```bash
salt '*' sys.returner_argspec xmpp
salt '*' sys.returner_argspec xmpp smtp
salt '*' sys.returner_argspec
```

salt.modules.sysmod.returner_doc(\'args\')

Return the docstrings for all returners. Optionally, specify a returner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple returners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```bash
salt '*' sys.returner_doc
salt '*' sys.returner_doc sqlite3
salt '*' sys.returner_doc sqlite3.get_fun
salt '*' sys.returner_doc sqlite3.get_fun etcd.get_fun
```

Returner names can be specified as globs.

New in version 2015.5.0.

```bash
salt '*' sys.returner_doc 'sqlite3.*'
```

salt.modules.sysmod.runner_argspec(\'module=\'"

Return the argument specification of functions in Salt runner modules.

New in version 2015.5.0.

CLI Example:

```bash
salt '*' sys.runner_argspec state
salt '*' sys.runner_argspec http
salt '*' sys.runner_argspec
```

Runner names can be specified as globs.

```bash
salt '*' sys.runner_argspec 'winrepo.*'
```

salt.modules.sysmod.runner_doc(\'args\')

Return the docstrings for all runners. Optionally, specify a runner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple runners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```bash
salt '*' sys.runner_doc
salt '*' sys.runner_doc_cache
```

(continues on next page)
Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.runner_doc cache.grains
salt '*' sys.runner_doc cache.grains mine.get
```

salt.modules.sysmod.state_argspec(module="")

Return the argument specification of functions in Salt state modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.state_argspec pkg.installed
salt '*' sys.state_argspec file
salt '*' sys.state_argspec
```

State names can be specified as globs.

```
salt '*' sys.state_argspec 'pkg.**'
```

salt.modules.sysmod.state_doc('args')

Return the docstrings for all states. Optionally, specify a state or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple states/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.state_doc
salt '*' sys.state_doc service
salt '*' sys.state_doc service.running
salt '*' sys.state_doc service.running ipables.append
```

State names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.state_doc 'service.**' 'iptables.**'
```

salt.modules.sysmod.state_schema(module="")

Return a JSON Schema for the given state function(s)

New in version 2016.3.0.

CLI Example:

```
salt '*' sys.state_schema
salt '*' sys.state_schema pkg.installed
```
26.6.443 salt.modules.sysrc

sysrc module for FreeBSD

salt.modules.sysrc.get(**kwargs)
    Return system rc configuration variables
    CLI Example:
    ```
    salt '*' sysrc.get includeDefaults=True
    ```

salt.modules.sysrc.remove(name, **kwargs)
    Remove system rc configuration variables
    CLI Example:
    ```
    salt '*' sysrc.remove name=sshd_enable
    ```

salt.modules.sysrc.set_(name, value, **kwargs)
    Set system rc configuration variables
    CLI Example:
    ```
    salt '*' sysrc.set name=sshd_flags value="-p 2222"
    ```

26.6.444 salt.modules.system

Support for reboot, shutdown, etc on POSIX-like systems.

Note: If a wrapper such as molly-guard to intercept interactive shutdown commands is configured, calling system.halt, system.poweroff, system.reboot, and system.shutdown with salt-call will hang indefinitely while the wrapper script waits for user input. Calling them with salt will work as expected.

salt.modules.system.get_computer_desc()
    Get PRETTY_HOSTNAME value stored in /etc/machine-info If this file doesn't exist or the variable doesn't exist return False.
    Returns
        Value of PRETTY_HOSTNAME in /etc/machine-info. If file/variable does not exist False.
        Return type
        str
    CLI Example:
    ```
    salt '*' system.get_computer_desc
    ```

salt.modules.system.get_computer_name()
    Get hostname.
    CLI Example:
    ```
    salt '*' network.get_hostname
    ```
salt.modules.system.get_reboot_required_witnessed()

Note: This only applies to Minions running on NI Linux RT

Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.

Returns
True if the a reboot request was witnessed, False otherwise

Return type
bool

CLI Example:
```bash
salt '*' system.get_reboot_required_witnessed
```

salt.modules.system.get_system_date(utc_offset=None)

Get the system date

Parameters
utc_offset (str) -- The UTC offset in 4 digit (+0000) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use +0000. Note: If being passed through the command line will need to be quoted twice to allow negative offsets (e.g. '+0000').

Returns
Returns the system date.

Return type
str

CLI Example:
```
salt '*' system.get_system_date
```

salt.modules.system.get_system_date_time(utc_offset=None)

Get the system date/time.

Parameters
utc_offset (str) -- The UTC offset in 4 digit (+0000) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use +0000. Note: If being passed through the command line will need to be quoted twice to allow negative offsets (e.g. '+0000').

Returns
Returns the system time in YYYY-MM-DD hh:mm:ss format.

Return type
str

CLI Example:
```
salt '*' system.get_system_date_time ''-0500''
```

salt.modules.system.get_system_time(utc_offset=None)

Get the system time.

Parameters
utc_offset (str) -- The UTC offset in 4 digit (e.g. +0000) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use +0000. Note: If being passed through the command line will need to be quoted twice to allow negative offsets (e.g. '+0000').

Returns
Returns the system time in HH:MM:SS AM/PM format.
Return type

\texttt{str}

CLI Example:

\begin{verbatim}
salt '*' system.get_system_time
\end{verbatim}

\begin{itemize}
\item \texttt{salt.modules.system.halt()}
\begin{itemize}
\item Halt a running system
\end{itemize}

\begin{verbatim}
salt '*' system.halt
\end{verbatim}

\item \texttt{salt.modules.system.has_settable_hwclock()}
\begin{itemize}
\item Returns True if the system has a hardware clock capable of being set from software.
\end{itemize}

\begin{verbatim}
salt '*' system.has_settable_hwclock
\end{verbatim}

\item \texttt{salt.modules.system.init(runlevel)}
\begin{itemize}
\item Change the system runlevel on sysV compatible systems
\end{itemize}

\begin{verbatim}
salt '*' system.init 3
\end{verbatim}

\item \texttt{salt.modules.system.poweroff()}
\begin{itemize}
\item Poweroff a running system
\end{itemize}

\begin{verbatim}
salt '*' system.poweroff
\end{verbatim}

\item \texttt{salt.modules.system.reboot(at_time=None)}
\begin{itemize}
\item Reboot the system
\item \texttt{at_time}
\begin{itemize}
\item The wait time in minutes before the system will be rebooted.
\end{itemize}
\end{itemize}

\begin{verbatim}
salt '*' system.reboot
\end{verbatim}

\item \texttt{salt.modules.system.set_computer_desc(desc)}
\begin{itemize}
\item Set PRETTY_HOSTNAME value stored in /etc/machine-info This will create the file if it does not exist. If it is unable to create or modify this file, False is returned.
\item Parameters
\begin{itemize}
\item \texttt{desc (str)} -- The computer description
\end{itemize}
\item Returns
\begin{itemize}
\item False on failure. True if successful.
\end{itemize}
\end{itemize}

\begin{verbatim}
salt '*' system.set_computer_desc "Michael's laptop"
\end{verbatim}

\item \texttt{salt.modules.system.set_computer_name(hostname)}
\begin{itemize}
\item Modify hostname.
\end{itemize}

\begin{verbatim}
salt '*' system.set_computer_name
\end{verbatim}
salt '*' system.set_computer_name master.saltstack.com

salt.modules.system.set_reboot_required_witnessed()

**Note:** This only applies to Minions running on NI Linux RT

This function is used to remember that an event indicating that a reboot is required was witnessed. This function writes to a temporary filesystem so the event gets cleared upon reboot.

- **Returns**
  - True if successful, otherwise False
- **Return type**
  - bool

**CLI Example:**

```bash
salt '*' system.set_reboot_required_witnessed
```

salt.modules.system.set_system_date(newdate, utc_offset=None)

Set the system date. Use `<mm-dd-yy>` format for the date.

- **Parameters**
  - `newdate` (**str**): The date to set. Can be any of the following formats:
    - YYYY-MM-DD
    - MM-DD-YYYY
    - MM-DD-YY
    - MM/DD/YYYY
    - MM/DD/YY
    - YYYY/MM/DD

**CLI Example:**

```bash
salt '*' system.set_system_date '03-28-13'
```

salt.modules.system.set_system_date_time(years=None, months=None, days=None, hours=None, minutes=None, seconds=None, utc_offset=None)

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if the year is not passed, the current system year will be used. (Used by `system.set_system_date` and `system.set_system_time`)

Updates hardware clock, if present, in addition to software (kernel) clock.

- **Parameters**
  - `years` (**int**): Years digit, e.g.: 2015
  - `months` (**int**): Months digit: 1-12
  - `days` (**int**): Days digit: 1-31
  - `hours` (**int**): Hours digit: 0-23
  - `minutes` (**int**): Minutes digit: 0-59
  - `seconds` (**int**): Seconds digit: 0-59
  - `utc_offset` (**str**): The UTC offset in 4 digit (+0600) format with an optional sign (+/-). Will default to `None` which will use the local timezone. To set the time based off of UTC use `+0000`. Note: If being passed through the command line will need to be quoted twice to allow negative offsets (e.g. "''+0000'").

- **Returns**
  - True if successful. Otherwise False.
- **Return type**
  - bool

**CLI Example:**
salt module documentation

### salt.modules.system.set_system_time

Set the system time.

**Parameters**

- `newtime (str)` -- The time to set. Can be any of the following formats.
  - HH:MM:SS AM/PM
  - HH:MM AM/PM
  - HH:MM:SS (24 hour)
  - HH:MM (24 hour)

  Note that the Salt command line parser parses the date/time before we obtain the argument (preventing us from doing UTC) Therefore the argument must be passed in as a string. Meaning the text might have to be quoted twice on the command line.

- `utc_offset (str)` -- The UTC offset in 4 digit (+0600) format with an optional sign (+/-). Will default to `None` which will use the local timezone. To set the time based off of UTC use `+0000`. Note: If being passed through the command line will need to be quoted twice to allow negative offsets (e.g. "'+0000"")

**Returns**

- Returns `True` if successful. Otherwise `False`.

**Return type**

`bool`

**CLI Example:**

```
salt '*' system.set_system_time "'11:20'"
```

### salt.modules.system.shutdown

Shutdown a running system

**at_time**

The wait time in minutes before the system will be shutdown.

**CLI Example:**

```
salt '*' system.shutdown 5
```

#### 26.6.445 salt.modules.system_profiler

**System Profiler Module**

Interface with macOS's command-line System Profiler utility to get information about package receipts and installed applications.

New in version 2015.5.0.

**salt.modules.system_profiler.applications()**

Return the results of a call to `system_profiler -xml -detail full SPApplicationsDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

Note that this can take a long time depending on how many applications are installed on the target Mac.

**CLI Example:**

```
salt '*' systemprofiler.applications
```
salt.modules.system_profiler.receipts()

Return the results of a call to `system_profiler -xml -detail full SPInstallHistoryDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

CLI Example:

```
salt '*' systemprofiler.receipts
```

26.6.446 salt.modules.systemd_service

Provides the service module for systemd

New in version 0.10.0.

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `service.start` is not available), see [here](#).

**Important:** This is an implementation of virtual 'service' module. As such, you must call it under the name 'service' and NOT 'systemd'. You can see that also in the examples below.

salt.modules.systemd_service.available(name)

New in version 0.10.4.

Check that the given service is available taking into account template units.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.systemd_service.disable(name, no_block=False, root=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a [config option](#) called `systemd.scope`, with a value of `False` (no quotes).

Disable the named service to not start when the system boots

**no_block**

[False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

**root**

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.systemd_service.disabled(name, root=None)

Return if the named service is disabled from starting on boot

**root**

Enable/disable/mask unit files in the specified root directory
CLI Example:

```
salt '*' service.disabled <service name>
```

```
salt.modules.systemd_service.enable(name, no_block=False, unmask=False, unmask_runtime=False, root=None, **kwargs)
```

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of False (no quotes).

Enable the named service to start when the system boots

```
no_block
  [False] Set to True to start the service using --no-block.
  New in version 2017.7.0.
```

```
unmask
  [False] Set to True to remove an indefinite mask before attempting to enable the service.
  New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.
```

```
unmask_runtime
  [False] Set to True to remove a runtime mask before attempting to enable the service.
  New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.
```

```
root
  Enable/disable/mask unit files in the specified root directory
```

CLI Example:

```
salt '*' service.enable <service name>
```

```
salt.modules.systemd_service.enabled(name, root=None, **kwargs)
```

Return if the named service is enabled to start on boot

```
root
  Enable/disable/mask unit files in the specified root directory
```

CLI Example:

```
salt '*' service.enabled <service name>
```

```
salt.modules.systemd_service.execs(root=None)
```

New in version 2014.7.0.

Return a list of all files specified as ExecStart for all services.

```
root
  Enable/disable/mask unit files in the specified root directory
```

CLI Example:

```
salt '*' service.execs
```

```
salt.modules.systemd_service.firstboot(locale=None, locale_message=None, keymap=None, timezone=None, hostname=None, machine_id=None, root=None)
```

New in version 3001.

Call systemd-firstboot to configure basic settings of the system
locale
  Set primary locale (LANG=)
locale_message
  Set message locale (LC_MESSAGES=)
keymap
  Set keymap
timezone
  Set timezone
hostname
  Set host name
machine_id
  Set machine ID
root
  Operate on an alternative filesystem root

CLI Example:

```shell
salt '*' service.firstboot keymap=jp locale=en_US.UTF-8
```

salt.modules.systemd_service.force_reload(name, no_block=True, unmask=False, unmask_runtime=False)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

New in version 0.12.0.

Force-reload the specified service with systemd

no_block
  [False] Set to True to start the service using --no-block.
  New in version 2017.7.0.
unmask
  [False] Set to True to remove an indefinite mask before attempting to force-reload the service.
  New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.
unmask_runtime
  [False] Set to True to remove a runtime mask before attempting to force-reload the service.
  New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

CLI Example:

```shell
salt '*' service.force_reload <service name>
```

salt.modules.systemd_service.get_all(root=None)

Return a list of all available services

root
  Enable/disable/mask unit files in the specified root directory

CLI Example:

```shell
salt '*' service.get_all
```

salt.modules.systemd_service.get_disabled(root=None)

Return a list of all disabled services
Salt Modules

**root**

Enable/disable/mask unit files in the specified root directory

**CLI Example:**

```
salt '*' service.get_disabled
```

salt.modules.systemd_service.get_enabled(root=None)

Return a list of all enabled services

**CLI Example:**

```
salt '*' service.get_enabled
```

salt.modules.systemd_service.get_running()

Return a list of all running services, so far as systemd is concerned

**CLI Example:**

```
salt '*' service.get_running
```

salt.modules.systemd_service.get_static(root=None)

New in version 2015.8.5.

Return a list of all static services

**CLI Example:**

```
salt '*' service.get_static
```

salt.modules.systemd_service.mask(name, runtime=False, root=None)

New in version 2015.8.5.

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called `systemd.scope`, with a value of `False` (no quotes).

Mask the specified service with systemd

**runtime**

[False] Set to `True` to mask this service only until the next reboot

New in version 2015.8.5.

**root**

Enable/disable/mask unit files in the specified root directory

**CLI Example:**

```
salt '*' service.mask foo
salt '*' service.mask foo runtime=True
```

salt.modules.systemd_service.masked(name, runtime=False, root=None)

New in version 2015.8.0.
Changed in version 2015.8.5: The return data for this function has changed. If the service is masked, the return value will now be the output of the `systemctl is-enabled` command (so that a persistent mask can be distinguished from a runtime mask). If the service is not masked, then `False` will be returned.

Changed in version 2017.7.0: This function now returns a boolean telling the user whether a mask specified by the new `runtime` argument is set. If `runtime` is `False`, this function will return `True` if an indefinite mask is set for the named service (otherwise `False` will be returned). If `runtime` is `False`, this function will return `True` if a runtime mask is set, otherwise `False`.

Check whether or not a service is masked

**runtime**

- `[False] Set to `True` to check for a runtime mask

New in version 2017.7.0: In previous versions, this function would simply return the output of `systemctl is-enabled` when the service was found to be masked. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now only checks for runtime masks if this argument is set to `True`. Otherwise, it will check for an indefinite mask.

**root**

Enable/disable/mask unit files in the specified root directory

CLI Examples:

```
salt '*' service.masked foo
salt '*' service.masked foo runtime=True
```

**salt.modules.systemd_service.missing(name)**

New in version 2014.1.0.

The inverse of `service.available`. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

**salt.modules.systemd_service.offline()**

New in version 3004.

Check if systemd is working in offline mode, where is not possible to talk with PID 1.

CLI Example:

```
salt '*' service.offline
```

**salt.modules.systemd_service.reload_(name, no_block=False, unmask=False, unmask_runtime=False)**

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd=>205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Reload the specified service with systemd

**no_block**

- `[False] Set to `True` to reload the service using `--no-block`.

New in version 2017.7.0.
unmask

[False] Set to True to remove an indefinite mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

unmask_runtime

[False] Set to True to remove a runtime mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.systemd_service.restart(name, no_block=False, unmask=False, unmask_runtime=False)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Restart the specified service with systemd

no_block

[False] Set to True to start the service using --no-block.

New in version 2017.7.0.

unmask

[False] Set to True to remove an indefinite mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

unmask_runtime

[False] Set to True to remove a runtime mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.systemd_service.show(name, root=None)

New in version 2014.7.0.

Show properties of one or more units/jobs or the manager

root

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.show <service name>
```

salt.modules.systemd_service.start(name, no_block=False, unmask=False, unmask_runtime=False)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).
Start the specified service with systemd

no_block

[False] Set to True to start the service using --no-block.

New in version 2017.7.0.

unmask

[False] Set to True to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

unmask_runtime

[False] Set to True to remove a runtime mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.start <service name>
```

```
salt.modules.systemd_service.status(name, sig=None)
```

Return the status for a service via systemd. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

- `name (str)` -- The name of the service to check
- `sig (str)` -- Not implemented

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

```
salt.modules.systemd_service.stop(name, no_block=False)
```

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Stop the specified service with systemd

no_block

[False] Set to True to start the service using --no-block.

New in version 2017.7.0.

CLI Example:

```
salt '*' service.stop <service name>
```

```
salt.modules.systemd_service.systemctl_reload()
```

New in version 0.15.0.

Reloads systemctl, an action needed whenever unit files are updated.

CLI Example:

```
```
salt '!' service.systemctl_reload

salt.modules.systemd_service.unmask_(name, runtime=False, root=None)

New in version 2015.5.0.

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Unmask the specified service with systemd

runtime

[False] Set to True to unmask this service only until the next reboot

New in version 2017.7.0: In previous versions, this function would remove whichever mask was identified by running systemctl is-enabled on the service. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now removes a runtime mask only when this argument is set to True, and otherwise removes an indefinite mask.

root

Enable/disable/mask unit files in the specified root directory

CLI Example:

salt '!' service.unmask foo
salt '!' service.unmask foo runtime=True

26.6.447 salt.modules.telegram

Module for sending messages via Telegram.

configuration

In order to send a message via the Telegram, certain configuration is required in /etc/salt/minion on the relevant minions or in the pillar. Some sample configs might look like:

```python
telegram.chat_id: '123456789'
telegram.token: '00000000:xxxxxxxxxxxxxxxxxxxxxxxxxx'
```

salt.modules.telegram.post_message(message, chat_id=None, token=None)

Send a message to a Telegram chat.

Parameters

- message -- The message to send to the Telegram chat.
- chat_id -- (optional) The Telegram chat id.
- token -- (optional) The Telegram API token.

Returns

Boolean if message was sent successfully.

CLI Example:

salt '!' telegram.post_message message="Hello Telegram!"
26.6.448 salt.modules.telemetry

Connection module for Telemetry
New in version 2016.3.0.
https://github.com/mongolab/mongolab-telemetry-api-docs/blob/master/alerts.md

configuration
This module accepts explicit telemetry credentials or can also read api key credentials from a pillar.
More Information available here.

In the minion's config file:

---

```
telemetry.telemetry_api_keys:
  - abc123  # Key 1
  - efg321  # Backup Key 1

telemetry_api_base_url: https://telemetry-api.mongolab.com/v0
```

depends
requests

salt.modules.telemetry.create_alarm(deployment_id, metric_name, data, api_key=None, profile='telemetry')

create an telemetry alarms.

data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.create_alarm rs-ds033197 {} profile=telemetry
```

salt.modules.telemetry.delete_alarms(deployment_id, alert_id=None, metric_name=None, api_key=None, profile='telemetry')

delete an alert specified by alert_id or if not specified blows away all the alerts
in the current deployment.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.delete_alarms rs-ds033197 profile=telemetry
```

salt.modules.telemetry.get_alarms(deployment_id, profile='telemetry')

get all the alarms set up against the current deployment.

Returns dictionary of alarm information

CLI Example:

```
salt myminion telemetry.get_alarms rs-ds033197 profile=telemetry
```

salt.modules.telemetry.get_alert_config(deployment_id, metric_name=None, api_key=None, profile='telemetry')

Get all alert definitions associated with a given deployment or if metric_name is specified, obtain the specific
alert config.

Returns dictionary or list of dictionaries.
CLI Example:

```
salt myminion telemetry.get_alert_config rs-ds033197 currentConnections
    profile=telemetry
salt myminion telemetry.get_alert_config rs-ds033197 profile=telemetry
```

`salt.modules.telemetry.get_notification_channel_id`(*notify_channel, profile='telemetry')

Given an email address, creates a notification-channels if one is not found and also returns the corresponding notification channel id.

- **notify_channel**: Email escalation policy
- **profile**: A dict of telemetry config information.

CLI Example:

```
salt myminion telemetry.get_notification_channel_id userx@company.com
    profile=telemetry
```

`salt.modules.telemetry.update_alarm`(*deployment_id, metric_name, data, api_key=None, profile='telemetry')

update an telemetry alarms. data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.update_alarm rs-ds033197 {} profile=telemetry
```

**26.6.449 salt.modules.temp**

Simple module for creating temporary directories and files

This is a thin wrapper around Python's tempfile module

New in version 2015.8.0.

`salt.modules.temp.dir`(*suffix='', prefix='tmp', parent=None)

Create a temporary directory

CLI Example:

```
salt '*temp.dir
salt '*temp.dir prefix='mytemp-' parent=''/var/run/
```

`salt.modules.temp.file`(*suffix='', prefix='tmp', parent=None)

Create a temporary file

CLI Example:

```
salt '*temp.file
salt '*temp.file prefix='mytemp-' parent=''/var/run/
```
26.6.450  salt.modules.test

Module for running arbitrary tests

```python
salt.modules.test.arg(*args, **kwargs)
```

Print out the data passed into the function `*args` and `kwargs`, this is used to both test the publication data and CLI argument passing, but also to display the information available within the publication data.

Returns:
```
{"args": args, "kwargs": kwargs}
```

Return type: `dict`

CLI Example:
```
salt '*' test.arg 1 "two" 3.1 txt="hello" wow='\{a: 1, b: "hello"\}'
```

```python
salt.modules.test.arg_clean(*args, **kwargs)
```

Like `test.arg` but cleans `kwargs` of the `__pub*` items.

CLI Example:
```
salt '*' test.arg_clean 1 "two" 3.1 txt="hello" wow='\{a: 1, b: "hello"\}'
```

```python
salt.modules.test.arg_repr(*args, **kwargs)
```

Print out the data passed into the function `*args` and `kwargs`, this is used to both test the publication data and CLI argument passing, but also to display the information available within the publication data.

Returns:
```
{"args": repr(args), "kwargs": repr(kwargs)}
```

CLI Example:
```
salt '*' test.arg_repr 1 "two" 3.1 txt="hello" wow='\{a: 1, b: "hello"\}'
```

```python
salt.modules.test.arg_type(*args, **kwargs)
```

Print out the types of the `args` and `kwargs`. This is used to test the types of the `args` and `kwargs` passed down to the Minion.

Returns:
```
{"args": repr(type(args)), "kwargs": repr(type(kwargs))}
```

Return type: `dict`

CLI Example:
```
salt '*' test.arg_type 1 'int'
```

```python
salt.modules.test.assertion(assertion)
```

Assert the given argument.

CLI Example:
```
salt '*' test.assertion False
```

```python
salt.modules.test.attr_call()
```

Call grains.items via the attribute

CLI Example:
```
salt '*' test.attr_call
```
salt.modules.test.collatz(start)
    Execute the collatz conjecture from the passed starting number, returns the sequence and the time it took to compute. Used for performance tests.
    
    CLI Example:
    ```
    salt '*' test.collatz 3
    ```

salt.modules.test.conf_test()
    Return the value for test.foo in the minion configuration file, or return the default value
    
    CLI Example:
    ```
    salt '*' test.conf_test
    ```

salt.modules.test.cross_test(func, args=None)
    Execute a minion function via the __salt__ object in the test module, used to verify that the Minion functions can be called via the __salt__ module.
    
    CLI Example:
    ```
    salt '*' test.cross_test file.gid_to_group 0
    ```

salt.modules.test.deprecation_warning()
    Return True, but also produce two DeprecationWarnings. One by date, the other by the codename - release Oganesson, which should correspond to Salt 3108.
    
    CLI Example:
    ```
    salt \\ test.deprecation_warning
    ```

salt.modules.test.echo(text)
    Return a string - used for testing the connection
    
    CLI Example:
    ```
    salt '*' test.echo 'foo bar baz quo qux'
    ```

salt.modules.test.exception(message='Test Exception')
    Raise an exception
    
    Optionally provide an error message or output the full stack.
    
    CLI Example:
    ```
    salt '*' test.exception 'Oh noes!'
    ```

salt.modules.test.false_()
    Always return False
    
    CLI Example:
    ```
    salt '*' test.false
    ```

salt.modules.test.fib(num)
    Return the num-th Fibonacci number, and the time it took to compute in seconds. Used for performance tests.
    
    This function is designed to have terrible performance.
CLI Example:
```
salt '*' test.fib 3
```

salt.modules.test.get_opts()
Return the configuration options passed to this minion

CLI Example:
```
salt '*' test.get_opts
```

salt.modules.test.kwarg(“**kwargs”)
Print out the data passed into the function **kwargs, this is used to both test the publication data and CLI kwarg passing, but also to display the information available within the publication data.

CLI Example:
```
salt '*' test.kwarg num=1 txt="two" env='{a: 1, b: "hello"}'}
```

salt.modules.test.missing_func()

salt.modules.test.module_report()
Return a dict containing all of the execution modules with a report on the overall availability via different references

CLI Example:
```
salt '*' test.module_report
```

salt.modules.test.not_loaded()
List the modules that were not loaded by the salt loader system

CLI Example:
```
salt '*' test.not_loaded
```

salt.modules.test.opts_pkg()
Return an opts package with the grains and opts for this Minion. This is primarily used to create the options used for Master side state compiling routines

CLI Example:
```
salt '*' test.opts_pkg
```

salt.modules.test.outputter(data)
Test the outputter, pass in data to return

CLI Example:
```
salt '*' test.outputter foobar
```

salt.modules.test.ping()
Used to make sure the minion is up and responding. Not an ICMP ping.
Returns True.

CLI Example:
salt '*' test.ping

salt.modules.test.provider(module)
Pass in a function name to discover what provider is being used
CLI Example:
salt '*' test.provider service

salt.modules.test.providers()
Return a dict of the provider names and the files that provided them
CLI Example:
salt '*' test.providers

salt.modules.test.raise_exception(name, *args, **kwargs)
Raise an exception. Built-in exceptions and those in salt.exceptions can be raised by this test function. If no matching exception is found, then no exception will be raised and this function will return False.
This function is designed to test Salt's exception and return code handling.
CLI Example:
salt '*' test.raise_exception TypeError "An integer is required"
salt '*' test.raise_exception salt.exceptions.CommandExecutionError → "Something went wrong"

salt.modules.test.rand_sleep(max=60)
Sleep for a random number of seconds, used to test long-running commands and minions returning at differing intervals
CLI Example:
salt '*' test.rand_sleep 60

salt.modules.test.rand_str(size=9999999999, hash_type=None)
This function has been renamed to test.random_hash. This function will stay to ensure backwards compatibility, but please switch to using the preferred name test.random_hash.

salt.modules.test.random_hash(size=9999999999, hash_type=None)
New in version 2015.5.2.
Changed in version 2018.3.0: Function has been renamed from test.rand_str to test.random_hash
Generates a random number between 1 and size, then returns a hash of that number. If no hash_type is passed, the hash_type specified by the Minion's hash_type config option is used.
CLI Example:
salt '*' test.random_hash
salt '*' test.random_hash hash_type=sha512

salt.modules.test.retcode(code=42)
Test that the returncode system is functioning correctly
CLI Example:
salt '*i' test.retcode 42

salt.modules.test.sleep(length)
Instruct the minion to initiate a process that will sleep for a given period of time.

CLI Example:
```
salt '*i' test.sleep 20
```

salt.modules.test.stack()
Return the current stack trace

CLI Example:
```
salt '*i' test.stack
```

salt.modules.test.true_()
Always return True

CLI Example:
```
salt '*i' test.true
```

salt.modules.test.try_(module, return_try_exception=False, **kwargs)
Try to run a module command. On an exception return None. If return_try_exception is set to True, return the exception. This can be helpful in templates where running a module might fail as expected.

Jinja Example:
```
{% for i in range(0,230) %}
  {{ salt['test.try'](module='ipmi.get_users', bmc_host='172.2.2.'~'+i) | yaml(False) }}
{% endfor %}
```

salt.modules.test.tty(*args, **kwargs)
Deprecated! Moved to cmd.tty

CLI Example:
```
salt '*i' test.tty tty0 'This is a test'
salt '*i' test.tty pts3 'This is a test'
```

salt.modules.test.version()
Return the version of salt on the minion

CLI Example:
```
salt '*i' test.version
```

salt.modules.test.versions()
This function is an alias of versions_report. Returns versions of components used by salt

CLI Example:
salt.modules.test.versions_information()

Report the versions of dependent and system software

CLI Example:

```bash
salt '*' test.versions_information
```

salt.modules.test.versions_report()

Returns versions of components used by salt

CLI Example:

```bash
salt '*' test.versions_report
```

### 26.6.451 salt.modules.test_virtual

Module for testing that a __virtual__ function returning False will not be available via the Salt Loader.

salt.modules.test_virtual.ping()

### 26.6.452 salt.modules.testinframod

This module exposes the functionality of the TestInfra library for use with SaltStack in order to verify the state of your minions. In order to allow for the addition of new resource types in TestInfra this module dynamically generates wrappers for the various resources by iterating over the values in the __all__ variable exposed by the testinfra.modules namespace.

**exception** salt.modules.testinframod.InvalidArgumentError

salt.modules.testinframod.camel_to_snake_case(camel_input)

Converts camelCase (or CamelCase) to snake_case. From https://codereview.stackexchange.com/questions/185966/functions-to-convert-camelcase-strings-to-snake-case

Parameters

- **camel_input** (str) -- The camelcase or CamelCase string to convert to snake_case

  :return str

salt.modules.testinframod.snake_to_camel_case(snake_input, uppercamel=False)

Converts snake_case to camelCase (or CamelCase if uppercamel is True). Inspired by https://codereview.stackexchange.com/questions/85311/transform-snake-case-to-camelcase

Parameters

- **snake_input** (str) -- The input snake_case string to convert to camelCase
- **uppercamel** (bool) -- Whether or not to convert to CamelCase instead

  :return str
26.6.453 salt.modules.textfsm_mod

TextFSM

New in version 2018.3.0.

Execution module that processes plain text and extracts data using TextFSM templates. The output is presented in JSON serializable data, and can be easily re-used in other modules, or directly inside the renderer (Jinja, Mako, Genshi, etc.).

depends

• textfsm Python library

Note: Install textfsm library: pip install textfsm.

salt.modules.textfsm_mod.extract(template_path, raw_text=None, raw_text_file=None, saltenv='base')

Extracts the data entities from the unstructured raw text sent as input and returns the data mapping, processing using the TextFSM template.

template_path
The path to the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:

• salt://, to fetch the template from the Salt fileserver.
• http:// or https://
• ftp://
• s3://
• swift://

raw_text: None
The unstructured text to be parsed.

raw_text_file: None
Text file to read, having the raw text to be parsed using the TextFSM template. Supports the same URL schemes as the template_path argument.

saltenv: base
Salt fileserver environment from which to retrieve the file. Ignored if template_path is not a salt:// URL.

CLI Example:

salt '*' textfsm.extract salt://textfsm/juniper_version_template raw_text_\file=s3://junos_ver.txt
salt '*' textfsm.extract http://some-server/textfsm/juniper_version_\template raw_text='Hostname: router.abc ... snip ...'

Jinja template example:

{% set raw_text = 'Hostname: router.abc ... snip ...' %}
{% set textfsm_extract = salt.textfsm.extract('https://some-server/\template/juniper_version_template', raw_text) %}

Raw text example:

Hostname: router.abc
Model: mx960
JUNOS Base OS boot [9.1S3.5]
JUNOS Base OS Software Suite [9.1S3.5]

(continues on next page)
TextFSM Example:

```
Value Chassis (\S+)
Value Required Model (\S+)
Value Boot (.*
Value Base (.*
Value Kernel (.*
Value Crypto (.*
Value Documentation (.*
Value Routing (.*

Start
# Support multiple chassis systems.
  ^\S+:$$ -> Continue.Record
  ^${Chassis}:$$
  ^Model: ${Model}
  ^JUNOS Base OS boot \[${Boot}\]
  ^JUNOS Software Release \[${Base}\]
  ^JUNOS Base OS Software Suite \[${Base}\]
  ^JUNOS Kernel Software Suite \[${Kernel}\]
  ^JUNOS Crypto Software Suite \[${Crypto}\]
  ^JUNOS Online Documentation \[${Documentation}\]
  ^JUNOS Routing Software Suite \[${Routing}\]

Output example:

```json```

```json```

```
{  
  "comment": "",  
  "result": true,  
  "out": [  
    {  
      "kernel": "9.1S3.5",  
      "documentation": "9.1S3.5",  
      "boot": "9.1S3.5",  
      "crypto": "9.1S3.5",  
      "chassis": "",  
      "routing": "9.1S3.5",  
      "base": "9.1S3.5",  
      "model": "mx960"
    }
  ]
}
```

```python```
salt.modules.textfsm_mod.index(command, platform=None, platform_grain_name=None,  
platform_column_name=None, output=None, output_file=None,  
textfsm_path=None, index_file=None, saltenv='base',  
include_empty=False, include_pat=None, exclude_pat=None)
Dynamically identify the template required to extract the information from the unstructured raw text.

The output has the same structure as the `extract` execution function, the difference being that `index` is capable to identify what template to use, based on the platform details and the `command`.

**command**
- The command executed on the device, to get the output.

**platform**
- The platform name, as defined in the TextFSM index file.

**platform_grain_name**
- The name of the grain used to identify the platform name in the TextFSM index file.

*Note:* For ease of use, it is recommended to define the TextFSM index file with values that can be matched using the grains.

**platform_column_name:** `Platform`
- The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: `Platform`.

*Note:* This field is case sensitive, make sure to assign the correct value to this option, exactly as defined in the index file.

*Note:* This option can be also specified in the minion configuration file or pillar as `textfsm_platform_column_name`.

**output**
- The raw output from the device, to be parsed and extract the structured data.

**output_file**
- The path to a file that contains the raw output from the device, used to extract the structured data. This option supports the usual Salt-specific schemes: `file://, salt://, http://, https://, ftp://, s3://, swift://`.

**textfsm_path**
- The path where the TextFSM templates can be found. This can be either absolute path on the server, either specified using the following URL schemes: `file://, salt://, http://, https://, ftp://, s3://, swift://`.

*Note:* This needs to be a directory with a flat structure, having an index file (whose name can be specified using the `index_file` option) and a number of TextFSM templates.

*Note:* This option can be also specified in the minion configuration file or pillar as `textfsm_path`. 

---

26.6. execution modules
**index_file:** index

The name of the TextFSM index file, under the textfsm_path. Default: index.

**Note:** This option can be also specified in the minion configuration file or pillar as textfsm_index_file.

**saltenv:** base

Salt fileserver environment from which to retrieve the file. Ignored if textfsm_path is not a salt:// / URL.

**include_empty:** False

Include empty files under the textfsm_path.

**include_pat**

Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

**exclude_pat**

Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

**Note:** If used with include_pat, files matching this pattern will be excluded from the subset of files defined by include_pat.

**CLI Example:**

```
salt '*' textfsm.index 'sh ver' platform=Juniper output_file=salt://textfsm/juniper_version_example textfsm_path=salt://textfsm/
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_example textfsm_path=ftp://textfsm/ platform_column_name=Vendor
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_example textfsm_path=https://some-server/textfsm/ platform_column_name=Vendor platform_grain_name=vendor
```

TextFSM index file example:

```
salt://textfsm/index
```

Template, Hostname, Vendor, Command

```
juniper_version_template, .*, Juniper, sh[[ow]] ve[[rsion]]
```

The usage can be simplified, by defining (some of) the following options: textfsm_platform_grain, textfsm_path, textfsm_platform_column_name, or textfsm_index_file, in the (proxy) minion configuration file or pillar.

**Configuration example:**

```
textfsm_platform_grain: vendor
textfsm_path: salt://textfsm/
textfsm_platform_column_name: Vendor
```

And the CLI usage becomes as simple as:

```
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_example
```

Usage inside a Jinja template:
26.6.454 salt.modules.timezone

Module for managing timezone on POSIX-like systems.

**salt.modules.timezone.get_hwclock()**
Get current hardware clock setting (UTC or localtime)

CLI Example:
```
salt '*' timezone.get_hwclock
```

**salt.modules.timezone.get_offset()**
Get current numeric timezone offset from UTC (i.e. -0700)

CLI Example:
```
salt '*' timezone.get_offset
```

**salt.modules.timezone.get_zone()**
Get current timezone (i.e. America/Denver)

Changed in version 2016.11.4.

Note: On AIX operating systems, Posix values can also be returned 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'

CLI Example:
```
salt '*' timezone.get_zone
```

**salt.modules.timezone.get_zonecode()**
Get current timezone (i.e. PST, MDT, etc)

CLI Example:
```
salt '*' timezone.get_zonecode
```

**salt.modules.timezone.set_hwclock(clock)**
Sets the hardware clock to be either UTC or localtime

CLI Example:
```
salt '*' timezone.set_hwclock UTC
```

**salt.modules.timezone.set_zone(timezone)**
Unlinks, then symlinks /etc/localtime to the set timezone.

The timezone is crucial to several system processes, each of which SHOULD be restarted (for instance, whatever you system uses as its cron and syslog daemons). This will not be automagically done and must be done manually!

CLI Example:
salt '*' timezone.set_zone 'America/Denver'

Changed in version 2016.11.4.

**Note:** On AIX operating systems, Posix values are also allowed, see below

salt '*' timezone.set_zone 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'

salt.modules.timezone.zone_compare(timezone)

Compares the given timezone name with the system timezone name. Checks the hash sum between the given timezone, and the one set in /etc/localtime. Returns True if names and hash sums match, and False if not. Mostly useful for running state checks.

Changed in version 2016.3.0.

**Note:** On Solaris-like operating systems only a string comparison is done.

Changed in version 2016.11.4.

**Note:** On AIX operating systems only a string comparison is done.

CLI Example:

```bash
salt '*' timezone.zone_compare 'America/Denver'
```

### 26.6.455 salt.modules.tls

A salt module for SSL/TLS. Can create a Certificate Authority (CA) or use Self-Signed certificates.

**depends**

PyOpenSSL Python module (0.10 or later, 0.14 or later for X509 extension support)

**configuration**

Add the following values in /etc/salt/minion for the CA module to function properly:

```
cert_base_path: '/etc/pki'
```

CLI Example #1: Creating a CA, a server request and its signed certificate:

```
# salt-call tls.create_ca my_little \
days=5 \nCN='My Little CA' \nC=US \nST=Utah \nL=Salt Lake City \nO=Saltstack \nemailAddress=pleasedontemail@example.com
```

Created Private Key: "/etc/pki/my_little/my_little_ca_cert.key"
Created CA "my_little_ca": "/etc/pki/my_little_ca/my_little_ca_cert.crt"

(continues on next page)
# salt-call tls.create_csr my_little CN=www.example.com
Created Private Key: "/etc/pki/my_little/certs/www.example.com.key"
Created CSR for "www.example.com": "/etc/pki/my_little/certs/www.example.com.csr"

# salt-call tls.create_ca_signed_cert my_little CN=www.example.com
Created Certificate for "www.example.com": /etc/pki/my_little/certs/www.example.com.crt"

CLI Example #2: Creating a client request and its signed certificate

# salt-call tls.create_csr my_little CN=DBReplica_No.1 cert_type=client
Created Private Key: "/etc/pki/my_little/certs/DBReplica_No.1.key"
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.csr"

# salt-call tls.create_ca_signed_cert my_little CN=DBReplica_No.1
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt"

CLI Example #3: Creating both a server and client req + cert for the same CN

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 cert_type=client
Created Private Key: "/etc/pki/my_little/certs/DBReplica_No.2.key"
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.2.client.csr"

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Certificate "MasterDBReplica_No.2" already exists
(doh!)

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 cert_type=server
cert_type=server 
Certificate "MasterDBReplica_No.2" already exists

(doh!)

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2 
cert_type=server type_ext=True
Certificate "MasterDBReplica_No.2" already exists

(DOH!)
Created Certificate for "MasterDBReplica_No.2": "/etc/pki/my_little/certs/MasterDBReplica_No.2_server.crt"

CLI Example #4: Create a server req + cert with non-CN filename for the cert

```bash
# salt-call tls.create_csr my_little CN=www.anothersometh.ing 
  cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/www.anothersometh.ing_server.key"
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/www.anothersometh.ing_server.csr"

# salt-call tls_create_ca_signed_cert my_little CN=www.anothersometh.ing 
  cert_type=server cert_filename="something_completely_different"
Created Certificate for "www.anothersometh.ing": /etc/pki/my_little/certs/something_completely_different.crt
```

salt.modules.tls.ca_exists(ca_name, cacert_path=None, ca_filename=None)

Verify whether a Certificate Authority (CA) already exists

- ca_name
  name of the CA
- cacert_path
  absolute path to ca certificates root directory
- ca_filename
  alternative filename for the CA

New in version 2015.5.3.

CLI Example:

```bash
salt '*' tls.ca_exists test_ca /etc/certs
```

salt.modules.tls.cert_base_path(cacert_path=None)

Return the base path for certs from CLI or from options

- cacert_path
  absolute path to ca certificates root directory

CLI Example:

```bash
salt '*' tls.cert_base_path
```

salt.modules.tls.cert_info(cert, digest='sha256')

Return information for a particular certificate

- cert
  path to the certificate PEM file or string

Changed in version 2018.3.4.

- digest
  what digest to use for fingerprinting

CLI Example:

```bash
salt '*' tls.cert_info /dir/for/certs/cert.pem
```

salt.modules.tls.create_ca(ca_name, bits=2048, days=365, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, fixmode=False, cacert_path=None, ca_filename=None, digest='sha256', onlyif=None, unless=None, replace=False)
Create a Certificate Authority (CA)

**ca_name**
- name of the CA

**bits**
- number of RSA key bits, default is 2048

**days**
- number of days the CA will be valid, default is 365

**CN**
- common name in the request, default is "localhost"

**C**
- country, default is "US"

**ST**
- state, default is "Utah"

**L**
- locality, default is "Centerville", the city where SaltStack originated

**O**
- organization, default is "SaltStack"

**OU**
- organizational unit, default is None

**emailAddress**
- email address for the CA owner, default is None

**cacert_path**
- absolute path to ca certificates root directory

**ca_filename**
- alternative filename for the CA

New in version 2015.5.3.

**digest**
- The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

**replace**
- Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a CA certificate based upon defined config values. If the file already exists, the function just returns assuming the CA certificate already exists.

If the following values were set:

```python
ca.cert_base_path='/etc/pki'
ca_name='koji'
```

the resulting CA, and corresponding key, would be written in the following location with appropriate permissions:

```text
/etc/pki/koji/koji_ca_cert.crt
/etc/pki/koji/koji_ca_cert.key
```

CLI Example:

```bash
salt '*' tls.create_ca test_ca
```

```python
salt.modules.tls.create_ca_signed_cert(ca_name, CN, days=365, cacert_path=None, ca_filename=None, cert_path=None, cert_filename=None, digest='sha256', cert_type=None, type_ext=False, replace=False)
```
Create a Certificate (CERT) signed by a named Certificate Authority (CA)

If the certificate file already exists, the function just returns assuming the CERT already exists.

The CN must match an existing CSR generated by create_csr. If it does not, this method does nothing.

c_a_name
  name of the CA

CN
  common name matching the certificate signing request

days
  number of days certificate is valid, default is 365 (1 year)

cacert_path
  absolute path to ca certificates root directory

c_a_filename
  alternative filename for the CA

New in version 2015.5.3.

cert_path
  full path to the certificates directory

cert_filename
  alternative filename for the certificate, useful when using special characters in the CN. If this option is
set it will override the certificate filename output effects of cert_type. type_ext will be completely
overridden.

New in version 2015.5.3.

digest
  The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by
EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

replace
  Replace this certificate even if it exists

New in version 2015.5.1.

cert_type
  string. Either 'server' or 'client' (see create_csr() for details).

  If create_csr(type_ext=True) this function must be called with the same cert_type so it can find the CSR
file.

Note:  create_csr() defaults to cert_type='server'; therefore, if it was also called with type_ext, cert_type
becomes a required argument for create_ca_signed_cert()

type_ext
  bool. If set True, use cert_type as an extension to the CN when formatting the filename.
  e.g.: some_subject_CN_server.crt or some_subject_CN_client.crt

  This facilitates the context where both types are required for the same subject

  If cert_filename is not None, setting type_ext has no effect

If the following values were set:

ca.cert_base_path='/etc/pki'
cia_name='koji'
CN='test.egavas.org'

the resulting signed certificate would be written in the following location:
CLI Example:

```
salt '*' tls.create_ca_signed_cert test localhost
```

salt.modules.tls.create_csr(ca_name, bits=2048, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, subjectAltName=None, cacert_path=None, ca_filename=None, csr_path=None, csr_filename=None, digest='sha256', type_ext=False, cert_type='server', replace=False)

Create a Certificate Signing Request (CSR) for a particular Certificate Authority (CA)

- **ca_name**: name of the CA
- **bits**: number of RSA key bits, default is 2048
- **CN**: common name in the request, default is "localhost"
- **C**: country, default is "US"
- **ST**: state, default is "Utah"
- **L**: locality, default is "Centerville", the city where SaltStack originated
- **O**: organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised
- **OU**: organizational unit, default is None
- **emailAddress**: email address for the request, default is None
- **subjectAltName**: valid subjectAltNames in full form, e.g. to add DNS entry you would call this function with this value:

  examples: `['DNS:somednsname.com', 'DNS:1.2.3.4', 'IP:1.2.3.4', 'IP:2001:4801:7821:77:be76:4eff:fe11:e51', 'email:me@i.like.pie.com']`

**Note:** some libraries do not properly query IP: prefixes, instead looking for the given req. source with a DNS: prefix. To be thorough, you may want to include both DNS: and IP: entries if you are using subjectAltNames for destinations for your TLS connections. e.g.: requests to `https://1.2.3.4` will fail from python's requests library w/out the second entry in the above list

New in version 2015.8.0.

- **cert_type**: Specify the general certificate type. Can be either server or client. Indicates the set of common extensions added to the CSR.

  - **server**: {
    'basicConstraints': 'CA:FALSE',
    'extendedKeyUsage': 'serverAuth',
    'keyUsage': 'digitalSignature, keyEncipherment'
  }

  - **client**: {
    'basicConstraints': 'CA:FALSE',
  }

(continues on next page)
'extendedKeyUsage': 'clientAuth',
'keyUsage': 'nonRepudiation, digitalSignature, keyEncipherment'
}

**type_ext**

boolean. Whether or not to extend the filename with CN_[cert_type] This can be useful if a server and client certificate are needed for the same CN. Defaults to False to avoid introducing an unexpected file naming pattern.

The files normally named some_subject_CN.csr and some_subject_CN.key will then be saved.

**replace**

Replace this signing request even if it exists.

New in version 2015.5.1.

Writes out a Certificate Signing Request (CSR) If the file already exists, the function just returns assuming the CSR already exists.

If the following values were set:

c.a.cert_base_path='/etc/pki'
c.ca_name='koji'
c.CN='test.egavas.org'

the resulting CSR, and corresponding key, would be written in the following location with appropriate permissions:

/etc/pki/koji/certs/test.egavas.org.csr
/etc/pki/koji/certs/test.egavas.org.key

CLI Example:

```shell
salt '*' tls.create_csr test
```

**salt.modules.tls.create_empty_crl** *(ca_name, cacert_path=None, ca_filename=None, crl_file=None, digest='sha256')*

Create an empty Certificate Revocation List.

New in version 2015.8.0.

**ca_name**

name of the CA

**cacert_path**

absolute path to ca certificates root directory

**ca_filename**

alternative filename for the CA

New in version 2015.5.3.

**crl_file**

full path to the CRL file

**digest**

The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

CLI Example:

```shell
salt '*' tls.create_empty_crl ca_name='koji' ca_filename='ca' crl_file='/etc/openvpn/team1/crl.pem'
```
salt.modules.tls.create_pkcs12(ca_name, CN, passphrase='', cacert_path=None, replace=False)

Create a PKCS#12 browser certificate for a particular Certificate (CN)

c_a_name
name of the CA

CN
common name matching the certificate signing request

passphrase
used to unlock the PKCS#12 certificate when loaded into the browser

cacert_path
absolute path to ca certificates root directory

replace
Replace this certificate even if it exists

New in version 2015.5.1.

If the following values were set:

c_a.cert_base_path='/etc/pki'
c_a_name='koji'
CN='test.egavas.org'

the resulting signed certificate would be written in the following location:

/etc/pki/koji/certs/test.egavas.org.p12

CLI Example:

```
salt '*' tls.create_pkcs12 test localhost
```

salt.modules.tls.create_self_signed_cert(tls_dir='tls', bits=2048, days=365, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, cacert_path=None, cert_filename=None, digest='sha256', replace=False)

Create a Self-Signed Certificate (CERT)

tls_dir
location appended to the ca.cert_base_path, default is 'tls'

bits
number of RSA key bits, default is 2048

CN
common name in the request, default is "localhost"

C
country, default is "US"

ST
state, default is "Utah"

L
locality, default is "Centerville", the city where SaltStack originated

O
organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised

OU
organizational unit, default is None

emailAddress
email address for the request, default is None

cacert_path
absolute path to ca certificates root directory

digest
The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by
EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

replace
Replace this certificate even if it exists

New in version 2015.5.1.
Wipes out a Self-Signed Certificate (CERT). If the file already exists, the function just returns.

If the following values were set:

| ca.cert_base_path= '/etc/pki' |
| tls_dir= 'koji' |
| CN= 'test.egavas.org' |

the resulting CERT, and corresponding key, would be written in the following location with appropriate permissions:

| /etc/pki/koji/certs/test.egavas.org.crt |
| /etc/pki/koji/certs/test.egavas.org.key |

CLI Example:

```
salt '*' tls.create_self_signed_cert
```

Passing options from the command line:

```
salt 'minion' tls.create_self_signed_cert CN='test.mysite.org'
```

salt.modules.tls.get_ca(ca_name, as_text=False, cacert_path=None)
Get the certificate path or content

| ca_name       |
| name of the CA |
| as_text       |
| if true, return the certificate content instead of the path |
| cacert_path   |
| absolute path to ca certificates root directory |

CLI Example:

```
salt '*' tls.get_ca test_ca as_text=False cacert_path=/etc/certs
```

salt.modules.tls.get_ca_signed_cert(ca_name, CN='localhost', as_text=False, cacert_path=None, cert_filename=None)
Get the certificate path or content

| ca_name       |
| name of the CA |
| CN            |
| common name of the certificate |
| as_text       |
| if true, return the certificate content instead of the path |
| cacert_path   |
| absolute path to certificates root directory |
| cert_filename |
| alternative filename for the certificate, useful when using special characters in the CN |

New in version 2015.5.3.

CLI Example:
salt.modules.tls.get_ca_signed_cert

Get the certificate path or content

cert
c
name of the CA

CN
common name of the certificate

as_text
if true, return the certificate content instead of the path

CACERT
absolute path to certificates root directory

key_filename
alternative filename for the key, useful when using special characters

New in version 2015.5.3.

CLI Example:
salt '*' tls.get_ca_signed_cert test_ca CN=localhost as_text=False cacert_path=/etc/certs

salt.modules.tls.get_ca_signed_key

Get the certificate path or content

cert
name of the CA

CN
common name of the certificate

as_text
if true, return the certificate content instead of the path

CACERT
absolute path to certificates root directory

key_filename
alternative filename for the key, useful when using special characters

New in version 2015.5.3.

CLI Example:
salt '*' tls.get_ca_signed_key test_ca CN=localhost as_text=False cacert_path=/etc/certs

salt.modules.tls.get_expiration_date

Get a certificate's expiration date

cert
Full path to the certificate

date_format
By default this will return the expiration date in YYYY-MM-DD format, use this to specify a different strftime format string. Note that the expiration time will be in UTC.

CLI Examples:
salt '*' tls.get_expiration_date /path/to/foo.crt
salt '*' tls.get_expiration_date /path/to/foo.crt date_format='%d/%m/%Y'

salt.modules.tls.get_extensions

Fetch X509 and CSR extension definitions from tls:extensions: (common|server|client) or set them to standard defaults.

New in version 2015.8.0.

cert_type:
The type of certificate such as server or client.

CLI Example:
salt '*' tls.get_extensions client

salt.modules.tls.maybe_fix_ssl_version

Check that the X509 version is correct (was incorrectly set in previous salt versions). This will fix the version if needed.

cert
ca authority name
**cacert_path**
absolute path to ca certificates root directory

**ca_filename**
alternative filename for the CA

New in version 2015.5.3.

CLI Example:
```
salt '*' tls.maybe_fix_ssl_version test_ca /etc/certs
```

**salt.modules.tls.revoke_cert**(ca_name, CN, cacert_path=None, ca_filename=None, cert_path=None, cert_filename=None, crl_file=None, digest='sha256')

Revoke a certificate.

New in version 2015.8.0.

**ca_name**
Name of the CA.

**CN**
Common name matching the certificate signing request.

**cacert_path**
Absolute path to ca certificates root directory.

**ca_filename**
Alternative filename for the CA.

**cert_path**
Path to the cert file.

**cert_filename**
Alternative filename for the certificate, useful when using special characters in the CN.

**crl_file**
Full path to the CRL file.

**digest**
The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

CLI Example:
```
salt '*' tls.revoke_cert ca_name='koji' ca_filename='ca' crl_file='/etc/openvpn/team1/crl.pem'
```

**salt.modules.tls.set_ca_path**(cacert_path)

If wanted, store the aforementioned cacert_path in context to be used as the basepath for further operations

CLI Example:
```
salt '*' tls.set_ca_path /etc/certs
```

**salt.modules.tls.validate**(cert, ca_name, crl_file)

New in version 3000.

Validate a certificate against a given CA/CRL.

**cert**
path to the certificate PEM file or string

**ca_name**
name of the CA

**crl_file**
full path to the CRL file
26.6.456  salt.modules.tomcat

Support for Tomcat

This module uses the manager webapp to manage Apache tomcat webapps. If the manager webapp is not configured some of the functions won’t work.

configuration

- Java bin path should be in default path
- If ipv6 is enabled make sure you permit manager access to ipv6 interface "0:0:0:0:0:0:0:1"
- If you are using tomcat.tar.gz it has to be installed or symlinked under /opt, preferably using name tomcat
- "tomcat.signal start/stop" works but it does not use the startup scripts

The following grains/pillar should be set:

```
tomcat-manager:
  user: <username>
  passwd: <password>
```

or the old format:

```
tomcat-manager.user: <username>
tomcat-manager.passwd: <password>
```

Also configure a user in the conf/tomcat-users.xml file:

```
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
  <role rolename="manager-script"/>
  <user username="tomcat" password="tomcat" roles="manager-script"/>
</tomcat-users>
```

Note:

- if you use only this module for deployments you’ve might want to strict access to the manager only from localhost for more info: http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access
- Tested on:
  JVM Vendor:
    Sun Microsystems Inc.
  JVM Version:
    1.6.0_43-b01
  OS Architecture:
    amd64
  OS Name:
    Linux
  OS Version:
    2.6.32-358.el6.x86_64
salt.modules.tomcat.deploy_war

Deploy a WAR file

```
salt '*' tomcat.deploy_war salt://salt-2015.8.6.war version=2015.08.
```

CLI Examples:

cp module

```
salt '*' tomcat.deploy_war salt://application.war /api
salt '*' tomcat.deploy_war salt://application.war /api no
salt '*' tomcat.deploy_war salt://application.war /api yes http://localhost:8080/manager
```

minion local file system

```
salt '*' tomcat.deploy_war /tmp/application.war /api
salt '*' tomcat.deploy_war /tmp/application.war /api no
salt '*' tomcat.deploy_war /tmp/application.war /api yes http://localhost:8080/manager
```

salt.modules.tomcat.extract_war_version

Extract the version from the war file name. There does not seem to be a standard for encoding the version into the war file name

Examples:
salt.modules.tomcat.fullversion()

Return all server information from catalina.sh version

CLI Example:

```
salt '*' tomcat.fullversion
```

salt.modules.tomcat.leaks(url='http://localhost:8080/manager', timeout=180)

Find memory leaks in tomcat

```
url [http://localhost:8080/manager] the URL of the server manager webapp

timeout [180] timeout for HTTP request
```

CLI Examples:

```
salt '*' tomcat.leaks
```

salt.modules.tomcat.ls(url='http://localhost:8080/manager', timeout=180)

list all the deployed webapps

```
url [http://localhost:8080/manager] the URL of the server manager webapp

timeout [180] timeout for HTTP request
```

CLI Examples:

```
salt '*' tomcat.ls
salt '*' tomcat.ls http://localhost:8080/manager
```

salt.modules.tomcat.passwd(passwd, user='', alg='sha1', realm=None)

This function replaces the $CATALINA_HOME/bin/digest.sh script convert a clear-text password to the
$CATALINA_BASE/conf/tomcat-users.xml format

CLI Examples:

```
salt '*' tomcat.passwd secret
salt '*' tomcat.passwd secret tomcat sha1 'Protected Realm'
```

salt.modules.tomcat.reload_(app, url='http://localhost:8080/manager', timeout=180)

Reload the webapp

```
app the webapp context path

url [http://localhost:8080/manager] the URL of the server manager webapp

timeout [180] timeout for HTTP request
```

CLI Examples:

```
salt '*' tomcat.reload /jenkins
salt '*' tomcat.reload /jenkins http://localhost:8080/manager
```
salt.modules.tomcat.serverinfo(url='http://localhost:8080/manager', timeout=180)

return details about the server

url
[http://localhost:8080/manager] the URL of the server manager webapp
timeout
[180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.serverinfo
salt '*' tomcat.serverinfo http://localhost:8080/manager
```

salt.modules.tomcat.sessions(app, url='http://localhost:8080/manager', timeout=180)

return the status of the webapp sessions

app
the webapp context path
url
[http://localhost:8080/manager] the URL of the server manager webapp
timeout
[180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.sessions /jenkins
salt '*' tomcat.sessions /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.signal(signal=None)
Signals catalina to start, stop, securestart, forcestop.

CLI Example:

```
salt '*' tomcat.signal start
```

salt.modules.tomcat.start(app, url='http://localhost:8080/manager', timeout=180)
Start the webapp

app
the webapp context path
url
[http://localhost:8080/manager] the URL of the server manager webapp
timeout
timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.start /jenkins
salt '*' tomcat.start /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.status(url='http://localhost:8080/manager', timeout=180)

Used to test if the tomcat manager is up

url
[http://localhost:8080/manager] the URL of the server manager webapp
timeout
[180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.status
salt '*' tomcat.status http://localhost:8080/manager
```
salt.modules.tomcat.status_webapp(app, url='http://localhost:8080/manager', timeout=180)

return the status of the webapp (stopped | running | missing)

app
the webapp context path

url
[http://localhost:8080/manager] the URL of the server manager webapp

timeout
[180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.status_webapp /jenkins
salt '*' tomcat.status_webapp /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.stop(app, url='http://localhost:8080/manager', timeout=180)

Stop the webapp

app
the webapp context path

url
[http://localhost:8080/manager] the URL of the server manager webapp

timeout
[180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.stop /jenkins
salt '*' tomcat.stop /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.undeploy(app, url='http://localhost:8080/manager', timeout=180)

Undeploy a webapp

app
the webapp context path

url
[http://localhost:8080/manager] the URL of the server manager webapp

timeout
[180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.undeploy /jenkins
salt '*' tomcat.undeploy /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.version()

Return server version from catalina.sh version

CLI Example:

```
salt '*' tomcat.version
```
26.6.457  salt.modules.trafficserver

Apache Traffic Server execution module.

New in version 2015.8.0.

*traffic_ctl* is used to execute individual Traffic Server commands and to script multiple commands in a shell.

salt.modules.trafficserver.alarms()

List all alarm events that have not been acknowledged (cleared).

    salt '*' trafficserver.alarms

salt.modules.trafficserver.bounce_cluster()

    salt '*' trafficserver.bounce_cluster

salt.modules.trafficserver.bounce_local(drain=False)

    drone

    This option modifies the restart behavior such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

    salt '*' trafficserver.bounce_local
    salt '*' trafficserver.bounce_local drain=True

salt.modules.trafficserver.clear_alarms(alarm)

Clear (acknowledge) an alarm event. The arguments are “all” for all current alarms, a specific alarm number (e.g. “1”), or an alarm string identifier (e.g. “MGMT_ALARM_PROXY_CONFIG_ERROR”).

    salt '*' trafficserver.clear_alarms [all | #event | name]

salt.modules.trafficserver.clear_cluster()

Clears accumulated statistics on all nodes in the cluster.

    salt '*' trafficserver.clear_cluster

salt.modules.trafficserver.clear_node()

Clears accumulated statistics on the local node.

    salt '*' trafficserver.clear_node

salt.modules.trafficserver.match_config(regex)

Display the current values of all configuration variables whose names match the given regular expression.

New in version 2016.11.0.

    salt '*' trafficserver.match_config regex
salt.modules.trafficserver.match_metric(regex)
    Display the current values of all metrics whose names match the given regular expression.
    New in version 2016.11.0.

    ```text
    salt '*' trafficserver.match_metric regex
    ```

salt.modules.trafficserver.offline(path)
    Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in storage.config. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the traffic_server process.

    ```text
    salt '*' trafficserver.offline /path/to/cache
    ```

salt.modules.trafficserver.read_config(*args)
    Read Traffic Server configuration variable definitions.
    New in version 2016.11.0.

    ```text
    salt '*' trafficserver.read_config proxy.config.http.keep_alive_post_out
    ```

salt.modules.trafficserver.read_metric(*args)
    Read Traffic Server one or more metrics.
    New in version 2016.11.0.

    ```text
    salt '*' trafficserver.read_metric proxy.process.http.tcp_hit_count_stat
    ```

salt.modules.trafficserver.refresh()
    Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

    The timestamp of the last reconfiguration event (in seconds since epoch) is published in the proxy.node.config.reconfigure_time metric.

    ```text
    salt '*' trafficserver.refresh
    ```

salt.modules.trafficserver.restart_cluster()
    Restart the traffic_manager process and the traffic_server process on all the nodes in a cluster.

    ```text
    salt '*' trafficserver.restart_cluster
    ```

salt.modules.trafficserver.restart_local(drain=False)
    Restart the traffic_manager and traffic_server processes on the local node.

    * drain
      This option modifies the restart behavior such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

    ```text
    salt '*' trafficserver.restart_local
    salt '*' trafficserver.restart_local drain=True
    ```

salt.modules.trafficserver.set_config(variable, value)
    Set the value of a Traffic Server configuration variable.
variable
   Name of a Traffic Server configuration variable.
value
   The new value to set.
New in version 2016.11.0.

```
salt '*' trafficserver.set_config proxy.config.http.keep_alive_post_out 0
```

```
salt.modules.trafficserver.shutdown()
   Shut down Traffic Server on the local node.
```

```
salt.modules.trafficserver.start()
   Start Traffic Server on the local node.
```

```
salt.modules.trafficserver.status()
   Show the current proxy server status, indicating if we're running or not.
```

```
salt.modules.trafficserver.zero_cluster()
   Reset performance statistics to zero across the cluster.
```

```
salt.modules.trafficserver.zero_node()
   Reset performance statistics to zero on the local node.
```

### 26.6.458 salt.modules.transactional_update module

**Transactional update**

New in version 3004.

A transactional system, like MicroOS, can present some challenges when the user decided to manage it via Salt.

MicroOS provides a read-only rootfs and a tool, transactional-update, that takes care of the management of the system (updating, upgrading, installation or reboot, among others) in an atomic way.

Atomicity is the main feature of MicroOS, and to guarantee this property, this model leverages snapper, zypper, btrfs and overlayfs to create snapshots that will be updated independently of the currently running system, and that are activated after the reboot. This implies, for example, that some changes made on the system are not visible until the next reboot, as those changes are living in a different snapshot of the file system.

This model presents a lot of problems with the traditional Salt model, where the inspections (like 'is this package installed?') are executed in order to determine if a subsequent action is required (like 'install this package').

Let's consider this use case, to see how it works on a traditional system, and in a transactional system:

1) Check if apache is installed
2) If it is not installed, install it

3) Check that a vhost is configured for apache

4) Make sure that apache2.service is enabled

5) If the configuration changes, restart apache2.service

In the traditional system everything will work as expected. The system can see if the package is present or not, install it if it isn’t, and a re-check will shows that is already present. The same will happen to the configuration file in /etc/apache2, that will be available as soon the package gets installed. Salt can inspect the current form of this file, and add the missing bits if required. Salt can annotate that a change is present, and restart the service.

In a transactional system we will have multiple issues. The first one is that Salt can only see the content of the snapshot where the system booted from. Later snapshots may contain different content, including the presence of apache. If Salt decides to install apache calling zypper, it will fail, as this will try to write into the read-only rootfs. Even if Salt would call transactional-update pkg install, the package would only be present in the new transaction (snapshot), and will not be found in the currently running system when later Salt tries to validate the presence of the package in the current one.

Any change in /etc alone will have also problems, as the changes will be alive in a different overlay, only visible after the reboot. And, finally, the service can only be enabled and restarted if the service file is already present in the current /etc.

**General strategy**

`transactional-update` is the reference tool used for the administration of transactional systems. Newer versions of this tool support the execution of random commands in the new transaction, the continuation of a transaction, the automatic detection of changes in new transactions and the merge of /etc overlays.

**Continue a transaction**

One prerequisite already present is the support for branching from a different snapshot than the current one in snapper.

With this feature we can represent in `transactional-update` the action of creating a transaction snapshot based on one that is planned to be the active one after the reboot. This feature removes a lot of user complains (like, for example, losing changes that are stored in a transaction not yet activated), but also provide a more simple model to work with.

So, for example, if the user have this scenario:

```
+--------+ *========+ +---V---+
| T.1    | | T.2 | | T.3 |
+--------+ *========+ +---A---+
```

where T.2 is the current active one, and T.3 is an snapshot generated from T.2 with a new package (apache2), and is marked to be the active after the reboot.

Previously, if the user (that is still on T.2) created a new transaction, maybe for adding a new package (tomcat, for example), the new T.4 will be based on the content of T.2 again, and not T.3, so the new T.4 will have lost the changes of T.3 (i.e. apache2 will not be present in T.4).

With the `--continue` parameter, `transactional-update` will create T.4 based on T.3, and nothing will be lost.
Command execution inside a new transaction

With `transactional-update run` we will create a new transaction based on the current one (T.2), where we can send interactive commands that can modify the new transaction, and as commented, with `transactional-update --continue run`, we will create a new transaction based on the last created (T.3).

The `run` command can execute any application inside the new transaction namespace. This module uses this feature to execute the different Salt execution modules, via `call()`. Or even the full `salt-thin` or `salt-call` via `sls()`, `apply()`, `single()` or `highstate`.

`transactional-update` will drop empty snapshots

The option `--drop-if-no-change` is used to detect whether there is any change in the file system on the read-only subvolume of the new transaction will be added. If a change is present, the new transaction will remain, if not it will be discarded.

For example:

```
transactional-update --continue --drop-if-no-change run zypper in apache2
```

If we are in the scenario described before, `apache2` is already present in T.3. In this case a new transaction, T.4, will be created based on T.3, `zypper` will detect that the package is already present and no change will be produced on T.4. At the end of the execution, `transactional-update` will validate that T.3 and T.4 are equivalent and T.4 will be discarded.

If the command is:

```
transactional-update --continue --drop-if-no-change run zypper in tomcat
```

the new T.4 will be indeed different from T.3, and will remain after the transaction is closed.

With this feature, every time that we call any function of this execution module, we will minimize the amount of transaction, while maintaining the idempotence so some operations.

Report for pending transaction

A change in the system will create a new transaction, that needs to be activated via a reboot. With `pending_transaction()` we can check if a reboot is needed. We can execute the reboot using the `reboot()` function, that will follow the plan established by the functions of the `rebootmgr` execution module.

/etc overlay merge when no new transaction is created

In a transactional model, `/etc` is an overlay file system. Changes done during the update are only present in the new transaction, and so will only be available after the reboot. Or worse, if the transaction gets dropped, because there is no change in the `rootfs`, the changes in `/etc` will be dropped too! This is designed like that in order to make the configuration files for the new package available only when new package is also available to the user. So, after the reboot.

This makes sense for the case when, for example, `apache2` is not present in the current transaction, but we installed it. The new snapshot contains the `apache2` service, and the configuration files in `/etc` will be accessible only after the reboot.
But this model presents an issue. If we use `transactional-update --continue --drop-if-no-change run <command>`, where `<command>` does not make any change in the read-only subvolume, but only in `/etc` (which is also read-write in the running system), the new overlay with the changes in `/etc` will be dropped together with the transaction.

To fix this, `transactional-update` will detect that when no change has been made on the read-only subvolume, but done in the overlay, the transaction will be dropped and the changes in the overlay will be merged back into `/etc` overlay of the current transaction.

**Using the execution module**

With this module we can create states that leverage Salt into this kind of systems:

```bash
# Install apache (low-level API)
salt-call transactional_update.pkg_install apache2

# We can call any execution module
salt-call transactional_update.call pkg.install apache2

# Or via a state
salt-call transactional_update.single pkg.installed name=apache2

# We can also execute a zypper directly
salt-call transactional_update.run "zypper in apache2" snapshot="continue"

# We can reuse SLS states
salt-call transactional_update.apply install_and_configure_apache

# Or apply the full highstate
salt-call transactional_update.highstate

# Is there any change done in the system?
salt-call transactional_update.pending_transaction

# If so, reboot via rebootmgr
salt-call transactional_update.reboot

# We can enable the service
salt-call service.enable apache2

# If apache2 is available, this will work too
salt-call service.restart apache2
```
Fixing some expectations

This module alone is an improvement over the current state, but is easy to see some limitations and problems:

Is not a fully transparent approach

The user needs to know if the system is transactional or not, as not everything can be expressed inside a transaction (for example, restarting a service inside transaction is not allowed).

Two step for service restart

In the apache2 example from the beginning we can observe the biggest drawback. If the package apache2 is missing, the new module will create a new transaction, will execute pkg.install inside the transaction (creating the salt-thin, moving it inside and delegating the execution to transactional-update CLI as part of the full state). Inside the transaction we can do too the required changes in /etc for adding the new vhost, and we can enable the service via systemctl inside the same transaction.

At this point we will not merge the /etc overlay into the current one, and we expect from the user call the reboot function inside this module, in order to activate the new transaction and start the apache2 service.

In the case that the package is already there, but the configuration for the vhost is required, the new transaction will be dropped and the /etc overlay will be visible in the live system. Then from outside the transaction, via a different call to Salt, we can command a restart of the apache2 service.

We can see that in both cases we break the user expectation, where a change on the configuration will trigger automatically the restart of the associated service. In a transactional scenario we need two different steps: or a reboot, or a restart from outside of the transaction.

maintainer

Alberto Planas <aplanas@suse.com>

maturity

new

depends

None

platform

Linux

salt.modules.transactional_update.apply_(mods=None, **kwargs)

Apply an state inside a transaction.

This function will call transactional_update.highstate or transactional_update.sls based on the arguments passed to this function. It exists as a more intuitive way of applying states.

For a formal description of the possible parameters accepted in this function, check state.apply documentation.

activate_transaction

If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (default False)

CLI Example:
salt microos transactional_update.apply
salt microos transactional_update.apply stuff
salt microos transactional_update.apply stuff pillar='{"foo": "bar"}'
salt microos transactional_update.apply stuff activate_transaction=True
salt.modules.transactional_update.bootloader \n\nReinstall the bootloader

self_update
Check for newer transactional-update versions.

snapshot
Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update bootloader snapshot="continue"
```

salt.modules.transactional_update.call \n\nExecutes a Salt function inside a transaction.

The chroot does not need to have Salt installed, but Python is required.

function
Salt execution module function

activate_transaction
If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (default False)

CLI Example:

```
salt microos transactional_update.call test.ping
salt microos transactional_update.call ssh.set_auth_key user key=mykey
salt microos transactional_update.call pkg.install emacs activate_transaction=True
```

salt.modules.transactional_update.cleanup \n\nRun both cleanup-snapshots and cleanup-overlays.

Identical to calling both cleanup-snapshots and cleanup-overlays.

self_update
Check for newer transactional-update versions.

CLI Example:

```
salt microos transactional_update.cleanup
```

salt.modules.transactional_update.cleanup_overlays \n\nRemove unused overlay layers.

Removes all unreferenced (and thus unused) /etc overlay directories in /var/lib/overlay.

self_update
Check for newer transactional-update versions.

CLI Example:

```
salt microos transactional_update.cleanup_overlays
```

salt.modules.transactional_update.cleanup_snapshots \n\nMark unused snapshots for snapper removal.

If the current root filesystem is identical to the active root filesystem (means after a reboot, before transactional-update creates a new snapshot with updates), all old snapshots without a cleanup algorithm get a cleanup algorithm set. This is to make sure, that old snapshots will be deleted by snapper. See the section about cleanup algorithms in snapper(8).
self_update
Check for newer transactional-update versions.

CLI Example:

```bash
salt microos transactional_update cleanup_snapshots
```

```python
salt.modules.transactional_update.dup(self_update=False, snapshot=None)
```

Call `zypper dup`

If new updates are available, a new snapshot is created and zypper dup --no-allow-vendor-change is used to update the snapshot. Afterwards, the snapshot is activated and will be used as the new root filesystem during next boot.

```python
self_update
Check for newer transactional-update versions.
```

```python
snapshot
Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.
```

CLI Example:

```bash
salt microos transactional_update dup snapshot="continue"
```

```python
salt.modules.transactional_update.grub_cfg(self_update=False, snapshot=None)
```

Regenerate grub.cfg

```python
grub2-mkconfig(8) is called to create a new /boot/grub2/grub.cfg configuration file for the bootloader.
```

```python
self_update
Check for newer transactional-update versions.
```

```python
snapshot
Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.
```

CLI Example:

```bash
salt microos transactional_update grub_cfg snapshot="continue"
```

```python
salt.modules.transactional_update.highstate(activate_transaction=False, queue=False,**kwargs)
```

Retrieve the state data from the salt master for this minion and execute it inside a transaction.

For a formal description of the possible parameters accepted in this function, check `state.highstate` documentation.

```python
activate_transaction
If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (Default: False).
```

```python
queue
Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.
```

This option starts a new thread for each queued state run, so use this option sparingly (Default: False).

CLI Example:

```bash
salt microos transactional_update.highstate
salt microos transactional_update.highstate pillar='{"foo": "bar"}'}
salt microos transactional_update.highstate activate_transaction=True
```

```python
salt.modules.transactional_update.in_transaction()
```

Check if Salt is executing while in a transaction
CLI Example:

```bash
salt microos transactional_update in_transaction
```

**salt.modules.transactional_update.initrd** *(self_update=False, snapshot=None)*

Regenerate initrd

A new initrd is created in a snapshot.

**self_update**

Check for newer transactional-update versions.

**snapshot**

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```bash
salt microos transactional_update initrd snapshot="continue"
```

**salt.modules.transactional_update.kdump** *(self_update=False, snapshot=None)*

Regenerate kdump initrd

A new initrd for kdump is created in a snapshot.

**self_update**

Check for newer transactional-update versions.

**snapshot**

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```bash
salt microos transactional_update kdump snapshot="continue"
```

**salt.modules.transactional_update.migration** *(self_update=False, snapshot=None)*

Updates systems registered via SCC / SMT

On systems which are registered against the SUSE Customer Center (SCC) or SMT, a migration to a new version of the installed products can be made with this option.

**self_update**

Check for newer transactional-update versions.

**snapshot**

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```bash
salt microos transactional_update migration snapshot="continue"
```

**salt.modules.transactional_update.patch** *(self_update=False, snapshot=None)*

Call 'zypper patch'

If new updates are available, a new snapshot is created and zypper patch is used to update the snapshot. Afterwards, the snapshot is activated and will be used as the new root filesystem during next boot.

**self_update**

Check for newer transactional-update versions.

**snapshot**

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:
salt microos transactional_update patch snapshot="continue"

salt.modules.transactional_update.pending_transaction()

Check if there is a pending transaction

CLI Example:

```
salt microos transactional_update pending_transaction
```

salt.modules.transactional_update.pkg_install(pkg=None, pkgs=None, args=None, self_update=False, snapshot=None)

Install individual packages

Installs additional software. See the install description in the "Package Management Commands" section of zypper's man page for all available arguments.

pkg

Package name to install

pkgs

List of packages names to install

args

String or list of extra parameters for zypper

self_update

Check for newer transactional-update versions.

snapshot

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update pkg_install pkg=emacs snapshot="continue"
```

salt.modules.transactional_update.pkg_remove(pkg=None, pkgs=None, args=None, self_update=False, snapshot=None)

Remove individual packages

Removes installed software. See the remove description in the "Package Management Commands" section of zypper's man page for all available arguments.

pkg

Package name to install

pkgs

List of packages names to install

args

String or list of extra parameters for zypper

self_update

Check for newer transactional-update versions.

snapshot

Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update pkg_remove pkg=vim snapshot="continue"
```

salt.modules.transactional_update.pkg_update(pkg=None, pkgs=None, args=None, self_update=False, snapshot=None)

Updates individual packages
Update selected software. See the update description in the "Update Management Commands" section of zypper's man page for all available arguments.

pkg
  Package name to install
pkgs
  List of packages names to install
args
  String or list of extra parameters for zypper
self_update
  Check for newer transactional-update versions.
snapshot
  Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update pkg_update pkg=emacs snapshot="continue"
```

salt.modules.transactional_update.reboot(self_update=False)

Reboot after update

Trigger a reboot after updating the system.

Several different reboot methods are supported, configurable via the REBOOT_METHOD configuration option in transactional-update.conf(5). By default rebootmgrd(8) will be used to reboot the system according to the configured policies if the service is running, otherwise systemctl reboot will be called.

self_update
  Check for newer transactional-update versions.

CLI Example:

```
salt microos transactional_update reboot
```

salt.modules.transactional_update.rollback(snapshot=None)

Set the current, given or last working snapshot as default snapshot

Sets the default root file system. On a read-only system the root file system is set directly using btrfs. On read-write systems snapper(8) rollback is called.

If no snapshot number is given, the current root file system is set as the new default root file system. Otherwise number can either be a snapshot number (as displayed by snapper list) or the word last. last will try to reset to the latest working snapshot.

snapshot
  Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "last" to indicate the last working snapshot done.

CLI Example:

```
salt microos transactional_update rollback
```

salt.modules.transactional_update.run(command, self_update=False, snapshot=None)

Run a command in a new snapshot

Execute the command inside a new snapshot. By default this snapshot will remain, but if --drop-if-no-change is set, the new snapshot will be dropped if there is no change in the file system.

command
  Command with parameters that will be executed (as string or array)
self_update
  Check for newer transactional-update versions.
snapshot
Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:
```
salt microos transactional_update run "mkdir /tmp/dir" snapshot="continue"
```

```
salt.modules.transactional_update.single(fun, name, activate_transaction=False, queue=False, **kwargs)
```

Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

activate_transaction
If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (Default: False).

queue
Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly (Default: False).

CLI Example:
```
salt microos transactional_update.single pkg.installed name=emacs
salt microos transactional_update.single pkg.installed name=emacs
activate_transaction=True
```

```
salt.modules.transactional_update.sls(mods, activate_transaction=False, queue=False, **kwargs)
```

Execute the states in one or more SLS files inside a transaction.

```
saltenv
 Specify a salt fileserver environment to be used when applying states
```
mods
List of states to execute

test
Run states in test-only (dry-run) mode

```
exclude
 Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.
```
activate_transaction
If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (Default: False).

queue
Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly (Default: False).

For a formal description of the possible parameters accepted in this function, check state.sls documentation.

CLI Example:
```
salt microos transactional_update.sls stuff pillar='{"foo": "bar"}';
salt microos transactional_update.sls stuff activate_transaction=True
```
salt.modules.transactional_update.transactional()
Check if the system is a transactional system
CLI Example:
```bash
salt microos transactional_update transactional
```

salt.modules.transactional_update.up(self_update=False, snapshot=None)
Call 'zypper up'
If new updates are available, a new snapshot is created and zypper up is used to update the snapshot. Afterwards, the snapshot is activated and will be used as the new root filesystem during next boot.

- **self_update**
  Check for newer transactional-update versions.
- **snapshot**
  Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:
```bash
salt microos transactional_update up snapshot="continue"
```

### 26.6.459 salt.modules.travisci

Commands for working with travisci.

- **depends**
  pyOpenSSL >= 16.0.0

salt.modules.travisci.verify_webhook(signature, body)
Verify the webhook signature from travisci

- **signature**
  The signature header from the webhook header
- **body**
  The full payload body from the webhook post

**Note:** The body needs to be the urlencoded version of the body.

CLI Example:
```bash
salt '*' travisci.verify_webhook 'M6NucCX5722bxisQs7e...' 'payload=%7B...
```

### 26.6.460 salt.modules.tuned

Interface to Red Hat tuned-adm module

- **maintainer**
  Syed Ali <alicsyed@gmail.com>
- **maturity**
  new
- **depends**
  tuned-adm
platform
  Linux

salt.modules.tuned.active()
  Return current active profile in stdout key if retcode is 0, otherwise raw result
  
  CLI Example:
  
  salt '*' tuned.active

salt.modules.tuned.list()
  List the profiles available
  
  CLI Example:
  
  salt '*' tuned.list

salt.modules.tuned.off()
  Turn off all profiles
  
  CLI Example:
  
  salt '*' tuned.off

salt.modules.tuned.profile(profile_name)
  Activate specified profile
  
  CLI Example:
  
  salt '*' tuned.profile virtual-guest

26.6.461 salt.modules.twilio_notify

Module for notifications via Twilio

New in version 2014.7.0.

  depends
    • twilio python module

  configuration
   Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config (with pillar_opts set to True).
    
    For example:
    
    my-twilio-account:
      twilio.account_sid: AC32a3c83990934481add5ce1659f04d2
      twilio.auth_token: mytoken

salt.modules.twilio_notify.send_sms(profile, body, to, from_)
  Send an sms
  
  CLI Example:
  
  twilio.send_sms my-twilio-account 'Test sms' '+18019999999' '+18011111111'
26.6.462 salt.modules.udev

Manage and query udev info

New in version 2015.8.0.

salt.modules.udev.env\(\text{dev}\)

Return all environment variables udev has for dev

CLI Example:

```
salt '*' udev.env /dev/sda
salt '*' udev.env /sys/class/net/eth0
```

salt.modules.udev.exportdb()

Return all the udev database

CLI Example:

```
salt '*' udev.exportdb
```

salt.modules.udev.info\(\text{dev}\)

Extract all info delivered by udevadm

CLI Example:

```
salt '*' udev.info /dev/sda
salt '*' udev.info /sys/class/net/eth0
```

salt.modules.udev.links\(\text{dev}\)

Return all udev-created device symlinks

CLI Example:

```
salt '*' udev.links /dev/sda
salt '*' udev.links /sys/class/net/eth0
```

salt.modules.udev.name\(\text{dev}\)

Return the actual dev name(s?) according to udev for dev

CLI Example:

```
salt '*' udev.dev /dev/sda
salt '*' udev.dev /sys/class/net/eth0
```

salt.modules.udev.path\(\text{dev}\)

Return the physical device path(s?) according to udev for dev

CLI Example:

```
salt '*' udev.path /dev/sda
salt '*' udev.path /sys/class/net/eth0
```
26.6.463 salt.modules.upstart_service

Module for the management of upstart systems. The Upstart system only supports service starting, stopping and
restarting.

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a
different module (or gives an error similar to `'service.start' is not available`, see [here](#)).

Currently (as of Ubuntu 12.04) there is no tool available to disable Upstart services (like update-rc.d). This[1] is the
recommended way to disable an Upstart service. So we assume that all Upstart services that have not been disabled
in this manner are enabled.

But this is broken because we do not check to see that the dependent services are enabled. Otherwise we would have
to do something like parse the output of “`initctl show-config`” to determine if all service dependencies are enabled
to start on boot. For example, see the “start on” condition for the lightdm service below[2]. And this would be too
hard. So we wait until the upstart developers have solved this problem. :) This is to say that an Upstart service that
is enabled may not really be enabled.

Also, when an Upstart service is enabled, should the dependent services be enabled too? Probably not. But there
should be a notice about this, at least.

[2] example upstart configuration file:

```ini
lightdm
emits login-session-start
emits desktop-session-start
emits desktop-shutdown
start on (((filesystem and runlevel ![06]) and started dbus) and (drm-device-
...added card0 PRIMARY_DEVICE_FOR_DISPLAY=1 or stopped udev-fallback-
...graphics)) or runlevel PREVLEVEL=S)
stop on runlevel [016]
```

**Warning:** This module should not be used on Red Hat systems. For these, the `rh_service` module should be
used, as it supports the hybrid upstart/sysvinit system used in RHEL/CentOS 6.

**salt.modules.upstart_service.available(name)**

Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```bash
salt '*' service.available sshd
```

**salt.modules.upstart_service.disable(name, **kwargs)**

Disable the named service from starting on boot.

CLI Example:

```bash
salt '*' service.disable <service name>
```

**salt.modules.upstart_service.disabled(name)**

Check to see if the named service is disabled to start on boot.

CLI Example:
salt '*' service.disabled <service name>

salt.modules.upstart_service.enable(name, **kwargs)
    Enable the named service to start at boot
    CLI Example:
    salt '*' service.enable <service name>

salt.modules.upstart_service.enabled(name, **kwargs)
    Check to see if the named service is enabled to start on boot
    CLI Example:
    salt '*' service.enabled <service name>

salt.modules.upstart_service.force_reload(name)
    Force-reload the named service
    CLI Example:
    salt '*' service.force_reload <service name>

salt.modules.upstart_service.full_restart(name)
    Do a full restart (stop/start) of the named service
    CLI Example:
    salt '*' service.full_restart <service name>

salt.modules.upstart_service.get_all()
    Return all installed services
    CLI Example:
    salt '*' service.get_all

salt.modules.upstart_service.get_disabled()
    Return the disabled services
    CLI Example:
    salt '*' service.get_disabled

salt.modules.upstart_service.get_enabled()
    Return the enabled services
    CLI Example:
    salt '*' service.get_enabled

salt.modules.upstart_service.missing(name)
    The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
    CLI Example:
salt '*' service.missing sshd

salt.modules.upstart_service.reload_(name)
    Reload the named service
    CLI Example:
    salt '*' service.reload <service name>

salt.modules.upstart_service.restart(name)
    Restart the named service
    CLI Example:
    salt '*' service.restart <service name>

salt.modules.upstart_service.start(name)
    Start the specified service
    CLI Example:
    salt '*' service.start <service name>

salt.modules.upstart_service.status(name, sig=None)
    Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.
    Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
    Parameters
        • name (str) -- The name of the service to check
        • sig (str) -- Signature to use to find the service via ps
    Returns
        True if running, False otherwise dict: Maps service name to True if running, False otherwise
    Return type
        bool
    CLI Example:
    salt '*' service.status <service name> [service signature]

salt.modules.upstart_service.stop(name)
    Stop the specified service
    CLI Example:
    salt '*' service.stop <service name>
26.6.464 salt.modules.uptime

Wrapper around uptime API

salt.modules.uptime.check_exists(name)
Check if a given URL is in being monitored by uptime

CLI Example:
```
salt '*' uptime.check_exists http://example.org
```

salt.modules.uptime.checks_list()
List URL checked by uptime

CLI Example:
```
salt '*' uptime.checks_list
```

salt.modules.uptime.create(name, **params)
Create a check on a given URL.

Additional parameters can be used and are passed to API (for example interval, maxTime, etc). See the documentation https://github.com/fzaninotto/uptime for a full list of the parameters.

CLI Example:
```
salt '*' uptime.create http://example.org
```

salt.modules.uptime.delete(name)
Delete a check on a given URL

CLI Example:
```
salt '*' uptime.delete http://example.org
```

26.6.465 salt.modules.useradd

Manage users with the useradd command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info' is not available), see here.

salt.modules.useradd.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, system=False, fullname='', roomnumber='', workphone='', homephone='', other='', createhome=True, loginclass=None, nologinit=False, root=None, usergroup=None, local=False)

Add a user to the minion

name
Username LOGIN to add

uid
User ID of the new account

gid
Name or ID of the primary group of the new account
groups
   List of supplementary groups of the new account
home
   Home directory of the new account
shell
   Login shell of the new account
unique
   If not True, the user account can have a non-unique UID
system
   Create a system account
fullname
   GECOS field for the full name
roomnumber
   GECOS field for the room number
workphone
   GECOS field for the work phone
homephone
   GECOS field for the home phone
other
   GECOS field for other information
createhome
   Create the user’s home directory
loginclass
   Login class for the new account (OpenBSD)
nologinit
   Do not add the user to the lastlog and faillog databases
root
   Directory to chroot into
usergroup
   Create and add the user to a new primary group of the same name
local
   (Only on systems with luseradd available)
      Specifically add the user locally rather than possibly through remote providers (e.g. LDAP)

New in version 3007.0.

CLI Example:

```bash
salt '*/' user.add name <uid> <gid> <groups> <home> <shell>
```

salt.modules.useradd.chfullname(name, fullname, root=None)
   Change the user’s Full Name
name
   User to modify
fullname
   GECOS field for the full name
root
   Directory to chroot into

CLI Example:

```bash
salt '*/' user.chfullname foo "Foo Bar"
```

salt.modules.useradd.chgid(name, gid, root=None)
   Change the default group of the user
name
   User to modify
gid
    Force use GID as new primary group
root
    Directory to chroot into
CLI Example:

    salt '*' user.chgid foo 4376

salt.modules.useradd.chgroups(name, groups, append=False, root=None)
    Change the groups to which this user belongs
name
    User to modify
groups
    Groups to set for the user
append
    [False] If True, append the specified group(s). Otherwise, this function will replace the user's groups
    with the specified group(s).
root
    Directory to chroot into
CLI Examples:

    salt '*' user.chgroups foo wheel,root
    salt '*' user.chgroups foo wheel,root append=True

salt.modules.useradd.chhome(name, home, persist=False, root=None)
    Change the home directory of the user, pass True for persist to move files to the new home directory if the old
    home directory exist.
name
    User to modify
home
    New home directory for the user account
persist
    Move contents of the home directory to the new location
root
    Directory to chroot into
CLI Example:

    salt '*' user.chhome foo /home/users/foo True

salt.modules.useradd.chhomephone(name, homephone, root=None)
    Change the user's Home Phone
name
    User to modify
homephone
    GECOS field for the home phone
root
    Directory to chroot into
CLI Example:

    salt '*' user.chhomephone foo 7735551234

salt.modules.useradd.chloginclass(name, loginclass, root=None)
    Change the default login class of the user
name
    User to modify
loginclass
    Login class for the new account
root
    Directory to chroot into

Note: This function only applies to OpenBSD systems.

CLI Example:
```
salt '*' user.chloginclass foo staff
```

```
salt.modules.useradd.chother(name, other, root=None)
```
Change the user's other GECOS attribute

name
    User to modify
other
    GECOS field for other information
root
    Directory to chroot into

CLI Example:
```
salt '*' user.chother foobar
```

```
salt.modules.useradd.chroomnumber(name, roomnumber, root=None)
```
Change the user's Room Number

CLI Example:
```
salt '*' user.chroomnumber foo 123
```

```
salt.modules.useradd.chshell(name, shell, root=None)
```
Change the default shell of the user

name
    User to modify
shell
    New login shell for the user account
root
    Directory to chroot into

CLI Example:
```
salt '*' user.chshell foo /bin/zsh
```

```
salt.modules.useradd.chuid(name, uid, root=None)
```
Change the uid for a named user

name
    User to modify
uid
    New UID for the user account
root
    Directory to chroot into

CLI Example:
```python
salt '*' user.chuid foo 4376
```

**salt.modules.useradd.chworkphone** *(name, workphone, root=None)*

Change the user’s Work Phone

- **name**: User to modify
- **workphone**: GECOS field for the work phone
- **root**: Directory to chroot into

CLI Example:

```python
salt '*' user.chworkphone foo 773550123
```

**salt.modules.useradd.delete** *(name, remove=False, force=False, root=None, local=False)*

Remove a user from the minion

- **name**: Username to delete
- **remove**: Remove home directory and mail spool
- **force**: Force some actions that would fail otherwise
- **root**: Directory to chroot into
- **local** *(Only on systems with luserdel available)*:
  - Ensure the user account is removed locally ignoring global account management (default is False).
  - New in version 3007.0.

CLI Example:

```python
salt '*' user.delete name remove=True force=True
```

**salt.modules.useradd.get_loginclass** *(name)*

Get the login class of the user

- **name**: User to get the information

**Note:** This function only applies to OpenBSD systems.

CLI Example:

```python
salt '*' user.get_loginclass foo
```

**salt.modules.useradd.getent** *(refresh=False, root=None)*

Return the list of all info for all users

- **refresh**: Force a refresh of user information
- **root**: Directory to chroot into

CLI Example:

```python
sicl '*' user.getent
```
salt.modules.useradd.info(name, root=None)
    Return user information
    name
        User to get the information
    root
        Directory to chroot into
    CLI Example:
    
    salt '*' user.info root

salt.modules.useradd.list_groups(name)
    Return a list of groups the named user belongs to
    name
        User to get the information
    CLI Example:
    
    salt '*' user.list_groups foo

salt.modules.useradd.list_users(root=None)
    Return a list of all users
    root
        Directory to chroot into
    CLI Example:
    
    salt '*' user.list_users

salt.modules.useradd.primary_group(name)
    Return the primary group of the named user
    New in version 2016.3.0.
    name
        User to get the information
    CLI Example:
    
    salt '*' user.primary_group saltadmin

salt.modules.useradd.rename(name, new_name, root=None)
    Change the username for a named user
    name
        User to modify
    new_name
        New value of the login name
    root
        Directory to chroot into
    CLI Example:
    
    salt '*' user.rename name new_name
26.6.466 salt.modules.uwsgi

maintainer

Peter Baumgartner <pete@lincolnloop.com>

maturity

new

platform

all

salt.modules.uwsgi.stats(socket)

Return the data from uwsgi --connect-and-read as a dictionary.

socket

The socket the uWSGI stats server is listening on

CLI Example:

```
salt '*' uwsgi.stats /var/run/mystatsserver.sock
salt '*' uwsgi.stats 127.0.0.1:5050
```

26.6.467 salt.modules.vagrant

Work with virtual machines managed by Vagrant.

New in version 2018.3.0.

Mapping between a Salt node id and the Vagrant machine name (and the path to the Vagrantfile where it is defined) is stored in a Salt sdb database on the Vagrant host (minion) machine. In order to use this module, sdb must be configured. An SQLite database is the recommended storage method. The URI used for the sdb lookup is "sdb://vagrant_sdb_data".

requirements:

- the VM host machine must have salt-minion, Vagrant and a vm provider installed.
- the VM host must have a valid definition for sdb://vagrant_sdb_data

Configuration example:

```
# file /etc/salt/minion.d/vagrant_sdb.conf

vagrant_sdb_data:
    driver: sqlite3
    database: /var/cache/salt/vagrant.sqlite
    table: sdb
    create_table: True
```

salt.modules.vagrant.destroy(name)

Destroy and delete a virtual machine. (vagrant destroy -f)

This also removes the salt_id name defined by vagrant.init.

CLI Example:

```
salt <host> vagrant.destroy <salt_id>
```
salt.modules.vagrant.get_machine_id(machine, cwd)

returns the salt_id name of the Vagrant VM

Parameters
• machine -- the Vagrant machine name
• cwd -- the path to Vagrantfile

Returns
salt_id name

salt.modules.vagrant.get_ssh_config(name, network_mask='', get_private_key=False)

Retrieve hints of how you might connect to a Vagrant VM.

Parameters
• name -- the salt_id of the machine
• network_mask -- a CIDR mask to search for the VM's address
• get_private_key -- (default: False) return the key used for ssh login

Returns
a dict of ssh login information for the VM

CLI Example:
salt <host> vagrant.get_ssh_config <salt_id>
salt my_laptop vagrant.get_ssh_config quail1 network_mask=10.0.0.0/8 get_private_key=True

The returned dictionary contains:
• key_filename: the name of the private key file on the VM host computer
• ssh_username: the username to be used to log in to the VM
• ssh_host: the IP address used to log in to the VM. (This will usually be 127.0.0.1)
• ssh_port: the TCP port used to log in to the VM. (This will often be 2222)
• [ip_address:] (if network_mask is defined. see below)
• [private_key:] (if get_private_key is True) the private key for ssh_username

About network_mask:
Vagrant usually uses a redirected TCP port on its host computer to log in to a VM using ssh. This redirected port and its IP address are "ssh_port" and "ssh_host". The ssh_host is usually the localhost (127.0.0.1). This makes it impossible for a third machine (such as a salt-cloud master) to contact the VM unless the VM has another network interface defined. You will usually want a bridged network defined by having a config.vm.network "public_network" statement in your Vagrantfile.

The IP address of the bridged adapter will typically be assigned by DHCP and unknown to you, but you should be able to determine what IP network the address will be chosen from. If you enter a CIDR network mask, Salt will attempt to find the VM's address for you. The host machine will send an "ip link show" or "ifconfig" command to the VM (using ssh to ssh_host:ssh_port) and return the IP address of the first interface it can find which matches your mask.

salt.modules.vagrant.get_vm_info(name)

get the information for a VM.

Parameters
• name -- salt_id name

Returns
dictionary of {'machine': x, 'cwd': y, ...}.

salt.modules.vagrant.init(name, cwd=None, machine='', runas=None, start=False, vagrant_provider='', vm=None)

Initialize a new Vagrant VM.

This inputs all the information needed to start a Vagrant VM. These settings are stored in a Salt sdb database on the Vagrant host minion and used to start, control, and query the guest VMs. The salt_id assigned here is
the key field for that database and must be unique.

Parameters

- **name** -- The salt_id name you will use to control this VM
- **cwd** -- The path to the directory where the Vagrantfile is located
- **machine** -- The machine name in the Vagrantfile. If blank, the primary machine will be used.
- **runas** -- The username on the host who owns the Vagrant work files.
- **start** -- (default: False) Start the virtual machine now.
- **vagrant_provider** -- The name of a Vagrant VM provider (if not the default).
- **vm** -- Optionally, all the above information may be supplied in this dictionary.

Returns

A string indicating success, or False.

CLI Example:

```
salt <host> vagrant.init <salt_id> /path/to/Vagrantfile
salt my_laptop vagrant.init x1 /projects/bevy_master machine=quail1
```

**salt.modules.vagrant.list_active_vms(cwd=None)**

Return a list of machine names for active virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:

```
salt '*' vagrant.list_active_vms cwd=/projects/project_1
```

**salt.modules.vagrant.list_domains()**

Return a list of the salt_id names of all available Vagrant VMs on this host without regard to the path where they are defined.

CLI Example:

```
salt '*' vagrant.list_domains --log-level=info
```

The log shows information about all known Vagrant environments on this machine. This data is cached and may not be completely up-to-date.

**salt.modules.vagrant.list_inactive_vms(cwd=None)**

Return a list of machine names for inactive virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:

```
salt '*' virt.list_inactive_vms cwd=/projects/project_1
```

**salt.modules.vagrant.pause(name)**

Pause (vagrant suspend) the named VM.

CLI Example:

```
salt <host> vagrant.pause <salt_id>
```

**salt.modules.vagrant.reboot(name, provision=False)**

Reboot a VM. (vagrant reload)

CLI Example:
salt <host> vagrant.reboot <salt_id> provision=True

Parameters
- name -- The salt_id name you will use to control this VM
- provision -- (False) also re-run the Vagrant provisioning scripts.

salt.modules.vagrant.shutdown(name)
Send a soft shutdown (vagrant halt) signal to the named vm.
This does the same thing as vagrant.stop. Other-VM control modules use "stop" and "shutdown" to differentiate between hard and soft shutdowns.

CLI Example:
salt <host> vagrant.shutdown <salt_id>

salt.modules.vagrant.start(name)
Start (vagrant up) a virtual machine defined by salt_id name. The machine must have been previously defined using "vagrant.init".

CLI Example:
salt <host> vagrant.start <salt_id>

salt.modules.vagrant.stop(name)
Hard shutdown the virtual machine. (vagrant halt)

CLI Example:
salt <host> vagrant.stop <salt_id>

salt.modules.vagrant.version()
Return the version of Vagrant on the minion

CLI Example:
salt '*' vagrant.version

salt.modules.vagrant.vm_state(name='', cwd=None)
Return list of information for all the vms indicating their state.
If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs defined by the Vagrantfile in the cwd directory.

CLI Example:
salt '*' vagrant.vm_state <name> cwd=/projects/project_1

returns a list of dictionaries with machine name, state, provider, and salt_id name.

datum = {'machine': '', # Vagrant machine name,
         'state': '', # string indicating machine state, like 'running'
         'provider': '', # the Vagrant VM provider
         'name': ''} # salt_id name

Known bug: if there are multiple machines in your Vagrantfile, and you request the status of the primary machine, which you defined by leaving the machine parameter blank, then you may receive the status of all of them. Please specify the actual machine name for each VM if there are more than one.
26.6.468 salt.modules.varnish

Support for Varnish
New in version 2014.7.0.

Note: These functions are designed to work with all implementations of Varnish from 3.x onwards

salt.modules.varnish.ban(ban_expression)

Add ban to the varnish cache

CLI Example:

```
salt '*' varnish.ban ban_expression
```

salt.modules.varnish.ban_list()

List varnish cache current bans

CLI Example:

```
salt '*' varnish.ban_list
```

salt.modules.varnish.param_set(param, value)

Set a param in varnish cache

CLI Example:

```
salt '*' varnish.param_set param value
```

salt.modules.varnish.param_show(param=None)

Show params of varnish cache

CLI Example:

```
salt '*' varnish.param_show param
```

salt.modules.varnish.purge()

Purge the varnish cache

CLI Example:

```
salt '*' varnish.purge
```

salt.modules.varnish.version()

Return server version from varnishd -V

CLI Example:

```
salt '*' varnish.version
```
26.6.469 salt.modules.vault

Warning: This module will be removed from Salt in version 3009 in favor of the vault Salt Extension.

Functions to interact with Hashicorp Vault.

maintainer
SaltStack

maturity
new

all

note
If you see the following error, you'll need to upgrade requests to at least 2.4.2

```
<timestamp> [salt.pillar][CRITICAL][14337] Pillar render error: Failed to...
→ load ext_pillar vault: {'error': "request() got an unexpected keyword...
→ argument 'json'"}
```

Configuration

In addition to the module configuration, it is required for the Salt master to be configured to allow peer runs in order to use the Vault integration.

Changed in version 3007.0: The vault configuration structure has changed significantly to account for many new features. If found, the old structure will be automatically translated to the new one.

Please update your peer_run configuration to take full advantage of the updated modules. The old endpoint (vault.generate_token) will continue to work, but result in unnecessary roundtrips once your minions have been updated.

To allow minions to pull configuration and credentials from the Salt master, add this segment to the master configuration file:

```
peer_run:
  .*:
  - vault.get_config # always
  - vault.generate_new_token # relevant when `token` == `issue:type`
  - vault.generate_secret_id # relevant when `approle` == `issue:type`
```

Minimally required configuration:

```
vault:
  auth:
    token: abcdefg-hijklmop-qrstuvw
  server:
    url: https://vault.example.com:8200
```

A sensible example configuration, e.g. in /etc/salt/master.d/vault.conf:
The above configuration requires the following policies for the master:

```yaml
# Issue tokens
path "auth/token/create" {
  capabilities = ["create", "read", "update"]
}

# Issue tokens with token roles
path "auth/token/create/*" {
  capabilities = ["create", "read", "update"]
}
```

A sensible example configuration that issues AppRoles to minions from a separate authentication endpoint (notice differing mounts):

```yaml
vault:
  auth:
    method: approle
    mount: approle    # <-- mount the salt master authenticates at
    role_id: e5a7b66e-5d08-da9c-7075-71984634b882
    secret_id: 841771dc-11c9-bbc7-bcac-6a3945a69cd9
    cache:
      backend: file
    issue:
      type: approle
      approle:
        mount: salt-minions    # <-- mount the salt master manages
      metadata:
        entity:
          minion-id: '{minion}'
          role: '{pillar[role]}'
      server:
        url: https://vault.example.com:8200
```

(continues on next page)
ext_pillar:
- vault: path=salt/minions/{minion}
- vault: path=salt/roles/{pillar[role]}

The above configuration requires the following policies for the master:

```yaml
# List existing AppRoles
path "auth/salt-minions/role" {
    capabilities = ["list"]
}

# Manage AppRoles
path "auth/salt-minions/role/*" {
    capabilities = ["read", "create", "update", "delete"]
}

# Lookup mount accessor
path "sys/auth/salt-minions" {
    capabilities = ["read", "sudo"]
}

# Lookup entities by alias name (role-id) and alias mount accessor
path "identity/lookup/entity" {
    capabilities = ["create", "update"]
    allowed_parameters = {
        "alias_name" = [],
        "alias_mount_accessor" = ["auth_approle_0a1b2c3d"]
    }
}

# Manage entities with name prefix salt_minion_
path "identity/entity/name/salt_minion_*" {
    capabilities = ["read", "create", "update", "delete"]
}

# Create entity aliases – you can restrict the mount_accessor
# This might allow privilege escalation in case the salt master
# is compromised and the attacker knows the entity ID of an
# entity with relevant policies attached – although you might
# have other problems at that point.
path "identity/entity-alias" {
    capabilities = ["create", "update"]
    allowed_parameters = {
        "id" = [],
        "canonical_id" = [],
        "mount_accessor" = ["auth_approle_0a1b2c3d"]
        "name" = []
    }
}
```

This enables you to write templated ACL policies like:
path "salt/data/minions/{{identity.entity.metadata.minion-id}}" {
    capabilities = ["read"]
}

path "salt/data/roles/{{identity.entity.metadata.role}}" {
    capabilities = ["read"]
}

Note: AppRole policies and entity metadata are generally not updated automatically. After a change, you will need to synchronize them by running `vault.sync_approles` or `vault.sync_entities` respectively.

All possible master configuration options with defaults:

```yaml
vault:
  auth:
    approle_mount: approle
    approle_name: salt-master
    method: token
    role_id: <required if auth:method == approle>
    secret_id: null
    token: <required if auth:method == token>
    token_lifecycle:
      minimum_ttl: 10
      renew_increment: null
  cache:
    backend: session
    config: 3600
    kv_metadata: connection
    secret: ttl
  issue:
    allow_minion_override_params: false
    type: token
  approle:
    mount: salt-minions
    params:
      bind_secret_id: true
      secret_id_num_uses: 1
      secret_id_ttl: 60
      token_explicit_max_ttl: 60
      token_num_uses: 10
      secret_id_bound_cidrs: null
      token_ttl: null
      token_max_ttl: null
      token_no_default_policy: false
      token_period: null
      token_bound_cidrs: null
      token:
        role_name: null
        params:
          explicit_max_ttl: null
          num_uses: 1
```
(continues on next page)
```yaml
  ttl: null
  period: null
  no_default_policy: false
  renewable: true
  wrap: 30s
  keys: []
  metadata:
    entity:
      minion-id: '{minion}'
    secret:
      saltstack-jid: '{jid}'
      saltstack-minion: '{minion}'
      saltstack-user: '{user}'
  policies:
    assign:
      - saltstack/minions
      - saltstack/{minion}
    cache_time: 60
    refresh_pillar: null
  server:
    url: <required, e. g. https://vault.example.com:8200>
    namespace: null
    verify: null
```

**auth**

Contains authentication information for the local machine.

**approle_mount**

New in version 3007.0.

The name of the AppRole authentication mount point. Defaults to `approle`.

**approle_name**

New in version 3007.0.

The name of the AppRole. Defaults to `salt-master`.

---

**Note:** Only relevant when a locally configured role_id/secret_id uses response wrapping.

---

**method**

Currently only `token` and `approle` auth types are supported. Defaults to `token`.

AppRole is the preferred way to authenticate with Vault as it provides some advanced options to control the authentication process. Please see the [Vault documentation](https://www.vaultproject.io) for more information.

**role_id**

The role ID of the AppRole. Required if `auth:method == approle`.

Changed in version 3007.0: In addition to a plain string, this can also be specified as a dictionary that includes `wrap_info`, i.e. the return payload of a wrapping request.

**secret_id**

The secret ID of the AppRole. Only required if the configured AppRole requires it.
Changed in version 3007.0: In addition to a plain string, this can also be specified as a dictionary that includes `wrap_info`, i.e. the return payload of a wrapping request.

**token**

Token to authenticate to Vault with. Required if `auth:method == token`.

The token must be able to create tokens with the policies that should be assigned to minions. You can still use the token auth via a OS environment variable via this config example:

```yaml
vault:
  auth:
    method: token
    token: sdb://osenv/VAULT_TOKEN
  server:
    url: https://vault.service.domain:8200

osenv:
  driver: env
```

And then export the `VAULT_TOKEN` variable in your OS:

```
export VAULT_TOKEN=11111111-1111-1111-1111-1111111111111
```

Changed in version 3007.0: In addition to a plain string, this can also be specified as a dictionary that includes `wrap_info`, i.e. the return payload of a wrapping request.

**token_lifecycle**

Token renewal settings.

- **minimum_ttl** specifies the time (in seconds or as a time string like `24h`) an in-use token should be valid for. If the current validity period is less than this and the token is renewable, a renewal will be attempted. If it is not renewable or a renewal does not extend the ttl beyond the specified minimum, a new token will be generated.

  - **Note**: This setting can be specified inside a minion's configuration as well and will override the master's default for the minion.

  - **Note**: Since leases like database credentials are tied to a token, setting this to a much higher value than the default can be necessary, depending on your specific use case and configuration.

- **renew_increment** specifies the amount of time the token's validity should be requested to be renewed for when renewing a token. When unset, will extend the token's validity by its default ttl. Set this to `false` to disable token renewals.

  - **Note**: The Vault server is allowed to disregard this request.
cache

Configures token/lease and metadata cache (for KV secrets) on all hosts as well as configuration cache on minions that receive issued credentials.

backend

Changed in version 3007.0: This used to be found in auth:token_backend.

The cache backend in use. Defaults to session, which will store the Vault configuration in memory only for that specific Salt run. disk/file/localfs will force using the localfs driver, regardless of configured minion data cache. Setting this to anything else will use the default configured cache for minion data (cache), by default the local filesystem as well.

clear_attempt_revocation

New in version 3007.0.

When flushing still valid cached tokens and leases, attempt to have them revoked after a (short) delay. Defaults to 60. Set this to false to disable revocation (not recommended).

clear_on_unauthorized

New in version 3007.0.

When encountering an Unauthorized response with an otherwise valid token, flush the cache and request new credentials. Defaults to true. If your policies are relatively stable, disabling this will prevent a lot of unnecessary overhead, with the tradeoff that once they change, you might have to clear the cache manually or wait for the token to expire.

config

New in version 3007.0.

The time in seconds to cache queried configuration from the master. Defaults to 3600 (one hour). Set this to null to disable cache expiration. Changed server configuration on the master will still be recognized, but changes in auth and cache will need a manual update using vault.update_config or cache clearance using vault.clear_cache.

Note: Expiring the configuration will also clear cached authentication credentials and leases.

expire_events

New in version 3007.0.

Fire an event when the session cache containing leases is cleared (vault/cache/<scope>/clear) or cached leases have expired (vault/lease/<cache_key>/expire). A reactor can be employed to ensure fresh leases are issued. Defaults to false.

kv_metadata

New in version 3007.0.

The time in seconds to cache KV metadata used to determine if a path is using version 1/2 for. Defaults to connection, which will clear the metadata cache once a new configuration is requested from the master. Setting this to null will keep the information indefinitely until the cache is cleared manually using vault.clear_cache with connection=false.

secret

New in version 3007.0.

The time in seconds to cache tokens/secret IDs for. Defaults to ttl, which caches the secret for as long as it is valid, unless a new configuration is requested from the master.
issue

Configures authentication data issued by the master to minions.

type

New in version 3007.0.

The type of authentication to issue to minions. Can be token or approle. Defaults to token.

To be able to issue AppRoles to minions, the master needs to be able to create new AppRoles on the configured auth mount (see policy example above). It is strongly encouraged to create a separate mount dedicated to minions.

approle

New in version 3007.0.

Configuration regarding issued AppRoles.

mount specifies the name of the auth mount the master manages. Defaults to salt-minions. This mount should be exclusively dedicated to the Salt master.

params configures the AppRole the master creates for minions. See the Vault AppRole API docs for details. If you update these params, you can update the minion AppRoles manually using the vault runner: salt-run vault.sync_approles, but they will be updated automatically during a request by a minion as well.

token

New in version 3007.0.

Configuration regarding issued tokens.

role_name specifies the role name for minion tokens created. Optional.

Changed in version 3007.0: This used to be found in role_name.

If omitted, minion tokens will be created without any role, thus being able to inherit any master token policy (including token creation capabilities).

Example configuration: https://www.nomadproject.io/docs/vault-integration/index.html#vault-token-role-configuration

By default, each token will expire after the auth:ttl value set. The possible parameters were synchronized with the Vault nomenclature:

• ttl previously was mapped to explicit_max_ttl on Vault, not ttl. For the same behavior as before, you will need to set explicit_max_ttl now.

• uses is now called num_uses.

See the Vault token API docs for details. To make full use of multi-use tokens, you should configure a cache that survives a single session (e.g. disk).

Note: If unset, the master issues single-use tokens to minions, which can be quite expensive.

allow_minion_override_params

Changed in version 3007.0: This used to be found in auth:allow_minion_override.

Whether to allow minions to request to override parameters for issuing credentials. See issue_params below.
**wrap**

New in version 3007.0.

The time a minion has to unwrap a wrapped secret issued by the master. Set this to false to disable wrapping, otherwise a time string like `30s` can be used. Defaults to `30s`.

**keys**

List of keys to use to unseal vault server with the `vault.unseal` runner.

**metadata**

New in version 3007.0.

Configures metadata for the issued entities/secrets. Values have to be strings and can be templated with the following variables:

- `{jid}` Salt job ID that issued the secret.
- `{minion}` The minion ID the secret was issued for.
- `{user}` The user the Salt daemon issuing the secret was running as.
- `{pillar[<var>]}` A minion pillar value that does not depend on Vault.
- `{grains[<var>]}` A minion grain value.

Note: Values have to be strings, hence templated variables that resolve to lists will be concatenated to a lexicographically sorted comma-separated list (Python `list.sort()`).

**entity**

Configures the metadata associated with the minion entity inside Vault. Entities are only created when issuing AppRoles to minions.

**secret**

Configures the metadata associated with issued tokens/secret IDs. They are logged in plaintext to the Vault audit log.

**policies**

Changed in version 3007.0: This used to specify the list of policies associated with a minion token only. The equivalent is found in `assign`.

**assign**

List of policies that are assigned to issued minion authentication data, either token or AppRole.

They can be static strings or string templates with

- `{minion}` The minion ID.
- `{pillar[<var>]}` A minion pillar value.
- `{grains[<var>]}` A minion grain value.

For pillar and grain values, lists are expanded, so `salt_role_{pillar[roles]}` with `[a, b]` results in `salt_role_a` and `salt_role_b` to be issued.
Defaults to [saltstack/minions, saltstack/{minion}].

New in version 3006.0: Policies can be templated with pillar values as well: `salt_role_{pillar[roles]}`. Make sure to only reference pillars that are not sourced from Vault since the latter ones might be unavailable during policy rendering. If you use the Vault integration in one of your pillar sls files, all values from that file will be absent during policy rendering, even the ones that do not depend on Vault.

**Important:** See [Is Targeting using Grain Data Secure?](#) for important security information. In short, everything except `grains[id]` is minion-controlled.

**Note:** List members which do not have simple string representations, such as dictionaries or objects, do not work and will throw an exception. Strings and numbers are examples of types which work well.

---

**cache_time**

New in version 3007.0.

Number of seconds compiled templated policies are cached on the master. This is important when using pillar values in templates, since compiling the pillar is an expensive operation.

**Note:** Only effective when issuing tokens to minions. Token policies need to be compiled every time a token is requested, while AppRole-associated policies are written to Vault configuration the first time authentication data is requested (they can be refreshed on demand by running `salt-run vault.sync_approles`).

They will also be refreshed in case other issuance parameters are changed (such as uses/ttl), either on the master or the minion (if `allow_minion_override_params` is True).

---

**refresh_pillar**

New in version 3007.0.

Whether to refresh the minion pillar when compiling templated policies that contain pillar variables. Only effective when issuing tokens to minions (see note on `cache_time` above).

- **null** (default) only compiles the pillar when no cached pillar is found.
- **false** never compiles the pillar. This means templated policies that contain pillar values are skipped if no cached pillar is found.
- **true** always compiles the pillar. This can cause additional strain on the master since the compilation is costly.

**Note:** Hardcoded to True when issuing AppRoles.

Using cached pillar data only (`refresh_pillar=False`) might cause the policies to be out of sync. If there is no cached pillar data available for the minion, pillar templates will fail to render at all.

If you use pillar values for templating policies and do not disable refreshing pillar data, make sure the relevant values are not sourced from Vault (ext_pillar, sdb) or from a pillar sls file that uses the vault execution/sdb module. Although this will often work when cached pillar data is available, if the master needs to compile the pillar data during policy rendering, all Vault modules will be broken to prevent an infinite loop.
server

Changed in version 3007.0: The values found in here were found in the vault root namespace previously.
Configures Vault server details.

url
URL of your Vault installation. Required.

verify
Configures certificate verification behavior when issuing requests to the Vault server. If unset, requests will use the CA certificates bundled with certifi.
For details, please see the requests documentation.
New in version 2018.3.0.
Changed in version 3007.0: Minions again respect the master configuration value, which was changed implicitly in v3001. If this value is set in the minion configuration as well, it will take precedence.
In addition, this value can now be set to a PEM-encoded CA certificate to use as the sole trust anchor for certificate chain verification.

namespace
Optional Vault namespace. Used with Vault Enterprise.
For details please see: https://www.vaultproject.io/docs/enterprise/namespaces
New in version 3004.

Minion configuration (optional):

config_location
Where to get the connection details for calling vault. By default, vault will try to determine if it needs to request the connection details from the master or from the local config. This optional option will force vault to use the connection details from the master or the local config. Can only be either master or local.
New in version 3006.0.

issue_params
Request overrides for token/AppRole issuance. This needs to be allowed on the master by setting issue:allow_minion_override_params to true. See the master configuration issue:token:params or issue:approle:params for reference.
Changed in version 3007.0: For token issuance, this used to be found in auth:ttl and auth:uses. Mind that the parameter names have been synchronized with Vault, see notes above (TLDR: ttl => explicit_max_ttl, uses => num_uses).

Note: auth:token_lifecycle and server:verify can be set on the minion as well.

salt.modules.vault.clear_cache(connection=True, session=False)
New in version 3007.0.
Delete Vault caches. Will ensure the current token and associated leases are revoked by default.
The cache is organized in a hierarchy: `/vault/connection/session/leases`. *(italics mark data that is only cached when receiving configuration from a master)*

**connection** contains KV metadata (by default), **configuration** and *(AppRole) auth credentials*. **session** contains the currently active token. **leases** contains leases issued to the currently active token like database credentials.

CLI Example:

```bash
salt '*' vault.clear_cache
salt '*' vault.clear_cache session=True
```

**connection**

Only clear the cached data scoped to a connection. This includes configuration, auth credentials, the currently active auth token as well as leases and KV metadata (by default). Defaults to true. Set this to false to clear all Vault caches.

**session**

Only clear the cached data scoped to a session. This only includes leases and the currently active auth token, but not configuration or *(AppRole) auth credentials*. Defaults to false. Setting this to true will keep the connection cache, regardless of **connection**.

```bash
salt.modules.vault.clear_token_cache()
```

Changed in version 3001.

Changed in version 3007.0: This is now an alias for `vault.clear_cache` with connection=True.

Delete minion Vault token cache.

CLI Example:

```bash
salt '*' vault.clear_token_cache
```

```bash
salt.modules.vault.delete_secret(path, `*args`
```

Delete secret at `<path>`. The vault policy used must allow this. If `<path>` is on KV v2, the secret will be soft-deleted.

CLI Example:

```bash
salt '*' vault.delete_secret "secret/my/secret"
```

```bash
salt '*' vault.delete_secret "secret/my/secret" 1 2 3
```

Required policy:

```yaml
path "<mount>/<secret>" {  capabilities = ["delete"]}
# or KV v2
path "<mount>/data/<secret>" {  capabilities = ["delete"]}
# KV v2 versions
path "<mount>/delete/<secret>" {  capabilities = ["update"]}
```
**salt.modules.vault.destroy_secret**(path, *args)

New in version 3001.

Destroy specified secret versions <path>. The vault policy used must allow this. Only supported on Vault KV version 2.

CLI Example:

```
salt '*' vault.destroy_secret "secret/my/secret" 1 2
```

Required policy:

```python
path "<mount>/destroy/<secret>" {
    capabilities = ["update"]
}
```

**salt.modules.vault.get_server_config()**

New in version 3007.0.

Return the server connection configuration that's currently in use by Salt. Contains `url`, `verify` and `namespace`.

CLI Example:

```
salt '*' vault.get_server_config
```

**salt.modules.vault.list_secrets**(path, default=``Constant.NOT_SET``), keys_only=False)

List secret keys at <path>. The vault policy used must allow this. The path should end with a trailing slash.

Changed in version 3001: The `default` argument has been added. When the path or path/key combination is not found, an exception will be raised, unless a default is provided.

CLI Example:

```
salt '*' vault.list_secrets "secret/my/"
```

Required policy:

```python
path "<mount>/<path>" {
    capabilities = ["list"]
}
```

# or KV v2
```python
path "<mount>/metadata/<path>" {
    capabilities = ["list"]
}
```

**path**

The path to the secret, including mount.
default
New in version 3001.

When the path is not found, an exception will be raised, unless a default is provided here.

keys_only
New in version 3007.0.

This function used to return a dictionary like {"keys": ["some/", "some/key"]}. Setting this to True will only return the list of keys. For backwards-compatibility reasons, this defaults to False.

```python
salt.modules.vault.patch_secret(path, **kwargs)
```

Patch secret dataset at <path>. Fields are specified as arbitrary keyword arguments.

Note: This works even for older Vault versions, KV v1 and with missing patch capability, but will use more than one request to simulate the functionality by issuing a read and update request.

For proper, single-request patching, requires versions of KV v2 that support the patch capability and the patch capability to be available for the path.

Note: This uses JSON Merge Patch format internally. Keys set to null (JSON/YAML)/None (Python) will be deleted.

CLI Example:

```
salt '*' vault.patch_secret "secret/my/secret" password="baz"
```

Required policy:

```python
# Proper patching
path "<mount>/data/<secret>" { 
  capabilities = ["patch"]
}

# OR (!), for older KV v2 setups:
path "<mount>/data/<secret>" { 
  capabilities = ["read", "update"]
}

# OR (!), for KV v1 setups:
path "<mount>/<secret>" { 
  capabilities = ["read", "update"]
}
```

```python
path
The path to the secret, including mount.
```

```python
salt.modules.vault.policies_list()
```

New in version 3007.0.

List all ACL policies.

CLI Example:
salt '*' vault.policies_list

Required policy:
```
path "sys/policy" {
    capabilities = ["read"]
}
```

salt.modules.vault.policy_delete(policy)

New in version 3007.0.
Delete an ACL policy. Returns False if the policy did not exist.

CLI Example:
```
salt '*' vault.policy_delete salt_minion
```

salt.modules.vault.policy_fetch(policy)

New in version 3007.0.
Fetch the rules associated with an ACL policy. Returns None if the policy does not exist.

CLI Example:
```
salt '*' vault.policy_fetch salt_minion
```

salt.modules.vault.policy_write(policy, rules)

New in version 3007.0.
Create or update an ACL policy.

CLI Example:
```
salt '*' vault.policy_write salt_minion 'path "secret/foo" {...}'
```

Required policy:
```
path "sys/policy/<policy>" {
    capabilities = ["create", "update"]
}
policy
   The name of the policy to create/update.

rules
   Rules to write, formatted as in-line HCL.

`salt.modules.vault.query` *(method, endpoint, payload=None)*

New in version 3007.0.

Issue arbitrary queries against the Vault API.

CLI Example:

```
salt '*' vault.query GET auth/token/lookup-self
```

Required policy: Depends on the query.

You can ask the vault CLI to output the necessary policy:

```
vault read -output-policy auth/token/lookup-self
```

**method**
   HTTP method to use.

**endpoint**
   Vault API endpoint to issue the request against. Do not include /v1/.

**payload**
   Optional dictionary to use as JSON payload.

`salt.modules.vault.read_secret` *(path, key=None, metadata=False, default=<Constant.NOT_SET>)*

Return the value of `<key>` at `<path>` in vault, or entire secret.

Changed in version 3001: The `default` argument has been added. When the path or path/key combination is not found, an exception will be raised, unless a default is provided.

CLI Example:

```
salt '*' vault.read_secret salt/kv/secret
```

Required policy:

```
path "<mount>/<secret>" {  
   capabilities = ["read"]
}
```

# or KV v2
```
path "<mount>/data/<secret>" {  
   capabilities = ["read"]
}
```

**path**
   The path to the secret, including mount.

**key**
   The data field at `<path>` to read. If unspecified, returns the whole dataset.

**metadata**
   New in version 3001.

   If using KV v2 backend, display full results, including metadata. Defaults to False.

**default**
   New in version 3001.
When the path or path/key combination is not found, an exception will be raised, unless a default is provided here.

```
salt.modules.vault.update_config(keep_session=False)
```

New in version 3007.0.

Attempt to update the cached configuration without clearing the currently active Vault session.

**CLI Example:**

```
salt '*' vault.update_config
```

**keep_session**

Only update configuration that can be updated without creating a new login session. If this is false, still tries to keep the active session, but might clear it if the server configuration has changed significantly.

Defaults to False.

```
salt.modules.vault.write_raw(path, raw)
```

Set raw data at `<path>`. The vault policy used must allow this.

**CLI Example:**

```
salt '*' vault.write_raw "secret/my/secret" '{"user":"foo","password":"bar"}'
```

Required policy: see write_secret

**path**

The path to the secret, including mount.

**raw**

Secret data to write to `<path>`. Has to be a mapping.

```
salt.modules.vault.write_secret(path, **kwargs)
```

Set secret dataset at `<path>`. The vault policy used must allow this. Fields are specified as arbitrary keyword arguments.

**CLI Example:**

```
salt '*' vault.write_secret "secret/my/secret" user="foo" password="bar"
```

Required policy:

```
path "<mount>/<secret>" {
    capabilities = ["create", "update"]
}
```

# or KV v2

```
path "<mount>/data/<secret>" {
    capabilities = ["create", "update"]
}
```

**path**

The path to the secret, including mount.
26.6.470  salt.modules.vbox_guest

VirtualBox Guest Additions installer

salt.modules.vbox_guest.additions_install(**kwargs)
Install VirtualBox Guest Additions. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

See https://www.virtualbox.org/manual/ch04.html#idp52733088 for more details.

CLI Example:

```bash
salt '*' vbox_guest.additions_install
salt '*' vbox_guest.additions_install reboot=True
salt '*' vbox_guest.additions_install upgrade_os=True
```

Parameters

- **reboot** *(bool)* -- reboot computer to complete installation
- **upgrade_os** *(bool)* -- upgrade OS (to ensure the latests version of kernel and developer tools are installed)

Returns

version of VirtualBox Guest Additions or string with error

salt.modules.vbox_guest.additions_mount()

Mount VirtualBox Guest Additions CD to the temp directory.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

CLI Example:

```bash
salt '*' vbox_guest.additions_mount
```

Returns

True or OSError exception

salt.modules.vbox_guest.additions_remove(**kwargs)

Remove VirtualBox Guest Additions.

Firstly it tries to uninstall itself by executing '/opt/VBoxGuestAdditions-VERSION/uninstall.run uninstall'. It uses the CD, connected by VirtualBox if it failes.

CLI Example:

```bash
salt '*' vbox_guest.additions_remove
salt '*' vbox_guest.additions_remove force=True
```

Parameters

- **force** *(bool)* -- force VirtualBox Guest Additions removing

Returns

True if VirtualBox Guest Additions were removed successfully else False

salt.modules.vbox_guest.additions_umount(mount_point)

Unmount VirtualBox Guest Additions CD from the temp directory.

CLI Example:
Parameters
  - `mount_point` (str) -- directory VirtualBox Guest Additions is mounted to

Returns
  True or an string with error

### salt.modules.vbox_guest.additions_version()

Check VirtualBox Guest Additions version.

CLI Example:
```
salt '*' vbox_guest.additions_version
```

Returns
  version of VirtualBox Guest Additions or False if they are not installed

### salt.modules.vbox_guest.grant_access_to_shared_folders_to(name, users=None)

Grant access to auto-mounted shared folders to the users.

User is specified by its name. To grant access for several users use argument `users`. Access will be denied to the users not listed in `users` argument.

See `https://www.virtualbox.org/manual/ch04.html#sf_mount_auto` for more details.

CLI Example:
```
salt '*' vbox_guest.grant_access_to_shared_folders_to fred
salt '*' vbox_guest.grant_access_to_shared_folders_to users ['fred', 'roman']
```

Parameters
  - `name` (str) -- name of the user to grant access to auto-mounted shared folders to
  - `users` (list of str) -- list of names of users to grant access to auto-mounted shared folders to (if specified, `name` will not be taken into account)

Returns
  list of users who have access to auto-mounted shared folders

### salt.modules.vbox_guest.list_shared_folders_users()

List users who have access to auto-mounted shared folders.

See `https://www.virtualbox.org/manual/ch04.html#sf_mount_auto` for more details.

CLI Example:
```
salt '*' vbox_guest.list_shared_folders_users
```

Returns
  list of users who have access to auto-mounted shared folders
26.6.471 salt.modules.vboxmanage

Support for VirtualBox using the VBoxManage command
New in version 2016.3.0.
If the vboxdrv kernel module is not loaded, this module can automatically load it by configuring autoload_vboxdrv in /etc/salt/minion:

| autoload_vboxdrv: True |

The default for this setting is False.

depends
    virtualbox

salt.modules.vboxmanage.clonemedium(medium=None, file_in=None, uuid_in=None, file_out=None, mformat=None, variant=None, existing=False, **kwargs)

Clone a new VM from an existing VM
CLI Example:

```
salt 'hypervisor' vboxmanage.clonemedium <name> <new_name>
```

salt.modules.vboxmanage.clonevm(name=None, uuid=None, new_name=None, snapshot_uuid=None, snapshot_name=None, mode='machine', options=None, basefolder=None, new_uuid=None, register=False, groups=None, **kwargs)

Clone a new VM from an existing VM
CLI Example:

```
salt 'hypervisor' vboxmanage.clonevm <name> <new_name>
```

salt.modules.vboxmanage.create(name, groups=None, ostype=None, register=True, basefolder=None, new_uuid=None, **kwargs)

Create a new VM
CLI Example:

```
salt 'hypervisor' vboxmanage.create <name>
```

salt.modules.vboxmanage.destroy(name)

Unregister and destroy a VM
CLI Example:

```
salt '*' vboxmanage.destroy my_vm
```

salt.modules.vboxmanage.list_items(item=None, details=False, group_by='UUID')

Return a list of a specific type of item. The following items are available:
- vms runningvms ostypes hostdvs hostfloppies intnets bridgedifs hostonlyifs natnets dhcpservers hostinfo hostcpuids hddbackends hdds dvds floppies usbhost usbfilters systemproperties extpacks groups webcams screenshotformats

CLI Example:
Some items do not display well, or at all, unless `details` is set to `True`. By default, items are grouped by the UUID field, but not all items contain that field. In those cases, another field must be specified.

```python
salt 'hypervisor' vboxmanage.items <item>
salt 'hypervisor' vboxmanage.items <item> details=True
salt 'hypervisor' vboxmanage.items <item> details=True group_by=Name
```

salt.modules.vboxmanage.list_nodes()

Return a list of registered VMs

CLI Example:

```bash
salt '*' vboxmanage.list_nodes
```

salt.modules.vboxmanage.list_nodes_full()

Return a list of registered VMs, with detailed information

CLI Example:

```bash
salt '*' vboxmanage.list_nodes_full
```

salt.modules.vboxmanage.list_nodes_min()

Return a list of registered VMs, with minimal information

CLI Example:

```bash
salt '*' vboxmanage.list_nodes_min
```

salt.modules.vboxmanage.list_ostypes()

List the available OS Types

CLI Example:

```bash
salt '*' vboxmanage.list_ostypes
```

salt.modules.vboxmanage.register(filename)

Register a VM

CLI Example:

```bash
salt '*' vboxmanage.register my_vm_filename
```

salt.modules.vboxmanage.start(name)

Start a VM

CLI Example:

```bash
salt '*' vboxmanage.start my_vm
```

salt.modules.vboxmanage.stop(name)

Stop a VM

CLI Example:

```bash
salt '*' vboxmanage.stop my_vm
```
salt.modules.vboxmanage.unregister(name, delete=False)
Unregister a VM
CLI Example:
```
salt '*' vboxmanage.unregister my_vm_filename
```
salt.modules.vboxmanage.vboxcmd()  
Return the location of the VBoxManage command
CLI Example:
```
salt '*' vboxmanage.vboxcmd
```

26.6.472 salt.modules.vcenter

Module used to access the vcenter proxy connection methods

**Warning:** This module will be deprecated in a future release of Salt. VMware strongly recommends using the VMware Salt extensions instead of the vCenter module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.

salt.modules.vcenter.get_details()

26.6.473 salt.modules.victorops

Support for VictorOps
New in version 2015.8.0.
Requires an `api_key` in `/etc/salt/minion`:

```
victorops:
  api_key: '280d4699-a817-4719-ba6f-ca56e573e44f'
```
salt.modules.victorops.create_event(message_type=None, routing_key='everybody', **kwargs)
Create an event in VictorOps. Designed for use in states.

The following parameters are required:

**Parameters**

- `message_type` -- One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:

**Parameters**

- `routing_key` -- The key for where messages should be routed. By default, sent to 'everyone' route.
- `entity_id` -- The name of alerting entity. If not provided, a random name will be assigned.
- `timestamp` -- Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.

:param timestamp_fmt The date format for the timestamp parameter.
Parameters

- **state_start_time** -- The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.
- **state_start_time_fmt** -- The date format for the timestamp parameter.
- **state_message** -- Any additional status information from the alert item.
- **entity_is_host** -- Used within VictorOps to select the appropriate display format for the incident.
- **entity_display_name** -- Used within VictorOps to display a human-readable name for the entity.
- **ack_message** -- A user entered comment for the acknowledgment.
- **ack_author** -- The user that acknowledged the incident.

Returns

A dictionary with result, entity_id, and message if result was failure.

CLI Example:

```
salt myminion victorops.create_event message_type='CRITICAL' routing_key='everyone' entity_id='hostname/diskspace'
salt myminion victorops.create_event message_type='ACKNOWLEDGEMENT' routing_key='everyone' entity_id='hostname/diskspace'
ack_message='Acknowledged' ack_author='username'
salt myminion victorops.create_event message_type='RECOVERY' routing_key='everyone' entity_id='hostname/diskspace'
```

The following parameters are required:
- message_type

26.6.474 salt.modules.virt

Work with virtual machines managed by libvirt

**depends**

- libvirt Python module
- libvirt client
- qemu-img
- grep

**Connection**

The connection to the virtualization host can be either setup in the minion configuration, pillar data or overridden for each individual call.

By default, the libvirt connection URL will be guessed: the first available libvirt hypervisor driver will be used. This can be overridden like this:

```
virt:
  connection:
    uri: lxc://
```

If the connection requires an authentication like for ESXi, this can be defined in the minion pillar data like this:
Connecting with SSH protocol

Libvirt can connect to remote hosts using SSH using one of the ssh, libssh and libssh2 transports. Note that libssh2 is likely to fail as it doesn’t read the known_hosts file. Libvirt may also have been built without libssh or libssh2 support.

To use the SSH transport, on the minion setup an SSH agent with a key authorized on the remote libvirt machine.

Per call connection setup

New in version 2019.2.0.

All the calls requiring the libvirt connection configuration as mentioned above can override this configuration using connection, username and password parameters.

This means that the following will list the domains on the local LXC libvirt driver, whatever the virt:connection is.

```
salt 'hypervisor' virt.list_domains connection=lxc://
```

The calls not using the libvirt connection setup are:

- seed_non_shared_migrate
- virt_type
- is_*hyper
- all migration functions
- libvirt ESX URI format
- libvirt URI format
- libvirt authentication configuration

Units

Units specification

New in version 3002.

The string should contain a number optionally followed by a unit. The number may have a decimal fraction. If the unit is not given then MiB are set by default. Units can optionally be given in IEC style (such as MiB), although the standard single letter style (such as M) is more convenient.

Valid units include:
<table>
<thead>
<tr>
<th>Standard Unit</th>
<th>IEC Unit</th>
<th>Standard Name</th>
<th>IEC Name</th>
<th>Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td></td>
<td>Bytes</td>
<td></td>
<td>1</td>
</tr>
<tr>
<td>K</td>
<td>KiB</td>
<td>Kilobytes</td>
<td>Kibibytes</td>
<td>$2^{10}$</td>
</tr>
<tr>
<td>M</td>
<td>MiB</td>
<td>Megabytes</td>
<td>Mebibytes</td>
<td>$2^{20}$</td>
</tr>
<tr>
<td>G</td>
<td>GiB</td>
<td>Gigabytes</td>
<td>Gibibytes</td>
<td>$2^{30}$</td>
</tr>
<tr>
<td>T</td>
<td>TiB</td>
<td>Terabytes</td>
<td>Tebibytes</td>
<td>$2^{40}$</td>
</tr>
<tr>
<td>P</td>
<td>PiB</td>
<td>Petabytes</td>
<td>Pebibytes</td>
<td>$2^{50}$</td>
</tr>
<tr>
<td>E</td>
<td>EiB</td>
<td>Exabytes</td>
<td>Exbibytes</td>
<td>$2^{60}$</td>
</tr>
<tr>
<td>Z</td>
<td>ZiB</td>
<td>Zettabytes</td>
<td>Zebibytes</td>
<td>$2^{70}$</td>
</tr>
<tr>
<td>Y</td>
<td>YiB</td>
<td>Yottabytes</td>
<td>Yobibytes</td>
<td>$2^{80}$</td>
</tr>
</tbody>
</table>

Additional decimal based units:

<table>
<thead>
<tr>
<th>Unit</th>
<th>Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>KB</td>
<td>$10^3$</td>
</tr>
<tr>
<td>MB</td>
<td>$10^6$</td>
</tr>
<tr>
<td>GB</td>
<td>$10^9$</td>
</tr>
<tr>
<td>TB</td>
<td>$10^{12}$</td>
</tr>
<tr>
<td>PB</td>
<td>$10^{15}$</td>
</tr>
<tr>
<td>EB</td>
<td>$10^{18}$</td>
</tr>
<tr>
<td>ZB</td>
<td>$10^{21}$</td>
</tr>
<tr>
<td>YB</td>
<td>$10^{24}$</td>
</tr>
</tbody>
</table>

salt.modules.virt.all_capabilities(**kwargs)**

Return the host and domain capabilities in a single call.

New in version 3001.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

CLI Example:

```
salt '*' virt.all_capabilities
```

salt.modules.virt.capabilities(**kwargs)**

Return the hypervisor connection capabilities.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.capabilities
```

salt.modules.virt.cpu_baseline(full=False, migratable=False, out='libvirt', **kwargs)**

Return the optimal 'custom' CPU baseline config for VM's on this minion

New in version 2016.3.0.
Parameters

- **full** -- Return all CPU features rather than the ones on top of the closest CPU model
- **migratable** -- Exclude CPU features that are unmigratable (libvirt 2.13+)
- **out** -- 'libvirt' (default) for usable libvirt XML definition, 'salt' for nice dict
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```plaintext
salt '*' virt.cpu_baseline
```

salt.modules.virt.create_xml_path(path, **kwargs)

Start a transient domain based on the XML-file path passed to the function

Parameters

- **path** -- path to a file containing the libvirt XML definition of the domain
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```plaintext
salt '*' virt.create_xml_path <path to XML file on the node>
```

salt.modules.virt.create_xml_str(xml, **kwargs)

Start a transient domain based on the XML passed to the function

Parameters

- **xml** -- libvirt XML definition of the domain
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```plaintext
salt '*' virt.create_xml_str <XML in string format>
```

salt.modules.virt.ctrl_alt_del(vm_, **kwargs)

Sends CTRL+ALT+DEL to a VM

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
• **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.ctrl_alt_del <domain>
```

```
salt.modules.virt.define_vol_xml_path(path, pool=None, **kwargs)
Define a volume based on the XML-file path passed to the function
Parameters
• **path** -- path to a file containing the libvirt XML definition of the volume
• **pool** -- storage pool name to define the volume in. If defined, this parameter will
  override the configuration setting.
  New in version 3001.
• **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.define_vol_xml_path <path to XML file on the node>
```

```
salt.modules.virt.define_vol_xml_str(xml, pool=None, **kwargs)
Define a volume based on the XML passed to the function
Parameters
• **xml** -- libvirt XML definition of the storage volume
• **pool** -- storage pool name to define the volume in. If defined, this parameter will
  override the configuration setting.
  New in version 3001.
• **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.define_vol_xml_str <XML in string format>
```

The storage pool where the disk image will be defined is **default** unless changed with the pool parameter
or a configuration like this:
```
virt:
  storagepool: mine
```
salt.modules.virt.define_xml_path(path, **kwargs)

Define a persistent domain based on the XML-file path passed to the function

Parameters

- path -- path to a file containing the libvirt XML definition of the domain
- connection -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username -- username to connect with, overriding defaults
  New in version 2019.2.0.
- password -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_xml_path <path to XML file on the node>
```

salt.modules.virt.define_xml_str(xml, **kwargs)

Define a persistent domain based on the XML passed to the function

Parameters

- xml -- libvirt XML definition of the domain
- connection -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username -- username to connect with, overriding defaults
  New in version 2019.2.0.
- password -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_xml_str <XML in string format>
```

salt.modules.virt.delete_snapshots(name, *names, **kwargs)

Delete one or more snapshots of the given VM.

Parameters

- name -- domain name
- names -- names of the snapshots to remove
- connection -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username -- username to connect with, overriding defaults
  New in version 2019.2.0.
- password -- password to connect with, overriding defaults
  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.delete_snapshots <domain> all=True
salt '*' virt.delete_snapshots <domain> <snapshot>
salt '*' virt.delete_snapshots <domain> <snapshot1> <snapshot2> ...
```

salt.modules.virt.domain_capabilities(emulator=None, arch=None, machine=None, domain=None, **kwargs)

26.6. execution modules
Return the domain capabilities given an emulator, architecture, machine or virtualization type.

New in version 2019.2.0.

Parameters

- **emulator** -- return the capabilities for the given emulator binary
- **arch** -- return the capabilities for the given CPU architecture
- **machine** -- return the capabilities for the given emulated machine type
- **domain** -- return the capabilities for the given virtualization type.
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

The list of the possible emulator, arch, machine and domain can be found in the host capabilities output.

If none of the parameters is provided, the libvirt default one is returned.

CLI Example:

```bash
salt '*' virt.domain_capabilities arch='x86_64' domain='kvm'
```

salt.modules.virt.freecpu(**kwargs)

Return an int representing the number of unallocated cpus on this hypervisor.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```bash
sicl '*' virt.freecpu
```

salt.modules.virt.freemem(**kwargs)

Return an int representing the amount of memory (in MB) that has not been given to virtual machines on this node.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```bash
sicl '*' virt.freemem
```

salt.modules.virt.full_info(**kwargs)

Return the node_info, vm_info and freemem.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.full_info
```

salt.modules.virt.get_disks(*vm_, **kwargs)*

Return the disks of a named vm

Parameters
- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.get_disks <domain>
```

salt.modules.virt.get_graphics(*vm_, **kwargs)*

Returns the information on vnc for a given vm

Parameters
- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.get_graphics <domain>
```

salt.modules.virt.get_hypervisor()

Returns the name of the hypervisor running on this node or None.

Detected hypervisors:
- kvm
- xen
- bhyve

CLI Example:
```
salt '*' virt.get_hypervisor
```

New in version 2019.2.0: the function and the kvm, xen and bhyve hypervisors support
salt.modules.virt.get_loader(vm, **kwargs)

Returns the information on the loader for a given vm

Parameters

• vm -- name of the domain
• connection -- libvirt connection URI, overriding defaults
• username -- username to connect with, overriding defaults
• password -- password to connect with, overriding defaults

CLI Example:

```
salt '*' virt.get_loader <domain>
```

New in version 2019.2.0.

salt.modules.virt.get_macs(vm, **kwargs)

Return a list of MAC addresses from the named vm

Parameters

• vm -- name of the domain
• connection -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• username -- username to connect with, overriding defaults
  New in version 2019.2.0.
• password -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_macs <domain>
```

salt.modules.virt.get_nics(vm, **kwargs)

Return info about the network interfaces of a named vm

Parameters

• vm -- name of the domain
• connection -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• username -- username to connect with, overriding defaults
  New in version 2019.2.0.
• password -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_nics <domain>
```

salt.modules.virt.get_profiles(hypervisor=None, **kwargs)

Return the virt profiles for hypervisor.

Currently there are profiles for:

• nic
• disk

Parameters

• hypervisor -- override the default machine type.
• connection -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```bash
salt '*' virt.get_profiles
salt '*' virt.get_profiles hypervisor=vmware
```

```bash
salt.modules.virt.get_xml(vm_, **kwargs)
```

Returns the XML for a given vm

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```bash
salt '*' virt.get_xml <domain>
```

salt.modules.virt.init(name, cpu, mem, nic='default', interfaces=None, hypervisor=None, start=True, disk='default', disks=None, saltenv='base', seed=True, install=True, pub_key=None, priv_key=None, seed_cmd='seed.apply', graphics=None, os_type=None, arch=None, boot=None, boot_dev=None, numatune=None, hypervisor_features=None, clock=None, serials=None, consoles=None, stop_on_reboot=False, host_devices=None, **kwargs)

Initialize a new vm

Parameters

- **name** -- name of the virtual machine to create
- **cpu** -- Number of virtual CPUs to assign to the virtual machine or a dictionary with detailed information to configure cpu model and topology, numa node tuning, cpu tuning and iothreads allocation. The structure of the dictionary is documented in *cpu parameters definition*.

```json

cpu:
    placement: static
    cpuset: 0-11
    current: 5
    maximum: 12
    vcpus:
      0:
        enabled: True
        hotpluggable: False
        order: 1
      1:
        enabled: False
        hotpluggable: True
```

New in version 3003.

- **mem** -- Amount of memory to allocate to the virtual machine in MiB. Since 3002, a dictionary can be used to contain detailed configuration which support memory allocation or tuning. Supported parameters are boot, current, max, slots, hard_limit, soft_limit, swap_hard_limit, min_guarantee, hugepages, nosharepages, locked, source, access, allocation and discard. The structure of the dictionary is documented in Memory parameter definition. Both decimal and binary base are supported. Detail unit specification is documented in Units specification. Please note that the value for slots must be an integer.

```json
{
    'boot': 1g,
    ...
}
```

(continues on next page)
{'current': '1g',
'max': '1g',
'slots': 10,
'hard_limit': '1024',
'soft_limit': '512m',
'swap_hard_limit': '1g',
'min_guarantee': '512mib',
'hugepages': [{'nodeset': '0-3,^2', 'size': '1g'},
              {'nodeset': '2', 'size': '2m'}],
'nosharepages': True,
'locked': True,
'source': 'file',
'access': 'shared',
'allocation': 'immediate',
'discard': True
}

Changed in version 3002.

- **nic** -- NIC profile to use (Default: 'default'). The profile interfaces can be customized / extended with the interfaces parameter. If set to None, no profile will be used.

- **interfaces** -- List of dictionaries providing details on the network interfaces to create. These data are merged with the ones from the nic profile. The structure of each dictionary is documented in Network Interfaces Definitions.

New in version 2019.2.0.

- **hypervisor** -- the virtual machine type. By default the value will be computed according to the virtual host capabilities.

- **start** -- True to start the virtual machine after having defined it (Default: True)

- **disk** -- Disk profile to use (Default: 'default'). If set to None, no profile will be used.

- **disks** -- List of dictionaries providing details on the disk devices to create. These data are merged with the ones from the disk profile. The structure of each dictionary is documented in Disks Definitions.

New in version 2019.2.0.

- **saltenv** -- Fileserver environment (Default: 'base'). See cp module for more details

- **seed** -- True to seed the disk image. Only used when the image parameter is provided. (Default: True)

- **install** -- install salt minion if absent (Default: True)

- **pub_key** -- public key to seed with (Default: None)

- **priv_key** -- public key to seed with (Default: None)

- **seed_cmd** -- Salt command to execute to seed the image. (Default: 'seed.apply')

- **graphics** -- Dictionary providing details on the graphics device to create. (Default: None) See Graphics Definition for more details on the possible values.

New in version 2019.2.0.

- **os_type** -- type of virtualization as found in the //os/type element of the libvirt definition. The default value is taken from the host capabilities, with a preference for hvm.

New in version 2019.2.0.
- **arch** -- architecture of the virtual machine. The default value is taken from the host capabilities, but x86_64 is prefed over i686.

  New in version 2019.2.0.

- **config** -- minion configuration to use when seeding. See seed module for more details

- **boot_dev** -- String of space-separated devices to boot from (Default: 'hd')

- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

- **stop_on_reboot** -- If set to True the guest will stop instead of rebooting. This is specially useful when creating a virtual machine with an installation cdrom or an autoinstallation needing a special first boot configuration. Defaults to False

  New in version 3003.

- **boot** -- Specifies kernel, initial ramdisk and kernel command line parameters for the virtual machine. This is an optional parameter, all of the keys are optional within the dictionary. The structure of the dictionary is documented in Boot parameters definition. If a remote path is provided to kernel or initrd, salt will handle the downloading of the specified remote file and modify the XML accordingly. To boot VM with UEFI, specify loader and nvram path or specify 'efi': True if your libvirtd version is >= 5.2.0 and QEMU >= 3.0.0.

  New in version 3000.

```python
{
    'kernel': '/root/f8-i386-vmlinuz',
    'initrd': '/root/f8-i386-initrd',
    'cmdline': 'console=ttyS0 ks=http://example.com/f8-
               i386/os/',
    'loader': '/usr/share/OVMF/OVMF_CODE.fd',
    'nvram': '/usr/share/OVMF/OVMF_VARS.ms.fd'
}
```

- **boot_dev** -- Space separated list of devices to boot from sorted by decreasing priority. Values can be hd, fd, cdrom or network.

  By default, the value will "hd".

- **numatune** -- The optional numatune element provides details of how to tune the performance of a NUMA host via controlling NUMA policy for domain process. The optional memory element specifies how to allocate memory for the domain process on a NUMA host. memnode elements can specify memory allocation policies per each guest NUMA node. The definition used in the dictionary can be found at cpu parameters definition.

  New in version 3003.

```python
{
    'memory': {'mode': 'strict', 'nodeset': '0-11'},
    'memnodes': {0: {'mode': 'strict', 'nodeset': 1}, 1:
                 {'mode': 'preferred', 'nodeset': 2}}
}
```
- **hypervisor_features** -- Enable or disable hypervisor-specific features on the virtual machine.

  New in version 3003.

  ```yaml
  hypervisor_features:
  kvm-hint-dedicated: True
  ```

- **clock** -- Configure the guest clock. The value is a dictionary with the following keys:
  - adjustment
    - time adjustment in seconds or reset
  - utc
    - set to False to use the host local time as the guest clock. Defaults to True.
  - timezone
    - synchronize the guest to the corresponding timezone
  - timers
    - a dictionary associating the timer name with its configuration. This configuration is a dictionary with the properties track, tickpolicy, catchup, frequency, mode, present, slew, threshold and limit. See libvirt time keeping documentation for the possible values.

  New in version 3003.

  Set the clock to local time using an offset in seconds .. code-block:: yaml

  ```yaml
clock:
  adjustment: 3600 utc: False
  ```

  Set the clock to a specific time zone:

  ```yaml
clock:
  timezone: CEST
  ```

  Tweak guest timers:

  ```yaml
clock:
  timers:
  tsc:
    frequency: 3504000000
    mode: native
  rtc:
    track: wall
    tickpolicy: catchup
    slew: 4636
    threshold: 123
    limit: 2342
  hpet:
    present: False
  ```

- **serials** -- Dictionary providing details on the serials connection to create. (Default: None) See Serials and Consoles Definitions for more details on the possible values.

  New in version 3003.

- **consoles** -- Dictionary providing details on the consoles device to create. (Default: None) See Serials and Consoles Definitions for more details on the possible values.

  New in version 3003.

- **host_devices** -- List of host devices to passthrough to the guest. The value is a list of device names as provided by the `node_devices()` function. (Default: None)
**cpu parameters definition**

The cpu parameters dictionary can contain the following properties:

- **cpuset**
  A comma-separated list of physical CPU numbers that domain process and virtual CPUs can be pinned to by default. e.g. `1-4,^3` cpuset 3 is excluded.

- **current**
  The number of virtual cpus available at startup

- **placement**
  Indicate the CPU placement mode for domain process. The value can be either static or auto

- **vcpus**
  Specify the state of individual vcpu. Possible attribute for each individual vcpu include: id, enabled, hotpluggable and order. Valid ids are from 0 to the maximum vCPU count minus 1. enabled takes boolean values which controls the state of the vcpu. hotpluggable take boolean value which controls whether given vCPU can be hotplugged and hotunplugged. order takes an integer value which specifies the order to add the online vCPUs.

- **match**
  The cpu attribute match attribute specifies how strictly the virtual CPU provided to the guest matches the CPU requirements, possible values are minimum, exact or strict.

- **check**
  Optional cpu attribute check attribute can be used to request a specific way of checking whether the virtual CPU matches the specification, possible values are none, partial and full.

- **mode**
  Optional cpu attribute mode attribute may be used to make it easier to configure a guest CPU to be as close to host CPU as possible, possible values are custom, host-model and host-passthrough.

- **model**
  Specifies CPU model requested by the guest. An optional fallback attribute can be used to forbid libvirt falls back to the closest model supported by the hypervisor, possible values are allow or forbid.

- **vendor_id**
  Attribute can be used to set the vendor id seen by the guest, the length must be exactly 12 characters long.

- **vendor**
  Specifies CPU vendor requested by the guest.

- **topology**
  Specifies requested topology of virtual CPU provided to the guest. Four possible attributes, sockets, dies, cores, and threads, accept non-zero positive integer values. They refer to the number of CPU sockets per NUMA node, number of dies per socket, number of cores per die, and number of threads per core, respectively.

- **features**
  A dictionary contains a set of cpu features to fine-tune features provided by the selected CPU model. Use cpu feature name as the key and the policy as the value. policy Attribute takes force, require, optional, disable or forbid.

- **cache**
  Describes the virtual CPU cache. Optional attribute level takes an integer value which describes cache level mode attribute supported three possible values: emulate, passthrough, disable

- **numa**
  Specify the guest numa topology. Cell element specifies a NUMA cell or a NUMA node, cpus specifies the CPU or range of CPUs that are part of the node, memory specifies the size of the node memory. All cells should have id attribute in case referring to some cell is necessary in the code. optional attribute memAccess control whether the memory is to be mapped as shared or private, discard attribute which fine tunes the discard feature for given numa node, possible values are True or False. distances element define the distance between NUMA cells and sibling sub-element is used to specify the distance value between sibling NUMA cells.
vcpupin
The optional vcpupin element specifies which of host's physical CPUs the domain vCPU will be pinned to.

emulatorpin
The optional emulatorpin element specifies which of host physical CPUs the "emulator", a subset of a domain not including vCPU or iothreads will be pinned to.

iothreadpin
The optional iothreadpin element specifies which of host physical CPUs the IOThreads will be pinned to.

shares
The optional shares element specifies the proportional weighted share for the domain.

period
The optional period element specifies the enforcement interval (unit: microseconds).

quota
The optional quota element specifies the maximum allowed bandwidth (unit: microseconds).

global_period
The optional global_period element specifies the enforcement CFS scheduler interval (unit: microseconds) for the whole domain in contrast with period which enforces the interval per vCPU.

global_quota
The optional global_quota element specifies the maximum allowed bandwidth (unit: microseconds) within a period for the whole domain.

emulator_period
The optional emulator_period element specifies the enforcement interval (unit: microseconds).

emulator_quota
The optional emulator_quota element specifies the maximum allowed bandwidth (unit: microseconds) for domain's emulator threads (those excluding vCPUs).

iothread_period
The optional iothread_period element specifies the enforcement interval (unit: microseconds) for IO-Threads.

iothread_quota
The optional iothread_quota element specifies the maximum allowed bandwidth (unit: microseconds) for IOThreads.

vcpusched
specify the scheduler type for vCPUs. The value is a list of dictionaries with the scheduler key (values batch, idle, fifo, rr) and the optional priority and vcpus keys. The priority value usually is a positive integer and the vcpus value is a cpu set like 1-4,^3,6 or simply the vcpu id.

iothreadsched
specify the scheduler type for IO threads. The value is a list of dictionaries with the scheduler key (values batch, idle, fifo, rr) and the optional priority and vcpus keys. The priority value usually is a positive integer and the vcpus value is a cpu set like 1-4,^3,6 or simply the vcpu id.

emulatorsched
specify the scheduler type (values batch, idle, fifo, rr) for particular the emulator. The value is a dictionary with the scheduler key (values batch, idle, fifo, rr) and the optional priority and vcpus keys. The priority value usually is a positive integer.

cachetune
Optional cachetune element can control allocations for CPU caches using the resctrl on the host.

monitor
The optional element monitor creates the cache monitor(s) for current cache allocation.

memorytune
Optional memorytune element can control allocations for memory bandwidth using the resctrl on the host.

iothreads
Number of threads for supported disk devices to perform I/O requests. iothread id will be numbered from 1 to the provided number (Default: None).
Boot parameters definition

The boot parameters dictionary can contains the following properties:

**kernel**
The URL or path to the kernel to run the virtual machine with.

**initrd**
The URL or path to the initrd file to run the virtual machine with.

**cmdline**
The parameters to pass to the kernel provided in the *kernel* property.

**loader**
The path to the UEFI binary loader to use.

New in version 3001.

**nvram**
The path to the UEFI data template. The file will be copied when creating the virtual machine.

New in version 3001.

**efi**
A boolean value.

New in version 3001.

Memory parameter definition

Memory parameter can contain the following properties:

**boot**
The maximum allocation of memory for the guest at boot time

**current**
The actual allocation of memory for the guest

**max**
The run time maximum memory allocation of the guest

**slots**
specifies the number of slots available for adding memory to the guest

**hard_limit**
the maximum memory the guest can use

**soft_limit**
memory limit to enforce during memory contention

**swap_hard_limit**
the maximum memory plus swap the guest can use

**min_guarantee**
the guaranteed minimum memory allocation for the guest

**hugepages**
memory allocated using hugepages instead of the normal native page size. It takes a list of dictionaries with nodeset and size keys. For example "hugepages": [{"nodeset": "1-4,^3", "size": "2m"}, {"nodeset": "3", "size": "1g"}].

**nosharepages**
boolean value to instruct hypervisor to disable shared pages (memory merge, KSM) for this domain

**locked**
boolean value that allows memory pages belonging to the domain will be locked in host's memory and the host will not be allowed to swap them out, which might be required for some workloads such as real-time.

**source**
possible values are file which utilizes file memorybacking, anonymous by default and memfd backing. (QEMU/KVM only)
access
specify if the memory is to be shared or private. This can be overridden per numa node by memAccess.

allocation
specify when to allocate the memory by supplying either immediate or ondemand.

discard
boolean value to ensure the memory content is discarded just before guest shuts down (or when DIMM module is unplugged). Please note that this is just an optimization and is not guaranteed to work in all cases (e.g. when hypervisor crashes). (QEMU/KVM only)

Network Interfaces Definitions

Network interfaces dictionaries can contain the following properties:

name
Name of the network interface. This is only used as a key to merge with the profile data

type
Network type. One of 'bridge', 'network'

source
The network source, typically the bridge or network name

mac
The desired mac address, computed if None (Default: None).

model
The network card model (Default: depends on the hypervisor)

Disks Definitions

Disk dictionaries can contain the following properties:

name
Name of the disk. This is mostly used in the name of the disk image and as a key to merge with the profile data.

format
Format of the disk image, like 'qcow2', 'raw', 'vmdk'. (Default: depends on the hypervisor)

size
Disk size in MiB

pool
Path to the folder or name of the pool where disks should be created. (Default: depends on hypervisor and the virt:storagepool configuration)

model
One of the disk busses allowed by libvirt (Default: depends on hypervisor)

image
Path to the image to use for the disk. If no image is provided, an empty disk will be created (Default: None)

Note that some pool types do not support uploading an image. This list can evolve with libvirt versions.

overlay_image
True to create a QCOW2 disk image with image as backing file. If False the file pointed to by the image property will simply be copied. (Default: False)

Changed in version 3001.
This property is only valid on path-based disks, not on volumes. To create a volume with a backing store, set the `backing_store_path` and `backing_store_format` properties.

**backing_store_path**
Path to the backing store image to use. This can also be the name of a volume to use as backing store within the same pool.

New in version 3001.

**backing_store_format**
Image format of the disk or volume to use as backing store. This property is mandatory when using `backing_store_path` to avoid problems.

New in version 3001.

**source_file**
Absolute path to the disk image to use. Not to be confused with `image` parameter. This parameter is useful to use disk images that are created outside of this module. Can also be `None` for devices that have no associated image like cdroms.

Changed in version 3001.

For volume disks, this can be the name of a volume already existing in the storage pool.

**device**
Type of device of the disk. Can be one of 'disk', 'cdrom', 'floppy' or 'lun'. (Default: 'disk')

**hostname_property**
When using ZFS volumes, setting this value to a ZFS property ID will make Salt store the name of the virtual machine inside this property. (Default: `None`)

**sparse_volume**
Boolean to specify whether to use a thin provisioned ZFS volume.

Example profile for a bhyve VM with two ZFS disks. The first is cloned from the specified image. The second disk is a thin provisioned volume.

```yaml
virt:
  disk:
    two_zvols:
      - system:
          image: zroot/bhyve/CentOS-7-x86_64-v1@v1.0.5
          hostname_property: virt:hostname
          pool: zroot/bhyve/guests
      - data:
          pool: tank/disks
          size: 20G
          hostname_property: virt:hostname
          sparse_volume: True
```

**io**
I/O control policy. String value amongst `native`, `threads` and `io_uring`. (Default: `native`)

New in version 3003.

**iothread_id**
I/O thread id to assign the disk to. (Default: none assigned)

New in version 3003.
Graphics Definition

The graphics dictionary can have the following properties:

- **type**
  - Graphics type. The possible values are `none`, `spice`, `vnc` and other values allowed as a libvirt graphics type (Default: None)
  - See the libvirt graphics element documentation for more details on the possible types.

- **port**
  - Port to export the graphics on for vnc, spice and rdp types.

- **tls_port**
  - Port to export the graphics over a secured connection for spice type.

- **listen**
  - Dictionary defining on what address to listen on for vnc, spice and rdp. It has a type property with address and None as possible values, and an address property holding the IP or hostname to listen on.
  - By default, not setting the listen part of the dictionary will default to listen on all addresses.

Serials and Consoles Definitions

Serial dictionaries can contain the following properties:

- **type**
  - Type of the serial connection, like `tcp`, `pty`, `file`, `udp`, `dev`, `pipe`, `unix`.

- **path**
  - Path to the source device. Can be a log file, a host character device to pass through, a unix socket, a named pipe path.

- **host**
  - The serial UDP or TCP host name. (Default: 23023)

- **port**
  - The serial UDP or TCP port number. (Default: 23023)

- **protocol**
  - Name of the TCP connection protocol. (Default: telnet)

- **tls**
  - Boolean value indicating whether to use hypervisor TLS certificates environment for TCP devices.

- **target_port**
  - The guest device port number starting from 0

- **target_type**
  - The guest device type. Common values are serial, virtio or usb-serial, but more are documented in the libvirt documentation.

CLI Example

```
salt 'hypervisor' virt.init vm_name 4 512 salt://path/to/image.raw
salt 'hypervisor' virt.init vm_name 4 512 /var/lib/libvirt/images/img.raw
salt 'hypervisor' virt.init vm_name 4 512 nic=profile disk=profile
```

The disk images will be created in an image folder within the directory defined by the `virt:images` option. Its default value is `/srv/salt-images/` but this can changed with such a configuration:

```
virt:
  images: /data/my/vm/images/
```
salt.modules.virt.is_hyper()

Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:

```
salt '*' virt.is_hyper
```

salt.modules.virt.list_active_vms(**kwargs)

Return a list of names for active virtual machine on the minion

Parameters

- connection -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.

- username -- username to connect with, overriding defaults
  
  New in version 2019.2.0.

- password -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_active_vms
```

salt.modules.virt.list_domains(**kwargs)

Return a list of available domains.

Parameters

- connection -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.

- username -- username to connect with, overriding defaults
  
  New in version 2019.2.0.

- password -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_domains
```

salt.modules.virt.list_inactive_vms(**kwargs)

Return a list of names for inactive virtual machine on the minion

Parameters

- connection -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.

- username -- username to connect with, overriding defaults
  
  New in version 2019.2.0.

- password -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_inactive_vms
```

salt.modules.virt.list_networks(**kwargs)

List all virtual networks.

Parameters

- connection -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_networks
```

`salt.modules.virt.list_pools(**kwargs)`

List all storage pools.

**Parameters**

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_pools
```

`salt.modules.virt.list_snapshots(domain=None, **kwargs)`

List available snapshots for certain vm or for all.

**Parameters**

- **domain** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.list_snapshots
salt '*' virt.list_snapshots <domain>
```

`salt.modules.virt.migrate(vm_, target, **kwargs)`

Shared storage migration

**Parameters**

- **vm** -- domain name
- **target** -- target libvirt URI or host name
- **kwargs** --
  - `live`: Use live migration. Default value is True.
  - `persistent`: Leave the domain persistent on destination host.
    Default value is True.
  - `undefinesource`: Undefine the domain on the source host.
    Default value is True.
  - `offline`: If set to True it will migrate the domain definition
    without starting the domain on destination and without stopping it on
    source host. Default value is False.
  - `max_bandwidth`: The maximum bandwidth (in MiB/s) that will be used.
- **max_downtime**: Set maximum tolerable downtime for live-migration.
  The value represents a number of milliseconds the guest is allowed to be
down at the end of live migration.

- **parallel_connections**: Specify a number of parallel network connections
to be used to send memory pages to the destination host.

- **compressed**: Activate compression.

- **comp_methods**: A comma-separated list of compression methods.
  Supported
  methods are "mt" and "xbzrle" and can be used in any combination.
  QEMU defaults to "xbzrle".

- **comp_mt_level**: Set compression level. Values are in range from 0 to 9,
  where 1 is maximum speed and 9 is maximum compression.

- **comp_mt_threads**: Set number of compress threads on source host.

- **comp_mt_dthreads**: Set number of decompress threads on target host.

- **comp_xbzrle_cache**: Set the size of page cache for xbzrle compression in bytes.

- **copy_storage**: Migrate non-shared storage. It must be one of the following
  values: all (full disk copy) or incremental (Incremental copy)

- **postcopy**: Enable the use of post-copy migration.

- **postcopy_bandwidth**: The maximum bandwidth allowed in post-copy phase.
  (MiB/s)

- **username**: Username to connect with target host

- **password**: Password to connect with target host

New in version 3002.

CLI Example:

```bash
salt '*' virt.migrate <domain> <target hypervisor URI>
salt src virt.migrate guest qemu+ssh://dst/system
salt src virt.migrate guest qemu+tls://dst/system
salt src virt.migrate guest qemu+tcp://dst/system
```

A tunnel data migration can be performed by setting this in the configuration:

```yaml
virt:
  tunnel: True
```

For more details on tunnelled data migrations, report to https://libvirt.org/migration.html#transporttunnel

### salt.modules.virt.migrate_start_postcopy(vm_)

Starts post-copy migration. This function has to be called while live migration is in progress and it has been
initiated with the postcopy=True option.

CLI Example:

```bash
salt '*' virt.migrate_start_postcopy <domain>
```

### salt.modules.virt.nesthash(value=None)

create default dict that allows arbitrary level of nesting

### salt.modules.virt.network_define(name, bridge, forward, ipv4_config=None, ipv6_config=None,
vport=None, tag=None, autostart=True, start=True, mtu=None,
domain=None, nat=None, interfaces=None, addresses=None,
physical_function=None, dns=None, **kwargs)

Create libvirt network.

**Parameters**

- **name** -- Network name.
• **bridge** -- Bridge name.
• **forward** -- Forward mode (bridge, router, nat).

Changed in version 3003: a `None` value creates an isolated network with no forwarding at all

• **vport** -- Virtualport type. The value can also be a dictionary with `type` and `parameters` keys. The `parameters` value is a dictionary of virtual port parameters.

```
- vport:
  type: openvswitch
  parameters:
    interfaceid: 09b11c53-8b5c-4eeb-8f00-d84eaa0aa4f
```

Changed in version 3003: possible dictionary value

• **tag** -- Vlan tag. The value can also be a dictionary with the `tags` and optional `trunk` keys. `trunk` is a boolean value indicating whether to use VLAN trunking. `tags` is a list of dictionaries with keys `id` and `nativeMode`. The `nativeMode` value can be one of `tagged` or `untagged`.

```
- tag:
  trunk: True
  tags:
    - id: 42
      nativeMode: untagged
    - id: 47
```

Changed in version 3003: possible dictionary value

• **autostart** -- Network autostart (default True).
• **start** -- Network start (default True).
• **ipv4_config** (`dict` or `None`) -- IP v4 configuration. Dictionary describing the IP v4 setup like IP range and a possible DHCP configuration. The structure is documented in `net-define-ip`.

New in version 3000.

• **ipv6_config** (`dict` or `None`) -- IP v6 configuration. Dictionary describing the IP v6 setup like IP range and a possible DHCP configuration. The structure is documented in `net-define-ip`.

New in version 3000.

• **connection** -- libvirt connection URI, overriding defaults.
• **username** -- username to connect with, overriding defaults.
• **password** -- password to connect with, overriding defaults.
• **mtu** -- size of the Maximum Transmission Unit (MTU) of the network. (default `None`)

New in version 3003.

• **domain** -- DNS domain name of the DHCP server. The value is a dictionary with a mandatory `name` property and an optional `localOnly` boolean one. (default `None`)

```
- domain:
  name: lab.acme.org
  localOnly: True
```

New in version 3003.

• **nat** -- addresses and ports to route in NAT forward mode. The value is a dictionary with optional keys `address` and `port`. Both values are a dictionary with `start` and `end` values. (default `None`)
- `forward`: nat
  - `nat`:
    - `address`:
      - `start`: 1.2.3.4
      - `end`: 1.2.3.10
    - `port`:
      - `start`: 500
      - `end`: 1000

New in version 3003.
- `interfaces` -- whitespace separated list of network interfaces devices that can be used for this network. (default None)

- `forward`: passthrough
- `interfaces`: "eth0 eth11 eth12"

New in version 3003.
- `addresses` -- whitespace separated list of addresses of PCI devices that can be used for this network in `hostdev` forward mode. (default None)

- `forward`: hostdev
- `interfaces`: "0000:04:00.1 0000:e3:01.2"

New in version 3003.
- `physical_function` -- device name of the physical interface to use in `hostdev` forward mode. (default None)

- `forward`: hostdev
- `physical_function`: "eth0"

New in version 3003.
- `dns` -- virtual network DNS configuration. The value is a dictionary described in `net-define-dns` (default None)

- `dns`:
  - `forwarders`:
    - `domain`: example.com
      - `addr`: 192.168.1.1
    - `addr`: 8.8.8.8
    - `domain`: www.example.com
  - `txt`:
    - `example.com`: "v=spf1 a -all"
    - `_http.tcp.example.com`: "name=value,paper=A4"
  - `hosts`:
    - `192.168.1.2`:
      - `mirror.acme.lab`
      - `test.acme.lab`
  - `srvs`:
    - `name`: ldap
      - `protocol`: tcp
      - `domain`: ldapserver.example.com
      - `target`: .
      - `port`: 389

(continues on next page)
New in version 3003.

**IP configuration definition**

Both the IPv4 and IPv6 configuration dictionaries can contain the following properties:

- **cidr**
  
  CIDR notation for the network. For example '192.168.124.0/24'

- **dhcp_ranges**
  
  A list of dictionaries with 'start' and 'end' properties.

- **hosts**
  
  A list of dictionaries with ip property and optional name, mac and id properties.

  New in version 3003.

- **bootp**
  
  A dictionary with a file property and an optional server one.

  New in version 3003.

- **tftp**
  
  The path to the TFTP root directory to serve.

  New in version 3003.

**DNS configuration definition**

The DNS configuration dictionary contains the following optional properties:

- **forwarders**
  
  List of alternate DNS forwarders to use. Each item is a dictionary with the optional domain and addr keys. If both are provided, the requests to the domain are forwarded to the server at the addr. If only domain is provided the requests matching this domain will be resolved locally. If only addr is provided all requests will be forwarded to this DNS server.

- **txt**
  
  Dictionary of TXT fields to set.

- **hosts**
  
  Dictionary of host DNS entries. The key is the IP of the host, and the value is a list of hostnames for it.

- **srvs**
  
  List of SRV DNS entries. Each entry is a dictionary with the mandatory name and protocol keys. Entries can also have target, port, priority, domain and weight optional properties.

CLI Example:

```bash
salt '*' virt.network_define network main bridge openvswitch
```

New in version 2019.2.0.

**salt.modules.virt.network_get_xml(name, **kwargs)**

Return the XML definition of a virtual network

**Parameters**

- **name** -- libvirt network name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults
New in version 3000.

CLI Example:

```
salt '*' virt.network_get_xml default
```

salt.modules.virt.network_info(name=None, **kwargs)

Return information on a virtual network provided its name.

**Parameters**
- name -- virtual network name
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

If no name is provided, return the infos for all defined virtual networks.

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.network_info default
```

salt.modules.virt.network_set_autostart(name, state='on', **kwargs)

Set the autostart flag on a virtual network so that the network will start with the host system on reboot.

**Parameters**
- name -- virtual network name
- state -- 'on' to auto start the network, anything else to mark the virtual network not to be started when the host boots
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt "*" virt.network_set_autostart <pool> <on | off>
```

salt.modules.virt.network_start(name, **kwargs)

Start a defined virtual network.

**Parameters**
- name -- virtual network name
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.network_start default
```

salt.modules.virt.network_stop(name, **kwargs)

Stop a defined virtual network.

**Parameters**
- name -- virtual network name
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults
New in version 2019.2.0.

CLI Example:
```
salt '*' virt.network_stop default
```

**salt.modules.virt.network_undefine(name, **kwargs)**

Remove a defined virtual network. This does not stop the virtual network.

**Parameters**
- **name** -- virtual network name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.network_undefine default
```

**salt.modules.virt.network_update(name, bridge, forward, ipv4_config=None, ipv6_config=None, vport=None, tag=None, mtu=None, domain=None, nat=None, interfaces=None, addresses=None, physical_function=None, dns=None, test=False, **kwargs)**

Update a virtual network if needed.

**Parameters**
- **name** -- Network name.
- **bridge** -- Bridge name.
- **forward** -- Forward mode (bridge, router, nat). A None value creates an isolated network with no forwarding at all.
- **vport** -- Virtualport type. The value can also be a dictionary with type and parameters keys. The parameters value is a dictionary of virtual port parameters.

```
- **vport**:
  type: openvswitch
  parameters:
  interfaceid: 09b11c53-8b5c-4eeb-8f00-d84ea0aaa4f
```

- **tag** -- Vlan tag. The value can also be a dictionary with the tags and optional trunk keys. trunk is a boolean value indicating whether to use VLAN trunking. tags is a list of dictionaries with keys id and nativeMode. The nativeMode value can be one of tagged or untagged.

```
- **tag**:
  trunk: True
  tags:
  - id: 42
    nativeMode: untagged
  - id: 47
```

- **ipv4_config**(dict or None) -- IP v4 configuration. Dictionary describing the IP v4 setup like IP range and a possible DHCP configuration. The structure is documented in net-define-ip.
- **ipv6_config**(dict or None) -- IP v6 configuration. Dictionary describing the IP v6 setup like IP range and a possible DHCP configuration. The structure is documented in net-define-ip.
- **connection** -- libvirt connection URI, overriding defaults.
- **username** -- username to connect with, overriding defaults.
- **password** -- password to connect with, overriding defaults.
- **mtu** -- size of the Maximum Transmission Unit (MTU) of the network. (default None)
- **domain** -- DNS domain name of the DHCP server. The value is a dictionary with a mandatory `name` property and an optional `localOnly` boolean one. (default None)

  ```
  - domain:
    name: lab.acme.org
    localOnly: True
  ```

- **nat** -- addresses and ports to route in NAT forward mode. The value is a dictionary with optional keys `address` and `port`. Both values are a dictionary with `start` and `end` values. (default None)

  ```
  - forward: nat
    nat:
      address:
        start: 1.2.3.4
        end: 1.2.3.10
      port:
        start: 500
        end: 1000
  ```

- **interfaces** -- whitespace separated list of network interfaces devices that can be used for this network. (default None)

  ```
  - forward: passthrough
    interfaces: "eth10 eth11 eth12"
  ```

- **addresses** -- whitespace separated list of addresses of PCI devices that can be used for this network in `hostdev` forward mode. (default None)

  ```
  - forward: hostdev
    interfaces: "0000:04:00.1 0000:e3:01.2"
  ```

- **physical_function** -- device name of the physical interface to use in `hostdev` forward mode. (default None)

  ```
  - forward: hostdev
    physical_function: "eth0"
  ```

- **dns** -- virtual network DNS configuration. The value is a dictionary described in `net-define-dns`. (default None)

  ```
  - dns:
    forwarders:
      - domain: example.com
        addr: 192.168.1.1
      - addr: 8.8.8.8
        domain: www.example.com
    txt:
      example.com: "v=spf1 a -all"
      _http.tcp.example.com: "name=value,paper=A4"
    hosts:
      192.168.1.2:
        - mirror.acme.lab
  ```
- test.acme.lab

srvs:
- name: ldap
  protocol: tcp
  domain: ldapserver.example.com
  target: .
  port: 389
  priority: 1
  weight: 10

New in version 3003.

salt.modules.virt.node_devices(**kwargs)
List the host available devices.

Parameters
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

New in version 3003.

salt.modules.virt.node_info(**kwargs)
Return a dict with information about this node

Parameters
- connection -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username -- username to connect with, overriding defaults
  New in version 2019.2.0.
- password -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt '*' virt.node_info

salt.modules.virt.pause(vm_, **kwargs)
Pause the named vm

Parameters
- vm -- domain name
- connection -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username -- username to connect with, overriding defaults
  New in version 2019.2.0.
- password -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt '*' virt.pause <domain>

salt.modules.virt.pool_build(name, **kwargs)
Build a defined libvirt storage pool.

Parameters
- name -- libvirt storage pool name
• **connection** -- libvirt connection URI, overriding defaults
• **username** -- username to connect with, overriding defaults
• **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.pool_build default
```

salt.modules.virt.pool_capabilities(**kwargs)

Return the hypervisor connection storage pool capabilities.

The returned data are either directly extracted from libvirt or computed. In the latter case some pool types could be listed as supported while they are not. To distinguish between the two cases, check the value of the computed property.

Parameters

• **connection** -- libvirt connection URI, overriding defaults
• **username** -- username to connect with, overriding defaults
• **password** -- password to connect with, overriding defaults

New in version 3000.

CLI Example:
```
salt '*' virt.pool_capabilities
```

salt.modules.virt.pool_define(name, ptype, target=None, permissions=None, source_devices=None, source_dir=None, source_initiator=None, source_adapter=None, source_hosts=None, source_auth=None, source_name=None, source_format=None, transient=False, start=True, **kwargs)

Create libvirt pool.

Parameters

• **name** -- Pool name
• **ptype** -- Pool type. See libvirt documentation for the possible values.
• **target** -- Pool full path target
• **permissions** -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See Permissions definition for more details on this structure.
• **source_devices** -- List of source devices for pools backed by physical devices. (Default: None)

Each item in the list is a dictionary with path and optionally part_separator keys. The path is the qualified name for iSCSI devices.

Report to this libvirt page for more information on the use of part_separator
• **source_dir** -- Path to the source directory for pools of type dir, netfs or gluster. (Default: None)
• **source_initiator** -- Initiator IQN for libiscsi-direct pool types. (Default: None)

New in version 3000.
• **source_adapter** -- SCSI source definition. The value is a dictionary with type, name, parent, managed, parent_wwnn, parent_wwpn, parent_fabric_wwn, wwnn, wwpn and parent_address keys.

The parent_address value is a dictionary with unique_id and address keys. The address represents a PCI address and is itself a dictionary with domain, bus, slot and function properties. Report to this libvirt page for the meaning and possible values of these properties.
- **source_hosts** -- List of source for pools backed by storage from remote servers. Each item is the hostname optionally followed by the port separated by a colon. (Default: None)

- **source_auth** -- Source authentication details. (Default: None)

  The value is a dictionary with type, username and secret keys. The type can be one of ceph for Ceph RBD or chap for iSCSI sources.

  The secret value links to a libvirt secret object. It is a dictionary with type and value keys. The type value can be either uuid or usage.

  Examples:

  ```py
  source_auth={
    'type': 'ceph',
    'username': 'admin',
    'secret': {
      'type': 'uuid',
      'value': '2ec115d7-3a88-3ceb-bc12-0ac909a6fd87'
    }
  }
  source_auth={
    'type': 'chap',
    'username': 'myname',
    'secret': {
      'type': 'usage',
      'value': 'mycluster_myname'
    }
  }
  ```

  Since 3000, instead the source authentication can only contain username and password properties. In this case the libvirt secret will be defined and used. For Ceph authentications a base64 encoded key is expected.

- **source_name** -- Identifier of name-based sources.

- **source_format** -- String representing the source format. The possible values are depending on the source type. See libvirt documentation for the possible values.

- **start** -- Pool start (default True)

- **transient** -- When True, the pool will be automatically undefined after being stopped. Note that a transient pool will force start to True. (Default: False)

- **connection** -- libvirt connection URI, overriding defaults

- **username** -- username to connect with, overriding defaults

- **password** -- password to connect with, overriding defaults

**Permissions definition**

The permissions are described by a dictionary containing the following keys:

- **mode**
  - The octal representation of the permissions. (Default: 0711)

- **owner**
  - the numeric user ID of the owner. (Default: from the parent folder)

- **group**
  - the numeric ID of the group. (Default: from the parent folder)

- **label**
  - the SELinux label. (Default: None)
CLI Example:

Local folder pool:

```shell
salt '*' virt.pool_define somepool dir target=/srv/mypool
  permissions="{'mode': '0744', 'owner': 107, 'group': 107}
  →"
```

CIFS backed pool:

```shell
salt '*' virt.pool_define myshare netfs source_format=cifs
  →
  source_dir=samba_share source_hosts="['example.com']
  →" target=/mnt/cifs
```

New in version 2019.2.0.

`salt.modules.virt.pool_delete(name, **kwargs)`
Delete the resources of a defined libvirt storage pool.

Parameters
- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```shell
salt '*' virt.pool_delete default
```

`salt.modules.virt.pool_get_xml(name, **kwargs)`
Return the XML definition of a virtual storage pool

Parameters
- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3000.

CLI Example:

```shell
salt '*' virt.pool_get_xml default
```

`salt.modules.virt.pool_info(name=None, **kwargs)`
Return information on a storage pool provided its name.

Parameters
- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

If no name is provided, return the infos for all defined storage pools.

New in version 2019.2.0.

CLI Example:

```shell
salt '*' virt.pool_info default
```
salt.modules.virt.pool_list_volumes(name, **kwargs)

List the volumes contained in a defined libvirt storage pool.

Parameters

- name -- libvirt storage pool name
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt "*" virt.pool_list_volumes <pool>
```

salt.modules.virt.pool_refresh(name, **kwargs)

Refresh a defined libvirt storage pool.

Parameters

- name -- libvirt storage pool name
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '...' virt.pool_refresh default
```

salt.modules.virt.pool_set_autostart(name, state='on', **kwargs)

Set the autostart flag on a libvirt storage pool so that the storage pool will start with the host system on reboot.

Parameters

- name -- libvirt storage pool name
- state -- 'on' to auto start the pool, anything else to mark the pool not to be started when the host boots
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt "*" virt.pool_set_autostart <pool> <on | off>
```

salt.modules.virt.pool_start(name, **kwargs)

Start a defined libvirt storage pool.

Parameters

- name -- libvirt storage pool name
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '...' virt.pool_start default
```

salt.modules.virt.pool_stop(name, **kwargs)

Stop a defined libvirt storage pool.
Parameters

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_stop default
```

salt.modules.virt.pool_undefined(name, **kwargs)

Remove a defined libvirt storage pool. The pool needs to be stopped before calling.

Parameters

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_undefine default
```

salt.modules.virt.pool_update(name, ptype=None, target=None, permissions=None, source_devices=None,
source_dir=None, source_initiator=None, source_adapter=None,
source_hosts=None, source_auth=None, source_name=None,
source_format=None, test=False, **kwargs)

Update a libvirt storage pool if needed. If called with test=True, this is also reporting whether an update would be performed.

Parameters

- **name** -- Pool name
- **ptype** -- Pool type. See libvirt documentation for the possible values.
- **target** -- Pool full path target
- **permissions** -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See Permissions definition for more details on this structure.
- **source_devices** -- List of source devices for pools backed by physical devices. (Default: None)

Each item in the list is a dictionary with path and optionally part_separator keys. The path is the qualified name for iSCSI devices.

Report to this libvirt page for more information on the use of part_separator
- **source_dir** -- Path to the source directory for pools of type dir, netfs or gluster. (Default: None)
- **source_initiator** -- Initiator IQN for libiscsi-direct pool types. (Default: None)

New in version 3000.
- **source_adapter** -- SCSI source definition. The value is a dictionary with type, name, parent, managed, parent_wwnn, parent_wwpn, parent_fabric_wwn, wwnn, wwpn and parent_address keys.

The parent_address value is a dictionary with unique_id and address keys. The address represents a PCI address and is itself a dictionary with domain, bus, slot and function properties. Report to this libvirt page for the meaning and possible values of these properties.
- **source_hosts** -- List of source for pools backed by storage from remote servers. Each item is the hostname optionally followed by the port separated by a colon. (Default: None)
- **source_auth** -- Source authentication details. (Default: None)

The value is a dictionary with `type`, `username` and `secret` keys. The type can be one of `ceph` for Ceph RBD or `chap` for iSCSI sources.

The `secret` value links to a libvirt secret object. It is a dictionary with `type` and `value` keys. The type value can be either `uuid` or `usage`.

Examples:

```
source_auth={
    'type': 'ceph',
    'username': 'admin',
    'secret': {
        'type': 'uuid',
        'uuid': '2ec115d7-3a88-3ceb-bc12-0ac909a6fd87'
    }
}
```

```
source_auth={
    'type': 'chap',
    'username': 'myname',
    'secret': {
        'type': 'usage',
        'uuid': 'mycluster_mynamen'
    }
}
```

Since 3000, instead the source authentication can only contain `username` and `password` properties. In this case the libvirt secret will be defined and used. For Ceph authentications a base64 encoded key is expected.

- **source_name** -- Identifier of name-based sources.
- **source_format** -- String representing the source format. The possible values are depending on the source type. See [libvirt documentation](https://libvirt.org/format.html) for the possible values.
- **test** -- run in dry-run mode if set to True
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

Example:

Local folder pool:

```
salt '*' virt.pool_update somepool dir target=/srv/mypool
    permissions="{'mode': '0744' 'ower': 107, 'group':107, }
```

CIFS backed pool:

```
salt '*' virt.pool_update myshare netfs source_format=cifs
    source_dir=samba_share source_hosts="[['example.com']]
    target=/mnt/cifs
```

---

Since 3000, instead the source authentication can only contain `username` and `password` properties. In this case the libvirt secret will be defined and used. For Ceph authentications a base64 encoded key is expected.

- **source_name** -- Identifier of name-based sources.
- **source_format** -- String representing the source format. The possible values are depending on the source type. See [libvirt documentation](https://libvirt.org/format.html) for the possible values.
- **test** -- run in dry-run mode if set to True
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

Example:

Local folder pool:

```
salt '*' virt.pool_update somepool dir target=/srv/mypool
    permissions="{'mode': '0744' 'ower': 107, 'group':107, }
```

CIFS backed pool:

```
salt '*' virt.pool_update myshare netfs source_format=cifs
    source_dir=samba_share source_hosts="[['example.com']]
    target=/mnt/cifs
```
New in version 3000.

`salt.modules.virt.purge(vm_, dirs=False, removables=False, **kwargs)`

Recursively destroy and delete a persistent virtual machine, pass True for dir’s to also delete the directories containing the virtual machine disk images - USE WITH EXTREME CAUTION!

**Parameters**
- `vm` -- domain name
- `dirs` -- pass True to remove containing directories
- `removables` -- pass True to remove removable devices
  
  New in version 2019.2.0.
- `connection` -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

**CLI Example:**

```
salt '*' virt.purge <domain>
```

`salt.modules.virt.reboot(name, **kwargs)`

Reboot a domain via ACPI request

**Parameters**
- `vm` -- domain name
- `connection` -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

**CLI Example:**

```
salt '*' virt.reboot <domain>
```

`salt.modules.virt.reset(vm_, **kwargs)`

Reset a VM by emulating the reset button on a physical machine

**Parameters**
- `vm` -- domain name
- `connection` -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

**CLI Example:**

```
salt '*' virt.reset <domain>
```
salt.modules.virt.resume

Resume the named vm

Parameters

* vm -- domain name
* connection -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
* username -- username to connect with, overriding defaults
  New in version 2019.2.0.
* password -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.resume <domain>
```

salt.modules.virt.revert_snapshot

Revert snapshot to the previous from current (if available) or to the specific.

Parameters

* name -- domain name
* vm_snapshot -- name of the snapshot to revert
* cleanup -- Remove all newer than reverted snapshots. Values: True or False (default False).
* connection -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
* username -- username to connect with, overriding defaults
  New in version 2019.2.0.
* password -- password to connect with, overriding defaults
  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.revert <domain>
salt '*' virt.revert <domain> <snapshot>
```

salt.modules.virt.seed_non_shared_migrate

Non shared migration requires that the disks be present on the migration destination, pass the disks information via this function, to the migration destination before executing the migration.

Parameters

* disks -- the list of disk data as provided by virt.get_disks
* force -- skip checking the compatibility of source and target disk images if True. (default: False)

CLI Example:

```
salt '*' virt.seed_non_shared_migrate <disks>
```

salt.modules.virt.set_autostart

Set the autostart flag on a VM so that the VM will start with the host system on reboot.

Parameters

* vm -- domain name
* state -- 'on' to auto start the VM, 'off' to mark the VM not to be started when the host boots
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt "*" virt.set_autostart <domain> <on | off>
```

```
salt.modules.virt.setmem(vm_, memory, config=False, **kwargs)
```
Changes the amount of memory allocated to VM. The VM must be shutdown for this to work.

Parameters
- **vm** -- name of the domain
- **memory** -- memory amount to set in MB
- **config** -- if True then libvirt will be asked to modify the config as well
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.setmem <domain> <size>
salt '*' virt.setmem my_domain 768
```

```
salt.modules.virt.setvcpus(vm_, vcpus, config=False, **kwargs)
```
Changes the amount of vcpus allocated to VM. The VM must be shutdown for this to work.

If config is True then we ask libvirt to modify the config as well

Parameters
- **vm** -- name of the domain
- **vcpus** -- integer representing the number of CPUs to be assigned
- **config** -- if True then libvirt will be asked to modify the config as well
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.setvcpus <domain> <amount>
salt '*' virt.setvcpus my_domain 4
```

```
salt.modules.virt.shutdown(vm_,**kwargs)
```
Send a soft shutdown signal to the named vm

Parameters
- **vm** -- domain name
• **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.

• **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.

• **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.shutdown <domain>
```

**saltnodes.virt.snapshot**(*domain*, *name=None*, *suffix=None*, **kwargs)

Create a snapshot of a VM.

**Parameters**

• **domain** -- domain name

• **name** -- Name of the snapshot. If the name is omitted, then will be used original domain name with ISO 8601 time as a suffix.

• **suffix** -- Add suffix for the new name. Useful in states, where such snapshots can be distinguished from manually created.

• **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.

• **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.

• **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.snapshot <domain>
```

**saltnodes.virt.start**(*name*, **kwargs)

Start a defined domain

**Parameters**

• **vm** -- domain name

• **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.

• **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.

• **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.start <domain>
```

**saltnodes.virt.stop**(*name*, **kwargs)

Hard power down the virtual machine, this is equivalent to pulling the power.

**Parameters**

• **vm** -- domain name

• **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
• **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```bash
salt '*! virt.stop <domain>
```

salt.modules.virt.undefine(*vm_, **kwargs)

Remove a defined vm, this does not purge the virtual machine image, and this only works if the vm is powered down

Parameters

• **vm** -- domain name

• **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.

• **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.

• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```bash
salt '*! virt.undefine <domain>
```

salt.modules.virt.update(*name*, cpu=0, mem=0, disk_profile=None, disks=None, nic_profile=None, interfaces=None, graphics=None, live=True, boot=0, numa_tune=None, test=False, boot_dev=None, hypervisor_features=None, clock=None, serials=None, consoles=None, stop_on_reboot=False, host_devices=None, autostart=False, **kwargs)

Update the definition of an existing domain.

Parameters

• **name** -- Name of the domain to update

• **cpu** -- Number of virtual CPUs to assign to the virtual machine or a dictionary with detailed information to configure cpu model and topology, numa node tuning, cpu tuning and iothreads allocation. The structure of the dictionary is documented in `cpu parameters definition`.

  To update any cpu parameters specify the new values to the corresponding tag. To remove any element or attribute, specify `None` object. Please note that `None` object is mapped to `null` in yaml, use `null` in sls file instead.

• **mem** -- Amount of memory to allocate to the virtual machine in MiB. Since 3002, a dictionary can be used to contain detailed configuration which support memory allocation or tuning. Supported parameters are boot, current, max, slots, hard_limit, soft_limit, swap_hard_limit, min Guarantee, hugepages, nosharepages, locked, source, access, allocation and discard. The structure of the dictionary is documented in `Memory parameter definition`. Both decimal and binary base are supported. Detail unit specification is documented in `Units specification`. Please note that the value for `slots` must be an integer.

  To remove any parameters, pass a `None` object, for instance: `soft_limit': None`. Please note that `None` is mapped to `null` in sls file, pass `null` in sls file instead.
Changed in version 3002.

- **disk_profile** -- disk profile to use
- **disks** -- Disk definitions as documented in the `init()` function. If neither the profile nor this parameter are defined, the disk devices will not be changed. However to clear disks set this parameter to empty list.
- **nic_profile** -- network interfaces profile to use
- **interfaces** -- Network interface definitions as documented in the `init()` function. If neither the profile nor this parameter are defined, the interface devices will not be changed. However to clear network interfaces set this parameter to empty list.
- **graphics** -- The new graphics definition as defined in *Graphics Definition*. If not set, the graphics will not be changed. To remove a graphics device, set this parameter to `{ 'type': 'none' }`.
- **live** -- False to avoid trying to live update the definition. In such a case, the new definition is applied at the next start of the virtual machine. If True, not all aspects of the definition can be live updated, but as much as possible will be attempted. (Default: True)
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults
- **boot** -- Specifies kernel, initial ramdisk and kernel command line parameters for the virtual machine. This is an optional parameter, all of the keys are optional within the dictionary.

Refer to *Boot parameters definition* for the complete boot parameter description.

To update any boot parameters, specify the new path for each. To remove any boot parameters, pass *None* object, for instance: `kernel`: *None*. To switch back to BIOS boot, specify (`loader`: *None* and `nvram`: *None*) or `efi`: *False*. Please note that *None* is mapped to *null* in sls file, pass *null* in sls file instead.

SLS file Example:

```yaml
- boot:
  loader: null
  nvram: null
```

New in version 3000.

- **boot_dev** -- Space separated list of devices to boot from sorted by decreasing priority. Values can be `hd`, `fd`, `cdrom` or `network`.

By default, the value will "hd".

New in version 3002.

- **numatune** -- The optional numatune element provides details of how to tune the performance of a NUMA host via controlling NUMA policy for domain process. The optional memory element specifies how to allocate memory for the domain process on a NUMA host. memnode elements can specify memory allocation policies per each guest NUMA node. The definition used in the dictionary can be found at *cpu parameters definition*.

To update any numatune parameters, specify the new value. To remove any numatune parameters, pass a *None* object, for instance: `numatune`: *None*. Please note that *None* is mapped to *null* in sls file, pass *null* in sls file instead.
New in version 3003.

- **serials** -- Dictionary providing details on the serials connection to create. (Default: None) See *Serials and Consoles Definitions* for more details on the possible values.

New in version 3003.

- **consoles** -- Dictionary providing details on the consoles device to create. (Default: None) See *Serials and Consoles Definitions* for more details on the possible values.

New in version 3003.

- **stop_on_reboot** -- If set to True the guest will stop instead of rebooting. This is specially useful when creating a virtual machine with an installation cdrom or an autoinstallation needing a special first boot configuration. Defaults to False

New in version 3003.

- **test** -- run in dry-run mode if set to True

New in version 3001.

- **hypervisor_features** -- Enable or disable hypervisor-specific features on the virtual machine.

New in version 3003.

<table>
<thead>
<tr>
<th>hypervisor_features:</th>
</tr>
</thead>
<tbody>
<tr>
<td>kvm-hint-dedicated: True</td>
</tr>
</tbody>
</table>

- **clock** -- Configure the guest clock. The value is a dictionary with the following keys:
  - adjustment
    - time adjustment in seconds or reset
  - utc
    - set to False to use the host local time as the guest clock. Defaults to True.
  - timezone
    - synchronize the guest to the corresponding timezone
  - timers
    - a dictionary associating the timer name with its configuration. This configuration is a dictionary with the properties track, tickpolicy, catchup, frequency, mode, present, slew, threshold and limit. See libvirt time keeping documentation for the possible values.

New in version 3003.

Set the clock to local time using an offset in seconds ...

```yaml
clock:
  adjustment: 3600 utc: False
```

Set the clock to a specific time zone:

```yaml
clock:
  timezone: CEST
```

Tweak guest timers:

```yaml
clock:
  timers:
    tsc:
      frequency: 3504000000
      mode: native
    rtc:
      track: wall
```

(continues on next page)
tickpolicy: catchup
slew: 4636
threshold: 123
limit: 2342
hpeta: present: False

- **host_devices** -- List of host devices to passthrough to the guest. The value is a list of device names as provided by the `node_devices()` function. (Default: None)
  
  New in version 3003.

- **autostart** -- If set to True the host will start the guest after boot. (Default: False)

Returns

Returns a dictionary indicating the status of what has been done. It is structured in the following way:

```python
{
    'definition': True,
    'cpu': True,
    'mem': True,
    'disks': {'attached': [list of actually attached disks],
              'detached': [list of actually detached disks]},
    'nics': {'attached': [list of actually attached nics],
             'detached': [list of actually detached nics]},
    'errors': ['error messages for failures']
}
```

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.update domain cpu=2 mem=1024
```

**salt.modules.virt.virt_type()**

Returns the virtual machine type as a string

CLI Example:

```
salt '*' virt.virt_type
```

**salt.modules.virt.vm_cputime(vm_=None, **kwargs)**

Return cputime used by the vms on this hyper in a list of dicts:

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.
[  
  'your-vm': {  
    'cputime' <int>,  
    'cputime_percent' <int>  
  },  
  ...
]  

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:  

```
salt 'your-vm' virt.vm_cputime  
```

salt.modules.virt.vm_diskstats(\n    vm_=None, **kwargs)  

Return disk usage counters used by the vms on this hyper in a list of dicts:

Parameters  
• vm -- domain name  
• connection -- libvirt connection URI, overriding defaults  
  New in version 2019.2.0.  
• username -- username to connect with, overriding defaults  
  New in version 2019.2.0.  
• password -- password to connect with, overriding defaults  
  New in version 2019.2.0.

```  
[  
  'your-vm': {  
    'rd_req' : 0,  
    'rd_bytes' : 0,  
    'wr_req' : 0,  
    'wr_bytes' : 0,  
    'errs' : 0  
  },  
  ...
]  
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:  

```
salt 'your-vm' virt.vm_blockstats  
```

salt.modules.virt.vm_info(\n    vm_=None, **kwargs)  

Return detailed information about the vms on this hyper in a list of dicts:

Parameters  
• vm -- name of the domain  
• connection -- libvirt connection URI, overriding defaults  
  New in version 2019.2.0.  
• username -- username to connect with, overriding defaults  
  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

```
[
    'your-vm': {
        'cpu': <int>,
        'maxMem': <int>,
        'mem': <int>,
        'state': '<state>',
        'cputime': <int>
    },
    ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```bash
salt '*' virt.vm_info
```

salt.modules.virt.vm_netstats(vm=None, **kwargs)

Return combined network counters used by the vms on this hyper in a list of dicts:

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

```
[
    'your-vm': {
        'rx_bytes' : 0,
        'rx_packets' : 0,
        'rx_errs' : 0,
        'rx_drop' : 0,
        'tx_bytes' : 0,
        'tx_packets' : 0,
        'tx_errs' : 0,
        'tx_drop' : 0
    },
    ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```bash
salt '*' virt.vm_netstats
```
salt.modules.virt.vm_state(*vm=None, **kwargs)

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

Parameters

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.vm_state <domain>
```

salt.modules.virt.volume_define(*pool, name, size, allocation=0, format=None, type=None,
permissions=None, backing_store=None, nocow=False, **kwargs)

Create libvirt volume.

Parameters

- **pool** -- name of the pool to create the volume in
- **name** -- name of the volume to define
- **size** -- capacity of the volume to define in MiB
- **allocation** -- allocated size of the volume in MiB. Defaults to 0.
- **format** -- volume format. The allowed values are depending on the pool type. Check the virt.pool_capabilities output for the possible values and the default.
- **type** -- type of the volume. One of file, block, dir, network, netdiri, ploop or None. By default, the type is guessed by libvirt from the pool type.
- **permissions** -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See Permissions definition for more details on this structure.
- **backing_store** -- dictionary describing a backing file for the volume. It must contain a path property pointing to the base volume and a format property defining the format of the base volume.

The base volume format will not be guessed for security reasons and is thus mandatory.
- **nocow** -- disable COW for the volume.
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults
**CLI Example:**

Volume on ESX:

```
salt '*' virt.volume_define "[local-storage]" myvm/myvm.vmdk vmdk 8192
```

QCow2 volume with backing file:

```
salt '*' virt.volume_define default myvm.qcow2 qcow2 8192
permissions="{'mode': '0775', 'owner': '123', 'group': '345'}"
backing_store="{'path': '/path/to/base.img', 'format': 'raw'}"
nocow=True
```

New in version 3001.

```python
salt.modules.virt.volume_delete(pool, volume, **kwargs)
```

Delete a libvirt managed volume.

**Parameters**
- `pool` -- libvirt storage pool name
- `volume` -- name of the volume to delete
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt "*" virt.volume_delete <pool> <volume>
```

```python
salt.modules.virt.volume_infos(pool=None, volume=None, **kwargs)
```

Provide details on a storage volume. If no volume name is provided, the infos all the volumes contained in the pool are provided. If no pool is provided, the infos of the volumes of all pools are output.

**Parameters**
- `pool` -- libvirt storage pool name (default: None)
- `volume` -- name of the volume to get infos from (default: None)
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt "*" virt.volume_infos <pool> <volume>
```

```python
salt.modules.virt.volume_upload(pool, volume, file, offset=0, length=0, sparse=False, **kwargs)
```

Create libvirt volume.

**Parameters**
- `pool` -- name of the pool to create the volume in
- `name` -- name of the volume to define
- `file` -- the file to upload to the volume
- `offset` -- where to start writing the data in the volume
- `length` -- amount of bytes to transfer to the volume
- `sparse` -- set to True to preserve data sparsiness.
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults
CLI Example:

```
salt '*' virt.volume_upload default myvm.qcow2 /path/to/disk.qcow2
```

New in version 3001.

## 26.6.475 `salt.modules.virtualenv`

Create virtualenv environments.

New in version 0.17.0.

```python
salt.modules.virtualenv_mod.create(path, venv_bin=None, system_site_packages=False, 
distribute=False, clear=False, python=None, 
extra_search_dir=None, never_download=None, prompt=None, 
pip=False, symlinks=None, upgrade=None, user=None, 
use_vt=False, saltenv='base', **kwargs)
```

Create a virtualenv

**path**

The path to the virtualenv to be created

**venv_bin**

The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`. Defaults to `virtualenv`.

**system_site_packages**

[False] Passthrough argument given to virtualenv or pyenv

**distribute**

[False] Passthrough argument given to virtualenv

**pip**

[False] Install pip after creating a virtual environment. Implies `distribute=True`

**clear**

[False] Passthrough argument given to virtualenv or pyenv

**python**

[None (default)] Passthrough argument given to virtualenv

**extra_search_dir**

[None (default)] Passthrough argument given to virtualenv

**never_download**

[None (default)] Passthrough argument given to virtualenv if True

**prompt**

[None (default)] Passthrough argument given to virtualenv if not None

**symlinks**

[None] Passthrough argument given to pyenv if True

**upgrade**

[None] Passthrough argument given to pyenv if True

**user**

[None] Set ownership for the virtualenv

---

**Note:** On Windows you must also pass a `password` parameter. Additionally, the user must have permissions to the location where the virtual environment is being created.

runas

[None] Set ownership for the virtualenv

Deprecated since version 2014.1.0: `user` should be used instead
**use vt**

[False] Use VT terminal emulation (see output while installing)

New in version 2015.5.0.

**saltenv**

[‘base’] Specify a different environment. The default environment is base.

New in version 2014.1.0.

**Note:** The runas argument is deprecated as of 2014.1.0. user should be used instead.

CLI Example:

```bash
salt '*' virtualenv.create /path/to/new/virtualenv
```

Example of using --always-copy environment variable (in case your fs doesn’t support symlinks).
This will copy files into the virtualenv instead of symlinking them.

```yaml
- env:
  - VIRTUALENV_ALWAYS_COPY: 1
```

**salt.modules.virtualenv_mod.get_distribution_path**(venv, distribution)

Return the path to a distribution installed inside a virtualenv

New in version 2016.3.0.

**v**env

Path to the virtualenv.

**distribution**

Name of the distribution. Note, all non-alphanumeric characters will be converted to dashes.

CLI Example:

```bash
salt '*' virtualenv.get_distribution_path /path/to/my/venv my_distribution
```

**salt.modules.virtualenv_mod.get_resource_content**(venv, package=None, resource=None)

Return the content of a package resource installed inside a virtualenv

New in version 2015.5.0.

**v**env

Path to the virtualenv

**package**

Name of the package in which the resource resides

New in version 2016.3.0.

**resource**

Name of the resource of which the content is to be returned

New in version 2016.3.0.

CLI Example:

```bash
salt '*' virtualenv.get_resource_content /path/to/my/venv my_package my/resource.xml
```
salt.modules.virtualenv_mod.get_resource_path(venv, package=None, resource=None)

Return the path to a package resource installed inside a virtualenv

New in version 2015.5.0.

venv
  Path to the virtualenv
package
  Name of the package in which the resource resides
  New in version 2016.3.0.
resource
  Name of the resource of which the path is to be returned
  New in version 2016.3.0.

CLI Example:

salt '*' virtualenv.get_resource_path /path/to/my/venv my_package my/resource.xml

salt.modules.virtualenv_mod.get_site_packages(venv)

Return the path to the site-packages directory of a virtualenv

venv
  Path to the virtualenv.

CLI Example:

salt '*' virtualenv.get_site_packages /path/to/my/venv

salt.modules.virtualenv_mod.virtualenv_ver(venv_bin, user=None, **kwargs)

return virtualenv version if exists

26.6.476   salt.modules.vmctl

Manage vms running on the OpenBSD VMM hypervisor using vmctl(8).
New in version 2019.2.0.

codeauthor
  Jasper Lievisse Adriaanse <jasper@openbsd.org>

Note: This module requires the vmd service to be running on the OpenBSD target machine.

salt.modules.vmctl.create_disk(name, size)

Create a VMM disk with the specified name and size.

size:
  Size in megabytes, or use a specifier such as M, G, T.

CLI Example:

salt '*' vmctl.create_disk /path/to/disk.img size=10G

salt.modules.vmctl.load(path)

Load additional configuration from the specified file.

path
  Path to the configuration file.

CLI Example:
salt.modules.vmctl.reload()
Remove all stopped VMs and reload configuration from the default configuration file.
CLI Example:
salt '*' vmctl.reload

salt.modules.vmctl.reset(all=False, vms=False, switches=False)
Reset the running state of VMM or a subsystem.
  all:
    Reset the running state.
  switches:
    Reset the configured switches.
  vms:
    Reset and terminate all VMs.
CLI Example:
salt '*' vmctl.reset all=True

salt.modules.vmctl.start(name=None, id=None, bootpath=None, disk=None, disks=None, local_iface=False, memory=None, nics=0, switch=None)
Starts a VM defined by the specified parameters. When both a name and id are provided, the id is ignored.
  name:
    Name of the defined VM.
  id:
    VM id.
  bootpath:
    Path to a kernel or BIOS image to load.
  disk:
    Path to a single disk to use.
  disks:
    List of multiple disks to use.
  local_iface:
    Whether to add a local network interface. See "LOCAL INTERFACES" in the vmctl(8) manual page for more information.
  memory:
    Memory size of the VM specified in megabytes.
  switch:
    Add a network interface that is attached to the specified virtual switch on the host.
CLI Example:
salt '*' vmctl.start 2    # start VM with id 2
salt '*' vmctl.start name=web1 bootpath='/bsd.rd' nics=2 memory=512M disk="/disk.img"

salt.modules.vmctl.status(name=None, id=None)
List VMs running on the host, or only the VM specified by id. When both a name and id are provided, the id is ignored.
  name:
    Name of the defined VM.
  id:
    VM id.
CLI Example:

```
salt '*' vmctl.status # to list all VMs
salt '*' vmctl.status name=web1 # to get a single VM
```

```
salt '*' vmctl.stop name=alpine
```

```
salt.modules.vmctl.stop(name=None, id=None)
```

Stop (terminate) the VM identified by the given id or name. When both a name and id are provided, the id is ignored.

- **name:**
  Name of the defined VM.
- **id:**
  VM id.

CLI Example:

```
salt '*' vmctl.stop name=alpine
```

### 26.6.477 salt.modules.vsphere

Manage VMware vCenter servers and ESXi hosts.

New in version 2015.8.4.

**Code author**

Alexandru Bleotu <alexandru.bleotu@morganstaley.com>

#### Dependencies

- pyVmomi Python Module
- ESXCLI

**pyVmomi**

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:**

Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original vSphere Execution Module was developed against.
vSphere Automation SDK

vSphere Automation SDK can be installed via pip:

```
pip install --upgrade pip setuptools
pip install --upgrade git+https://github.com/vmware/vsphere-automation-sdk-python.git
```

Note: The SDK also requires OpenSSL 1.0.1+ if you want to connect to vSphere 6.5+ in order to support TLS1.1 & 1.2.

In order to use the tagging functions in this module, vSphere Automation SDK is necessary to install.

The module is currently in version 1.0.3 (as of 8/26/2019)

ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for vSphere 5.5 and vSphere 6.0.

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

Note: Be aware that some functionality in this execution module may depend on the type of license attached to a vCenter Server or ESXi host(s).

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The ntpd service is restricted to an Enterprise Plus license, while ssh is available via the Standard license.

Please see the vSphere Comparison page for more information.

About

This execution module was designed to be able to handle connections both to a vCenter Server, as well as to an ESXi host. It utilizes the pyVmomi Python library and the ESXCLI package to run remote execution functions against either the defined vCenter server or the ESXi host.

Whether or not the function runs against a vCenter Server or an ESXi host depends entirely upon the arguments passed into the function. Each function requires a host location, username, and password. If the credentials provided apply to a vCenter Server, then the function will be run against the vCenter Server. For example, when listing hosts using vCenter credentials, you'll get a list of hosts associated with that vCenter Server:
However, some functions should be used against ESXi hosts, not vCenter Servers. Functionality such as getting a host's coredump network configuration should be performed against a host and not a vCenter server. If the authentication information you're using is against a vCenter server and not an ESXi host, you can provide the host name that is associated with the vCenter server in the command, as a list, using the `host_names` or `esxi_host` kwargs.

For example:

```bash
# salt my-minion vsphere.list_hosts <vcenter-ip> <vcenter-user> <vcenter-password>
my-minion:
- esxi-1.example.com
- esxi-2.example.com
```

You can also use these functions against an ESXi host directly by establishing a connection to an ESXi host using the host's location, username, and password. If ESXi connection credentials are used instead of vCenter credentials, the `host_names` and `esxi_hosts` arguments are not needed.

```bash
# salt my-minion vsphere.get_coredump_network_config esxi-1.example.com root 
<host-password>
local:
10.4.28.150:
    __________
    Coredump Config:
    __________
    enabled:
      True
    host_vnic:
      vmk0
    ip:
      coredump-location.example.com
    port:
      6500
```
salt.modules.vsphere.add_capacity_to_diskgroup(cache_disk_id, capacity_disk_ids, safety_checks=True, service_instance=None)

Adds capacity disks to the disk group with the specified cache disk.

- **cache_disk_id**
  The canonical name of the cache disk.

- **capacity_disk_ids**
  A list containing canonical names of the capacity disks to add.

- **safety_checks**
  Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.

- **service_instance**
  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

**CLI Example:**

```
salt '*' vsphere.add_capacity_to_diskgroup
  cache_disk_id='naa.000000000000001'
  capacity_disk_ids='[naa.000000000000002, naa.000000000000003]'```

salt.modules.vsphere.add_host_to_dvs(host, username, password, vmnic_name, vmnic_name, dvs_name, target_portgroup_name, uplink_portgroup_name, protocol=None, port=None, host_names=None, verify_ssl=True)

Adds an ESXi host to a vSphere Distributed Virtual Switch and migrates the desired adapters to the DVS from the standard switch.

- **host**
  The location of the vCenter server.

- **username**
  The username used to login to the vCenter server.

- **password**
  The password used to login to the vCenter server.

- **vmnic_name**
  The name of the virtual NIC to migrate.

- **vmnic_name**
  The name of the physical NIC to migrate.

- **dvs_name**
  The name of the Distributed Virtual Switch.

- **target_portgroup_name**
  The name of the distributed portgroup in which to migrate the virtual NIC.

- **uplink_portgroup_name**
  The name of the uplink portgroup in which to migrate the physical NIC.

- **protocol**
  Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is https.

- **port**
  Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is 443.

- **host_names**
  An array of VMware host names to migrate.
**verify_ssl**
Verify the SSL certificate. Default: True

CLI Example:

```bash
salt some_host vsphere.add_host_to_dvs host='vsphere.corp.com'
    username='administrator@vsphere.corp.com' password='vsphere_password'
    vmknic_name='vmk0' vmnic_name='vmnic0' dvs_name='DSwitch'
    target_portgroup_name='DPortGroup' uplink_portgroup_name='DSwitch1-
    ←DVUplinks-181'
    protocol='https' port='443', host_names=['esxi1.corp.com', 'esxi2.
    ←corp.com', 'esxi3.corp.com']
```

Return Example:

```bash
somehost:
    ---------
esxi1.corp.com:  
    ---------
    dvs: DSwitch
    portgroup:  DPortGroup
    status: True
    uplink:  DSwitch-DVUplinks-181
    vmknic:  vmk0
    vmnic:  vmnic0
esxi2.corp.com:  
    ---------
    dvs: DSwitch
    portgroup:  DPortGroup
    status: True
    uplink:  DSwitch-DVUplinks-181
    vmknic:  vmk0
    vmnic:  vmnic0
esxi3.corp.com:  
    ---------
    dvs: DSwitch
    portgroup:  DPortGroup
    status: True
    uplink:  DSwitch-DVUplinks-181
```

(continues on next page)
This was very difficult to figure out. VMware's PyVmomi documentation at https://github.com/vmware/pyvmomi/blob/master/docs/vim/DistributedVirtualSwitch.rst (which is a copy of the official documentation here: https://www.vmware.com/support/developer/converter-sdk/conv60_apireference/vim.DistributedVirtualSwitch.html) says to create the DVS, create distributed portgroups, and then add the host to the DVS specifying which physical NIC to use as the port backing. However, if the physical NIC is in use as the only link from the host to vSphere, this will fail with an unhelpful "busy" error.

There is, however, a Powershell PowerCLI cmdlet called Add-VDSwitchPhysicalNetworkAdapter that does what we want. I used Onyx (https://labs.vmware.com/flings/onyx) to sniff the SOAP stream from Powershell to our vSphere server and got this snippet out:

```xml
<UpdateNetworkConfig xmlns="urn:vim25">
  <_this type="HostNetworkSystem">networkSystem-187</_this>
  <config>
    <vswitch>
      <changeOperation>edit</changeOperation>
      <name>vSwitch0</name>
      <spec>
        <numPorts>7812</numPorts>
      </spec>
    </vswitch>
    <proxySwitch>
      <changeOperation>edit</changeOperation>
      <uuid>73 a4 05 50 b0 d2 7e b9-38 80 5d 24 65 8f da 70</uuid>
      <spec>
        <backing xsi:type="DistributedVirtualSwitchHostMemberPnicBacking">
          <pnicSpec><pnicDevice>vmnic0</pnicDevice></pnicSpec>
        </backing>
      </spec>
    </proxySwitch>
    <portgroup>
      <changeOperation>remove</changeOperation>
      <spec>
        <name>Management Network</name><vlanId>-1</vlanId><vswitchName />
        <policy />
      </spec>
    </portgroup>
    <vnic>
      <changeOperation>edit</changeOperation>
      <device>vmk0</device>
      <portgroup />
      <spec>
        <distributedVirtualPort>
```
The SOAP API maps closely to PyVmomi, so from there it was (relatively) easy to figure out what Python to write.

`salt.modules.vsphere.add_license` *(key, description, safety_checks=\text{True}, service_instance=\text{None})*

Adds a license to the vCenter or ESXi host

key
License key.
description
License description added in as a label.
safety\_checks
Specify whether to perform safety check or to skip the checks and try performing the required task
service\_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
    salt '*' vsphere.add_license key=<license_key> desc='License desc'
```

`salt.modules.vsphere.assign_default_storage_policy_to_datastore` *(policy, datastore, service_instance=\text{None})*

Assigns a storage policy as the default policy to a datastore.

policy
Name of the policy to assign.
datastore
Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.

CLI Example:

```
    salt '*' vsphere.assign_storage_policy_to_datastore policy='policy name' datastore=ds1
```

`salt.modules.vsphere.assign_license` *(license_key, license_name, entity, entity\_display\_name, safety_checks=\text{True}, service_instance=\text{None})*

Assigns a license to an entity

license\_key
Key of the license to assign See \_get\_entity docstrings for format.
license\_name
Display name of license
entity
Dictionary representation of an entity
entity\_display\_name
Entity name used in logging
safety_checks
Specify whether to perform safety check or to skip the checks and try performing the required task.
Default is False.
service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:
salt '*' vsphere.assign_license license_key=AAAAA-11111-AAAAA-11111-AAAAA license_name=test entity={type:cluster, datacenter:dc, cluster:cl}

salt.modules.vsphere.attach_tag(object_id, tag_id, managed_obj='ClusterComputeResource', server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)

Attach an existing tag to an input object.

The tag needs to meet the cardinality (CategoryModel.cardinality) and associability (CategoryModel.associable_types) criteria in order to be eligible for attachment. If the tag is already attached to the object, then this method is a no-op and an error will not be thrown. To invoke this method, you need the attach tag privilege on the tag and the read privilege on the object.

CLI Example:
salt vm_minion vsphere.attach_tag domain-c2283,
→ urn:vmomi:InventoryServiceTag:b55ecc77-f4a5-49f8-ab52-
→ 38865467cfbe:GLOBAL

Parameters
- object_id (str) -- The identifier of the input object.
- tag_id (str) -- The identifier of the tag object.
- managed_obj (str) -- Classes that contain methods for creating and deleting resources typically contain a class attribute specifying the resource type for the resources being created and deleted.
- server (basestring) -- Target DNS or IP of vCenter center.
- username (basestring) -- Username associated with the vCenter center.
- password (basestring) -- Password associated with the vCenter center.
- verify_ssl (boolean) -- Verify the SSL certificate. Default: True
- ca_bundle (basestring) -- Path to the ca bundle to use when verifying SSL certificates.

Returns
The list of all tag identifiers that correspond to the tags attached to the given object.

Return type
list of tags

Raise
Unauthorized if you do not have the privilege to read the object.

Raise
Unauthenticated if the user can not be authenticated.

salt.modules.vsphere.compare_vm_configs(new_config, current_config)
Compares virtual machine current and new configuration, the current is the one which is deployed now, and the new is the target config. Returns the differences between the objects in a dictionary, the keys are the configuration parameter keys and the values are differences objects: either list or recursive difference

new_config:
New config dictionary with every available parameter
current_config
Currently deployed configuration
salt.modules.vsphere.configure_host_cache( enabled, datastore=None, swap_size_MiB=None, service_instance=None)

Configures the host cache on the selected host.

- **enabled**: Boolean flag specifying whether the host cache is enabled.
- **datastore**: Name of the datastore that contains the host cache. Must be set if enabled is `true`.
- **swap_size_MiB**: Swap size in Mibibytes. Needs to be set if enabled is `true`. Must be smaller than the datastore size.
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:
```
salt '*' vsphere.configure_host_cache enabled=False
salt '*' vsphere.configure_host_cache enabled=True datastore=ds1 swap_size_MiB=1024
```

salt.modules.vsphere.coredump_network_enable( host, username, password, enabled, protocol=None, port=None, esxi_hosts=None, credstore=None)

Enable or disable ESXi core dump collection. Returns `True` if coredump is enabled and returns `False` if core dump is not enabled. If there was an error, the error will be the value printed in the `Error` key dictionary for the given host.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as `root`.
- **password**: The password used to login to the host.
- **enabled**: Python True or False to enable or disable coredumps.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **esxi_hosts**: If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
- **credstore**: Optionally set to path to the credential store file.

CLI Example:
```
# Used for ESXi host connection information
salt '*' vsphere.coredump_network_enable my.esxi.host root bad-password False

# Used for connecting to a vCenter Server
salt '*' vsphere.coredump_network_enable my.vcenter.location root bad-password True esxi_hosts='[esxi-1.host.com, esxi-2.host.com]' True
```

salt.modules.vsphere.create_cluster( cluster_dict, datacenter=None, cluster=None, service_instance=None)
Creates a cluster.

Note: cluster_dict['name'] will be overridden by the cluster param value

config_dict
  Dictionary with the config values of the new cluster.
datacenter
  Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.
cluster
  Name of cluster. Ignored if already contained by proxy details. Default value is None.
service_instance
  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
# esxdatacenter proxy
salt '*' vsphere.create_cluster cluster_dict=$cluster_dict cluster=cl1
# esxcluster proxy
salt '*' vsphere.create_cluster cluster_dict=$cluster_dict
```

salt.modules.vsphere.create_datacenter(datacenter_name, service_instance=None)

Creates a datacenter.

Supported proxies: esxdatacenter
datacenter_name
  The datacenter name
service_instance
  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.create_datacenter dcl
```

salt.modules.vsphere.create_diskgroup(cache_disk_id, capacity_disk_ids, safety_checks=True, service_instance=None)

Creates disk group on an ESXi host with the specified cache and capacity disks.
cache_disk_id
  The canonical name of the disk to be used as a cache. The disk must be ssd.
capacity_disk_ids
  A list containing canonical names of the capacity disks. Must contain at least one id. Default is True.
safety_checks
  Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.
service_instance
  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.create_diskgroup cache_disk_id='naa.000000000000001'
capacity_disk_ids='[naa.000000000000002, naa.000000000000003]' service_instance
```

salt.modules.vsphere.create_dvportgroup(portgroup_dict, portgroup_name, dvs, service_instance=None)

Creates a distributed virtual portgroup.

Note: The portgroup_name param will override any name already set in portgroup_dict.
portgroup_dict
  Dictionary with the config values the portgroup should be created with (example in salt.states.dvs).

portgroup_name
  Name of the portgroup to be created.

dvs
  Name of the DVS that will contain the portgroup.

service_instance
  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.create_dvportgroup portgroup_dict=<dict>
  portgroup_name=pg1 dvs=dvs1
```

salt.modules.vsphere.create_dvs(dvs_dict, dvs_name, service_instance=None)

Creates a distributed virtual switch (DVS).

Note: The dvs_name param will override any name set in dvs_dict.

dvs_dict
  Dict representation of the new DVS (example in salt.states.dvs)

dvs_name
  Name of the DVS to be created.

service_instance
  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.create_dvs dvs dict=$dvs_dict dvs_name=dvs_name
```

salt.modules.vsphere.create_storage_policy(policy_name, policy_dict, service_instance=None)

Creates a storage policy.

Supported capability types: scalar, set, range.

policy_name
  Name of the policy to create. The value of the argument will override any existing name in policy_dict.

policy_dict
  Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)

service_instance
  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.create_storage_policy policy_name='policy name'
  policy_dict="$policy_dict"
```

salt.modules.vsphere.create_tag(name, description, category_id, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)

Create a tag under a category with given description.

CLI Example:

```
salt vm_minion vsphere.create_tag
```

Parameters
  - **server** (basestring) -- Target DNS or IP of vCenter client.
  - **username** (basestring) -- Username associated with the vCenter client.
  - **password** (basestring) -- Password associated with the vCenter client.
• **name** *(str)* -- Name of tag category to create (ex. Machine, OS, Availability, etc.)
• **description** *(str)* -- Given description of tag category.
• **category_id** *(str)* -- Value of category_id representative of the category created previously.
• **verify_ssl** *(boolean)* -- Verify the SSL certificate. Default: True
• **ca_bundle** *(basestring)* -- Path to the ca bundle to use when verifying SSL certificates.

**Returns**
The identifier of the created tag.

**Return type**
str

**Raise**

AlreadyExists if the name provided in the create_spec is the name of an already existing tag in the input category.

Raise

InvalidArgument if any of the input information in the create_spec is invalid.

Raise

NotFound if the category for in the given create_spec does not exist in the system.

Raise

Unauthorized if you do not have the privilege to create tag.

```
salt.modules.vsphere.create_tag_category(name, description, cardinality, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)
```

Create a category with given cardinality.

**CLI Example:**

```
salt vm_minion vsphere.create_tag_category
```

**Parameters**

• **name** *(str)* -- Name of tag category to create (ex. Machine, OS, Availability, etc.)
• **description** *(str)* -- Given description of tag category.
• **cardinality** *(str)* -- The associated cardinality (SINGLE, MULTIPLE) of the category.
• **server** *(basestring)* -- Target DNS or IP of vCenter center.
• **username** *(basestring)* -- Username associated with the vCenter center.
• **password** *(basestring)* -- Password associated with the vCenter center.
• **verify_ssl** *(boolean)* -- Verify the SSL certificate. Default: True
• **ca_bundle** *(basestring)* -- Path to the ca bundle to use when verifying SSL certificates.

**Returns**

Identifier of the created category.

**Return type**
str

**Raise**

AlreadyExists if the name provided in the create_spec is the name of an already existing category.

Raise

InvalidArgument if any of the information in the create_spec is invalid.

Raise

Unauthorized if you do not have the privilege to create a category.
salt.modules.vsphere.create_vm(vm_name, cpu, memory, image, version, datacenter, datastore, placement, interfaces, disks, scsi_devices, serial_ports=None, ide_controllers=None, sata_controllers=None, cd_drives=None, advanced_configs=None, service_instance=None)

Creates a virtual machine container.

CLI Example:
```
salt vm_minion vsphere.create_vm vm_name=vmname cpu='{{count: 2, nested: [True]}}' ...
```

**vm_name**  
Name of the virtual machine

**cpu**  
Properties of CPUs for freshly created machines

**memory**  
Memory size for freshly created machines

**image**  
Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier

**version**  
Virtual machine container hardware version

**datacenter**  
Datacenter where the virtual machine will be deployed (mandatory)

**datastore**  
Datastore where the virtual machine files will be placed

**placement**  
Resource pool or cluster or host or folder where the virtual machine will be deployed

**interfaces**

```
interfaces:
  adapter: 'Network adapter 1'
  name: vlan100
  switch_type: distributed or standard
  adapter_type: vmxnet3 or vmxnet, vmxnet2, vmxnet3, e1000, e1000e
  mac: '00:11:22:33:44:55'
  connectable:
    allow_guest_control: True
    connected: True
    start_connected: True
```

**disks**

```
disks:
  adapter: 'Hard disk 1'
  size: 16
  unit: GB
  address: '0:0'
  controller: 'SCSI controller 0'
  thin_provision: False
  eagerly_scrub: False
  datastore: 'myshare'
  filename: 'vm/mydisk.vmdk'
```

**scsi_devices**
scsi_devices:
    controller: 'SCSI controller 0'
    type: paravirtual
    bus_sharing: no_sharing

serial_ports
serial_ports:
    adapter: 'Serial port 1'
    type: network
    backing:
        uri: 'telnet://something:port'
        direction: <client|server>
        filename: 'service_uri'
    connectable:
        allow_guest_control: True
        connected: True
        start_connected: True
    yield: False

cd_drives
cd_drives:
    adapter: 'CD/DVD drive 0'
    controller: 'IDE 0'
    device_type: datastore_iso_file
    datastore_iso_file:
        path: path_to_iso
    connectable:
        allow_guest_control: True
        connected: True
        start_connected: True

advanced_config
Advanced config parameters to be set for the virtual machine

salt.modules.vsphere.create_vmfs_datastore(datastore_name, disk_id, vmfs_major_version, safety_checks=True, service_instance=None)

Creates a ESXi host disk group with the specified cache and capacity disks.

datastore_name
    The name of the datastore to be created.
disk_id
    The disk id (canonical name) on which the datastore is created.
vmfs_major_version
    The VMFS major version.
safetyChecks
    Specify whether to perform safety check or to skip the checks and try performing the required task. Default is True.
service_instance
    Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:
salt '*' vsphere.create_vmfs_datastore datastore_name=ds1 disk_id=
    vmfs_major_version=5
salt.modules.vsphere.delete_advanced_configs

Removes extra config parameters from a virtual machine.

- **vm_name**
  - Virtual machine name
- **datacenter**
  - Datacenter name where the virtual machine is available
- **advanced_configs**
  - List of advanced config values to be removed
- **service_instance**
  - vCenter service instance for connection and configuration

salt.modules.vsphere.delete_tag

Delete a tag.

CLI Example:

```
salt vm_minion vsphere.delete_tag
```

**Parameters**

- **tag_id** *(str)* -- The identifier of tag to be deleted. The parameter must be an identifier for the resource type: `com.vmware.cis.tagging.Tag`.
- **server** *(basestring)* -- Target DNS or IP of vCenter center.
- **username** *(basestring)* -- Username associated with the vCenter center.
- **password** *(basestring)* -- Password associated with the vCenter center.
- **verify_ssl** *(boolean)* -- Verify the SSL certificate. Default: True
- **ca_bundle** *(basestring)* -- Path to the ca bundle to use when verifying SSL certificates.

*Raise*

- **AlreadyExists** if the name provided in the create_spec is the name of an already existing category.
- **InvalidArgument** if any of the information in the create_spec is invalid.
- **Unauthorized** if you do not have the privilege to create a category.

salt.modules.vsphere.delete_tag_category

Delete a category.

CLI Example:

```
salt vm_minion vsphere.delete_tag_category
```

**Parameters**

- **category_id** *(str)* -- The identifier of category to be deleted. The parameter must be an identifier for the resource type: `com.vmware.cis.tagging.Category`.
- **server** *(basestring)* -- Target DNS or IP of vCenter center.
- **username** *(basestring)* -- Username associated with the vCenter center.
- **password** *(basestring)* -- Password associated with the vCenter center.
- **verify_ssl** *(boolean)* -- Verify the SSL certificate. Default: True
- **ca_bundle** *(basestring)* -- Path to the ca bundle to use when verifying SSL certificates.
Raise
   NotFound if the tag for the given tag_id does not exist in the system.
Raise
   Unauthorized if you do not have the privilege to delete the tag.
Raise
   Unauthenticated if the user can not be authenticated.

salt.modules.vsphere.delete_vm(name, datacenter, placement=None, power_off=False, service_instance=None)

Deletes a virtual machine defined by name and placement

name
   Name of the virtual machine
datacenter
   Datacenter of the virtual machine
placement
   Placement information of the virtual machine
service_instance
   vCenter service instance for connection and configuration

CLI Example:

```
salt '*' vsphere.delete_vm name=my_vm datacenter=my_datacenter
```

salt.modules.vsphere.disconnect(service_instance)

Disconnects from a vCenter or ESXi host

Note: Should be used by state functions, not invoked directly.

service_instance
   Service instance (vim.ServiceInstance)

CLI Example:

```
See note above.
```

salt.modules.vsphere.enable_firewall_ruleset(host, username, password, ruleset_enable, ruleset_name, protocol=None, port=None, esxi_hosts=None, credstore=None)

Enable or disable an ESXi firewall rule set.

host
   The location of the host.
username
   The username used to login to the host, such as root.
password
   The password used to login to the host.
ruleset_enable
   True to enable the ruleset, false to disable.
ruleset_name
   Name of ruleset to target.
protocol
   Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port
   Optionally set to alternate port if the host is not using the default port. Default port is 443.
esxi_hosts
   If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi
machines.

credstore
Optionally set to path to the credential store file.

Returns
A standard cmd.run_all dictionary, per host.

CLI Example:

```bash
# Used for ESXi host connection information
salt '*' vsphere.enable_firewall_ruleset my.esxi.host root bad-password True 'syslog'

# Used for connecting to a vCenter Server
salt '*' vsphere.enable_firewall_ruleset my.vcenter.location root bad-password True 'syslog' esxi_hosts=['esxi-1.host.com', esxi-2.host.com']
```

salt.modules.vsphere.erase_disk_partitions(disk_id=None, scsi_address=None, service_instance=None)

Erases the partitions on a disk. The disk can be specified either by the canonical name, or by the scsi_address.

- **disk_id**
  Canonical name of the disk. Either disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).

- **scsi_address**
  Scsi address of the disk. disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).

- **service_instance**
  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```bash
salt '*' vsphere.erase_disk_partitions scsi_address='vmhaba0:C0:T0:L0'
salt '*' vsphere.erase_disk_partitions disk_id='naa.000000000000001'
```

salt.modules.vsphere.esxcli_cmd(cmd_str, host=None, username=None, password=None, protocol=None, port=None, esxi_hosts=None, credstore=None)

Run an ESXCLI command directly on the host or list of hosts.

- **host**
  The location of the host.

- **username**
  The username used to login to the host, such as root.

- **password**
  The password used to login to the host.

- **cmd_str**
  The ESXCLI command to run. Note: This should not include the -s, -u, -p, -h, --protocol, or --portnumber arguments that are frequently passed when using a bare ESXCLI command from the command line. Those arguments are handled by this function via the other args and kwargs.

- **protocol**
  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

- **port**
  Optionally set to alternate port if the host is not using the default port. Default port is 443.

- **esxi_hosts**
  If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi
machines.
credstore
   Optionally set to path to the credential store file.

CLI Example:

```bash
# Used for ESXi host connection information
salt '*' vsphere.esxcli_cmd my.esxi.host root bad-password
   → 'system coredump network get'

# Used for connecting to a vCenter Server
salt '*' vsphere.esxcli_cmd my.vcenter.location root bad-password
   → 'system coredump network get' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_advanced_configs(vm_name, datacenter, service_instance=None)

Returns extra config parameters from a virtual machine advanced config list

- **vm_name**
  Virtual machine name

- **datacenter**
  Datacenter name where the virtual machine is available

- **service_instance**
  vCenter service instance for connection and configuration

salt.modules.vsphere.get_coredump_network_config(host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None)

Retrieve information on ESXi or vCenter network dump collection and format it into a dictionary.

- **host**
  The location of the host.

- **username**
  The username used to login to the host, such as root.

- **password**
  The password used to login to the host.

- **protocol**
  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

- **port**
  Optionally set to alternate port if the host is not using the default port. Default port is 443.

- **esxi_hosts**
  If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

- **credstore**
  Optionally set to path to the credential store file.

- **Returns**
  A dictionary with the network configuration, or, if getting the network config failed, an error message retrieved from the standard cmd.run_all dictionary, per host.

CLI Example:

```bash
# Used for ESXi host connection information
salt '*' vsphere.get_coredump_network_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
```
salt.modules.vsphere.get_firewall_status(host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None)

Show status of all firewall rule sets.

**host**
The location of the host.

**username**
The username used to login to the host, such as `root`.

**password**
The password used to login to the host.

**protocol**
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**esxi_hosts**
If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

**credstore**
Optionally set to path to the credential store file.

**Returns**
Nested dictionary with two toplevel keys `rulesets` and `success` success will be True or False depending on query success. `rulesets` will list the rulesets and their statuses if success was true, per host.

**CLI Example:**

```bash
# Used for ESXi host connection information
salt '*' vsphere.get_firewall_status my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_firewall_status my.vcenter.location root bad-password esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_host_cache(service_instance=None)

Returns the host cache configuration on the proxy host.

**service_instance**
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

**CLI Example:**

```bash
salt '*' vsphere.get_host_cache
```

salt.modules.vsphere.get_host_datetime(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Get the date/time information for a given host or list of host_names.

**host**
The location of the host.

**username**
The username used to login to the host, such as `root`.
password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port
Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get date/time information.

If host_names is not provided, the date/time information will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```shell
# Used for single ESXi host connection information
salt '*' vsphere.get_host_datetime my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_host_datetime my.vcenter.location root bad-password →
host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_ntp_config
Get the NTP configuration information for a given host or list of host_names.

- host
  The location of the host.

- username
  The username used to login to the host, such as root.

- password
  The password used to login to the host.

- protocol
  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

- port
  Optionally set to alternate port if the host is not using the default port. Default port is 443.

- host_names
  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get ntp configuration information.

  If host_names is not provided, the NTP configuration will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

- verify_ssl
  Verify the SSL certificate. Default: True

CLI Example:

```shell
# Used for single ESXi host connection information
salt '*' vsphere.get_ntp_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_ntp_config my.vcenter.location root bad-password →
host_names='[esxi-1.host.com, esxi-2.host.com]'
```

(continues on next page)
salt '*v' vsphere.get_ntp_config my.vcenter.location root bad-password

host_names='[esxi-1.host.com, esxi-2.host.com]'

salt.modules.vsphere.get_proxy_type()

Returns the proxy type retrieved either from the pillar of from the proxy minion's config. Returns <undefined> otherwise.

CLI Example:
salt '*' vsphere.get_proxy_type

salt.modules.vsphere.get_service_instance_via_proxy(service_instance=None)

Returns a service instance to the proxied endpoint (vCenter/ESXi host).

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

Note: Should be used by state functions not invoked directly.

CLI Example:
See note above

salt.modules.vsphere.get_service_policy(host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True)

Get the service name's policy for a given host or list of hosts.

host
The location of the host.

username
The username used to login to the host, such as root.

password
The password used to login to the host.

service_name
The name of the service for which to retrieve the policy. Supported service names are:
- DCUI
- TSM
- SSH
- ldbd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port
Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter
Server, the host_names argument is required to tell vCenter the hosts for which to get service policy information.

If host_names is not provided, the service policy information will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.get_service_policy my.esxi.host root bad-password 'ssh'
```

```
salt '*' vsphere.get_service_policy my.vcenter.location root bad-password
    host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.get_service_running( host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True)
```

Get the service name’s running state for a given host or list of hosts.

host
The location of the host.

username
The username used to login to the host, such as root.

password
The password used to login to the host.

service_name
The name of the service for which to retrieve the policy. Supported service names are:
- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port
Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get the service’s running state.

If host_names is not provided, the service’s running state will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:
# Used for single ESXi host connection information
salt '*' vsphere.get_service_running my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_running my.vcenter.location root bad-
password 'ntpd' host_names='[esxi-1.host.com, esxi-2.host.com]'

salt.modules.vsphere.get_ssh_key(host, username, password, protocol=None, port=None,
certificate_verify=None)

Retrieve the authorized_keys entry for root. This function only works for ESXi, not vCenter.

Parameters
- **host** -- The location of the ESXi Host
- **username** -- Username to connect as
- **password** -- Password for the ESXi web endpoint
- **protocol** -- defaults to https, can be http if ssl is disabled on ESXi
- **port** -- defaults to 443 for https
- **certificate_verify** -- If true require that the SSL connection present a valid
certificate. Default: True

Returns
True if upload is successful

CLI Example:
```
salt '*' vsphere.get_ssh_key my.esxi.host root bad-password certificate_
verify=True
```

salt.modules.vsphere.get_syslog_config(host, username, password, protocol=None, port=None,
esxi_hosts=None, credstore=None)

Retrieve the syslog configuration.

**host**
The location of the host.

**username**
The username used to login to the host, such as root.

**password**
The password used to login to the host.

**protocol**
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**
Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi_hosts**
If **host** is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

**credstore**
Optionally set to path to the credential store file.

Returns
Dictionary with keys and values corresponding to the syslog configuration, per host.

CLI Example:
```
# Used for ESXi host connection information
salt '*' vsphere.get_syslog_config my.esxi.host root bad-password
```

(continues on next page)
salt.modules.vsphere.get_vm(name, datacenter=None, vm_properties=None, traversal_spec=None, parent_ref=None, service_instance=None)

Returns vm object properties.

- **name**: Name of the virtual machine.
- **datacenter**: Datacenter name.
- **vm_properties**: List of vm properties.
- **traversal_spec**: Traversal Spec object(s) for searching.
- **parent_ref**: Container Reference object for searching under a given object.
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt.modules.vsphere.get_vm_config(name, datacenter=None, objects=True, service_instance=None)

Queries and converts the virtual machine properties to the available format from the schema. If the objects attribute is True the config objects will have extra properties, like 'object' which will include the vim.vm.device.VirtualDevice, this is necessary for deletion and update actions.

- **name**: Name of the virtual machine
- **datacenter**: Datacenter's name where the virtual machine is available
- **objects**: Indicates whether to return the vmware object properties (eg. object, key) or just the properties which can be set
- **service_instance**: vCenter service instance for connection and configuration

salt.modules.vsphere.get_vm_config_file(name, datacenter, placement, datastore, service_instance=None)

Queries the virtual machine config file and returns vim.host.DatastoreBrowser.SearchResults object on success None on failure

- **name**: Name of the virtual machine
- **datacenter**: Datacenter name
- **datastore**: Datastore where the virtual machine files are stored
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt.modules.vsphere.get_vmotion_enabled(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Get the VMotion enabled status for a given host or a list of host_names. Returns True if VMotion is enabled, False if it is not enabled.

- **host**: The location of the host.
username
The username used to login to the host, such as root.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port
Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if VMotion is enabled.

If host_names is not provided, the VMotion status will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.get_vmotion_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vmotion_enabled my.vcenter.location root bad-password
   host_names='[esxi-1.host.com, esxi-2.host.com]'
```

Returns a list of VSAN-eligible disks for a given host or list of host_names.

host
The location of the host.

username
The username used to login to the host, such as root.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port
Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if any VSAN-eligible disks are available.

If host_names is not provided, the VSAN-eligible disks will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.get_vsan_eligible_disks my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vsan_eligible_disks my.vcenter.location root bad-
   password host_names='[esxi-1.host.com, esxi-2.host.com]'
```
salt.modules.vsphere.get_vsan_enabled

Get the VSAN enabled status for a given host or a list of host_names. Returns True if VSAN is enabled, False if it is not enabled, and None if a VSAN Host Config is unset, per host.

- **host**
  The location of the host.
- **username**
  The username used to login to the host, such as root.
- **password**
  The password used to login to the host.
- **protocol**
  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**
  Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names**
  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if VSAN enabled.
  If host_names is not provided, the VSAN status will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **verify_ssl**
  Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.get_vsan_enabled my.vcenter.location root bad-password host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.list_assigned_licenses

Lists the licenses assigned to an entity

- **entity**
  Dictionary representation of an entity. See _get_entity docstrings for format.
- **entity_display_name**
  Entity name used in logging
- **license_keys**
  List of license keys to be retrieved. Default is None.
- **service_instance**
  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_assigned_licenses entity={type:cluster,datacenter:dc,cluster:cl} entity_display_name=cl
```
salt.modules.vsphere.list_attached_tags(object_id, managed_obj='ClusterComputeResource', server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)

List existing tags a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_attached_tags domain-c2283
```

Parameters

- object_id (str) -- The identifier of the input object.
- managed_obj (str) -- Classes that contain methods for creating and deleting resources typically contain a class attribute specifying the resource type for the resources being created and deleted.
- server (basestring) -- Target DNS or IP of vCenter center.
- username (basestring) -- Username associated with the vCenter center.
- password (basestring) -- Password associated with the vCenter center.
- verify_ssl (boolean) -- Verify the SSL certificate. Default: True
- ca_bundle (basestring) -- Path to the ca bundle to use when verifying SSL certificates.

Returns

The list of all tag identifiers that correspond to the tags attached to the given object.

Return type

list of tags

Raise

Unauthorized if you do not have the privilege to read the object.

Raise

Unauthenticated if the user can not be authenticated.

salt.modules.vsphere.list_capability_definitions(service_instance=None)

Returns a list of the metadata of all capabilities in the vCenter.

service_instance

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_capabilities
```

salt.modules.vsphere.list_cluster(datacenter=None, cluster=None, service_instance=None)

Returns a dict representation of an ESX cluster.

datacenter

Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.

cluster

Name of cluster. Ignored if already contained by proxy details. Default value is None.

service_instance

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
# vcenter proxy
salt '*' vsphere.list_cluster datacenter=dc1 cluster=cl1

# esxdatalcenter proxy
salt '*' vsphere.list_cluster cluster=cl1
```
salt.modules.vsphere.list_clusters

**salt.modules.vsphere.list_clusters** *(host, username, password, protocol=None, port=None, verify_ssl=True)*

Returns a list of clusters for the specified host.

**host**
The location of the host.

**username**
The username used to login to the host, such as `root`.

**password**
The password used to login to the host.

**protocol**
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**verify_ssl**
Verify the SSL certificate. Default: True

**CLI Example:**

```
salt '*' vsphere.list_clusters 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_datacenters

**salt.modules.vsphere.list_datacenters** *(host, username, password, protocol=None, port=None, verify_ssl=True)*

Returns a list of datacenters for the specified host.

**host**
The location of the host.

**username**
The username used to login to the host, such as `root`.

**password**
The password used to login to the host.

**protocol**
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**verify_ssl**
Verify the SSL certificate. Default: True

**CLI Example:**

```
salt '*' vsphere.list_datacenters 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_datacenters_via_proxy

**salt.modules.vsphere.list_datacenters_via_proxy** *(datacenter_names=None, service_instance=None)*

Returns a list of dict representations of VMware datacenters. Connection is done via the proxy details.

**Supported proxies:** `esxdatacenter`

**datacenter_names**
List of datacenter names. Default is `None`.

**service_instance**
Service instance (vim.ServiceInstance) of the vCenter. Default is `None`.
CLI Example:

```
salt '*' vsphere.list_datacenters_via_proxy
dsalt '*' vsphere.list_datacenters_via_proxy dc1
dsalt '*' vsphere.list_datacenters_via_proxy dc1,dc2
```

dsalt '*' vsphere.list_datacenters_via_proxy datacenter_names=[dc1, dc2]

salt.modules.vsphere.list_datastore_clusters(host, username, password, protocol=None, port=None, verify_ssl=True)

Returns a list of datastore clusters for the specified host.

**host**
The location of the host.

**username**
The username used to login to the host, such as `root`.

**password**
The password used to login to the host.

**protocol**
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**verify_ssl**
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_datastore_clusters 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_datastores(host, username, password, protocol=None, port=None, verify_ssl=True)

Returns a list of datastores for the specified host.

**host**
The location of the host.

**username**
The username used to login to the host, such as `root`.

**password**
The password used to login to the host.

**protocol**
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**verify_ssl**
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_datastores 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_datastores_via_proxy(datastore_names=None, backing_disk_ids=None, backing_disk_scsi_addresses=None, service_instance=None)
Returns a list of dict representations of the datastores visible to the proxy object. The list of datastores can be filtered by datastore names, backing disk ids (canonical names) or backing disk scsi addresses.

Supported proxy types: esxi, esxcluster, esxdatacenter
datastore_names
  List of the names of datastores to filter on
backing_disk_ids
  List of canonical names of the backing disks of the datastores to filer. Default is None.
backing_disk_scsi_addresses
  List of scsi addresses of the backing disks of the datastores to filter. Default is None.
service_instance
  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_datastores_via_proxy
datatstore_names=[ds1, ds2]
```

salt.modules.vsphere.list_default_storage_policy_of_datastore(datastore, service_instance=None)

Returns a list of datastores assign the storage policies.
datastore
  Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.
service_instance
  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_default_storage_policy_of_datastore datastore=ds1
```

salt.modules.vsphere.list_default_vsan_policy(service_instance=None)

Returns the default vsan storage policy.
service_instance
  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_default_vsan_policy
```

salt.modules.vsphere.list_disk_partitions(disk_id=None, scsi_address=None, service_instance=None)

Lists the partitions on a disk. The disk can be specified either by the canonical name, or by the scsi_address.
disk_id
  Canonical name of the disk. Either disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).
scsi_address
  Scsi address of the disk. disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).
service_instance
  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_disk_partitions scsi_address='vmhaba0:C0:T0:L0'
```

(continues on next page)
salt.modules.vsphere.list_diskgroups(cache_disk_ids=None, service_instance=None)

Returns a list of disk group dict representation on an ESXi host. The list of disk groups can be filtered by the cache disks canonical names. If no filtering is applied, all disk groups are returned.

cache_disk_ids:
List of cache disk canonical names of the disk groups to be retrieved. Default is None.

use_proxy_details
Specify whether to use the proxy minion’s details instead of the arguments

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:
```
salt '*' vsphere.list_diskgroups
salt '*' vsphere.list_diskgroups cache_disk_ids='[naa.000000000000001]'
```

salt.modules.vsphere.list_disks(disk_ids=None, scsi_addresses=None, service_instance=None)

Returns a list of dict representations of the disks in an ESXi host. The list of disks can be filtered by disk canonical names or scsi addresses.

disk_ids:
List of disk canonical names to be retrieved. Default is None.

scsi_addresses
List of scsi addresses of disks to be retrieved. Default is None

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:
```
salt '*' vsphere.list_disks
salt '*' vsphere.list_disks disk_ids='[naa.00, naa.001]'
salt '*' vsphere.list_disks scsi_addresses='[vmhba0:C0:T0:L0, vmhba1:C0:T0:L0]'
```

salt.modules.vsphere.list_dvportgroups(dvs=None, portgroup_names=None, service_instance=None)

Returns a list of distributed virtual switch portgroups. The list can be filtered by the portgroup names or by the DVS.

dvs
Name of the DVS containing the portgroups. Default value is None.

portgroup_names
List of portgroup names to look for. If None, all portgroups are returned. Default value is None

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:
```
salt '*' vsphere.list_dvportgroups
salt '*' vsphere.list_dvportgroups dvs=dvs1
salt '*' vsphere.list_dvportgroups portgroup_names=[pg1]
```

(continues on next page)
salt '*' vsphere.list_dvportgroups dvs=dvs1 portgroup_names=[pg1]

salt.modules.vsphere.list_dvs(host, username, password, protocol=None, port=None, verify_ssl=True)

Returns a list of distributed virtual switches for the specified host.

- **host**
  The location of the host.

- **username**
  The username used to login to the host, such as `root`.

- **password**
  The password used to login to the host.

- **protocol**
  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

- **port**
  Optionally set to alternate port if the host is not using the default port. Default port is `443`.

- **verify_ssl**
  Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_dvs 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_dvss(datacenter=None, dvs_names=None, service_instance=None)

Returns a list of distributed virtual switches (DVSs). The list can be filtered by the datacenter or DVS names.

- **datacenter**
  The datacenter to look for DVSs in. Default value is None.

- **dvs_names**
  List of DVS names to look for. If None, all DVSs are returned. Default value is None.

CLI Example:

```
salt '*' vsphere.list_dvss
salt '*' vsphere.list_dvss dvs_names=[dvs1,dvs2]
```

salt.modules.vsphere.list_folders(host, username, password, protocol=None, port=None, verify_ssl=True)

Returns a list of folders for the specified host.

- **host**
  The location of the host.

- **username**
  The username used to login to the host, such as `root`.

- **password**
  The password used to login to the host.

- **protocol**
  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

- **port**
  Optionally set to alternate port if the host is not using the default port. Default port is `443`.

- **verify_ssl**
  Verify the SSL certificate. Default: True

CLI Example:
salt '*' vsphere.list_folders 1.2.3.4 root bad-password

salt.modules.vsphere.list_hosts(host, username, password, protocol=None, port=None, verify_ssl=True)

Returns a list of hosts for the specified VMware environment.

host
  The location of the host.

username
  The username used to login to the host, such as root.

password
  The password used to login to the host.

protocol
  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port
  Optionally set to alternate port if the host is not using the default port. Default port is 443.

verify_ssl
  Verify the SSL certificate. Default: True

CLI Example:
salt '*' vsphere.list_hosts 1.2.3.4 root bad-password

salt.modules.vsphere.list_hosts_via_proxy(hostnames=None, datacenter=None, cluster=None, service_instance=None)

Returns a list of hosts for the specified VMware environment. The list of hosts can be filtered by datacenter name and/or cluster name

hostnames
  Hostnames to filter on.

datacenter_name
  Name of datacenter. Only hosts in this datacenter will be retrieved. Default is None.

cluster_name
  Name of cluster. Only hosts in this cluster will be retrieved. If a datacenter is not specified the first cluster with this name will be considered. Default is None.

service_instance
  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:
salt '*' vsphere.list_hosts_via_proxy
salt '*' vsphere.list_hosts_via_proxy hostnames=[esxi1.example.com]
salt '*' vsphere.list_hosts_via_proxy datacenter=dcl cluster=cluster1

salt.modules.vsphere.list_licenses(service_instance=None)

Lists all licenses on a vCenter.

service_instance
  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:
salt '*' vsphere.list_licenses

salt.modules.vsphere.list_networks(host, username, password, protocol=None, port=None, verify_ssl=True)
Returns a list of networks for the specified host.

- **host**
  The location of the host.

- **username**
  The username used to login to the host, such as `root`.

- **password**
  The password used to login to the host.

- **protocol**
  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

- **port**
  Optionally set to alternate port if the host is not using the default port. Default port is `443`.

- **verify_ssl**
  Verify the SSL certificate. Default: True

**CLI Example:**

```
salt '*' vsphere.list_networks 1.2.3.4 root bad-password
```

---

salt.modules.vsphere.list_non_ssds

```
host, username, password, protocol=None, port=None,
host_names=None, verify_ssl=True
```

Returns a list of Non-SSD disks for the given host or list of host_names.

---

**Note:** In the pyVmomi StorageSystem, ScsiDisks may, or may not have an `ssd` attribute. This attribute indicates if the ScsiDisk is SSD backed. As this option is optional, if a relevant disk in the StorageSystem does not have `ssd = true`, it will end up in the `non_ssds` list here.

---

- **host**
  The location of the host.

- **username**
  The username used to login to the host, such as `root`.

- **password**
  The password used to login to the host.

- **protocol**
  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

- **port**
  Optionally set to alternate port if the host is not using the default port. Default port is `443`.

- **host_names**
  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to retrieve Non-SSD disks.

  If `host_names` is not provided, Non-SSD disks will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **verify_ssl**
  Verify the SSL certificate. Default: True

**CLI Example:**

```
# Used for single ESXi host connection information
salt '*' vsphere.list_non_ssds my.esxi.host root bad-password
```

(continues on next page)
salt.modules.vsphere.list_resourcepools(host, username, password, protocol=None, port=None, verify_ssl=True)

Returns a list of resource pools for the specified host.

- **host**
  The location of the host.

- **username**
  The username used to login to the host, such as root.

- **password**
  The password used to login to the host.

- **protocol**
  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

- **port**
  Optionally set to alternate port if the host is not using the default port. Default port is 443.

- **verify_ssl**
  Verify the SSL certificate. Default: True

**CLI Example:**
salt '*' vsphere.list_resourcepools 1.2.3.4 root bad-password

salt.modules.vsphere.list_ssds(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Returns a list of SSDs for the given host or list of host_names.

- **host**
  The location of the host.

- **username**
  The username used to login to the host, such as root.

- **password**
  The password used to login to the host.

- **protocol**
  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

- **port**
  Optionally set to alternate port if the host is not using the default port. Default port is 443.

- **host_names**
  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to retrieve SSDs.

  If host_names is not provided, SSDs will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **verify_ssl**
  Verify the SSL certificate. Default: True

**CLI Example:**

```
# Used for single ESXi host connection information
salt '*' vsphere.list_ssds my.esxi.host root bad-password
```

# Used for connecting to a vCenter Server
salt.modules.vsphere.list_storage_policies(policy_names=None, service_instance=None)

Returns a list of storage policies.

- **policy_names**
  - Names of policies to list. If None, all policies are listed. Default is None.
- **service_instance**
  - Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_storage_policies
salt '*' vsphere.list_storage_policies policy_names=[policy_name]
```

salt.modules.vsphere.list_tag_categories(server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)

List existing categories a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_tag_categories
```

**Parameters**

- **server** (basestring) -- Target DNS or IP of vCenter center.
- **username** (basestring) -- Username associated with the vCenter center.
- **password** (basestring) -- Password associated with the vCenter center.
- **verify_ssl** (boolean) -- Verify the SSL certificate. Default: True
- **ca_bundle** (basestring) -- Path to the ca bundle to use when verifying SSL certificates.

**Returns**

Value(s) of category_id.

**Return type**

list of str

salt.modules.vsphere.list_tags(server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)

List existing tags a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_tags
```

**Parameters**

- **server** (basestring) -- Target DNS or IP of vCenter center.
- **username** (basestring) -- Username associated with the vCenter center.
- **password** (basestring) -- Password associated with the vCenter center.
- **verify_ssl** (boolean) -- Verify the SSL certificate. Default: True
- **ca_bundle** (basestring) -- Path to the ca bundle to use when verifying SSL certificates.

**Returns**

Value(s) of tag_id.
Return type
list of str

`salt.modules.vsphere.list_uplink_dvportgroup(dvs, service_instance=None)`

Returns the uplink portgroup of a distributed virtual switch.

- **dvs**
  Name of the DVS containing the portgroup.
- **service_instance**
  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:
```
salt '*' vsphere.list_uplink_dvportgroup dvs=dvs_name
```

`salt.modules.vsphere.list_vapps(host, username, password, protocol=None, port=None, verify_ssl=True)`

Returns a list of vApps for the specified host.

- **host**
  The location of the host.
- **username**
  The username used to login to the host, such as root.
- **password**
  The password used to login to the host.
- **protocol**
  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**
  Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **verify_ssl**
  Verify the SSL certificate. Default: True

CLI Example:
```
# List vapps from all minions
salt '*' vsphere.list_vapps 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_vms(host, username, password, protocol=None, port=None, verify_ssl=True)`

Returns a list of VMs for the specified host.

- **host**
  The location of the host.
- **username**
  The username used to login to the host, such as root.
- **password**
  The password used to login to the host.
- **protocol**
  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**
  Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **verify_ssl**
  Verify the SSL certificate. Default: True

CLI Example:
```
salt '*' vsphere.list_vms 1.2.3.4 root bad-password
```

`salt.modules.vsphere.power_off_vm(name, datacenter=None, service_instance=None)`
Powers off a virtual machine specified by its name.

**name**
Name of the virtual machine

**datacenter**
Datacenter of the virtual machine

**service_instance**
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:
```
salt '*' vsphere.power_off_vm name=my_vm
```

salt.modules.vsphere.power_on_vm(name, datacenter=None, service_instance=None)

Powers on a virtual machine specified by its name.

**name**
Name of the virtual machine

**datacenter**
Datacenter of the virtual machine

**service_instance**
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:
```
salt '*' vsphere.power_on_vm name=my_vm
```

salt.modules.vsphere.register_vm(name, datacenter, placement, vmx_path, service_instance=None)

Registers a virtual machine to the inventory with the given vmx file. Returns comments and change list.

**name**
Name of the virtual machine

**datacenter**
Datacenter of the virtual machine

**placement**
Placement dictionary of the virtual machine, host or cluster

**vmx_path**
Full path to the vmx file, datastore name should be included

**service_instance**
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt.modules.vsphere.remove_capacity_from_diskgroup(cache_disk_id, capacity_disk_ids, data_evacuation=True, safety_checks=True, service_instance=None)

Remove capacity disks from the disk group with the specified cache disk.

**cache_disk_id**
The canonical name of the cache disk.

**capacity_disk_ids**
A list containing canonical names of the capacity disks to add.

**data_evacuation**
Specifies whether to gracefully evacuate the data on the capacity disks before removing them from the disk group. Default value is True.

**safety_checks**
Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.

**service_instance**
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.
salt documentation, release 3007.1

cli example:

```bash
salt '*' vsphere.remove_capacity_from_diskgroup
    cache_disk_id='naa.000000000000001'
    capacity_disk_ids='[naa.000000000000002, naa.000000000000003]'
```

salt.modules.vsphere.remove_datastore(datastore, service_instance=None)

Removes a datastore. If multiple datastores an error is raised.

- `datastore`
  - Datastore name
- `service_instance`
  - Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

cli example:

```bash
salt '*' vsphere.remove_datastore ds_name
```

salt.modules.vsphere.remove_diskgroup(cache_disk_id, data_accessibility=True, service_instance=None)

Remove the diskgroup with the specified cache disk.

- `cache_disk_id`
  - The canonical name of the cache disk.
- `data_accessibility`
  - Specifies whether to ensure data accessibility. Default value is True.
- `service_instance`
  - Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

cli example:

```bash
salt '*' vsphere.remove_diskgroup cache_disk_id='naa.000000000000001'
```

salt.modules.vsphere.remove_dvportgroup(portgroup, dvs, service_instance=None)

Removes a distributed virtual portgroup.

- `portgroup`
  - Name of the portgroup to be removed.
- `dvs`
  - Name of the DVS containing the portgroups.
- `service_instance`
  - Service instance (vim.ServiceInstance) of the vCenter. Default is None.

cli example:

```bash
salt '*' vsphere.remove_dvportgroup portgroup=pg1 dvs=dvs1
```

salt.modules.vsphere.rename_datastore(datastore_name, new_datastore_name, service_instance=None)

Renames a datastore. The datastore needs to be visible to the proxy.

- `datastore_name`
  - Current datastore name.
- `new_datastore_name`
  - New datastore name.
- `service_instance`
  - Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

cli example:

```bash
salt '*' vsphere.rename_datastore old_name new_name
```
salt.modules.vsphere.reset_syslog_config

Reset the syslog service to its default settings.

Valid syslog_config values are logdir, loghost, logdir-unique, default-rotate, default-size, default-timeout, or all for all of these.

**host**
The location of the host.

**username**
The username used to login to the host, such as root.

**password**
The password used to login to the host.

**protocol**
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**
Optionally set to alternate port if the host is not using the default port. Default port is 443.

**syslog_config**
List of parameters to reset, provided as a comma-delimited string, or 'all' to reset all syslog configuration parameters. Required.

**esxi_hosts**
If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

**credstore**
Optionally set to path to the credential store file.

**Returns**
Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

**Note:** syslog_config can be passed as a quoted, comma-separated string. See CLI Example for details.

**CLI Example:**

```bash
# Used for ESXi host connection information
salt '*' vsphere.reset_syslog_config my.esxi.host root bad-password
   → syslog_config='logdir,loghost'

# Used for connecting to a vCenter Server
salt '*' vsphere.reset_syslog_config my.vcenter.location root bad-
   → password syslog_config='logdir,loghost' esxi_hosts='[esxi-1.
   → host.com, esxi-2.host.com]'
```

salt.modules.vsphere.service_restart

Restart the named service for the given host or list of hosts.

**host**
The location of the host.

**username**
The username used to login to the host, such as root.

**password**
The password used to login to the host.

**service_name**
The name of the service for which to set the policy. Supported service names are:
• DCUI
• TSM
• SSH
• lbtd
• lsassd
• lwiod
• netlogond
• ntpd
• sfbd-watchdog
• snmpd
• vprobed
• vpxa
• xorg

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port
Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to restart the service.

If host_names is not provided, the service will be restarted for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```yaml
# Used for single ESXi host connection information
salt '*' vsphere.service_restart my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_restart my.vcenter.location root bad-password
  →'ntpd' host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.service_start(host, username, password, service_name, protocol=None,
  port=None, host_names=None, verify_ssl=True)
```

Start the named service for the given host or list of hosts.

host
The location of the host.

username
The username used to login to the host, such as root.

password
The password used to login to the host.

service_name
The name of the service for which to set the policy. Supported service names are:

• DCUI
• TSM
• SSH
• lbtd
• lsassd
• lwiod
• netlogond
• ntpd
• sfcbd-watchdog
• snmpd
• vprobed
• vpxa
• xorg

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port
Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to start the service.

If host_names is not provided, the service will be started for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.service_start my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_start my.vcenter.location root bad-password 'ntpd
   host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.service_stop( host, username, password, service_name, protocol=None,
   port=None, host_names=None, verify_ssl=True)
```

Stop the named service for the given host or list of hosts.

host
The location of the host.

username
The username used to login to the host, such as root.

password
The password used to login to the host.

service_name
The name of the service for which to set the policy. Supported service names are:

• DCUI
• TSM
• SSH
• lbtd
• lsassd
• lwiod
• netlogond
• ntpd
• sfcbd-watchdog
• snmpd
• vprobed
• vpxa
• xorg

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port
   Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names
   List of ESXi host names. When the host, username, and password credentials are provided for a vCenter
   Server, the host_names argument is required to tell vCenter the hosts for which to stop the service.

   If host_names is not provided, the service will be stopped for the host location instead. This is useful
   for when service instance connection information is used for a single ESXi host.

verify_ssl
   Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.service_stop my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_stop my.vcenter.location root bad-password 'ssh'

   host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.set_advanced_configs(vm_name, datacenter, advanced_configs,
                                         service_instance=None)

Appends extra config parameters to a virtual machine advanced config list

- **vm_name**
  Virtual machine name

- **datacenter**
  Datacenter name where the virtual machine is available

- **advanced_configs**
  Dictionary with advanced parameter key value pairs

- **service_instance**
  vCenter service instance for connection and configuration

salt.modules.vsphere.set_coredump_network_config(host, username, password, dump_ip,
                                                protocol=None, port=None,
                                                host_vnic='vmk0', dump_port=6500,
                                                esxi_hosts=None, credstore=None)

Set the network parameters for a network coredump collection. Note that ESXi requires that the dumps first
be enabled (see coredump_network_enable) before these parameters may be set.

- **host**
  The location of the host.

- **username**
  The username used to login to the host, such as root.

- **password**
  The password used to login to the host.

- **dump_ip**
  IP address of host that will accept the dump.

- **protocol**
  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is
  https.

- **port**
  Optionally set to alternate port if the host is not using the default port. Default port is 443.

- **esxi_hosts**
  If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi
  machines.

- **host_vnic**
  Host VNic port through which to communicate. Defaults to vmk0.
dump_port
    TCP port to use for the dump, defaults to 6500.
credstore
    Optionally set to path to the credential store file.
Returns
    A standard cmd.run_all dictionary with a success key added, per host. success will be True if the set succeeded, False otherwise.

CLI Example:

```bash
# Used for ESXi host connection information
salt '*' vsphere.set_coredump_network_config my.esxi.host root bad-
    → password 'dump_ip.host.com'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_coredump_network_config my.vcenter.location root bad-
    → password 'dump_ip.host.com' esxi_hosts='[esxi-1.host.com,
    →esxi-2.host.com]'
```

salt.modules.vsphere.set_ntp_config(host, username, password, ntp_servers, protocol=None, port=None, host_names=None, verify_ssl=True)

Set NTP configuration for a given host of list of host_names.

host
    The location of the host.
username
    The username used to login to the host, such as root.
password
    The password used to login to the host.
ntp_servers
    A list of servers that should be added to and configured for the specified host's NTP configuration.
protocol
    Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port
    Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names
    List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to configure ntp servers.

If host_names is not provided, the NTP servers will be configured for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
    Verify the SSL certificate. Default: True

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.ntp_configure my.esxi.host root bad-password '([192.174.1.
    →100, 192.174.1.200]'

# Used for connecting to a vCenter Server
salt '*' vsphere.ntp_configure my.vcenter.location root bad-password
    →'([192.174.1.100, 192.174.1.200]' host_names='[esxi-1.host.com,
    →esxi-2.host.com]'
```
salt.modules.vsphere.set_service_policy(host, username, password, service_name, service_policy, protocol=None, port=None, host_names=None, verify_ssl=True)

Set the service name's policy for a given host or list of hosts.

host
The location of the host.

username
The username used to login to the host, such as root.

password
The password used to login to the host.

service_name
The name of the service for which to set the policy. Supported service names are:
• DCUI
• TSM
• SSH
• lbtld
• lsassd
• lwiod
• netlogond
• ntpd
• sfcbd-watchdog
• snmpd
• vprobed
• vpxa
• xorg

service_policy
The policy to set for the service. For example, 'automatic'.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port
Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to set the service policy.

If host_names is not provided, the service policy information will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.set_service_policy my.esxi.host root bad-password 'ntpd' →'automatic'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_service_policy my.vcenter.location root bad-password 'ntpd' 'automatic' host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.set_syslog_config(host, username, password, syslog_config, config_value, protocol=None, port=None, firewall=True, reset_service=True, esxi_hosts=None, credstore=None)
Set the specified syslog configuration parameter. By default, this function will reset the syslog service after the configuration is set.

**host**
ESXi or vCenter host to connect to.

**username**
User to connect as, usually root.

**password**
Password to connect with.

**syslog_config**
Name of parameter to set (corresponds to the command line switch for esxcli without the double dashes (--) )

Valid syslog_config values are `logdir`, `loghost`, `default-rotate`, `default-size`, `default-timeout`, and `logdir-unique`.

**config_value**
Value for the above parameter. For `loghost`, URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas.

**protocol**
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**
Optionally set to alternate port if the host is not using the default port. Default port is 443.

**firewall**
Enable the firewall rule set for syslog. Defaults to `True`.

**reset_service**
After a successful parameter set, reset the service. Defaults to `True`.

**esxi_hosts**
If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore**
Optionally set to path to the credential store file.

**Returns**
Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

**CLI Example:**

```bash
# Used for ESXi host connection information
salt '*' vsphere.set_syslog_config my.esxi.host root bad-password
  → loghost ssl://localhost:5432,tcp://10.1.0.1:1514

# Used for connecting to a vCenter Server
salt '*' vsphere.set_syslog_config my.vcenter.location root bad-password
  → loghost ssl://localhost:5432,tcp://10.1.0.1:1514
  → esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.syslog_service_reload

**(host, username, password, protocol=\-None, port=\-None, esxi_hosts=\-None, credstore=\-None)**

Reload the syslog service so it will pick up any changes.

**host**
The location of the host.
username
The username used to login to the host, such as root.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port
Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts
If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore
Optionally set to path to the credential store file.

Returns
A standard cmd.run_all dictionary. This dictionary will at least have a retcode key. If retcode is 0 the command was successful.

CLI Example:

```
salt '*' vsphere.syslog_service_reload my.esxi.host root bad-password
```

salt.modules.vsphere.system_info (host, username, password, protocol=None, port=None, verify_ssl=True)

Return system information about a VMware environment.

host
The location of the host.

username
The username used to login to the host, such as root.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port
Optionally set to alternate port if the host is not using the default port. Default port is 443.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.system_info 1.2.3.4 root bad-password
```

salt.modules.vsphere.test_vcenter_connection (service_instance=None)

Checks if a connection is to a vCenter

CLI Example:

```
salt '*' vsphere.test_vcenter_connection
```
salt.modules.vsphere.unregister_vm(name, datacenter, placement=None, power_off=False, service_instance=None)

Unregisters a virtual machine defined by name and placement

name
  Name of the virtual machine
datacenter
  Datacenter of the virtual machine
placement
  Placement information of the virtual machine
service_instance
  vCenter service instance for connection and configuration

CLI Example:
```
salt '*' vsphere.unregister_vm name=my_vm datacenter=my_datacenter
```
Updates a distributed virtual switch (DVS).

**Note:** Updating the product info, capability, uplinks of a DVS is not supported so the corresponding entries in `dvs_dict` will be ignored.

- **dvs_dict**
  Dictionary with the values the DVS should be update with (example in `salt.states.dvs`)

- **dvs**
  Name of the DVS to be updated.

- **service_instance**
  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

**CLI Example:**

```bash
salt '*' vsphere.update_dvs dvs_dict=$dvs_dict dvs=dvs1
```

salt.modules.vsphere.update_host_datetime

Update the date/time on the given host or list of host_names. This function should be used with caution since network delays and execution delays can result in time skews.

- **host**
  The location of the host.

- **username**
  The username used to login to the host, such as `root`.

- **password**
  The password used to login to the host.

- **protocol**
  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

- **port**
  Optionally set to alternate port if the host is not using the default port. Default port is 443.

- **host_names**
  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts should update their date/time. If `host_names` is not provided, the date/time will be updated for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **verify_ssl**
  Verify the SSL certificate. Default: True

**CLI Example:**

```bash
# Used for single ESXi host connection information
salt '*' vsphere.update_date_time my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.update_date_time my.vcenter.location root bad-password host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.update_host_password

Update the password for a given host.

**Note:** Currently only works with connections to ESXi hosts. Does not work with vCenter servers.
The location of the ESXi host.

**username**
The username used to login to the ESXi host, such as `root`.

**password**
The password used to login to the ESXi host.

**new_password**
The new password that will be updated for the provided username on the ESXi host.

**protocol**
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

**verify_ssl**
Verify the SSL certificate. Default: `True`

CLI Example:
```
salt '*' vsphere.update_host_password my.esxi.host root original-bad-password new-bad-password
```

salt.modules.vsphere.update_storage_policy

Updates a storage policy.

Supported capability types: scalar, set, range.

**policy**
Name of the policy to update.

**policy_dict**
Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)

**service_instance**
Service instance (vim.ServiceInstance) of the vCenter. Default is `None`.

CLI Example:
```
salt '*' vsphere.update_storage_policy policy='policy name' policy_dict="$policy_dict"
```

salt.modules.vsphere.update_vm

Updates the configuration of the virtual machine if the config differs.

**vm_name**
Virtual Machine name to be updated

**cpu**
CPU configuration options

**memory**
Memory configuration options

**version**
Virtual machine container hardware version

**image**
Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier

**interfaces**
Network interfaces configuration options

**disks**
Disks configuration options
scsi_devices
   SCSI devices configuration options
serial_ports
   Serial ports configuration options
datacenter
   Datacenter where the virtual machine is available
datastore
   Datastore where the virtual machine config files are available
cd_dvd_drives
   CD/DVD drives configuration options
advanced_config
   Advanced config parameters to be set for the virtual machine
service_instance
   vCenter service instance for connection and configuration

salt.modules.vsphere.upload_ssh_key(host, username, password, ssh_key=None, ssh_key_file=None, protocol=None, port=None, certificate_verify=None)

Upload an ssh key for root to an ESXi host via http PUT. This function only works for ESXi, not vCenter. Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

Parameters
   • host -- The location of the ESXi Host
   • username -- Username to connect as
   • password -- Password for the ESXi web endpoint
   • ssh_key -- Public SSH key, will be added to authorized_keys on ESXi
   • ssh_key_file -- File containing the SSH key. Use 'ssh_key' or ssh_key_file, but not both.
   • protocol -- defaults to https, can be http if ssl is disabled on ESXi
   • port -- defaults to 443 for https
   • certificate_verify -- If true require that the SSL connection present a valid certificate. Default: True

Returns
   Dictionary with a 'status' key, True if upload is successful. If upload is unsuccessful, 'status' key will be False and an 'Error' key will have an informative message.

CLI Example:

```bash
salt '*' vsphere.upload_ssh_key my.esxi.host root bad-password ssh_key_file=/etc/salt/my_keys/my_key.pub
```

salt.modules.vsphere.vmotion_disable(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Disable vMotion for a given host or list of host_names.

host
   The location of the host.
username
   The username used to login to the host, such as root.
password
   The password used to login to the host.
protocol
   Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port
   Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names
   List of ESXi host names. When the host, username, and password credentials are provided for a vCenter
Server, the host_names argument is required to tell vCenter which hosts should disable VMotion. If host_names is not provided, VMotion will be disabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

### verify_ssl
Verify the SSL certificate. Default: True

#### CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_disable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_disable my.vcenter.location root bad-password

```

#### `salt.modules.vsphere.vmotion_enable`
Enable VMotion for a given host or list of host_names.

- **host**
  The location of the host.

- **username**
  The username used to login to the host, such as root.

- **password**
  The password used to login to the host.

- **protocol**
  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

- **port**
  Optionally set to alternate port if the host is not using the default port. Default port is 443.

- **host_names**
  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should enable VMotion.

  If host_names is not provided, VMotion will be enabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **device**
  The device that uniquely identifies the VirtualNic that will be used for VMotion for each host. Defaults to vmk0.

- **verify_ssl**
  Verify the SSL certificate. Default: True

#### CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_enable my.vcenter.location root bad-password

```

#### `salt.modules.vsphere.vsan_add_disks`
Add any VSAN-eligible disks to the VSAN System for the given host or list of host_names.

- **host**
  The location of the host.
username
The username used to login to the host, such as root.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port
Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts need to add any VSAN-eligible disks to the host's VSAN system.

If host_names is not provided, VSAN-eligible disks will be added to the host's VSAN system for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.vsan_add_disks my.esxi.host root bad-password
```

```
salt '*' vsphere.vsan_add_disks my.vcenter.location root bad-password
  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.vsan_disable(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Disable VSAN for a given host or list of host_names.

host
The location of the host.

username
The username used to login to the host, such as root.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port
Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should disable VSAN.

If host_names is not provided, VSAN will be disabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.vsan_disable my.esxi.host root bad-password
```

(continues on next page)
# Used for connecting to a vCenter Server

```bash
salt '*' vsphere.vsan_disable my.vcenter.location root bad-password

→ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```bash
salt '*' vsphere.vsan_enable

salt.modules.vsphere.vsan_enable( host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True )
```

Enable VSAN for a given host or list of host_names.

**host**  
The location of the host.

**username**  
The username used to login to the host, such as `root`.

**password**  
The password used to login to the host.

**protocol**  
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**  
Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host_names**  
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should enable VSAN.

If host_names is not provided, VSAN will be enabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl**  
Verify the SSL certificate. Default: True

**CLI Example:**

```bash
# Used for single ESXi host connection information
salt '*' vsphere.vsan_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_enable my.vcenter.location root bad-password

→ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

## 26.6.478 salt.modules.webutil

Support for htpasswd command. Requires the apache2-utils package for Debian-based distros.

New in version 2014.1.0.

The functions here will load inside the webutil module. This allows other functions that don’t use htpasswd to use the webutil module name.

```bash
salt.modules.webutil.useradd( pwfile, user, password, opts='', runas=None )
```

Add a user to htpasswd file using the htpasswd command. If the htpasswd file does not exist, it will be created.

**pwfile**  
Path to htpasswd file

**user**  
User name

**password**  
User password
Valid options that can be passed are:

- `n` Don't update file; display results on stdout.
- `m` Force MD5 encryption of the password (default).
- `d` Force CRYPT encryption of the password.
- `p` Do not encrypt the password (plaintext).
- `s` Force SHA encryption of the password.

The system user to run htpasswd command with

CLI Examples:

```
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpassword
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpass opts=ns
```

**salt.modules.webutil.userdel(pwfile, user, runas=None, all_results=False)**

Delete a user from the specified htpasswd file.

- `pwfile` Path to htpasswd file
- `user` User name
- `runas` The system user to run htpasswd command with
- `all_results` Return stdout, stderr, and retcode, not just stdout

CLI Examples:

```
salt '*' webutil.userdel /etc/httpd/htpasswd larry
```

**salt.modules.webutil.verify(pwfile, user, password, opts='', runas=None)**

Return True if the htpasswd file exists, the user has an entry, and their password matches.

- `pwfile` Fully qualified path to htpasswd file
- `user` User name
- `password` User password
- `opts` Valid options that can be passed are:
  - `m` Force MD5 encryption of the password (default).
  - `d` Force CRYPT encryption of the password.
  - `p` Do not encrypt the password (plaintext).
  - `s` Force SHA encryption of the password.
- `runas` The system user to run htpasswd command with

CLI Examples:

```
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword opts=ns
```
26.6.479 salt.modules.win_appx

Manage provisioned apps

New in version 3007.0.

Provisioned apps are part of the image and are installed for every user the first time the user logs on. Provisioned apps are also updated and sometimes reinstalled when the system is updated.

Apps removed with this module will remove the app for all users and deprovision the app. Deprovisioned apps will neither be installed for new users nor will they be upgraded.

An app removed with this module can only be re-provisioned on the machine, but it can't be re-installed for all users. Also, once a package has been deprovisioned, the only way to reinstall it is to download the package. This is difficult. The steps are outlined below:

1. Obtain the Microsoft Store URL for the app:
   
   • Open the page for the app in the Microsoft Store
   • Click the share button and copy the URL

2. Look up the packages on https://store.rg-adguard.net/:
   
   • Ensure URL (link) is selected in the first dropdown
   • Paste the URL in the search field
   • Ensure Retail is selected in the 2nd dropdown
   • Click the checkmark button

This should return a list of URLs for the package and all dependencies for all architectures. Download the package and all dependencies for your system architecture. These will usually have one of the following file extensions:

   • .appx
   • .appxbundle
   • .msix
   • .msixbundle

Dependencies will need to be installed first.

Not all packages can be found this way, but it seems like most of them can.

Use the appx.install function to provision the new app.

```
salt.modules.win_appx.install(package)
```

This function uses dism to provision a package. This means that it will be made a part of the online image and added to new users on the system. If a package has dependencies, those must be installed first.

If a package installed using this function has been deprovisioned previously, the registry entry marking it as deprovisioned will be removed.

Note: There is no appx.present state. Instead, use the dism.provisioned_package_installed state.

Parameters

- **package (str)** -- The full path to the package to install. Can be one of the following:
  - .appx or .appxbundle
  - .msix or .msixbundle
ppkg

Returns
True if successful, otherwise False

Return type
bool

CLI Example:
salt "*" appx.install "C:\Temp\Microsoft.ZuneMusic.msixbundle"

salt.modules.win_appx.list(query=None, field='Name', include_store=False, frameworks=False, bundles=True)

Get a list of Microsoft Store packages installed on the system.

Parameters

- query (str) -- The query string to use to filter packages to be listed. The string can match multiple packages. None will return all packages. Here are some example strings:
  - *teams* - Returns Microsoft Teams
  - *zune* - Returns Windows Media Player and ZuneVideo
  - *zuneMusic* - Only returns Windows Media Player
  - *xbox* - Returns all xbox packages, there are 5 by default
  - * - Returns everything but the Microsoft Store, unless include_store=True
- field (str) -- This function returns a list of packages on the system. It can display a short name or a full name. If None is passed, a dictionary will be returned with some common fields. The default is Name. Valid options are any fields returned by the powershell command Get-AppxPackage. Here are some useful fields:
  - Name
  - Version
  - PackageFullName
  - PackageFamilyName
- include_store (bool) -- Include the Microsoft Store in the results. Default is False
- frameworks (bool) -- Include frameworks in the results. Default is False
- bundles (bool) -- If True, this will return application bundles only. If False, this will return individual packages only, even if they are part of a bundle.

Returns
A list of packages ordered by the string passed in field list: A list of dictionaries of package information if field is None

Return type
list

Raises
CommandExecutionError -- If an error is encountered retrieving packages

CLI Example:

```
# List installed apps that contain the word "candy"
salt '!' appx.list *candy*

# Return more information about the package
salt '!' appx.list *candy* field=None

# List all installed apps, including the Microsoft Store
salt '!' appx.list include_store=True
```
### List all installed apps, including frameworks

```shell
salt '*' appx.list frameworks=True
```

### List all installed apps that are bundles

```shell
salt '*' appx.list bundles=True
```

```python
salt.modules.win_appx.list_deprovisioned(query=None)
```

When an app is deprovisioned, a registry key is created that will keep it from being reinstalled during a major system update. This function returns a list of keys for apps that have been deprovisioned.

**Parameters**

- `query` *(str)* -- The query string to use to filter packages to be listed. The string can match multiple packages. **None** will return all packages. Here are some example strings:
  - `*teams*` - Returns Microsoft Teams
  - `*zune*` - Returns Windows Media Player and ZuneVideo
  - `*zuneMusic*` - Only returns Windows Media Player
  - `*xbox*` - Returns all xbox packages, there are 5 by default
  - `*` - Returns everything but the Microsoft Store, unless `include_store=True`

**Returns**

A list of packages matching the query criteria

**Return type**

- `list`

**CLI Example:**

```
salt "*" appx.list_deprovisioned *zune*
```

```python
salt.modules.win_appx.remove(query=None, include_store=False, frameworks=False, deprovision_only=False)
```

Removes Microsoft Store packages from the system. If the package is part of a bundle, the entire bundle will be removed.

This function removes the package for all users on the system. It also deprovisions the package so that it isn’t re-installed by later system updates. To only deprovision a package and not remove it for all users, set `deprovision_only=True`.

**Parameters**

- `query` *(str)* -- The query string to use to select the packages to be removed. If the string matches multiple packages, they will all be removed. Here are some example strings:
  - `*teams*` - Remove Microsoft Teams
  - `*zune*` - Remove Windows Media Player and ZuneVideo
  - `*zuneMusic*` - Only remove Windows Media Player
  - `*xbox*` - Remove all xbox packages, there are 5 by default
  - `*` - Remove everything but the Microsoft Store, unless `include_store=True`

**Note:** Use the `appx.list` function to make sure your query is returning what you expect. Then use the same query to remove those packages

- `include_store` *(bool)* -- Include the Microsoft Store in the results of the query to be removed. Use this with caution. It is difficult to reinstall the Microsoft Store once it has been removed with this function. Default is **False**

- `frameworks` *(bool)* -- Include frameworks in the results of the query to be removed. Default is **False**

- `deprovision_only` *(bool)* -- Only deprovision the package. The package will be
removed from the current user and added to the list of deprovisioned packages. The package will not be re-installed in future system updates. New users of the system will not have the package installed. However, the package will still be installed for existing users. Default is False

**Returns**
True if successful, None if no packages found

**Return type**
bool

**Raises**

*CommandExecutionError* -- On errors encountered removing the package

CLI Example:
```
salt "*" appx.remove *candy*
```

---

### 26.6.480 salt.modules.win_auditpol

A salt module for modifying the audit policies on the machine

Though this module does not set group policy for auditing, it displays how all auditing configuration is applied on the machine, either set directly or via local or domain group policy.

New in version 2018.3.4.

New in version 2019.2.1.

This module allows you to view and modify the audit settings as they are applied on the machine. The audit settings are broken down into nine categories:

- Account Logon
- Account Management
- Detailed Tracking
- DS Access
- Logon/Logoff
- Object Access
- Policy Change
- Privilege Use
- System

The `get_settings` function will return the subcategories for all nine of the above categories in one dictionary along with their auditing status.

To modify a setting you only need to specify the subcategory name and the value you wish to set. Valid settings are:

- No Auditing
- Success
- Failure
- Success and Failure

CLI Example:
# Get current state of all audit settings
salt * auditpol.get_settings

# Get the current state of all audit settings in the "Account Logon"
# category
salt * auditpol.get_settings category="Account Logon"

# Get current state of the "Credential Validation" setting
salt * auditpol.get_setting name="Credential Validation"

# Set the state of the "Credential Validation" setting to Success and
# Failure
salt * auditpol.set_setting name="Credential Validation" value="Success and Failure"

# Set the state of the "Credential Validation" setting to No Auditing
salt * auditpol.set_setting name="Credential Validation" value="No Auditing"

salt.modules.win_auditpol.get_setting(name)

Get the current configuration for the named audit setting

Parameters

name (str) -- The name of the setting to retrieve

Returns

The current configuration for the named setting

Return type

str

Raises

- **KeyError** -- On invalid setting name
- **CommandExecutionError** -- If an error is encountered retrieving the settings

CLI Example:

```
# Get current state of the "Credential Validation" setting
salt * auditpol.get_setting "Credential Validation"
```

salt.modules.win_auditpol.get_settings(category='All')

Get the current configuration for all audit settings specified in the category

Parameters

category (str) -- One of the nine categories to return. Can also be All to return the
settings for all categories. Valid options are:

- Account Logon
- Account Management
- Detailed Tracking
- DS Access
- Logon/Logoff
- Object Access
- Policy Change
- Privilege Use
- System
- All

Default value is All

Returns

A dictionary containing all subcategories for the specified
category along with their current configuration
Return type
dict

Raises
- **KeyError** -- On invalid category
- **CommandExecutionError** -- If an error is encountered retrieving the settings

CLI Example:

```plaintext
# Get current state of all audit settings
salt * auditipol.get_settings

# Get the current state of all audit settings in the "Account Logon" category
salt * auditipol.get_settings "Account Logon"
```

**salt.modules.win_auditpol.set_setting(name, value)**

Set the configuration for the named audit setting

Parameters
- **name (str)** -- The name of the setting to configure
- **value (str)** -- The configuration for the named value. Valid options are:
  - No Auditing
  - Success
  - Failure
  - Success and Failure

Returns
True if successful

Return type
bool

Raises
- **KeyError** -- On invalid name or value
- **CommandExecutionError** -- If an error is encountered modifying the setting

CLI Example:

```plaintext
# Set the state of the "Credential Validation" setting to Success and Failure
salt * auditipol.set_setting "Credential Validation" "Success and Failure"

# Set the state of the "Credential Validation" setting to No Auditing
salt * auditipol.set_setting "Credential Validation" "No Auditing"
```

**26.6.481 salt.modules.win_autoruns**

Module for listing programs that automatically run on startup (very alpha...not tested on anything but my Win 7x64)

**salt.modules.win_autoruns.list()**

Get a list of automatically running programs

CLI Example:

```plaintext
salt '*! autoruns.list
```
26.6.482 salt.modules.win_certutil

This module allows you to install certificates into the windows certificate manager.

```
salt '*' certutil.add_store salt://cert.cer "TrustedPublisher"
```

```
salt.modules.win_certutil.add_store(source, store, retcode=False, saltenv='base')
```

Add the cert to the given Certificate Store

- **source** (str):
  - The source certificate file. This is either the path to a local file or a file from the file server in the form of `salt://path/to/file`
- **store** (str):
  - The certificate store to add the certificate to

```
salt '*' certutil.add_store salt://cert.cer TrustedPublisher
salt '*' certutil.add_store C:\path\to\local.cer TrustedPublisher
```

```
salt.modules.win_certutil.del_store(source, store, retcode=False, saltenv='base')
```

Delete the cert from the given Certificate Store

- **source** (str):
  - The source certificate file. This is either the path to a local file or a file from the file server in the form of `salt://path/to/file`
- **store** (str):
  - The certificate store to delete the certificate from

```
salt '*' certutil.del_store salt://cert.cer TrustedPublisher
salt '*' certutil.del_store C:\path\to\local.cer TrustedPublisher
```

```
salt.modules.win_certutil.get_cert_serial(cert_file, saltenv='base')
```

Get the serial number of a certificate file

- **cert_file** (str):
  - The certificate file to find the serial for. Can be a local file or a file on the file server (`salt://`)

Returns

- **Return type**
  - `str`

```
salt '*' certutil.get_cert_serial <certificate name>
```

```
salt.modules.win_certutil.get_stored_cert_serials(store)
```

Get all of the certificate serials in the specified store
**store** (str):
The store to get all the certificate serials from

**Returns**
A list of serial numbers found, or an empty list if none found

**Return type**
list

**CLI Example:**
```
salt '*' certutil.get_stored_cert_serials <store>
```

### 26.6.483 salt.modules.win_dacl

Manage DACLs on Windows

**depends**
- winreg Python module

**salt.modules.win_dacl.add_ace** *(path, objectType, user, permission, acetype, propagation)*

add an ace to an object

- **path**: path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc)
- **user**: user to add
- **permission**: permissions for the user acetype: either allow/deny for each user/permission (ALLOW, DENY)
- **propagation**: how the ACE applies to children for Registry Keys and Directories (KEY, KEY&SUBKEYS, SUBKEYS)

**CLI Example:**
```
salt 'myminion' win_dacl.add_ace 'HKEY_LOCAL_MACHINE\SOFTWARE\somekey' 'Registry' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'
```

**salt.modules.win_dacl.check_ace** *(path, objectType, user, permission=None, acetype=None, propagation=None, exactPermissionMatch=False)*

Checks a path to verify the ACE (access control entry) specified exists

**Parameters**
- **path**: path to the file/reg key
- **objectType**: The type of object (FILE, DIRECTORY, REGISTRY)
- **user**: user that the ACL is for
- **permission**: permission to test for (READ, FULLCONTROL, etc)
- **acetype**: the type of ACE (ALLOW or DENY)
- **propagation**: the propagation type of the ACE (FILES, FOLDERS, KEY, KEY&SUBKEYS, SUBKEYS, etc)
- **exactPermissionMatch**: the ACL must match exactly, IE if READ is specified, the user must have READ exactly and not FULLCONTROL (which also has the READ permission obviously)

**Returns** (dict): 'Exists' true if the ACE exists, false if it does not

**CLI Example:**
```
salt 'minion-id' win_dacl.check_ace c: emp directory <username>\
   └──fullcontrol
```
salt.modules.win_dacl.check_inheritance(path, objectType, user=None)

Check a specified path to verify if inheritance is enabled

Parameters

- path -- path of the registry key or file system object to check
- objectType -- The type of object (FILE, DIRECTORY, REGISTRY)
- user -- if provided, will consider only the ACEs for that user

Returns (bool): 'Inheritance' of True/False

CLI Example:
salt 'minion-id' win_dacl.check_inheritance c: emp directory <username>

class salt.modules.win_dacl.daclConstants

DACL constants used throughout the module

getAceTypeBit(t)
returns the acetype bit of a text value

getaAceTypeText(t)
returns the textual representation of a acetype bit

ggetObjectTypeBit(t)
returns the bit value of the string object type

getPermissionBit(t, m)
returns a permission bit of the string permission value for the specified object type

getPermissionText(t, m)
returns the permission textual representation of a specified permission bit/object type

getPropagationBit(t, p)
returns the propagation bit of a text value

getPropagationText(t, p)
returns the textual representation of a propagation bit

getSecurityHkey(s)
returns the necessary string value for an HKEY for the win32security module

processPath(path, objectType)
processes a path/object type combo and returns:
registry types with the correct HKEY text representation files/directories with environment variables expanded

salt.modules.win_dacl.disable_inheritance(path, objectType, copy=True)

Disable inheritance on an object

Parameters

- path -- The path to the object
- objectType -- The type of object (FILE, DIRECTORY, REGISTRY)
- copy -- True will copy the Inherited ACEs to the DACL before disabling inheritance

Returns (dict): A dictionary containing the results

CLI Example:
salt 'minion-id' win_dacl.disable_inheritance c: emp directory
salt.modules.win_dacl.enable_inheritance(path, objectType, clear=False)

enable/disable inheritance on an object

Parameters
- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **clear** -- True will remove non-Inherited ACEs from the ACL

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.enable_inheritance c: emp directory
```

salt.modules.win_dacl.get(path, objectType, user=None)

Get the ACL of an object. Will filter by user if one is provided.

Parameters
- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- A user name to filter by

Returns (dict): A dictionary containing the ACL

CLI Example:

```
salt 'minion-id' win_dacl.get c: emp directory
```

salt.modules.win_dacl.rm_ace(path, objectType, user, permission=None, acetype=None, propagation=None)

remove an ace to an object

path: path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc) user: user to remove permission: permissions for the user acetypes: either allow/deny for each user/permission (ALLOW, DENY) propagation: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

If any of the optional parameters are omitted (or set to None) they act as wildcards.

CLI Example:

```
remove allow domain\fakeuser full control on HKLM\SOFTWARE\somekey
salt 'myminion' win_dacl.rm_ace 'Registry' 'HKEY_LOCAL_MACHINE\SOFTWARE\somekey' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'
```

26.6.484 salt.modules.win_disk

Module for gathering disk information on Windows

**depends**
- win32api Python module

salt.modules.win_disk.usage()

Return usage information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.usage
```
26.6.485  salt.modules.win_dism

Install features/packages for Windows using DISM, which is useful for minions not running server versions of Windows. Some functions are only available on Windows 10.

salt.modules.win_dism.add_capability(capability, source=None, limit_access=False, image=None, restart=False)

Install a capability

Parameters

- **capability** (str) -- The capability to install
- **source** (Optional[str]) -- The optional source of the capability. Default is set by group policy and can be Windows Update.
- **limit_access** (Optional[bool]) -- Prevent DISM from contacting Windows Update for the source package
- **image** (Optional[str]) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (Optional[bool]) -- Reboot the machine if required by the install

Raises

- **NotImplementedError** -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

Returns

A dictionary containing the results of the command

Return type

dict

CLI Example:

```
salt '*' dism.add_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

salt.modules.win_dism.add_feature(feature, package=None, source=None, limit_access=False, enable_parent=False, image=None, restart=False)

Install a feature using DISM

Parameters

- **feature** (str) -- The feature to install
- **package** (Optional[str]) -- The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- **source** (Optional[str]) -- The optional source of the capability. Default is set by group policy and can be Windows Update
- **limit_access** (Optional[bool]) -- Prevent DISM from contacting Windows Update for the source package
- **enable_parent** (Optional[bool]) -- True will enable all parent features of the specified feature
- **image** (Optional[str]) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (Optional[bool]) -- Reboot the machine if required by the install

Returns

A dictionary containing the results of the command

Return type

dict

CLI Example:

```
salt '*' dism.add_feature NetFx3
```
salt.modules.win_dism.add_package

Install a package using DISM

Parameters

- **package** *(str)* -- The package to install. Can be a .cab file, a .msu file, or a folder

  **Note**: An .msu package is supported only when the target image is offline, either mounted or applied.

- **ignore_check** *(Optional[bool])* -- Skip installation of the package if the applicability checks fail

- **prevent_pending** *(Optional[bool])* -- Skip the installation of the package if there are pending online actions

- **image** *(Optional[str])* -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

- **restart** *(Optional[bool])* -- Reboot the machine if required by the install

Returns

A dictionary containing the results of the command

Return type
dict

CLI Example:

```
salt '*' dism.add_package C:\Packages\package.cab
```

salt.modules.win_dism.add_provisioned_package

Provision a package using DISM. A provisioned package will install for new users on the system. It will also be reinstalled on each user if the system is updated.

New in version 3007.0.

Parameters

- **package** *(str)* -- The package to install. Can be one of the following:
  - .appx or .appxbundle
  - .msix or .msixbundle
  - .ppkg

- **image** *(Optional[str])* -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

- **restart** *(Optional[bool])* -- Reboot the machine if required by the installation. Default is False

Returns

A dictionary containing the results of the command

Return type
dict

CLI Example:

```
salt '*'
```

```
salt '*' dism.add_provisioned_package C:\Packages\package.appx
salt '*' dism.add_provisioned_package C:\Packages\package.appxbundle
salt '*' dism.add_provisioned_package C:\Packages\package.msix
salt '*' dism.add_provisioned_package C:\Packages\package.msixbundle
salt '*' dism.add_provisioned_package C:\Packages\package.ppkg
```

salt.modules.win_dism.available_capabilities

List the capabilities available on the system

Parameters

- **image** *(Optional[str])* -- The path to the root directory of an offline Windows image.
If `None` is passed, the running operating system is targeted. Default is None.

Raises

- `NotImplementedError` -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

Returns

A list of available capabilities

Return type

list

CLI Example:

```
salt '*' dism.installed_capabilities
```

salt.modules.win_dism.available_features(image=None)

List the features available on the system

Parameters

- `image (Optional[str])` -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is None.

Returns

A list of available features

Return type

list

CLI Example:

```
salt '*' dism.available_features
```

salt.modules.win_dism.get_capabilities(image=None)

List all capabilities on the system

Parameters

- `image (Optional[str])` -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is None.

Raises

- `NotImplementedError` -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

Returns

A list of capabilities

Return type

list

CLI Example:

```
salt '*' dism.get_capabilities
```

salt.modules.win_dism.get_features(package=None, image=None)

List features on the system or in a package

Parameters

- `package (Optional[str])` -- The full path to the package. Can be either a `.cab` file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for `.msu` files.

This can also be the name of a package as listed in `dism.installed_packages`

- `image (Optional[str])` -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is None.
Returns
A list of features

Return type
list

CLI Example:

```bash
# Return all features on the system
salt '*' dism.get_features

# Return all features in package.cab
salt '*' dism.get_features C:\packages\package.cab

# Return all features in the calc package
salt '*' dism.get_features Microsoft.Windows.Calc.Demo~6595b6144ccf1df~x86~en~1.0.0.0
```

salt.modules.win_dism.get_kb_package_name(kb, image=None)

Get the actual package name on the system based on the KB name

New in version 3006.0.

Parameters

- `kb (str)` -- The name of the KB to remove. Can also be just the KB number
- `image (Optional[str])` -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is None.

Returns
The name of the package found on the system None: If the package is not installed on the system

Return type
str

CLI Example:

```bash
# Get the package name for KB1231231
salt '*' dism.get_kb_package_name KB1231231

# Get the package name for KB1231231 using just the number
salt '*' dism.get_kb_package_name 1231231
```

salt.modules.win_dism.installed_capabilities(image=None)

List the capabilities installed on the system

Parameters

- `image (Optional[str])` -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is None.

Raises
- `NotImplementedError` -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

Returns
A list of installed capabilities

Return type
list

CLI Example:

```bash
salt '*' dism.installed_capabilities
```
salt.modules.win_dism.\_\_installed\_\_features\(image=None\)

List the features installed on the system

**Parameters**

- `image (Optional[str])` -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is None.

**Returns**

- A list of installed features

**Return type**

- list

**CLI Example:**

```
salt '*' dism.installed_features
```

salt.modules.win_dism.\_\_installed\_\_packages\(image=None\)

List the packages installed on the system

**Parameters**

- `image (Optional[str])` -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is None.

**Returns**

- A list of installed packages

**Return type**

- list

**CLI Example:**

```
salt '*' dism.installed_packages
```

salt.modules.win_dism.\_\_package\_\_info\(package, image=None\)

Display information about a package

**Parameters**

- `package (str)` -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files
- `image (Optional[str])` -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is None.

**Returns**

- A dictionary containing the results of the command

**Return type**

- dict

**CLI Example:**

```
salt '*' dism.package_info C:\packages\package.cab
```

salt.modules.win_dism.\_\_provisioned\_\_packages\(image=None\)

List the packages installed on the system

New in version 3007.0.

**Parameters**

- `image (Optional[str])` -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is None.

**Returns**

- A list of installed packages

**Return type**

- list

**CLI Example:**
salt '*' dism.installed_packages

salt.modules.win_dism.remove_capability(capability, image=None, restart=False)

Uninstall a capability

Parameters

- **capability** *(str)* -- The capability to be removed
- **image** *(Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** *(Optional[bool]*) -- Reboot the machine if required by the install

Raises

- **NotImplementedError** -- For all versions of Windows that are not Windows 10 and later. *Server editions of Windows use ServerManager instead.*

Returns

A dictionary containing the results of the command

Return type

dict

CLI Example:

```
salt '*' dism.remove_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

salt.modules.win_dism.remove_feature(feature, remove_payload=False, image=None, restart=False)

Disables the feature.

Parameters

- **feature** *(str)* -- The feature to uninstall
- **remove_payload** *(Optional[bool]*) -- Remove the feature's payload. Must supply source when enabling in the future.
- **image** *(Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** *(Optional[bool]*) -- Reboot the machine if required by the install

Returns

A dictionary containing the results of the command

Return type

dict

CLI Example:

```
salt '*' dism.remove_feature NetFx3
```

salt.modules.win_dism.remove_kb(kb, image=None, restart=False)

Remove a package by passing a KB number. This searches the installed packages to get the full package name of the KB. It then calls the *dism.remove_package* function to remove the package.

New in version 3006.0.

Parameters

- **kb** *(str)* -- The name of the KB to remove. Can also be just the KB number
- **image** *(Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** *(Optional[bool]*) -- Reboot the machine if required by the uninstall

Returns

A dictionary containing the results of the command

Return type

dict

CLI Example:
salt.modules.win_dism.remove_package(\texttt{package}, \texttt{image=None}, \texttt{restart=False})

Uninstall a package

Parameters
\begin{itemize}
  \item \texttt{package (str)} -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in \texttt{dism.installed_packages}
  \item \texttt{image (Optional [str])} -- The path to the root directory of an offline Windows image. If \texttt{None} is passed, the running operating system is targeted. Default is \texttt{None}.
  \item \texttt{restart (Optional [bool])} -- Reboot the machine if required by the uninstall
\end{itemize}

Returns
A dictionary containing the results of the command

Return type
\texttt{dict}

CLI Example:

\begin{verbatim}
# Remove the Calc Package
salt '*' dism.remove_package Microsoft.Windows.Calc.Demo-6595b6144ccf1df~x86~en~1.0.0.0

# Remove the package.cab (does not remove C:\packages\package.cab)
salt '*' dism.remove_package C:\packages\package.cab
\end{verbatim}

\section*{26.6.486 salt.modules.win_dns_client}

Module for configuring DNS Client on Windows systems

salt.modules.win_dns_client.add_dns(\texttt{ip}, \texttt{interface='Local Area Connection'}, \texttt{index=1})

Add the DNS server to the network interface (index starts from 1)

Note: if the interface DNS is configured by DHCP, all the DNS servers will be removed from the interface and the requested DNS will be the only one

CLI Example:

\begin{verbatim}
salt '*' win_dns_client.add_dns \langle ip \rangle \langle interface \rangle \langle index \rangle
\end{verbatim}

salt.modules.win_dns_client.dns_dhcp(\texttt{interface='Local Area Connection'})

Configure the interface to get its DNS servers from the DHCP server

CLI Example:

\begin{verbatim}
salt '*' win_dns_client.dns_dhcp \langle interface \rangle
\end{verbatim}

salt.modules.win_dns_client.get_dns_config(\texttt{interface='Local Area Connection'})

Get the type of DNS configuration (dhcp / static).

Parameters
\begin{itemize}
  \item \texttt{interface (str)} -- The name of the network interface. This is the
• **device**  
  *(Description in the Network Connection Details for the)* --

  Returns
  True if DNS is configured, otherwise False

  Return type
  bool

  CLI Example:

  ```
  salt '*' win_dns_client.get_dns_config 'Local Area Connection'
  ```

salt.modules.win_dns_client.get_dns_servers *(interface='Local Area Connection')*

  Return a list of the configured DNS servers of the specified interface

  Parameters
  
  • **interface** *(str)* -- The name of the network interface. This is the name as
    Connections *(it appears in the Control Panel under Network)* --

  Returns
  A list of dns servers

  Return type
  list

  CLI Example:

  ```
  salt '*' win_dns_client.get_dns_servers 'Local Area Connection'
  ```

salt.modules.win_dns_client.rm_dns *(ip, interface='Local Area Connection')*

  Remove the DNS server from the network interface

  CLI Example:

  ```
  salt '*' win_dns_client.rm_dns <ip> <interface>
  ```

### 26.6.487 salt.modules.win_dsc

Module for working with Windows PowerShell DSC (Desired State Configuration)

This module is Alpha

This module applies DSC Configurations in the form of PowerShell scripts or MOF (Managed Object Format) schema files.

Use the `psget` module to manage PowerShell resources.

The idea is to leverage Salt to push DSC configuration scripts or MOF files to the Minion.

```
depends
• PowerShell 5.0
```

**salt.modules.win_dsc.apply_config** *(path, source=None, salt_env='base')*

Run an compiled DSC configuration (a folder containing a .mof file). The folder can be cached from the salt master using the `source` option.

Parameters

• **path** *(str)* -- Local path to the directory that contains the .mof configuration file to apply. Required.

• **source** *(str)* -- Path to the directory that contains the .mof file on the `file_roots`. The source directory will be copied to the path directory and then
executed. If the path and source directories differ, the source directory will be applied. If source is not passed, the config located at path will be applied. Optional.

- `salt_env (str)` -- The salt environment to use when copying your source. Default is 'base'

**Returns**

True if successful, otherwise False

**Return type**

bool

**CLI Example:**

To apply a config that already exists on the system

```
salt '*' dsc.apply_config C:\DSC\WebSiteConfiguration
```

To cache a configuration from the master and apply it:

```
salt '*' dsc.apply_config C:\DSC\WebSiteConfiguration salt://dsc/configs/WebSiteConfiguration
```

**salt.modules.win_dsc.compile_config(path, source=None, config_name=None, config_data=None, config_data_source=None, script_parameters=None, salt_env='base')**

Compile a config from a PowerShell script (.ps1)

**Parameters**

- `path (str)` -- Path (local) to the script that will create the .mof configuration file. If no source is passed, the file must exist locally. Required.
- `source (str)` -- Path to the script on file_roots to cache at the location specified by path. The source file will be cached locally and then executed. If source is not passed, the config script located at path will be compiled. Optional.
- `config_name (str)` -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a config_name must be specified. If the config_name is not specified, the name of the file will be used as the config_name to run. Optional.
- `config_data (str)` -- Configuration data in the form of a hash table that will be passed to the ConfigurationData parameter when the config_name is compiled. This can be the path to a .psd1 file containing the proper hash table or the PowerShell code to create the hash table.

New in version 2017.7.0.

- `config_data_source (str)` -- The path to the .psd1 file on file_roots to cache at the location specified by config_data. If this is specified, config_data must be a local path instead of a hash table.

New in version 2017.7.0.

- `script_parameters (str)` -- Any additional parameters expected by the configuration script. These must be defined in the script itself.

New in version 2017.7.0.

- `salt_env (str)` -- The salt environment to use when copying the source. Default is 'base'

**Returns**

A dictionary containing the results of the compilation

**Return type**

dict

**CLI Example:**

To compile a config from a script that already exists on the system:
To cache a config script to the system from the master and compile it:

```
salt '*' dsc.compile_config C:\DSC\WebsiteConfig.ps1
```

salt.modules.win_dsc.get_config()
Get the current DSC Configuration

Returns
A dictionary representing the DSC Configuration on the machine

Return type
dict

Raises
`CommandExecutionError` -- On failure

CLI Example:

```
salt '*' dsc.get_config
```

salt.modules.win_dsc.get_config_status()
Get the status of the current DSC Configuration

Returns
A dictionary representing the status of the current DSC Configuration on the machine

Return type
dict

CLI Example:

```
salt '*' dsc.get_config_status
```

salt.modules.win_dsc.get_lcm_config()
Get the current Local Configuration Manager settings

Returns
A dictionary representing the Local Configuration Manager settings on the machine

Return type
dict

CLI Example:

```
salt '*' dsc.get_lcm_config
```

salt.modules.win_dsc.remove_config(reset=False)
Remove the current DSC Configuration. Removes current, pending, and previous dsc configurations.

New in version 2017.7.5.

Parameters

- `reset` (bool) -- Attempts to reset the DSC configuration by removing the following from C:\Windows\System32\Configuration:
  - File: DSCStatusHistory.mof
  - File: DSCEngineCache.mof
  - Dir: ConfigurationStatus

Default is False
Warning: remove_config may fail to reset the DSC environment if any of the files in the ConfigurationStatus directory are in use. If you wait a few minutes and run again, it may complete successfully.

<table>
<thead>
<tr>
<th>Returns</th>
<th>True if successful</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return type</td>
<td>bool</td>
</tr>
<tr>
<td>Raises</td>
<td>CommandExecutionError -- On failure</td>
</tr>
</tbody>
</table>

CLI Example:
```
salt '*' dsc.remove_config True
```

salt.modules.win_dsc.restore_config()
Reapplies the previous configuration.
New in version 2017.7.5.

**Note:** The current configuration will be come the previous configuration. If run a second time back-to-back it is like toggling between two configs.

<table>
<thead>
<tr>
<th>Returns</th>
<th>True if successfully restored</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return type</td>
<td>bool</td>
</tr>
<tr>
<td>Raises</td>
<td>CommandExecutionError -- On failure</td>
</tr>
</tbody>
</table>

CLI Example:
```
salt '*' dsc.restore_config
```

salt.modules.win_dsc.run_config(path=None, source=None, config_name=None, config_data=None, config_data_source=None, script_parameters=None, salt_env='base')

Compile a DSC Configuration in the form of a PowerShell script (.ps1) and apply it. The PowerShell script can be cached from the master using the source option. If there is more than one config within the PowerShell script, the desired configuration can be applied by passing the name in the config option.

This command would be the equivalent of running dsc.compile_config followed by dsc.apply_config.

**Parameters**
- **path (str)** -- The local path to the PowerShell script that contains the DSC Configuration. Required.
- **source (str)** -- The path to the script on file_roots to cache at the location specified by path. The source file will be cached locally and then executed. If source is not passed, the config script located at path will be compiled. Optional.
- **config_name (str)** -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a config_name must be specified. If the config_name is not specified, the name of the file will be used as the config_name to run. Optional.
- **config_data (str)** -- Configuration data in the form of a hash table that will be passed to the ConfigurationData parameter when the config_name is com-
piled. This can be the path to a .psd1 file containing the proper hash table or the PowerShell code to create the hash table.

New in version 2017.7.0.
• **config_data_source (str)** -- The path to the .psd1 file on file_roots to cache at the location specified by config_data. If this is specified, config_data must be a local path instead of a hash table.

New in version 2017.7.0.
• **script_parameters (str)** -- Any additional parameters expected by the configuration script. These must be defined in the script itself. Note that these are passed to the script (the outermost scope), and not to the dsc configuration inside the script (the inner scope).

New in version 2017.7.0.
• **salt_env (str)** -- The salt environment to use when copying the source. Default is 'base'

Returns
True if successfully compiled and applied, otherwise False

Return type
bool

CLI Example:
To compile a config from a script that already exists on the system:

```
salt '*' dsc.run_config C:\DSC\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.run_config C:\DSC\WebsiteConfig.ps1 salt://dsc/configs/WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it, passing in script_parameters:

```
salt '*' dsc.run_config path=C:\DSC\WebsiteConfig.ps1 source=salt://dsc/configs/WebsiteConfig.ps1 script_parameters="-hostname 'my-computer' -ip '192.168.1.10' -DnsArray '192.168.1.3','192.168.1.4','1.1.1.1'"
```

salt.modules.win_dsc.set_lcm_config(**config_mode=None, config_mode_freq=None, refresh_freq=None, reboot_if_needed=None, action_after_reboot=None, refresh_mode=None, certificate_id=None, configuration_id=None, allow_module_overwrite=None, debug_mode=False, status_retention_days=None)**

For detailed descriptions of the parameters see: https://msdn.microsoft.com/en-us/PowerShell/DSC/metaConfig

**config_mode (str)**: How the LCM applies the configuration. Valid values are:
- ApplyOnly
- ApplyAndMonitor
- ApplyAndAutoCorrect

**config_mode_freq (int)**: How often, in minutes, the current configuration is checked and applied. Ignored if config_mode is set to ApplyOnly. Default is 15.

**refresh_mode (str)**: How the LCM gets configurations. Valid values are:
- Disabled
- Push
Pull

refresh_freq (int): How often, in minutes, the LCM checks for updated configurations. (pull mode only) Default is 30.
reboot_if_needed (bool): Reboot the machine if needed after a configuration is applied. Default is False.
action_after_reboot (str): Action to take after reboot. Valid values are:
  • ContinueConfiguration
  • StopConfiguration
certificate_id (guid): A GUID that specifies a certificate used to access the configuration: (pull mode)
configuration_id (guid): A GUID that identifies the config file to get from a pull server. (pull mode)
allow_module_overwrite (bool): New configs are allowed to overwrite old ones on the target node.
debug_mode (str): Sets the debug level. Valid values are:
  • None
  • ForceModuleImport
  • All
status_retention_days (int): Number of days to keep status of the current config.

Note: Either config_mode_freq or refresh_freq needs to be a multiple of the other. See documentation on MSDN for more details.

Returns
True if successful, otherwise False
Return type
bool

CLI Example:
salt '*' dsc.set_lcm_config ApplyOnly

salt.modules.win_dsc.test_config()
Tests the current applied DSC Configuration
Returns
True if successfully applied, otherwise False
Return type
bool

CLI Example:
salt '*' dsc.test_config
26.6.488  salt.modules.win_event

A module for working with the Windows Event log system. .. versionadded:: 3006.0

salt.modules.win_event.add(log_name, event_id, event_category=0, event_type=None,
    event_strings=None, event_data=None, event_sid=None)

Adds an event to the application event log.

Parameters

- **log_name** *(str)* -- The name of the application or source
- **event_id** *(int)* -- The event ID
- **event_category** *(int)* -- The event category
- **event_type** *(str)* -- The event category. Must be one of:
  - Success
  - Error
  - Warning
  - Information
  - AuditSuccess
  - AuditFailure
- **event_strings** *(list)* -- A list of strings
- **event_data** *(bytes)* -- Event data. Strings will be converted to bytes
- **event_sid** *(sid)* -- The SID for the event

Raises

- **CommandExecutionError** -- event_id is not an integer
- **CommandExecutionError** -- event_category is not an integer
- **CommandExecutionError** -- event_type is not one of the valid event types
- **CommandExecutionError** -- event_strings is not a list or string

CLI Example:

```
# A simple Application event log warning entry
salt '*' win_event.add Application 1234 12 Warning

# A more complex System event log information entry
salt '*' win_event.add System 1234 12 Information "['Event string data 1', 'Event string data 2']" "Some event data"

# Log to the System Event log with the source "Service Control Manager"
salt '*' win_event.add "Service Control Manager" 1234 12 Warning "['Event string data 1', 'Event string data 2']" "Some event data"

# Log to the PowerShell event log with the source "PowerShell (PowerShell)"
salt-call --local win_event.add "PowerShell" 6969 12 Warning
```

salt.modules.win_event.clear(log_name, backup=None)

Clears the specified event log.

**Note:** A clear log event will be added to the log after it is cleared.

Parameters

- **log_name** *(str)* -- The name of the log to clear
- **backup** *(str)* -- Path to backup file

CLI Example:
salt "*" win_event.clear Application

salt.modules.win_event.count(log_name)

Gets the number of events in the specified.

Parameters

log_name (str) -- The name of the log

Returns

The number of events the log contains

Return type

int

CLI Example:

salt "*" win_event.count Application

salt.modules.win_event.get(log_name)

Get events from the specified log. Get a list of available logs using the win_event.get_log_names function.

Warning: Running this command on a log with thousands of events, such as the Applications log, can take a long time.

Parameters

log_name (str) -- The name of the log to retrieve.

Returns

tuple: A tuple of events as dictionaries

CLI Example:

salt '*' win_event.get Application

salt.modules.win_event.get_filtered(log_name, all_requirements=True, **kwargs)

Will find events that match the fields and values specified in the kwargs. Kwargs can be any item in the return for the event.

Warning: Running this command on a log with thousands of events, such as the Applications log, can take a long time.

Parameters

- log_name (str) -- The name of the log to retrieve
- all_requirements (bool) -- True matches all requirements. False matches any requirement. Default is True

Kwargs:

eventID (int): The event ID number

eventType (int): The event type number. Valid options and their corresponding meaning are:

- 0: Success
- 1: Error
- 2: Warning
- 4: Information
- 8: Audit Success
- 10: Audit Failure
year (int): The year
month (int): The month
day (int): The day of the month
hour (int): The hour
minute (int): The minute
second (int): The second
eventCategory (int): The event category number
sid (sid): The SID of the user that created the event
sourceName (str): The name of the event source

Returns
A tuple of dicts of each filtered event

Return type
tuple

CLI Example:

```bash
# Return all events from the Security log with an ID of 1100
salt "*" win_event.get_filtered Security eventID=1100

# Return all events from the System log with an Error (1) event type
salt "*" win_event.get_filtered System eventType=1

# Return all events from System log with an Error (1) type, source is Service Control Manager, and data is netprofm
salt "*" win_event.get_filtered System eventType=1 sourceName="Service\Control Manager" data="netprofm"

# Return events from the System log that match any of the kwargs below
salt "*" win_event.get_filtered System eventType=1 sourceName="Service\Control Manager" data="netprofm" all_requirements=False
```

salt.modules.win_event.get_log_names()
Get a list of event logs available on the system

Returns
A list of event logs available on the system

Return type
list

CLI Example:

```bash
salt "*" win_event.get_log_names
```

salt.modules.win_event.query(log_name, query_text=None, records=20, latest=True, raw=False)
Query a log for a specific event_id. Return the top number of records specified. Use the win_event.get_log_names to see a list of available logs on the system.

Note: You can use the Windows Event Viewer to create the XPath query for the query_text parameter. Click on Filter Current Log, configure the filter, then click on the XML tab. Copy the text between the two <Select> tags. This will be the contents of the query_text parameter. You will have to convert
some codes. For example, &gt; becomes >, &lt; becomes <. Additionally, you’ll need to put spaces between comparison operators. For example: this >= that.

Parameters

- log_name (str) -- The name of the log to query
- query_text (str) -- The filter to apply to the log
- records (int) -- The number of records to return
- latest (bool) -- True will return the newest events. False will return the oldest events. Default is True
- raw (bool) -- True will return the raw xml results. False will return the xml converted to a dictionary. Default is False

Returns

A list of dict objects that contain information about the event

Return type

list

CLI Example:

```bash
# Return the 20 most recent events from the Application log with an event ID of 22
salt '*' win_event.query Application "*[System[(EventID=22)]]"

# Return the 20 most recent events from the Application log with an event ID of 22
salt '*' win_event.query Application "*[System[(EventID=22)]]" raw=True

# Return raw xml
salt '*' win_event.query Application "*[System[(EventID=22)]]" raw=True

# Return the 20 oldest events from the Application log with an event ID of 22
salt '*' win_event.query Application "*[System[(EventID=22)]]" latest=False

# Return the 20 most recent Critical (1) events from the Application log in the last 12 hours
salt '*' win_event.query Application "*[System[(Level=1) and TimeCreated[timediff(@SystemTime) <= 43200000)]]"

# Return the 5 most recent Error (2) events from the application log
salt '*' win_event.query Application "*[System[(Level=2)]]" records=5

# Return the 20 most recent Warning (3) events from the Windows PowerShell log where the Event Source is PowerShell
salt '*' win_event.query "Windows PowerShell" "*[System[Provider[@Name='PowerShell'] and (Level=3)]"

# Return the 20 most recent Information (0 or 4) events from the Microsoft-Windows-PowerShell/Operational on 2022-08-24 with an Event ID of 4013
salt '*' win_event.query "Microsoft-Windows-PowerShell/Operational" "*[System[(Level=4 or Level=0) and (EventID=4013) and TimeCreated[@SystemTime >= '2022-08-24T06:00:00.000Z']]]"

# Return the 20 most recent Information (0 or 4) events from the
```
26.6.489 salt.modules.win_file

Manage information about files on the minion, set/read user, group data, modify the ACL of files/directories

depends
- win32api
- win32file
- win32con
- salt.utils.win_dacl

salt.modules.win_file.check_perms(path, ret=None, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)

Check owner and permissions for the passed directory. This function checks the permissions and sets them, returning the changes made. Used by the file state to populate the return dict

Parameters
- path (str) -- The full path to the directory.
- ret (dict) -- A dictionary to append changes to and return. If not passed, will create a new dictionary to return.
- owner (str) -- The owner to set for the directory.
- grant_perms (dict) -- A dictionary containing the user/group and the basic permissions to check/grant, ie: {'user': {'perms': 'basic_permission'}}. Default is None.
- deny_perms (dict) -- A dictionary containing the user/group and permissions to check/deny. Default is None.
- inheritance (bool) -- True will check if inheritance is enabled and enable it. False will check if inheritance is disabled and disable it. Default is True.
- reset (bool) -- True will show what permissions will be removed by resetting the DACL. False will do nothing. Default is False.

Returns
A dictionary of changes that have been made

Return type
dict

CLI Example:

# To see changes to `C:\Temp` if the 'Users' group is given 'read & execute' permissions.
salt '*' file.check_perms C:\Temp \ {} Administrators "{'Users': {'perms': 'read_execute'}}"

# Locally using salt call
salt-call file.check_perms C:\Temp \ {} Administrators "{'Users': {'perms': 'read_execute', 'applies_to': 'this_folder_only'}}"
salt.modules.win_file.chgrp(path, group)

Change the group of a file

Under Windows, this will do nothing.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to do nothing while still being compatible with Unix behavior. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to set the 'primary group' of a file, use file.chgrp.

To set group permissions use file.set_perms

Parameters

- **path (str)** -- The path to the file or directory
- **group (str)** -- The group (unused)

Returns

None

CLI Example:

```
salt '*' file.chgrp c:\temp\test.txt administrators
```

salt.modules.win_file.chown(path, user, group=None, pgroup=None, follow_symlinks=True)

Chown a file, pass the file the desired user and group

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, pgroup, instead.

Parameters

- **path (str)** -- The path to the file or directory
- **user (str)** -- The name of the user to own the file
- **group (str)** -- The group (not used)
- **pgroup (str)** -- The primary group to assign
- **follow_symlinks (bool)** -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns

True if successful, otherwise error

Return type

bool

CLI Example:

```
salt '*' file.chown c:\temp\test.txt myusername
salt '*' file.chown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.chown c:\temp\test.txt myusername "pgroup='None'"
```
salt.modules.win_file.chgrp(path, group)

Change the group of a file

Under Windows, this will set the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

Parameters
- `path` (str) -- The path to the file or directory
- `pgroup` (str) -- The primary group to assign

Returns
- True if successful, otherwise error

Return type
- `bool`

CLI Example:

```sh
salt '*' file.chgrp c:\temp\test.txt Administrators
salt '*' file.chgrp c:\temp\test.txt ''None''
```

salt.modules.win_file.get_attributes(path)

Return a dictionary object with the Windows file attributes for a file.

Parameters
- `path` (str) -- The path to the file or directory

Returns
- A dictionary of file attributes

Return type
- `dict`

CLI Example:

```sh
salt '*' file.get_attributes c:\temp\a.txt
```

salt.modules.win_file.get_gid(path, follow_symlinks=True)

Return the id of the group that owns a given file

Under Windows, this will return the uid of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use `file.get_pgid`.

Parameters
- `path` (str) -- The path to the file or directory
- `follow_symlinks` (bool) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns
- The gid of the owner

Return type
- `str`

CLI Example:
Salt Documentation, Release 3007.1

```
salt '*' file.get_gid c:\temp\test.txt
```

**salt.modules.win_file.get_group(path, follow_symlinks=True)**  
Return the group that owns a given file

Under Windows, this will return the user (owner) of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use **file.get_pgroup**.

**Parameters**

- **path (str)** -- The path to the file or directory
- **follow_symlinks (bool)** -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns**

The name of the owner

**Return type**

str

**CLI Example:**

```
salt '*' file.get_group c:\temp\test.txt
```

```
salt '*' file.get_mode /etc/passwd
```

**salt.modules.win_file.get_mode(path)**  
Return the mode of a file

Right now we're just returning None because Windows' doesn't have a mode like Linux

**Parameters**

- **path (str)** -- The path to the file or directory

**Returns**

None

**CLI Example:**

```
salt '*' file.get_mode /etc/passwd
```

**salt.modules.win_file.get_pgid(path, follow_symlinks=True)**  
Return the id of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

**Parameters**

- **path (str)** -- The path to the file or directory
- **follow_symlinks (bool)** -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns**

The gid of the primary group

**Return type**

str

**CLI Example:**
salt.modules.win_file.get_pgroup(path, follow_symlinks=True)
Return the name of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions
unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

The return value may be 'None', e.g. if the user is not on a domain. This is a valid group - do not confuse
this with the Salt/Python value of None which means no value was returned. To be certain, use the get_pgid
function which will return the SID, including for the system 'None' group.

Parameters

• path (str) -- The path to the file or directory
• follow_symlinks (bool) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns
The name of the primary group

Return type
str

CLI Example:

```
salt '*' file.get_pgroup c:\temp\test.txt
```

salt.modules.win_file.get_uid(path, follow_symlinks=True)
Return the id of the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify follow_symlinks=False to turn off this behavior.

Parameters

• path (str) -- The path to the file or directory
• follow_symlinks (bool) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns
The uid of the owner

Return type
str

CLI Example:

```
salt '*' file.get_uid c:\temp\test.txt
salt '*' file.get_uid c:\temp\test.txt follow_symlinks=False
```

salt.modules.win_file.get_user(path, follow_symlinks=True)
Return the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify follow_symlinks=False to turn off this behavior.

Parameters

• path (str) -- The path to the file or directory
• follow_symlinks (bool) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns
The name of the owner
Return type
str

CLI Example:

```
salt '*' file.get_user c:\temp\test.txt
salt '*' file.get_user c:\temp\test.txt  follow_symlinks=False
```

salt.modules.win_file.gid_to_group(gid)
Convert the group id to the group name on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as uid_to_user.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the uid_to_user function instead; an info level log entry will be generated if this function is used directly.

Parameters
  gid (str) -- The gid of the group

Returns
  The name of the group

Return type
str

CLI Example:

```
salt '*' file.gid_to_group S-1-5-21-626487655-2533044672-482107328-1010
```

salt.modules.win_file.group_to_gid(group)
Convert the group to the gid on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as user_to_uid, except if None is given, "" is returned.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the user_to_uid function instead; an info level log entry will be generated if this function is used directly.

Parameters
  group (str) -- The name of the group

Returns
  The gid of the group

Return type
str

CLI Example:

```
salt '*' file.group_to_gid administrators
```

salt.modules.win_file.is_link(path)
Check if the path is a symlink

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a SaltInvocationError, not an OSError.

Parameters
  path (str) -- The path to a file or directory

Returns
  True if path is a symlink, otherwise False

Return type
bool
salt Documentation, Release 3007.1

**CLI Example:**

```bash
salt '*' file.is_link /path/to/link
```

**salt.modules.win_file.lchown(path, user, group=None, pgroup=None)**

Chown a file, pass the file the desired user and group without following any symlinks.

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a ‘primary group’ property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the ‘primary group’ property and understand the implications, pass the Windows only parameter, pgroup, instead.

To set the primary group to ‘None’, it must be specified in quotes. Otherwise Salt will interpret it as the Python value of None and no primary group changes will occur. See the example below.

**Parameters**

- **path** *(str)* -- The path to the file or directory
- **user** *(str)* -- The name of the user to own the file
- **group** *(str)* -- The group (not used)
- **pgroup** *(str)* -- The primary group to assign

**Returns**

True if successful, otherwise error

**Return type**

`bool`

**CLI Example:**

```bash
salt '*' file.lchown c:\temp\test.txt myusername
salt '*' file.lchown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.lchown c:\temp\test.txt myusername "pgroup='None'"
```

**salt.modules.win_file.makedirs_(path, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)**

Ensure that the parent directory containing this path is available.

**Parameters**

- **path** *(str)* -- The full path to the directory.

**Note:** The path must end with a trailing slash otherwise the directory(s) will be created up to the parent directory. For example if path is `C:\temp\test`, then it would be treated as `C:\temp\` but if the path ends with a trailing slash like `C:\temp\test\`, then it would be treated as `C:\temp\test`.

- **owner** *(str)* -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.
- **grant_perms** *(dict)* -- A dictionary containing the user/group and the basic permissions to grant, ie: `{user: {perms: 'basic_permission'}`. You can also set the applies_to setting here. The default is this_folder_subfolders_files. Specify another applies_to setting like this:

```python
{user: {perms: 'full_control', 'applies_to': 'this_folder'}}
```

To set advanced permissions use a list for the `perms` parameter, ie:
{'user': {'perms': ['read_attributes', 'read_ea'],
'applies_to': 'this_folder'}}

- **deny_perms** *(dict)* -- A dictionary containing the user/group and permissions to deny along with the applies_to setting. Use the same format used for the grant_perms parameter. Remember, deny permissions supersede grant permissions.

- **inheritance** *(bool)* -- If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.

- **reset** *(bool)* -- If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Returns
True if successful

Return type
bool

Raises
CommandExecutionError -- If unsuccessful

CLI Example:

# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs C:\Temp\ Administrators "{'Users': {'perms': 'read_→execute'}}"

# Locally using salt call
salt-call file.makedirs C:\Temp\ Administrators "{'Users': {'perms': →'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.makedirs C:\Temp\ Administrators "{'jsnuffy': {'perms': [→'read_attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"

salt.modules.win_file.makedirs_perms(path, owner=None, grant_perms=None, deny_perms=None,
inheritance=True, reset=True)

Set owner and permissions for each directory created.

Parameters

- **path** *(str)* -- The full path to the directory.

- **owner** *(str)* -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.

- **grant_perms** *(dict)* -- A dictionary containing the user/group and the basic permissions to grant, ie: {'user': {'perms': 'basic_permission'}}. You can also set the applies_to setting here. The default is this_folder_subfolders_files. Specify another applies_to setting like this:

\n{'user': {'perms': 'full_control', 'applies_to': 'this_→folder'}}\n
To set advanced permissions use a list for the perms parameter, ie:
deny_perms (dict) -- A dictionary containing the user/group and permissions to deny along with the applies_to setting. Use the same format used for the grant_perms parameter. Remember, deny permissions supersede grant permissions.

inheritance (bool) -- If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.

reset (bool) -- If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Returns
True if successful, otherwise raises an error

Return type
bool

CLI Example:

```bash
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs_perms C:\Temp\ Administrators "{'Users': {'perms': 'read_execute'}}"

# Locally using salt call
salt-call file.makedirs_perms C:\Temp\ Administrators "{'Users': {'perms': 'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.makedirs_perms C:\Temp\ Administrators "{'jsnuffy': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_files'}}"
```

salt.modules.win_file.mkdir(path, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)

Ensure that the directory is available and permissions are set.

Parameters

- path (str) -- The full path to the directory.
- owner (str) -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM
- grant_perms (dict) -- A dictionary containing the user/group and the basic permissions to grant, ie: {'user': {'perms': 'basic_permission'}}. You can also set the applies_to setting here. The default is this_folder_subfolders_files. Specify another applies_to setting like this:

  ```json
  {'user': {'perms': 'full_control', 'applies_to': 'this_folder'}}
  ```

To set advanced permissions use a list for the perms parameter, ie:

```json
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
```

- deny_perms (dict) -- A dictionary containing the user/group and permissions
to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.

- **inheritance** *(bool)* -- If `True` the object will inherit permissions from the parent. If `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.

- **reset** *(bool)* -- If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

Returns

True if successful

Return type

bool

Raises

**CommandExecutionError** -- If unsuccessful

CLI Example:

```bash
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.mkdir C:\Temp\Administrators "{'Users': {'perms': 'read_execute'}}"

# Locally using salt call
salt-call file.mkdir C:\Temp\Administrators "{'Users': {'perms': 'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.mkdir C:\Temp\Administrators "{'jsnuffy': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

salt.modules.win_file.remove *(path, force=False)*

Remove the named file or directory

Parameters

- **path** *(str)* -- The path to the file or directory to remove.
- **force** *(bool)* -- Remove even if marked Read-Only. Default is `False`

Returns

True if successful, False if unsuccessful

Return type

bool

CLI Example:

```bash
salt '*' file.remove C:\Temp
```

salt.modules.win_file.set_attributes *(path, archive=None, hidden=None, normal=None, notIndexed=None, readonly=None, system=None, temporary=None)*

Set file attributes for a file. Note that the normal attribute means that all others are false. So setting it will clear all others.

Parameters

- **path** *(str)* -- The path to the file or directory
- **archive** *(bool)* -- Sets the archive attribute. Default is None
- **hidden** *(bool)* -- Sets the hidden attribute. Default is None
- **normal** *(bool)* -- Resets the file attributes. Cannot be used in conjunction with any
other attribute. Default is None

- **notIndexed** (*bool*) -- Sets the indexed attribute. Default is None
- **readonly** (*bool*) -- Sets the readonly attribute. Default is None
- **system** (*bool*) -- Sets the system attribute. Default is None
- **temporary** (*bool*) -- Sets the temporary attribute. Default is None

Returns
True if successful, otherwise False

Return type
bool

CLI Example:
```bash
salt '*' file.set_attributes c:\temp\a.txt normal=True
salt '*' file.set_attributes c:\temp\a.txt readonly=True hidden=True
```

**salt.modules.win_file.set_mode**(*path, mode*)

Set the mode of a file

This just calls `get_mode`, which returns `None` because we don't use mode on Windows

Parameters
- **path** -- The path to the file or directory
- **mode** -- The mode (not used)

Returns
None

CLI Example:
```
salt '*' file.set_mode /etc/passwd 0644
```

**salt.modules.win_file.set_perms**(*path, grant_perms=None, deny_perms=None, inheritance=True, reset=False*)

Set permissions for the given path

Parameters
- **path** (*str*) -- The full path to the directory.
- **grant_perms** (*dict*) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here for directories. The default for `applies_to` is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

  ```json
  {'user': {'perms': 'full_control', 'applies_to': 'this_folder'}}
  ```

To set advanced permissions use a list for the `perms` parameter, ie:

```json
{'user': {'perms': ['read_attributes', 'read_ea'],
         'applies_to': 'this_folder'}}
```

To see a list of available attributes and applies to settings see the documentation for `salt.utils.win_dacl`.

A value of `None` will make no changes to the `grant` portion of the DACL. Default is `None`.

- **deny_perms** (*dict*) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
A value of `None` will make no changes to the deny portion of the DACL. Default is `None`.

- **inheritance (bool)** -- If `True` the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created. Default is `False`.

- **reset (bool)** -- If `True` the existing DCL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

Returns
- True if successful

Return type
- bool

Raises
- `CommandExecutionError` -- If unsuccessful

CLI Example:

```bash
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.set_perms C:\Temp\ "{'Users': {'perms': 'read_execute'}}"

# Locally using salt-call
salt-call file.set_perms C:\Temp\ "{'Users': {'perms': 'read_execute',
  'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.set_perms C:\Temp\ "{'jsnuffy': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

`salt.modules.win_file.stats(path, hash_type='sha256', follow_symlinks=True)`

Return a dict containing the stats about a given file

Under Windows, `gid` will equal `uid` and `group` will equal `user`.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps these properties to keep some kind of compatibility with Unix behavior. If the 'primary group' is required, it can be accessed in the `pgroup` and `pgid` properties.

Parameters
- **path (str)** -- The path to the file or directory
- **hash_type (str)** -- The type of hash to return
- **follow_symlinks (bool)** -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns
- A dictionary of file/directory stats

Return type
- dict

CLI Example:

```bash
salt '*' file.stats /etc/passwd
```

`salt.modules.win_file.symlink(src, link, force=False, atomic=False, follow_symlinks=True)`

Create a symbolic link to a file
This is only supported with Windows Vista or later and must be executed by a user with the SeCreateSymbol-
icLink privilege.

The behavior of this function matches the Unix equivalent, with one exception - invalid symlinks cannot be created. The source path must exist. If it doesn't, an error will be raised.

**Parameters**

- **src (str)** -- The path to a file or directory
- **link (str)** -- The path to the link. Must be an absolute path
- **force (bool)** -- Overwrite an existing symlink with the same name .. versionadded:: 3005
- **atomic (bool)** -- Use atomic file operations to create the symlink .. versionadded:: 3006.0
- **follow_symlinks (bool)** -- If set to False, use os.path.lexists() for existence checks instead of os.path.exists() .. versionadded:: 3007.0

**Returns**

True if successful, otherwise raises CommandExecutionError

**Return type**

bool

CLI Example:

```bash
salt '*' file.symlink /path/to/file /path/to/link
```

salt.modules.win_file.uid_to_user(uid)

Convert a uid to a user name

**Parameters**

- **uid (str)** -- The user id to lookup

**Returns**

The name of the user

**Return type**

str

CLI Example:

```bash
salt '*' file.uid_to_user S-1-5-21-626487655-2533044672-482107328-1010
```

salt.modules.win_file.user_to_uid(user)

Convert user name to a uid

**Parameters**

- **user (str)** -- The user to lookup

**Returns**

The user id of the user

**Return type**

str

CLI Example:

```bash
salt '*' file.user_to_uid myusername
```

salt.modules.win_file.version(path)

Get the version of a file.

**Note:** Not all files have version information. The following are common file types that contain version information:

- .exe
Parameters

\texttt{path (str)} -- The path to the file.

Returns

The version of the file if the file contains it. Otherwise, an empty string will be returned.

Return type

\texttt{str}

Raises

\begin{itemize}
  \item \texttt{CommandExecutionError} -- If the file does not exist
  \item \texttt{CommandExecutionError} -- If the path is not a file
\end{itemize}

CLI Example:

\begin{verbatim}
salt * file.version C:\Windows\notepad.exe
\end{verbatim}

\texttt{salt.modules.win_file.version_details(path)}

New in version 3005.

Get file details for a file. Similar to what's in the details tab on the file properties.

\textbf{Note:} Not all files have version information. The following are common file types that contain version information:

\begin{itemize}
  \item ..exe
  \item ..dll
  \item ..sys
\end{itemize}

Parameters

\texttt{path (str)} -- The path to the file.

Returns

A dictionary containing details about the file related to version. An empty dictionary if the file contains no version information.

Return type

\texttt{dict}

Raises

\begin{itemize}
  \item \texttt{CommandExecutionError} -- If the file does not exist
  \item \texttt{CommandExecutionError} -- If the path is not a file
\end{itemize}

CLI Example:

\begin{verbatim}
salt * file.version_details C:\Windows\notepad.exe
\end{verbatim}
26.6.490  salt.modules.win_firewall

Module for configuring Windows Firewall using netsh

```python
salt.modules.win_firewall.add_rule(name, localport, protocol='tcp', action='allow', dir='in', remoteip='any')
```

New in version 2015.5.0.

Add a new inbound or outbound rule to the firewall policy

**Parameters**

- `name (str)` -- The name of the rule. Must be unique and cannot be "all". Required.
- `localport (int)` -- The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- `protocol (Optional[str])` -- The protocol. Can be any of the following:
  - A number between 0 and 255
  - icmpv4
  - icmpv6
  - tcp
  - udp
  - any
- `action (Optional[str])` -- The action the rule performs. Can be any of the following:
  - allow
  - block
  - bypass
- `dir (Optional[str])` -- The direction. Can be `in` or `out`.
- `remoteip (Optional [str])` -- The remote IP. Can be any of the following:
  - any
  - localsubnet
  - dns
  - dhcp
  - wins
  - defaultgateway
  - Any valid IPv4 address (192.168.0.12)
  - Any valid subnet (192.168.1.0/24)
  - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
  - A list of valid IP addresses

Can be combinations of the above separated by commas.

**Returns**

- True if successful

**Return type**

- `bool`

**Raises**

- `CommandExecutionError` -- If the command fails

CLI Example:

```bash
salt '*' firewall.add_rule 'test' '8080' 'tcp'
salt '*' firewall.add_rule 'test' '1' 'icmpv4'
salt '*' firewall.add_rule 'test_remote_ip' '8000' 'tcp' 'allow' 'in' '192.168.0.1'
```

```python
salt.modules.win_firewall.delete_rule(name=None, localport=None, protocol=None, dir=None, remoteip=None)
```

New in version 2015.8.0.
Delete an existing firewall rule identified by name and optionally by ports, protocols, direction, and remote IP.

Parameters
- **name** *(str)* -- The name of the rule to delete. If the name `all` is used you must specify additional parameters.
- **localport** *(Optional[str]*) -- The port of the rule. If protocol is not specified, protocol will be set to `tcp`
- **protocol** *(Optional[str]*) -- The protocol of the rule. Default is `tcp` when `localport` is specified
- **dir** *(Optional[str]*) -- The direction of the rule.
- **remoteip** *(Optional[str]*) -- The remote IP of the rule.

Returns
- True if successful

Return type
- bool

Raises
- **CommandExecutionError** -- If the command fails

CLI Example:
```
# Delete incoming tcp port 8080 in the rule named 'test'
salt '*' firewall.delete_rule 'test' '8080' 'tcp' 'in'

# Delete the incoming tcp port 8000 from 192.168.0.1 in the rule named # 'test_remote_ip'
salt '*' firewall.delete_rule 'test_remote_ip' '8000' 'tcp' 'in' '192.168.0.1'

# Delete all rules for local port 80:
salt '*' firewall.delete_rule all 80 tcp

# Delete a rule called 'allow80':
salt '*' firewall.delete_rule allow80
```

`salt.modules.win_firewall.disable(profile='allprofiles')`

Disable firewall profile

Parameters
- **profile** *(Optional[str]*) -- The name of the profile to disable. Default is `allprofiles`. Valid options are:
  - `allprofiles`
  - `domainprofile`
  - `privateprofile`
  - `publicprofile`

Returns
- True if successful

Return type
- bool

Raises
- **CommandExecutionError** -- If the command fails

CLI Example:
```
salt '*' firewall.disable
```

`salt.modules.win_firewall.enable(profile='allprofiles')`

New in version 2015.5.0.

Enable firewall profile
Parameters

profile (Optional[str]) -- The name of the profile to enable. Default is allprofiles. Valid options are:
  • allprofiles
  • domainprofile
  • privateprofile
  • publicprofile

Returns
True if successful

Return type
bool

Raises
CommandExecutionError -- If the command fails

CLI Example:
salt '*' firewall.enable

salt.modules.win_firewall.get_all_profiles(store='local')

Gets all properties for all profiles in the specified store

New in version 2018.3.4.
New in version 2019.2.0.

Parameters

store (str) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  • lgpo
  • local
Default is local

Returns
A dictionary containing the specified settings for each profile

Return type
dict

CLI Example:

# Get all firewall settings for all profiles
salt '*' firewall.get_all_settings

# Get all firewall settings for all profiles as defined by local group policy
salt '*' firewall.get_all_settings lgpo

salt.modules.win_firewall.get_all_settings(domain, store='local')

Gets all the properties for the specified profile in the specified store

New in version 2018.3.4.
New in version 2019.2.0.

Parameters

• profile (str) -- The firewall profile to query. Valid options are:
  • domain
  • public
  • private
  • store (str) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
salt.modules.win_firewall.get_all_settings(profile, section, store='local')

Get the firewall property from the specified profile in the specified store as returned by netsh advfirewall.

New in version 2018.3.4.
New in version 2019.2.0.

Parameters

- **profile** *(str)* -- The firewall profile to query. Valid options are:
  - domain

Returns

A dictionary of all rules or rules that match the name exactly

Return type
dict

Raises

CommandExecutionError -- If the command fails

CLI Example:

```
salt '* firewall.get_rule MyAppPort'
```

salt.modules.win_firewall.get_config()  

Get the status of all the firewall profiles

Returns

A dictionary of all profiles on the system

Return type
dict

Raises

CommandExecutionError -- If the command fails

CLI Example:

```
salt '*' firewall.get_config
```

salt.modules.win_firewall.get_rule(name='all')

New in version 2015.5.0.

Display all matching rules as specified by name

Parameters

- **name** *(Optional[str])* -- The full name of the rule. all will return all rules. Default is all

Returns

A dictionary of all rules or rules that match the name exactly

Return type
dict

Raises

CommandExecutionError -- If the command fails

CLI Example:

```
salt '* firewall.get_rule MyAppPort'
```

salt.modules.win_firewall.get_settings(profile, section, store='local')

Get the firewall property from the specified profile in the specified store as returned by netsh advfirewall.

New in version 2018.3.4.
New in version 2019.2.0.

Parameters

- **profile** *(str)* -- The firewall profile to query. Valid options are:
  - domain

Returns

A dictionary containing the specified settings

Return type
dict

CLI Example:

```
# Get all firewall settings for connections on the domain profile
salt '*' win_firewall.get_all_settings domain

# Get all firewall settings for connections on the domain profile as defined by local group policy
salt '*' win_firewall.get_all_settings domain lgpo
```
- public
- private

- **section (str)** -- The property to query within the selected profile. Valid options are:
  - firewallpolicy: inbound/outbound behavior
  - logging: firewall logging settings
  - settings: firewall properties
  - state: firewalls state (on | off)

- **store (str)** -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
  
  Default is local

Returns
A dictionary containing the properties for the specified profile

Return type
``dict``

Raises
- **CommandExecutionError** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:
```
# Get the inbound/outbound firewall settings for connections on the local domain profile
salt * win_firewall.get_settings domain firewallpolicy

# Get the inbound/outbound firewall settings for connections on the domain profile as defined by local group policy
salt * win_firewall.get_settings domain firewallpolicy lgpo
```

salt.modules.win_firewall.rule_exists(name)
New in version 2016.11.6.
Checks if a firewall rule exists in the firewall policy

Parameters
- **name (str)** -- The name of the rule

Returns
True if exists, otherwise False

Return type
``bool``

CLI Example:
```
# Is there a rule named RemoteDesktop
salt '*' firewall.rule_exists RemoteDesktop
```

salt.modules.win_firewall.set_firewall_settings(profile, inbound=None, outbound=None, store='local')
Set the firewall inbound/outbound settings for the specified profile and store

New in version 2018.3.4.
New in version 2019.2.0.

Parameters
- **profile (str)** -- The firewall profile to query. Valid options are:
  - domain
- public
- private

- **inbound** *(str)* -- The inbound setting. If `None` is passed, the setting will remain unchanged. Valid values are:
  - blockinbound
  - blockinboundalways
  - allowinbound
  - notconfigured

  Default is `None`

- **outbound** *(str)* -- The outbound setting. If `None` is passed, the setting will remain unchanged. Valid values are:
  - allowoutbound
  - blockoutbound
  - notconfigured

  Default is `None`

- **store** *(str)* -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

  Default is `local`

**Returns**

- `True` if successful

**Return type**

- `bool`

**Raises**

- `CommandExecutionError` -- If an error occurs
- `ValueError` -- If the parameters are incorrect

**CLI Example:**

```bash
# Set the inbound setting for the domain profile to block inbound
salt * firewall.set_firewall_settings domain='domain' inbound='blockinbound'

# Set the outbound setting for the domain profile to allow outbound
salt * firewall.set_firewall_settings domain='domain' outbound='allowoutbound'

# Set inbound/outbound settings for the domain profile in the group policy to block inbound and allow outbound
salt * firewall.set_firewall_settings domain='domain' inbound='blockinbound' outbound='allowoutbound' store='lgpo'
```

salt.modules.win_firewall.set_logging_settings *(profile, setting, value, store='local')*

Configure logging settings for the Windows firewall.

**New in version 2018.3.4.**

**New in version 2019.2.0.**

**Parameters**

- **profile** *(str)* -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
• **setting** *(str)* -- The logging setting to configure. Valid options are:
  - allowedconnections
  - droppedconnections
  - filename
  - maxfilesize

• **value** *(str)* -- The value to apply to the setting. Valid values are dependent upon the setting being configured. Valid options are:

  allowedconnections:
  - enable
  - disable
  - notconfigured

  droppedconnections:
  - enable
  - disable
  - notconfigured

  filename:
  - Full path and name of the firewall log file
  - notconfigured

  maxfilesize:
  - 1 - 32767
  - notconfigured

**Note:** *notconfigured* can only be used when using the lgpo store

• **store** *(str)* -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:

  - lgpo
  - local

  Default is local

**Returns**

*True* if successful

**Return type**

*bool*

**Raises**

• **CommandExecutionError** -- If an error occurs

• **ValueError** -- If the parameters are incorrect

**CLI Example:**

```bash
# Log allowed connections and set that in local group policy
salt * firewall.set_logging_settings domain allowedconnections enable lgpo

# Don't log dropped connections
salt * firewall.set_logging_settings profile=private →setting=droppedconnections value=disable

# Set the location of the log file
salt * firewall.set_logging_settings domain filename C:\windows\logs\ →firewall.log

# You can also use environment variables
salt * firewall.set_logging_settings domain filename %systemroot%\ →system32\LogFiles\Firewall\pfirewall.log
```
(continues on next page)
salt.modules.win_firewall.set_settings(profile, setting, value, store='local')

Configure firewall settings.

New in version 2018.3.4.

New in version 2019.2.0.

Parameters

• **profile** *(str)* -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private

• **setting** *(str)* -- The firewall setting to configure. Valid options are:
  - localfirewallrules
  - localconsecrules
  - inboundusernotification
  - remotemanagement
  - unicastresponsetomulticast

• **value** *(str)* -- The value to apply to the setting. Valid options are
  - enable
  - disable
  - notconfigured

  **Note:** `notconfigured` can only be used when using the lgpo store

• **store** *(str)* -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

Default is local

Returns

True if successful

Return type

bool

Raises

• **CommandExecutionError** -- If an error occurs

• **ValueError** -- If the parameters are incorrect

CLI Example:

```bash
# Merge local rules with those distributed through group policy
salt * firewall.set_settings domain localfirewallrules enable

# Allow remote management of Windows Firewall
salt * firewall.set_settings domain remotemanagement enable
```

salt.modules.win_firewall.set_state(profile, state, store='local')

Configure the firewall state.

New in version 2018.3.4.

New in version 2019.2.0.

Parameters
- **profile** *(str)* -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
- **state** *(str)* -- The firewall state. Valid options are:
  - on
  - off
  - notconfigured

*Note:* **notconfigured** can only be used when using the **lgpo store**

- **store** *(str)* -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
  
  Default is **local**

  **Returns**
  
  True if successful

  **Return type**
  
  bool

**Raises**

- **CommandExecutionError** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

**CLI Example:**

```bash
# Turn the firewall off when the domain profile is active
salt * firewall.set_state domain off

# Turn the firewall on when the public profile is active and set that in # the local group policy
salt * firewall.set_state public on lgpo
```

## 26.6.491 salt.modules.win_groupadd

Manage groups on Windows

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see [here](#).

**salt.modules.win_groupadd.add** *(name, **kwargs)*

Add the specified group

**Parameters**

- **name** *(str)* -- The name of the group to add

**Returns**

True if successful, otherwise False

**Return type**

bool

**CLI Example:**

```bash
salt '*' group.add foo
```
salt.modules.win_groupadd.adduser(name, username, **kwargs)

Add a user to a group
Parameters
- name (str) -- The name of the group to modify
- username (str) -- The name of the user to add to the group
Returns
True if successful, otherwise False
Return type
bool

CLI Example:
salt '*' group.adduser foo username

salt.modules.win_groupadd.delete(name, **kwargs)

Remove the named group
Parameters
- name (str) -- The name of the group to remove
Returns
True if successful, otherwise False
Return type
bool

CLI Example:
salt '*' group.delete foo

salt.modules.win_groupadd.deluser(name, username, **kwargs)

Remove a user from a group
Parameters
- name (str) -- The name of the group to modify
- username (str) -- The name of the user to remove from the group
Returns
True if successful, otherwise False
Return type
bool

CLI Example:
salt '*' group.deluser foo username

salt.modules.win_groupadd.getent(refresh=False)

Return info on all groups
Parameters
- refresh (bool) -- Refresh the info for all groups in __context__. If False only the groups in __context__ will be returned. If True the __context__ will be refreshed with current data and returned. Default is False
Returns
A list of groups and their information

CLI Example:
salt '*' group.getent

salt.modules.win_groupadd.info(name)

Return information about a group
Parameters
- name (str) -- The name of the group for which to get information
Returns
A dictionary of information about the group

Return type
dict

CLI Example:

```shell
salt '*' group.info foo
```

salt.modules.win_groupadd.list_groups(refresh=False)

Return a list of groups

Parameters

- `refresh (bool)` -- Refresh the info for all groups in __context__. If False only the groups in __context__ will be returned. If True, the __context__ will be refreshed with current data and returned. Default is False

Returns
A list of groups on the machine

Return type
list

CLI Example:

```shell
salt '*' group.list_groups
```

salt.modules.win_groupadd.members(name, members_list, **kwargs)

Ensure a group contains only the members in the list

Parameters

- `name (str)` -- The name of the group to modify
- `members_list (str)` -- A single user or a comma separated list of users. The group will contain only the users specified in this list.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```shell
salt '*' group.members foo 'user1,user2,user3'
```

26.6.492 salt.modules.win_iis

Microsoft IIS site management via WebAdministration powershell module

maintainer
Shane Lee <slee@saltstack.com>, Robert Booth <rbooth@saltstack.com>

platform
Windows

depends
PowerShell

depends
WebAdministration module (PowerShell) (IIS)

New in version 2016.3.0.
salt.modules.win_iis.create_app(name, site, sourcepath, apppool=None)
Create an IIS application.

Note: This function only validates against the application name, and will return True even if the application already exists with a different configuration. It will not modify the configuration of an existing application.

Parameters
- name (str) -- The IIS application.
- site (str) -- The IIS site name.
- sourcepath (str) -- The physical path.
- apppool (str) -- The name of the IIS application pool.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:
```bash
salt '*' win_iis.create_app name='app0' site='site0' sourcepath='C:\site0' apppool='site0'
```

salt.modules.win_iis.create_apppool(name)
Create an IIS application pool.

Note: This function only validates against the application pool name, and will return True even if the application pool already exists with a different configuration. It will not modify the configuration of an existing application pool.

Parameters
- name (str) -- The name of the IIS application pool.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:
```bash
salt '*' win_iis.create_apppool name='MyTestPool'
```

salt.modules.win_iis.create_backup(name)
Backup an IIS Configuration on the System.

New in version 2017.7.0.

Note: Backups are stored in the $env:Windir\System32\inetsrv\backup folder.

Parameters
- name (str) -- The name to give the backup

Returns
True if successful, otherwise False

Return type
bool
CLI Example:

```shell
classic  '*
```

```
salt '*' win_iis.create_backup good_config_20170209
```

```
salt.modules.win_iis.create_binding(site='site0', hostheader='example.com', ipaddress='*', port=80)
```

Create an IIS Web Binding.

Note: This function only validates against the binding:ipaddress:port:hostheader combination, and will return True even if the binding already exists with a different configuration. It will not modify the configuration of an existing binding.

Parameters

- **site** (str) -- The IIS site name.
- **hostheader** (str) -- The host header of the binding. Usually a hostname.
- **ipaddress** (str) -- The IP address of the binding.
- **port** (int) -- The TCP port of the binding.
- **protocol** (str) -- The application protocol of the binding.
- **sslflags** (str) -- The flags representing certificate type and storage of the binding.

Returns

True if successful, otherwise False

Return type

```
bool
```

CLI Example:

```shell
classic  '*
```

```
salt '*' win_iis.create_binding site='site0' hostheader='example.com' ipaddress='*' port=80
```

Assign a certificate to an IIS Web Binding.

New in version 2016.11.0.

Note: The web binding that the certificate is being assigned to must already exist.

Parameters

- **name** (str) -- The thumbprint of the certificate.
- **site** (str) -- The IIS site name.
- **hostheader** (str) -- The host header of the binding.
- **ipaddress** (str) -- The IP address of the binding.
- **port** (int) -- The TCP port of the binding.
- **sslflags** (int) -- Flags representing certificate type and certificate storage of the binding.

Returns

True if successful, otherwise False

Return type

```
bool
```

CLI Example:
salt 'win_iis.create_cert_binding' name='AAA000' site='site0' hostheader='example.com' ipaddress='*' port='443'

salt.modules.win_iis.create_cert_binding(name='AAA000', site='site0', hostheader='example.com', ipaddress='*', port=443)

salt.modules.win_iis.create_site(name, sourcepath, apppool='', hostheader='', ipaddress='*', port=80, protocol='http')

Create a basic website in IIS.

Note: This function only validates against the site name, and will return True even if the site already exists with a different configuration. It will not modify the configuration of an existing site.

Parameters
- name (str) -- The IIS site name.
- sourcepath (str) -- The physical path of the IIS site.
- apppool (str) -- The name of the IIS application pool.
- hostheader (str) -- The host header of the binding. Usually the hostname or website name, i.e.: www.contoso.com
- ipaddress (str) -- The IP address of the binding.
- port (int) -- The TCP port of the binding.
- protocol (str) -- The application protocol of the binding. (http, https, etc.)

Returns
True if successful, otherwise False.

Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:

```
salt '*' win_iis.create_site name='My Test Site' sourcepath='c:\stage' apppool='TestPool'
```

salt.modules.win_iis.create_vdir(name, site, sourcepath, app='/')

Create an IIS virtual directory.

Note: This function only validates against the virtual directory name, and will return True even if the virtual directory already exists with a different configuration. It will not modify the configuration of an existing virtual directory.

Parameters
- name (str) -- The virtual directory name.
- site (str) -- The IIS site name.
- sourcepath (str) -- The physical path.
- app (str) -- The IIS application.

Returns
True if successful, otherwise False

Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:
salt '*' win_iis.create_vdir name='vd0' site='site0' sourcepath='C:\inetpub\vdirs\vd0'

salt.modules.win_iis.get_container_setting(name, container, settings)
Get the value of the setting for the IIS container.
New in version 2016.11.0.
Parameters
• name (str) -- The name of the IIS container.
• container (str) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
• settings (dict) -- A dictionary of the setting names and their values.
Returns
A dictionary of the provided settings and their values.
Return type
dict
CLI Example:
salt '*' win_iis.get_container_setting name='MyTestPool' container='AppPools' settings='[processModel.identityType]'

salt.modules.win_iis.get_webapp_settings(name, site, settings)
Get the value of the setting for the IIS web application.
New in version 2017.7.0.
Parameters
• name (str) -- The name of the IIS web application.
• site (str) -- The site name contains the web application. Example: Default Web Site
• settings (str) -- A dictionary of the setting names and their values. Available settings: physicalPath, applicationPool, userName, password
Returns
A dictionary of the provided settings and their values.
Return type
dict
CLI Example:
salt '*' win_iis.get_webapp_settings name='app0' site='Default Web Site' settings='[physicalPath,applicationPool]'

salt.modules.win_iis.get_webconfiguration_settings(name, settings)
Get the webconfiguration settings for the IIS PSPath.
Parameters
• name (str) -- The PSPPath of the IIS webconfiguration settings.
• settings (list) -- A list of dictionaries containing setting name and filter.
Returns
A list of dictionaries containing setting name, filter and value.
Return type
dict
CLI Example:

```
salt '*' win_iis.get_webconfiguration_settings name='IIS:\' settings='[{
    'name': 'enabled', 'filter': 'system.webServer/security/authentication/
    anonymousAuthentication'}]
```

**salt.modules.win_iis.list_apppools()**

List all configured IIS application pools.

**Returns**
A dictionary of IIS application pools and their details.

**Return type**
dict

CLI Example:

```
salt '*' win_iis.list_apppools
```

**salt.modules.win_iis.list_apps()**

Get all configured IIS applications for the specified site.

**Parameters**

- **site (str)** -- The IIS site name.

**Returns**
A dictionary of the application names and properties.

CLI Example:

```
salt '*' win_iis.list_apps site
```

**salt.modules.win_iis.list_backups()**

List the IIS Configuration Backups on the System.

**New in version 2017.7.0.**

**Note:** Backups are made when a configuration is edited. Manual backups are stored in the `$env:Windir\System32\inetsrv\backup` folder.

**Returns**
A dictionary of IIS Configurations backed up on the system.

**Return type**
dict

CLI Example:

```
salt '*' win_iis.list_backups
```

**salt.modules.win_iis.list_bindings()**

Get all configured IIS bindings for the specified site.

**Parameters**

- **site (str)** -- The name if the IIS Site

**Returns**
A dictionary of the binding names and properties.

**Return type**
dict

CLI Example:
salt 'win_iis.list_bindings site

salt.modules.win_iis.list_cert_bindings(site)
  List certificate bindings for an IIS site.
  New in version 2016.11.0.
  Parameters
  site (str) -- The IIS site name.
  Returns
  A dictionary of the binding names and properties.
  Return type
dict
  CLI Example:
  salt 'win_iis.list_bindings site

salt.modules.win_iis.list_sites()
  List all the currently deployed websites.
  Returns
  A dictionary of the IIS sites and their properties.
  Return type
dict
  CLI Example:
  salt 'win_iis.list_sites

salt.modules.win_iis.list_vdirs(site, app='/')
  Get all configured IIS virtual directories for the specified site, or for the combination of site and application.
  Parameters
  site (str) -- The IIS site name.
  app (str) -- The IIS application.
  Returns
  A dictionary of the virtual directory names and properties.
  Return type
dict
  CLI Example:
  salt 'win_iis.list_vdirs site

salt.modules.win_iis.list_worker_processes(apppool)
  Returns a list of worker processes that correspond to the passed application pool.
  New in version 2017.7.0.
  Parameters
  apppool (str) -- The application pool to query
  Returns
  A dictionary of worker processes with their process IDs
  Return type
dict
  CLI Example:
  salt 'win_iis.list_worker_processes 'My App Pool'

salt.modules.win_iis.modify_binding(site, binding, hostheader=None, ipaddress=None, port=None, sslflags=None)
Modify an IIS Web Binding. Use site and binding to target the binding.

New in version 2017.7.0.

Parameters

- **site**(str) -- The IIS site name.
- **binding**(str) -- The binding to edit. This is a combination of the IP address, port, and hostheader. It is in the following format: ipaddress:port:hostname. For example, *:80: or *:80:salt.com
- **hostheader**(str) -- The host header of the binding. Usually the hostname.
- **ipaddress**(str) -- The IP address of the binding.
- **port**(int) -- The TCP port of the binding.
- **sslflags**(str) -- The flags representing certificate type and storage of the binding.

Returns

- True if successful, otherwise False

Return type

- bool

CLI Example:

The following will set the host header of binding *:80: for site0 to example.com

```
salt '*' win_iis.modify_binding site='site0' binding='*:80:' hostheader='example.com'
```

salt.modules.win_iis.modify_site(name, sourcepath=None, apppool=None)

Modify a basic website in IIS.

New in version 2017.7.0.

Parameters

- **name**(str) -- The IIS site name.
- **sourcepath**(str) -- The physical path of the IIS site.
- **apppool**(str) -- The name of the IIS application pool.

Returns

- True if successful, otherwise False

Return type

- bool

Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:

```
salt '*' win_iis.modify_site name='My Test Site' sourcepath='c:\new_path' apppool='NewTestPool'
```

salt.modules.win_iis.remove_app(name, site)

Remove an IIS application.

Parameters

- **name**(str) -- The application name.
- **site**(str) -- The IIS site name.

Returns

- True if successful, otherwise False

Return type

- bool

CLI Example:
salt.modules.win_iis.remove_app(name='app0' site='site0')

salt.modules.win_iis.remove_apppool(name)
Remove an IIS application pool.

Parameters
  name (str) -- The name of the IIS application pool.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:
salt '*' win_iis.remove_apppool name='MyTestPool'

salt.modules.win_iis.remove_backup(name)
Remove an IIS Configuration backup from the System.

New in version 2017.7.0.

Parameters
  name (str) -- The name of the backup to remove

Returns
True if successful, otherwise False

Return type
bool

CLI Example:
salt '*' win_iis.remove_backup backup_20170209

salt.modules.win_iis.remove_binding(site, hostheader='', ipaddress='*', port=80)
Remove an IIS binding.

Parameters
  site (str) -- The IIS site name.
  hostheader (str) -- The host header of the binding.
  ipaddress (str) -- The IP address of the binding.
  port (int) -- The TCP port of the binding.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:
salt '*' win_iis.remove_binding site='site0' hostheader='example.com'
  ipaddress='*' port='80'

salt.modules.win_iis.remove_cert_binding(name, site, hostheader='', ipaddress='*', port=443)
Remove a certificate from an IIS Web Binding.

New in version 2016.11.0.

Note: This function only removes the certificate from the web binding. It does not remove the web binding itself.

Parameters
• **name** *(str)* -- The thumbprint of the certificate.
• **site** *(str)* -- The IIS site name.
• **hostheader** *(str)* -- The host header of the binding.
• **ipaddress** *(str)* -- The IP address of the binding.
• **port** *(int)* -- The TCP port of the binding.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:
```
salt '*' win_iis.remove_cert_binding name='AAA000' site='site0'
  hostheader='example.com' ipaddress='*' port='443'
```

salt.modules.win_iis.remove_site(name)
Delete a website from IIS.

Parameters
  - **name** *(str)* -- The IIS site name.

Returns
True if successful, otherwise False

Return type
bool

Note: This will not remove the application pool used by the site.

CLI Example:
```
salt '*' win_iis.remove_site name='My Test Site'
```

salt.modules.win_iis.remove_vdir(name, site, app='/')
Remove an IIS virtual directory.

Parameters
  - **name** *(str)* -- The virtual directory name.
  - **site** *(str)* -- The IIS site name.
  - **app** *(str)* -- The IIS application.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:
```
salt '*' win_iis.remove_vdir name='vdir0' site='site0'
```

salt.modules.win_iis.restart_apppool(name)
Restart an IIS application pool.

New in version 2016.11.0.

Parameters
  - **name** *(str)* -- The name of the IIS application pool.

Returns
True if successful, otherwise False

Return type
bool
salt.modules.win_iis.restart_site(name)
Restart a Web Site in IIS.
New in version 2017.7.0.

Parameters
- `name (str)` -- The name of the website to restart.

Returns
True if successful, otherwise False

Return type
bool

salt.modules.win_iis.set_container_setting(name, container, settings)
Set the value of the setting for an IIS container.
New in version 2016.11.0.

Parameters
- `name (str)` -- The name of the IIS container.
- `container (str)` -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- `settings (dict)` -- A dictionary of the setting names and their values.

Returns
True if successful, otherwise False

Return type
bool

salt.modules.win_iis.set_webapp_settings(name, site, settings)
Configure an IIS application.
New in version 2017.7.0.

Note: This function only configures an existing app. Params are case sensitive.

Parameters
- `name (str)` -- The IIS application.
- `site (str)` -- The IIS site name.
- `settings (str)` -- A dictionary of the setting names and their values. - physicalPath: The physical path of the webapp. - applicationPool: The application pool for the webapp. - userName: "connectAs" user - password: "connectAs" password for user

Returns
A boolean representing whether all changes succeeded.

Return type
bool
CLI Example:
```
salt '*' win_iis.set_webapp_settings name='app0' site='site0' settings="{
  'physicalPath': 'C:\site0', 'apppool': 'site0'}"
```

salt.modules.win_iis.set_webconfiguration_settings(name, settings)

Set the value of the setting for an IIS container.

Parameters

- `name (str)` -- The PSPath of the IIS webconfiguration settings.
- `settings (list)` -- A list of dictionaries containing setting name, filter and value.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:
```
salt '*' win_iis.set_webconfiguration_settings name='IIS:/' settings="[{"name": 'enabled', 'filter': 'system.webServer/security/authentication/anonymousAuthentication', 'value': False}]"
```

salt.modules.win_iis.start_apppool(name)

Start an IIS application pool.

New in version 2017.7.0.

Parameters

- `name (str)` -- The name of the App Pool to start.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:
```
salt '*' win_iis.start_apppool name='MyTestPool'
```

salt.modules.win_iis.start_site(name)

Start a Web Site in IIS.

New in version 2017.7.0.

Parameters

- `name (str)` -- The name of the website to start.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:
```
salt '*' win_iis.start_site name='My Test Site'
```

salt.modules.win_iis.stop_apppool(name)

Stop an IIS application pool.

New in version 2017.7.0.

Parameters

- `name (str)` -- The name of the App Pool to stop.

Returns

True if successful, otherwise False
Return type

bool

CLI Example:

```
salt '*' win_iis.stop_apppool name='MyTestPool'
```

salt.modules.win_iis.stop_site(name)

Stop a Web Site in IIS.

New in version 2017.7.0.

Parameters

name (str) -- The name of the website to stop.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' win_iis.stop_site name='My Test Site'
```

26.6.493 salt.modules.win_ip

The networking module for Windows based systems

salt.modules.win_ip.disable(iface)

Disable an interface

CLI Example:

```
salt -G 'os_family:Windows' ip.disable 'Local Area Connection #2'
```

salt.modules.win_ip.enable(iface)

Enable an interface

CLI Example:

```
salt -G 'os_family:Windows' ip.enable 'Local Area Connection #2'
```

salt.modules.win_ip.get_all_interfaces()

Return configs for all interfaces

CLI Example:

```
salt -G 'os_family:Windows' ip.get_all_interfaces
```

salt.modules.win_ip.get_default_gateway()

Set DNS source to DHCP on Windows

CLI Example:

```
salt -G 'os_family:Windows' ip.get_default_gateway
```

salt.modules.win_ip.get_interface(iface)

Return the configuration of a network interface

CLI Example:
salt -G 'os_family:Windows' ip.get_interface 'Local Area Connection'

salt.modules.win_ip.get_subnet_length(mask)
Convenience function to convert the netmask to the CIDR subnet length
CLI Example:
salt -G 'os_family:Windows' ip.get_subnet_length 255.255.255.0

salt.modules.win_ip.is_disabled(iface)
Returns True if interface is disabled, otherwise False
CLI Example:
salt -G 'os_family:Windows' ip.is_disabled 'Local Area Connection #2'

salt.modules.win_ip.is_enabled(iface)
Returns True if interface is enabled, otherwise False
CLI Example:
salt -G 'os_family:Windows' ip.is_enabled 'Local Area Connection #2'

salt.modules.win_ip.raw_interface_configs()
Return raw configs for all interfaces
CLI Example:
salt -G 'os_family:Windows' ip.raw_interface_configs

salt.modules.win_ip.set_dhcp_all(iface)
Set both IP Address and DNS to DHCP
CLI Example:
salt -G 'os_family:Windows' ip.set_dhcp_all 'Local Area Connection'

salt.modules.win_ip.set_dhcp_dns(iface)
Set DNS source to DHCP on Windows
CLI Example:
salt -G 'os_family:Windows' ip.set_dhcp_dns 'Local Area Connection'

salt.modules.win_ip.set_dhcp_ip(iface)
Set Windows NIC to get IP from DHCP
CLI Example:
salt -G 'os_family:Windows' ip.set_dhcp_ip 'Local Area Connection'

salt.modules.win_ip.set_static_dns(iface, *addrs)
Set static DNS configuration on a Windows NIC
Parameters
  • iface (str) -- The name of the interface to set
  • addrs -- One or more DNS servers to be added. To clear the list of DNS servers pass an empty list ([ ]). If undefined or None no changes will be made.
Returns
A dictionary containing the new DNS settings

Return type
dict

CLI Example:

```bash
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' → '192.168.1.1'
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' → '192.168.1.1252' '192.168.1.253'
```

```
salt.modules.win_ip.set_static_ip(iface, addr, gateway=None, append=False)
```

Set static IP configuration on a Windows NIC

iface
The name of the interface to manage

addr
IP address with subnet length (ex. 10.1.2.3/24). The `ip.get_subnet_length` function can be used to calculate the subnet length from a netmask.

gateway
[None] If specified, the default gateway will be set to this value.

append
[False] If True, this IP address will be added to the interface. Default is False, which overrides any existing configuration for the interface and sets addr as the only address on the interface.

CLI Example:

```bash
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.3/24 gateway=10.1.2.1
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.4/24 append=True
```

26.6.494 salt.modules.win_lgpo

Manage Local Policy on Windows

This module allows configuring local group policy (i.e. `gpedit.msc`) on a Windows machine.

New in version 2016.11.0.

**Warning:** Local Group Policy will always be superseded by Domain Group policy. If policies are configured with Local Group Policy that are also configured with Domain Group policy, the Domain Group policy will take precedence.

**Administrative Templates**

Administrative template policies are dynamically read from ADMX/ADML files on the server.
Windows Settings

Policies contained in the "Windows Settings" section of the gpedit.msc GUI are statically defined in this module. Each policy is configured for the section (Machine/User) in the module's _policy_info class. The _policy_info class contains a "policies" dict on how the module will configure the policy, where the policy resides in the GUI (for display purposes), data validation data, data transformation data, etc.

Current known limitations

- At this time, start/shutdown scripts policies are displayed, but are not configurable.
- Not all "Security Settings" policies exist in the _policy_info class

depends

- pywin32 Python module
- lxml
- uuid
- struct
- salt.utils.win_reg

salt.modules.win_lgpo.clear_policy_cache()

Clears the policy definitions and resource stored in __context__. They will be rebuilt the next time a policy is applied.

CLI Example:

```
salt '*' lgpo.clear_policy_cache
```

salt.modules.win_lgpo.get(policy_class=None, return_full_policy_names=True, hierarchical_return=False, adml_language='en-US', return_not_configured=False)

Get a policy value

Parameters

- **policy_class** (str) -- Some policies are both user and computer, by default all policies will be pulled, but this can be used to retrieve only a specific policy class User/USER/user = retrieve user policies Machine/MACHINE/machine/Computer/COMPUTER/computer = retrieve machine/computer policies
- **return_full_policy_names** (bool) -- True/False to return the policy name as it is seen in the gpedit.msc GUI or to only return the policy key/id.
- **hierarchical_return** (bool) -- True/False to return the policy data in the hierarchy as seen in the gpedit.msc GUI. The default of False will return data split only into User/Computer configuration sections
- **adml_language** (str) -- The ADML language to use for processing display/descriptive names and enumeration values of ADMX template data, defaults to en-US
- **return_not_configured** (bool) -- Include Administrative Template policies that are 'Not Configured' in the return data

Returns

A dictionary containing the policy values for the specified class

Return type
dict

CLI Example:
Get the current settings for a single policy on the machine.

Parameters
- **policy_name (str)** -- The name of the policy to retrieve. Can be one of the names or aliases returned by `lgpo.get_policy_info`.
- **policy_class (str)** -- The policy class. Must be one of `machine` or `user`.
- **adml_language (str)** -- The language code for the adml file to use for localization. The default is `en-US`.
- **return_value_only (bool)** -- True will return only the value for the policy, without the name of the policy. `return_full_policy_names` and `hierarchical_return` will be ignored. Default is True.
- **return_full_policy_names (bool)** -- Returns the full policy name regardless of what was passed in `policy_name`.

Note: This setting applies to sub-elements of the policy if they exist. The value passed in `policy_name` will always be used as the policy name when this setting is False.

- **hierarchical_return (bool)** -- Returns a hierarchical view of the policy showing its parents.

Returns
- A dictionary containing the policy settings.

Return type
dict

CLI Example:

```bash
salt '*' lgpo.get_policy LockoutDuration machine
salt '*' lgpo.get_policy AutoUpdateCfg machine

salt '*' lgpo.get_policy "Account lockout duration" machine
salt '*' lgpo.get_policy "Configure Automatic Updates" machine

salt '*' lgpo.get_policy_info "Windows Components\Windows Update\Configure Automatic Updates" machine
```
You can use `lgpo.get_policy_info` to get all the possible names that could be used in a state file or from the command line (along with elements that need to be set/etc). The key is to match the text you see in the `gpedit.msc` gui exactly, including quotes around words or phrases. The "full path" style is really only needed when there are multiple policies that use the same base name. For example, `Access data sources across domains` exists in ~10 different paths. If you put that through `get_policy_info` you'll get back a message that it is used for multiple policies and you need to be more specific.

CLI Example:

```
salt-call --local lgpo.get_policy_info ShellRemoveOrderPrints_2 machine
```

```
local: ---------
    message: 
    policy_aliases: 
      - Turn off the "Order Prints" picture task 
      - ShellRemoveOrderPrints_2 
      - System\Internet Communication Management\Internet Communication\ 
        settings\Turn off the "Order Prints" picture task 
    policy_class: 
      machine 
    policy_elements: 
    policy_found: 
      True 
    policy_name: 
      ShellRemoveOrderPrints_2 
    rights_assignment: 
      False
```

Escaping can get tricky in cmd/Powershell. The following is an example of escaping in Powershell using backquotes:

```
PS>salt-call --local lgpo.get_policy_info "Turn off the `\"Order Prints\"` picture task" machine
```

```
local: ---------
    message: 
    policy_aliases: 
      - Turn off the "Order Prints" picture task 
      - ShellRemoveOrderPrints_2 
      - System\Internet Communication Management\Internet Communication\ 
        settings\Turn off the "Order Prints" picture task 
    policy_class: 
      machine 
    policy_elements: 
    policy_found: 
      True 
    policy_name: 
      Turn off the "Order Prints" picture task 
    rights_assignment: 
      False
```
This function can then be used to get the options available for specifying Group Policy Objects to be used in state files. Based on the above any of these *should* be usable:

```yaml
internet_communications_settings:
  lgpo.set:
    - computer_policy:
        Turn off the "Order Prints" picture task: Enabled
```

```yaml
internet_communications_settings:
  lgpo.set:
    - computer_policy:
        ShellRemoveOrderPrints_2: Enabled
```

When using the full path, it might be a good idea to use single quotes around the path:

```yaml
internet_communications_settings:
  lgpo.set:
    - computer_policy:
        'System\Internet Communication Management\Internet Communication\settings\Turn off the "Order Prints" picture task': 'Enabled'
```

If you struggle to find the policy from `get_policy_info` using the name as you see in `gpedit.msc`, the names such as "ShellRemoveOrderPrints_2" come from the .admx files. If you know nothing about .admx/.adml relationships (ADML holds what you see in the GUI, ADMX holds the more technical details), then this may be a little bit too much info, but here is an example with the above policy using Powershell:

```powershell
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.adml | Select-String "ShellRemoveOrderPrints"
C:\windows\PolicyDefinitions\en-US\ICM.adml:152: <string id="ShellRemoveOrderPrints">Turn off the "Order Prints" picture task</string>
C:\windows\PolicyDefinitions\en-US\ICM.adml:153: <string id="ShellRemoveOrderPrints_Help">This policy setting specifies whether the "Order Prints Online" task is available from Picture Tasks in Windows folders.
C:\windows\PolicyDefinitions\en-US\ICM.adml:155:The Order Prints Online Wizard is used to download a list of providers and allow users to order prints online.
C:\windows\PolicyDefinitions\en-US\ICM.adml:157:If you enable this policy setting, the task "Order Prints Online" is removed from Picture Tasks in File Explorer folders.
```

From this grep, we can see id "ShellRemoveOrderPrints" is the ID of the string used to describe this policy, then we search for it in the ADMX:

```powershell
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.admx | Select-String "ShellRemoveOrderPrints"
C:\windows\PolicyDefinitions\ICM.admx:661: <policy name="ShellRemoveOrderPrints_1" class="User" displayName="$(string.ShellRemoveOrderPrints_Help)" explainText="$(string.ShellRemoveOrderPrints_Help)" key="Software\Microsoft\Windows\CurrentVersion\Policies\Explorer" valueName="NoOnlinePrintsWizard">
```

(continues on next page)
C:\windows\PolicyDefinitions\ICM.admx:671: <policy name="ShellRemoveOrderPrints_2" class="Machine" displayName="$\{string.ShellRemoveOrderPrints\}" explainText="$\{string.ShellRemoveOrderPrints_Help\}" key="Software\Microsoft\Windows\CurrentVersion\Policies\Explorer\" valueName="NoOnlinePrintsWizard">

Now we have two to pick from. And if you notice the class="Machine" and class="User" (which details if it is a computer policy or user policy respectively) the ShellRemoveOrderPrints_2 is the "short name" we could use to pass through get_policy_info to see what the module itself is expecting.

salt.modules.win_lgpo.set_(computer_policy=None, user_policy=None, cumulative_rights_assignments=True, admilanguage='en-US')

Set a local server policy.

Parameters

- **computer_policy** *(dict)* -- A dictionary of "policyname: value" pairs of computer policies to set. 'value' should be how it is displayed in the gpedit GUI, i.e. if a setting can be 'Enabled'/"Disabled", then that should be passed.

Administrative Template data may require dicts within dicts, to specify each element of the Administrative Template policy. Administrative Templates policies are always cumulative.

Policy names can be specified in a number of ways based on the type of policy:

Windows Settings Policies:
These policies can be specified using the GUI display name or the key name from the _policy_info class in this module.
The GUI display name is also contained in the _policy_info class in this module.

Administrative Template Policies:
These can be specified using the policy name as displayed in the GUI (case sensitive). Some policies have the same name, but a different location (for example, "Access data sources across domains"). These can be differentiated by the "path" in the GUI (for example, "Windows Components\Internet Explorer\Internet Control Panel\Security Page\Internet Zone\Access data sources across domains").

Additionally, policies can be specified using the "name" and "id" attributes from the ADMX files.

For Administrative Templates that have policy elements, each element can be specified using the text string as seen in the GUI or using the ID attribute from the ADMX file. Due to the way some of the GUI text is laid out, some policy element names could include descriptive text that appears before the policy element in the GUI.

Use the get_policy_info function for the policy name to view the element ID/names that the module will accept.

- **user_policy** *(dict)* -- The same setup as the computer_policy, except with data to configure the local user policy.

- **cumulative_rights_assignments** *(bool)* -- Determine how user rights assignment policies are configured.

If True, user right assignment specifications are simply added to the existing policy
If False, only the users specified will get the right (any existing will have the right revoked)

- `adm_language (str)` -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

Returns

True is successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' lgpo.set computer_policy="{'LockoutDuration': 2, 'RestrictAnonymous': 'Enabled', 'AuditProcessTracking': 'Success, Failure'}"
```

```
salt.modules.win_lgpo.set_computer_policy(nam, set, cumulative_rights_assignments=True, adml_language='en-US')
```

Set a single computer policy

Parameters

- `name (str)` -- The name of the policy to configure
- `setting (str)` -- The setting to configure the named policy with
- `cumulativeRightsAssignments (bool)` -- Determine how user rights assignment policies are configured. If True, user right assignment specifications are simply added to the existing policy. If False, only the users specified will get the right (any existing will have the right revoked)
- `adm_language (str)` -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' lgpo.set computer_policy LockoutDuration 1440
```

```
salt.modules.win_lgpo.set_user_policy(nam, set, adml_language='en-US')
```

Set a single user policy

Parameters

- `name (str)` -- The name of the policy to configure
- `setting (str)` -- The setting to configure the named policy with
- `adm_language (str)` -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

Returns

True if successful, Otherwise False

Return type

bool

CLI Example:

```
salt '*' lgpo.set_user_policy "Control Panel\Display\Disable the Display" Control Panel" Enabled
```
LGPO - Registry.pol

New in version 3006.0.

A module for working with registry based policies in Windows Local Group Policy (LGPO). This module contains functions for working with the Registry.pol file. The Registry.pol file is the source of truth for registry settings and LGPO.

Group Policy is refreshed every 90 seconds by default. During that refresh the contents of the Registry.pol file are applied to the Registry. If the setting is changed outside of Group Policy to something other than what is contained in the Registry.pol file, it will be changed back during the next refresh.

In the Group Policy Editor (gpedit.msc) these policies can be set to three states:

- Not Configured
- Enabled
- Disabled

A policy that is "Not Configured" does not have an entry in the Registry.pol file. A Group Policy refresh will not make any changes to key/value pairs in the registry that are not specified in the Registry.pol file.

An "Enabled" policy will have an entry in the Registry.pol files that contains its key path, value name, value type, value size, and value data. When Group Policy is refreshed, existing values will be overwritten with those contained in the Registry.pol file.

A "Disabled" policy will have an entry in the Registry.pol file with the key path and the value name, but the value name will be prepended with **del.. When Group Policy is refreshed the key/value will be deleted from the registry. If the key contains no values, it will also be deleted.

Working with LGPO Reg

The easiest way to figure out the values needed for this module is to set the policy using the Group Policy Editor (gpedit.msc) and then run the lgpo_reg.read_reg_pol function. This function will display a dictionary of all registry-based policies in the Registry.pol file. From its return you can get the key, v_name, v_type, and v_data required to "enable" that policy. Use those values to set/disable/delete policies using this module. The same values can also be used to create states for setting these policies.

Note: Not all policies in the Group Policy Editor (gpedit.msc) that write to the registry make that change in the Registry.pol file. Those policies could still be enforced via the Registry.pol file... theoretically. But you will have to find the values needed to set them with this module using a different method.

salt.modules.win_lgpo_reg.delete_value(key, v_name, policy_class='Machine')

Delete a key/value pair from the Registry.pol file. This bypasses the admx/adml style policies. This is the equivalent of setting the policy to Not Configured.

Parameters

- key (str) -- The registry key path
- v_name (str) -- The registry value name within the key
- policy_class (str) -- The registry class to write to. Can be one of the following:
  - Computer
  - Machine
  - User
  Default is Machine
Raises

- **SaltInvocationError** -- Invalid policy_class
- **CommandExecutionError** -- On failure

Returns

True if successful, otherwise False None: Key/value not present

Return type

bool

CLI Example:

```bash
# Delete all values under a key
salt '*' lgpo_reg.delete_value "SOFTWARE\MyKey" "MyValue"
```

**salt.modules.win_lgpo_reg.disable_value(key, v_name, policy_class='Machine')**

Mark a registry value for deletion in the registry.pol file. This bypasses the admx/adml style policies. This is the equivalent of setting the policy to Disabled in the Group Policy editor (`gpedit.msc`)

Parameters

- **key (str)** -- The registry key path
- **v_name (str)** -- The registry value name within the key
- **policy_class (str)** -- The registry class to write to. Can be one of the following:
  - Computer
  - Machine
  - User
  - Default is Machine

Raises

- **SaltInvocationError** -- Invalid policy_class
- **CommandExecutionError** -- On failure

Returns

True if successful, otherwise False None: If already disabled

Return type

bool

CLI Example:

```bash
# Delete a value
salt '*' lgpo_reg.delete_value "SOFTWARE\MyKey" "MyValue"
```

**salt.modules.win_lgpo_reg.get_key(key, policy_class='Machine')**

Get all the values set in a key in the Registry.pol file.

Parameters

- **key (str)** -- The registry key where the values reside
- **policy_class (str)** -- The registry class to read from. Can be one of the following:

Raises

- **SaltInvocationError** -- Invalid policy class

Returns

A dictionary containing the value data and the value type

Return type

dict

CLI Example:

```bash
# Get all values from a key
salt '*' lgpo_reg.get_key "SOFTWARE\MyKey"
```

**salt.modules.win_lgpo_reg.get_value(key, v_name, policy_class='Machine')**

Get the value of a single value pair as set in the Registry.pol file.
Parameters

- **key** *(str)* -- The registry key where the value name resides
- **v_name** *(str)* -- The value name to retrieve
- **policy_class** *(str)* -- The registry class to read from. Can be one of the following:

Raises

- **SaltInvocationError** -- Invalid policy class

Returns

A dictionary containing the value data and the value type found

Return type

dict

CLI Example:

```
# Get a value
salt '*' lgpo_reg.get_value "SOFTWARE\MyKey" "MyValue"
```

salt.modules.win_lgpo_reg.read_reg_pol(policy_class='Machine')

Read the contents of the Registry.pol file. Display the contents as a human-readable dictionary.

Parameters

- **policy_class** *(str)* -- The registry class to retrieve. Can be one of the following:
  - Computer
  - Machine
  - User
  
  Default is Machine

Raises

- **SaltInvocationError** -- Invalid policy class

Returns

A dictionary representing the contents of the Registry.pol file

Return type

dict

CLI Example:

```
# Read the machine Registry.pol
salt '*' lgpo_reg.read_reg_pol
```

salt.modules.win_lgpo_reg.set_value(key, v_name, v_data, v_type='REG_DWORD', policy_class='Machine')

Add a key/value pair to the registry.pol file. This bypasses the admx/adml style policies. This is the equivalent of setting a policy to Enabled

Parameters

- **key** *(str)* -- The registry key path
- **v_name** *(str)* -- The registry value name within the key
- **v_data** *(str)* -- The registry value
- **v_type** *(str)* -- The registry value type. Must be one of the following:
  - REG_BINARY
  - REG_DWORD
  - REG_EXPAND_SZ
  - REG_MULTI_SZ
  - REG_QWORD
  - REG_SZ

  Default is REG_DWORD

- **policy_class** *(str)* -- The registry class to write to. Can be one of the following:
  - Computer
  - Machine
- User
  Default is Machine

Raises
  • `SaltInvocationError` -- Invalid policy_class
  • `SaltInvocationError` -- Invalid v_type
  • `SaltInvocationError` -- v_data doesn't match v_type

Returns
  True if successful, otherwise False

Return type
  `bool`

CLI Example:

```
# Set REG_DWORD value (default)
salt '*' lgpo_reg.set_value "SOFTWARE\MyKey" "MyValue" 1

# Set REG_SZ value
salt '*' lgpo_reg.set_value "SOFTWARE\MyKey" "MyValue" "string value"
```

```
salt.modules.win_lgpo_reg.write_reg_pol(data, policy_class='Machine')
Write data to the Registry.pol file. The data is a dictionary that is then converted to the appropriate bytes format expected by Registry.pol

Parameters
  • `data (dict)` -- A dictionary containing Registry.pol data
  • `policy_class (str)` -- The registry class to write to. Can be one of the following:
    - Computer
    - Machine
    - User
      Default is Machine

Raises
  • `SaltInvocationError` -- Invalid policy class
  • `CommandExecutionError` -- On failure

Returns
  True if successful

Return type
  `bool`

CLI Example:

```
# Write to Machine Registry.pol
salt '*' lgpo_reg.write_reg_pol "{'SOFTWARE\MyKey': {'MyValue': 'data': 1, →'type': 'REG_DWORD'}}"
```

26.6.496 salt.modules.win_license

This module allows you to manage windows licensing via slmgr.vbs

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXX
```

```
salt.modules.win_license.activate()
    Attempt to activate the current machine via Windows Activation
```

CLI Example:
salt '*' license.activate

salt.modules.win_license.info()
Return information about the license, if the license is not correctly activated this will return None.

CLI Example:
salt '*' license.info

salt.modules.win_license.install(product_key)
Install the given product key

CLI Example:
salt '*' license.install XXXX-XXXX-XXXX-XXXX-XXXX

salt.modules.win_license.installed(product_key)
Check to see if the product key is already installed.

Note: This is not 100% accurate as we can only see the last 5 digits of the license.

CLI Example:
salt '*' license.installed XXXX-XXXX-XXXX-XXXX-XXXX

salt.modules.win_license.licensed()
Return true if the current machine is licensed correctly

CLI Example:
salt '*' license.licensed

salt.modules.win_license.uninstall()
Uninstall the current product key

CLI Example:
salt '*' license.uninstall

26.6.497 salt.modules.win_network
Module for gathering and managing network information

salt.modules.win_network.connect(host, port=None, **kwargs)
Test connectivity to a host using a particular port from the minion.

New in version 2016.3.0.

CLI Example:
salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
salt.modules.win_network.dig(host)
    Performs a DNS lookup with dig
    Note: dig must be installed on the Windows minion
    CLI Example:
    ```
salt '*' network.dig archlinux.org
    ```

salt.modules.win_network.get_route(ip)
    Return routing information for given destination ip
    New in version 2016.11.5.
    CLI Example:
    ```
salt '*' network.get_route 10.10.10.10
    ```

salt.modules.win_network.hw_addr(iface)
    Return the hardware address (a.k.a. MAC address) for a given interface
    CLI Example:
    ```
salt '*' network.hw_addr 'Wireless Connection #1'
    ```

salt.modules.win_network.hwaddr(iface)
    This function is an alias of hw_addr.
    Return the hardware address (a.k.a. MAC address) for a given interface
    CLI Example:
    ```
salt '*' network.hw_addr 'Wireless Connection #1'
    ```

salt.modules.win_network.in_subnet(cidr)
    Returns True if host is within specified subnet, otherwise False
    CLI Example:
    ```
salt '*' network.in_subnet 10.0.0.0/16
    ```

salt.modules.win_network.interfaces()
    Return a dictionary of information about all the interfaces on the minion
    CLI Example:
    ```
salt '*' network.interfaces
    ```

salt.modules.win_network.interfaces_names()
    Return a list of all the interfaces names
    CLI Example:
salt '*' network.interfaces_names

salt.modules.win_network.ip_addrs(interface=None, include_loopback=False, cidr=None, type=None)
Returns a list of IPv4 addresses assigned to the host.

interface
Only IP addresses from that interface will be returned.

include_loopback
[False] Include loopback 127.0.0.1 IPv4 address.

cidr
Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.
   Changed in version 2019.2.0.

type
If option set to 'public' then only public addresses will be returned. Ditto for 'private'.
   Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs
salt '*' network.ip_addrs cidr=10.0.0.0/8
salt '*' network.ip_addrs cidr=192.168.0.0/16 type=private
```

salt.modules.win_network.ip_addrs6(interface=None, include_loopback=False, cidr=None)
Returns a list of IPv6 addresses assigned to the host.

interface
Only IP addresses from that interface will be returned.

include_loopback
[False] Include loopback ::1 IPv6 address.

cidr
Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.
   Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs6
salt '*' network.ip_addrs6 cidr=2000::/3
```

salt.modules.win_network.ipaddr(interface=None, include_loopback=False, cidr=None, type=None)
This function is an alias of ip_addrs.
Returns a list of IPv4 addresses assigned to the host.

interface
Only IP addresses from that interface will be returned.

include_loopback
[False] Include loopback 127.0.0.1 IPv4 address.

cidr
Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.
   Changed in version 2019.2.0.

CLI Example:
salt.modules.win_network.ipaddrs6(interface=None, include_loopback=False, cidr=None)
This function is an alias of ip_addrs6.
Returns a list of IPv6 addresses assigned to the host.
interface
Only IP addresses from that interface will be returned.
include_loopback
[False] Include loopback ::1 IPv6 address.
cidr
Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.
Changed in version 2019.2.0.
CLI Example:
salt '*' network.ip_addrs6
salt '*' network.ip_addrs6 cidr=2000::/3

salt.modules.win_network.is_private(ip_addr)
Check if the given IP address is a private address
New in version 2019.2.0.
CLI Example:
salt '*' network.is_private 10.0.0.3

salt.modules.win_network.netstat()
Return information on open ports and states
CLI Example:
salt '*' network.netstat

salt.modules.win_network.nslookup(host)
Query DNS for information about a domain or ip address
CLI Example:
salt '*' network.nslookup archlinux.org

salt.modules.win_network.ping(host, timeout=False, return_boolean=False)
Performs a ping to a host
CLI Example:
salt '*' network.ping archlinux.org
New in version 2016.11.0.
Return a True or False instead of ping output.
salt '*' network.ping archlinux.org return_boolean=True
Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

**salt.modules.win_network.subnets()**

Returns a list of subnets to which the host belongs

CLI Example:
```
salt '*' network.subnets
```

**salt.modules.win_network.traceroute(host)**

Performs a traceroute to a 3rd party host

CLI Example:
```
salt '*' network.traceroute archlinux.org
```

### 26.6.498 salt.modules.win_ntp

Management of NTP servers on Windows

New in version 2014.1.0.

**salt.modules.win_ntp.get_servers()**

Get list of configured NTP servers

CLI Example:
```
salt '*' ntp.get_servers
```

**salt.modules.win_ntp.set_servers('servers')**

Set Windows to use a list of NTP servers

CLI Example:
```
salt '*' ntp.set_servers 'pool.ntp.org' 'us.pool.ntp.org'
```

### 26.6.499 salt.modules.win_path

Manage the Windows System PATH

Note that not all Windows applications will rehash the PATH environment variable, Only the ones that listen to the WM_SETTINGCHANGE message.

**salt.modules.win_path.add(path, index=None, **kwargs)**

Add the directory to the SYSTEM path in the index location. Returns True if successful, otherwise False.

- **path**
  Directory to add to path

- **index**
  Optionally specify an index at which to insert the directory

- **rehash**
  [True] If the registry was updated, and this value is set to True, sends a WM_SETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

CLI Examples:
salt.modules.win_path.add(path, index=-1)

salt.modules.win_path.exists(path)
Check if the directory is configured in the SYSTEM path Case-insensitive and ignores trailing backslash
Returns
boolean True if path exists, False if not
CLI Example:
salt '*' win_path.exists 'c:\python27'
salt '*' win_path.exists 'c:\python27\'
salt '*' win_path.exists 'C:\python27'

salt.modules.win_path.get_path()
Returns a list of items in the SYSTEM path
CLI Example:
salt '*' win_path.get_path

salt.modules.win_path.rehash()
Send a WM_SETTINGCHANGE Broadcast to Windows to refresh the Environment variables for new processes.

Note: This will only affect new processes that aren't launched by services. To apply changes to the path to services, the host must be restarted. The salt-minion, if running as a service, will not see changes to the environment until the system is restarted. See MSDN Documentation
CLI Example:
salt '*' win_path.rehash

salt.modules.win_path.remove(path, **kwargs)
Remove the directory from the SYSTEM path
Returns
boolean True if successful, False if unsuccessful
rehash
[True] If the registry was updated, and this value is set to True, sends a WM_SETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

CLI Example:
# Will remove C:\Python27 from the path
salt '*' win_path.remove 'c:\\python27'
26.6.500 salt.modules.win_pkg

A module to manage software on Windows

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to ‘pkg.install’ is not available), see here.

The following functions require the existence of a windows repository metadata DB, typically created by running pkg.refresh_db:

- pkg.get_repo_data
- pkg.install
- pkg.latest_version
- pkg.list_available
- pkg.list_pkgs
- pkg.list_upgrades
- pkg.remove

If a metadata DB does not already exist and one of these functions is run, then one will be created from the repo SLS files that are present.

As the creation of this metadata can take some time, the winrepo_cache_expire_min minion config option can be used to suppress refreshes when the metadata is less than a given number of seconds old.

**Note:** Version numbers can be version number string, latest and Not Found, where Not Found means this module was not able to determine the version of the software installed, it can also be used as the version number in sls definitions file in these cases. Versions numbers are sorted in order of 0, Not Found, order version numbers, ..., latest.

**salt.modules.win_pkg.compare_versions**(*ver1='', oper='==', ver2='')*

Compare software package versions. Made public for use with Jinja

**Parameters**

- **ver1** (str) -- A software version to compare
- **oper** (str) -- The operand to use to compare
- **ver2** (str) -- A software version to compare

**Returns**

True if the comparison is valid, otherwise False

**Return type**

bool

**CLI Example:**

```
salt '*' pkg.compare_versions 1.2 >= 1.3
```

**salt.modules.win_pkg.genrepo(**"**kwargs")**

Generate package metadata db based on files within the winrepo_source_dir

**Kwargs:**

- **saltenv** (str): Salt environment. Default: base
- **verbose** (bool):

  Return verbose data structure which includes 'success_list', a list of all sls files and the package names contained within. Default False.
failhard (bool):
    If True, an error will be raised if any repo SLS files failed to process. If False, no error
    will be raised, and a dictionary containing the full results will be returned.

Note:
- Hidden directories (directories beginning with '.', such as '.git') will be ignored.

Returns
A dictionary of the results of the command

Return type
dict

CLI Example:
```
salt-run pkg.genrepo
salt -G 'os:windows' pkg.genrepo verbose=true failhard=false
salt -G 'os:windows' pkg.genrepo saltenv=base
```

salt.modules.win_pkg.get_package_info(name, saltenv='base')
Get information about the package as found in the winrepo database

Parameters
- name (str) -- The name of the package
- saltenv (str) -- The salt environment to use. Default is "base"

Returns
A dictionary of package info, empty if package not available

Return type
dict

CLI Example:
```
salt '*' pkg.get_package_info chrome
```

salt.modules.win_pkg.get_repo_data(saltenv='base')
Returns the existing package metadata db. Will create it, if it does not exist, however will not refresh it.

Parameters
- saltenv (str) -- Salt environment. Default base

Returns
A dict containing contents of metadata db.

Return type
dict

CLI Example:
```
salt '*' pkg.get_repo_data
```

salt.modules.win_pkg.install(name=None, refresh=False, pkgs=None, **kwargs)
Install the passed package(s) on the system using winrepo

Parameters
- name (str) -- The name of a single package, or a comma-separated list of packages to install. (no spaces after the commas)
- refresh (bool) -- Boolean value representing whether or not to refresh the winrepo db. Default False.
- pkgs (list) -- A list of packages to install from a software repository. All packages listed under pkgs will be installed via a single command.

You can specify a version by passing the item as a dict:
CLI Example:

```bash
salt '*' pkg.install pkgs='["foo", "bar"]'
```

```bash
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
```

Kwargs:

**version (str):**
The specific version to install. If omitted, the latest version will be installed. Recommend for use when installing a single package.

If passed with a list of packages in the `pkgs` parameter, the version will be ignored.

CLI Example:

```bash
salt '*' pkg.install pkgs='["foo", 'bar']" version=1.2.3
```

If passed with a comma separated list in the `name` parameter, the version will apply to all packages in the list.

CLI Example:

```bash
salt '*' pkg.install foo,bar version=1.2.3
```

**extra_install_flags (str):**
Additional install flags that will be appended to the `install_flags` defined in the software definition file. Only applies when single package is passed.

**saltenv (str):**
Salt environment. Default 'base'

**report_reboot_exit_codes (bool):**
If the installer exits with a recognized exit code indicating that a reboot is required, the module function `win_system.set_reboot_required_witnessed` will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code. The value of this param defaults to True.

New in version 2016.11.0.

Returns

Return a dict containing the new package names and versions. If the package is already installed, an empty dict is returned.

If the package is installed by `pkg.install`:

```json
{ '<package>': { 'old': '<old-version>', 'new': '<new-version>' }}
```

Return type

`dict`

The following example will refresh the winrepo and install a single package, 7zip.

CLI Example:
salt '*/' pkg.install 7zip refresh=True

CLI Example:
salt '*/' pkg.install 7zip
salt '*/' pkg.install 7zip,filezilla
salt '*/' pkg.install pkgs=['"7zip","filezilla"]

WinRepo Definition File Examples:
The following example demonstrates the use of cache_file. This would be used if you have multiple installers in the same directory that use the same install.ini file and you don't want to download the additional installers.

ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_file: 'salt://win/repo/ntp/install.ini'
    install_flags: '/USEFILE:C:\salt\var\cache\salt\minion\files\base\win\...
    uninstaller: 'NTP/uninst.exe'

The following example demonstrates the use of cache_dir. It assumes a file named install.ini resides in the same directory as the installer.

ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_dir: True
    cache_file: 'salt://win/repo/ntp/install.ini'
    install_flags: '/USEFILE:C:\salt\var\cache\salt\minion\files\base\win\...
    uninstaller: 'NTP/uninst.exe'

salt.modules.win_pkg.latest_version('names', **kwargs)
Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned. If the latest version of a given package is already installed, an empty string will be returned for that package.

Note: Since this is looking for the latest version available, a refresh_db will be triggered by default. This can take some time. To avoid this set refresh to False.

Parameters
  names (str) -- A single or multiple names to lookup

Kwarg:
  saltenv (str): Salt environment. Default base
  refresh (bool): Refresh package metadata. Default True
Returns
A dictionary of packages with the latest version available

Return type
dict

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

```
salt.modules.win_pkg.list_available(*names, **kwargs)
```
Return a list of available versions of the specified package.

Parameters

- **names** *(str)* -- One or more package names

Kwarg:

- **saltenv** *(str)*: The salt environment to use. Default *base*.
- **refresh** *(bool)*: Refresh package metadata. Default *False*.
- **return_dict_always** *(bool)*: Default *False* dict when a single package name is queried.

Returns
The package name with its available versions

Return type
dict

```
{ '<package name>': ['<version>', '<version>', ] }
```

CLI Example:

```
salt '*' pkg.list_available <package name> return_dict_always=True
salt '*' pkg.list_available <package name01> <package name02>
```

```
salt.modules.win_pkg.list_pkgs(versions_as_list=False, include_components=True, include_updates=True, **kwargs)
```
List the packages currently installed.

Note: To view installed software as displayed in the Add/Remove Programs, set **include_components** and **include_updates** to *False*.

Parameters

- **versions_as_list** *(bool)* -- Returns the versions as a list
- **include_components** *(bool)* -- Include sub components of installed software.
  Default is *True*
- **include_updates** *(bool)* -- Include software updates and Windows updates. Default is *True*

Kwarg:

- **saltenv** *(str)*: The salt environment to use. Default *base*
- **refresh** *(bool)*: Refresh package metadata. Default *False*

Returns

A dictionary of installed software with versions installed
Return type
dict

{"<package_name>': '<version>'}

CLI Example:
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True

salt.modules.win_pkg.list_upgrades(refresh=True, **kwargs)
List all available package upgrades on this system
Parameters
refresh (bool) -- Refresh package metadata. Default True
Kwargs:
saltenv (str): Salt environment. Default base
Returns
A dictionary of packages with available upgrades
Return type
dict

CLI Example:
salt '*' pkg.list_upgrades

salt.modules.win_pkg.normalize_name(name)
Nothing to do on Windows. We need this function so that Salt doesn't go through every module looking for pkg.normalize_name.
New in version 3006.0.
Parameters
name (str) -- The name of the package
Returns
The name of the package
Return type
str

CLI Example:
salt '*' pkg.normalize_name git

salt.modules.win_pkg.purge(name=None, pkgs=None, **kwargs)
Package purges are not supported on Windows, this function is identical to remove().

Note: At some point in the future, pkg.purge may direct the installer to remove all configs and settings for software packages that support that option.

New in version 0.16.0.
Parameters
• name (str) -- The name of the package to be deleted.
• version (str) -- The version of the package to be deleted. If this option is used in combination with the pkgs option below, then this version will be applied to all targeted packages.
- **pkgs** *(list)* -- A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

**Kwargs:**
- `saltenv` *(str)*: Salt environment. Default `base`
- `refresh` *(bool)*: Refresh package metadata. Default `False`

**Returns**
A dict containing the changes.

**Return type**
dict

**CLI Example:**

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.win_pkg.refresh_db(**kwargs)``

Generates the local software metadata database *(winrepo.p)* on the minion. The database is stored in a serialized format located by default at the following location:

```
C:\ProgramData\Salt Project\Salt\var\cache\salt\minion\files\base\win\repo-ng\winrepo.p
```

This module performs the following steps to generate the software metadata database:

- Fetch the package definition files *(.sls)* from `winrepo_source_dir` (default `salt://win/repo-ng`) and cache them in `<cachedir-files-saltenv>` (default: `C:\ProgramData\Salt Project\Salt\var\cache\salt\minion\files\base\win\repo-ng`)
- Call `pkg.genrepo` to parse the package definition files and generate the repository metadata database file *(winrepo.p)*
- Return the report received from `pkg.genrepo`

The default winrepo directory on the master is `/srv/salt/win/repo-ng`. All files that end with `.sls` in this and all subdirectories will be used to generate the repository metadata database *(winrepo.p)*.

**Note:**
- Hidden directories (directories beginning with `.'`, such as `'.git'`) will be ignored.

**Note:** There is no need to call `pkg.refresh_db` every time you work with the pkg module. Automatic refresh will occur based on the following minion configuration settings:
  - `winrepo_cache_expire_min`
  - `winrepo_cache_expire_max`

However, if the package definition files have changed, as would be the case if you are developing a new package definition, this function should be called to ensure the minion has the latest information about packages available to it.

**Warning:** Directories and files fetched from `<winrepo_source_dir>` (`/srv/salt/win/repo-ng`) will be processed in alphabetical order. If two or more software definition files contain the same name, the last one processed replaces all data from the files processed before it.

For more information see *Windows Software Repository*

**Arguments:**
saltenv (str): Salt environment. Default: base

verbose (bool):
Return a verbose data structure which includes 'success_list', a list of all sls files and the package names contained within. Default is 'False'

failhard (bool):
If True, an error will be raised if any repo SLS files fails to process. If False, no error will be raised, and a dictionary containing the full results will be returned.

Returns
A dictionary containing the results of the database refresh.

Return type
dict

Note: A result with a total: 0 generally means that the files are in the wrong location on the master. Try running the following command on the minion: salt-call -l debug pkg.refresh saltenv=base

Warning: When calling this command from a state using module.run be sure to pass failhard: False. Otherwise, the state will report failure if it encounters a bad software definition file.

CLI Example:
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db saltenv=base

salt.modules.win_pkg.remove(name=None, pkgs=None, **kwargs)
Remove the passed package(s) from the system using winrepo

New in version 0.16.0.

Parameters
- name (str) -- The name(s) of the package(s) to be uninstalled. Can be a single package or a comma delimited list of packages, no spaces.
- pkgs (list) -- A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Kwargs:
version (str):
The version of the package to be uninstalled. If this option is used to to uninstall multiple packages, then this version will be applied to all targeted packages. Recommended using only when uninstalling a single package. If this parameter is omitted, the latest version will be uninstalled.

Returns
Returns a dict containing the changes.

If the package is removed by pkg.remove:
{<package>: {'old': '<old-version>',
'new': '<new-version>'}}
If the package is already uninstalled:
{<package>: {'current': 'not installed'}}

Return type
dict
CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

**salt.modules.win_pkg.upgrade(**`**kwargs**`)**

Upgrades all software. Currently not implemented

**Kwargs:**
- `saltenv (str)`: The salt environment to use. Default `base`
- `refresh (bool)`: Refresh package metadata. Default `True`.

**Note:** This feature is not yet implemented for Windows.

**Returns**
- Empty dict, until implemented
**Return type**
- dict

CLI Example:

```
salt '*' pkg.upgrade
```

**salt.modules.win_pkg.upgrade_available**(name,**`**kwargs**`)**

Check whether or not an upgrade is available for a given package

**Parameters**
- `name (str)` -- The name of a single package

**Kwargs:**
- `refresh (bool)`: Refresh package metadata. Default `True`
- `saltenv (str)`: The salt environment. Default `base`

**Returns**
- True if new version available, otherwise False
**Return type**
- bool

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

**salt.modules.win_pkg.version**(names,**`**kwargs**`)**

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**Parameters**
- `names (str)` -- One or more package names

**Kwargs:**
- `saltenv (str)`: The salt environment to use. Default `base`
- `refresh (bool)`: Refresh package metadata. Default `False`.

**Returns**
- version string when a single package is specified. dict: The package name(s) with the installed versions.
**Return type**
- str
26.6.501  salt.modules.win_pki

**platform**

Windows

**depends**

- PowerShell 4
- PKI Client Module (Windows 8+ / Windows Server 2012+)

New in version 2016.11.0.

salt.modules.win_pki.export_cert( name, thumbprint, cert_format='cer', context='LocalMachine', store='My', password=''' )

Export the certificate to a file from the given certificate store.

**Parameters**

- `name` (str) -- The destination path for the exported certificate file.
- `thumbprint` (str) -- The thumbprint value of the target certificate.
- `cert_format` (str) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- `context` (str) -- The name of the certificate store location context.
- `store` (str) -- The name of the certificate store.
- `password` (str) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

**Returns**

A boolean representing whether all changes succeeded.

**Return type**

bool

CLI Example:

```salt '*' win_pki.export_cert name='C:\certs\example.cer' thumbprint='AAA000'```

salt.modules.win_pki.get_cert_file( name, cert_format='cer', password=''' )

Get the details of the certificate file.

**Parameters**

- `name` (str) -- The filesystem path of the certificate file.
- `cert_format` (str) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
• **password** (*str*) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

**Returns**
A dictionary of the certificate thumbprints and properties.

**Return type**
dict

**CLI Example:**
```
salt '*' win_pki.get_cert_file name='C:\certs\example.cer'
```

**salt.modules.win_pki.get_certs**( **context**='LocalMachine', **store**='My')
Get the available certificates in the given store.

**Parameters**
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.

**Returns**
A dictionary of the certificate thumbprints and properties.

**Return type**
dict

**CLI Example:**
```
salt '*' win_pki.get_certs
```

**salt.modules.win_pki.get_stores()**
Get the certificate location contexts and their corresponding stores.

**Returns**
A dictionary of the certificate location contexts and stores.

**Return type**
dict

**CLI Example:**
```
salt '*' win_pki.get_stores
```

**salt.modules.win_pki.import_cert**( **name**,** cert_format**='cer', **context**='LocalMachine', **store**='My', **exportable**=True, **password**='', **saltenv**='base')
Import the certificate file into the given certificate store.

**Parameters**
- **name** (*str*) -- The path of the certificate file to import.
- **cert_format** (*str*) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.
- **exportable** (*bool*) -- Mark the certificate as exportable. Only applicable to pfx format.
- **password** (*str*) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.
- **saltenv** (*str*) -- The environment the file resides in.

**Returns**
A boolean representing whether all changes succeeded.

**Return type**
bool

**CLI Example:**
salt.modules.win_pki.import_cert(name='salt://cert.cer')

salt.modules.win_pki.remove_cert(thumbprint, context='LocalMachine', store='My')

Remove the certificate from the given certificate store.

Parameters

- **thumbprint** (str) -- The thumbprint value of the target certificate.
- **context** (str) -- The name of the certificate store location context.
- **store** (str) -- The name of the certificate store.

Returns

A boolean representing whether all changes succeeded.

Return type

bool

CLI Example:

```
salt '*' win_pki.remove_cert thumbprint='AAA000'
```

salt.modules.win_pki.test_cert(thumbprint, context='LocalMachine', store='My', untrusted_root=False, dns_name='', eku='')

Check the certificate for validity.

Parameters

- **thumbprint** (str) -- The thumbprint value of the target certificate.
- **context** (str) -- The name of the certificate store location context.
- **store** (str) -- The name of the certificate store.
- **untrusted_root** (bool) -- Whether the root certificate is required to be trusted in chain building.
- **dns_name** (str) -- The DNS name to verify as valid for the certificate.
- **eku** (str) -- The enhanced key usage object identifiers to verify for the certificate chain.

Returns

A boolean representing whether the certificate was considered valid.

Return type

bool

CLI Example:

```
salt '*' win_pki.test_cert thumbprint='AAA000' dns_name='example.test'
```

26.6.502 salt.modules.win_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```
# Set monitor to never turn off on Battery power
salt '*' powercfg.set_monitor_timeout 0 power=dc
# Set disk timeout to 120 minutes on AC power
salt '*' powercfg.set_disk_timeout 120 power=ac
```

salt.modules.win_powercfg.get_disk_timeout(scheme=None)

Get the current disk timeout of the given scheme.

Parameters

- **scheme** (str) -- The scheme to use, leave as None to use the current. Default is None.

This can be the GUID or the Alias for the Scheme. Known Aliases are:
## powercfg.get_disk_timeout

Get the current disk timeout of the given scheme.

**Parameters**

- **scheme** *(str)* -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the alias for the scheme. Known aliases are:
  - `SCHEME_BALANCED` - Balanced
  - `SCHEME_MAX` - Power saver
  - `SCHEME_MIN` - High performance

**Returns**

A dictionary of both the AC and DC settings

**Return type**

`dict`

**CLI Example:**
```
salt '*' powercfg.get_disk_timeout
```

## powercfg.get_hibernate_timeout

Get the current hibernate timeout of the given scheme.

**Parameters**

- **scheme** *(str)* -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the alias for the scheme. Known aliases are:
  - `SCHEME_BALANCED` - Balanced
  - `SCHEME_MAX` - Power saver
  - `SCHEME_MIN` - High performance

**Returns**

A dictionary of both the AC and DC settings

**Return type**

`dict`

**CLI Example:**
```
salt '*' powercfg.get_hibernate_timeout
```

## powercfg.get_monitor_timeout

Get the current monitor timeout of the given scheme.

**Parameters**

- **scheme** *(str)* -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the alias for the scheme. Known aliases are:
  - `SCHEME_BALANCED` - Balanced
  - `SCHEME_MAX` - Power saver
  - `SCHEME_MIN` - High performance

**Returns**

A dictionary of both the AC and DC settings

**Return type**

`dict`

**CLI Example:**
```
salt '*' powercfg.get_monitor_timeout
```

## powercfg.get_standby_timeout

Get the current standby timeout of the given scheme.

**Parameters**

- **scheme** *(str)* -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the alias for the scheme. Known aliases are:
  - `SCHEME_BALANCED` - Balanced
  - `SCHEME_MAX` - Power saver
  - `SCHEME_MIN` - High performance

**Returns**

A dictionary of both the AC and DC settings
Return type
dict

CLI Example:

```
salt '*' powercfg.get_standby_timeout
```

salt.modules.win_powercfg.set_disk_timeout(*timeout, power='ac', scheme=None*)

Set the disk timeout in minutes for the given power scheme

Parameters

- **timeout** (int) -- The amount of time in minutes before the disk will timeout
- **power** (str) -- Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme** (str) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
# Sets the disk timeout to 30 minutes on battery
salt '*' powercfg.set_disk_timeout 30 power=dc
```

salt.modules.win_powercfg.set_hibernate_timeout(*timeout, power='ac', scheme=None*)

Set the hibernate timeout in minutes for the given power scheme

Parameters

- **timeout** (int) -- The amount of time in minutes before the computer hibernates
- **power** (str) -- Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme** (str) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
# Sets the hibernate timeout to 30 minutes on Battery
salt '*' powercfg.set_hibernate_timeout 30 power=dc
```

salt.modules.win_powercfg.set_monitor_timeout(*timeout, power='ac', scheme=None*)

Set the monitor timeout in minutes for the given power scheme

Parameters

- **timeout** (int) -- The amount of time in minutes before the monitor will timeout
- **power** (str) -- Set the value for AC or DC power. Default is ac. Valid options are:
- ac (AC Power)
- dc (Battery)
  - **scheme** (*str*) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
    - SCHEME_BALANCED - Balanced
    - SCHEME_MAX - Power saver
    - SCHEME_MIN - High performance

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```bash
# Sets the monitor timeout to 30 minutes
salt '*' powercfg.set_monitor_timeout 30
```

**salt.modules.win_powercfg.set_standby_timeout**(*timeout, power='ac', scheme=None*)

Set the standby timeout in minutes for the given power scheme

Parameters
  - **timeout** (*int*) -- The amount of time in minutes before the computer sleeps
  - **power** (*str*) -- Set the value for AC or DC power. Default is ac. Valid options are:
    - ac (AC Power)
    - dc (Battery)
  - **scheme** (*str*) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
    - SCHEME_BALANCED - Balanced
    - SCHEME_MAX - Power saver
    - SCHEME_MIN - High performance

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```bash
# Sets the system standby timeout to 30 minutes on Battery
salt '*' powercfg.set_standby_timeout 30 power=dc
```

### 26.6.503  salt.modules.win_psget

Module for managing PowerShell through PowerShellGet (PSGet)

**depends**
- PowerShell 5.0
- PSGet

Support for PowerShell

**salt.modules.win_psget.avail_modules**(*desc=False*)

List available modules in registered Powershell module repositories.

Parameters
  - **desc** (bool) -- If True, the verbose description will be returned.

CLI Example:
salt.modules.win_psget.bootstrap()

Make sure that nuget-anycpu.exe is installed. This will download the official nuget-anycpu.exe from the internet.

CLI Example:

```python
salt 'win01' psget.bootstrap
```

salt.modules.win_psget.get_repository(name)

Get the details of a local PSGet repository

Parameters
- **name** (str) -- Name of the repository

CLI Example:

```python
salt 'win01' psget.get_repository MyRepo
```

salt.modules.win_psget.install(name, minimum_version=None, required_version=None, scope=None, repository=None)

Install a Powershell module from powershell gallery on the system.

Parameters
- **name** (str) -- Name of a Powershell module
- **minimum_version** (str) -- The maximum version to install, e.g. 1.23.2
- **required_version** (str) -- Install a specific version
- **scope** (str) -- The scope to install the module to, e.g. CurrentUser, Computer
- **repository** (str) -- The friendly name of a private repository, e.g. MyREpo

CLI Example:

```python
salt 'win01' psget.install PowerPlan
```

salt.modules.win_psget.list_modules(desc=False)

List currently installed PSGet Modules on the system.

Parameters
- **desc** (bool) -- If True, the verbose description will be returned.

CLI Example:

```python
salt 'win01' psget.list_modules	salt 'win01' psget.list_modules desc=True
```

salt.modules.win_psget.register_repository(name, location, installation_policy=None)

Register a PSGet repository on the local machine

Parameters
- **name** (str) -- The name for the repository
- **location** (str) -- The URI for the repository
- **installation_policy** (str) -- The installation policy for packages, e.g. Trusted, Untrusted

CLI Example:

```python
salt 'win01' psget.register_repository MyRepo https://myrepo.mycompany.com/packages
```
salt.modules.win_psget.remove(name)

Remove a Powershell DSC module from the system.

Parameters

- name (str) -- Name of a Powershell DSC module

CLI Example:

```bash
salt 'win01' psget.remove PowerPlan
```

salt.modules.win_psget.update(name, maximum_version=None, required_version=None)

Update a PowerShell module to a specific version, or the newest

Parameters

- name (str) -- Name of a Powershell module
- maximum_version (str) -- The maximum version to install, e.g. 1.23.2
- required_version (str) -- Install a specific version

CLI Example:

```bash
tsalt 'win01' psget.update PowerPlan 26.6.504
```

26.6.504  salt.modules.win_servermanager

Manage Windows features via the ServerManager powershell module. Can list available and installed roles/features. Can install and remove roles/features.

- maintainer
  Shane Lee <slee@saltstack.com>

- platform
  Windows Server 2008R2 or greater

- depends
  PowerShell module ServerManager

salt.modules.win_servermanager.install(feature, recurse=False, restart=False, source=None, exclude=None)

Install a feature

Note: Some features require reboot after un/installation, if so until the server is restarted other features can not be installed!

Note: Some features take a long time to complete un/installation, set -t with a long timeout

Parameters

- feature (str, list) -- The name of the feature(s) to install. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.

  New in version 2018.3.0: Added the ability to pass a list of features to be installed.

- recurse (Options[bool]) -- Install all sub-features. Default is False

- restart (Optional[bool]) -- Restarts the computer when installation is complete, if required by the role/feature installed. Will also trigger a reboot if an item in exclude requires a reboot to be properly removed. Default is False
- **source (Optional[str])** -- Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None
- **exclude (Optional[str])** -- The name of the feature to exclude when installing the named feature. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

**Warning:** As there is no exclude option for the Add-WindowsFeature or Install-WindowsFeature PowerShell commands the features named in exclude will be installed with other sub-features and will then be removed. If the feature named in "exclude" is not a sub-feature of one of the installed items it will still be removed.

**Returns**
A dictionary containing the results of the install

**Return type**
dict

**CLI Example:**

```bash
# Install the Telnet Client passing a single string
salt '*' win_servermanager.install Telnet-Client

# Install the TFTP Client and the SNMP Service passing a comma-delimited string. Install all sub-features
salt '*' win_servermanager.install TFTP-Client,SNMP-Service recurse=True

# Install the TFTP Client from d:\side-by-side
salt '*' win_servermanager.install TFTP-Client source=d:\\side-by-side

# Install the XPS Viewer, SNMP Service, and Remote Access passing a list. Install all sub-features, but exclude the Web Server
salt '*' win_servermanager.install "['XPS-Viewer', 'SNMP-Service', 'RemoteAccess']" True recurse=True exclude="Web-Server"
```

```
salt.modules.win_servermanager.list_available()
List available features to install

**Returns**
A list of available features as returned by the Get-WindowsFeature PowerShell command

**Return type**
str

**CLI Example:**

```bash
salt '*' win_servermanager.list_available
```

```
salt.modules.win_servermanager.list_installed()
List installed features. Supported on Windows Server 2008 and Windows 8 and newer.

**Returns**
A dictionary of installed features

**Return type**
dict

**CLI Example:**

```bash
```
salt '*l' win_servermanager.list_installed

salt.modules.win_servermanager.remove(feature, remove_payload=False, restart=False)
Remove an installed feature

**Note:** Some features require a reboot after installation/uninstallation. If one of these features are modified, then other features cannot be installed until the server is restarted. Additionally, some features take a while to complete installation/uninstallation, so it is a good idea to use the `-t` option to set a longer timeout.

**Parameters**

- **feature (str, list)** -- The name of the feature(s) to remove. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.
  
  New in version 2018.3.0: Added the ability to pass a list of features to be removed.

- **remove_payload (Optional[bool])** -- True will cause the feature to be removed from the side-by-side store (%SystemDrive%:\Windows\WinSxS). Default is False

- **restart (Optional[bool])** -- Restarts the computer when uninstall is complete, if required by the role/feature removed. Default is False

**Returns**

A dictionary containing the results of the uninstall

**Return type**

dict

**CLI Example:**

```bash
salt -t 600 '*l' win_servermanager.remove Telnet-Client
```

**26.6.505 salt.modules.win_service**

Windows Service module.

Changed in version 2016.11.0: Rewritten to use PyWin32

salt.modules.win_service.available(name)
Check if a service is available on the system.

**Parameters**

- **name (str)** -- The name of the service to check

**Returns**

True if the service is available, False otherwise

**Return type**

bool

**CLI Example:**

```bash
salt '*l' service.available <service name>
```

salt.modules.win_service.create(name, bin_path, exe_args=None, display_name=None, description=None, service_type='own', start_type='manual', start_delayed=False, error_control='normal', load_order_group=None, dependencies=None, account_name='\LocalSystem', account_password=None, run_interactive=False, **kwargs)
Create the named service.
New in version 2015.8.0.

Parameters

- **name (str)** -- Specifies the service name. This is not the display_name
- **bin_path (str)** -- Specifies the path to the service binary file. Backslashes must be escaped, eg: C:\path\to\binary.exe
- **exe_args (str)** -- Any additional arguments required by the service binary.
- **display_name (str)** -- The name to be displayed in the service manager. If not passed, the name will be used
- **description (str)** -- A description of the service
- **service_type (str)** -- Specifies the service type. Default is own. Valid options are as follows:
  - kernel: Driver service
  - filesystem: File system driver service
  - adapter: Adapter driver service (reserved)
  - recognizer: Recognizer driver service (reserved)
  - own (default): Service runs in its own process
  - share: Service shares a process with one or more other services
- **start_type (str)** -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual (default): Service must be started manually
  - disabled: Service cannot be started
- **start_delayed (bool)** -- Set the service to Auto(Delayed Start). Only valid if the start_type is set to Auto. If service_type is not passed, but the service is already set to Auto, then the flag will be set. Default is False
- **error_control (str)** -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal (normal): Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues, no notification is given to the user
- **load_order_group (str)** -- The name of the load order group to which this service belongs
- **dependencies (list)** -- A list of services or load ordering groups that must start before this service
- **account_name (str)** -- The name of the account under which the service should run. For own type services this should be in the domain\username format. The following are examples of valid built-in service accounts:
  - NT Authority\LocalService
  - NT Authority\NetworkService
  - NT Authority\LocalSystem
  - \LocalSystem
- **account_password (str)** -- The password for the account name specified in account_name. For the above built-in accounts, this can be None. Otherwise a password must be specified.
- **run_interactive (bool)** -- If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

Returns

A dictionary containing information about the new service
Return type
dict

CLI Example:
```bash
salt '*' service.create <service name> <path to exe> display_name='→<display name>'
```

`salt.modules.win_service.create_win_salt_restart_task()`
Create a task in Windows task scheduler to enable restarting the salt-minion
Returns
True if successful, otherwise False
Return type
bool

CLI Example:
```bash
salt '*' service.create_win_salt_restart_task()
```

`salt.modules.win_service.delete(name, timeout=90)`
Delete the named service
Parameters
- **name** *(str)* -- The name of the service to delete
- **timeout** *(int)* -- The time in seconds to wait for the service to be deleted before returning. This is necessary because a service must be stopped before it can be deleted. Default is 90 seconds
  
New in version 2017.7.9,2018.3.4.
Returns
True if successful, otherwise False. Also returns True if the service is not present
Return type
bool

CLI Example:
```bash
salt '*' service.delete <service name>
```

`salt.modules.win_service.disable(name, **kwargs)`
Disable the named service to start at boot
Parameters
- **name** *(str)* -- The name of the service to disable
Returns
True if disabled, False otherwise
Return type
bool

CLI Example:
```bash
salt '*' service.disable <service name>
```

`salt.modules.win_service.disabled(name)`
Check to see if the named service is disabled to start on boot
Parameters
- **name** *(str)* -- The name of the service to check
Returns
True if the service is disabled
Return type
bool
CLI Example:

```
salt '*' service.disabled <service name>
```

```
salt.modules.win_service.enable(name, start_type='auto', start_delayed=False, **kwargs)
```

Enable the named service to start at boot

**Parameters**

- **name (str)** -- The name of the service to enable.
- **start_type (str)** -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual: Service must be started manually
  - disabled: Service cannot be started
- **start_delayed (bool)** -- Set the service to Auto(Delayed Start). Only valid if the
  start_type is set to Auto. If service_type is not passed, but the service is already set
  to Auto, then the flag will be set.

**Returns**

True if successful, False otherwise

**Return type**

bool

CLI Example:

```
salt '*' service.enable <service name>
```

```
salt.modules.win_service.enabled(name, **kwargs)
```

Check to see if the named service is enabled to start on boot

**Parameters**

- **name (str)** -- The name of the service to check

**Returns**

True if the service is set to start

**Return type**

bool

CLI Example:

```
salt '*' service.enabled <service name>
```

```
salt.modules.win_service.execute_salt_restart_task()
```

Run the Windows Salt restart task

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```
salt '*' service.execute_salt_restart_task()
```

```
salt.modules.win_service.get_all()
```

Return all installed services

**Returns**

Returns a list of all services on the system.

**Return type**

list

CLI Example:
salt '*' service.get_all

salt.modules.win_service.get_disabled()
Return a list of disabled services. Disabled is defined as a service that is marked 'Disabled' or 'Manual'.

Returns
A list of disabled services.

Return type
list

CLI Example:
salt '*' service.get_disabled

salt.modules.win_service.get_enabled()
Return a list of enabled services. Enabled is defined as a service that is marked to Auto Start.

Returns
A list of enabled services

Return type
list

CLI Example:
salt '*' service.get_enabled

salt.modules.win_service.get_service_name(*args)
The Display Name is what is displayed in Windows when services.msc is executed. Each Display Name has an associated Service Name which is the actual name of the service. This function allows you to discover the Service Name by returning a dictionary of Display Names and Service Names, or filter by adding arguments of Display Names.

If no args are passed, return a dict of all services where the keys are the service Display Names and the values are the Service Names.

If arguments are passed, create a dict of Display Names and Service Names

Returns
A dictionary of display names and service names

Return type
dict

CLI Examples:
salt '*' service.get_service_name
salt '*' service.get_service_name 'Google Update Service (gupdate)' 'DHCP Client'

salt.modules.win_service.getsid(name)
Return the SID for this windows service

Parameters
name (str) -- The name of the service for which to return the SID

Returns
A string representing the SID for the service

Return type
str

CLI Example:
salt '*' service.getsid <service name>
salt.modules.win_service.info(name)

Get information about a service on the system

Parameters

- **name** *(str)* -- The name of the service. This is not the display name. Use `get_service_name` to find the service name.

Returns

A dictionary containing information about the service.

Return type

dict

CLI Example:

```
salt '*' service.info spooler
```

salt.modules.win_service.missing(name)

The inverse of service.available.

Parameters

- **name** *(str)* -- The name of the service to check

Returns

True if the service is missing, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.missing <service name>
```

salt.modules.win_service.modify(name, bin_path=None, exe_args=None, display_name=None, description=None, service_type=None, start_type=None, start_delayed=None, error_control=None, load_order_group=None, dependencies=None, account_name=None, account_password=None, run_interactive=None)

Modify a service's parameters. Changes will not be made for parameters that are not passed.

New in version 2016.11.0.

Parameters

- **name** *(str)* -- The name of the service. Can be found using the `service.get_service_name` function
- **bin_path** *(str)* -- The path to the service executable. Backslashes must be escaped, eg: C:\path\to\binary.exe
- **exe_args** *(str)* -- Any arguments required by the service executable
- **display_name** *(str)* -- The name to display in the service manager
- **description** *(str)* -- The description to display for the service
- **service_type** *(str)* -- Specifies the service type. Default is `own`. Valid options are as follows:
  - kernel: Driver service
  - filesystem: File system driver service
  - adapter: Adapter driver service (reserved)
  - recognizer: Recognizer driver service (reserved)
  - own (default): Service runs in its own process
  - share: Service shares a process with one or more other services
- **start_type** *(str)* -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual: Service must be started manually
- disabled: Service cannot be started
- **start_delayed**(bool) -- Set the service to Auto(Delayed Start). Only valid if the start_type is set to Auto. If service_type is not passed, but the service is already set to Auto, then the flag will be set.
- **error_control**(str) -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal: Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues, no notification is given to the user
- **load_order_group**(str) -- The name of the load order group to which this service belongs
- **dependencies**(list) -- A list of services or load ordering groups that must start before this service
- **account_name**(str) -- The name of the account under which the service should run. For **own** type services this should be in the **domain\username** format. The following are examples of valid built-in service accounts:
  - NT Authority\LocalService
  - NT Authority\NetworkService
  - NT Authority\LocalSystem
  - .\LocalSystem
- **account_password**(str) -- The password for the account name specified in **account_name**. For the above built-in accounts, this can be None. Otherwise a password must be specified.
- **run_interactive**(bool) -- If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

Returns
a dictionary of changes made

Return type
dict

CLI Example:
```
salt '*' service.modify spooler start_type=disabled
```

salt.modules.win_service.restart(name, timeout=90)
Restart the named service. This issues a stop command followed by a start.

Parameters
- **name**(str) -- The name of the service to restart.

Note: If the name passed is **salt-minion** a scheduled task is created and executed to restart the salt-minion service.

- **timeout**(int) -- The time in seconds to wait for the service to stop and start before returning. Default is 90 seconds

Note: The timeout is cumulative meaning it is applied to the stop and then to the start command. A timeout of 90 could take up to 180 seconds if the service is long in stopping and starting
New in version 2017.7.9,2018.3.4.

```
Returns
True if successful, otherwise False
```

```
Return type
bool
```

CLI Example:
```
salt '.*' service.restart <service name>
```

salt.modules.win_service.start(name, timeout=90)
Start the specified service.

```
Warning: You cannot start a disabled service in Windows. If the service is disabled, it will be changed to Manual start.
```

```
Parameters
- name (str) -- The name of the service to start
- timeout (int) -- The time in seconds to wait for the service to start before returning.
  Default is 90 seconds
```

```
Returns
True if successful, otherwise False. Also returns True if the service is already started
```

```
Return type
bool
```

CLI Example:
```
salt '.*' service.start <service name>
```

salt.modules.win_service.status(name, *args, **kwargs)
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

```
Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
```

```
Changed in version 3006.0: Returns "Not Found" if the service is not found on the system
```

```
Parameters
- name (str) -- The name of the service to check
```

```
Returns
True if running, False otherwise dict: Maps service name to True if running, False otherwise
str: Not Found if the service is not found on the system
```

```
Return type
bool
```

CLI Example:
```
salt '.*' service.status <service name>
```

salt.modules.win_service.stop(name, timeout=90)
Stop the specified service

```
Parameters
- name (str) -- The name of the service to stop
- timeout (int) -- The time in seconds to wait for the service to stop before returning.
  Default is 90 seconds
```

26.6. execution modules
New in version 2017.7.9,2018.3.4.

Returns

- **True** if successful, otherwise **False**. Also returns **True** if the service is already stopped

Return type

- bool

CLI Example:

```
salt '*' service.stop <service name>
```

### 26.6.506 salt.modules.win_shadow

Manage the shadow file

---

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to 'shadow.info' is not available), see here.

---

#### salt.modules.win_shadow.info(name)

Return information for the specified user. This is just returns dummy data so that salt states can work.

Parameters

- name *(str)* -- The name of the user account to show.

CLI Example:

```
salt '*' shadow.info root
```

#### salt.modules.win_shadow.require_password_change(name)

Require the user to change their password the next time they log in.

Parameters

- name -- The name of the user account to require a password change.

Returns

- True if successful. False if unsuccessful.

Return type

- bool

CLI Example:

```
salt '*' shadow.require_password_change <username>
```

#### salt.modules.win_shadow.set_expire(name, expire)

Set the expiration date for a user account.

Parameters

- name -- The name of the user account to edit.
- expire -- The date the account will expire.

Returns

- True if successful. False if unsuccessful.

Return type

- bool

CLI Example:

```
salt '*' shadow.set_expire <username> 2016/7/1
```

#### salt.modules.win_shadow.set_password(name, password)

Set the password for a named user.
Parameters
- **name** (*str*) -- The name of the user account
- **password** (*str*) -- The new password

Returns
True if successful. False if unsuccessful.

Return type
`bool`

CLI Example:
```
salt '*' shadow.set_password root mysecretpassword
```

textmodulenew

salt.modules.win_shadow.unlock_account(*name*)

Unlocks a user account.

Parameters
- **name** -- The name of the user account to unlock.

Returns
True if successful. False if unsuccessful.

Return type
`bool`

CLI Example:
```
salt '*' shadow.unlock_account <username>
```

26.6.507 salt.modules.win_shortcut

Execution module for creating shortcuts on Windows. Handles file shortcuts (.lnk) and url shortcuts (.url). Allows for the configuration of icons and hot keys on file shortcuts. Changing the icon and hot keys are unsupported for url shortcuts.

New in version 3005.

textmodulenew

salt.modules.win_shortcut.create(*path*, *target*, *arguments""", *description""", *hot_key""", *icon_index* 0, *icon_location""", *window_style"Normal", *working_dir""", *backup* False, *force* False, *make_dirs* False, *user* None)

Create a new shortcut. This can be a file shortcut (.lnk) or a url shortcut (.url).

Parameters
- **path** (*str*) -- The full path to the shortcut. Must have a .lnk or .url file extension.
- **target** (*str*) -- The full path to the target
- **arguments** (*str*, optional) -- Any arguments to be passed to the target
- **description** (*str*, optional) -- The description for the shortcut. This is shown in the Comment field of the dialog box. Default is an empty string
- **hot_key** (*str*, optional) -- A combination of hot Keys to trigger this shortcut. This is something like Ctrl+Alt+D. This is shown in the Shortcut key field in the dialog box. Default is an empty string. Available options are:
  - Ctrl
  - Alt
  - Shift
  - Ext
- **icon_index** (*int*, optional) -- The index for the icon to use in files that contain multiple icons. Default is 0
- **icon_location** (*str*, optional) -- The full path to a file containing icons. This is shown in the Change Icon dialog box by clicking the Change Icon button. If no file is specified and a binary is passed as the target, Windows will attempt to get the icon from the binary file. Default is an empty string

26.6. execution modules
• **window_style** *(str, optional)* -- The window style the program should start in. This is shown in the Run field of the dialog box. Default is Normal. Valid options are:
  - Normal
  - Minimized
  - Maximized

• **working_dir** *(str, optional)* -- The full path to the working directory for the program to run in. This is shown in the Start in field of the dialog box.

• **backup** *(bool, optional)* -- If there is already a shortcut with the same name, set this value to True to backup the existing shortcut and continue creating the new shortcut. Default is False.

• **force** *(bool, optional)* -- If there is already a shortcut with the same name and you aren't backing up the shortcut, set this value to True to remove the existing shortcut and create a new with these settings. Default is False.

• **make_dirs** *(bool, optional)* -- If the parent directory structure does not exist for the new shortcut, create it. Default is False.

• **user** *(str, optional)* -- The user to be the owner of any directories created by setting make_dirs to True. If no value is passed Salt will use the user account that it is running under. Default is an empty string.

Returns

True if successful

Return type

bool

Raises

• **CommandExecutionError** -- If the path is not a .lnk or .url file extension.

• **CommandExecutionError** -- If there is an existing shortcut with the same name and backup and force are both False.

• **CommandExecutionError** -- If the parent directory is not created and make_dirs is False.

• **CommandExecutionError** -- If there was an error creating the parent directories.

CLI Example:

```bash
# Create a shortcut and set the `"Shortcut key"` ("hot_key")
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"
  →hot_key="Ctrl+Alt+N"

# Create a shortcut and change the icon to the 3rd one in the icon file
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"
  →icon_location="C:\path\to\icon.ico" icon_index=2

# Create a shortcut and change the startup mode to full screen
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"
  →window_style="Maximized"

# Create a shortcut and change the icon
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"
  →icon_location="C:\path\to\icon.ico"

# Create a shortcut and force it to overwrite an existing shortcut
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"
  →force=True

# Create a shortcut and create any parent directories if they are missing
(continues on next page)
```
salt.modules.win_shortcut.get(path)

Gets the properties for a shortcut

Parameters
- **path** *(str)* -- The path to the shortcut. Must have a .lnk or .url file extension.

Returns
A dictionary containing all available properties for the specified shortcut

Return type
- **dict**

CLI Example:
salt * shortcut.get path="C:\path\to\shortcut.lnk"

salt.modules.win_shortcut.modify(path, target='', arguments='', description='', hot_key='', icon_index=0, icon_location='', window_style='Normal', working_dir='')

Modify an existing shortcut. This can be a file shortcut (.lnk) or a url shortcut (.url).

Parameters
- **path** *(str)* -- The full path to the shortcut. Must have a .lnk or .url file extension.
- **target** *(str, optional)* -- The full path to the target
- **arguments** *(str, optional)* -- Any arguments to be passed to the target
- **description** *(str, optional)* -- The description for the shortcut. This is shown in the Comment field of the dialog box. Default is an empty string
- **hot_key** *(str, optional)* -- A combination of hot Keys to trigger this shortcut. This is something like Ctrl+Alt+D. This is shown in the Shortcut key field in the dialog box. Default is an empty string. Available options are:
  - Ctrl
  - Alt
  - Shift
  - Ext
- **icon_index** *(int, optional)* -- The index for the icon to use in files that contain multiple icons. Default is 0
- **icon_location** *(str, optional)* -- The full path to a file containing icons. This is shown in the Change Icon dialog box by clicking the Change Icon button. If no file is specified and a binary is passed as the target, Windows will attempt to get the icon from the binary file. Default is an empty string
- **window_style** *(str, optional)* -- The window style the program should start in. This is shown in the Run field of the dialog box. Default is Normal. Valid options are:
  - Normal
  - Minimized
  - Maximized
- **working_dir** *(str, optional)* -- The full path to the working directory for the program to run in. This is shown in the Start in field of the dialog box.

Returns
True if successful

Return type
- **bool**

CLI Example:
26.6.508 salt.modules.win_smtp_server

Module for managing IIS SMTP server configuration on Windows servers. The Windows features 'SMTP-Server' and 'Web-WMI' must be installed.

depends
  wmi

salt.modules.win_smtp_server.get_connection_ip_list(as_wmi_format=False,
  server='SmtpSvc/1')

Get the IPGrant list for the SMTP virtual server.

Parameters
  • as_wmi_format (bool) -- Returns the connection IPs as a list in the format WMI expects.
  • server (str) -- The SMTP server name.

Returns
  A dictionary of the IP and subnet pairs.

Return type
dict

CLI Example:

salt '*' win_smtp_server.get_connection_ip_list

salt.modules.win_smtp_server.get_log_format(server='SmtpSvc/1')

Get the active log format for the SMTP virtual server.

Parameters
  server (str) -- The SMTP server name.

Returns
  A string of the log format name.

Return type
  str

CLI Example:

salt '*' win_smtp_server.get_log_format

salt.modules.win_smtp_server.get_log_format_types()

Get all available log format names and ids.

Returns
  A dictionary of the log format names and ids.

Return type
  dict

CLI Example:

salt '*' win_smtp_server.get_log_format_types

salt.modules.win_smtp_server.get_relay_ip_list(server='SmtpSvc/1')

Get the RelayIpList list for the SMTP virtual server.

Parameters
  server (str) -- The SMTP server name.
Returns
A list of the relay IPs.

Return type
list

Note: A return value of None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

CLI Example:
```
salt '*' win_smtp_server.get_relay_ip_list
```

salt.modules.win_smtp_server.get_server_setting(settings, server='SmtpSvc/1')

Get the value of the setting for the SMTP virtual server.

Parameters
- **settings**(str) -- A list of the setting names.
- **server**(str) -- The SMTP server name.

Returns
A dictionary of the provided settings and their values.

Return type
dict

CLI Example:
```
salt '*' win_smtp_server.get_server_setting settings="['MaxRecipients']"
```

salt.modules.win_smtp_server.get_servers()

Get the SMTP virtual server names.

Returns
A list of the SMTP virtual servers.

Return type
list

CLI Example:
```
salt '*' win_smtp_server.get_servers
```

salt.modules.win_smtp_server.set_connection_ip_list(addresses=None, 
grant_by_default=False, 
server='SmtpSvc/1')

Set the IPGrant list for the SMTP virtual server.

Parameters
- **addresses**(str) -- A dictionary of IP + subnet pairs.
- **grant_by_default**(bool) -- Whether the addresses should be a blacklist or whitelist.
- **server**(str) -- The SMTP server name.

Returns
A boolean representing whether the change succeeded.

Return type
bool

CLI Example:
```
salt '*' win_smtp_server.set_connection_ip_list addresses="{"127.0.0.1":
....'255.255.255.255'}"
```
**salt.modules.win_smtp_server.set_log_format** *(log_format, server='SmtpSvc/1')*

Set the active log format for the SMTP virtual server.

**Parameters**
- **log_format** *(str)* -- The log format name.
- **server** *(str)* -- The SMTP server name.

**Returns**
A boolean representing whether the change succeeded.

**Return type**
bool

**CLI Example:**
```
salt '*' win_smtp_server.set_log_format 'Microsoft IIS Log File Format'
```

**salt.modules.win_smtp_server.set_relay_ip_list** *(addresses=None, server='SmtpSvc/1')*

Set the RelayIpList list for the SMTP virtual server.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting '127.0.0.1' as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.0.0', '0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.0', '0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0', '255.255.255.255', '127.0.0.1']
```

**Note:** Setting the list to None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

**Parameters**
- **addresses** *(str)* -- A list of the relay IPs. The order of the list is important.
- **server** *(str)* -- The SMTP server name.

**Returns**
A boolean representing whether the change succeeded.

**Return type**
bool

**CLI Example:**
```
salt '*' win_smtp_server.set_relay_ip_list addresses="[192.168.1.1, 172.16.1.1]"
```

**salt.modules.win_smtp_server.set_server_setting** *(settings, server='SmtpSvc/1')*

Set the value of the setting for the SMTP virtual server.

**Note:** The setting names are case-sensitive.

**Parameters**
- **settings** *(str)* -- A dictionary of the setting names and their values.
- `server (str)` -- The SMTP server name.

  Returns
  A boolean representing whether all changes succeeded.

  Return type
  bool

  CLI Example:

  ```
salt '*' win_smtp_server.set_server_settings settings="{'MaxRecipients': '500'}"
  ```

**26.6.509 salt.modules.win_snmp**

Module for managing SNMP service settings on Windows servers. The Windows feature 'SNMP-Service' must be installed.

salt.modules.win_snmp.get_agent_service_types()

Get the sysServices types that can be configured.

  Returns
  A list of service types.

  Return type
  list

  CLI Example:

  ```
salt '*' win_snmp.get_agent_service_types
  ```

salt.modules.win_snmp.get_agent_settings()

Determine the value of the SNMP sysContact, sysLocation, and sysServices settings.

  Returns
  A dictionary of the agent settings.

  Return type
  dict

  CLI Example:

  ```
salt '*' win_snmp.get_agent_settings
  ```

salt.modules.win_snmp.get_auth_traps_enabled()

Determine whether the host is configured to send authentication traps.

  Returns
  True if traps are enabled, otherwise False

  Return type
  bool

  CLI Example:

  ```
salt '*' win_snmp.get_auth_traps_enabled
  ```

salt.modules.win_snmp.get_community_names()

Get the current accepted SNMP community names and their permissions.

If community names are being managed by Group Policy, those values will be returned instead like this:

  TestCommunity:
  Managed by GPO
Community names managed normally will denote the permission instead:

<table>
<thead>
<tr>
<th>TestCommunity:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read Only</td>
</tr>
</tbody>
</table>

**Returns**
A dictionary of community names and permissions.

**Return type**
dict

**CLI Example:**
```
salt '*' win_snmp.get_community_names
```

**salt.modules.win_snmp.get_permission_types()**
Get the permission types that can be configured for communities.

**Returns**
A list of permission types.

**Return type**
list

**CLI Example:**
```
salt '*' win_snmp.get_permission_types
```

**salt.modules.win_snmp.set_agent_settings(contact=None, location=None, services=None)**
Manage the SNMP sysContact, sysLocation, and sysServices settings.

**Parameters**
- `contact` (str, optional) -- The SNMP contact.
- `location` (str, optional) -- The SNMP location.
- `services` (list, optional) -- A list of selected services. The possible service names can be found via `win_snmp.get_agent_service_types`. To disable all services pass a list of None, ie: `['None']`

**Returns**
True if successful, otherwise False

**Return type**
bool

**CLI Example:**
```
salt '*' win_snmp.set_agent_settings contact='Contact Name' location='Place' services='["Physical"]'
```

**salt.modules.win_snmp.set_auth_traps_enabled(status=True)**
Manage the sending of authentication traps.

**Parameters**
- `status` (bool) -- True to enable traps. False to disable.

**Returns**
True if successful, otherwise False

**Return type**
bool

**CLI Example:**
```
salt '*' win_snmp.set_auth_traps_enabled status='True'
```

**salt.modules.win_snmp.set_community_names(community)**
Manage the SNMP accepted community names and their permissions.
Note: Settings managed by Group Policy will always take precedence over those set using the SNMP interface. Therefore if this function finds Group Policy settings it will raise a CommandExecutionError.

Parameters

- **communities**(dict) -- A dictionary of SNMP community names and permissions. The possible permissions can be found via `win_snmp.get_permission_types`.

Returns

- True if successful, otherwise False

Return type

- bool

Raises

- **CommandExecutionError** -- If SNMP settings are being managed by Group Policy

CLI Example:

```bash
salt '*' win_snmp.set_community_names communities="{'TestCommunity': 'Read Only'}"
```

### 26.6.510 salt.modules.win_status

Module for returning various status data about a minion. These data can be useful for compiling into stats later, or for problem solving if your minion is having problems.

New in version 0.12.0.

- **depends**
  - wmi

**class** salt.modules.win_status.SYSTEM_PERFORMANCE_INFORMATION

```
salt.modules.win_status.cpuload()
```
New in version 2015.8.0.

Return the processor load as a percentage

CLI Example:
```
salt '*' status.cpuload
```

```
salt.modules.win_status.cpustats()
```
Return information about the CPU.

Returns

dict: A dictionary containing information about the CPU stats

CLI Example:
```
salt '*' status.cpustats
```

```
salt.modules.win_status.diskusage(human_readable=False, path=None)
```
New in version 2015.8.0.

Return the disk usage for this minion

**human_readable**

[False] If True, usage will be in KB/MB/GB etc.

CLI Example:
```
salt '*' status.diskusage path=c:/salt
```
salt.modules.win_status.loadavg()

    Returns counter information related to the load of the machine

    Returns
    A dictionary of counters

    Return type
    dict

    CLI Example:

```
salt * status.loadavg
```

salt.modules.win_status.master(master=None, connected=True)

    New in version 2015.5.0.

    Fire an event if the minion gets disconnected from its master. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, is must be resolvable to a valid IPv4 address.

    CLI Example:

```
salt '*' status.master
```

salt.modules.win_status.meminfo()

    Return information about physical and virtual memory on the system

    Returns
    A dictionary of information about memory on the system

    Return type
    dict

    CLI Example:

```
salt * status.meminfo
```

salt.modules.win_status.procs(count=False)

    Return the process data

    count
    [False] If True, this function will simply return the number of processes.

    New in version 2015.8.0.

    CLI Example:

```
salt '*' status.procs
salt '*' status.procs count
```

salt.modules.win_status.saltmem(human_readable=False)

    New in version 2015.8.0.

    Returns the amount of memory that salt is using

    human_readable
    [False] return the value in a nicely formatted number

    CLI Example:

```
salt '*' status.saltmem
salt '*' status.saltmem human_readable=True
```

salt.modules.win_status.uptime(human_readable=False)

    New in version 2015.8.0.

    Return the system uptime for the machine
Parameters

**human_readable (bool)** -- Return uptime in human readable format if True, otherwise return seconds. Default is False

Note: Human readable format is days, hours:min:sec. Days will only be displayed if more than 0

Returns

The uptime in seconds or human readable format depending on the value of human_readable

Return type

str

CLI Example:

```
salt '*' status.uptime
salt '*' status.uptime human_readable=True
```

salt.modules.win_status.vmstats()

Return information about the virtual memory on the machine

Returns

A dictionary of virtual memory stats

Return type

dict

CLI Example:

```
salt '*' status.vmstats
```

### 26.6.511 salt.modules.win_system

Module for managing Windows systems and getting Windows system information. Support for reboot, shutdown, join domain, rename

depends

- pywintypes
- win32api
- win32con
- win32net
- wmi

salt.modules.win_system.get_computer_desc()

Get the Windows computer description

Returns

Returns the computer description if found. Otherwise returns False.

Return type

str

CLI Example:

```
salt 'minion-id' system.get_computer_desc
```
salt.modules.win_system.get_computer_description()

This function is an alias of get_computer_desc.
Get the Windows computer description

Returns:
str: Returns the computer description if found. Otherwise returns False.

CLI Example:
```
salt 'minion-id' system.get_computer_desc
```

salt.modules.win_system.get_computer_name()

Get the Windows computer name

Returns:
Returns the computer name if found. Otherwise returns False.

Return type
str

CLI Example:
```
salt 'minion-id' system.get_computer_name
```

salt.modules.win_system.get_domain_workgroup()

Get the domain or workgroup the computer belongs to.

New in version 2015.5.7.
New in version 2015.8.2.

Returns:
The name of the domain or workgroup

Return type
str

CLI Example:
```
salt 'minion-id' system.get_domain_workgroup
```

salt.modules.win_system.get_hostname()

Get the hostname of the windows minion

New in version 2016.3.0.

Returns:
Returns the hostname of the windows minion

Return type
str

CLI Example:
```
salt 'minion-id' system.get_hostname
```

salt.modules.win_system.get_pending_component_servicing()

Determine whether there are pending Component Based Servicing tasks that require a reboot.

New in version 2016.11.0.

Returns:
True if there are pending Component Based Servicing tasks, otherwise False

Return type
bool

CLI Example:
salt 'system.get_pending_component_servicing

salt.modules.win_system.get_pending_computer_name()

Get a pending computer name. If the computer name has been changed, and the change is pending a system
reboot, this function will return the pending computer name. Otherwise, None will be returned. If there was
an error retrieving the pending computer name, False will be returned, and an error message will be logged
to the minion log.

Returns

Returns the pending name if pending restart. Returns None if not pending restart.

Return type

str

CLI Example:

salt 'minion-id' system.get_pending_computer_name

salt.modules.win_system.get_pending_domain_join()

Determine whether there is a pending domain join action that requires a reboot.

New in version 2016.11.0.

Returns

True if there is a pending domain join action, otherwise False

Return type

bool

CLI Example:

salt 'system.get_pending_domain_join

salt.modules.win_system.get_pending_file_rename()

Determine whether there are pending file rename operations that require a reboot.

New in version 2016.11.0.

Returns

True if there are pending file rename operations, otherwise False

Return type

bool

CLI Example:

salt 'system.get_pending_file_rename

salt.modules.win_system.get_pending_reboot()

Determine whether there is a reboot pending.

New in version 2016.11.0.

Returns

True if the system is pending reboot, otherwise False

Return type

bool

CLI Example:

salt 'system.get_pending_reboot

salt.modules.win_system.get_pending_reboot_details()

Determine which check is signalling that the system is pending a reboot. Useful in determining why your
system is signalling that it needs a reboot.
New in version 3001.

Returns
A dictionary of the results of each system that would indicate a pending reboot

Return type
dict

CLI Example:
salt '*' system.get_pending_reboot_details

salt.modules.win_system.get_pending_servermanager()
Determine whether there are pending Server Manager tasks that require a reboot.

New in version 2016.11.0.

Returns
True if there are pending Server Manager tasks, otherwise False

Return type
bool

CLI Example:
salt '*' system.get_pending_servermanager

salt.modules.win_system.get_pending_update()
Determine whether there are pending updates that require a reboot.

New in version 2016.11.0.

Returns
True if there are pending updates, otherwise False

Return type
bool

CLI Example:
salt '*' system.get_pending_update

salt.modules.win_system.get_pending_windows_update()
Check the Windows Update system for a pending reboot state.

This leverages the Windows Update System to determine if the system is pending a reboot.

New in version 3001.

Returns
True if the Windows Update system reports a pending update, otherwise False

Return type
bool

CLI Example:
salt '*' system.get_pending_windows_update

salt.modules.win_system.get_reboot_required_witnessed()
Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.

This function will return True if an install completed with exit code 3010 during the current boot session and can be extended where appropriate in the future.

New in version 2016.11.0.

Returns
True if the Requires reboot registry flag is set to 1, otherwise False
Return type

- **bool**

CLI Example:

```bash
salt '*' system.get_reboot_required_witnessed
```

salt.modules.win_system.get_system_date()

Get the Windows system date

**Returns**

- Returns the system date

**Return type**

- **str**

CLI Example:

```bash
salt '*' system.get_system_date
```

salt.modules.win_system.get_system_info()

Get system information.

**Note:** Not all system info is available across all versions of Windows. If it is not available on an older version, it will be skipped

**Returns**

- Dictionary containing information about the system to include name, description, version, etc...

**Return type**

- **dict**

CLI Example:

```bash
salt 'minion-id' system.get_system_info
```

salt.modules.win_system.get_system_time()

Get the system time.

**Returns**

- Returns the system time in HH:MM:SS AM/PM format.

**Return type**

- **str**

CLI Example:

```bash
salt 'minion-id' system.get_system_time
```

salt.modules.win_system.halt(timeout=5, in_seconds=False)

Halt a running system.

**Parameters**

- `timeout` (**int**) -- Number of seconds before halting the system. Default is 5 seconds.
- `in_seconds` (**bool**) -- Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

**Returns**

- True if successful, otherwise False

**Return type**

- **bool**

CLI Example:
**salt.system.halt**

Change the system runlevel on sysV compatible systems. Not applicable to Windows

**CLI Example:**

```
salt 'minion-id' system.halt 5 True
```

---

**salt.modules.win_system.init** *(runlevel)*

Change the system runlevel on sysV compatible systems. Not applicable to Windows

**CLI Example:**

```
salt 'minion-id' system.init 3
```

---

**salt.modules.win_system.join_domain** *(domain, username=None, password=None, account_ou=None, account_exists=False, restart=False)*

Join a computer to an Active Directory domain. Requires a reboot.

**Parameters**

- **domain** *(str)* -- The domain to which the computer should be joined, e.g. example.com
- **username** *(str)* -- Username of an account which is authorized to join computers to the specified domain. Needs to be either fully qualified like user@domain.tld or simply user
- **password** *(str)* -- Password of the specified user
- **account_ou** *(str)* -- The DN of the OU below which the account for this computer should be created when joining the domain, e.g. ou=computers, ou=departm_432,dc=my-company,dc=com
- **account_exists** *(bool)* -- If set to True the computer will only join the domain if the account already exists. If set to False the computer account will be created if it does not exist, otherwise it will use the existing account. Default is False
- **restart** *(bool)* -- True will restart the computer after a successful join. Default is False

**Returns**

Returns a dictionary if successful, otherwise False

**Return type**

dict

**CLI Example:**

```
salt 'minion-id' system.join_domain domain='domain.tld' \ username='joinuser' password='joinpassword' \ account_ou='ou=clients,ou=org,dc=domain,dc=tld' \ account_exists=False, restart=True
```

---

**salt.modules.win_system.lock** *

Lock the workstation.

**Returns**

True if successful, otherwise False

**Return type**

bool

**CLI Example:**

```
salt 'minion-id' system.lock
```

---

**salt.modules.win_system.poweroff** *(timeout=5, in_seconds=False)*

Power off a running system.

**Parameters**
• **timeout** *(int)* -- Number of seconds before powering off the system. Default is 5 seconds.
• **in_seconds** *(bool)* -- Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

**Returns**
True if successful, otherwise False

**Return type**
bool

CLI Example:
```
salt '*' system.poweroff 5
```

salt.modules.win_system.reboot *(timeout=5, in_seconds=False, wait_for_reboot=False, only_on_pending_reboot=False)*

Reboot a running system.

**Parameters**
• **timeout** *(int)* -- The number of minutes/seconds before rebooting the system. Use of minutes or seconds depends on the value of *in_seconds*. Default is 5 minutes.
• **in_seconds** *(bool)* --
  True will cause the timeout parameter to be in seconds.
  False will be in minutes. Default is False.

New in version 2015.8.0.

• **wait_for_reboot** *(bool)* -- True will sleep for timeout + 30 seconds after reboot has been initiated. This is useful for use in a highstate. For example, you may have states that you want to apply only after the reboot. Default is False.

New in version 2015.8.0.

• **only_on_pending_reboot** *(bool)* -- If this is set to True, then the reboot will only proceed if the system reports a pending reboot. Setting this parameter to True could be useful when calling this function from a final housekeeping state intended to be executed at the end of a state run (using *order: last*). Default is False.

**Returns**
True if successful (a reboot will occur), otherwise False

**Return type**
bool

CLI Example:
```
salt '*' system.reboot 5
salt '*' system.reboot 5 True
```

Invoking this function from a final housekeeping state:
```
final_housekeeping:
  module.run:
    - name: system.reboot
    - only_on_pending_reboot: True
    - order: last
```

salt.modules.win_system.set_computer_desc *(desc=None)*

Set the Windows computer description

**Parameters**
• **desc** *(str)* -- The computer description

**Returns**
Description if successful, otherwise False
Return type
str

CLI Example:
salt 'minion-id' system.set_computer_desc 'This computer belongs to Dave!'

salt.modules.win_system.set_computer_description(desc=None)
This function is an alias of set_computer_desc.
Set the Windows computer description

Args:
desc (str):
The computer description

Returns:
str: Description if successful, otherwise False

CLI Example:
salt 'minion-id' system.set_computer_desc 'This computer belongs to Dave!'

salt.modules.win_system.set_computer_name(name)
Set the Windows computer name

Parameters
name (str) -- The new name to give the computer. Requires a reboot to take effect.

Returns
Returns a dictionary containing the old and new names if successful. False if not.

Return type
dict

CLI Example:
salt 'minion-id' system.set_computer_name 'DavesComputer'

salt.modules.win_system.set_domain_workgroup(workgroup)
Set the domain or workgroup the computer belongs to.

New in version 3001.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:
salt 'minion-id' system.set_domain_workgroup LOCAL

salt.modules.win_system.set_hostname(hostname)
Set the hostname of the windows minion, requires a restart before this will be updated.

New in version 2016.3.0.

Parameters
hostname (str) -- The hostname to set

Returns
True if successful, otherwise False

Return type
bool
CLI Example:

```bash
salt 'minion-id' system.set_hostname newhostname
```

`salt.modules.win_system.set_reboot_required_witnessed()`

This function is used to remember that an event indicating that a reboot is required was witnessed. This function relies on the salt-minion's ability to create the following volatile registry key in the HKLM hive:

```
SYSTEM\CurrentControlSet\Services\salt-minion\Volatile-Data
```

Because this registry key is volatile, it will not persist beyond the current boot session. Also, in the scope of this key, the name 'Reboot required' will be assigned the value of 1.

For the time being, this function is being used whenever an install completes with exit code 3010 and can be extended where appropriate in the future.

New in version 2016.11.0.

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```bash
salt '*' system.set_reboot_required_witnessed
```

`salt.modules.win_system.set_system_date(newdate)`

Set the Windows system date. Use <mm-dd-yyyy> format for the date.

**Parameters**

- `newdate (str)` -- The date to set. Can be any of the following formats
  - YYYY-MM-DD
  - MM-DD-YYYY
  - MM-DD-YY
  - MM/DD/YYYY
  - MM/DD/YY
  - YYYY/MM/DD

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

```bash
salt '*' system.set_system_date '03-28-13'
```

`salt.modules.win_system.set_system_date_time(years=None, months=None, days=None, hours=None, minutes=None, seconds=None)`

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by set_system_date and set_system_time)

**Parameters**

- `years (int)` -- Years digit, ie: 2015
- `months (int)` -- Months digit: 1 - 12
- `days (int)` -- Days digit: 1 - 31
- `hours (int)` -- Hours digit: 0 - 23
- `minutes (int)` -- Minutes digit: 0 - 59
- `seconds (int)` -- Seconds digit: 0 - 59

**Returns**

True if successful, otherwise False
Return type

`bool`

CLI Example:

```
salt '*' system.set_system_date_time 2015 5 12 11 37 53
```

salt.modules.win_system.set_system_time(newtime)

Set the system time.

Parameters

- `newtime (str)` -- The time to set. Can be any of the following formats:
  - HH:MM:SS AM/PM
  - HH:MM AM/PM
  - HH:MM:SS (24 hour)
  - HH:MM (24 hour)

Returns

True if successful, otherwise False

Return type

`bool`

CLI Example:

```
salt 'minion-id' system.set_system_time 12:01
```

salt.modules.win_system.shutdown

```
message=None, timeout=5, force_close=True, reboot=False,
in_seconds=False, only_on_pending_reboot=False)
```

Shutdown a running system.

Parameters

- `message (str)` -- The message to display to the user before shutting down.
- `timeout (int)` -- The length of time (in seconds) that the shutdown dialog box should be displayed. While this dialog box is displayed, the shutdown can be aborted using the `system.shutdown_abort` function.

If timeout is not zero, InitiateSystemShutdown displays a dialog box on the specified computer. The dialog box displays the name of the user who called the function, the message specified by the `lpMessage` parameter, and prompts the user to log off. The dialog box beeps when it is created and remains on top of other windows (system modal). The dialog box can be moved but not closed. A timer counts down the remaining time before the shutdown occurs.

If timeout is zero, the computer shuts down immediately without displaying the dialog box and cannot be stopped by `system.shutdown_abort`.

Default is 5 minutes

- `in_seconds (bool)` -- `True` will cause the `timeout` parameter to be in seconds. `False` will be in minutes. Default is `False`.

New in version 2015.8.0.

- `force_close (bool)` -- `True` will force close all open applications. `False` will display a dialog box instructing the user to close open applications. Default is `True`.

- `reboot (bool)` -- `True` restarts the computer immediately after shutdown. `False` powers down the system. Default is `False`.

- `only_on_pending_reboot (bool)` -- If this is set to `True`, then the shutdown will only proceed if the system reports a pending reboot. To optionally shutdown in a highstate, consider using the `shutdown` state instead of this module.

- `only_on_pending_reboot` -- If `True` the shutdown will only proceed if there is a reboot pending. `False` will shutdown the system. Default is `False`. 
Returns
True if successful (a shutdown or reboot will occur), otherwise False
Return type
bool

CLI Example:
```bash
salt '*' system.shutdown "System will shutdown in 5 minutes"
```

salt.modules.win_system.shutdown_abort()

Abort a shutdown. Only available while the dialog box is being displayed to the user. Once the shutdown has initiated, it cannot be aborted.
Returns
True if successful, otherwise False
Return type
bool

CLI Example:
```bash
salt 'minion-id' system.shutdown_abort
```

salt.modules.win_system.shutdown_hard()

Shutdown a running system with no timeout or warning.
Returns
True if successful, otherwise False
Return type
bool

CLI Example:
```bash
salt '*' system.shutdown_hard
```

salt.modules.win_system.start_time_service()

Start the Windows time service
Returns
True if successful, otherwise False
Return type
bool

CLI Example:
```bash
salt '*' system.start_time_service
```

salt.modules.win_system.stop_time_service()

Stop the Windows time service
Returns
True if successful, otherwise False
Return type
bool

CLI Example:
```bash
salt '*' system.stop_time_service
```

salt.modules.win_system.unjoin_domain(username=None, password=None, domain=None, workgroup='WORKGROUP', disable=False, restart=False)

Unjoin a computer from an Active Directory Domain. Requires a restart.

Parameters
- **username** *(str)* -- Username of an account which is authorized to manage computer accounts on the domain. Needs to be a fully qualified name like `user@domain.tld` or `domain.tld\user`. If the domain is not specified, the passed domain will be used. If the computer account doesn’t need to be disabled after the computer is unjoined, this can be `None`.
- **password** *(str)* -- The password of the specified user
- **domain** *(str)* -- The domain from which to unjoin the computer. Can be `None`
- **workgroup** *(str)* -- The workgroup to join the computer to. Default is `WORKGROUP`

- **disable** *(bool)* -- `True` to disable the computer account in Active Directory. Default is `False`
- **restart** *(bool)* -- `True` will restart the computer after successful unjoin. Default is `False`

Returns

Returns a dictionary if successful, otherwise `False`

**Return type**

dict

**CLI Example:**

```shell
salt 'minion-id' system.unjoin_domain restart=True
salt 'minion-id' system.unjoin_domain username='unjoinuser' \
  password='unjoinpassword' disable=True \
  restart=True
```

### 26.6.512 salt.modules.win_task

Windows Task Scheduler Module .. versionadded:: 2016.3.0

A module for working with the Windows Task Scheduler. You can add and edit existing tasks. You can add and clear triggers and actions. You can list all tasks, folders, triggers, and actions.

**salt.modules.win_task.add_action**( name=None, location='\', action_type='Execute', **kwargs)

Add an action to a task.

**Parameters**

- **name** *(str)* -- The name of the task to which to add the action.
- **location** *(str)* -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- **action_type** *(str)* -- The type of action to add. There are three action types. Each one requires its own set of Keyword Arguments (kwargs). Valid values are:
  - Execute
  - Email
  - Message

**Required arguments for each action_type:**

**Execute**

Execute a command or an executable

- **cmd** *(str)*:
  
  (required) The command or executable to run.

- **arguments** *(str)*:
  
  (optional) Arguments to be passed to the command or executable. To launch a
script the first command will need to be the interpreter for the script. For example, to run a vbscript you would pass `cscript.exe` in the `cmd` parameter and pass the script in the `arguments` parameter as follows:

- `cmd='cscript.exe' arguments='c:\scripts\myscript.vbs'`

Batch files do not need an interpreter and may be passed to the `cmd` parameter directly.

**start_in (str):**

(optional) The current working directory for the command.

**Email**

Send and email. Requires `server`, `from`, and `to` or `cc`.

- `from (str):` The sender
- `reply_to (str):` Who to reply to
- `to (str):` The recipient
- `cc (str):` The CC recipient
- `bcc (str):` The BCC recipient
- `subject (str):` The subject of the email
- `body (str):` The Message Body of the email
- `server (str):` The server used to send the email

**attachments (list):**

A list of attachments. These will be the paths to the files to attach. ie:

```python
attachments="['C:\attachment1.txt', 'C:\attachment2.txt']"
```

**Message**

Display a dialog box. The task must be set to "Run only when user is logged on" in order for the dialog box to display. Both parameters are required.

- `title (str):` The dialog box title.
- `message (str):` The dialog box message body

**Returns**

A dictionary containing the task configuration

**Return type**

`dict`

**CLI Example:**

```
salt 'minion-id' task.add_action <task_name> cmd='del /Q /S C:\\Temp'
```

```python
salt.modules.win_task.add_trigger(name=None, location='\\', trigger_type=None, trigger_enabled=True, start_date=None, start_time=None, end_date=None, end_time=None, random_delay=None, repeat_interval=None, repeat_duration=None, repeat_stop_at_duration_end=False, execution_time_limit=None, delay=None, **kwargs)
```

Add a trigger to a Windows Scheduled task

**Note:** Arguments are parsed by the YAML loader and are subject to yaml's idiosyncrasies. Therefore, time values in some formats (%H:%M:%S and %H:%M) should to be quoted. See YAML IDIOSYNCRASIES for more information.
Parameters

- **name**(str) -- The name of the task to which to add the trigger.
- **location**(str) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
- **trigger_type**(str) -- The type of trigger to create. This is defined when the trigger is created and cannot be changed later. Options are as follows:
  - Event
  - Once
  - Daily
  - Weekly
  - Monthly
  - MonthlyDay
  - OnIdle
  - OnTaskCreation
  - OnBoot
  - OnLogon
  - OnSessionChange
- **trigger_enabled**(bool) -- Boolean value that indicates whether the trigger is enabled.
- **start_date**(str) -- The date when the trigger is activated. If no value is passed, the current date will be used. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d
- **start_time**(str) -- The time when the trigger is activated. If no value is passed, midnight will be used. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M
- **end_date**(str) -- The date when the trigger is deactivated. The trigger cannot start the task after it is deactivated. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d
- **end_time**(str) -- The time when the trigger is deactivated. If this is not passed with **end_date** it will be set to midnight. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M
- **random_delay**(str) -- The delay time that is randomly added to the start time of the trigger. Valid values are:
  - 30 seconds
  - 1 minute
- 30 minutes
- 1 hour
- 8 hours
- 1 day

**Note:** This parameter applies to the following trigger types
- Once
- Daily
- Weekly
- Monthly
- MonthlyDay

- **repeat_interval** *(str)* -- The amount of time between each restart of the task.
  Valid values are:
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour

- **repeat_duration** *(str)* -- How long the pattern is repeated. Valid values are:
  - Indefinitely
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 12 hours
  - 1 day

- **repeat_stop_at_duration_end** *(bool)* -- Boolean value that indicates if a running instance of the task is stopped at the end of the repetition pattern duration.

- **execution_time_limit** *(str)* -- The maximum amount of time that the task launched by the trigger is allowed to run. Valid values are:
  - 30 minutes
  - 1 hour
  - 2 hours
  - 4 hours
  - 8 hours
  - 12 hours
  - 1 day
  - 3 days (default)

- **delay** *(str)* -- The time the trigger waits after its activation to start the task. Valid values are:
  - 15 seconds
  - 30 seconds
  - 1 minute
  - 30 minutes
  - 1 hour
  - 8 hours
  - 1 day

**Note:** This parameter applies to the following trigger types:
- OnLogon
- OnBoot
- Event
- OnTaskCreation
- OnSessionChange
**kwargs**

There are optional keyword arguments determined by the type of trigger being defined. They are as follows:

**Event**

The trigger will be fired by an event.

**subscription (str):**

An event definition in xml format that fires the trigger. The easiest way to get this would is to create an event in Windows Task Scheduler and then copy the xml text.

**Once**

No special parameters required.

**Daily**

The task will run daily.

**days_interval (int):**

The interval between days in the schedule. An interval of 1 produces a daily schedule. An interval of 2 produces an every-other day schedule. If no interval is specified, 1 is used. Valid entries are 1 - 999.

**Weekly**

The task will run weekly.

**weeks_interval (int):**

The interval between weeks in the schedule. An interval of 1 produces a weekly schedule. An interval of 2 produces an every-other week schedule. If no interval is specified, 1 is used. Valid entries are 1 - 52.

**days_of_week (list):**

Sets the days of the week on which the task runs. Should be a list. ie: ['Monday', 'Wednesday', 'Friday']. Valid entries are the names of the days of the week.

**Monthly**

The task will run monthly.

**months_of_year (list):**

Sets the months of the year during which the task runs. Should be a list. ie: ['January', 'July']. Valid entries are the full names of all the months.

**days_of_month (list):**

Sets the days of the month during which the task runs. Should be a list. ie: [1, 15, 'Last']. Options are all days of the month 1 - 31 and the word 'Last' to indicate the last day of the month.

**last_day_of_month (bool):**

Boolean value that indicates that the task runs on the last day of the month regardless of the actual date of that day.

**Note:** You can set the task to run on the last day of the month by either including the word 'Last' in the list of days, or setting the parameter 'last_day_of_month' equal to True.

**MonthlyDay**

The task will run monthly on the specified day.

**months_of_year (list):**

Sets the months of the year during which the task runs. Should be a list. ie: ['January', 'July']. Valid entries are the full names of all the months.

**weeks_of_month (list):**

Sets the weeks of the month during which the task runs. Should be a list. ie: ['First', 'Third']. Valid options are:
• First
• Second
• Third
• Fourth

last_week_of_month (bool):
  Boolean value that indicates that the task runs on the last week of the month.

days_of_week (list):
  Sets the days of the week during which the task runs. Should be a list. i.e: ['Monday', 'Wednesday', 'Friday']. Valid entries are the names of the days of the week.

OnIdle
  No special parameters required.
OnTaskCreation
  No special parameters required.
OnBoot
  No special parameters required.
OnLogon
  No special parameters required.
OnSessionChange
  The task will be triggered by a session change.
    session_user_name (str):
      Sets the user for the Terminal Server session. When a session state change is detected for this user, a task is started. To detect session status change for any user, do not pass this parameter.
    state_change (str):
      Sets the kind of Terminal Server session change that would trigger a task launch. Valid options are:
      • ConsoleConnect: When you connect to a user session (switch users)
      • ConsoleDisconnect: When you disconnect a user session (switch users)
      • RemoteConnect: When a user connects via Remote Desktop
      • RemoteDisconnect: When a user disconnects via Remote Desktop
      • SessionLock: When the workstation is locked
      • SessionUnlock: When the workstation is unlocked

Returns
  True if successful, otherwise False
Return type
  bool

CLI Example:

```
salt 'minion-id' task.add_trigger <task_name> trigger_type=Once trigger__enabled=True start_date=2016/12/1 start_time="12:01"
```

salt.modules.win_task.clear_triggers(name, location='\')

Remove all triggers from the task.

Parameters
  • name (str) -- The name of the task from which to clear all triggers.
  • location (str) -- A string value representing the location of the task. Default is \
    which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns
  True if successful, otherwise False
Return type
  bool

CLI Example:
salt 'minion-id' task.clear_trigger <task_name>

```
salt.modules.win_task.create_folder(name, location='\')

Create a folder in which to create tasks.
Parameters
  • name (str) -- The name of the folder. This will be displayed in the task scheduler.
  • location (str) -- A string value representing the location in which to create the folder. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns
  True if successful, otherwise False
Return type
  bool
CLI Example:
```
salt 'minion-id' task.create_folder <folder_name>
```

salt.modules.win_task.create_task(name, location='\', user_name='System', password=None, force=False, **kwargs)

Create a new task in the designated location. This function has many keyword arguments that are not listed here. For additional arguments see:
  • edit_task()
  • add_action()
  • add_trigger()
Parameters
  • name (str) -- The name of the task. This will be displayed in the task scheduler.
  • location (str) -- A string value representing the location in which to create the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
  • user_name (str) -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
  • password (str) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.
  • force (bool) -- If the task exists, overwrite the existing task.

Returns
  True if successful, otherwise False
Return type
  bool
CLI Example:
```
salt 'minion-id' task.create_task <task_name> user_name=System force=True
  action_type=Execute cmd='del /Q /S C:\\Temp' trigger_type=Once start_
  date=2016-12-1 start_time="01:00"
```

salt.modules.win_task.create_task_from_xml(name, location='\', xml_text=None, xml_path=None, user_name='System', password=None)

Create a task based on XML. Source can be a file or a string of XML.
Parameters
  • name (str) -- The name of the task. This will be displayed in the task scheduler.
  • location (str) -- A string value representing the location in which to create the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
**xml_text (str)** -- A string of xml representing the task to be created. This will be overridden by xml_path if passed.

**xml_path (str)** -- The path to an XML file on the local system containing the xml that defines the task. This will override xml_text.

**user_name (str)** -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.

**password (str)** -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

Returns

* True if successful, otherwise False

str: A string with the error message if there is an error

Return type

bool

Raises

* ArgumentError -- If arguments are invalid
* CommandExecutionError --

CLI Example:

```
salt '*' task.create_task_from_xml <task_name> xml_path=C:\task.xml
```

**salt.modules.win_task.delete_folder (name, location='\')**

Delete a folder from the task scheduler.

Parameters

* **name (str)** -- The name of the folder to delete.
* **location (str)** -- A string value representing the location of the folder. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns

* True if successful, otherwise False

Return type

bool

CLI Example:

```
salt 'minion-id' task.delete_folder <folder_name>
```

**salt.modules.win_task.delete_task (name, location='\')**

Delete a task from the task scheduler.

Parameters

* **name (str)** -- The name of the task to delete.
* **location (str)** -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns

* True if successful, otherwise False

Return type

bool

CLI Example:

```
salt 'minion-id' task.delete_task <task_name>
```
salt.modules.win_task.edit_task(name=None, location='\', user_name=None, password=None, description=None, enabled=None, hidden=None, run_if_idle=None, idle_duration=None, idle_wait_timeout=None, idle_stop_on_end=None, idle_restart=None, ac_only=None, stop_if_on_batteries=None, wake_to_run=None, run_if_network=None, network_id=None, network_name=None, allow_demand_start=None, start_when_available=None, restart_every=None, restart_count=3, execution_time_limit=None, force_stop=None, delete_after=None, multiple_instances=None, **kwargs)

Edit the parameters of a task. Triggers and Actions cannot be edited yet.

Parameters

- **name (str)** -- The name of the task. This will be displayed in the task scheduler.
- **location (str)** -- A string value representing the location in which to create the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
- **user_name (str)** -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- **password (str)** -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

Note: The combination of user_name and password determine how the task runs. For example, if a username is passed without a password the task will only run when the user is logged in. If a password is passed as well the task will run whether the user is logged on or not. If you pass 'System' as the username the task will run as the system account (the password parameter is ignored).

- **description (str)** -- A string representing the text that will be displayed in the description field in the task scheduler.
- **enabled (bool)** -- A boolean value representing whether or not the task is enabled.
- **hidden (bool)** -- A boolean value representing whether or not the task is hidden.
- **run_if_idle (bool)** -- Boolean value that indicates that the Task Scheduler will run the task only if the computer is in an idle state.
- **idle_duration (str)** -- A value that indicates the amount of time that the computer must be in an idle state before the task is run. Valid values are:
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
- **idle_wait_timeout (str)** -- A value that indicates the amount of time that the Task Scheduler will wait for an idle condition to occur. Valid values are:
  - Do not wait
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours
- **idle_stop_on_end (bool)** -- Boolean value that indicates that the Task Scheduler will terminate the task if the idle condition ends before the task is completed.
• **idle_restart** (*bool*) -- Boolean value that indicates whether the task is restarted when the computer cycles into an idle condition more than once.
• **ac_only** (*bool*) -- Boolean value that indicates that the Task Scheduler will launch the task only while on AC power.
• **stop_if_on_batteries** (*bool*) -- Boolean value that indicates that the task will be stopped if the computer begins to run on battery power.
• **wake_to_run** (*bool*) -- Boolean value that indicates that the Task Scheduler will wake the computer when it is time to run the task.
• **run_if_network** (*bool*) -- Boolean value that indicates that the Task Scheduler will run the task only when a network is available.
• **network_id** (*guid*) -- GID value that identifies a network profile.
• **network_name** (*str*) -- Sets the name of a network profile. The name is used for display purposes.
• **allow_demand_start** (*bool*) -- Boolean value that indicates that the task can be started by using either the Run command or the Context menu.
• **start_when_available** (*bool*) -- Boolean value that indicates that the Task Scheduler can start the task at any time after its scheduled time has passed.
• **restart_every** (*str*) -- A value that specifies the interval between task restart attempts. Valid values are:
  - False (to disable)
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours
• **restart_count** (*int*) -- The number of times the Task Scheduler will attempt to restart the task. Valid values are integers 1 - 999.
• **execution_time_limit** (*bool, str*) -- The amount of time allowed to complete the task. Valid values are:
  - False (to disable)
  - 1 hour
  - 2 hours
  - 4 hours
  - 8 hours
  - 12 hours
  - 1 day
  - 3 days
• **force_stop** (*bool*) -- Boolean value that indicates that the task may be terminated by using TerminateProcess.
• **delete_after** (*bool, str*) -- The amount of time that the Task Scheduler will wait before deleting the task after it expires. Requires a trigger with an expiration date. Valid values are:
  - False (to disable)
  - Immediately
  - 30 days
  - 90 days
  - 180 days
  - 365 days
• **multiple_instances** (*str*) -- Sets the policy that defines how the Task Scheduler deals with multiple instances of the task. Valid values are:
  - Parallel
  - Queue
- No New Instance
- Stop Existing

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
> salt '*' task.edit_task <task_name> description='This task is awesome'
```

```python
salt.modules.win_task.info(name, location='\')
```

Get the details about a task in the task scheduler.

Parameters

- **name (str)** -- The name of the task for which to return the status
- **location (str)** -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns

A dictionary containing the task configuration

Return type

dict

CLI Example:

```
> salt 'minion-id' task.info <task_name>
```

```python
salt.modules.win_task.list_actions(name, location='\')
```

List all actions that pertain to a task in the specified location.

Parameters

- **name (str)** -- The name of the task for which list actions.
- **location (str)** -- A string value representing the location of the task from which to list actions. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns

Returns a list of actions.

Return type

list

CLI Example:

```
# List all actions for a task in the default location
> salt 'minion-id' task.list_actions <task_name>

# List all actions for the XblGameSaveTask in the Microsoft\XblGameSave location
> salt 'minion-id' task.list_actions XblGameSaveTask Microsoft\XblGameSave
```

```python
salt.modules.win_task.list_folders(location='\')
```

List all folders located in a specific location in the task scheduler.

Parameters

- **location (str)** -- A string value representing the folder from which you want to list tasks. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns

Returns a list of folders.

Return type

list
CLI Example:

```bash
# List all folders in the default location
salt 'minion-id' task.list_folders

# List all folders in the Microsoft directory
salt 'minion-id' task.list_folders Microsoft
```

`salt.modules.win_task.list_tasks(location='\\')`

List all tasks located in a specific location in the task scheduler.

**Parameters**

- `location` *(str)* -- A string value representing the folder from which you want to list tasks. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

**Returns**

Returns a list of tasks.

**Return type**

list

CLI Example:

```bash
# List all tasks in the default location
salt 'minion-id' task.list_tasks

# List all tasks in the Microsoft\XblGameSave Directory
salt 'minion-id' task.list_tasks Microsoft\XblGameSave
```

`salt.modules.win_task.list_triggers(name, location='\\')`

List all triggers that pertain to a task in the specified location.

**Parameters**

- `name` *(str)* -- The name of the task for which list triggers.
- `location` *(str)* -- A string value representing the location of the task from which to list triggers. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

**Returns**

Returns a list of triggers.

**Return type**

list

CLI Example:

```bash
# List all triggers for a task in the default location
salt 'minion-id' task.list_triggers <task_name>

# List all triggers for the XblGameSaveTask in the Microsoft\XblGameSave
# location
salt '*' task.list_triggers XblGameSaveTask Microsoft\XblGameSave
```

`salt.modules.win_task.run(name, location='\\')`

Run a scheduled task manually.

**Parameters**

- `name` *(str)* -- The name of the task to run.
- `location` *(str)* -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

**Returns**

True if successful, otherwise False
Return type
bool

CLI Example:

```shell
salt 'minion-id' task.run <task_name>
```

`salt.modules.win_task.run_wait(name, location='\')`

Run a scheduled task and return when the task finishes.

Parameters
- `name` (str) -- The name of the task to run.
- `location` (str) -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```shell
salt 'minion-id' task.run_wait <task_name>
```

`salt.modules.win_task.status(name, location='\')`

Determine the status of a task. Is it Running, Queued, Ready, etc.

Parameters
- `name` (str) -- The name of the task for which to return the status
- `location` (str) -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns
The current status of the task. Will be one of the following:
- Unknown
- Disabled
- Queued
- Ready
- Running

Return type
str

CLI Example:

```shell
salt 'minion-id' task.list_status <task_name>
```

`salt.modules.win_task.stop(name, location='\')`

Stop a scheduled task.

Parameters
- `name` (str) -- The name of the task to stop.
- `location` (str) -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```shell
salt 'minion-id' task.list_stop <task_name>
```
26.6.513 salt.modules.win_timezone

Module for managing timezone on Windows systems.

```python
class salt.modules.win_timezone.TzMapper(unix_to_win):
    add(k, v)
    get_unix(key, default=None)
    get_win(key, default=None)
    list_unix()
    list_win()
    remove(k)
```

```python
salt.modules.win_timezone.get_hwclock()
Get current hardware clock setting (UTC or localtime)

Note: The hardware clock is always local time on Windows so this will always return "localtime"

CLI Example:
```
salt '*' timezone.get_hwclock
```

```python
salt.modules.win_timezone.get_offset()
Get current numeric timezone offset from UTC (i.e. -0700)

    Returns
    Offset from UTC
    Return type
    str

CLI Example:
```
salt '*' timezone.get_offset
```

```python
salt.modules.win_timezone.get_zone()
Get current timezone (i.e. America/Denver)

    Returns
    Timezone in unix format
    Return type
    str

    Raises
    CommandExecutionError -- If timezone could not be gathered

CLI Example:
```
salt '*' timezone.get_zone
```

```python
salt.modules.win_timezone.get_zonecode()
Get current timezone (i.e. PST, MDT, etc)

    Returns
    An abbreviated timezone code
    Return type
    str
```
Salt Documentation, Release 3007.1

**CLI Example:**

```bash
salt '*' timezone.get_zonecode
```

**salt.modules.win_timezone.list(unix_style=True)**

Return a list of Timezones that this module supports. These can be in either Unix or Windows format.

New in version 2018.3.3.

**Parameters**

- `unix_style` *(bool)* -- True returns Unix-style timezones. False returns Windows-style timezones. Default is True

**Returns**

A list of supported timezones

**Return type**

list

**CLI Example:**

```bash
# Unix-style timezones
salt '*' timezone.list

# Windows-style timezones
salt '*' timezone.list unix_style=False
```

**salt.modules.win_timezone.set_hwclock(clock)**

Sets the hardware clock to be either UTC or localtime

**Note:** The hardware clock is always local time on Windows so this will always return False

**CLI Example:**

```bash
salt '*' timezone.set_hwclock UTC
```

**salt.modules.win_timezone.set_zone(timezone)**

Sets the timezone using the tzutil.

**Parameters**

- `timezone` *(str)* -- A valid timezone

**Returns**

True if successful, otherwise False

**Return type**

bool

**Raises**

`CommandExecutionError` -- If invalid timezone is passed

**CLI Example:**

```bash
salt '*' timezone.set_zone 'America/Denver'
```

**salt.modules.win_timezone.zone_compare(timezone)**

Compares the given timezone with the machine timezone. Mostly useful for running state checks.

**Parameters**

- `timezone` *(str)* -- The timezone to compare. This can be in Windows or Unix format. Can be any of the values returned by the `timezone.list` function

**Returns**

True if they match, otherwise False
Return type

\textbf{bool}

Example:

```
salt 'salt.' timezone.zone_compare 'America/Denver'
```

### 26.6.514 \texttt{salt.modules.win_useradd}

Module for managing Windows Users.

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to ‘\texttt{user.info} is not available’), see here.

**depends**

- pywintypes
- win32api
- win32con
- win32net
- win32netcon
- win32profile
- win32security
- win32ts
- wmi

**Note:** This currently only works with local user accounts, not domain accounts

```
salt.modules.win_useradd.add(name, password=None, fullname=None, description=None, groups=None, home=None, homedrive=None, profile=None, logonscript=None)
```

Add a user to the minion.

**Parameters**

- \textbf{name (str)} -- The username for the new account
- \textbf{password (str, optional)} -- User's password in plain text.
- \textbf{fullname (str, optional)} -- The user's full name.
- \textbf{description (str, optional)} -- A brief description of the user account.
- \textbf{groups (str, optional)} -- A list of groups to add the user to. (see chgroups)
- \textbf{home (str, optional)} -- The path to the user's home directory.
- \textbf{homedrive (str, optional)} -- The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- \textbf{profile (str, optional)} -- An explicit path to a profile. Can be a UNC or a folder on the system. If left blank, windows uses its default profile directory.
- \textbf{logonscript (str, optional)} -- Path to a login script to run when the user logs on.

**Returns**

True if successful, otherwise False.

**Return type**

\textbf{bool}
CLI Example:

```
salt '*' user.add name password
```

```python
salt.modules.win_useradd.addgroup(name, group)
```
Add user to a group

**Parameters**

- `name (str)` -- The username to add to the group
- `group (str)` -- The name of the group to which to add the user

**Returns**

True if successful, otherwise False.

**Return type**

bool

CLI Example:

```
salt '*' user.addgroup jsnuffy 'Power Users'
```

```python
salt.modules.win_useradd.chfullname(name, fullname)
```
Change the full name of the user

**Parameters**

- `name (str)` -- The username for which to change the full name
- `fullname (str)` -- The new value for the full name

**Returns**

True if successful, otherwise False.

**Return type**

bool

CLI Example:

```
salt '*' user.chfullname user 'First Last'
```

```python
salt.modules.win_useradd.chgroups(name, groups, append=True)
```
Change the groups this user belongs to, add append=False to make the user a member of only the specified groups

**Parameters**

- `name (str)` -- The username for which to change groups
- `groups (str, list)` -- A single group or a list of groups to assign to the user. For multiple groups this can be a comma delimited string or a list.
- `append (bool, optional)` -- True adds the passed groups to the user's current groups. False sets the user's groups to the passed groups only. Default is True.

**Returns**

True if successful, otherwise False.

**Return type**

bool

CLI Example:

```
salt '*' user.chgroups jsnuffy Administrators,Users True
```

```python
salt.modules.win_useradd.chhome(name, home, **kwargs)
```
Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

**Parameters**

- `name (str)` -- The name of the user whose home directory you wish to change
- `home (str)` -- The new location of the home directory
Returns
True if successful, otherwise False.

Return type
bool

CLI Example:
```
salt '*' user.chhome foo fileserver\home\foo True
```

```
salt.modules.win_useradd.chprofile(name, profile)
```
Change the profile directory of the user

Parameters
- **name** *(str)* -- The name of the user whose profile you wish to change
- **profile** *(str)* -- The new location of the profile

Returns
True if successful, otherwise False.

Return type
bool

CLI Example:
```
salt '*' user.chprofile foo fileserver\profiles\foo
```

```
salt.modules.win_useradd.current(sam=False)
```
Get the username that salt-minion is running under. If salt-minion is running as a service it should return the Local System account. If salt is running from a command prompt it should return the username that started the command prompt.

New in version 2015.5.6.

Parameters
- **sam** *(bool, optional)* -- False returns just the username without any domain notation. True returns the domain with the username in the SAM format. Ie: domain\username

Returns
Returns username

Return type
str

CLI Example:
```
salt '*' user.current
```

```
salt.modules.win_useradd.delete(name, purge=False, force=False)
```
Remove a user from the minion

Parameters
- **name** *(str)* -- The name of the user to delete
- **purge** *(bool, optional)* -- Boolean value indicating that the user profile should also be removed when the user account is deleted. If set to True the profile will be removed. Default is False.
- **force** *(bool, optional)* -- Boolean value indicating that the user account should be deleted even if the user is logged in. True will log the user out and delete user.

Returns
True if successful, otherwise False.

Return type
bool

CLI Example:
salt '*' user.delete name

salt.modules.win_useradd.getUserSid(username)
   Deprecated function. Please use get_user_sid instead
   CLI Example:
   
   salt '*' user.get_user_sid jsnuffy

salt.modules.win_useradd.get_user_sid(username)
   Get the Security ID for the user
   Parameters
      username (str) -- The username for which to look up the SID
   Returns
      The user SID
   Return type
      str
   CLI Example:
   
   salt '*' user.get_user_sid jsnuffy

salt.modules.win_useradd.getent(refresh=False)
   Return the list of all info for all users
   Parameters
      refresh (bool, optional) -- Refresh the cached user information. Useful when used
         from within a state function. Default is False.
   Returns
      A dictionary containing information about all users on the system
   Return type
      dict
   CLI Example:
   
   salt '*' user.getent

salt.modules.win_useradd.info(name)
   Return user information
   Parameters
      name (str) -- Username for which to display information
   Returns
      A dictionary containing user information
      • fullname
      • username
      • SID
      • passwd (will always return None)
      • comment (same as description, left here for backwards compatibility)
      • description
      • active
      • logonscript
      • profile
      • home
      • homedrive
      • groups
      • password_changed
      • successful_logon_attempts
- `failed_logon_attempts`
- `last_logon`
- `account_disabled`
- `account_locked`
- `expiration_date`
- `password_never_expires`
- `disallow_change_password`
- `gid`

**Return type**

| dict |

**CLI Example:**

```
salt '*' user.info jsnuffy
```

salt.modules.win_useradd.list_groups(name)

Return a list of groups the named user belongs to

**Parameters**

- `name (str)` -- The username for which to list groups

**Returns**

A list of groups to which the user belongs

**Return type**

| list |

**CLI Example:**

```
salt '*' user.list_groups foo
```

salt.modules.win_useradd.list_users()

Return a list of all users on Windows

**Returns**

A list of all users on the system

**Return type**

| list |

**CLI Example:**

```
salt '*' user.list_users
```

salt.modules.win_useradd.removegroup(name, group)

Remove user from a group

**Parameters**

- `name (str)` -- The username to remove from the group
- `group (str)` -- The name of the group from which to remove the user

**Returns**

True if successful, otherwise False.

**Return type**

| bool |

**CLI Example:**

```
salt '*' user.removegroup jsnuffy 'Power Users'
```

salt.modules.win_useradd.rename(name, new_name)

Change the username for a named user

**Parameters**

- `name (str)` -- The username to change
- `new_name (str)` -- The new name for the current user
Returns
True if successful, otherwise False.
Return type
bool
CLI Example:
```text
salt '*' user.rename jsnuffy jshmoe
```
Returns

True if successful, otherwise False.

Return type

bool

CLI Example:

```
salt '*' user.update bob password=secret profile=C:\Users\Bob
home=\server\homeshare\bob homedrive=U:
```

26.6.515 salt.modules.win_wua

Module for managing Windows Updates using the Windows Update Agent.

List updates on the system using the following functions:

- `win_wua.available`
- `win_wua.list`

This is an easy way to find additional information about updates available to the system, such as the GUID, KB number, or description.

Once you have the GUID or a KB number for the update you can get information about the update, download, install, or uninstall it using these functions:

- `win_wua.get`
- `win_wua.download`
- `win_wua.install`
- `win_wua.uninstall`

The get function expects a name in the form of a GUID, KB, or Title and should return information about a single update. The other functions accept either a single item or a list of items for downloading/installing/uninstalling a specific list of items.

The `win_wua.list` and `win_wua.get` functions are utility functions. In addition to returning information about updates they can also download and install updates by setting `download=True` or `install=True`. So, with `py:func:win_wua.list <salt.modules.win_wua.list>` for example, you could run the function with the filters you want to see what is available. Then just add `install=True` to install everything on that list.

If you want to download, install, or uninstall specific updates, use `win_wua.download`, `win_wua.install`, or `win_wua.uninstall`. To update your system with the latest updates use `win_wua.list` and set `install=True`.

You can also adjust the Windows Update settings using the `win_wua.set_wu_settings` function. This function is only supported on the following operating systems:

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

As of Windows 10 and Windows Server 2016, the ability to modify the Windows Update settings has been restricted. The settings can be modified in the Local Group Policy using the `lgpo` module.

New in version 2015.8.0.
depends
salt.utils.win_update

salt.modules.win_wua.available_software=True, drivers=True, summary=False, skip_installed=True, skip_hidden=True, skip_mandatory=False, skip_reboot=False, categories=None, severities=None, online=True)

New in version 2017.7.0.

List updates that match the passed criteria. This allows for more filter options than list(). Good for finding a specific GUID or KB.

Parameters

- **software** *(bool)* -- Include software updates in the results. Default is True
- **drivers** *(bool)* -- Include driver updates in the results. Default is True
- **summary** *(bool)* --
  - True: Return a summary of updates available for each category.
  - False (default): Return a detailed list of available updates.
- **skip_installed** *(bool)* -- Skip updates that are already installed. Default is True
- **skip_hidden** *(bool)* -- Skip updates that have been hidden. Default is True
- **skip_mandatory** *(bool)* -- Skip mandatory updates. Default is False
- **skip_reboot** *(bool)* -- Skip updates that require a reboot. Default is False
- **categories** *(list)* -- Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
- Definition Updates
- Drivers (make sure you set drivers=True)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender

- **severities** *(list)* -- Specify the severities to include. Must be passed as a list.

All severities returned by default.

Severities include the following:

- Critical
- Important

- **online** *(bool)* -- Tells the Windows Update Agent go online to update its local update database. True will go online. False will use the local update database as is. Default is True

New in version 3001.

Returns

Returns a dict containing either a summary or a list of updates:

```
Dict of Updates:
{'<GUID>': {  
'Title': <title>,

(continues on next page)
Return type

dict

CLI Examples:

# Normal Usage (list all software updates)
salt '*' win_wua.available

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.available categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.available categories=['Security Updates'] severities=['Critical']

# List all updates with a severity of Critical
salt '*' win_wua.available severities=['Critical']

# A summary of all available updates
salt '*' win_wua.available summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.available categories=['Feature Packs','Windows 8.1']

(continues on next page)
salt.modules.win_wua.download(names)

New in version 2017.7.0.

Downloads updates that match the list of passed identifiers. It’s easier to use this function by using list_updates and setting download=True.

Parameters

`names (str, list) -- A single update or a list of updates to download. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.`

Note: An error will be raised if there are more results than there are items in the names parameter

Returns

A dictionary containing the details about the downloaded updates

Return type

dict

CLI Example:

```
# Normal Usage
salt '*' win_wua.download names=['12345678-abcd-1234-abcd-1234567890ab', 'KB2131233']
```

salt.modules.win_wua.get(name, download=False, install=False, online=True)

New in version 2017.7.0.

Returns details for the named update

Parameters

- `name (str) -- The name of the update you’re searching for. This can be the GUID, a KB number, or any part of the name of the update. GUIDs and KBs are preferred. Run list to get the GUID for the update you’re looking for.
- `download (bool) -- Download the update returned by this function. Run this function first to see if the update exists, then set download=True to download the update.
- `install (bool) -- Install the update returned by this function. Run this function first to see if the update exists, then set install=True to install the update.
- `online (bool) -- Tells the Windows Update Agent go online to update its local update database. True will go online. False will use the local update database as is. Default is True

New in version 3001.

Returns

Returns a dict containing a list of updates that match the name if download and install are both set to False. Should usually be a single update, but can return multiple if a partial name is given.

If download or install is set to true it will return the results of the operation.

```
Dict of Updates:
{
  '<GUID>': {
    'Title': <title>,
    'KB': <KB>,
    'GUID': <the globally unique identifier for the update>,
    ...
  }
```

(continues on next page)
{'Description': <description>,
'Downloaded': <has the update been downloaded>,
'Installed': <has the update been installed>,
'Mandatory': <is the update mandatory>,
'UserInput': <is user input required>,
'EULAAccepted': <has the EULA been accepted>,
'Severity': <update severity>,
'NeedsReboot': <is the update installed and awaiting reboot>,
'RebootBehavior': <will the update require a reboot>,
'Categories': [
  '<category 1>',
  '<category 2>',
  ...
]}

Return type
dict

CLI Examples:

```
# Recommended Usage using GUID without braces
# Use this to find the status of a specific update
salt '*' win_wua.get 12345678-abcd-1234-abcd-1234567890ab

# Use the following if you don't know the GUID:

# Using a KB number
# Not all updates have an associated KB
salt '*' win_wua.get KB3030298

# Using part or all of the name of the update
# Could possibly return multiple results
# Not all updates have an associated KB
salt '*' win_wua.get 'Microsoft Camera Codec Pack'
```

**salt.modules.win_wua.get_needs_reboot()**

Determines if the system needs to be rebooted.

**Returns**

True if the system requires a reboot, otherwise False

**Return type**

bool

CLI Examples:

```
salt '*' win_wua.get_needs_reboot
```

**salt.modules.win_wua.get_wu_settings()**

Get current Windows Update settings.

**Returns**

A dictionary of Windows Update settings:

**Featured Updates:**

Boolean value that indicates whether to display notifications for featured updates.

**Group Policy Required (Read-only):**

Boolean value that indicates whether Group Policy requires the Automatic Updates
service.

**Microsoft Update:**
Boolean value that indicates whether to turn on Microsoft Update for other Microsoft Products

**Needs Reboot:**
Boolean value that indicates whether the machine is in a reboot pending state.

**Non Admins Elevated:**
Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.

**Notification Level:**
Number 1 to 4 indicating the update level:
1. Never check for updates
2. Check for updates but let me choose whether to download and install them
3. Download updates but let me choose whether to install them
4. Install updates automatically

**Read Only (Read-only):**
Boolean value that indicates whether the Automatic Update settings are read-only.

**Recommended Updates:**
Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.

**Scheduled Day:**
Days of the week on which Automatic Updates installs or uninstalls updates.

**Scheduled Time:**
Time at which Automatic Updates installs or uninstalls updates.

Return type
dict

CLI Examples:
salt '*' win_wua.get_wu_settings

```python
salt.modules.win_wua.install(names)
```

New in version 2017.7.0.

Installs updates that match the list of identifiers. It may be easier to use the list_updates function and set install=True.

**Parameters**

**names** *(str, list)* -- A single update or a list of updates to install. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

**Note:** An error will be raised if there are more results than there are items in the names parameter

**Returns**
A dictionary containing the details about the installed updates

Return type
dict

CLI Examples:

```
# Normal Usage
salt '*' win_wua.install KB12323211
```

```python
salt.modules.win_wua.installed(summary=False, kbs_only=False)
```

New in version 3001.
Get a list of all updates that are currently installed on the system.

**Note:** This list may not necessarily match the Update History on the machine. This will only show the updates that apply to the current build of Windows. So, for example, the system may have shipped with Windows 10 Build 1607. That machine received updates to the 1607 build. Later the machine was upgraded to a newer feature release, 1803 for example. Then more updates were applied. This will only return the updates applied to the 1803 build and not those applied when the system was at the 1607 build.

**Parameters**

- **summary (bool)** -- Return a summary instead of a detailed list of updates. True will return a Summary, False will return a detailed list of installed updates. Default is False

- **kbs_only (bool)** -- Only return a list of KBs installed on the system. If this parameter is passed, the summary parameter will be ignored. Default is False

**Returns**

Returns a dictionary of either a Summary or a detailed list of updates installed on the system when kbs_only=False

Returns a list of KBs installed on the system when kbs_only=True

**Return type**

dict

**CLI Examples:**

```bash
# Get a detailed list of all applicable updates installed on the system
salt '*' win_wua.installed

# Get a summary of all applicable updates installed on the system
salt '*' win_wua.installed summary=True

# Get a simple list of KBs installed on the system
salt '*' win_wua.installed kbs_only=True
```

**New in version 2017.7.0.**

Returns a detailed list of available updates or a summary. If download or install is True the same list will be downloaded and/or installed.

**Parameters**

- **software (bool)** -- Include software updates in the results. Default is True

- **drivers (bool)** -- Include driver updates in the results. Default is False

- **summary (bool)** --
  - True: Return a summary of updates available for each category.
  - False (default): Return a detailed list of available updates.

- **skip_installed (bool)** -- Skip installed updates in the results. Default is True

- **download (bool)** -- (Overrides reporting functionality) Download the list of updates returned by this function. Run this function first with download=False to see what will be downloaded, then set download=True to download the updates. Default is False

- **install (bool)** -- (Overrides reporting functionality) Install the list of updates returned by this function. Run this function first with install=False to see what will be installed, then set install=True to install the updates. Default is False
• **categories** *(list)* -- Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:
  - Critical Updates
  - Definition Updates
  - Drivers (make sure you set `drivers=True`)
  - Feature Packs
  - Security Updates
  - Update Rollups
  - Updates
  - Update Rollups
  - Windows 7
  - Windows 8.1
  - Windows 8.1 drivers
  - Windows 8.1 and later drivers
  - Windows Defender

• **severities** *(list)* -- Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:
  - Critical
  - Important

• **online** *(bool)* -- Tells the Windows Update Agent go online to update its local update database. `True` will go online. `False` will use the local update database as is. Default is `True`.

New in version 3001.

**Returns**

Returns a dict containing either a summary or a list of updates:

```python
Dict of Updates:
{ '<GUID>': {
  'Title': '<title>',
  'KB': '<KB>',
  'GUID': '<the globally unique identifier for the update>',
  'Description': '<description>',
  'Downloaded': '<has the update been downloaded>',
  'Installed': '<has the update been installed>',
  'Mandatory': '<is the update mandatory>',
  'UserInput': '<is user input required>',
  'EULAAccepted': '<has the EULA been accepted>',
  'Severity': '<update severity>',
  'NeedsReboot': '<is the update installed and awaiting reboot>',
  'RebootBehavior': '<will the update require a reboot>',
  'Categories': [
    '<category 1>',
    '<category 2>',
    ...
  ]
}}

Summary of Updates:
{ 'Total': '<total number of updates returned>',
(continues on next page)
'Available': <updates that are not downloaded or installed>,
'Downloaded': <updates that are downloaded but not installed>,
'Installed': <updates installed (usually 0 unless installed=True)>,
'Categories': {
    <category 1>: <total for that category>,
    <category 2>: <total for category 2>,
    ...
}

Return type
dict
CLI Examples:

# Normal Usage (list all software updates)
salt '*' win_wua.list

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.list categories=['Critical Updates', 'Drivers']

# List all Critical Security Updates
salt '*' win_wua.list categories=['Security Updates'] severities=['Critical']

# List all updates with a severity of Critical
salt '*' win_wua.list severities=['Critical']

# A summary of all available updates
salt '*' win_wua.list summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.list categories=['Feature Packs', 'Windows 8.1']

salt.modules.win_wua.set_wu_settings(level=None, recommended=None, featured=None, elevated=None, msupdate=None, day=None, time=None)

Change Windows Update settings. If no parameters are passed, the current value will be returned.

Supported:
- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

Parameters
- **level (int)** -- Number from 1 to 4 indicating the update level:
  1. Never check for updates
  2. Check for updates but let me choose whether to download and install them
  3. Download updates but let me choose whether to install them
  4. Install updates automatically
- **recommended (bool)** -- Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.
- **featured (bool)** -- Boolean value that indicates whether to display notifications
for featured updates.

- **elevated** *(bool)* -- Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.
- **msupdate** *(bool)* -- Boolean value that indicates whether to turn on Microsoft Update for other Microsoft products
- **day** *(str)* -- Days of the week on which Automatic Updates installs or uninstalls updates. Accepted values:
  - Everyday
  - Monday
  - Tuesday
  - Wednesday
  - Thursday
  - Friday
  - Saturday
- **time** *(str)* -- Time at which Automatic Updates installs or uninstalls updates. Must be in the ##:##24hr format, eg. 3:00 PM would be 15:00. Must be in 1 hour increments.

**Returns**

Returns a dictionary containing the results.

**Return type**

```
dict
```

**CLI Examples:**

```
salt '*' win_wua.set_wu_settings level=4 recommended=True featured=False
```

---

salt.modules.win_wua.uninstall*(names)*

New in version 2017.7.0.

Uninstall updates.

**Parameters**

- **names** *(str, list)* -- A single update or a list of updates to uninstall. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

**Returns**

A dictionary containing the details about the uninstalled updates

**Return type**

```
dict
```

**CLI Examples:**

```
# Normal Usage
salt '*' win_wua.uninstall KB3121212

# As a list
salt '*' win_wua.uninstall guid=['12345678-abcd-1234-abcd-1234567890ab',
   'KB1231231']
```
26.6.516  salt.modules.win_wusa

Microsoft Update files management via wusa.exe

maintainer
   Thomas Lemarchand

platform
   Windows

depends
   PowerShell

New in version 2018.3.4.

salt.modules.win_wusa.install(path, restart=False)

Install a KB from a .msu file.

Parameters
   • path (str) -- The full path to the msu file to install
   • restart (bool) -- True to force a restart if required by the installation. Adds the /forcerestart switch to the wusa.exe command. False will add the /norestart switch instead. Default is False

Returns
   True if successful, otherwise False

Return type
   bool

Raises
   CommandExecutionError -- If the package is already installed or an error is encountered

CLI Example:

salt '*' wusa.install C:/temp/KB123456.msu

salt.modules.win_wusa.is_installed(name)

Check if a specific KB is installed.

Parameters
   name (str) -- The name of the KB to check

Returns
   True if installed, otherwise False

Return type
   bool

CLI Example:

salt '*' wusa.is_installed KB123456

salt.modules.win_wusa.list_()

Get a list of updates installed on the machine

Returns
   A list of installed updates

Return type
   list

CLI Example:

salt '*' wusa.list
salt.modules.win_wusa.uninstall(path, restart=False)

Uninstall a specific KB.

Parameters

- **path**(str) -- The full path to the msu file to uninstall. This can also be just the name of the KB to uninstall
- **restart**(bool) -- True to force a restart if required by the installation. Adds the /forcerestart switch to the wusa.exe command. False will add the /norestart switch instead. Default is False

Returns

- True if successful, otherwise False

Return type

bool

Raises

CommandExecutionError -- If an error is encountered

CLI Example:

```
salt '*' wusa.uninstall KB123456
# or
salt '*' wusa.uninstall C:/temp/KB123456.msu
```

### 26.6.517 salt.modules.winrepo

Module to manage Windows software repo on a Standalone Minion

**file_client:** local must be set in the minion config file.

For documentation on Salt's Windows Repo feature, see [here](#).

salt.modules.winrepo.genrepo()

Generate winrepo_cachefile based on sls files in the winrepo_dir

CLI Example:

```
salt-call winrepo.genrepo
```

class.show_sls(name, saltenv='base')

New in version 2015.8.0.

Display the rendered software definition from a specific sls file in the local winrepo cache. This will parse all Jinja. Run pkg.refresh_db to pull the latest software definitions from the master.

**Note:** This function does not ask a master for an sls file to render. Instead it directly processes the file specified in **name**

Parameters

- **str**(saltenv) -- The name/path of the package you want to view. This can be the
- **local** (full path to a file on the minion file system or a file on the)
- **cache** (minion)
- **str** -- The default environment is base

Returns

Returns a dictionary containing the rendered data structure
Return type

dict

Note: To use a file from the minion cache start from the local winrepo root (C:\salt\var\cache\salt\minion\files\base\win\repo-ng). If you have .sls files organized in subdirectories you'll have to denote them with .. For example, if you have a test directory in the winrepo root with a gvim.sls file inside, would target that file like so: test.gvim. Directories can be targeted as well as long as they contain an init.sls inside. For example, if you have a node directory with an init.sls inside, target that like so: node.

CLI Example:

salt '*' winrepo.show_sls gvim
salt '*' winrepo.show_sls test.npp
salt '*' winrepo.show_sls C:\test\gvim.sls

salt.modules.winrepo.update_git_repos(clean=False)

Checkout git repos containing Windows Software Package Definitions.

Important: This function requires Git for Windows to be installed in order to work. When installing, make sure to select an installation option which permits the git executable to be run from the Command Prompt.

clean

[False] Clean repo cachedirs which are not configured under winrepo_remotes.

Note: This option only applies if either pygit2 or GitPython is installed into Salt's bundled Python.

Warning: This argument should not be set to True if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Example:

salt-call winrepo.update_git_repos

26.6.518 salt.modules.wordpress

This module is used to manage Wordpress installations

derpends

wp binary from http://wp-cli.org/

class salt.modules.wordpress.Plugin(name, status, update, versino)

name

Alias for field number 0

26.6. execution modules
**status**
Alias for field number 1

**update**
Alias for field number 2

**versino**
Alias for field number 3

```python
salt.modules.wordpress.activate(name, path, user)
```
Activate a wordpress plugin

- **name**
  Wordpress plugin name
- **path**
  path to wordpress install location
- **user**
  user to run the command as

CLI Example:

```
salt '*' wordpress.activate HyperDB /var/www/html apache
```

```python
salt.modules.wordpress.deactivate(name, path, user)
```
Deactivate a wordpress plugin

- **name**
  Wordpress plugin name
- **path**
  path to wordpress install location
- **user**
  user to run the command as

CLI Example:

```
salt '*' wordpress.deactivate HyperDB /var/www/html apache
```

```python
salt.modules.wordpress.install(path, user, admin_user, admin_password, admin_email, title, url)
```
Run the initial setup functions for a wordpress install

- **path**
  path to wordpress install location
- **user**
  user to run the command as
- **admin_user**
  Username for the Administrative user for the wordpress install
- **admin_password**
  Initial Password for the Administrative user for the wordpress install
- **admin_email**
  Email for the Administrative user for the wordpress install
- **title**
  Title of the wordpress website for the wordpress install
- **url**
  Url for the wordpress install

CLI Example:

```
salt '*' wordpress.install /var/www/html apache dwallace password123 dwallace@example.com "Daniel's Awesome Blog" https://blog.dwallace.com
```
salt.modules.wordpress.is_installed(path, user=None)

Check if wordpress is installed and setup

path  path to wordpress install location
user  user to run the command as

CLI Example:

```
salt '*' wordpress.is_installed /var/www/html apache
```

salt.modules.wordpress.list_plugins(path, user)

List plugins in an installed wordpress path

path  path to wordpress install location
user  user to run the command as

CLI Example:

```
salt '*' wordpress.list_plugins /var/www/html apache
```

salt.modules.wordpress.show_plugin(name, path, user)

Show a plugin in a wordpress install and check if it is installed

name  Wordpress plugin name
path  path to wordpress install location
user  user to run the command as

CLI Example:

```
salt '*' wordpress.show_plugin HyperDB /var/www/html apache
```

26.6.519 salt.modules.x509

Manage X509 certificates

New in version 2015.8.0.

depends
M2Crypto

Deprecated since version 3006.0.

Warning:  This module has been deprecated and will be removed in Salt 3009 (Potassium). Please migrate to the replacement modules. For breaking changes between both versions, you can refer to the x509_v2 execution module docs.

They will become the default x509 modules in Salt 3008 (Argon). You can explicitly switch to the new modules before that release by setting features: {x509_v2: true} in your minion configuration.

salt.modules.x509.create_certificate(path=None, text=False, overwrite=True, ca_server=None, **kwargs)

Create an X509 certificate.

26.6. execution modules
path:
    Path to write the certificate to.

text:
    If True, return the PEM text without writing to a file. Default False.

overwrite:
    If True (default), create_certificate will overwrite the entire PEM file. Set False to preserve existing private keys and dh params that may exist in the PEM file.

kwargs:
    Any of the properties below can be included as additional keyword arguments.

call_server:
    Request a remotely signed certificate from ca_server. For this to work, a signing_policy must be specified, and that same policy must be configured on the ca_server. See signing_policy for details. Also, the salt master must permit peers to call the sign_remote_certificate function.

Example:
/etc/salt/master.d/peer.conf

peer:
    .*
    - x509.sign_remote_certificate

subject properties:
    Any of the values below can be included to set subject properties. Any other subject properties supported by OpenSSL should also work.

C:
    2 letter Country code

CN:
    Certificate common name, typically the FQDN.

Email:
    Email address

GN:
    Given Name

L:
    Locality

O:
    Organization

OU:
    Organization Unit

SN:
    SurName

ST:
    State or Province

signing_private_key:
    A path or string of the private key in PEM format that will be used to sign this certificate. If neither signing_cert, public_key, or csr are included, it will be assumed that this is a self-signed certificate, and the public key matching signing_private_key will be used to create the certificate.

signing_private_key_passphrase:
    Passphrase used to decrypt the signing_private_key.

signing_cert:
    A certificate matching the private key that will be used to sign this certificate. This is used to populate the issuer values in the resulting certificate. Do not include this value for self-signed certificates.

public_key:
    The public key to be included in this certificate. This can be sourced from a public key, certificate, CSR or private key. If a private key is used, the matching public key from the private key will be generated before any processing is done. This means you can request a certificate from a remote CA using a
private key file as your public_key and only the public key will be sent across the network to the CA. If neither public_key or csr are specified, it will be assumed that this is a self-signed certificate, and the public key derived from signing_private_key will be used. Specify either public_key or csr, not both. Because you can input a CSR as a public key or as a CSR, it is important to understand the difference. If you import a CSR as a public key, only the public key will be added to the certificate, subject or extension information in the CSR will be lost.

**public_key_passphrase:**
If the public key is supplied as a private key, this is the passphrase used to decrypt it.

csr:
A file or PEM string containing a certificate signing request. This will be used to supply the subject, extensions and public key of a certificate. Any subject or extensions specified explicitly will overwrite any in the CSR.

**basicConstraints:**
X509v3 Basic Constraints extension.

**extensions:**
The following arguments set X509v3 Extension values. If the value starts with critical, the extension will be marked as critical.

Some special extensions are subjectKeyIdentifier and authorityKeyIdentifier.

subjectKeyIdentifier can be an explicit value or it can be the special string hash. hash will set the subjectKeyIdentifier equal to the SHA1 hash of the modulus of the public key in this certificate. Note that this is not the exact same hashing method used by OpenSSL when using the hash value.

authorityKeyIdentifier Use values acceptable to the openssl CLI tools. This will automatically populate authorityKeyIdentifier with the subjectKeyIdentifier of signing_cert. If this is a self-signed cert these values will be the same.

**basicConstraints:**
X509v3 Basic Constraints

**keyUsage:**
X509v3 Key Usage

**extendedKeyUsage:**
X509v3 Extended Key Usage

**subjectKeyIdentifier:**
X509v3 Subject Key Identifier

**issuerAltName:**
X509v3 Issuer Alternative Name

**subjectAltName:**
X509v3 Subject Alternative Name

**crlDistributionPoints:**
X509v3 CRL Distribution Points

**issuingDistributionPoint:**
X509v3 Issuing Distribution Point

**certificatePolicies:**
X509v3 Certificate Policies

**policyConstraints:**
X509v3 Policy Constraints

**inhibitAnyPolicy:**
X509v3 Inhibit Any Policy

**nameConstraints:**
X509v3 Name Constraints

**noCheck:**
X509v3 OCSP No Check

**nsComment:**
Netscape Comment

---

26.6. execution modules
nsCertType:
  Netscape Certificate Type
days_valid:
  The number of days this certificate should be valid. This sets the notAfter property of the certificate. Defaults to 365.
version:
  The version of the X509 certificate. Defaults to 3. This is automatically converted to the version value, so version=3 sets the certificate version field to 0x2.
serial_number:
  The serial number to assign to this certificate. If omitted a random serial number of size serial_bits is generated.
serial_bits:
  The number of bits to use when randomly generating a serial number. Defaults to 64.
algorithm:
  The hashing algorithm to be used for signing this certificate. Defaults to sha256.
copypath:
  An additional path to copy the resulting certificate to. Can be used to maintain a copy of all certificates issued for revocation purposes.
prepend_cn:
  If set to True, the CN and a dash will be prepended to the copypath's filename.
  Example:
  /etc/pki/issued_certs/www.example.com-DE:CA:FB:AD:00:00:00:00.crt
signing_policy:
  A signing policy that should be used to create this certificate. Signing policies should be defined in the minion configuration, or in a minion pillar. It should be a YAML formatted list of arguments which will override any arguments passed to this function. If the minions key is included in the signing policy, only minions matching that pattern (see match.glob and match.compound) will be permitted to remotely request certificates from that policy. In order to match.compound to work salt master must peers permit peers to call it.
  Example:
  /etc/salt/master.d/peer.conf

peer:
  .*: 
    - match.compound

Example:

```
x509_signing_policies:
  www:
    - minions: 'www*'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/
```
The above signing policy can be invoked with `signing_policy=www`

**not_before:**
Initial validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'. New in version 3001.

**not_after:**
Final validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'. New in version 3001.

CLI Example:
```
salt '*' x509.create_certificate path=/etc/pki/myca.crt signing_private_key='/etc/pki/myca.key' csr='/etc/pki/myca.csr'}
```

```
salt.modules.x509.create_crl(path=None, text=False, signing_private_key=None, signing_private_key_passphrase=None, signing_cert=None, revoked=None, include_expired=False, days_valid=100, digest='')
```

Create a CRL

**Depends**
- PyOpenSSL Python module

**path:**
Path to write the CRL to.

**text:**
If `True`, return the PEM text without writing to a file. Default `False`.

**signing_private_key:**
A path or string of the private key in PEM format that will be used to sign the CRL. This is required.

**signing_private_key_passphrase:**
Passphrase to decrypt the private key.

**signing_cert:**
A certificate matching the private key that will be used to sign the CRL. This is required.

**revoked:**
A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A dict must contain either the key `serial_number` with the value of the serial number to revoke, or `certificate` with either the PEM encoded text of the certificate, or a path to the certificate to revoke.

The dict can optionally contain the `revocation_date` key. If this key is omitted the revocation date will be set to now. If should be a string in the format '%Y-%m-%d %H:%M:%S'.

The dict can also optionally contain the `not_after` key. This is redundant if the `certificate` key is included. If the `Certificate` key is not included, this can be used for the logic behind the `include_expired` parameter. If should be a string in the format '%Y-%m-%d %H:%M:%S'.

The dict can also optionally contain the `reason` key. This is the reason code for the revocation. Available choices are `unspecified`, `keyCompromise`, `CACompromise`, `affiliationChanged`, `superseded`, `cessationOfOperation` and `certificateHold`.

**include_expired:**
Include expired certificates in the CRL. Default is `False`.

**days_valid:**
The number of days that the CRL should be valid. This sets the Next Update field in the CRL.

**digest:**
The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14

CLI Example:
```
salt '*' x509.create_crl path=/etc/pki/mykey.key \\n   signing_private_key=/etc/pki/ca.key \
(continues on next page)"
salt.modules.x509.create_csr(path=None, text=False, **kwargs)

Create a certificate signing request.

path:
Path to write the certificate to.

text:
If True, return the PEM text without writing to a file. Default False.

algorithm:
The hashing algorithm to be used for signing this request. Defaults to sha256.

kwargs:
The subject, extension and version arguments from x509.create_certificate can be used.

CLI Example:
```
salt '*' x509.create_csr path=/etc/pki/myca.csr public_key='/etc/pki/myca.key' CN='My Cert'
```

salt.modules.x509.create_private_key(path=None, text=False, bits=2048, passphrase=None, cipher='aes_128_cbc', verbose=True)

Creates a private key in PEM format.

path:
The path to write the file to, either path or text are required.

text:
If True, return the PEM text without writing to a file. Default False.

bits:
Length of the private key in bits. Default 2048

passphrase:
Passphrase for encrypting the private key

cipher:
Cipher for encrypting the private key. Has no effect if passphrase is None.

verbose:
Provide visual feedback on stdout. Default True

New in version 2016.11.0.

CLI Example:
```
salt '*' x509.create_private_key path=/etc/pki/mykey.key
```

salt.modules.x509.expired(certificate)

Returns a dict containing limited details of a certificate and whether the certificate has expired.

New in version 2016.11.0.

certificate:
The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:
```
salt '*' x509.expired '/etc/pki/mycert.crt'
```

salt.modules.x509.get_pem_entries(glob_path)

Returns a dict containing PEM entries in files matching a glob
glob_path:
    A path to certificates to be read and returned.

CLI Example:
```
salt '*' x509.get_pem_entries '/etc/pki/*.crt'
```

salt.modules.x509.get_pem_entry(text, pem_type=None)

Returns a properly formatted PEM string from the input text fixing any whitespace or line-break issues.

- **text:** Text containing the X509 PEM entry to be returned or path to a file containing the text.
- **pem_type:** If specified, this function will only return a pem of a certain type, for example 'CERTIFICATE' or 'CERTIFICATE REQUEST'.

CLI Example:
```
salt '*' x509.get_pem_entry "-----BEGIN CERTIFICATE REQUEST-----MIICyzCCAr8CAQI...-----END CERTIFICATE REQUEST"
```

salt.modules.x509.get_private_key_size(private_key, passphrase=None)

Returns the bit length of a private key in PEM format.

- **private_key:** A path or PEM encoded string containing a private key.

CLI Example:
```
salt '*' x509.get_private_key_size /etc/pki/mycert.key
```

salt.modules.x509.get_public_key(key, passphrase=None, asObj=False)

Returns a string containing the public key in PEM format.

- **key:** A path or PEM encoded string containing a CSR, Certificate or Private Key from which a public key can be retrieved.

CLI Example:
```
salt '*' x509.get_public_key /etc/pki/mycert.cer
```

salt.modules.x509.get_signing_policy(signing_policy_name)

Returns the details of a names signing policy, including the text of the public key that will be used to sign it. Does not return the private key.

CLI Example:
```
salt '*' x509.get_signing_policy www
```

salt.modules.x509.read_certificate(certificate)

Returns a dict containing details of a certificate. Input can be a PEM string or file path.

- **certificate:** The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:
```
salt '*' x509.read_certificate /etc/pki/mycert.crt
```

salt.modules.x509.read_certificates(glob_path)

Returns a dict containing details of all certificates matching a glob...
Salt Documentation, Release 3007.1

```
glob_path:
   A path to certificates to be read and returned.
CLI Example:
salt '*' x509.read_certificates "/etc/pki/*.crt"

salt.modules.x509.read_crl(crl)
   Returns a dict containing details of a certificate revocation list. Input can be a PEM string or file path.
   Depends
      • OpenSSL command line tool
crl:
   A path or PEM encoded string containing the CRL to read.
CLI Example:
salt '*' x509.read_crl /etc/pki/mycrl.crl

salt.modules.x509.read_csr(csr)
   Returns a dict containing details of a certificate request.
   Depends
      • OpenSSL command line tool
csr:
   A path or PEM encoded string containing the CSR to read.
CLI Example:
salt '*' x509.read_csr /etc/pki/mycert.csr

salt.modules.x509.sign_remote_certificate(argdic, **kwargs)
   Request a certificate to be remotely signed according to a signing policy.
   argdic:
      A dict containing all the arguments to be passed into the create_certificate function. This will become
      kwargs when passed to create_certificate.
   kwargs:
      kwargs delivered from publish.publish
CLI Example:
salt '*' x509.sign_remote_certificate argdic="{'public_key': '/etc/pki/wwww.key', 'signing_policy': 'www'}" __pub_id='www1'

salt.modules.x509.verify_crl(crl, cert)
   Validate a CRL against a certificate. Parses openssl command line output, this is a workaround for M2Crypto's
   inability to get them from CSR objects.
crl:
   The CRL to verify
cert:
   The certificate to verify the CRL against
CLI Example:
salt '*' x509.verify_crl crl=/etc/pki/myca.crl cert=/etc/pki/myca.crt

salt.modules.x509.verify_private_key(private_key, public_key, passphrase=None)
   Verify that 'private_key' matches 'public_key'
```
private_key:
The private key to verify, can be a string or path to a private key in PEM format.

public_key:
The public key to verify, can be a string or path to a PEM formatted certificate, CSR, or another private key.

passphrase:
Passphrase to decrypt the private key.

CLI Example:
```
salt '*' x509.verify_private_key private_key=/etc/pki/myca.key \
   public_key=/etc/pki/myca.crt
```

```
salt.modules.x509.verify_signature(certificate, signing_pub_key=None, 
                                  signing_pub_key_passphrase=None)
```
Verify that certificate has been signed by signing_pub_key

certificate:
The certificate to verify. Can be a path or string containing a PEM formatted certificate.

signing_pub_key:
The public key to verify, can be a string or path to a PEM formatted certificate, CSR, or private key.

signing_pub_key_passphrase:
Passphrase to the signing_pub_key if it is an encrypted private key.

CLI Example:
```
salt '*' x509.verify_signature /etc/pki/mycert.pem \
   signing_pub_key=/etc/pki/myca.crt
```

```
salt.modules.x509.will_expire(certificate, days)
```
Returns a dict containing details of a certificate and whether the certificate will expire in the specified number of days. Input can be a PEM string or file path.

New in version 2016.11.0.

certificate:
The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:
```
salt '*' x509.will_expire "/etc/pki/mycert.crt" days=30
```

```
salt.modules.x509.write_pem(text, path, overwrite=True, pem_type=None)
```
Writes out a PEM string fixing any formatting or whitespace issues before writing.

text:
PEM string input to be written out.

path:
Path of the file to write the PEM out to.

overwrite:
If True (default), write_pem will overwrite the entire PEM file. Set False to preserve existing private keys and dh params that may exist in the PEM file.

pem_type:
The PEM type to be saved, for example CERTIFICATE or PUBLIC KEY. Adding this will allow the function to take input that may contain multiple PEM types.

CLI Example:
```
salt '*' x509.write_pem "-----BEGIN CERTIFICATE-----MIIGMzCCBBugA..." \
   path=/etc/pki/mycert.crt
```

26.6. execution modules
26.6.520 salt.modules.x509_v2

Manage X.509 certificates

depends
cryptography

New in version 3006.0: This module represents a complete rewrite of the original x509 modules and is named x509_v2 since it introduces breaking changes.

Note:
- PKCS12-related operations require at least cryptography release 36.
- PKCS12-related operations with Edwards-curve keys require at least cryptography release 37.
- PKCS7-related operations require at least cryptography release 37.

Configuration

Explicit activation

Since this module uses the same virtualname as the previous x509 modules, but is incompatible with them, it needs to be explicitly activated on each minion by including the following line in the minion configuration:

```
#/etc/salt/minion.d/x509.conf
features:
x509_v2: true
```

Peer communication

To be able to remotely sign certificates, it is required to configure the Salt master to allow Peer Communication:

```
#/etc/salt/master.d/peer.conf
peer:
  .*
  - x509.sign_remote_certificate
```

In order for the Compound Matcher to work with restricting signing policies to a subset of minions, in addition calls to `match.compound_matches` by the minion acting as the CA must be permitted:

```
#/etc/salt/master.d/peer.conf
peer:
  .*
  - x509.sign_remote_certificate
peer_run:
  ca_server:
    - match.compound_matches
```
Note: When compound match expressions are employed, pillar values can only be matched literally. This is a barrier to enumeration attacks by the CA server.

Also note that compound matching requires a minion data cache on the master. Any certificate signing request will be denied if `minion_data_cache` is disabled (it is enabled by default).

Note: Since grain values are controlled by minions, you should avoid using them to restrict certificate issuance.

See Is Targeting using Grain Data Secure?.

Changed in version 3007.0: Previously, a compound expression match was validated by the requesting minion itself via peer publishing, which did not protect from compromised minions. The new match validation takes place on the master using peer running.

**Signing policies**

In addition, the minion representing the CA needs to have at least one signing policy configured, remote calls not referencing one are always rejected.

The parameters specified in this signing policy override any parameters passed from the minion requesting the certificate. It can be configured in the CA minion's pillar, which takes precedence, or any location `config.get` looks up in. Signing policies are defined under `x509_signing_policies`.

You can restrict which minions can request a certificate under a configured signing policy by specifying a matcher in `minions`. This can be a glob or compound matcher (for the latter, see the notes above).

```
x509_signing_policies:
  www:
    - minions: 'www*'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical, CA:false"
    - keyUsage: "critical, cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/
```

Note: The following semantics are applied regarding the order of preference for specifying the subject name:

- If neither `subject` nor any name attributes (like CN) are part of the policy, issued certificates can contain any requested ones.
- If any name attributes are specified in the signing policy, `subject` contained in requests is ignored.
- If `subject` is specified in the signing policy, any name attributes are ignored. If the request contains the same data type for `subject` as the signing policy (for dicts and lists, and only then), merging is performed, otherwise `subject` is taken from the signing policy. Dicts are merged and list items are appended, with the items taken from the signing policy having priority.
Breaking changes versus the previous x509 modules

- The output format has changed for all read_* functions as well as the state return dict.
- The formatting of some extension definitions might have changed, but should be stable for most basic use cases.
- The default ordering of RDNs/Name Attributes in the subject’s Distinguished Name has been adapted to industry standards. This might cause a reissuance during the first state run.
- For x509.private_keyManaged, the file mode defaults to 0400. This should be considered a bug fix because writing private keys with world-readable permissions by default is a security issue.
- Restricting signing policies using compound match expressions requires peer run permissions instead of peer publishing permissions:

```python
# x509, x509_v2 in 3006.*
peer:
  ca_server:
    - match.compound

# x509_v2 from 3007.0 onwards
peer_run:
  ca_server:
    - match.compound_matches
```

Note that when a ca_server is involved, both peers must use the updated module version.

```
salt.modules.x509_v2.create_certificate(ca_server=None, signing_policy=None, encoding='pem',
append_certs=None, pkcs12_passphrase=None,
pkcs12_encryption_compat=False,
pkcs12_friendlyname=None, path=None, overwrite=True,
raw=False, **kwargs)
```

Create an X.509 certificate and return an encoded version of it.

**Note:** All parameters that take a public key, private key or certificate can be specified either as a PEM/hex/base64 string or a path to a local file encoded in all supported formats for the type.

**CLI Example:**

```
salt '*' x509.create_certificate signing_private_key='/etc/pki/myca.key'
csr='/etc/pki/my.csr'
```

- **ca_server**
  Request a remotely signed certificate from ca_server. For this to work, a signing_policy must be specified, and that same policy must be configured on the ca_server. See Signing policies for details. Also, the Salt master must permit peers to call the sign_remote_certificate function, see Peer communication.

- **signing_policy**
  The name of a configured signing policy. Parameters specified in there are hardcoded and cannot be overridden. This is required for remote signing, otherwise optional. See Signing policies for details.

- **encoding**
  Specify the encoding of the resulting certificate. It can be returned as a pem (or pkcs7_pem) string or several (base64-encoded) binary formats (der, pkcs7_der, pkcs12). Defaults to pem.
**append_certs**
A list of additional certificates to append to the new one, e.g. to create a CA chain.

*Note:* Mind that when der encoding is in use, appending certificatees is prohibited.

**copypath**
Create a copy of the issued certificate in PEM format in this directory. The file will be named `<serial_number>.crt` if `prepend_cn` is False.

**prepend_cn**
When `copypath` is set, prepend the common name of the certificate to the file name like so: `<CN>-<serial_number>.crt`. Defaults to False.

**pkcs12_passphrase**
When encoding a certificate as `pkcs12`, encrypt it with this passphrase.

*Note:* PKCS12 encryption is very weak and should not be relied on for security.

**pkcs12_encryption_compat**
OpenSSL 3 and cryptography v37 switched to a much more secure default encryption for PKCS12, which might be incompatible with some systems. This forces the legacy encryption. Defaults to False.

**pkcs12_friendlyname**
When encoding a certificate as `pkcs12`, a name for the certificate can be included.

**path**
Instead of returning the certificate, write it to this file path.

**overwrite**
If `path` is specified and the file exists, overwrite it. Defaults to true.

**raw**
Return the encoded raw bytes instead of a string. Defaults to false.

**digest**
The hashing algorithm to use for the signature. Valid values are: sha1, sha224, sha256, sha384, sha512, sha512_224, sha512_256, sha3_224, sha3_256, sha3_384, sha3_512. Defaults to sha256. This will be ignored for ed25519 and ed448 key types.

**private_key**
The private key corresponding to the public key the certificate should be issued for. This is one way of specifying the public key that will be included in the certificate, the other ones being `public_key` and `csr`.

**private_key_passphrase**
If `private_key` is specified and encrypted, the passphrase to decrypt it.

**public_key**
The public key the certificate should be issued for. Other ways of passing the required information are `private_key` and `csr`. If neither are set, the public key of the `signing_private_key` will be included, i.e. a self-signed certificate is generated.

**csr**
A certificate signing request to use as a base for generating the certificate. The following information will be respected, depending on configuration: * public key * extensions, if not otherwise specified (arguments, signing_policy)

**signing_cert**
The CA certificate to be used for signing the issued certificate.

**signing_private_key**
The private key corresponding to the public key in `signing_cert`. Required.

**signing_private_key_passphrase**
If `signing_private_key` is encrypted, the passphrase to decrypt it.

**serial_number**
A serial number to be embedded in the certificate. If unspecified, will autogenerate one. This should be
an integer, either in decimal or hexadecimal notation.

**not_before**
Set a specific date the certificate should not be valid before. The format should follow %Y-%m-%d %H:%M:%S and will be interpreted as GMT/UTC. Defaults to the time of issuance.

**not_after**
Set a specific date the certificate should not be valid after. The format should follow %Y-%m-%d %H:%M:%S and will be interpreted as GMT/UTC. If unspecified, defaults to the current time plus `days_valid` days.

**days_valid**
If `not_after` is unspecified, the number of days from the time of issuance the certificate should be valid for. Defaults to 30.

**subject**
The subject’s distinguished name embedded in the certificate. This is one way of passing this information (see `kwargs` below for the other). This argument will be preferred and allows to control the order of RDNs in the DN as well as to embed RDNs with multiple attributes. This can be specified as an RFC4514-encoded string (CN=example.com,O=Example Inc,C=US, mind that the rendered order is reversed from what is embedded), a list of RDNs encoded as in RFC4514 ("["C=US", "O=Example Inc", "CN=example.com"]") or a dictionary ({"CN": "example.com", "C": "US", "O": "Example Inc"}, default ordering). Multiple name attributes per RDN are concatenated with a +.

---

**Note:** Parsing of RFC4514 strings requires at least cryptography release 37.

**kwargs**
Embedded X.509v3 extensions and the subject’s distinguished name can be controlled via supplemental keyword arguments. See the following for an overview.

**Subject properties in kwargs**
C, ST, L, STREET, O, OU, CN, MAIL, SN, GN, UID, SERIALNUMBER

**X.509v3 extensions in kwargs**
Most extensions can be configured using the same string format as OpenSSL, while some require adjustments. In general, since the strings are parsed to dict/lists, you can always use the latter formats directly. Marking an extension as critical is done by including it at the beginning of the configuration string, in the list or as a key in the dictionary with the value `true`.

Examples (some showcase dict/list correspondance):

**basicConstraints**
critical, CA:TRUE, pathlen:1 or

```
- basicConstraints:
  - critical: true
  - ca: true
  - pathlen: 1
```

**keyUsage**
critical, cRLSign, keyCertSign or

```
- keyUsage:
  - critical
  - cRLSign
  - keyCertSign
```

**subjectKeyIdentifier**
This can be an explicit value or hash, in which case the value will be set to the SHA1 hash of some encoding of the associated public key, depending on the underlying algorithm (RSA/ECDSA/EdDSA).
authorityKeyIdentifier
   keyid:always, issuer

subjectAltName
   There is support for all OpenSSL-defined types except otherName.
   email:me@example.com,DNS:example.com or
   # mind this being a list, not a dict
   - subjectAltName:
     - email:me@example.com
     - DNS:example.com

issuerAltName
   The syntax is the same as for subjectAltName, except that the additional value
   issuer:copy is supported, which will copy the values of subjectAltName in the issuer's certificate.

authorityInfoAccess
   OCSP;URI:http://ocsp.example.com/,caIssuers;URI:http://myca.example.com/ca.cer

crlDistributionPoints
   When set to a string value, items are interpreted as fullnames:
   URI:http://example.com/myca.crl, URI:http://example.org/my.crl
   There is also support for more attributes using the full form:
   - crlDistributionPoints:
     - fullname: URI:http://example.com/myca.crl
crlissuer: DNS:example.org
   reasons:
     - keyCompromise
     - URI:http://example.org/my.crl

certificatePolicies
   critical, 1.2.4.5, 1.1.3.4
   Again, there is support for more attributes using the full form:
   - certificatePolicies:
     critical: true
     1.2.3.4.5: https://my.ca.com/pratice_statement
     1.2.4.5.6:
      - https://my.ca.com/pratice_statement
      - organization: myorg
      noticeNumbers: [1, 2, 3]
      text: mytext

policyConstraints
   requireExplicitPolicy:3,inhibitPolicyMapping:1

inhibitAnyPolicy
   The value is just an integer: - inhibitAnyPolicy: 1

nameConstraints
   critical,permitted;IP:192.168.0.0/255.255.0.0,permitted;email:.example.com,excluded;email:.com
   - nameConstraints:
     critical: true
     permitted:
noCheck
This extension does not take any values, except critical. Just the presence in the keyword args will include it.

tlsfeature
status_request
For more information, visit the OpenSSL docs.

```
salt.modules.x509_v2.create_crl(
signing_private_key, revoked, signing_cert=None,
signing_private_key_passphrase=None,
days_valid=None, digest='sha256', encoding='pem', extensions=None,
include_expired=False, path=None, raw=False, **kwargs)
```

Create a certificate revocation list.

CLI Example:
```
salt '*' x509.create_crl signing_cert=/etc/pki/ca.crt
   ->signing_private_key=/etc/pki/ca.key
   revoked="[{
   ->'certificate': '/etc/pki/certs/www1.crt', 'revocation_date': '2015-03-
   ->01 00:00:00'}]
```

**signing_private_key**
Your certificate authority's private key. It will be used to sign the CRL. Required.

**revoked**
A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A dict must contain either the key `serial_number` with the value of the serial number to revoke, or `certificate` with some reference to the certificate to revoke.

The dict can optionally contain the `revocation_date` key. If this key is omitted, the revocation date will be set to now. It should be a string in the format "%Y-%m-%d %H:%M:%S".

The dict can also optionally contain the `not_after` key. This is redundant if the `certificate` key is included, since it will be sourced from the certificate. If the `certificate` key is not included, this can be used for the logic behind the `include_expired` parameter. It should be a string in the format "%Y-%m-%d %H:%M:%S".

The dict can also optionally contain the `extensions` key, which allows to set CRL entry-specific extensions. The following extensions are supported:

**certificateIssuer**
Identifies the certificate issuer associated with an entry in an indirect CRL. The format is the same as for `subjectAltName`.

**CRLReason**
Identifies the reason for certificate revocation. Available choices are `unspecified`, `keyCompromise`, `CACompromise`, `affiliationChanged`, `superseded`, `cessationOfOperation`, `certificateHold`, `privilegeWithdrawn`, `aACompromise` and `removeFromCRL`.

**invalidityDate**
Provides the date on which the certificate likely became invalid. The value should be a string in the same format as `revocation_date`.

**signing_cert**
The CA certificate to be used for signing the CRL.
signing_private_key_passphrase
    If signing_private_key is encrypted, the passphrase to decrypt it.

include_expired
    Also include already expired certificates in the CRL. Defaults to false.

days_valid
    The number of days the CRL should be valid for. This sets the Next Update field. Defaults to 100 (until v3009) or 7 (from v3009 onwards).

digest
    The hashing algorithm to use for the signature. Valid values are: sha1, sha224, sha256, sha384, sha512, sha512_224, sha512_256, sha3_224, sha3_256, sha3_384, sha3_512. Defaults to sha256. This will be ignored for ed25519 and ed448 key types.

encoding
    Specify the encoding of the resulting certificate revocation list. It can be returned as a pem string or base64-encoded der. Defaults to pem.

extensions
    Add CRL extensions. The following are available:

    authorityKeyIdentifier
        See x509.create_certificate.

    authorityInfoAccess
        See x509.create_certificate.

    cRLNumber
        Specifies a sequential number for each CRL issued by a CA. Values must be integers.

    deltaCRLIndicator
        If the CRL is a delta CRL, this value points to the cRLNumber of the base cRL. Values must be integers.

    freshestCRL
        Identifies how delta CRL information is obtained. The format is the same as crlDistributionPoints.

    issuerAltName
        See x509.create_certificate.

    issuingDistributionPoint
        Identifies the CRL distribution point for a particular CRL and indicates what kinds of revocation it covers. The format is comparable to crlDistributionPoints. Specify as follows:

        **issuingDistributionPoint**:
            **fullname**: # or relativename with RDN
                - URI:http://example.com/myca.crl
            **onlysomeReasons**:
                - keyCompromise
            **onlyuser**: true
            **onlyCA**: true
            **onlyAA**: true
            **indirectCRL**: false

path
    Instead of returning the CRL, write it to this file path.

raw
    Return the encoded raw bytes instead of a string. Defaults to false.

salt.modules.x509_v2.create_csr(private_key, private_key_passphrase=None, digest='sha256', encoding='pem', path=None, raw=False, **kwargs)

Create a certificate signing request.

CLI Example:
private_key

The private key corresponding to the public key the certificate should be issued for. The CSR will be signed by it. Required.

private_key_passphrase

If private_key is encrypted, the passphrase to decrypt it.

digest

The hashing algorithm to use for the signature. Valid values are: sha1, sha224, sha256, sha384, sha512, sha512_224, sha512_256, sha3_224, sha3_256, sha3_384, sha3_512. Defaults to sha256. This will be ignored for ed25519 and ed448 key types.

encoding

Specify the encoding of the resulting certificate signing request. It can be returned as a pem string or base64-encoded der. Defaults to pem.

path

Instead of returning the CSR, write it to this file path.

generated

Return the encoded raw bytes instead of a string. Defaults to false.

kwargs

Embedded X.509v3 extensions and the subject's distinguished name can be controlled via supplemental keyword arguments. See x509.create_certificate for an overview. Mind that some extensions are not available for CSR (authorityInfoAccess, authorityKeyIdentifier, issuerAltName, crlDistributionPoints).

salt.modules.x509_v2.create_private_key(algo='rsa', keysize=None, passphrase=None, encoding='pem', pkcs12_encryption_compat=False, path=None, raw=False, **kwargs)

Create a private key.

CLI Example:

```
salt '*' x509.create_private_key algo=ec keysize=384
```

algo

The digital signature scheme the private key should be based on. Available: rsa, ec, ed25519, ed448. Defaults to rsa.

keysize

For rsa, specifies the bitlength of the private key (2048, 3072, 4096). For ec, specifies the NIST curve to use (256, 384, 521). Irrelevant for Edwards-curve schemes (ed25519, ed448). Defaults to 2048 for RSA and 256 for EC.

passphrase

If this is specified, the private key will be encrypted using this passphrase. The encryption algorithm cannot be selected, it will be determined automatically as the best available one.

encoding

Specify the encoding of the resulting private key. It can be returned as a pem string, base64-encoded der or base64-encoded pkcs12. Defaults to pem.

pkcs12_encryption_compat

Some operating systems are incompatible with the encryption defaults for PKCS12 used since OpenSSL v3. This switch triggers a fallback to PBESv1SHA1And3KeyTripleDESCBC. Please consider the notes on PKCS12 encryption.

path

Instead of returning the private key, write it to this file path. Note that this does not use safe permissions and should be avoided.

raw
Return the encoded raw bytes instead of a string. Defaults to false.

```python
salt.modules.x509_v2.encode_certificate(certificate, encoding='pem', append_certs=None, private_key=None, private_key_passphrase=None, pkcs12_passphrase=None, pkcs12_encryption_compat=False, pkcs12_friendlyname=None, raw=False)
```

Create an encoded representation of a certificate, optionally including other structures. This can be used to create certificate chains, convert a certificate into a different encoding or embed the corresponding private key (for pkcs12).

CLI Example:

```
salt '*' x509.encode_certificate /etc/pki/my.crt pem /etc/pki/ca.crt
```

**certificate**  
The certificate to encode.

**encoding**  
Specify the encoding of the resulting certificate. It can be returned as a pem (or pkcs7_pem) string or several (base64-encoded) binary formats (der, pkcs7_der, pkcs12). Defaults to pem.

**append_certs**  
A list of additional certificates to encode with the new one, e.g. to create a CA chain.

---

**Note:** Mind that when der encoding is in use, appending certificatees is prohibited.

**private_key**  
For pkcs12, the private key corresponding to the public key of the certificate to be embedded.

**private_key_passphrase**  
For pkcs12, if the private key to embed is encrypted, specify the corresponding passphrase.

**pkcs12_passphrase**  
For pkcs12, the container can be encrypted. Specify the passphrase to use here. Mind that PKCS12 encryption should not be relied on for security purposes, see note above in `x509.create_certificate`.

**pkcs12_encryption_compat**  
OpenSSL 3 and cryptography v37 switched to a much more secure default encryption for PKCS12, which might be incompatible with some systems. This forces the legacy encryption. Defaults to False.

**pkcs12_friendlyname**  
When encoding a certificate as pkcs12, a name for the certificate can be included.

**raw**  
Return the encoded raw bytes instead of a string. Defaults to false.

```python
salt.modules.x509_v2.encode_crl(crl, encoding='pem', raw=False)
```

Create an encoded representation of a certificate revocation list.

CLI Example:

```
salt '*' x509.encode_crl /etc/pki/my.crl der
```

**crl**  
The certificate revocation list to encode.

**encoding**  
Specify the encoding of the resulting certificate revocation list. It can be returned as a pem string or base64-encoded der. Defaults to pem.

**raw**  
Return the encoded raw bytes instead of a string. Defaults to false.
salt.modules.x509_v2.encode_csr(csr, encoding='pem', raw=False)

Create an encoded representation of a certificate signing request.

CLI Example:

```
salt '*' x509.encode_csr /etc/pki/my.csr der
```

csr
The certificate signing request to encode.

encoding
Specify the encoding of the resulting certificate signing request. It can be returned as a pem string or base64-encoded der. Defaults to pem.

raw
Return the encoded raw bytes instead of a string. Defaults to false.

salt.modules.x509_v2.encode_private_key(private_key, encoding='pem', passphrase=None, private_key_passphrase=None, pkcs12_encryption_compat=False, raw=False)

Create an encoded representation of a private key.

CLI Example:

```
salt '*' x509.encode_private_key /etc/pki/my.key der
```

private_key
The private key to encode.

encoding
Specify the encoding of the resulting private key. It can be returned as a pem string, base64-encoded der and base64-encoded pkcs12. Defaults to pem.

passphrase
If this is specified, the private key will be encrypted using this passphrase. The encryption algorithm cannot be selected, it will be determined automatically as the best available one.

private_key_passphrase
New in version 3006.2.

If the current private_key is encrypted, the passphrase to decrypt it.

pkcs12_encryption_compat
Some operating systems are incompatible with the encryption defaults for PKCS12 used since OpenSSL v3. This switch triggers a fallback to PBESv1SHA1And3KeyTripleDESCBC. Please consider the notes on PKCS12 encryption.

raw
Return the encoded raw bytes instead of a string. Defaults to false.

salt.modules.x509_v2.expired(certificate)

Returns a dict containing limited details of a certificate and whether the certificate has expired.

CLI Example:

```
salt '*' x509.expired /etc/pki/mycert.crt
```

certificate
The certificate to check.

salt.modules.x509_v2.expires(certificate, days=0)

Determine whether a certificate will expire or has expired already. Returns a boolean only.

CLI Example:
salt '*' x509.expires /etc/pki/my.crt days=7

certificate
    The certificate to check.
days
    If specified, determine expiration x days in the future. Defaults to 0, which checks for the current time.

salt.modules.x509_v2.get_pem_entries(glob_path)
    Returns a dict containing PEM entries in files matching a glob.

    CLI Example:

    salt '*' x509.get_pem_entries "*/etc/pki/*.crt"

glob_path
    A path representing certificates to be read and returned.

salt.modules.x509_v2.get_pem_entry(text, pem_type=None)
    Returns a properly formatted PEM string from the input text, fixing any whitespace or line-break issues.

    CLI Example:

    salt '*' x509.get_pem_entry "-----BEGIN CERTIFICATE REQUEST-----MIICyzCCAr8CAQI...
    -----END CERTIFICATE REQUEST"

text
    Text containing the X509 PEM entry to be returned or path to a file containing the text.
pem_type
    If specified, this function will only return a pem of a certain type, for example 'CERTIFICATE' or 'CERTIFICATE REQUEST'.

salt.modules.x509_v2.get_private_key_size(private_key, passphrase=None)
    Return information about the keysize of a private key (RSA/EC).

    CLI Example:

    salt '*' x509.get_private_key_size /etc/pki/my.key

private_key
    The private key to check.
passphrase
    If private_key is encrypted, the passphrase to decrypt it.

salt.modules.x509_v2.get_public_key(key, passphrase=None, asObj=None)
    Returns a PEM-encoded public key derived from some reference. The reference should be a public key, certificate, private key or CSR.

    CLI Example:

    salt '*' x509.get_public_key /etc/pki/my.key

key
    A reference to the structure to look the public key up for.
passphrase
    If key is encrypted, the passphrase to decrypt it.
salt.modules.x509_v2.get_signing_policy(signing_policy, ca_server=None)

Returns the specified named signing policy.

CLI Example:

```
salt '*' x509.get_signing_policy www
```

**signing_policy**
The name of the signing policy to return.

**ca_server**
If this is set, the CA server will be queried for the signing policy instead of looking it up locally.

salt.modules.x509_v2.read_certificate(certificate)

Returns a dict containing details of a certificate.

CLI Example:

```
salt '*' x509.read_certificate /etc/pki/mycert.crt
```

**certificate**
The certificate to read.

salt.modules.x509_v2.read_certificates(glob_path)

Returns a dict containing details of all certificates matching a glob.

CLI Example:

```
salt '*' x509.read_certificates "/etc/pki/*.crt"
```

**glob_path**
A path to certificates to be read and returned.

salt.modules.x509_v2.read_crl(crl)

Returns a dict containing details of a certificate revocation list.

CLI Example:

```
salt '*' x509.read_crl /etc/pki/my.crl
```

**crl**
The certificate revocation list to read.

salt.modules.x509_v2.read_csr(csr)

Returns a dict containing details of a certificate signing request.

CLI Example:

```
salt '*' x509.read_csr /etc/pki/mycert.csr
```

**csr**
The certificate signing request to read.

salt.modules.x509_v2.sign_remote_certificate(signing_policy, **kwargs, get_signing_policy_only=False, **more_kwargs)

Request a certificate to be remotely signed according to a signing policy. This is mostly for internal use and does not make much sense on the CLI.

CLI Example:
salt '*' x509.sign_remote_certificate www kwargs="{'public_key': '/etc/pki/www.key'}"

**signing_policy**
The name of the signing policy to use. Required.

**kwargs**
A dict containing all the arguments to be passed into the `x509.create_certificate` function.

**get_signing_policy_only**
Only return the named signing policy. Defaults to false.

salt.modules.x509_v2.verify_crl(crl, cert)
Verify that a signature on a certificate revocation list was made by the private key corresponding to the public key associated with the specified certificate.

CLI Example:
salt '*' x509.verify_crl /etc/pki/my.crl /etc/pki/my.crt

crl
The certificate revocation list to check the signature on.

cert
The certificate (or any reference that can be passed to `get_public_key`) to retrieve the public key from.

salt.modules.x509_v2.verify_private_key(private_key, public_key, passphrase=None)
Verify that a private key belongs to the specified public key.

CLI Example:
salt '*' x509.verify_private_key /etc/pki/my.key /etc/pki/my.crt

private_key
The private key to check.

public_key
The certificate (or any reference that can be passed to `get_public_key`) to retrieve the public key from.

passphrase
If `private_key` is encrypted, the passphrase to decrypt it.

salt.modules.x509_v2.verify_signature(certificate, signing_pub_key=None, signing_pub_key_passphrase=None)
Verify that a signature on a certificate was made by the private key corresponding to the public key associated with the specified certificate.

CLI Example:
salt '*' x509.verify_signature /etc/pki/my.key /etc/pki/my.crt

certificate
The certificate to check the signature on.

signing_pub_key
Any reference that can be passed to `get_public_key` to retrieve the public key of the signing entity from. If unspecified, will take the public key of `certificate`, i.e. verify a self-signed certificate.

signing_pub_key_passphrase
If `signing_pub_key` is encrypted, the passphrase to decrypt it.
salt.modules.x509_v2.will_expire(certificate, days)

Returns a dict containing details of a certificate and whether the certificate will expire in the specified number of days.

CLI Example:

```
salt '*' x509.will_expire "/etc/pki/mycert.crt" days=30
```

certificate
The certificate to check.

days
The number of days in the future to check the validity for.

salt.modules.x509_v2.write_pem(text, path, overwrite=True, pem_type=None)

Writes out a PEM string, fixing any formatting or whitespace issues before writing.

CLI Example:

```
salt '*' x509.write_pem "-----BEGIN CERTIFICATE-----MIIGMzCCBBugA..." path="/etc/pki/mycert.crt"
```

text
PEM string input to be written out.

path
Path of the file to write the PEM out to.

overwrite
If True (default), write_pem will overwrite the entire PEM file. Set to False to preserve existing private keys and DH params that may exist in the PEM file.

pem_type
The PEM type to be saved, for example CERTIFICATE or PUBLIC KEY. Adding this will allow the function to take input that may contain multiple PEM types.

26.6.521 salt.modules.xapi_virt

This module (mostly) uses the XenAPI to manage Xen virtual machines.

Big fat warning: the XenAPI used in this file is the one bundled with Xen Source, NOT XenServer nor Xen Cloud Platform. As a matter of fact it will fail under those platforms. From what I've read, little work is needed to adapt this code to XS/XCP, mostly playing with XenAPI version, but as XCP is not taking precedence on Xen Source on many platforms, please keep compatibility in mind.

Useful documentation:

- http://docs.vmd.citrix.com/XenServer/6.0.0/1.0/en_gb/api/
- https://github.com/xapi-project/xen-api/tree/master/scripts/examples/python
- http://xenbits.xen.org/gitweb/?p=xen.git;a=tree;f=tools/python/xen/xm;hb=HEAD

salt.modules.xapi_virt.freecpu()

Return an int representing the number of unallocated cpus on this hypervisor

CLI Example:

```
salt '*' virt.freecpu
```

salt.modules.xapi_virt.freemem()

Return an int representing the amount of memory that has not been given to virtual machines on this node

CLI Example:
salt '*' virt.freemem

salt.modules.xapi_virt.full_info()
    Return the node_info, vm_info and freemem
    CLI Example:
    salt '*' virt.full_info

salt.modules.xapi_virt.get_disks(vm_)
    Return the disks of a named vm
    CLI Example:
    salt '*' virt.get_disks <vm name>

salt.modules.xapi_virt.get_macs(vm_)
    Return a list off MAC addresses from the named vm
    CLI Example:
    salt '*' virt.get_macs <vm name>

salt.modules.xapi_virt.get_nics(vm_)
    Return info about the network interfaces of a named vm
    CLI Example:
    salt '*' virt.get_nics <vm name>

salt.modules.xapi_virt.is_hyper()
    Returns a bool whether or not this node is a hypervisor of any kind
    CLI Example:
    salt '*' virt.is_hyper

salt.modules.xapi_virt.list_domains()
    Return a list of virtual machine names on the minion
    CLI Example:
    salt '*' virt.list_domains

salt.modules.xapi_virt.migrate(vm_, target, live=1, port=0, node=-1, ssl=None, change_home_server=0)
    Migrates the virtual machine to another hypervisor
    CLI Example:
    salt '*' virt.migrate <vm name> <target hypervisor> [live] [port] [node] [ssl] [change_home_server]

    Optional values:
    live
        Use live migration
    port
        Use a specified port
node
  Use specified NUMA node on target
ssl
  use ssl connection for migration
change_home_server
  change home server for managed domains

salt.modules.xapi_virt.node_info()
  Return a dict with information about this node
  CLI Example:
  `salt '*' virt.node_info`

salt.modules.xapi_virt.pause(vm_)
  Pause the named vm
  CLI Example:
  `salt '*' virt.pause <vm name>`

salt.modules.xapi_virt.reboot(vm_)
  Reboot a domain via ACPI request
  CLI Example:
  `salt '*' virt.reboot <vm name>`

salt.modules.xapi_virt.reset(vm_)
  Reset a VM by emulating the reset button on a physical machine
  CLI Example:
  `salt '*' virt.reset <vm name>`

salt.modules.xapi_virt.resume(vm_)
  Resume the named vm
  CLI Example:
  `salt '*' virt.resume <vm name>`

salt.modules.xapi_virt.setmem(vm_, memory)
  Changes the amount of memory allocated to VM.
  Memory is to be specified in MB
  CLI Example:
  `salt '*' virt.setmem myvm 768`

salt.modules.xapi_virt.setvcpus(vm_, vcpus)
  Changes the amount of vcpus allocated to VM.
  vcpus is an int representing the number to be assigned
  CLI Example:
salt '*' virt.setvcpus myvm 2

salt.modules.xapi_virt.shutdown(vm_)
   Send a soft shutdown signal to the named vm
   CLI Example:
   salt '*' virt.shutdown <vm name>

salt.modules.xapi_virt.start(config_)
   Start a defined domain
   CLI Example:
   salt '*' virt.start <path to Xen cfg file>

salt.modules.xapi_virt.stop(vm_)
   Hard power down the virtual machine, this is equivalent to pulling the power
   CLI Example:
   salt '*' virt.stop <vm name>

salt.modules.xapi_virt.vcpu_pin(vm_, vcpu, cpus)
   Set which CPUs a VCPU can use.
   CLI Example:
   salt 'foo' virt.vcpu_pin domU-id 2 1
   salt 'foo' virt.vcpu_pin domU-id 2 2-6

salt.modules.xapi_virt.vm_cputime(vm_=None)
   Return cputime used by the vms on this hyper in a list of dicts:
   
   ```
   [
   'your-vm': {  
   'cputime' <int> 
   'cputime_percent' <int>
   },
   ... 
   ]
   ```

   If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.
   CLI Example:
   salt '*' virt.vm_cputime

salt.modules.xapi_virt.vm_diskstats(vm_=None)
   Return disk usage counters used by the vms on this hyper in a list of dicts:
   
   ```
   [
   'your-vm': {  
   'io_read_kbs' : 0,
   (continues on next page)```
If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_diskstats
```

salt.modules.xapi_virt.vm_info(vm_=None)
Return detailed information about the vms.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

salt.modules.xapi_virt.vm_netstats(vm_=None)
Return combined network counters used by the vms on this hyper in a list of dicts:

```
[
    'your-vm': {
        'io_read_kbs' : 0,
        'io_total_read_kbs' : 0,
        'io_total_write_kbs' : 0,
        'io_write_kbs' : 0,
    },
    ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

salt.modules.xapi_virt.vm_state(vm_=None)
Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_state <vm name>
```
26.6.522 salt.modules.xbpspkg

Package support for XBPS package manager (used by VoidLinux)

New in version 2016.11.0.

salt.modules.xbpspkg.add_repo(repo, conffile='/usr/share/xbps.d/15-saltstack.conf')
  Add an XBPS repository to the system.
  repo
    url of repo to add (persistent).
  conffile
    path to xbps conf file to add this repo default: /usr/share/xbps.d/15-saltstack.conf

CLI Examples:

```
salt '*' pkg.add_repo <repo url> [conffile=/path/to/xbps/repo.conf]
```

salt.modules.xbpspkg.available_version(*names, **kwargs)
  Return the latest version of the named package available for upgrade or installation. If more than one package
  name is specified, a dict of name/version pairs is returned.
  
  If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.xbpspkg.del_repo(repo, **kwargs)
  Remove an XBPS repository from the system.
  repo
    url of repo to remove (persistent).

CLI Examples:

```
salt '*' pkg.del_repo <repo url>
```

salt.modules.xbpspkg.get_repo(repo, **kwargs)
  Display information about the repo.

CLI Examples:

```
salt '*' pkg.get_repo 'repo-url'
```

salt.modules.xbpspkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
  Install the passed package
  name
    The name of the package to be installed.
  refresh
    Whether or not to refresh the package database before installing.
  fromrepo
    Specify a package repository (url) to install from.
  Multiple Package Installation Options:
  pkgs
    A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:
salt '★' pkg.install pkgs=['"foo","bar"]'

**sources**

A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and
the values being the source URI or local path to the package.

CLI Example:

```
salt '★' pkg.install sources=['{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]'
```

Return a dict containing the new package names and versions:

```
{<package>: {'old': '<old-version>',
'new': '<new-version>'}}
```

CLI Example:

```
salt '★' pkg.install <package name>
```

salt.modules.xbpspkg.**latest_version**("names", **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package
name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '★' pkg.latest_version <package name>
salt '★' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.xbpspkg.**list_pkgs**(versions_as_list=False, **kwargs)

List the packages currently installed as a dict:

```
{<package_name>: '<version>'}
```

CLI Example:

```
salt '★' pkg.list_pkgs
```

salt.modules.xbpspkg.**list_repos**( **kwargs)

List all repos known by XBPS

CLI Example:

```
salt '★' pkg.list_repos
```

salt.modules.xbpspkg.**list_upgrades**(refresh=True, **kwargs)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '★' pkg.list_upgrades
```

salt.modules.xbpspkg.**refresh_db**( **kwargs)

Update list of available packages from installed repos

CLI Example:
salt '=*' pkg.refresh_db

salt.modules.xbpspkg.remove(name=None, pkgs=None, recursive=True, **kwargs)

name
The name of the package to be deleted.

recursive
Also remove dependent packages (not required elsewhere). Default mode: enabled.

Multiple Package Options:

pkgs
A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

salt '=*' pkg.remove <package name> [recursive= False]
salt '=*' pkg.remove <package1>,<package2>,<package3> [recursive= False]
salt '=*' pkg.remove pkgs='["foo", "bar"]' [recursive= False]

salt.modules.xbpspkg.upgrade(refresh=True, **kwargs)

Run a full system upgrade

refresh
Whether or not to refresh the package database before installing. Default is True.

Returns a dictionary containing the changes:

{"<package>': {'old': '<old-version>',
'new': '<new-version>'}}

CLI Example:

salt '=*' pkg.upgrade

salt.modules.xbpspkg.upgrade_available(name,**kwargs)

Check whether or not an upgrade is available for a given package

CLI Example:

salt '=*' pkg.upgrade_available <package name>

salt.modules.xbpspkg.version(*names,**kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

salt '=*' pkg.version <package name>
salt '=*' pkg.version <package1> <package2> <package3> ...
26.6.523  salt.modules.xfs

Module for managing XFS file systems.

salt.modules.xfs.defragment(device)

Defragment mounted XFS filesystem. In order to mount a filesystem, device should be properly mounted and writable.

CLI Example:

```
salt '*' xfs.defragment /dev/sdal
```

salt.modules.xfs.devices()

Get known XFS formatted devices on the system.

CLI Example:

```
salt '*' xfs.devices
```

salt.modules.xfs.dump(device, destination, level=0, label=None, noerase=None)

Dump filesystem device to the media (file, tape etc).

Required parameters:
- device: XFS device, content of which to be dumped.
- destination: Specifies a dump destination.

Valid options are:
- label: Label of the dump. Otherwise automatically generated label is used.
- level: Specifies a dump level of 0 to 9.
- noerase: Pre-erase media.

Other options are not used in order to let xfsdump use its default values, as they are most optimal. See the xfsdump(8) manpage for a more complete description of these options.

CLI Example:

```
salt '*' xfs.dump /dev/sdal /destination/on/the/client
salt '*' xfs.dump /dev/sdal /destination/on/the/client label='Company\accountancy'
salt '*' xfs.dump /dev/sdal /destination/on/the/client noerase=True
```

salt.modules.xfs.estimate(path)

Estimate the space that an XFS filesystem will take. For each directory estimate the space that directory would take if it were copied to an XFS filesystem. Estimation does not cross mount points.

CLI Example:

```
salt '*' xfs.estimate /path/to/file
salt '*' xfs.estimate /path/to/dir/*
```

salt.modules.xfs.info(device)

Get filesystem geometry information.

CLI Example:

```
salt '*' xfs.info /dev/sdal
```
salt.modules.xfs.inventory()
Display XFS dump inventory without restoration.

CLI Example:
```
salt '*' xfs.inventory
```

salt.modules.xfs.mkfs(device, label=None, ssize=None, noforce=None, bso=None, GMO=None, ino=None, lso=None, rso=None, nmo=None, dso=None)
Create a file system on the specified device. By default wipes out with force.

General options:
- **label**: Specify volume label.
- **ssize**: Specify the fundamental sector size of the filesystem.
- **noforce**: Do not force create filesystem, if disk is already formatted.

Filesystem geometry options:
- **bso**: Block size options.
- **gmo**: Global metadata options.
- **dso**: Data section options. These options specify the location, size, and other parameters of the data section of the filesystem.
- **ino**: Inode options to specify the inode size of the filesystem, and other inode allocation parameters.
- **lso**: Log section options.
- **nmo**: Naming options.
- **rso**: Realtime section options.

See the `mkfs.xfs(8)` manpage for a more complete description of corresponding options description.

CLI Example:
```
salt '*' xfs.mkfs /dev/sdal
salt '*' xfs.mkfs /dev/sdal dso='su=32k,sw=6' noforce=True
salt '*' xfs.mkfs /dev/sdal dso='su=32k,sw=6' lso='logdev=/dev/sda2,
size=10000b'
```

salt.modules.xfs.modify(device, label=None, lazy_counting=None, uuid=None)
Modify parameters of an XFS filesystem.

CLI Example:
```
salt '*' xfs.modify /dev/sdal label='My backup' lazy_counting=False
salt '*' xfs.modify /dev/sdal uuid=False
salt '*' xfs.modify /dev/sdal uuid=True
```

salt.modules.xfs.prune_dump(sessionid)
Prunes the dump session identified by the given session id.

CLI Example:
```
salt '*' xfs.prune_dump b74a3586-e52e-4a4a-8775-c3334fa8ea2c
```
26.6.524 salt.modules.xml

XML file manager
New in version 3000.
salt.modules.xml.get_attribute(file, element)
Return the attributes of the matched xpath element.

CLI Example:
```bash
salt '*' xml.get_attribute /tmp/test.xml "./element[@id='3']"
```
salt.modules.xml.get_value(file, element)
Returns the value of the matched xpath element

CLI Example:
```bash
salt '*' xml.get_value /tmp/test.xml "./element"
```
salt.modules.xml.set_attribute(file, element, key, value)
Set the requested attribute key and value for matched xpath element.

CLI Example:
```bash
salt '*' xml.set_attribute /tmp/test.xml "./element[@id='3']" editedby "gal"
```
salt.modules.xml.set_value(file, element, value)
Sets the value of the matched xpath element

CLI Example:
```bash
salt '*' xml.set_value /tmp/test.xml "./element" "new value"
```

26.6.525 salt.modules.xmpp

Module for Sending Messages via XMPP (a.k.a. Jabber)
New in version 2014.1.0.

depends
- sleekxmpp>=1.3.1
- pyasn1
- pyasn1-modules
- dnspython

configuration
This module can be used by either passing a jid and password directly to send_message, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:
```bash
my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org/resource
  xmpp.password: verybadpass
```
The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```plaintext
my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org/salt
  xmpp.password: verybadpass

my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org
  xmpp.password: verybadpass
```

class salt.modules.xmpp.SendMsgBot(jid, password, recipient, msg)

  classmethod create_multi(jid, password, msg, recipients=None, rooms=None, nick='SaltStack Bot')
    Alternate constructor that accept multiple recipients and rooms

  start(event)

class salt.modules.xmpp.SleekXMPPMUC(name='')

  filter(record)
    Determine if the specified record is to be logged.
    Is the specified record to be logged? Returns 0 for no, nonzero for yes. If deemed appropriate, the record may be modified in-place.

salt.modules.xmpp.send_msg(recipient, message, jid=None, password=None, profile=None)

  Send a message to an XMPP recipient. Designed for use in states.

  CLI Examples:

  ```
  xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test' profile='my-xmpp-account'
  xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test' jid='myuser@xmpp.example.com/salt' password='verybadpass'
  ```

salt.modules.xmpp.send_msg_multi(message, recipients=None, rooms=None, jid=None, password=None, nick='SaltStack Bot', profile=None)

  Send a message to an XMPP recipient, support send message to multiple recipients or chat room.

  CLI Examples:

  ```
  xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=['secret@conference.xmpp.example.com'] 'This is a salt module test' profile='my-xmpp-account'
  xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=['secret@conference.xmpp.example.com'] jid='myuser@xmpp.example.com/salt' password='verybadpass'
  ```
26.6.526  salt.modules.yaml

Yaml helper module for troubleshooting yaml
New in version 3005.

depends
  yamllint >= 1.20.0

salt.modules.yaml.lint(source, saltenv=None, pre_render=None, **kwargs)
lint the output after detecting a successful render.

Parameters
  - source (str) -- managed source file
  - saltenv (str) -- the saltenv to use, defaults to minions enviroment or base if not set
  - pre_render (str) -- The render options passed to slsutil.renderer other wise file
    is cached and loaded as stream

CLI Example:

salt '*' yaml.lint salt://example/bad_yaml.sls

26.6.527  salt.modules.yumpkg

Support for YUM/DNF

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a
different module (or gives an error similar to 'pkg.install' is not available), see here.

Note: DNF is fully supported as of version 2015.5.10 and 2015.8.4 (partial support for DNF was initially added in
2015.8.0), and DNF is used automatically in place of YUM in Fedora 22 and newer.

New in version 3003: Support for tdnf on Photon OS.
New in version 3007.0: Support for dnf5` on Fedora 39

class salt.modules.yumpkg.AvailablePackages(*args, **kwargs)
salt.modules.yumpkg.available_version(*names, **kwargs)

This function is an alias of latest_version.
  Return the latest version of the named package available for upgrade or installation. If more than
  one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for
that package.

A specific repo can be requested using the fromrepo keyword argument, and the
disableexcludes option is also supported.

New in version 2014.7.0: Support for the disableexcludes option

CLI Example:
salt.modules.yumpkg.clean_metadata("**kwargs")

New in version 2014.1.0.

Cleans local yum metadata. Functionally identical to refresh_db().

CLI Example:

```bash
salt '*' pkg.clean_metadata
```

salt.modules.yumpkg.del_repo(repo, basedir=None, **kwargs)

Delete a repo from <basedir> (default basedir: all dirs in reposdir yum option).

If the .repo file in which the repo exists does not contain any other repo configuration, the file itself will be deleted.

Strict parsing of configuration files is the default, this can be disabled using the strict_config keyword argument set to False

CLI Examples:

```bash
salt '*' pkg.del_repo myrepo
salt '*' pkg.del_repo myrepo basedir=/path/to/dir strict_config=False
salt '*' pkg.del_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

salt.modules.yumpkg.diff("paths", **kwargs)

Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

**Parameters**

- path -- Full path to the installed file

**Returns**

Difference string or raises and exception if examined file is binary.

CLI Example:

```bash
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

salt.modules.yumpkg.download("packages", **kwargs)

New in version 2015.5.0.

Download packages to the local disk. Requires yumdownloader from yum-utils package.

**Note:** yum-utils will already be installed on the minion if the package was installed from the Fedora / EPEL repositories.

CLI Example:

```bash
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```
salt.modules.yumpkg.file_dict("packages", "kwargs")
New in version 2014.1.0.
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.yumpkg.file_list("packages", "kwargs")
New in version 2014.1.0.
List the files that belong to a package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.yumpkg.get_locked_packages(pattern='[^\w+]+(?:[\w+][-^]+)*', full=True)
This function is an alias of list_holds.
Changed in version 2015.5.10, 2015.8.4, 2016.3.0: Function renamed from pkg.get_locked_pkgs to pkg.list_holds.
List information on locked packages

**Note:** Requires the appropriate versionlock plugin package to be installed:
- On RHEL 5: yum-versionlock
- On RHEL 6 & 7: yum-plugin-versionlock
- On Fedora: python-dnf-plugins-extras-versionlock

**pattern**
[w+?(?:[-^]+)+] Regular expression used to match the package name

**full**
[True] Show the full hold definition including version and epoch. Set to False to return just the name of the package(s) being held.

CLI Example:
```
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

salt.modules.yumpkg.get_repo(repo, basedir=None, "kwargs")
Display a repo from <basedir> (default basedir: all dirs in reposdir yum option).

CLI Examples:
```
salt '*' pkg.get_repo myrepo
salt '*' pkg.get_repo myrepo basedir=/path/to/dir
salt '*' pkg.get_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```
salt.modules.yumpkg.group_diff(name, **kwargs)

New in version 2014.1.0.

Changed in version 2015.5.10,2015.8.4,2016.3.0: Environment groups are now supported. The key names have been renamed, similar to the changes made in pkg.group_info.

Changed in version 3006.2: Support for fromrepo, enablerepo, and disablerepo (as used in pkg.install) has been added.

Lists which of a group's packages are installed and which are not installed

name
The name of the group to check

fromrepo
Restrict yum groupinfo to the specified repo(s). (e.g., yum --disablerepo='*' --enablerepo='somerepo')

New in version 3006.2.

enablerepo (ignored if fromrepo is specified)
Specify a disabled package repository (or repositories) to enable. (e.g., yum --enablerepo='somerepo')

New in version 3006.2.

disablerepo (ignored if fromrepo is specified)
Specify an enabled package repository (or repositories) to disable. (e.g., yum --disablerepo='somerepo')

New in version 3006.2.

CLI Example:

```bash
salt '*' pkg.group_diff 'Perl Support'
salt '*' pkg.group_diff 'Perl Support' fromrepo=base,updates
salt '*' pkg.group_diff 'Perl Support' enablerepo=somerepo
```

salt.modules.yumpkg.group_info(name, expand=False, ignore_groups=None, **kwargs)

New in version 2014.1.0.

Changed in version 2015.5.10,2015.8.4,2016.3.0,3001: The return data has changed. A new key type has been added to distinguish environment groups from package groups. Also, keys for the group name and group ID have been added. The mandatory packages, optional packages, and default packages keys have been renamed to mandatory, optional, and default for accuracy, as environment groups include other groups, and not packages. Finally, this function now properly identifies conditional packages.

Changed in version 3006.2: Support for fromrepo, enablerepo, and disablerepo (as used in pkg.install) has been added.

Lists packages belonging to a certain group

name
Name of the group to query

expand
[False] If the specified group is an environment group, then the group will be expanded and the return data will include package names instead of group names.

New in version 2016.3.0.

ignore_groups
[None] This parameter can be used to pass a list of groups to ignore when expanding subgroups. It is used during recursion in order to prevent expanding the same group multiple times.

New in version 3001.
fromrepo
Restrict yum groupinfo to the specified repo(s). (e.g. `yum --disablerepo='*' --enablerepo='somerepo'`)

New in version 3006.2.

enablerepo (ignored if fromrepo is specified)
Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

New in version 3006.2.

disablerepo (ignored if fromrepo is specified)
Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

New in version 3006.2.

CLI Example:
```
salt '*' pkg.group_info 'Perl Support'
salt '*' pkg.group_info 'Perl Support' fromrepo=base,updates
salt '*' pkg.group_info 'Perl Support' enablerepo=somerepo
```

salt.modules.yumpkg.group_install(name, skip=(), include=(), **kwargs)
New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around `pkg.install`, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

name
Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

CLI Examples:
```
salt '*' pkg.group_install 'Group 1'
salt '*' pkg.group_install 'Group 1,Group 2'
salt '*' pkg.group_install ['"Group 1", "Group 2"]'
```

skip
Packages that would normally be installed by the package group ("default" packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:
```
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip=['"foo", "bar"]'
```

include
Packages which are included in a group, which would not normally be installed by a `yum groupinstall` ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:
```
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include=['"foo", "bar"]'
```

Note: Because this is essentially a wrapper around `pkg.install`, any argument which can be passed to
pkg.install may also be included here, and it will be passed along wholesale.

```
salt.modules.yumpkg.group_list()
```

New in version 2014.1.0.

Lists all groups known by yum on this system

CLI Example:

```
salt '*' pkg.group_list
```

```
salt.modules.yumpkg.groupinstall(name, skip=(), include=(), **kwargs)
```

This function is an alias of `group_install`.

New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around `pkg.install`, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

**name**

Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

CLI Examples:

```
salt '*' pkg.group_install 'Group 1'
salt '*' pkg.group_install 'Group 1,Group 2'
salt '*' pkg.group_install '"Group 1", "Group 2"]'
```

**skip**

Packages that would normally be installed by the package group ("default" packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip=['foo', 'bar']
```

**include**

Packages which are included in a group, which would not normally be installed by a yum `groupinstall` ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include=['foo', 'bar']
```

**Note:** Because this is essentially a wrapper around `pkg.install`, any argument which can be passed to `pkg.install` may also be included here, and it will be passed along wholesale.

```
salt.modules.yumpkg.hold(name=None, pkgs=None, sources=None, normalize=True, **kwargs)
```

New in version 2014.7.0.

Version-lock packages
Note: Requires the appropriate versionlock plugin package to be installed:
  - On RHEL 5: yum-versionlock
  - On RHEL 6 & 7: yum-plugin-versionlock
  - On Fedora: python-dnf-plugins-extras-versionlock

name
The name of the package to be held.

Multiple Package Options:

pkgs
A list of packages to hold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

salt.modules.yumpkg.info_installed(*names, **kwargs)

Return the information of the named package(s), installed on the system.

Parameters

- all_versions -- Include information for all versions of the packages installed on the minion.

CLI Example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2> <package3> all_
  versions=True
```

salt.modules.yumpkg.install(name=None, refresh=False, skip_verify=False, pkgs=None, sources=None, downloadonly=False, reinstall=False, normalize=True, update_holds=False, saltenv='base', ignore_epoch=False, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Install the passed package(s), add refresh=True to clean the yum database before package is installed.

name
The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (.i686, .i586, etc.) to the end of the package name.

CLI Example:
**salt** `'*' pkg.install <package name>`

**refresh**
Whether or not to update the yum database before executing.

**reinstall**
Specifying reinstall=True will use `yum reinstall` rather than `yum install` for requested packages that are already installed.

If a version is specified with the requested package, then `yum reinstall` will only be used if the installed version matches the requested version.

Works with sources when the package header of the source can be matched to the name and version of an installed package.

New in version 2014.7.0.

**skip_verify**
Skip the GPG verification check (e.g., `--nogpgcheck`)

**downloadonly**
Only download the packages, do not install.

**version**
Install a specific version of the package, e.g. 1.2.3-4.el5. Ignored if "pkgs" or "sources" is passed.

Changed in version 2018.3.0: version can now contain comparison operators (e.g. >1.2.3, <=2.0, etc.)

**update_holds**
[False] If True, and this function would update the package version, any packages held using the yum/dnf "versionlock" plugin will be unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and an error will be raised.

New in version 2016.11.0.

**setopt**
A comma-separated or Python list of key=value options. This list will be expanded and `--setopt` prepended to each in the yum/dnf command that is run.

CLI Example:
```
salt '/*' pkg.install foo setopt='obsoletes=0,plugins=0'
```

New in version 2019.2.0.

Repository Options:

**fromrepo**
Specify a package repository (or repositories) from which to install. (e.g., yum `--disablerepo='*' --enablerepo='somerepo'`)

**enablerepo** (ignored if **fromrepo** is specified)
Specify a disabled package repository (or repositories) to enable. (e.g., yum `--enablerepo='somerepo'`)

**disablerepo** (ignored if **fromrepo** is specified)
Specify an enabled package repository (or repositories) to disable. (e.g., yum `--disablerepo='somerepo'`)

**disableexcludes**
Disable exclude from main, for a repo or for everything, (e.g., yum `--disableexcludes='main'`)

New in version 2014.7.0.

**ignore_epoch**
[False] Only used when the version of a package is specified using a comparison operator (e.g. >4.1).
If set to True, then the epoch will be ignored when comparing the currently-installed version to the desired version.
New in version 2018.3.0.

Multiple Package Installation Options:

pkgs
A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version.

CLI Examples:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-4.el5"}]'
```

sources
A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=["foo": "salt://foo.rpm"], ["bar": "salt://bar.rpm"]'
```

normalize
[True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.install gpfs.gplbin-2.6.32-279.31.1.el6.x86_64
-normalize=False
```

New in version 2014.7.0.

split_arch
[True] If set to False it prevents package name normalization more strict way than normalize set to False does.

New in version 3006.0.

**diff_attr:**
If a list of package attributes is specified, returned value will contain them, eg.:

```
{"<package>": {
    'old': {
        'version': '<old-version>',
        'arch': '<old-arch>'
    },
    'new': {
        'version': '<new-version>',
        'arch': '<new-arch>'
    }
}}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

Returns a dict containing the new package names and versions:

```
{"<package>": {'old': '<old-version>', 'new': '<new-version>'}}
```

If an attribute list in diff_attr is specified, the dict will also contain any specified attribute, eg.
salt.modules.yumpkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the fromrepo keyword argument, and the disableexcludes option is also supported.

New in version 2014.7.0: Support for the disableexcludes option

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=epel-testing
salt '*' pkg.latest_version <package name> disableexcludes=main
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.yumpkg.list_installed(**kwargs)

New in version 2017.7.0.

List prefetched packages downloaded by Yum in the local disk.

CLI Example:

```
salt '*' pkg.list_installed
```

salt.modules.yumpkg.list_holds(pattern='[\w+][-\[\w\.-]+]*', full=True)

Changed in version 2015.5.10,2015.8.4,2016.3.0: Function renamed from pkg.get_locked_pkgs to pkg.list_holds.

List information on locked packages

Note: Requires the appropriate versionlock plugin package to be installed:
- On RHEL 5: yum-versionlock
- On RHEL 6 & 7: yum-plugin-versionlock
- On Fedora: python-dnf-plugins-extras-versionlock

- **pattern** [w+\([-\[\w\.-]+\)] Regular expression used to match the package name
- **full** [True] Show the full hold definition including version and epoch. Set to False to return just the name of the package(s) being held.

CLI Example:
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False

salt.modules.yumpkg.list_installed_patches(**kwargs)
New in version 2017.7.0.
List installed advisory patches on the system.

CLI Examples:
salt '*' pkg.list_installed_patches

salt.modules.yumpkg.list_patches(refresh=False, **kwargs)
New in version 2017.7.0.
List all known advisory patches from available repos.
refresh
force a refresh if set to True. If set to False (default) it depends on yum if a refresh is executed.

CLI Examples:
salt '*' pkg.list_patches

salt.modules.yumpkg.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

```
{'<package_name>': '<version>[,<version>...]'}
```

versions_as_list:
If set to true, the versions are provided as a list

```
{'<package_name>': ['<version>', '<version>']}
```

attr:
If a list of package attributes is specified, returned value will contain them in addition to version, eg.:

```
{'<package_name>': [{'version': 'version', 'arch': 'arch'}]}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.
If all is specified, all valid attributes will be returned.
New in version 2018.3.0.

CLI Example:
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs attr=version,arch
salt '*' pkg.list_pkgs attr=['"version", "arch"]

salt.modules.yumpkg.list_repo_pkgs(*args, **kwargs)
New in version 2014.1.0.

Changed in version 2014.7.0: All available versions of each package are now returned. This required a slight modification to the structure of the return dict. The return data shown below reflects the updated return dict structure. Note that packages which are version-locked using pkg.hold will only show the currently-installed version, as locking a package will make other versions appear unavailable to yum/dnf.
Changed in version 2017.7.0: By default, the versions for each package are no longer organized by repository. To get results organized by repository, use `byrepo=True`.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

**Warning:** Running this function on RHEL/CentOS 6 and earlier will be more resource-intensive, as the version of yum that ships with older RHEL/CentOS has no yum subcommand for listing packages from a repository. Thus, a `yum list installed` and `yum list available` are run, which generates a lot of output, which must then be analyzed to determine which package information to include in the return data.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```python
# With byrepo=False (default)
{
    'bash': ['4.1.2-15.el6_5.2',
            '4.1.2-15.el6_5.1',
            '4.1.2-15.el6_4'],
    'kernel': ['2.6.32-431.29.2.el6',
               '2.6.32-431.23.3.el6',
               '2.6.32-431.20.5.el6',
               '2.6.32-431.20.3.el6',
               '2.6.32-431.17.1.el6',
               '2.6.32-431.11.2.el6',
               '2.6.32-431.5.1.el6',
               '2.6.32-431.3.1.el6',
               '2.6.32-431.1.2.0.1.el6',
               '2.6.32-431.el6']
}

# With byrepo=True
{
    'base': {
        'bash': ['4.1.2-15.el6_4'],
        'kernel': ['2.6.32-431.el6']
    },
    'updates': {
        'bash': ['4.1.2-15.el6_5.2', '4.1.2-15.el6_5.1'],
        'kernel': ['2.6.32-431.29.2.el6',
                   '2.6.32-431.23.3.el6',
                   '2.6.32-431.20.5.el6',
                   '2.6.32-431.20.3.el6',
                   '2.6.32-431.17.1.el6',
                   '2.6.32-431.11.2.el6',
                   '2.6.32-431.5.1.el6',
                   '2.6.32-431.3.1.el6',
                   '2.6.32-431.1.2.0.1.el6',
                   '2.6.32-431.el6']
    }
}
```
fromrepo

[None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

enablereco (ignored if fromrepo is specified)

Specify a disabled package repository (or repositories) to enable. (e.g., yum
--enablereco='somerepo')

New in version 2017.7.0.

disablereco (ignored if fromrepo is specified)

Specify an enabled package repository (or repositories) to disable. (e.g., yum
--disablereco='somerepo')

New in version 2017.7.0.

byrepo

[False] When True, the return data for each package will be organized by repository.

New in version 2017.7.0.

cacheonly

[False] When True, the repo information will be retrieved from the cached repo metadata. This is equivalent to passing the -C option to yum/dnf.

New in version 2017.7.0.

setopt

A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

CLI Examples:

salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*1 fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True

salt.modules.yumpkg.list_repos(basedir=None, **kwargs)

Lists all repos in <basedir> (default: all dirs in reposdir yum option).

Strict parsing of configuration files is the default, this can be disabled using the strict_config keyword argument set to False

CLI Example:

salt '*' pkg.list_repos
salt '*' pkg.list_repos basedir=/path/to/dir
salt '*' pkg.list_repos basedir=/path/to/dir,/path/to/another/dir strict_config=False

salt.modules.yumpkg.list_updates(refresh=True, **kwargs)

This function is an alias of list_upgrades.

Check whether or not an upgrade is available for all packages

The fromrepo, enablereco, and disablereco arguments are supported, as used in pkg states, and the disableexcludes option is also supported.

New in version 2014.7.0: Support for the disableexcludes option

CLI Example:
salt modules.yumpkg.list_upgrades(refresh=True, **kwargs)
Check whether or not an upgrade is available for all packages
The fromrepo, enablerepo, and disablerepo arguments are supported, as used in pkg states, and the disableexcludes option is also supported.
New in version 2014.7.0: Support for the disableexcludes option
CLI Example:
salt '*' pkg.list_upgrades

salt modules.yumpkg.mod_repo(repo, basedir=None, **kwargs)
Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:
repo
    name by which the yum refers to the repo
name
    a human-readable name for the repo
baseurl
    the URL for yum to reference
mirrorlist
    the URL for yum to reference
Key/Value pairs may also be removed from a repo’s configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a baseurl can only be deleted if a mirrorlist is specified (or vice versa).
Strict parsing of configuration files is the default, this can be disabled using the strict_config keyword argument set to False
CLI Examples:
salt '*' pkg.mod_repo reponame enabled=1 gpgcheck=1
salt '*' pkg.mod_repo reponame basedir=/path/to/dir enabled=1 strict_config=False
salt '*' pkg.mod_repo reponame baseurl= mirrorlist=http://host.com/

salt modules.yumpkg.modified(*packages, **flags)
List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system’s RPM database.
New in version 2015.5.0.
Filtering by flags (True or False):
size
    Include only files where size changed.
mode
    Include only files where file’s mode has been changed.
checksum
    Include only files which MD5 checksum has been changed.
device
    Include only files which major and minor numbers has been changed.
symlink
    Include only files which are symbolic link contents.
owner
    Include only files where owner has been changed.
group
   Include only files where group has been changed.

time
   Include only files where modification time of the file has been changed.

capabilities
   Include only files where capabilities differ or not. Note: supported only on newer RPM versions.
   CLI Examples:
   
   ```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

salt.modules.yumpkg.normalize_name(name)
   Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:
   
   - If the arch is 32 bit and the package name ends in a 32-bit arch.
   - If the arch matches the OS arch, or is noarch.
   
   CLI Example:
   
   ```
salt '*' pkg.normalize_name zsh.x86_64
```

salt.modules.yumpkg.owner(*paths, **kwargs)
   New in version 2014.7.0.
   Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.
   
   If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

   CLI Examples:
   
   ```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

salt.modules.yumpkg.parse_arch(name)
   Parse name and architecture from the specified package name.
   
   CLI Example:
   
   ```
salt '*' pkg.parse_arch zsh.x86_64
```

salt.modules.yumpkg.purge(name=None, pkgs=None, **kwargs)
   Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a `config option` called `systemd.scope`, with a value of `False` (no quotes).

   Package purges are not supported by yum, this function is identical to `pkg.remove`.
   
   name
      The name of the package to be purged

   Multiple Package Options:
pkgs
A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.
Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.yumpkg.refresh_db(**kwargs)
Check the yum repos for updated packages

Returns:
- True: Updates are available
- False: An error occurred
- None: No updates are available

repo
Refresh just the specified repo
disableremo
Do not refresh the specified repo
enableremo
Refresh a disabled repo using this option
branch
Add the specified branch when refreshing
disableexcludes
Disable the excludes defined in your config files. Takes one of three options: - all - disable all excludes - main - disable excludes defined in [main] in yum.conf - repoid - disable excludes defined for that repo
setopt
A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.yumpkg.remove(name=None, pkgs=None, **kwargs)
Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Remove packages
name
The name of the package to be removed
Multiple Package Options:
pkgs
A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.

**split_arch**

[True] If set to False it prevents package name normalization by removing arch.

New in version 3006.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.yumpkg.**services_need_restart**(**kwargs**)

New in version 3003.

List services that use files which have been changed by the package manager. It might be needed to restart them.

Requires systemd.

CLI Examples:

```
salt '*' pkg.services_need_restart
```

salt.modules.yumpkg.**unhold**(name=None, pkgs=None, sources=None, **kwargs**)

New in version 2014.7.0.

Remove version locks

**Note:** Requires the appropriate versionlock plugin package to be installed:
- On RHEL 5: yum-versionlock
- On RHEL 6 & 7: yum-plugin-versionlock
- On Fedora: python-dnf-plugins-extras-versionlock

**name**

The name of the package to be unheld

Multiple Package Options:

**pkgs**

A list of packages to unhold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

salt.modules.yumpkg.**update**(name=None, pkgs=None, refresh=True, skip_verify=False, normalize=True, minimal=False, obsoletes=False, **kwargs**)

New in version 2019.2.0.

Calls **pkg.upgrade** with obsoletes=False. Mirrors the CLI behavior of yum update. See **pkg.upgrade** for further documentation.

CLI Example:
salt '*/' pkg.update

salt.modules.yumpkg.upgrade(name=None, pkgs=None, refresh=True, skip_verify=False, normalize=True, minimal=False, obsoletes=True, diff_attr=None, **kwargs)

Run a full system upgrade (a `yum upgrade` or `dnf upgrade`), or upgrade specified packages. If the packages aren't installed, they will not be installed.

Changed in version 2014.7.0.

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (See `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a `config option` called `systemd.scope`, with a value of False (no quotes).

Changed in version 2019.2.0: Added `obsoletes` and `minimal` arguments

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example:

```
salt '*/' pkg.upgrade
salt '*/' pkg.upgrade name=openssl
```

Repository Options:

**fromrepo**

Specify a package repository (or repositories) from which to install. (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

**enablerepo** (ignored if **fromrepo** is specified)

Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

**disablerepo** (ignored if **fromrepo** is specified)

Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

**disableexcludes**

Disable exclude from main, for a repo or for everything. (e.g., `yum --disableexcludes='main'`)

New in version 2014.7.0.

**name**

The name of the package to be upgraded. Note that this parameter is ignored if "pkgs" is passed.

32-bit packages can be upgraded on 64-bit systems by appending the architecture designation (.i686, .i586, etc.) to the end of the package name.

Warning: if you forget 'name=' and run pkg.upgrade openssl, ALL packages are upgraded. This will be addressed in next releases.

CLI Example:

```
salt '*/' pkg.upgrade name=openssl
```

New in version 2016.3.0.

**pkgs**

A list of packages to upgrade from a software repository. Must be passed as a python list. A specific
version number can be specified by using a single-element dict representing the package and its version. If the package was not already installed on the system, it will not be installed.

CLI Examples:

```
salt '*' pkg.upgrade pkgs='["foo", "bar"]'
salt '*' pkg.upgrade pkgs='["foo", {"bar": "1.2.3-4.el5"}]'
```

New in version 2016.3.0.

**normalize**
[True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.upgrade gpfs.gplbin-2.6.32-279.31.1.el6.x86_64

-normalize=False
```

New in version 2016.3.0.

**minimal**
[False] Use upgrade-minimal instead of upgrade (e.g., yum upgrade-minimal) Goes to the ‘newest’ package match which fixes a problem that affects your system.

```
salt '*' pkg.upgrade minimal=True
```

New in version 2019.2.0.

**obsoletes**
[True] Controls whether yum/dnf should take obsoletes into account and remove them. If set to False yum will use update instead of upgrade and dnf will be run with --obsoletes=False

```
salt '*' pkg.upgrade obsoletes=False
```

New in version 2019.2.0.

**setopt**
A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

**diff_attr:**
If a list of package attributes is specified, returned value will contain them, eg.:

```
{"<package">: {
    'old': {
        'version': '<old-version>',
        'arch': '<old-arch>'},

    'new': {
        'version': '<new-version>',
        'arch': '<new-arch>'}}}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 3006.0.
Note: To add extra arguments to the `yum upgrade` command, pass them as key word arguments. For arguments without assignments, pass `True`

```
salt '*' pkg.upgrade security=True exclude='kernel*'
```

documented:

```python
salt.modules.yumpkg.upgrade_available(name, **kwargs)
```
Check whether or not an upgrade is available for a given package

CLI Example:
```
salt '*' pkg.upgrade_available <package name>
```

documented:

```python
salt.modules.yumpkg.verify(*names, **kwargs)
```
New in version 2014.1.0.
Runs an `rpm -Va` on a system, and returns the results in a dict
Pass options to modify `rpm verify` behavior using the `verify_options` keyword argument
Files with an attribute of `config`, `doc`, `ghost`, `license` or `readme` in the package header can be ignored using the `ignore_types` keyword argument
CLI Example:
```
salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix'
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
salt '*' pkg.verify 'httpd postfix' verify_options=['nodeps','nosize']
```

documented:

```python
salt.modules.yumpkg.version(*names, **kwargs)
```
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

documented:

```python
salt.modules.yumpkg.version_cmp(pkg1, pkg2, ignore_epoch=False, **kwargs)
```
New in version 2015.5.4.
Do a cmp-style comparison on two packages. Return -1 if `pkg1 < pkg2`, 0 if `pkg1 == pkg2`, and 1 if `pkg1 > pkg2`. Return None if there was a problem making the comparison.
```
ignore_epoch

[False] Set to `True` to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.
```
CLI Example:
```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```
26.6.528  salt.modules.zabbix

**Warning:** This module will be removed from Salt in version 3009 in favor of the zabbix Salt Extension.

Support for Zabbix

**optdepends**
- zabbix server

**configuration**
This module is not usable until the zabbix user and zabbix password are specified either in a pillar or in the minion's config file. Zabbix url should be also specified.

```
zabbix.user: Admin
zabbix.password: mypassword
zabbix.url: http://127.0.0.1/zabbix/api_jsonrpc.php
```

Connection arguments from the minion config file can be overridden on the CLI by using arguments with _connection_ prefix.

```
zabbix.apiinfo_version _connection_user=Admin _connection_password=zabbix _connection_url=http://host/zabbix/
```

codeauthor
Jiri Kotlin <jiri.kotlin@ultimum.io>

**salt.modules.zabbix.apiinfo_version**(“connection_args”)
Retrieve the version of the Zabbix API.
New in version 2016.3.0.

**Parameters**
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**
On success string with Zabbix API version, False on failure.

CLI Example:
```
salt '*' zabbix.apiinfo_version
```

**salt.modules.zabbix.compare_params**(defined, existing, return_old_value=False)
Compares Zabbix object definition against existing Zabbix object.
New in version 2017.7.0.

**Parameters**
- **defined** -- Zabbix object definition taken from sls file.
- **existing** -- Existing Zabbix object taken from result of an API call.
- **return_old_value** -- Default False. If True, returns dict("old"=old_val, "new"=new_val) for rollback purpose.
Returns
Params that are different from existing object. Result extended by object ID can be passed
directly to Zabbix API update method.

CLI Example:
```
salt '*' zabbix.compare_params new_zabbix_object_dict existing_zabbix_object_dict
```

```
salt.modules.zabbix.configuration_import(config_file, rules=None, file_format='xml', **connection_args)
```

New in version 2017.7.0.
Imports Zabbix configuration specified in file to Zabbix server.

Parameters
- `config_file` -- File with Zabbix config (local or remote)
- `rules` -- Optional - Rules that have to be different from default (defaults are the same
  as in Zabbix web UI)
- `file_format` -- Config file format (default: xml)
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see
  module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or
  pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts,
  pillar, see module's docstring)

CLI Example:
```
salt '*' zabbix.configuration_import salt://zabbix/config/zabbix_
templates.xml "{'screens': {'createMissing': True,
  'updateExisting': True}}"
```

```
salt.modules.zabbix.get_object_id_by_params(obj, params=None, **connection_args)
```

New in version 2017.7.0.
Get ID of single Zabbix object specified by its name.

Parameters
- `obj` -- Zabbix object type
- `params` -- Parameters by which object is uniquely identified
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see
  module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or
  pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts,
  pillar, see module's docstring)

Returns
object ID

CLI Example:
```
salt '*' zabbix.get_object_id_by_params object_type params=zabbix_api_
->query_parameters_dict
```

```
salt.modules.zabbix.get_zabbix_id_mapper()
```

New in version 2017.7.0.
Make ZABBIX_ID_MAPPER constant available to state modules.

Returns
`ZABBIX_ID_MAPPER`
salt.modules.zabbix.host_create

Create new host

New in version 2016.3.0.

Parameters

- **host** -- technical name of the host
- **groups** -- groupids of host groups to add the host to
- **interfaces** -- interfaces to be created for the host
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible_name** -- string with visible name of the host, use 'visible_name' instead of 'name' parameter to not mess with value supplied from Salt sls file.

return: ID of the created host.

CLI Example:

taxt '*' zabbix.host_create technicalname 4 interfaces='{{type: 1, main: 1, useip: 1, ip: "192.168.3.1", dns: ", port: 10050}" visible_name='Host Visible Name' inventory_mode=0 inventory='{{"alias": "something"}}'

salt.modules.zabbix.host_delete

Delete hosts.

New in version 2016.3.0.

Parameters

- **hostids** -- Hosts (hostids) to delete.
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns

IDs of the deleted hosts.

CLI Example:

taxt '*' zabbix.host_delete 10106

salt.modules.zabbix.host_exists

Check if host exists.

New in version 2016.3.0.

Parameters

- **host** -- technical name of the host
- **hostid** -- Host id to check the host
- **name** -- Host name to check the host
- **node** -- Node id to check the host
- **nodeids** -- Node ids to check the hosts

Returns

True/False if host exists.

CLI Example:

salt '*' zabbix.host_exists
Checks if at least one host that matches the given filter criteria exists.

New in version 2016.3.0.

Parameters

- **host** -- technical name of the host
- **hostids** -- Hosts (hostids) to delete.
- **name** -- visible name of the host
- **node** -- name of the node the hosts must belong to (zabbix API < 2.4)
- **nodeids** -- IDs of the node the hosts must belong to (zabbix API < 2.4)
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns

IDs of the deleted hosts, False on failure.

CLI Example:

```
salt '.*' zabbix.host_exists 'Zabbix server'
```

salt.modules.zabbix.host_get(host=None, name=None, hostids=None, **connection_args)

New in version 2016.3.0.

Retrieve hosts according to the given parameters

**Note:** This function accepts all optional host.get parameters: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **host** -- technical name of the host
- **name** -- visible name of the host
- **hostids** -- ids of the hosts
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns

Array with convenient hosts details, False if no host found or on failure.

CLI Example:

```
salt '.*' zabbix.host_get 'Zabbix server'
```

salt.modules.zabbix.host_inventory_get(hostids, **connection_args)

Retrieve host inventory according to the given parameters. See: https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory

New in version 2019.2.0.

Parameters

- **hostids** -- ID of the host to query
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
Array with host inventory fields, populated or not, False if host inventory is disabled or on failure.

CLI Example:
salt '*' zabbix.host_inventory_get 101054

salt.modules.zabbix.host_inventory_set(hostid, **connection_args)
Update host inventory items NOTE: This function accepts all standard host: keyword argument names for inventory see: https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory
New in version 2019.2.0.

Parameters
• hostid -- ID of the host to update
• clear_old -- Set to True in order to remove all existing inventory items before setting the specified items
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
ID of the updated host, False on failure.

CLI Example:
salt '*' zabbix.host_inventory_set 101054 asset_tag=jml3322 type=vm clear_old=True

salt.modules.zabbix.host_list(**connection_args)
Retrieve all hosts.
New in version 2016.3.0.

Parameters
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
Array with details about hosts, False on failure.

CLI Example:
salt '*' zabbix.host_list

salt.modules.zabbix.host_update(hostid, **connection_args)
Update existing hosts
New in version 2016.3.0.
Note: This function accepts all standard host and host.update properties: keyword argument names differ depending on your zabbix version, see the documentation for host objects and the documentation for updating hosts.

Parameters

- **hostid** -- ID of the host to update
- **_connection_user** -- Optional - Zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - Zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of Zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible_name** -- string with visible name of the host, use 'visible_name' instead of 'name' parameter to not mess with value supplied from Salt sls file.

Returns

ID of the updated host.

CLI Example:

```bash
salt '*' zabbix.host_update 10084 name='Zabbix server2'
```

salt.modules.zabbix.hostgroup_create

New in version 2016.3.0.

Create a host group

Note: This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **name** -- name of the host group
- **_connection_user** -- Optional - Zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - Zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of Zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns

ID of the created host group.

CLI Example:

```bash
salt '*' zabbix.hostgroup_create MyNewGroup
```

salt.modules.zabbix.hostgroup_delete

Delete the host group.

New in version 2016.3.0.

Parameters

- **hostgroupids** -- IDs of the host groups to delete
- **_connection_user** -- Optional - Zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - Zabbix password (can also be set in opts or pillar, see module's docstring)
**_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**
ID of the deleted host groups, False on failure.

**CLI Example:**
```
salt '*' zabbix.hostgroup_delete 23
```

**salt.modules.zabbix.hostgroup_exists**(*name=None, groupid=None, node=None, nodeids=None, **connection_args*)

Checks if at least one host group that matches the given filter criteria exists.

**New in version 2016.3.0.**

**Parameters**
- **name** -- names of the host groups
- **groupid** -- host group IDs
- **node** -- name of the node the host groups must belong to (zabbix API < 2.4)
- **nodeids** -- IDs of the nodes the host groups must belong to (zabbix API < 2.4)
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**
True if at least one host group exists, False if not or on failure.

**CLI Example:**
```
salt '*' zabbix.hostgroup_exists MyNewGroup
```

**salt.modules.zabbix.hostgroup_get**(*name=None, groupids=None, hostids=None, **connection_args*)

**New in version 2016.3.0.**

Retrieve host groups according to the given parameters

**Note:** This function accepts all standard hostgroup.get properties: keyword argument names differ depending on your zabbix version, see [here](#).

**Parameters**
- **name** -- names of the host groups
- **groupid** -- host group IDs
- **node** -- name of the node the host groups must belong to
- **nodeids** -- IDs of the nodes the host groups must belong to
- **hostids** -- return only host groups that contain the given hosts
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**
Array with host groups details, False if no convenient host group found or on failure.

**CLI Example:**
salt '*' zabbix.hostgroup_get MyNewGroup

salt.modules.zabbix.hostgroup_list(**connection_args)
Retrieve all host groups.
New in version 2016.3.0.
Parameter
- _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
Returns
Array with details about host groups, False on failure.
CLI Example:

salt '*' zabbix.hostgroup_list

salt.modules.zabbix.hostgroup_update(groupid, name=None, **connection_args)
Update existing hosts group
Note: This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see here.
Parameter
- groupid -- ID of the host group to update
- name -- name of the host group
- _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
Returns
IDs of updated host groups.
CLI Example:

salt '!' zabbix.hostgroup_update 24 name='Renamed Name'

salt.modules.zabbix.hostinterface_create(hostid, ip_, dns='', main=1, if_type=1, useip=1, port=None, **connection_args)
Create new host interface
Note: This function accepts all standard host group interface: keyword argument names differ depending on your zabbix version, see here.
Parameter
Salt Documentation, Release 3007.1

- **hostid** -- ID of the host the interface belongs to
- **ip** -- IP address used by the interface
- **dns** -- DNS name used by the interface
- **main** -- whether the interface is used as default on the host (0 - not default, 1 - default)
- **port** -- port number used by the interface
- **type** -- Interface type (1 - agent; 2 - SNMP; 3 - IPMI; 4 - JMX)
- **useip** -- Whether the connection should be made via IP (0 - connect using host DNS name; 1 - connect using host IP address for this host interface)
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
ID of the created host interface, False on failure.

CLI Example:
salt '*' zabbix.hostinterface_create 10105 192.193.194.197

salt.modules.zabbix.hostinterface_delete(interfaceids, **connection_args)
Delete host interface

New in version 2016.3.0.

Parameters
- **interfaceids** -- IDs of the host interfaces to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
ID of deleted host interfaces, False on failure.

CLI Example:
salt '*' zabbix.hostinterface_delete 50

salt.modules.zabbix.hostinterface_get(hostids, **connection_args)
Retrieve host groups according to the given parameters

Note: This function accepts all standard hostinterface.get properities: keyword argument names differ depending on your zabbix version, see here.

Parameters
- **hostids** -- Return only host interfaces used by the given hosts.
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
Returns
Array with host interfaces details, False if no convenient host interfaces found or on failure.

CLI Example:
```bash
salt '*' zabbix.hostinterface_get 101054
```

```
salt.modules.zabbix.hostinterface_update(interfaceid, **connection_args)
```

New in version 2016.3.0.

Update host interface

**Note:** This function accepts all standard hostinterface: keyword argument names differ depending on your zabbix version, see here.

Parameters

- `interfaceid` -- ID of the hostinterface to update
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
ID of the updated host interface, False on failure.

CLI Example:
```bash
salt '*' zabbix.hostinterface_update 6 ip_=0.0.0.2
```

```
salt.modules.zabbix.mediatype_create(name, mediatype, **connection_args)
```

Create new mediatype

**Note:** This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- `mediatype` -- media type - 0: email, 1: script, 2: sms, 3: Jabber, 100: Ez Texting
- `exec_path` -- exec path - Required for script and Ez Texting types, see Zabbix API docs
- `gsm_modem` -- exec path - Required for sms type, see Zabbix API docs
- `smtp_email` -- email address from which notifications will be sent, required for email type
- `smtp_helo` -- SMTP HELO, required for email type
- `smtp_server` -- SMTP server, required for email type
- `status` -- whether the media type is enabled - 0: enabled, 1: disabled
- `username` -- authentication user, required for Jabber and Ez Texting types
- `passwd` -- authentication password, required for Jabber and Ez Texting types
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
Salt Documentation, Release 3007.1

return: ID of the created mediatype.

CLI Example:

```
salt '*' zabbix.mediatype_create 'Email' smtp_email='noreply@example.com'

salt.modules.zabbix.mediatype_delete(mediatypeids, **connection_args)
```

Delete mediatype

Parameters

- **interfaceids** -- IDs of the mediatypes to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns

ID of deleted mediatype, False on failure.

CLI Example:

```
salt '*' zabbix.mediatype_delete 3
```

salt.modules.zabbix.mediatype_get(name=None, mediatypeids=None, **connection_args)

Retrieve mediatypes according to the given parameters.

Parameters

- **name** -- Name or description of the mediatype
- **mediatypeids** -- ids of the mediatypes
- **connection_args** (optional) -- _connection_user: zabbix user (can also be set in opts or pillar, see module's docstring) _connection_password: zabbix password (can also be set in opts or pillar, see module's docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

all optional mediatype.get parameters: keyword argument names depends on your zabbix version, see:

```
https://www.zabbix.com/documentation/2.2/manual/api/reference/mediatype/get
```

Returns

Array with mediatype details, False if no mediatype found or on failure.

CLI Example:

```
salt '*' zabbix.mediatype_get name='Email'
salt '*' zabbix.mediatype_get mediatypeids="[1', '2', '3']"
```

salt.modules.zabbix.mediatype_update(mediatypeid, name=False, mediatype=False, **connection_args)

Update existing mediatype

Note: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **mediatypeid** -- ID of the mediatype to update
•  **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
•  **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
•  **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
IDs of the updated mediatypes, False on failure.

CLI Example:
salt '*' zabbix.usergroup_update 8 name="Email update"

salt.modules.zabbix.run_query(*method, params, **connection_args*)
Send Zabbix API call
Parameters
•  **method** -- actual operation to perform via the API
•  **params** -- parameters required for specific method
•  **connection_args** (optional) -- _connection_user: zabbix user (can also be set in opts or pillar, see module's docstring)_connection_password: zabbix password (can also be set in opts or pillar, see module's docstring)_connection_url: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

all optional template.get parameters: keyword argument names depends on your zabbix version, see:
https://www.zabbix.com/documentation/2.4/manual/api/reference/

Returns
Response from Zabbix API

CLI Example:
salt '*' zabbix.run_query proxy.create '{"host": "zabbixproxy.domain.com", → "status": "5"}'

salt.modules.zabbix.substitute_params(*input_object, extend_params=None, filter_key='name', **kwargs*)

New in version 2017.7.0.

Go through Zabbix object params specification and if needed get given object ID from Zabbix API and put it back as a value. Definition of the object is done via dict with keys "query_object" and "query_name".

Parameters
•  **input_object** -- Zabbix object type specified in state file
•  **extend_params** -- Specify query with params
•  **filter_key** -- Custom filtering key (default: name)
•  **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
•  **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
•  **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
Params structure with values converted to string for further comparison purposes

CLI Example:
salt '*' zabbix.substitute_params '{"query_object": "object_name", "query_ → name": "specific_object_name"}'}
salt.modules.zabbix.template_get(name=None, host=None, templateids=None, **connection_args)

Retrieve templates according to the given parameters.

Parameters

- **host** -- technical name of the template
- **name** -- visible name of the template
- **hostids** -- ids of the templates
- **connection_args** *(optional)* -- _connection_user: zabbix user (can also be set in opts or pillar, see module's docstring)_connection_password: zabbix password (can also be set in opts or pillar, see module's docstring)_connection_url: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

all optional template.get parameters: keyword argument names depends on your zabbix version, see:

https://www.zabbix.com/documentation/2.4/manual/api/reference/template/get

Returns

Array with convenient template details, False if no template found or on failure.

CLI Example:

```
salt '*' zabbix.template_get name='Template OS Linux'
salt '*' zabbix.template_get templateids="['10050', '10001']"
```

salt.modules.zabbix.user_addmedia(userids, active, mediatypeid, period, sendto, severity, **connection_args)

Add new media to multiple users. Available only for Zabbix version 3.4 or older.

New in version 2016.3.0.

Parameters

- **userids** -- ID of the user that uses the media
- **active** -- Whether the media is enabled (0 enabled, 1 disabled)
- **mediatypeid** -- ID of the media type used by the media
- **period** -- Time when the notifications can be sent as a time period
- **sendto** -- Address, user name or other identifier of the recipient
- **severity** -- Trigger severities to send notifications about
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns

IDs of the created media.

CLI Example:

```
salt '*' zabbix.user_addmedia 4 active=0 mediatypeid=1 period='1-7,00:00-24:00' sendto='support2@example.com' severity=63
```

salt.modules.zabbix.user_create(alias, passwd, usgrps, **connection_args)

New in version 2016.3.0.

Create new zabbix user

**Note:** This function accepts all standard user properties: keyword argument names differ depending on your
zabbix version, see here.

Parameters

- alias -- user alias
- passwd -- user’s password
- usgrgps -- user groups to add the user to
- _connection_user -- zabbix user (can also be set in opts or pillar, see module’s docstring)
- _connection_password -- zabbix password (can also be set in opts or pillar, see module’s docstring)
- _connection_url -- url of zabbix frontend (can also be set in opts or pillar, see module’s docstring)
- firstname -- string with firstname of the user, use 'firstname' instead of 'name' parameter to not mess with value supplied from Salt sls file.

Returns

On success string with id of the created user.

CLI Example:
salt '*' zabbix.user_create james password007 '[7, 12]' firstname='James Bond'

salt.modules.zabbix.user_delete(users, **connection_args)

Delete zabbix users.

New in version 2016.3.0.

Parameters

- users -- array of users (userids) to delete
- _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns

On success array with userids of deleted users.

CLI Example:
salt '*' zabbix.user_delete 15

salt.modules.zabbix.user_deletemedia(mediaids, **connection_args)

Delete media by id. Available only for Zabbix version 3.4 or older.

New in version 2016.3.0.

Parameters

- mediaids -- IDs of the media to delete
- _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns

IDs of the deleted media, False on failure.

CLI Example:
salt modules.zabbix.user_exists

 Parameters
• alias -- user alias
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

 Returns
True if user exists, else False.

 CLI Example:
salt 'salt '*' zabbix.user_exists james

salt modules.zabbix.user_get

 Parameters
• alias -- user alias
• userids -- return only users with the given IDs
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

 Returns
Array with details of convenient users, False on failure of if no user found.

 CLI Example:
salt 'salt '*' zabbix.user_get james

salt modules.zabbix.user_getmedia

 New in version 2016.3.0.
Retrieve media according to the given parameters

 Note: This function accepts all standard usermedia.get properties: keyword argument names differ depending on your zabbix version, see here.

 Parameters
• userids -- return only media that are used by the given users
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
List of retrieved media, False on failure.

CLI Example:
salt '*' zabbix.user_getmedia

salt.modules.zabbix.user_list(**connection_args)
Retrieve all of the configured users.
New in version 2016.3.0.

Parameters
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
Array with user details.

CLI Example:
salt '*' zabbix.user_list

salt.modules.zabbix.user_update(userid, **connection_args)
Update existing users

Note: This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see here.

Parameters
• userid -- id of the user to update
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
Id of the updated user on success.

CLI Example:
salt '*' zabbix.user_update 16 visible_name='James Brown'

salt.modules.zabbix.usergroup_create(name, **connection_args)
Create new user group

26.6. execution modules
Note: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **name** -- name of the user group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
IDs of the created user groups.

CLI Example:

```
salt '*' zabbix.usergroup_create GroupName
```

salt.modules.zabbix.usergroup_delete(usergroupids, **connection_args)

New in version 2016.3.0.

Parameters

- **usergroupids** -- IDs of the user groups to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
IDs of the deleted user groups.

CLI Example:

```
salt '*' zabbix.usergroup_delete 28
```

salt.modules.zabbix.usergroup_exists(name=None, node=None, nodeids=None, **connection_args)

Checks if at least one user group that matches the given filter criteria exists

New in version 2016.3.0.

Parameters

- **name** -- names of the user groups
- **node** -- name of the node the user groups must belong to (This will override the nodeids parameter.)
- **nodeids** -- IDs of the nodes the user groups must belong to
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
True if at least one user group that matches the given filter criteria exists, else False.

CLI Example:
salt '*' zabbix.usergroup_exists Guests

salt.modules.zabbix.usergroup_get(name=\None, usrgrpids=\None, userids=\None, **\connection_args)

New in version 2016.3.0.
Retrieve user groups according to the given parameters

Note: This function accepts all usergroup_get properties: keyword argument names differ depending on your zabbix version, see here.

Parameters
- name -- names of the user groups
- usrgrpids -- return only user groups with the given IDs
- userids -- return only user groups that contain the given users
- _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
Array with convenient user groups details, False if no user group found or on failure.

CLI Example:
salt '*' zabbix.usergroup_get Guests

salt.modules.zabbix.usergroup_list(**\connection_args)

Retrieve all enabled user groups.
New in version 2016.3.0.

Parameters
- _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
Array with enabled user groups details, False on failure.

CLI Example:
salt '*' zabbix.usergroup_list

salt.modules.zabbix.usergroup_update(usrgrpid, **\connection_args)

New in version 2016.3.0.
Update existing user group

Note: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see here.
• **usrgrp** -- ID of the user group to update.
• **connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**
IDs of the updated user group, False on failure.

CLI Example:
```
salt '*' zabbix.usergroup_update 8 name=guestsRenamed
```

```python
salt.modules.zabbix.usermacro_create(macro, value, hostid, **connection_args)
```
Create new host usermacro.

**Parameters**
- **macro** -- name of the host usermacro
- **value** -- value of the host usermacro
- **hostid** -- hostid or templated
- **connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the created host usermacro.

CLI Example:
```
salt '*' zabbix.usermacro_create '{$SNMP_COMMUNITY}' 'public' 1
```

```python
salt.modules.zabbix.usermacro_createglobal(macro, value, **connection_args)
```
Create new global usermacro.

**Parameters**
- **macro** -- name of the global usermacro
- **value** -- value of the global usermacro
- **connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the created global usermacro.

CLI Example:
```
salt '*' zabbix.usermacro_createglobal '{$SNMP_COMMUNITY}' 'public'
```

```python
salt.modules.zabbix.usermacro_delete(macroids, **connection_args)
```
Delete host usermacros.

**Parameters**
- **macroids** -- macroids of the host usermacros
- **connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: IDs of the deleted host usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_delete 21
```

salt.modules.zabbix.usermacro_deleteglobal(macroids, **connection_args)

Delete global usermacros.

Parameters

- **macroids** -- macroids of the global usermacros
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: IDs of the deleted global usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_deleteglobal 21
```

salt.modules.zabbix.usermacro_get(macro=None, hostids=None, templateids=None, hostmacroids=None, globalmacroids=None, globalmacro=False, **connection_args)

Retrieve user macros according to the given parameters.

Parameters

- **macro** -- name of the usermacro
- **hostids** -- Return macros for the given hostids
- **templateids** -- Return macros for the given templateids
- **hostmacroids** -- Return macros with the given hostmacroids
- **globalmacroids** -- Return macros with the given globalmacroids (implies globalmacro=True)
- **globalmacro** -- if True, returns only global macros
- **connection_args** (optional) -- _connection_user: zabbix user (can also be set in opts or pillar, see module's docstring) _connection_password: zabbix password (can also be set in opts or pillar, see module's docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

Returns

Array with usermacro details, False if no usermacro found or on failure.

CLI Example:

```
salt '*' zabbix.usermacro_get macro='{$SNMP_COMMUNITY}'
```

salt.modules.zabbix.usermacro_update(hostmacroid, value, **connection_args)

Update existing host usermacro.

Parameters

- **hostmacroid** -- id of the host usermacro
- **value** -- new value of the host usermacro
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
Salt Documentation, Release 3007.1

• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the update host usermacro.

CLI Example:

```
salt '*!' zabbix.usermacro_update 1 'public'
```

salt.modules.zabbix.usermacro_updateglobal(globalmacroid, value, **connection_args)

Update existing global usermacro.

Parameters

• globalmacroid -- id of the host usermacro
• value -- new value of the host usermacro
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the update global usermacro.

CLI Example:

```
salt '*!' zabbix.usermacro_updateglobal 1 'public'
```

26.6.529 salt.modules.zcbuildout

Management of zc.buildout

New in version 2014.1.0.

This module is inspired by minitage’s buildout maker

Note: The zc.buildout integration is still in beta; the API is subject to change

General notes

You have those following methods:

• upgrade_bootstrap
• bootstrap
• run_buildout
• buildout

salt.modules.zcbuildout.bootstrap(*a, **kw)

Run the buildout bootstrap dance (python bootstrap.py).

directory
directory to execute in

config
alternative buildout configuration file to use
runas
    User used to run buildout as
env
    environment variables to set when running
buildout_ver
    force a specific buildout version (1 | 2)
test_release
    buildout accept test release
offline
    are we executing buildout in offline mode
distribute
    Forcing use of distribute
new_st
    Forcing use of setuptools >= 0.7
python
    path to a python executable to use in place of default (salt one)
onlyif
    Only execute cmd if statement on the host return 0
unless
    Do not execute cmd if statement on the host return 0
use_vt
    Use the new salt VT to stream output [experimental]

CLI Example:

```
salt '*' buildout.bootstrap /srv/mybuildout
```

```
salt.modules.zcbuildout.buildout(*a,**kw)
```

Run buildout in a directory.
directory
    directory to execute in
cfg
    buildout config to use
parts
    specific buildout parts to run
runas
    user used to run buildout as
env
    environment variables to set when running
buildout_ver
    force a specific buildout version (1 | 2)
test_release
    buildout accept test release
new_st
    Forcing use of setuptools >= 0.7
distribute
    use distribute over setuptools if possible
offline
    does buildout run offline
python
    python to use
debug
    run buildout with -D debug flag
onlyif
    Only execute cmd if statement on the host return 0
unless
Do not execute cmd if statement on the host return 0
newest
run buildout in newest mode
verbose
run buildout in verbose mode (-vvvvv)
use_vt
Use the new salt VT to stream output [experimental]

CLI Example:

```
salt '*' buildout.buildout /srv/mybuildout
```

salt.modules.zcbuildout.run_buildout(*a, **kw)
Run a buildout in a directory.
directory
directory to execute in
config
alternative buildout configuration file to use
offline
are we executing buildout in offline mode
runas
user used to run buildout as
env
environment variables to set when running
onlyif
Only execute cmd if statement on the host return 0
unless
Do not execute cmd if statement on the host return 0
newest
run buildout in newest mode
force
run buildout unconditionally
verbose
run buildout in verbose mode (-vvvvv)
use_vt
Use the new salt VT to stream output [experimental]

CLI Example:

```
salt '*' buildout.run_buildout /srv/mybuildout
```

salt.modules.zcbuildout.upgrade_bootstrap(*a, **kw)
Upgrade current bootstrap.py with the last released one.
Indeed, when we first run a buildout, a common source of problem is to have a locally stale bootstrap, we just
try to grab a new copy
directory
directory to execute in
offline
are we executing buildout in offline mode
buildout_ver
forcing to use a specific buildout version (1 | 2)
onlyif
Only execute cmd if statement on the host return 0
unless
Do not execute cmd if statement on the host return 0
CLI Example:

```bash
salt '*' buildout.upgrade_bootstrap /srv/mybuildout
```

### 26.6.530 salt.modules.zenoss

Module for working with the Zenoss API

New in version 2016.3.0.

**configuration**

This module requires a 'zenoss' entry in the master/minion config.

For example:

```yaml
zenoss:
  hostname: https://zenoss.example.com
  username: admin
  password: admin123
  verify_ssl: True
  ca_bundle: /etc/ssl/certs/ca-certificates.crt
```

salt.modules.zenoss.add_device(*device=None, device_class=None, collector='localhost', prod_state=1000)*

A function to connect to a zenoss server and add a new device entry.

**Parameters**

- **device** -- (Optional) Will use the grain 'fqdn' by default.
- **device_class** -- (Optional) The device class to use. If none, will determine based on kernel grain.
- **collector** -- (Optional) The collector to use for this device. Defaults to 'localhost'.
- **prod_state** -- (Optional) The prodState to set on the device. If none, defaults to 1000 (production)

CLI Example:

```bash
salt '*' zenoss.add_device
```

salt.modules.zenoss.device_exists(*device=None)*

Check to see if a device already exists in Zenoss.

**Parameters**

- **device** -- (Optional) Will use the grain 'fqdn' by default

CLI Example:

```bash
salt '*' zenoss.device_exists
```

salt.modules.zenoss.find_device(*device=None)*

Find a device in Zenoss. If device not found, returns None.

**Parameters**

- **device** -- (Optional) Will use the grain 'fqdn' by default

CLI Example:

```bash
salt '*' zenoss.find_device
```

salt.modules.zenoss.set_prod_state(*prod_state, device=None)*

A function to set the prod_state in zenoss.

**Parameters**

- **prod_state**
- **device**
- **prod_state** -- (Required) Integer value of the state
- **device** -- (Optional) Will use the grain 'fqdn' by default.

CLI Example:

```
salt zenoss.set_prod_state 1000 hostname
```

### 26.6.531 salt.modules.zfs

Module for running ZFS command

**codeauthor**
Nitin Madhok <nmadhok@g.clemson.edu>, Jorge Schrauwen <sjorge@blackdot.be>

**maintainer**
Jorge Schrauwen <sjorge@blackdot.be>

**maturity**
new

**depends**
salt.utils.zfs

**platform**
illumos,freebsd,linux

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

**salt.modules.zfs.bookmark**(*snapshot, bookmark*)

Creates a bookmark of the given snapshot

**Note:** Bookmarks mark the point in time when the snapshot was created, and can be used as the incremental source for a zfs send command.

This feature must be enabled to be used. See zpool-features(5) for details on ZFS feature flags and the bookmarks feature.

**snapshot**
[string] name of snapshot to bookmark

**bookmark**
[string] name of bookmark

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.bookmark myzpool/mydataset@yesterday myzpool/mydataset
```

**salt.modules.zfs.clone**(*name_a, name_b, **kwargs*)

Creates a clone of the given snapshot.

**name_a**
[string] name of snapshot

**name_b**
[string] name of filesystem or volume
create_parent
[boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.

properties
[dict] additional zfs properties (-o)

Note: ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{"property1": 'value1', 'property2': 'value2'}"
```

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.clone myzpool/mydataset@yesterday myzpool/mydataset_yesterday
```

```
salt.modules.zfs.create(name, **kwargs)
Create a ZFS File System.

name
[string] name of dataset or volume

volume_size
[string] if specified, a zvol will be created instead of a dataset

sparse
[boolean] create sparse volume

create_parent
[boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.

properties
[dict] additional zfs properties (-o)

Note: ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{"property1": 'value1', 'property2': 'value2'}"
```

New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.create myzpool/mydataset [create_parent=True|False]
salt '*' zfs.create myzpool/mydataset properties="{"mountpoint": '/export/zfs', 'sharenfs': 'on'}"
salt '*' zfs.create myzpool/volume volume_size=1G [sparse=True|False]
salt '*' zfs.create myzpool/volume volume_size=1G properties="{"volblocksize": '512'}" [sparse=True|False]
```

salt.modules.zfs.destroy(name, **kwargs)
Destroy a ZFS File System.

name
[string] name of dataset, volume, or snapshot
force
[boolean] force an unmount of any file systems using the unmount -f command.

recursive
[boolean] recursively destroy all children. (-r)

recursive_all
[boolean] recursively destroy all dependents, including cloned file systems outside the target hierarchy. (-R)

**Warning:** watch out when using recursive and recursive_all

New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.destroy myzpool/mydataset [force=True|False]
```

salt.modules.zfs.diff(name_a, name_b=None, **kwargs)
Display the difference between a snapshot of a given filesystem and another snapshot of that filesystem from
a later time or the current contents of the filesystem.

name_a
[string] name of snapshot

name_b
[string] (optional) name of snapshot or filesystem

show_changetime
[boolean] display the path's inode change time as the first column of output. (default = True)

show_indication
[boolean] display an indication of the type of file. (default = True)

parsable
[boolean] if true we don't parse the timestamp to a more readable date (default = True)

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.diff myzpool/mydataset@yesterday myzpool/mydataset
```

salt.modules.zfs.exists(name, **kwargs)
Check if a ZFS filesystem or volume or snapshot exists.

name
[string] name of dataset

type
[string] also check if dataset is of a certain type, valid choices are: filesystem, snapshot, volume, bookmark, or all.

New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.exists myzpool/mydataset
salt '*' zfs.exists myzpool/myvolume type=volume
```

salt.modules.zfs.get("dataset", **kwargs)
Displays properties for the given datasets.

dataset
[string] name of snapshot(s), filesystem(s), or volume(s)

properties
[string] comma-separated list of properties to list, defaults to all
```
recursive
  [boolean] recursively list children

depth
  [int] recursively list children to depth

fields
  [string] comma-separated list of fields to include, the name and property field will always be added

type
  [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.

  Changed in version 3004.

  type is ignored on Solaris 10 and 11 since not a valid parameter on those platforms

source
  [string] comma-separated list of sources to display. Must be one of the following: local, default, inherited, temporary, and none. The default value is all sources.

parsable
  [boolean] display numbers in parsable (exact) values (default = True) .. versionadded:: 2018.3.0

Note: If no datasets are specified, then the command displays properties for all datasets on the system.

New in version 2016.3.0.

CLI Example:

salt '*' zfs.get
salt '*' zfs.get myzpool/mydataset [recursive=True|False]

salt '*' zfs.get myzpool/mydataset properties="sharenfs,mountpoint" #
  [recursive=True|False]

salt '*' zfs.get myzpool/mydataset myzpool/myotherdataset#
  [properties=available fields=value depth=1]

salt.modules.zfs.hold(tag, *snapshot, **kwargs)

Adds a single reference, named with the tag argument, to the specified snapshot or snapshots.

Note: Each snapshot has its own tag namespace, and tags must be unique within that space.

If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

tag
  [string] name of tag

snapshot
  [string] name of snapshot(s)

recursive
  [boolean] specifies that a hold with the given tag is applied recursively to the snapshots of all descendent file systems.

New in version 2016.3.0.

Changed in version 2018.3.1.

Warning: As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It's now possible to create a tag that contains a comma, this was impossible before.
Salt Documentation, Release 3007.1

CLI Example:

```
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot myzpool/
        → mydataset@myothersnapshot
```

salt.modules.zfs.holds(snapshot, **kwargs)

Lists all existing user references for the given snapshot or snapshots.

- **snapshot**
  - [string] name of snapshot
- **recursive**
  - [boolean] lists the holds that are set on the named descendent snapshots also.

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.holds myzpool/mydataset@baseline
```

salt.modules.zfs.inherit(prop, name, **kwargs)

Clears the specified property

- **prop**
  - [string] name of property
- **name**
  - [string] name of the filesystem, volume, or snapshot
- **recursive**
  - [boolean] recursively inherit the given property for all children.
- **revert**
  - [boolean] revert the property to the received value if one exists; otherwise operate as if the -S option was not specified.

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.inherit canmount myzpool/mydataset [recursive=True|False]
```

salt.modules.zfs.list_(name=None, **kwargs)

Return a list of all datasets or a specified dataset on the system and the values of their used, available, referenced, and mountpoint properties.

- **name**
  - [string] name of dataset, volume, or snapshot
- **recursive**
  - [boolean] recursively list children
- **depth**
  - [int] limit recursion to depth
- **properties**
  - [string] comma-separated list of properties to list, the name property will always be added
- **type**
  - [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.
- **sort**
  - [string] property to sort on (default = name)
- **order**
  - [string [ascending|descending]] sort order (default = ascending)
- **parsable**
  - [boolean] display numbers in parsable (exact) values .. versionadded:: 2018.3.0
New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.list
salt '*' zfs.list myzpool/mydataset [recursive=True|False]
salt '*' zfs.list myzpool/mydataset properties="share nfs,mountpoint"
```

**salt.modules.zfs.list_mount()**

List mounted ZFS filesystems

New in version 2018.3.1.

CLI Example:

```
salt '*' zfs.list_mount
```

**salt.modules.zfs.mount(name=None, **kwargs)**

Mounts ZFS file systems

- **name** [string] name of the filesystem, having this set to None will mount all filesystems. (this is the default)
- **overlay** [boolean] perform an overlay mount.
- **options** [string] optional comma-separated list of mount options to use temporarily for the duration of the mount.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** Passing `-a` as name is deprecated and will be removed in 3001.

CLI Example:

```
salt '*' zfs.mount
salt '*' zfs.mount myzpool/mydataset
salt '*' zfs.mount myzpool/mydataset options=ro
```

**salt.modules.zfs.promote(name)**

Promotes a clone file system to no longer be dependent on its "origin" snapshot.

**Note:** This makes it possible to destroy the file system that the clone was created from. The clone parent-child dependency relationship is reversed, so that the origin file system becomes a clone of the specified file system.

The snapshot that was cloned, and any snapshots previous to this snapshot, are now owned by the promoted clone. The space they use moves from the origin file system to the promoted clone, so enough space must be available to accommodate these snapshots. No new space is consumed by this operation, but the space accounting is adjusted. The promoted clone must not have any conflicting snapshot names of its own. The rename subcommand can be used to rename any conflicting snapshots.

- **name** [string] name of clone-filesystem

New in version 2016.3.0.
CLI Example:

```
salt '*' zfs.promote myzpool/myclone
```

**salt.modules.zfs.release**(tag, snapshot, **kwargs)

Removes a single reference, named with the tag argument, from the specified snapshot or snapshots.

**Note:** The tag must already exist for each snapshot. If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

**tag**
[string] name of tag

**snapshot**
[string] name of snapshot(s)

**recursive**
[boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It's is now possible to create a tag that contains a comma, this was impossible before.

CLI Example:

```
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot myzpool/
          → mydataset@myothersnapshot
```

**salt.modules.zfs.rename**(name, new_name, **kwargs)

Rename or Relocate a ZFS File System.

**name**
[string] name of dataset, volume, or snapshot

**new_name**
[string] new name of dataset, volume, or snapshot

**force**
[boolean] force unmount any filesystems that need to be unmounted in the process.

**create_parent**
[boolean] creates all the nonexistent parent datasets. Datasets created in this manner are automatically mounted according to the mountpoint property inherited from their parent.

**recursive**
[boolean] recursively rename the snapshots of all descendent datasets. Snapshots are the only dataset that can be renamed recursively.

New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.rename myzpool/mydataset myzpool/renameddataset
```

**salt.modules.zfs.rollback**(name, **kwargs)

Roll back the given dataset to a previous snapshot.
name
[string] name of snapshot

recursive
[boolean] destroy any snapshots and bookmarks more recent than the one specified.

recursive_all
[boolean] destroy any more recent snapshots and bookmarks, as well as any clones of those snapshots.

force
[boolean] used with the -R option to force an unmount of any clone file systems that are to be destroyed.

**Warning:** When a dataset is rolled back, all data that has changed since the snapshot is discarded, and the dataset reverts to the state at the time of the snapshot. By default, the command refuses to roll back to a snapshot other than the most recent one.

In order to do so, all intermediate snapshots and bookmarks must be destroyed by specifying the -r option.

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.rollback myzpool/mydataset@yesterday
```

salt.modules.zfs.set("dataset", **kwargs)
Sets the property or list of properties to the given value(s) for each dataset.

dataset
[string] name of snapshot(s), filesystem(s), or volume(s)

properties
[string] additional zfs properties pairs

**Note:** properties are passed as key-value pairs. e.g.
compression=off

**Note:** Only some properties can be edited.

See the Properties section for more information on what properties can be set and acceptable values.

Numeric values can be specified as exact values, or in a human-readable form with a suffix of B, K, M, G, T, P, E (for bytes, kilobytes, megabytes, gigabytes, terabytes, petabytes, or exabytes respectively).

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.set myzpool/mydataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=lz4
canmount=off
```

canmount
[boolean] canmount=off

salt.modules.zfs.snapshot("snapshot", **kwargs)
Creates snapshots with the given names.

snapshot
[string] name of snapshot(s)

recursive
[boolean] recursively create snapshots of all descendent datasets.
properties
[dict] additional zfs properties (-o)

Note: ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties = {"property1": 'value1', 'property2': 'value2'}
```

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.snapshot myzpool/mydataset@yesterday [recursive=True]
salt '*' zfs.snapshot myzpool/mydataset@yesterday myzpool/
  → myotherdataset@yesterday [recursive=True]
```

```
salt.modules.zfs.unmount(name, **kwargs)
```

Unmounts ZFS file systems

name
[string] name of the filesystem, you can use None to unmount all mounted filesystems.

force
[boolean] forcefully unmount the file system, even if it is currently in use.

**Warning:** Using `-a` for the name parameter will probably break your system, unless your rootfs is not on zfs.

New in version 2016.3.0.
Changed in version 2018.3.1.

**Warning:** Passing `-a` as name is deprecated and will be removed in 3001.

CLI Example:

```
salt '*' zfs.unmount myzpool/mydataset [force=True|False]
```

26.6.532 salt.modules.zk_concurrency

Concurrency controls in zookeeper

depends
kazoo

configuration
See `salt.modules.zookeeper` for setup instructions.

This module allows you to acquire and release a slot. This is primarily useful for ensuring that no more than N hosts take a specific action at once. This can also be used to coordinate between masters.
salt.modules.zk_concurrency.lock(path, zk_hosts=None, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False, force=False, profile=None, scheme=None, username=None, password=None, default_acl=None)

Get lock (with optional timeout)

path
The path in zookeeper where the lock is

zk_hosts
zookeeper connect string

identifier
Name to identify this minion, if unspecified defaults to the hostname

max_concurrency
Maximum number of lock holders

timeout
timeout to wait for the lock. A None timeout will block forever

ephemeral_lease
Whether the locks in zookeeper should be ephemeral

force
Forcibly acquire the lock regardless of available slots

Example:
```
salt minion zk_concurrency.lock /lock/path host1:1234,host2:1234
```

salt.modules.zk_concurrency.lock_holders(path, zk_hosts=None, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False, profile=None, scheme=None, username=None, password=None, default_acl=None)

Return an un-ordered list of lock holders

path
The path in zookeeper where the lock is

zk_hosts
zookeeper connect string

identifier
Name to identify this minion, if unspecified defaults to hostname

max_concurrency
Maximum number of lock holders

timeout
timeout to wait for the lock. A None timeout will block forever

ephemeral_lease
Whether the locks in zookeeper should be ephemeral

Example:
```
salt minion zk_concurrency.lock_holders /lock/path host1:1234,host2:1234
```

salt.modules.zk_concurrency.party_members(path, zk_hosts=None, min_nodes=1, blocking=False, profile=None, scheme=None, username=None, password=None, default_acl=None)

Get the List of identifiers in a particular party, optionally waiting for the specified minimum number of nodes (min_nodes) to appear

path
The path in zookeeper where the lock is

zk_hosts
zookeeper connect string

min_nodes
The minimum number of nodes expected to be present in the party
blocking
   The boolean indicating if we need to block until min_nodes are available
Example:

```shell
salt minion zk_concurrency.party_members /lock/path host1:1234,host2:1234
salt minion zk_concurrency.party_members /lock/path host1:1234,host2:1234
   \_min_nodes=3  blocking=True
```

salt.modules.zk_concurrency.unlock(path, zk_hosts=None, identifier=None, max_concurrency=1,
   ephemeral_lease=False, scheme=None, profile=None,
   username=None, password=None, default_acl=None)

Remove lease from semaphore
path
   The path in zookeeper where the lock is
zk_hosts
   zookeeper connect string
identifier
   Name to identify this minion, if unspecified defaults to hostname
max_concurrency
   Maximum number of lock holders
timeout
   timeout to wait for the lock. A None timeout will block forever
ephemeral_lease
   Whether the locks in zookeeper should be ephemeral
Example:

```shell
salt minion zk_concurrency.unlock /lock/path host1:1234,host2:1234
```

26.6.533 salt.modules.znc

znc - An advanced IRC bouncer
New in version 2014.7.0.
Provides an interface to basic ZNC functionality
salt.modules.znc.buildmod("modules")
   Build module using znc-buildmod
   CLI Example:
   ```shell
   salt '*' znc.buildmod module.cpp [...]```

salt.modules.znc.dumpconf()
   Write the active configuration state to config file
   CLI Example:
   ```shell
   salt '*' znc.dumpconf```

salt.modules.znc.rehashconf()
   Rehash the active configuration state from config file
   CLI Example:
salt '*' znc.rehashconf

salt.modules.znc.version()

Return server version from znc --version

CLI Example:
salt '*' znc.version

26.6.534 salt.modules.zoneadm

Module for Solaris 10's zoneadm

maintainer
Jorge Schrauwen <sjorge@blackdot.be>
maturity
new
platform
OmniOS,OpenIndiana,SmartOS,OpenSolaris,Solaris 10

New in version 2017.7.0.

Warning: Oracle Solaris 11's zoneadm is not supported by this module!

salt.modules.zoneadm.attach(zone, force=False, brand_opts=None)

Attach the specified zone.

zone
[string] name of the zone

force
[boolean] force the zone into the "installed" state with no validation

brand_opts
[string] brand specific options to pass

CLI Example:
salt '*' zoneadm.attach lawrence
salt '*' zoneadm.attach lawrence True

salt.modules.zoneadm.boot(zone, single=False, altinit=None, smf_options=None)

Boot (or activate) the specified zone.

zone
[string] name or uuid of the zone

single
[boolean] boots only to milestone svc:/milestone/single-user:default.

altinit
[string] valid path to an alternative executable to be the primordial process.

smf_options
[string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:
salt '*' zoneadm.boot clementine
salt '*' zoneadm.boot maeve single=True
salt '*' zoneadm.boot teddy single=True smf_options=verbose

salt.modules.zoneadm.clone(zone, source, snapshot=None)
Install a zone by copying an existing installed zone.
zone
 [string] name of the zone
source
 [string] zone to clone from
snapshot
 [string] optional name of snapshot to use as source
CLI Example:
salt '*' zoneadm.clone clementine dolores

salt.modules.zoneadm.detach(zone)
Detach the specified zone.
zone
 [string] name or uuid of the zone
CLI Example:
salt '*' zoneadm.detach kissy

salt.modules.zoneadm.halt(zone)
Halt the specified zone.
zone
 [string] name or uuid of the zone
Note: To cleanly shutdown the zone use the shutdown function.

CLI Example:
salt '*' zoneadm.halt hector

salt.modules.zoneadm.install(zone, nodataset=False, brand_opts=None)
Install the specified zone from the system.
zone
 [string] name of the zone
nodataset
 [boolean] do not create a ZFS file system
brand_opts
 [string] brand specific options to pass
CLI Example:
salt '*' zoneadm.install dolores
salt '*' zoneadm.install teddy True

salt.modules.zoneadm.list_zones(verbos=True, installed=False, configured=False, hide_global=True)
List all zones
verbose
 [boolean] display additional zone information
installed
  [boolean] include installed zones in output

cfgured
  [boolean] include configured zones in output

hide_global
  [boolean] do not include global zone

CLI Example:
salt '*' zoneadm.list

salt.modules.zoneadm.move(zone, zonepath)
  Move zone to new zonepath.
  zone
    [string] name or uuid of the zone
  zonepath
    [string] new zonepath

CLI Example:
salt '*' zoneadm.move meave /sweetwater/meave

salt.modules.zoneadm.ready(zone)
  Prepares a zone for running applications.
  zone
    [string] name or uuid of the zone

CLI Example:
salt '*' zoneadm.ready clementine

salt.modules.zoneadm.reboot(zone, single=False, altinit=None, smf_options=None)
  Restart the zone. This is equivalent to a halt boot sequence.
  zone
    [string] name or uuid of the zone
  single
    [boolean] boots only to milestone svc:/milestone/single-user:default.
  altinit
    [string] valid path to an alternative executable to be the primordial process.
  smf_options
    [string] include two categories of options to control booting behavior of the service management facility:
    recovery options and messages options.

CLI Example:
salt '*' zoneadm.reboot dolores
salt '*' zoneadm.reboot teddy single=True

salt.modules.zoneadm.shutdown(zone, reboot=False, single=False, altinit=None, smf_options=None)
  Gracefully shutdown the specified zone.
  zone
    [string] name or uuid of the zone
  reboot
    [boolean] reboot zone after shutdown (equivalent of shutdown -i6 -g0 -y)
  single
    [boolean] boots only to milestone svc:/milestone/single-user:default.
  altinit
    [string] valid path to an alternative executable to be the primordial process.
**smf_options**

[string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```bash
salt '*' zoneadm.shutdown peter
salt '*' zoneadm.shutdown armistice reboot=True
```

salt.modules.zoneadm.uninstall(zone)

Uninstall the specified zone from the system.

zone

[string] name or uuid of the zone

**Warning:** The `-F` flag is always used to avoid the prompts when uninstalling.

CLI Example:

```bash
salt '*' zoneadm.uninstall teddy
```

salt.modules.zoneadm.verify(zone)

Check to make sure the configuration of the specified zone can safely be installed on the machine.

zone

[string] name of the zone

CLI Example:

```bash
salt '*' zoneadm.verify dolores
```

### 26.6.535 salt.modules.zonecfg

Module for Solaris 10's zonecfg

maintainer

Jorge Schrauwen <sjorge@blackdot.be>

maturity

new

platform

OmniOS, OpenIndiana, SmartOS, OpenSolaris, Solaris 10

depend

salt.modules.file

New in version 2017.7.0.

**Warning:** Oracle Solaris 11's zonecfg is not supported by this module!

salt.modules.zonecfg.add_resource(zone, resource_type, **kwargs)

Add a resource

zone

[string] name of zone

resource_type

[string] type of resource
salt.modules.zonecfg.clear_property(zone, key)

Clear a property

zone [string] name of zone
key [string] name of property

CLI Example:
```
salt '*' zonecfg.clear_property deathscythe cpu-shares
```

salt.modules.zonecfg.create(zone, brand, zonepath, force=False)

Create an in-memory configuration for the specified zone.

zone [string] name of zone
brand [string] brand name
zonepath [string] path of zone
force [boolean] overwrite configuration

CLI Example:
```
salt '*' zonecfg.create deathscythe ipkg /zones/deathscythe
```

salt.modules.zonecfg.create_from_template(zone, template)

Create an in-memory configuration from a template for the specified zone.

zone [string] name of zone
template [string] name of template

Warning: existing config will be overwritten!

CLI Example:
```
salt '*' zonecfg.create_from_template leo tallgeese
```

salt.modules.zonecfg.delete(zone)

Delete the specified configuration from memory and stable storage.

zone [string] name of zone

CLI Example:
```
salt '*' zonecfg.delete epyon
```
salt.modules.zonecfg.export(zone, path=None)

Export the configuration from memory to stable storage.

zone
  [string] name of zone

path
  [string] path of file to export to

CLI Example:

```
salt '*' zonecfg.export epyon
salt '*' zonecfg.export epyon /zones/epyon.cfg
```

salt.modules.zonecfg.import_(zone, path)

Import the configuration to memory from stable storage.

zone
  [string] name of zone

path
  [string] path of file to export to

CLI Example:

```
salt '*' zonecfg.import epyon /zones/epyon.cfg
```

salt.modules.zonecfg.info(zone, show_all=False)

Display the configuration from memory

zone
  [string] name of zone

show_all
  [boolean] also include calculated values like capped-cpu, cpu-shares, ...

CLI Example:

```
salt '*' zonecfg.info tallgeese
```

salt.modules.zonecfg.remove_resource(zone, resource_type, resource_key, resource_value)

Remove a resource

zone
  [string] name of zone

resource_type
  [string] type of resource

resource_key
  [string] key for resource selection

resource_value
  [string] value for resource selection

Note: Set resource_selector to None for resource that do not require one.

CLI Example:

```
salt '*' zonecfg.remove_resource tallgeese rctl name zone.max-locked-memory
```

salt.modules.zonecfg.set_property(zone, key, value)

Set a property

zone
  [string] name of zone
key
  [string] name of property
value
  [string] value of property
CLI Example:
salt '*' zonecfg.set_property deathscythe cpu-shares 100

salt.modules.zonecfg.update_resource(zone, resource_type, resource_selector, **kwargs)
Add a resource
zone
  [string] name of zone
resource_type
  [string] type of resource
resource_selector
  [string] unique resource identifier
kwargs
  [string|int|...] resource properties

Note: Set resource_selector to None for resource that do not require one.

CLI Example:
salt '*' zonecfg.update_resource tallgeese rctl name name=zone.max-locked-memory value='(priv=privileged,limit=33554432,action=deny)'

26.6.536 salt.modules.zookeeper

Zookeeper Module

maintainer
  SaltStack
maturity
  new
platform
  all
depends
  kazoo
New in version 2018.3.0.
Configuration

This module is not usable until the following are specified either in a pillar or in the minion's config file:

```yaml
zookeeper:
    hosts: zoo1,zoo2,zoo3
    default_acl:
        - username: daniel
          password: test
          read: true
          write: true
          create: true
          delete: true
          admin: true
    username: daniel
    password: test
```

If configuration for multiple zookeeper environments is required, they can be set up as different configuration profiles. For example:

```yaml
zookeeper:
    prod:
        hosts: zoo1,zoo2,zoo3
        default_acl:
            - username: daniel
              password: test
              read: true
              write: true
              create: true
              delete: true
              admin: true
        username: daniel
        password: test
    dev:
        hosts:
            - dev1
            - dev2
            - dev3
        default_acl:
            - username: daniel
              password: test
              read: true
              write: true
              create: true
              delete: true
              admin: true
        username: daniel
        password: test
```

salt.modules.zookeeper.create(path, value='', acls=None, ephemeral=False, sequence=False, makepath=False, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)
Create Znode

path
path of znode to create
value
value to assign to znode (Default: ")
acls
list of acl dictionaries to be assigned (Default: None)
ephemeral
indicate node is ephemeral (Default: False)
sequence
indicate node is suffixed with a unique index (Default: False)
makepath
Create parent paths if they do not exist (Default: False)
profile
Configured Zookeeper profile to authenticate with (Default: None)
hosts
Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme
Scheme to authenticate with (Default: 'digest')
username
Username to authenticate (Default: None)
password
Password to authenticate (Default: None)
default_acl
Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
salt minion1 zookeeper.create /test/name daniel profile=prod

Delete znode

path
path to znode
version
only delete if version matches (Default: -1 (always matches))
profile
Configured Zookeeper profile to authenticate with (Default: None)
hosts
Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme
Scheme to authenticate with (Default: 'digest')
username
Username to authenticate (Default: None)
password
Password to authenticate (Default: None)
default_acl
Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
salt minion1 zookeeper.delete /test/name profile=prod

Ensure Path

salt.modules.zookeeper.ensure_path(path, acls=None, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

26.6. execution modules
Ensure Znode path exists

**path**
Parent path to create

**acls**
List of acls dictionaries to be assigned (Default: None)

**profile**
Configured Zookeeper profile to authenticate with (Default: None)

**hosts**
Lists of Zookeeper Hosts (Default: ’127.0.0.1:2181)

**scheme**
Scheme to authenticate with (Default: ’digest’)

**username**
Username to authenticate (Default: None)

**password**
Password to authenticate (Default: None)

**default_acl**
Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.ensure_path /test/name profile=prod
```

```text
salt.modules.zookeeper.exists(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)
```

Check if path exists

**path**
Path to check

**profile**
Configured Zookeeper profile to authenticate with (Default: None)

**hosts**
Lists of Zookeeper Hosts (Default: ’127.0.0.1:2181)

**scheme**
Scheme to authenticate with (Default: ’digest’)

**username**
Username to authenticate (Default: None)

**password**
Password to authenticate (Default: None)

**default_acl**
Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.exists /test/name profile=prod
```

```text
salt.modules.zookeeper.get(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)
```

Get value saved in znode

**path**
Path to check

**profile**
Configured Zookeeper profile to authenticate with (Default: None)

**hosts**
Lists of Zookeeper Hosts (Default: ’127.0.0.1:2181)

**scheme**
Scheme to authenticate with (Default: ’digest’)

**username**
Username to authenticate (Default: None)

password

Password to authenticate (Default: None)

default_acl

Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.get /test/name profile=prod
```

salt.modules.zookeeper.get_acls(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Get acls on a znode

path

path to znode

profile

Configured Zookeeper profile to authenticate with (Default: None)

hosts

Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)

scheme

Scheme to authenticate with (Default: 'digest')

username

Username to authenticate (Default: None)

password

Password to authenticate (Default: None)

default_acl

Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.get_acls /test/name profile=prod
```

salt.modules.zookeeper.get_children(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Get children in znode path

path

path to check

profile

Configured Zookeeper profile to authenticate with (Default: None)

hosts

Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)

scheme

Scheme to authenticate with (Default: 'digest')

username

Username to authenticate (Default: None)

password

Password to authenticate (Default: None)

default_acl

Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.get_children /test profile=prod
```

salt.modules.zookeeper.make_digest_acl(username, password, read=False, write=False, create=False, delete=False, admin=False, allperms=False)

Generate acl object
Note: This is heavily used in the zookeeper state and probably is not useful as a cli module

username
username of acl

password
plain text password of acl

read
read acl

write
write acl

create
create acl

delete
delete acl

admin
admin acl

allperms
set all other acls to True

CLI Example:
```
salt minion1 zookeeper.make_digest_acl username=daniel password=mypass
    allperms=True
```

salt.modules.zookeeper.set(path, value, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Update znode with new value

path
znode to update

value
value to set in znode

version
only update znode if version matches (Default: -1 (always matches))

profile
Configured Zookeeper profile to authenticate with (Default: None)

hosts
Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

scheme
Scheme to authenticate with (Default: 'digest')

username
Username to authenticate (Default: None)

password
Password to authenticate (Default: None)

default_acl
Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
```
salt minion1 zookeeper.set /test/name gtmanfred profile=prod
```

salt.modules.zookeeper.set_acls(path, acls, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Set acls on a znode
path
  path to znode

clds
  list of acl dictionaries to set on the znode

version
  only set acls if version matches (Default: -1 (always matches))

profile
  Configured Zookeeper profile to authenticate with (Default: None)

hosts
  Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

scheme
  Scheme to authenticate with (Default: 'digest')

username
  Username to authenticate (Default: None)

password
  Password to authenticate (Default: None)

default_acl
  Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.set_acls /test/name acls='["username": "gtmanfred", "password": "test", "all": True]'
```

### 26.6.537 salt.modules.zpool

Module for running ZFS zpool command

- **codeauthor**
  - Nitin Madhok <nmadhok@g.clemson.edu>, Jorge Schrauwen <sjorge@blackdot.be>

- **maintainer**
  - Jorge Schrauwen <sjorge@blackdot.be>

- **maturity**
  - new

- **depends**
  - salt.utils.zfs

- **platform**
  - illumos,freebsd,linux

**Changed in version 2018.3.1:** Big refactor to remove duplicate code, better type conversions and improved consistency in output.

```
salt.modules.zpool.add(zpool, *vdevs, **kwargs)
```

- Add the specified vdev's to the given storage pool

  - **zpool**
    - [string] Name of storage pool

  - **vdevs**
    - [string] One or more devices

  - **force**
    - [boolean] Forces use of device

CLI Example:
salt.zpool.attach(zpool, device, new_device, force=False)

Attach specified device to zpool

- **zpool**: [string] Name of storage pool
- **device**: [string] Existing device name too
- **new_device**: [string] New device name (to be attached to device)
- **force**: [boolean] Forces use of device

CLI Example:

```
salt '*' zpool.attach myzpool /path/to/vdev1 /path/to/vdev2 [...]```

salt.zpool.clear(zpool, device=None)

Clears device errors in a pool.

**Warning:** The device must not be part of an active pool configuration.

- **zpool**: [string] name of storage pool
- **device**: [string] (optional) specific device to clear

New in version 2018.3.1.

CLI Example:

```
salt '*' zpool.clear mypool
salt '*' zpool.clear mypool /path/to/dev```

salt.zpool.create(zpool, *vdevs, **kwargs)

Create a simple zpool, a mirrored zpool, a zpool having nested VDEVs, a hybrid zpool with cache, spare and log drives or a zpool with RAIDZ-1, RAIDZ-2 or RAIDZ-3

- **zpool**: [string] Name of storage pool
- **vdevs**: [string] One or move devices
- **force**: [boolean] Forces use of vdevs, even if they appear in use or specify a conflicting replication level.
- **mountpoint**: [string] Sets the mount point for the root dataset
- **altroot**: [string] Equivalent to "-o cachefile=none,altroot=root"
- **properties**: [dict] Additional pool properties
- **filesystem_properties**: [dict] Additional filesystem properties
- **createboot**: [boolean] create a boot partition
New in version 2018.3.0.

CLI Examples:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...] [force=True|False]
salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 [...] mirror /path/to/vdev2 /path/to/vdev3 [...] [force=True|False]
salt '*' zpool.create myhybridzpool mirror /tmp/file1 [...] log mirror / [...]
```

Note: Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

Filesystem properties can be specified at the time of creation of the pool by passing an additional argument called "filesystem_properties" and specifying the properties with their respective values in the form of a python dictionary:

```
filesystem_properties="{'property1': 'value1', 'property2': 'value2'}"
```

Example:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] properties="{'property1': 'value1', 'property2': 'value2'}"
```

CLI Example:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...] [force=True|False]
salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 [...] mirror /path/to/vdev2 /path/to/vdev3 [...] [force=True|False]
salt '*' zpool.create myhybridzpool mirror /tmp/file1 [...] log mirror / [...]
```

salt.modules.zpool.create_file_vdev(size, *vdevs)

Creates file based virtual devices for a zpool

CLI Example:

```
salt '*' zpool.create_file_vdev 7G /path/to/vdev1 [...] [force=True|False]
```

Note: Depending on file size, the above command may take a while to return.
salt.modules.zpool.destroy(zpool, force=False)
    Destroys a storage pool
    
    zpool
        [string] Name of storage pool
    force
        [boolean] Force destroy of pool

    CLI Example:
    salt '*' zpool.destroy myzpool

salt.modules.zpool.detach(zpool, device)
    Detach specified device to zpool
    
    zpool
        [string] Name of storage pool
    device
        [string] Device to detach

    CLI Example:
    salt '*' zpool.detach myzpool /path/to/vdev1

salt.modules.zpool.exists(zpool)
    Check if a ZFS storage pool is active
    
    zpool
        [string] Name of storage pool

    CLI Example:
    salt '*' zpool.exists myzpool

salt.modules.zpool.export(pools, **kwargs)
    New in version 2015.5.0.
    Export storage pools
    
    pools
        [string] One or more storage pools to export
    force
        [boolean] Force export of storage pools

    CLI Example:
    salt '*' zpool.export myzpool ...
    salt '*' zpool.export myzpool2 myzpool2 ...

salt.modules.zpool.get(zpool, prop=None, show_source=False, parsable=True)
    New in version 2016.3.0.
    Retrieves the given list of properties
    
    zpool
        [string] Name of storage pool
    prop
        [string] Optional name of property to retrieve
    show_source
        [boolean] Show source of property
    parsable
        [boolean] Display numbers in parsable (exact) values

    New in version 2018.3.0.
CLI Example:

```
salt '*' zpool.get myzpool
```

**salt.modules.zpool.healthy()**
Check if all zpools are healthy
New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.healthy
```

**salt.modules.zpool.history(zpool=None, internal=False, verbose=False)**
Displays the command history of the specified pools, or all pools if no pool is specified
zpool
  [string] Optional storage pool
internal
  [boolean] Toggle display of internally logged ZFS events
verbose
  [boolean] Toggle display of the user name, the hostname, and the zone in which the operation was performed

CLI Example:

```
salt '*' zpool.upgrade myzpool
```

**salt.modules.zpool.import_(zpool=None, new_name=None, **kwargs)**
Import storage pools or list pools available for import
zpool
  [string] Optional name of storage pool
new_name
  [string] Optional new name for the storage pool
mntopts
  [string] Comma-separated list of mount options to use when mounting datasets within the pool.
force
  [boolean] Forces import, even if the pool appears to be potentially active.
altroot
  [string] Equivalent to "-o cachefile=none,altroot=root"
dir
  [string] Searches for devices or files in dir, multiple dirs can be specified as follows: dir="dir1, dir2"
no_mount
  [boolean] Import the pool without mounting any file systems.
only_destroyed
  [boolean] Imports destroyed pools only. This also sets force=True.
recovery
  [boolean|str] false: do not try to recovery broken pools true: try to recovery the pool by rolling back the latest transactions test: check if a pool can be recovered, but don't import it nolog: allow import without log device, recent transactions might be lost

**Note:** If feature flags are not support this forced to the default of ‘false’
Warning: When recovery is set to 'test' the result will be have imported set to True if the pool can be imported. The pool might also be imported if the pool was not broken to begin with.

properties
[dict] Additional pool properties

Note: Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:
properties="{'property1': 'value1', 'property2': 'value2'}"

CLI Example:
salt '*' zpool.import [force=True|False]
salt '*' zpool.import myzpool [mynewzpool] [force=True|False]
salt '*' zpool.import myzpool dir='/tmp'

salt.modules.zpool.iostat(zpool=None, sample_time=5, parsable=True)
Display I/O statistics for the given pools
zpool
[string] optional name of storage pool
sample_time
[int] seconds to capture data before output default a sample of 5 seconds is used
parsable
[boolean] display data in pythonc values (True, False, Bytes,...)
New in version 2016.3.0.
Changed in version 2018.3.1: Added `parsable` parameter that defaults to True
CLI Example:
salt '*' zpool.iostat myzpool

salt.modules.zpool.labelclear(device, force=False)
New in version 2018.3.0.
Removes ZFS label information from the specified device
device
[string] Device name; must not be part of an active pool configuration.
force
[boolean] Treat exported or foreign devices as inactive
CLI Example:
salt '*' zpool.labelclear /path/to/dev

salt.modules.zpool.list_(properties='size,alloc,free,cap,frag,health', zpool=None, parsable=True)
New in version 2015.5.0.
Return information about (all) storage pools
zpool
[string] optional name of storage pool
properties
[string] comma-separated list of properties to list
parsable
[boolean] display numbers in parsable (exact) values
New in version 2018.3.0.

Note: The name property will always be included, while the frag property will get removed if not available.

zpool
[boolean] name of storage pool
Note: Multiple storage pool can be provided as a space separated list.

CLI Example:

```
salt '*' zpool.list
salt '*' zpool.list zpool=tank
salt '*' zpool.list 'size,free'
tank
salt '*' zpool.list 'size,free'

salt.modules.zpool.online(zpool, 'vdevs', **kwargs)
New in version 2015.5.0.
Ensure that the specified devices are online

Warning: By default, the OFFLINE state is persistent. The device remains offline when the system is rebooted. To temporarily take a device offline, use temporary=True.

zpool
[boolean] name of storage pool
vdevs
[boolean] One or more devices
temporary
[boolean] Enable temporarily offline

CLI Example:

```
salt '*' zpool.offline myzpool /path/to/vdev1 [...] [temporary=True|False]

salt.modules.zpool.online(zpool, 'vdevs', **kwargs)
New in version 2015.5.0.
Ensure that the specified devices are online
zpool
[boolean] name of storage pool
vdevs
[boolean] one or more devices
expand
[boolean] Expand the device to use all available space.

Note: If the device is part of a mirror or raidz then all devices must be expanded before the new space will become available to the pool.

CLI Example:
salt '*' zpool.online myzpool /path/to/vdev1 [...]

salt.modules.zpool.reguid(zpool)
Generates a new unique identifier for the pool

**Warning:** You must ensure that all devices in this pool are online and healthy before performing this action.

zpool
[string] name of storage pool
New in version 2016.3.0.
CLI Example:

```
salt '*' zpool.reguid myzpool
```

salt.modules.zpool.reopen(zpool)
Reopen all the vdevs associated with the pool
zpool
[string] name of storage pool
New in version 2016.3.0.
CLI Example:

```
salt '*' zpool.reopen myzpool
```

salt.modules.zpool.replace(zpool, old_device, new_device=None, force=False)
Replaces old_device with new_device

**Note:** This is equivalent to attaching new_device, waiting for it to resilver, and then detaching old_device.

The size of new_device must be greater than or equal to the minimum size of all the devices in a mirror or raidz configuration.

zpool
[string] Name of storage pool
old_device
[string] Old device to replace
new_device
[string] Optional new device
force
[boolean] Forces use of new_device, even if its appears to be in use.
CLI Example:

```
salt '*' zpool.replace myzpool /path/to/vdev1 /path/to/vdev2
```

salt.modules.zpool.scrub(zpool, stop=False, pause=False)
Scrub a storage pool
zpool
[string] Name of storage pool
**stop**

[boolean] If True, cancel ongoing scrub

**pause**

[boolean] If True, pause ongoing scrub

New in version 2018.3.0.

---

**Note:** Pause is only available on recent versions of ZFS.

If both `pause` and `stop` are True, then `stop` will win.

---

CLI Example:

```
salt '*' zpool.scrub myzpool
```

**salt.modules.zpool.set(zpool, prop, value)**

Sets the given property on the specified pool

**zpool**

[string] Name of storage pool

**prop**

[string] Name of property to set

**value**

[string] Value to set for the specified property

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.set myzpool readonly yes
```

**salt.modules.zpool.split(zpool, newzpool, **kwargs)**

New in version 2018.3.0.

Splits devices off pool creating newpool.

---

**Note:** All vdevs in pool must be mirrors. At the time of the split, `newzpool` will be a replica of `zpool`. After splitting, do not forget to import the new pool!

---

**zpool**

[string] Name of storage pool

**newzpool**

[string] Name of new storage pool

**mountpoint**

[string] Sets the mount point for the root dataset

**altroot**

[string] Sets altroot for newzpool

**properties**

[dict] Additional pool properties for newzpool

CLI Examples:

```
salt '*' zpool.split datamirror databackup
salt '*' zpool.split datamirror databackup altroot=/backup
```
Note: Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

Example:

```
salt '*' zpool.split datamirror databackup properties="{'readonly': 'on'}"
```

CLI Example:

```
salt '*' zpool.split datamirror databackup
salt '*' zpool.split datamirror databackup altroot=/backup
```

salt.modules.zpool.status(zpool=None)
Return the status of the named zpool

zpool
[string] optional name of storage pool
New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.status myzpool
```

salt.modules.zpool.upgrade(zpool=None, version=None)
New in version 2016.3.0.

Enables all supported features on the given pool

zpool
[string] Optional storage pool, applies to all otherwize
version
[int] Version to upgrade to, if unspecified upgrade to the highest possible

Warning: Once this is done, the pool will no longer be accessible on systems that do not support feature flags. See zpool-features(5) for details on compatibility with systems that support feature flags, but do not support all features enabled on the pool.

CLI Example:

```
salt '*' zpool.upgrade myzpool
```

26.6.538 salt.modules.zypperpkg

Package support for openSUSE via the zypper package manager

depends

- rpm Python module. Install with zypper install rpm-python

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.
class salt.modules.zypperpkg.Wildcard(zypper)

New in version 2017.7.0.

Converts string wildcard to a zypper query. .. rubric:: Example

'*2.3.*' is '2.3.*,whatever.is.here' and is equal to: '2.3.* <= and < 2.3.5'

Parameters

- ptn -- Pattern

Returns

Query range

$Z_{OP} = ['<', '<=', '=', '>=', '>', '>=']$

salt.modules.zypperpkg.available_version(*names, **kwargs)

This function is an alias of latest_version.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty dict will be returned for that package.

- refresh -- force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

- root -- operate on a different root directory.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.zypperpkg.clean_locks(root=None)

Remove unused locks that do not currently (with regard to repositories used) lock any package.

- root -- operate on a different root directory.

CLI Example:

```
salt '*' pkg.clean_locks
```

salt.modules.zypperpkg.del_repo(repo, root=None)

Delete a repo.

- root -- operate on a different root directory.

CLI Examples:

```
salt '*' pkg.del_repo alias
```

salt.modules.zypperpkg.diff(*paths, **kwargs)

Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

The root parameter can also be passed via the keyword argument.

Parameters

- path -- Full path to the installed file

Returns

Difference string or raises and exception if examined file is binary.

CLI Example:
salt.modules.zypperpkg.download(*packages, **kwargs)

Download packages to the local disk.

- **refresh**
  force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

- **root**
  operate on a different root directory.

CLI Example:

```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

salt.modules.zypperpkg.file_dict(*packages, **kwargs)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

The root parameter can also be passed via the keyword argument.

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.zypperpkg.file_list(*packages, **kwargs)

List the files that belong to a package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

The root parameter can also be passed via the keyword argument.

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.zypperpkg.get_repo(repo, root=None, **kwargs)

Display a repo.

- **root**
  operate on a different root directory.

CLI Example:

```
salt '*' pkg.get_repo alias
```

salt.modules.zypperpkg.hold(name=None, pkgs=None, root=None, **kwargs)

New in version 3003.

Add a package hold. Specify one of name and pkgs.

- **name**
  A package name to hold, or a comma-separated list of package names to hold.

- **pkgs**
  A list of packages to hold. The name parameter will be ignored if this option is passed.

- **root**
  operate on a different root directory.

CLI Example:
salt.modules.zypperpkg.info_available(*names, **kwargs)

Return the information of the named package available for the system.

**refresh**
force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

**root**
operate on a different root directory.

CLI Example:

```
salt '*' pkg.info_available <package1>
salt '*' pkg.info_available <package1> <package2> <package3> ...
```

salt.modules.zypperpkg.info_installed(*names, **kwargs)

Return the information of the named package(s), installed on the system.

**Parameters**
- **names** -- Names of the packages to get information about.
- **attr** -- Comma-separated package attributes. If no `attr` is specified, all available attributes returned.
  - **Valid attributes are:**
    - version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, package, url, summary, description.
  - **errors** -- Handle RPM field errors. If `ignore` is chosen, then various mistakes are simply ignored and omitted from the texts or strings. If `report` is chosen, then a field with a mistake is not returned, instead a `N/A (broken)` (not available, broken) text is placed.
  - **Valid attributes are:**
    - ignore, report
- **all_versions** -- Include information for all versions of the packages installed on the minion.
- **root** -- Operate on a different root directory.

CLI Example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2> <package3> all_versions=True
salt '*' pkg.info_installed <package1> attr=version,vendor all_versions=True
salt '*' pkg.info_installed <package1> <package2> <package3> ...
  → attr=version,vendor
salt '*' pkg.info_installed <package1> <package2> <package3> ...
  → attr=version,vendor errors=ignore
salt '*' pkg.info_installed <package1> <package2> <package3> ...
  → attr=version,vendor errors=report
```

salt.modules.zypperpkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, downloadonly=None, skip_verify=False, version=None, ignore_repo_failure=False, no_recommends=False, root=None, **kwargs)
Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemctl(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the salt-minion service is restarted. (See KillMode in the systemctl(1) manpage for more information). If desired, usage of systemctl(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Install the passed package(s), add refresh=True to force a 'zypper refresh' before package is installed.

**name**

The name of the package to be installed. Note that this parameter is ignored if either pkgs or sources is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the sources option.

CLI Example:

```bash
salt '*' pkg.install <package name>
```

**refresh**

force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

**fromrepo**

Specify a package repository to install from.

**downloadonly**

Only download the packages, do not install.

**skip_verify**

Skip the GPG verification check (e.g., --no-gpg-checks)

**version**

Can be either a version number, or the combination of a comparison operator (<, >, <=, >=, =) and a version number (ex. '>1.2.3-4'). This parameter is ignored if pkgs or sources is passed.

**resolve_capabilities**

If this option is set to True zypper will take capabilities into account. In this case names which are just provided by a package will get installed. Default is False.

**Multiple Package Installation Options:**

**pkgs**

A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the version parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```bash
salt '*' pkg.install pkgs=["foo", "bar"]
salt '*' pkg.install pkgs=["foo", {"bar": "1.2.3-4"}]
salt '*' pkg.install pkgs=["foo", {"bar": "<1.2.3-4"}]
```

**sources**

A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```bash
salt '*' pkg.install sources=[{"foo": "salt://foo.rpm"},{"bar": "salt://bar.rpm"}]
```

**ignore_repo_failure**

Zypper returns error code 106 if one of the repositories are not available for various reasons. In case to set strict check, this parameter needs to be set to True. Default: False.

**no_recommends**

Do not install recommended packages, only required ones.
root
operate on a different root directory.

diff_attr:
If a list of package attributes is specified, returned value will contain them, eg:

```python
{'<package>': {
    'old': {
        'version': '<old-version>',
        'arch': '<old-arch>'},
    'new': {
        'version': '<new-version>',
        'arch': '<new-arch>'}}}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.
If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

Returns a dict containing the new package names and versions:

```python
{'<package>': {'old': '<old-version>',
    'new': '<new-version>'}}
```

If an attribute list is specified in diff_attr, the dict will also contain any specified attribute, eg:

```python
{'<package>': {
    'old': {
        'version': '<old-version>',
        'arch': '<old-arch>'},
    'new': {
        'version': '<new-version>',
        'arch': '<new-arch>'}}
```

salt.modules.zypperpkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty dict will be returned for that package.

refresh
force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

root
operate on a different root directory.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.zypperpkg.list_downloaded(root=None, **kwargs)

New in version 2017.7.0.

List prefetched packages downloaded by Zypper in the local disk.

root
operate on a different root directory.
CLI Example:
```
salt '*' pkg.list_downloaded
```

**salt.modules.zypperpkg.list_holds** (*pattern*=`None`, *full*=`True`, *root*=`None`, **kwargs)

New in version 3005.
List information on locked packages.

**Note:** This function returns the computed output of `list_locks` to show exact locked packages.

**pattern**
Regular expression used to match the package name

**full**
[True] Show the full hold definition including version and epoch. Set to False to return just the name of the package(s) being held.

**root**
Operate on a different root directory.

CLI Example:
```
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

**salt.modules.zypperpkg.list_installed_patches** (*root*=`None`, **kwargs)

New in version 2017.7.0.
List installed advisory patches on the system.

**root**
operate on a different root directory.

CLI Examples:
```
salt '*' pkg.list_installed_patches
```

**salt.modules.zypperpkg.list_installed_patterns** (*root*=`None`)
List installed patterns on the system.

**root**
operate on a different root directory.

CLI Examples:
```
salt '*' pkg.list_installed_patterns
```

**salt.modules.zypperpkg.list_locks** (*root*=`None`)
List current package locks.

**root**
operate on a different root directory.

Return a dict containing the locked package with attributes:

```
{'<package>': {'case_sensitive': '<case_sensitive>',
              'match_type': '<match_type>',
              'type': '<type>'}}
```

CLI Example:
salt '*' pkg.list_locks

salt.modules.zypperpkg.list_patches(refresh=False, root=None, **kwargs)

New in version 2017.7.0.
List all known advisory patches from available repos.
refresh
force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.
root
operate on a different root directory.

CLI Examples:
salt '*' pkg.list_patches

salt.modules.zypperpkg.list_patterns(refresh=False, root=None)

List all known patterns from available repos.
refresh
force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.
root
operate on a different root directory.

CLI Examples:
salt '*' pkg.list_patterns

salt.modules.zypperpkg.list_pkgs(versions_as_list=False, root=None, includes=None, **kwargs)

List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

{ '<package_name>': '<version>[,<version>...]'

versions_as_list:
If set to True, the versions are provided as a list
{ '<package_name>': ['<version>', '<version>']

root:
operate on a different root directory.

includes:
List of types of packages to include (package, patch, pattern, product) By default packages are always included

attr:
If a list of package attributes is specified, returned value will contain them in addition to version, eg.:

{ '<package_name>': [{'version': 'version', 'arch': 'arch'}]}

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.
If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

removed:
not supported

purge_desired:
not supported

CLI Example:
salt '.*' pkg.list_pkgs
salt '.*' pkg.list_pkgs attr="version", "arch"
salt '.*' pkg.list_pkgs attr="version", "arch""

salt.modules.zypperpkg.list_products(all=False, refresh=False, root=None)
List all available or installed SUSE products.
- all: List all products available or only installed. Default is False.
- refresh: force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.
- root: operate on a different root directory.
Includes handling for OEM products, which read the OEM productline file and overwrite the release value.

CLI Examples:
salt '.*' pkg.list_products
salt '.*' pkg.list_products all=True

salt.modules.zypperpkg.list_provides(root=None, **kwargs)
New in version 2018.3.0.
List package provides of installed packages as a dict. {'<provided_name>': ['<package_name>', '<package_name>', ...]}
- root: operate on a different root directory.

CLI Examples:
salt '.*' pkg.list_provides

salt.modules.zypperpkg.list_repo_pkgs(*args, **kwargs)
New in version 2017.7.5,2018.3.1.
Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.
This function can be helpful in discovering the version or repo to specify in a pkg.installed state.
The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If byrepo is set to True, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
  'bash': ['4.3-83.3.1',
           '4.3-82.6'],
  'vim': ['7.4.326-12.1']
}
{
  'OSS': {
    'bash': ['4.3-82.6'],
    'vim': ['7.4.326-12.1']
  },
  'OSS Update': {
    'bash': ['4.3-83.3.1']
  }
```
(continues on next page)
fromrepo
    [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.
byrepo
    [False] When True, the return data for each package will be organized by repository.
root
    operate on a different root directory.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
salt '*' pkg.list_repo_pkgs 'python2-*' fromrepo='OSS Updates'
```

```python
salt.modules.zypperpkg.list_repos(root=None, **kwargs)
```
Lists all repos.
root
    operate on a different root directory.

CLI Example:
```
salt '*' pkg.list_repos
```

```python
salt.modules.zypperpkg.list_updates(refresh=True, root=None, **kwargs)
```
This function is an alias of list_upgrades. List all available package upgrades on this system.
refresh
    force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.
root
    operate on a different root directory.

CLI Example:
```
salt '*' pkg.list_upgrades
```

```python
salt.modules.zypperpkg.list_upgrades(refresh=True, root=None, **kwargs)
```
List all available package upgrades on this system.
refresh
    force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.
root
    operate on a different root directory.

CLI Example:
```
salt '*' pkg.list_upgrades
```

```python
salt.modules.zypperpkg.mod_repo(repo, **kwargs)
```
Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:
repo or alias
    alias by which Zypper refers to the repo
url, mirrorlist or baseurl
    the URL for Zypper to reference

enabled
    Enable or disable (True or False) repository, but do not remove if disabled.

name
    This is used as the descriptive name value in the repo file.

refresh
    Enable or disable (True or False) auto-refresh of the repository.

cache
    Enable or disable (True or False) RPM files caching.

gpgcheck
    Enable or disable (True or False) GPG check for this repository.

gpgautoimport
    [False] If set to True, automatically trust and import public GPG key for the repository.

root
    operate on a different root directory.

Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a URL can only be deleted if a mirrorlist is specified (or vice versa).

CLI Examples:

```
salt '*' pkg.mod_repo alias alias=new_alias
salt '*' pkg.mod_repo alias url= mirrorlist=http://host.com/
```

salt.modules.zypperpkg.modified(“packages”, “flags”)
    List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system's RPM database.

    New in version 2015.5.0.

    Filtering by flags (True or False):

    size
        Include only files where size changed.

    mode
        Include only files which file's mode has been changed.

    checksum
        Include only files which MD5 checksum has been changed.

    device
        Include only files which major and minor numbers has been changed.

    symlink
        Include only files which are symbolic link contents.

    owner
        Include only files where owner has been changed.

    group
        Include only files where group has been changed.

    time
        Include only files where modification time of the file has been changed.

    capabilities
        Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

    root
        operate on a different root directory.

CLI Examples:
salt.modules.zypperpkg.normalize_name(name)

Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:

• If the arch is 32 bit and the package name ends in a 32-bit arch.
• If the arch matches the OS arch, or is noarch.

CLI Example:

```
salt '*' pkg.normalize_name zsh.x86_64
```

salt.modules.zypperpkg.owner(*paths, **kwargs)

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

The root parameter can also be passed via the keyword argument.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

salt.modules.zypperpkg.parse_arch(name)

Parse name and architecture from the specified package name.

CLI Example:

```
salt '*' pkg.parse_arch zsh.x86_64
```

salt.modules.zypperpkg.purge(name=None, pkgs=None, root=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the salt-minion service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of False (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a zypper `--remove -u`

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

root

Operate on a different root directory.

New in version 0.16.0.
Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`.refresh_db(force=None, root=None, gpgautoimport=False, **kwargs)`

Trigger a repository refresh by calling `zypper refresh`. Refresh will run with `--force` if the "force=True" flag is passed on the CLI or `refreshdb_force` is set to `true` in the pillar. The CLI option overrides the pillar setting.

It will return a dict:

```
{'<database name>': Bool}
```

- `gpgautoimport`
  - [False] If set to True, automatically trust and import public GPG key for the repository.
    - New in version 3007.0.
- `repos`
  - Refresh just the specified repos
    - New in version 3007.0.
- `root`
  - Operate on a different root directory.

CLI Example:

```
salt '*' pkg.refresh_db [force=true|false]
```

Pillar Example:

```
zypper:
  refreshdb_force: false
```

`.remove(name=None, pkgs=None, root=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any zypper commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of `False` (no quotes).

Remove packages with `zypper -n remove`

```
name
```

- The name of the package to be deleted.

Multiple Package Options:

```
pkgs
```

- A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

```
root
```

- Operate on a different root directory.
  - New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['"foo", "bar"]

Changed in version 3007.0: Can now remove also PTF packages which require a different handling in the backend.

Can now remove also PTF packages which require a different handling in the backend.

salt.modules.zypperpkg.resolve_capabilities(pkgs, refresh=False, root=None, **kwargs)

New in version 2018.3.0.

Convert name provides in pkgs into real package names if resolve_capabilities parameter is set to True. In case of resolve_capabilities is set to False the package list is returned unchanged.

refresh
force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

root
operate on a different root directory.

resolve_capabilities
If this option is set to True the input will be checked if a package with this name exists. If not, this function will search for a package which provides this name. If one is found the output is exchanged with the real package name. In case this option is set to False (Default) the input will be returned unchanged.

CLI Examples:

salt '*' pkg.resolve_capabilities resolve_capabilities=True w3m_ssl

salt.modules.zypperpkg.search(criteria, refresh=False, **kwargs)

List known packages, available to the system.

refresh
force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

match (str)
One of exact, words, substrings. Search for an exact match or for the whole words only. Default to substrings to patch partial words.

provides (bool)
Search for packages which provide the search strings.

recommends (bool)
Search for packages which recommend the search strings.

requires (bool)
Search for packages which require the search strings.

suggests (bool)
Search for packages which suggest the search strings.

conflicts (bool)
Search packages conflicting with search strings.

obsoletes (bool)
Search for packages which obsolete the search strings.

file_list (bool)
Search for a match in the file list of packages.

search_descriptions (bool)
Search also in package summaries and descriptions.

case_sensitive (bool)
Perform case-sensitive search.

installed_only (bool)
Show only installed packages.

26.6. execution modules
not_installed_only (bool)
Show only packages which are not installed.
details (bool)
Show version and repository
root
operate on a different root directory.

CLI Examples:
```
salt '*'
