Windows Changes

pkg Execution Module

Significant changes (PR #43708 & #45390, damon-atkins) have been made to the pkg execution module. Users should test this release against their existing package sls definition files.

- **pkg.list_available** no longer defaults to refreshing the winrepo meta database.
- **pkg.install** without a version parameter no longer upgrades software if the software is already installed. Use `pkg.install version=latest` (or simply use a `pkg.latest` state to get the old behavior.
- **pkg.list_pkgs** now returns multiple versions if software installed more than once.
- **pkg.list_pkgs** now returns Not Found when the version is not found instead of (value not set) which matches the contents of the sls definitions.
- **pkg.remove** will wait up to 3 seconds (normally about a second) to detect changes in the registry after removing software, improving reporting of version changes.
- **pkg.remove** can remove latest software, if latest is defined in sls definition.
- Documentation was update for the execution module to match the style in new versions, some corrections as well.
- All install/remove commands are prefix with cmd.exe shell and cmdmod is called with a command line string instead of a list. Some sls files in saltstack/salt-winrepo-ng expected the commands to be prefixed with cmd.exe (i.e. the use of &).
- Some execution module functions results, now behave more like their Unix/Linux versions.
**cmd Execution Module**

Due to a difference in how Python's `subprocess.Popen()` spawns processes on Windows, passing the command as a list of arguments can result in problems. This is because Windows' `CreateProcess` requires the command to be passed as a single string. Therefore, `subprocess` will attempt to re-assemble the list of arguments into a string. Some escaped characters and quotes can cause the resulting string to be incorrectly-assembled, resulting in a failure to execute the command.

Salt now deals with these cases by joining the list of arguments correctly and ensuring that the command is passed to `subprocess.Popen()` as a string.

31.2.78 Salt 2016.3.0 Release Notes - Codename Boron

Known Issues

Warning: Some Salt Masters may need to apply a patch for Default Job Cache to prevent a possible crash

An issue exists that prevents the Salt master from cleaning the default job cache. This issue can cause an over-consumption of resources resulting in a crash. 2016.3.0 Salt masters should apply the patch in PR #33555. This issue will be addressed in 2016.3.1.

- issue #33516: When upgrading from 2015.8.10 to 2016.3.0 on centos7/redhat7 salt-minion must be restarted twice.
- issue #33517: SPM does not work on amazon linux 2015 in 2016.3.0.

Backwards-incompatible Changes

- The default path for the `extension_modules` master config option has been changed. Prior to this release, the location was a directory named `extmods` in the Salt cachedir. On most platforms, this would put the `extension_modules` directory in `/var/cache/salt/extmods`. It has been moved one directory down, into the master cachedir. On most platforms, this is `/var/cache/salt/master/extmods`. Most users won’t have to worry about this, but those who have been manually placing custom runners into `/var/cache/salt/extmods/runners`, or outputters into `/var/cache/salt/extmods/output`, etc. will be affected by this. To transition, it is recommended not to simply move the extmods directory into `/var/cache/salt/master`, but to copy the custom modules into the salt fileserver under `salt:///_runners`, `salt:///_output`, etc. and sync them using the functions in the new `saltutil runner`.
- The `pkg.check_db` function has been removed for yum/dnf.

Core Changes

- The `onchanges` requisite now fires if any watched state changes. issue #19592.
- The `ext_pillar` functions must now accept a minion ID as the first argument. This stops the deprecation path started in Salt 0.17.x. Before this minion ID first argument was introduced, the minion ID could be retrieved accessing `__opts__['id']` losing the reference to the master ID initially set in opts. This is no longer the case, `__opts__['id']` will be kept as the master ID.
- Custom types can now be synced to the master using the new `saltutil runner`. Before, these needed to manually be placed under the `extension_modules` directory. This allows custom modules to easily be synced to the master to make them available when compiling Pillar data. Just place custom runners into `salt:///_runners`, custom outputters into `salt:///_output`, etc. and use the functions from the `saltutil runner` to sync them.
- The `client_acl` configuration options were renamed to `publisher_acl`.
- Added a new `--config-dump` option (issue #26639).
- TCP Transport presence events were updated to work with a NAT (PR #30629).
• A `minion_pillar_cache` setting was added to save rendered pillar data to cachedir for later use when `file_client` is set to local (PR #30428).

• Added the ability for binary data (such as a license key) to be distributed via pillar using the `file.managed` (issue #9569).

• Scheduled jobs now include `success` and `retcode` (issue #24237).

• The `saltversioninfo` grain was changed from a string to a list to enable reading values by index. (PR #30082).

• A `pillar_merge_lists` option was added to enable recursively merging pillar lists by aggregating them instead of replacing them (PR #30062).

• Grain values reported by Debian 8 (jessie) when lsb-release is installed were updated for consistency (PR #28649).

• A new option for minions called `master_tries` has been added. This specifies the number of times a minion should attempt to contact a master to attempt a connection. This allows better handling of occasional master downtime in a multi-master topology.

• The default directory for deploying the salt-thin tarball has changed for salt-ssh. It is now `/var/tmp` instead of `/tmp`. Users may also wish to delete any directories in `/tmp` ending with `_salt/` (issue #32771).

**External Module Packaging**

Modules may now be packaged via entry-points in setuptools. See external module packaging tutorial for more information.

**Cloud Changes**

• Refactored the OpenNebula driver and added numerous `--function` and `--action` commands to enhance Salt support for image, template, security group, virtual network and virtual machine management in OpenNebula.

• Added execution/state modules to support the deployment of AWS cognito identity pools (PR #31094).

• Added ability to set tags and listener policies on a AWS ELB (PR #27552).

**Platform Changes**

• Renamed modules related to macOS. The following module filenames were changed. The virtual name remained unchanged.

  PR ##30558: renamed osxdesktop.py to mac_desktop.py
  PR ##30557: renamed macports.py to mac_ports.py
  PR ##30556: renamed darwin_sysctl.py to mac_sysctl.py
  PR ##30555: renamed brew.py to mac_brew.py
  PR ##30552: renamed darwin_pkgutil.py to mac_pkgutil.py
Package Support

- Ubuntu Xenial: Packages for Ubuntu Xenial (16.04) are available for 2016.3.0 and onwards. See [repo.saltstack.com](http://repo.saltstack.com) for more information. Note that Xenial comes with Debian’s packaged version of Salt 2015.8.8 and official repo.saltstack.com packages are available for 2015.8 releases beginning with Salt 2015.8.11.

Proxy Minion Changes

The deprecated config option `enumerate_proxy_minions` has been removed.

As mentioned in earlier documentation, the `add_proxymodule_to_opts` configuration variable defaults to `False` in this release. This means if you have proxymodules or other code looking in `__opts__['proxymodule']` you will need to set this variable in your `/etc/salt/proxy` file, or modify your code to use the `__proxy__` injected variable.

The `__proxyenabled__` directive now only applies to grains and proxy modules themselves. Standard execution modules and state modules are not prevented from loading for proxy minions.

Support has been added to Salt’s loader allowing custom proxymodules to be placed in `salt://_proxy`. Proxy minions that need these modules will need to be restarted to pick up any changes. A corresponding utility function, `saltutil.sync_proxymodules`, has been added to sync these modules to minions.

Enhancements in grains processing have made the `__proxyenabled__` directive somewhat redundant in dynamic grains code. It is still required, but best practices for the `__virtual__` function in grains files have changed. It is now recommended that the `__virtual__` functions check to make sure they are being loaded for the correct proxtotype, example below:

```python
def __virtual__()
    
    Only work on proxy
    
    try:
        if salt.utils.is_proxy() and __opts__['proxy']['proxytype'] == "ssh_sample":
            return __virtualname__
        except KeyError:
            pass

    return False
```

Note: `salt.utils.is_proxy()` has been renamed to `salt.utils.platform.is_proxy` as of the Oxygen release.

The try/except block above exists because grains are processed very early in the proxy minion startup process, sometimes earlier than the proxy key in the `__opts__` dictionary is populated.

Grains are loaded so early in startup that no dunder dictionaries are present, so `__proxy__`, `__salt__`, etc. are not available. Custom grains located in `/srv/salt/_grains` and in the salt install grains directory can now take a single argument, `proxy`, that is identical to `__proxy__`. This enables patterns like

```python
def get_ip(proxy):
    
    Ask the remote device what IP it has
    
    return {"ip": proxy["proxymodulename.get_ip"]()}
```
Then the grain ip will contain the result of calling the get_ip() function in the proxymodule called proxymodulename.

Proxy modules now benefit from including a function called initialized(). This function should return True if the proxy’s init() function has been successfully called. This is needed to make grains processing easier.

Finally, if there is a function called grains in the proxymodule, it will be executed on proxy-minion startup and its contents will be merged with the rest of the proxy’s grains. Since older proxy-minions might have used other methods to call such a function and add its results to grains, this is config-gated by a new proxy configuration option called proxy_merge_grains_in_module. This defaults to False in this release. It will default to True in the release after next. The next release is codenamed Carbon, the following is Nitrogen.

The example proxy minions rest_sample and ssh_sample have been updated to reflect these changes.

Syndic Updates

A major performance and management issue was found and fixed in the syndic. This makes the Salt Syndic substantially more reliable and performant. Please make sure that the syndic and the master of masters which syndics attach to are updated, otherwise the syndic fixes alone can cause minor performance issues with older master of masters. Please update masters first, then syndics. Minions do not need to be updated for this fix to work.

Module Changes

- **file execution module:** show_diff is deprecated in favor of show_changes. (PR #30988)
- **reg execution module:**
  - Removed the following deprecated functions from the reg module (PR #30956):
    - read_key
    - set_key
    - create_key
    - delete_key
  - Removed force parameter from reg state module
  - Fixed virtual function in state
  - Improved error information for reg.delete_value function
- **jboss7 execution module:** deployed function was decoupled from Artifactory by removing Artifactory-specific functionality. Note that the changes in some of the function arguments break existing state files, see issue #30515 and PR #3080 for details.
- **pkg state module:** The wait function was removed, the functionality was replaced with the onchanges requisite (PR #30297).
- **firewalld state module:** A permanent argument was added add_port. Note that permanent defaults to True, which changes previous behavior (PR #30275). A bind function was also added that allows binding zones to interfaces and sources (PR #29497).
- **journald beacon module:** The event string was updated to include a tag. Note this might impact existing reactors based on this beacon. (PR #30116).
- **postgres_privileges state module:** The default value of the prepend argument was changed from None to public.
- **zenoss execution module:** The add_device function was updated with a default value of 1000 for prod_state to match the documentation (PR #28924).
• The etcd execution module, state module, returner module, and util module were refactor (PR #28599). This refactor changes error returns for several functions (primarily edge cases):
  – get: Used to return " on key-not-found. Now returns None.
  – set: Used to return " on issues setting keys. Now returns None.
  – ls: Used to return [path: {}] on key-not-found. Now returns None.
  – Tree: Used to return {} on key-not-found. Now returns None.
• smartos_virt execution module: Updated to use most of the new smartos_vmadm (PR #28284).
• apache_conf state module, apache_module state module, and apache_site state module: the enable and disable functions were renamed to enabled and disabled, respectively. In PR #33562, these functions were readded and properly deprecated and will be removed in Salt 2017.7.0. This fix will be available in 2016.3.1. As a workaround, try

```
apache_module.enable{{{ 'd' if grains.saltversioninfo == [2016, 3, 0] else '' }}
```

New Features

Thorium - Provisional New Reactor

The 2016.3 release introduces the new Thorium Reactor. This reactor is an experimental new feature that implements a flow programming interface using the salt state system as the engine. This means that the Thorium reactor uses a classic state tree approach to create a reactor that can aggregate event data from multiple sources and make aggregate decisions about executing reactions.

This feature is both experimental and provisional, it may be removed and APIs may be changed. This system should be considered as ambitious as the Salt State System in that the scope of adding a programmable logic engine of this scale into the event systems is non trivial.

See Thorium Complex Reactor.

Improved Mac OS Support

Improved Solaris Support

A lot of work was done to improve support for SmartOS. This work also resulted in improvements for Solaris and illumos as SmartOS.

• rewrite of vmadm module (SmartOS)
• rewrite of imgadm module (SmartOS)
• depreciation of virt module in favor of vmadm (SmartOS)
• implemented smartos state (SmartOS)
• improved zpool module add SmartOS, illumos and Solaris support
• improved zfs module add SmartOS, illumos and Solaris support
• implemented zpool state
• implemented zfs state implemented solaris_system system module to provide better Solaris support (PR #30519)
• other minor fixes to grains, localmod, ...
Tornado Transport

Important: The Tornado Transport wire protocol was changed in 2016.3, making it incompatible with 2015.8 (PR #29339).

Windows DSC Integration (Experiemental)

Dimension Data Cloud Support

A SaltStack Cloud driver for Dimension Data Public Cloud, provides the driver functionality to service automation for any of the Dimension Data Public Cloud locations:

- Deploy new virtual machines
- List and query virtual machine images
- Destroy and query virtual machines

Documentation of the Dimension Data SaltStack integration is found on developer.dimensiondata.com

Minion Blackout

During a blackout, minions will not execute any remote execution commands, except for saltutil.refresh_pillar. Blackouts are enabled using a special pillar key, minion_blackout set to True.

See Minion Blackout.

Splunk Returner

A Splunk Returner that uses HTTP Event Collector is now available (PR #30718).

SQLCipher Pillar Module

Support was added for retrieving pillar data via queries to SQLCipher databases (PR #29782).

31.2.79 Salt 2016.3.1 Release Notes

Version 2016.3.1 is a bugfix release for 2016.3.0.

Statistics

• Total Merges: 87
• Total Issue References: 23
• Total PR References: 58
• Contributors: 25 (abednarik, amontalban, anlutro, habilen, cachedout, clburlison, danslimmon, eliasp, glomium, jacobhammons, jfindlay, kev009, lomeroe, michalsuba, neil-williamson, onorua, opdude, rallytime, sjorge, terminalmage, thatch45, ticosax, tomlaredo, twangboy, zigarn)

Final Release of Debian 7 Packages

Regular security support for Debian 7 ended on April 25th, 2016. As a result, 2016.3.1 and 2015.8.10 will be the last Salt releases for which Debian 7 packages are created.

- Total PR References: 115
- Contributors: 36 (The-Loeki, abednarik, cachedout, cro, deniszh, dkruger, dmurphy18, eliasp, farcaller, galet, gtmanfred, hu-dabao, isbm, jacobhammons, jacobweinstock, jfindlay, justinta, kstreee, lubyou, markuskramer, meaksh, mihael, mzupan, nishigori, rallytime, s0undt3ch, skizunov, tankywoo, terminalmage, thatch45, theredcat, ticosax, tonybaloney, twangboy, vutny, whiteinge)

Known Issues

issue #36055: Salt Cloud events (salt/cloud) are not generated on the master event bus when provisioning cloud systems.

Bootstrap Issue #973: python-futures is not installed when installing from a git tag on RedHat-based distributions. Python futures is needed when running Salt with the TCP transport. This is fixed on the develop branch of the salt-bootstrap repo and the fix will be included in the upcoming release of salt-bootstrap, but is a bug in the bootstrap release that ships with this version of Salt. Please see the salt-bootstrap repo for more information on how to update your bootstrap version.

Known Issues

The Salt Minion does not clean up files in /tmp when rendering templates. This potentially results in either running out of disk space or running out of inodes. Please see issue #37541 for more information. This bug was fixed with PR #37540, which will be available in the 2016.3.5 release of Salt.

The release of the bootstrap-salt.sh script that is included with 2016.3.4 release has a bug in it that fails to install salt correctly for git installs using tags in the 2015.5 branch. This bug has not been fixed in the salt-bootstrap repository yet, but the previous bootstrap release (v2016.08.16) does not contain this bug.

Changes

- The disk.wipe execution module function has been modified so that it correctly wipes a disk.
- Add ability to clone from a snapshot to the VMWare salt-cloud driver.
- Add ability to specify disk backing mode in the VMWare salt cloud profile.

Security Fixes

CVE-2017-5192 local_batch client external authentication not respected

The LocalClient.cmd_batch() method client does not accept external_auth credentials and so access to it from salt-api has been removed for now. This vulnerability allows code execution for already-authenticated users and is only in effect when running salt-api as the root user.

CVE-2017-5200 Salt-api allows arbitrary command execution on a salt-master via Salt’s ssh_client

Users of Salt-API and salt-ssh could execute a command on the salt master via a hole when both systems were enabled.

We recommend everyone on the 2016.3 branch upgrade to a patched release as soon as possible.

Improved Checksum Handling in file.managed, archive.extracted States

When the source_hash argument for these states refers to a file containing checksums, Salt now looks for checksums matching the name of the source URI, as well as the file being managed. Prior releases only looked for checksums matching the filename being managed. Additionally, a new argument (source_hash_name) has been added, which allows the user to disambiguate ambiguous matches when more than one matching checksum is found in the source_hash file.

A more detailed explanation of this functionality can be found in the file.managed documentation, in the section for the new source_hash_name argument.

31.2.85 Salt 2016.3.7 Release Notes

Version 2016.3.7 is a bugfix release for 2016.3.0.

Security Fix

CVE-2017-12791 Maliciously crafted minion IDs can cause unwanted directory traversals on the Salt-master

This release corrects a flaw in minion ID validation which could allow certain minions to authenticate to a master despite not having the correct credentials. To exploit the vulnerability, an attacker must create a salt-minion with an ID containing characters that will cause a directory traversal. Credit for discovering the security flaw goes to: Vernhk@qq.com

- dc649ded51 Add clean_id function to salt.utils.verify.py
31.2.86 Salt 2016.3.8 Release Notes

Version 2016.3.8 is a bugfix release for 2016.3.0.

Security Fix

CVE-2017-14695 Directory traversal vulnerability in minion id validation in SaltStack. Allows remote minions with incorrect credentials to authenticate to a master via a crafted minion ID. Credit for discovering the security flaw goes to: Julian Brost (julian@0x4a42.net)

CVE-2017-14696 Remote Denial of Service with a specially crafted authentication request. Credit for discovering the security flaw goes to: Julian Brost (julian@0x4a42.net)

31.2.87 Salt 2016.3.9 Release Notes

Version 2016.3.9 is a bugfix release for 2016.3.0.

Master Changes

The following options have been added to the master config file:

- `allow_minion_key_revoke` - This option controls whether a minion can request that the master revoke its key. When True, a minion can request a key revocation and the master will comply. If it is False, the key will not be revoked by the master.

- `require_minion_sign_messages` - This requires that minions cryptographically sign the messages they publish to the master. If minions are not signing, then log this information at loglevel INFO and drop the message without acting on it.

- `drop_messages_signature_fail` - Drop messages from minions when their signatures do not validate. Note that when this option is False but `require_minion_sign_messages` is True, minions MUST sign their messages, but the validity of their signatures is ignored.

- `minion_sign_messages` - Causes the minion to cryptographically sign the payload of messages it places on the event bus for the master. The payloads are signed with the minion's private key so the master can verify the signature with its public key.

- #25257: (notpeter) Document SourceDestCheck added in #25242.
The 2015.8.0 feature release of Salt contains several major new features. As usual the release notes are not exhaustive and primarily include the most notable additions and improvements. Hundreds of bugs have been fixed and many modules have been substantially updated and added.

New SaltStack Installation Repositories

SaltStack now provides installation repositories for several platforms, with more to come. For instructions, see: repo.saltstack.com.
Send Event on State Completion

A `fire_event` global state keyword argument was added that allows any state to send an event upon completion. Useful for custom progress bars and checking in on long state runs. See `fire_event`.

ZeroMQ socket monitoring

If `zmq_monitor` is enabled, log all ZMQ events for socket monitoring purposes. Verbose, but useful.

SPM (Salt Package Manager)

Allows Salt formulas to be packaged for ease of deployment. See `spm`.

Note: The spm executable was not included in the Debian or Ubuntu packages for the 2015.8.0 or the 2015.8.1 releases. This executable will be included in an upcoming release. As a workaround, copy the SPM script from the salt library installation into `/usr/local/bin` or your local equivalent.

Specify a Single Environment for Top Files

A new `default_top` option was added to load the state top file from a single, specific environment, rather than merging top data across all environments. Additionally, new `top_file_merge_strategy` and `env_order` options were added for more control over top file merging. See The Top File.

Tornado TCP Transport

Implemented a pure-TCP transport, in addition to ZeroMQ and RAET. The new transport uses Tornado, which allows Salt to use a standardized set of libraries for asynchronous behavior, which should greatly improve reliability and performance.

Note: Tornado is considered experimental in this release. The following known issues were being investigated at the time of release:

- TCP tests show performance degradation over time ([issue #26051](#))
- TCP transport stacktrace on windows minion: Future exception was never retrieved ([issue #25718](#))
- [freebsd] TCP transport not working in 2015.8.0rc3 ([issue #26364](#))

Proxy Minion Enhancements

Proxy Minions have undergone a significant overhaul in 2015.8, see Proxy Minion Enhancements.
Engines

Salt engines are long-running, external processes that leverage Salt. See Salt Engines.

Core Changes

- Add system version info to versions_report, which appears in both salt --versions-report and salt '*' test.versions_report. Also added is an alias test.versions to test.versions_report. (issue #21906)
- Add colorized console logging support. This is activated by using %(colorlevel)s, %(colormessage)s, %(colorprocess)s, and %(colormsg)s in log_fmt_console in the config file for any of salt-master, salt-minion, and salt-cloud.

Git Pillar

The git external pillar has been rewritten to bring it up to feature parity with gitfs. Support for pygit2 has been added, bringing with it the ability to access authenticated repositories.

Using the new features will require updates to the git ext_pillar configuration, further details can be found in the pillar.git_pillar docs.

Salt Cloud Improvements

- Pricing data from several cloud providers (GCE, DigitalOcean, SoftLayer_HW, EC2)
- All cloud providers now use standardized bootstrapping code.
- Modified the Linode Salt Cloud driver to use Linode’s native API instead of depending on apache-libcloud or linode-python.

Salt Cloud Changes

- Changed the default behavior of rename_on_destroy to be set to True in the EC2 and AWS drivers.
- Changed the default behavior of the EC2 and AWS drivers to always check for duplicate names of VMs before trying to create a new VM. Will now throw an error similarly to other salt-cloud drivers when trying to create a VM of the same name, even if the VM is in the terminated state.
- When querying for VMs in digital_ocean.py, the number of VMs to include in a page was changed from 20 (default) to 200 to reduce the number of API calls to Digital Ocean.Ocean.

State and Execution Module Improvements

- New and improved Docker state and execution modules (state and execution module).
Git State and Execution Modules Rewritten

The git state and execution modules have gone through an extensive overhaul.

Changes in the `git.latest` State

- The `branch` argument has been added, allowing for a custom branch name to be used in the local checkout maintained by the `git.latest` state. This can be helpful in avoiding ambiguous refs in the local checkout when a tag is used as the `rev` argument. If no `branch` is specified, then the state uses the value of `rev` as the branch name.
- The `always_fetch` argument no longer has any effect, and will be removed in a future release. The state now detects whether or not a fetch is needed based on comparisons made between the local and remote repositories.
- The `force_fetch` argument has been added to force a fetch if the fetch is not a fast-forward (for instance, if someone has done a reset and force-pushed to the remote repository).
- The `remote_name` argument has been deprecated and renamed to `remote`.
- The `force` argument has been deprecated and renamed to `force_clone` to reduce ambiguity with the other "force" arguments.
- Using SHA1 hashes (full or shortened) in the `rev` argument is now properly supported.
- Non-fast-forward merges are now detected before the repository is updated, and the state will not update the repository if the change is not a fast-forward. Non-fast-forward updates must be overridden with the `force_reset` argument. If `force_reset` is set to `True`, the state will only reset the repository if it cannot be fast-forwarded. This is in contrast to the earlier behavior, in which a hard-reset would be performed every time the state was run if `force_reset` was set to `True`.
- A `git pull` is no longer performed by this state, dropped in favor of a fetch-and-merge (or fetch-and-reset) workflow.

`git.config_unset` state added

This state allows for configuration values (or entire keys) to be unset. See here for more information and example SLS.

`git.config` State Renamed to `git.config_set`

To reduce confusion after the addition of `git.config_unset`, the `git.config` state has been renamed to `git.config_set`. The old `config.get` name will still work for a couple releases, allowing time for SLS files to be updated.

In addition, this state now supports managing multivar git configuration values. See here for more information and example SLS.
Initial Support for Git Worktrees in Execution Module

Several functions have been added to the execution module to manage worktrees (a feature new to Git 2.5.0). State support does not exist yet, but will follow soon.

New Functions in Git Execution Module

- `git.config_get_regexp`
- `git.config_unset`
- `git.is_worktree`
- `git.list_branches`
- `git.list_tags`
- `git.list_worktrees`
- `git.merge_base`
- `git.merge_tree`
- `git.rev_parse`
- `git.version`
- `git.worktree_rm`
- `git.worktree_add`
- `git.worktree_prune`

Changes to Functions in Git Execution Module

**git.add**

- `--verbose` is now implied when running the `git add` command, to provide a list of the files added in the return data.

**git.archive**

- Now returns `True` when the `git archive` command was successful, and otherwise raises an error.
- The `overwrite` argument has been added to prevent an existing archive from being overwritten by this function.
- The `fmt` argument has been deprecated and renamed to `format`.
- Trailing slash no longer implied in `prefix` argument, must be included if this argument is passed.
**git.checkout**

- The `rev` argument is now optional when using `-b` or `-B` in `opts`, allowing for a branch to be created (or reset) using HEAD as the starting point.

**git.clone**

- The `name` argument has been added to specify the name of the directory in which to clone the repository. If this option is specified, then the clone will be made within the directory specified by the `cwd`, instead of at that location.
- The `repository` argument has been deprecated and renamed to `url`.

**git.config_get**

- The `setting_name` argument has been deprecated and renamed to `key`.
- The `global` argument has been added, to query the global git configuration.
- The `all` argument has been added to return a list of all values for the specified key, allowing for all values in a multivar to be returned.
- The `cwd` argument is now optional if `global` is set to `True`.

**git.config_set**

- The value(s) of the key being set are now returned.
- The `setting_name` argument has been deprecated and renamed to `key`.
- The `setting_value` argument has been deprecated and renamed to `value`.
- The `is_global` argument has been deprecated and renamed to `global`.
- The `multivar` argument has been added to specify a list of values to set for the specified key. The `value` argument is not compatible with `multivar`.
- The `add` argument has been added to add a value to a key (this essentially just adds an `--add` to the `git config` command that is run to set the value).

**git.fetch**

- The `force` argument has been added to force the fetch when it is not a fast-forward. This could have been achieved in previous Salt versions by including `--force` in the `opts` argument, this argument is just for convenience and to match the usage of other functions with `force` arguments.
- The `refsspecs` argument has been added to allow for one or more refspecs to be provided which override the one(s) specified by the `remote.remote_name.fetch` git configuration option.
**git.ls_remote**

- The `repository` argument has been deprecated and renamed to `remote`.
- The `branch` argument has been deprecated and renamed to `ref`.
- The `opts` argument has been added to allow for additional CLI options to be passed to the `git ls-remote` command.

**git.merge**

- The `branch` argument has been deprecated and renamed to `rev`.

**git.status**

- Return data has been changed from a list of lists to a dictionary containing lists of files in the modified, added, deleted, and untracked states.

**git.submodule**

- Added the `command` argument to allow for operations other than `update` to be run on submodules, and deprecated the `init` argument. To do a submodule update with `init=True` moving forward, use `command=update opts='--init'`.
- OpenStack Glance API V2 execution module
- Amazon VPC state module
- RallyDev execution module
- BambooHR execution module
- Stormpath execution, state modules
- Remove unused argument `timeout` in `jboss7.status`.
- Deprecate `enabled` argument in `pkgrepo.managed` in favor of `disabled`.
- Archive module changes: In the `archive.tar` and `archive.cmd_unzip` module functions, remove the arbitrary prefixing of the options string with `-`. An options string beginning with a `--long-option`, would have uncharacteristically needed its first `-` removed under the former scheme. Also, tar will parse its options differently if short options are used with or without a preceding `-`, so it is better to not confuse the user into thinking they're using the non-`-` format, when really they are using the with-`-` format.
- Added `__state__` to state modules, for cross-calling states. This enables using existing states when writing custom states. See `cross calling states`.
Windows Improvements

- Enhanced the windows minion silent installation with command line parameters to configure the salt master and minion name.
- Improved user management with additional capabilities in the user module for Windows.
- Improved patch management with a new module for managing windows updates (win_wua).
- Turned on multi-processing by default for windows in minion configuration.

Windows Software Repo Changes

A next-generation (ng) windows software repo is available for 2015.8.0 and later minions. When using this new repository, the repo cache is compiled on the Salt Minion, which enables pillar, grains and other things to be available during compilation time.

See the Windows Software Repository documentation for more information.

Changes to legacy Windows repository

If you have pre 2015.8 Windows minions connecting to your 2015.8 Salt master, you can continue to use the legacy Windows repository for these Salt minions.

If you were previously using this repository and have customized settings, be aware that several config options have been renamed to make their naming more consistent.

See the Windows Software Repository documentation for more information.

Win System Module

The unit of the timeout parameter in the system.halt, system.poweroff, system.reboot, and system.shutdown functions has been changed from seconds to minutes in order to be consistent with the linux timeout setting. (issue #24411) Optionally, the unit can be reverted to seconds by specifying in_seconds=True.

Other Improvements

- Sanitize sensitive fields in http.query
- Allow authorization to be read from Django and eauth
- Add templating to SMTP returner
- New REST module for SDB
- Added rest_timeout config option and timeout argument to jobs api call
- Provide config options for Raet lane and road buffer count. (Useful for BSD kernels)
- Implemented ZeroMQ socket monitor for master and minion
- Add end time to master job cache for jobs (optional, off by default)
- Tornado is now the default backend for http.request
- Support pillarenv selection as it's done for saltenv
- salt was updated to use python-crypto version 2.6.1, which removes the dependency on python-m2crypto.
Deprecations

- The `digital_ocean.py` Salt Cloud driver was removed in favor of the `digital_ocean_v2.py` driver as DigitalOcean has removed support for APIv1. The `digital_ocean_v2.py` was renamed to `digital_ocean.py` and supports DigitalOcean's APIv2.
- The `vsphere.py` Salt Cloud driver has been deprecated in favor of the `vmware.py` driver.
- The `openstack.py` Salt Cloud driver has been deprecated in favor of the `nova.py` driver.
- The use of `provider` in Salt Cloud provider files to define cloud drivers has been deprecated in favor of using `driver`. Both terms will work until the 2017.7.0 release of Salt. Example provider file:

```
my-ec2-cloud-config:
  id: 'HJGRYCILJLKJYG'
  key: 'kdjgfsym;woorgml/aserigksjdhasdfgn'
  private_key: /etc/salt/my_test_key.pem
  keyname: my_test_key
  securitygroup: default
  driver: ec2
```

- The use of `lock` has been deprecated and from `salt.utils.fopen`, `salt.utils.flopen` should be used instead.
- The following args have been deprecated from the `rabbitmq_vhost.present` state: `user`, `owner`, `conf`, `write`, `read`, and `runas`.
- The use of `runas` has been deprecated from the `rabbitmq_vhost.absent` state.
- Support for output in `mine.get` was removed. `--out` should be used instead.
- The use of `delim` was removed from the following functions in the `match` execution module: `pillar_pcre`, `pillar`, `grain_pcre`.

Security Fixes

CVE-2015-6918 - Git modules leaking HTTPS auth credentials to debug log

Updated the Git state and execution modules to no longer display HTTPS basic authentication credentials in log level debug output on the Salt master. These credentials are now replaced with REDACTED in the debug output. Thanks to Andreas Stieger <asteiger@suse.com> for bringing this to our attention.

Major Bug Fixes

- Fixed minion failover to next master on DNS errors (issue #21082)
- Fixed memory consumption in SaltEvents (issue #25557)
- Don't lookup outside system path in which() util (issue #24085)
- Fixed broken jobs rest api call (issue #23408)
- Fixed stale grains data using in modules (issue #24073)
- Added ssh_identities_only config flag for ssh-agent configured environments (issue #24096)
- Fixed "object has no attribute" errors for Raet transport (issue #21640)
- Flush event returners before master exit (issue #22814)
- Fix CommandExecutionError in grains generation with lspci missing (issue #23342)
• Fix salt-ssh against CentOS 7 when python-zmq not installed (issue #23503)
• Fix salt-ssh issues related to out-of-date six module (issue #20949)
• Fix salt-ssh thin generation after previous run was interrupted (issue #24376)
• Use proper line endings on Windows with "file.managed" w/contents (issue #25675)
• Fixed broken comment/uncomment functions in file.py (issue #24620)
• Fixed problem with unicode when changing computer description (issue #12255)
• Fixed problem with chocolatey module not loading (issue #25717)
• Fixed problem adding users to groups with spaces in the name (issue #25144)
• Fixed problem adding full name to user account (issue #25206)
• Fixed gem module stack trace (issue #21041)
• Fixed problem with file.managed when test=True (issue #20441)
• Fixed problem with powershell hanging while waiting for user input (issue #13943)
• Fixed problem where the salt-minion service would not consistently start (issue #25272)
• Fixed problem where pkg.refresh_db would return True even when winrepo.p was not found (issue #18919)
• Could someone please provide end to end example for Proxy Minion with REST (issue #25500)
• Proxy minions stopped working between 2014.7 and 2015.5 (issue #25053)
• Proxy minion documentation includes outdated code sample (issue #24018)
• Proxy Minion documentation missing grains example (issue #18273)
• Improve process management in proxy minion (issue #12024)
• Proxy minion never comes up with message 'I am XXX and I am not supposed to start any proxies.' (issue #25908)
• Fixed an issue that caused an exception when using Salt mine from pillar. (issue #11509)

**31.2.89 Salt 2015.8.1 Release Notes**

Security Fixes

CVE-2015-6941 The Windows user module and salt-cloud display passwords in log when log level is set to debug or more verbose.

For the Windows user module, the password is now replaced with the string XXX-REDACTED-XXX.

For salt-cloud, debug logging no longer displays win_password and sudo_password authentication credentials.

CVE-2015-6918 Git state/execution modules log HTTPS auth credentials when log level is set to debug or more verbose.

These credentials are now replaced with REDACTED in the debug output. Thanks to Andreas Stieger <asteiger@suse.com> for bringing this to our attention.

Major Bug Fixes

• Add support for spm.d/* .conf configuration of SPM (issue #27010)
• Fix proxy grains breakage for non-proxy minions (issue #27039)
• Fix global key management for git state
• Fix passing http auth to util.http from state.file (issue #21917)
• Fix multiprocessing: True in windows (on by default)
• Add pkg.info to pkg modules
• Fix name of serial grain (this was accidentally renamed in 2015.8.0)
• Merge config values from master.d/minion.d conf files (rather than flat update)
• Clean grains cache on grains sync (issue #19853)
• Remove streamed response for fileclient to avoid HTTP redirection problems (issue #27093)
• Fixed incorrect warning about osrelease grain (issue #27065)
• Fix authentication via Salt-API with tokens (issue #27270)
• Fix winrepo downloads from https locations (issue #27081)
• Fix potential error with salt-call as non-root user (issue #26889)
• Fix global minion provider overrides (issue #27209)
• Fix backward compatibility issues for pecl modules
• Fix Windows uninstaller to only remove ./bin, salt*, nssm.exe, uninst.exe (issue #27383)
• Fix misc issues with mongo returner.
• Add sudo option to cloud config files (issue #27398)
• Fix regression in RunnerClient argument handling (issue #25107)
• Fix dockerng.running replacing creation hostconfig with runtime hostconfig (issue #27265)
• Fix dockerng.running replacing creation hostconfig with runtime hostconfig (issue #27265)
• Increased performance on boto asg/elb states due to __states__ integration
• Windows minion no longer requires powershell to restart (issue #26629)
• Fix x509 module to support recent versions of OpenSSL (issue #27326)
Some issues with proxy minions were corrected.

Known Issues

Proxy minions currently cannot execute a highstate because of the way the proxymodule is being loaded internally. This will be fixed in a future release.

31.2.90 Salt 2015.8.10 Release Notes

Version 2015.8.10 is a bugfix release for 2015.8.0.

This release includes fixes for two issues discovered in 2015.8.9:

- Pip state broken in 2015.8.9 with pip <6.0 (issue #33376)
- Fix traceback in logging for config validation (PR #33386)

Final Release of Debian 7 Packages

Regular security support for Debian 7 ended on April 25th 2016. As a result, 2016.3.1 and 2015.8.10 will be the last Salt releases for which Debian 7 packages are created.

Important Post-Upgrade Instructions for Linux Mint

As a result of some upstream changes, the os grain on Mint Linux is now being detected as LinuxMint (issue #33295). Run the following command after you upgrade to 2015.8.10 to reset the os grain to Mint and the os_family grain to Debian:

```
salt -G 'os:LinuxMint' grains.setvals "{'os': 'Mint', 'os_family': 'Debian'}"
```

Ubuntu 16.04 Packages

SaltStack is now providing official Salt 2015.8 packages for Ubuntu 16.04.

Returner Changes

- Any returner which implements a `save_load` function is now required to accept a `minions` keyword argument. All returners which ship with Salt have been modified to do so.

New Master Configuration Parameter

- `rotate_aes_key` - if `True`, causes Salt to generate a new AES key whenever a minion key is deleted. This eliminates the chance that a deleted minion could continue to eavesdrop on communications with the master if it continues to run after its key is deleted.

31.2.93 Salt 2015.8.13 Release Notes

Version 2015.8.13 is a bugfix release for 2015.8.0.

Security Fixes

CVE-2017-5192 local_batch client external authentication not respected

The LocalClient.cmd_batch() method client does not accept external_auth credentials and so access to it from salt-api has been removed for now. This vulnerability allows code execution for already-authenticated users and is only in effect when running salt-api as the root user.

CVE-2017-5200 Salt-api allows arbitrary command execution on a salt-master via Salt's ssh_client

Users of Salt-API and salt-ssh could execute a command on the salt master via a hole when both systems were enabled.

We recommend everyone on the 2015.8 branch upgrade to a patched release as soon as possible.

31.2.94 Salt 2015.8.2 Release Notes

Version 2015.8.2 is a bugfix release for 2015.8.0.

Security Fix

CVE-2015-8034 Saving state.sls cache data to disk with insecure permissions

This affects users of the state.sls function. The state run cache on the minion was being created with incorrect permissions. This file could potentially contain sensitive data that was inserted via jinja into the state SLS files. The permissions for this file are now being set correctly. Thanks to zmalone for bringing this issue to our attention.

### 31.2.96 Salt 2015.8.4 Release Notes

Version 2015.8.4 is a bugfix release for 2015.8.0.

**Known Issues**

- *in requisites (issue #30820)

  This issue affects all users targeting an explicit `- name: <name>` with an `in` requisite (such as `watch_in` or `require_in`). If you are not using explicit `- name: <name>` arguments, are targeting with the state ID instead of the name, or are not using `in` requisites, then you should be safe to upgrade to 2015.8.4.

  This issue is resolved in the 2015.8.5 release.

**Security Fix**

**CVE-2016-1866** Improper handling of clear messages on the minion, which could result in executing commands not sent by the master.

This issue affects only the 2015.8.x releases of Salt. In order for an attacker to use this attack vector, they would have to execute a successful attack on an existing TCP connection between minion and master on the pub port. It does not allow an external attacker to obtain the shared secret or decrypt any encrypted traffic between minion and master. Thank you to Sebastian Krahmer <krahmer@suse.com> for bringing this issue to our attention.

We recommend everyone upgrade to 2015.8.4 as soon as possible.
Core Changes

- Support for IAM roles added to S3 module
- Added option `mock=True` for `state.sls` and `state.highstate`. This allows the state compiler to process sls data in a state run without actually calling the state functions, thus providing feedback on the validity of the arguments used for the functions beyond the preprocessing validation provided by `state.show_sls` (issue #30118 and issue #30189).

```
salt '*' state.sls core,edit.vim mock=True
salt '*' state.highstate mock=True
salt '*' state.apply edit.vim mock=True
```

  - 8ec36497a1 Added note about systemd and uncleanshutdown. Also fixed line length of comments to max 80 characters as per PEP0008
  - a50428d02c On an unclean shutdown, if oncleanshutdown is given a path, an keyy:value of shut-
down:unclean is added to the returned data. The documentation states that the key should be 'un-
cleanshutdown' and that the value should either be True or False. This is fixed in the code
  - 51b57f1820 Fixed issue number #30117 - When no parameters are given to a service, the service object
  is of type None and thus isn't iterable. This is contrary to the documentation which states that there are
  default values. Default values added as False

### 31.2.97 Salt 2015.8.5 Release Notes

Version 2015.8.5 is a bugfix release for 2015.8.0.

**Important**: About this Release Salt 2015.8.5 is identical to the 2015.8.4 release with the addition of a fix for issue #30820, fixed by PR #30833. See here for the 2015.8.4 release notes.

#### Known Issue in `boto_*` execution modules

This release contains an issue that causes the `boto_*` execution modules to display a `__salt__ not defined` error (issue #30300). This issue will be fixed in an upcoming release, but can be manually resolved by completing the following:

1. Download the `boto_*` execution modules that you would like to update from the 2015.8 branch of Salt. A complete list of affected modules with the specific changes is available in `pull 30867`
2. Place the `boto_*` modules into `salt://_modules`
3. Run the following command to sync these modules to all Salt minions:

```bash
salt '*' saltutil.sync_modules
```

31.2.98 Salt 2015.8.7 Release Notes

Version 2015.8.7 is a bugfix release for 2015.8.0.

Note: Salt 2015.8.4, 2015.8.5, and 2015.8.7 were all released within a short period due to regressions found soon after the releases of 2015.8.4 and 2015.8.5. See here for the 2015.8.4 release notes, and here for the 2015.8.5 release notes.

Change to Epoch Support for YUM/DNF

For pkg.installed states, on Linux distributions which use yum/dnf, packages which have a non-zero epoch in the version number now require this epoch to be included when specifying an exact version for a package. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

The pkg.latest_version and pkg.list_repo_pkgs functions can be used to get the correct version string to use, as they will now contain the epoch when it is non-zero.

### 31.2.99 Salt 2015.8.8 Release Notes

Version 2015.8.8 is a bugfix release for 2015.8.0.

**Important:** Version 2015.8.8.2 was released shortly after 2015.8.8 to fix several known issues. If you installed 2015.8.8 before 03/30/2016, you likely have installed 2015.8.8 and can optionally upgrade (find out which version you have installed using salt --version).

Security Fix

CVE-2016-3176 Insecure configuration of PAM external authentication service

This issue affects all Salt versions prior to 2015.8.8/2015.5.10 when PAM external authentication is enabled. This issue involves passing an alternative PAM authentication service with a command that is sent to LocalClient, enabling the attacker to bypass the configured authentication service. Thank you to Dylan Frese <dmfrese@gmail.com> for bringing this issue to our attention.

This update defines the PAM eAuth service that users authenticate against in the Salt Master configuration.

Read Before Upgrading Debian 7 (Wheezy) from 2015.8.7 to 2015.8.8

Before you upgrade from 2015.8.7 on Debian 7, you must run the following commands to remove previous packages:

```
sudo apt-get remove python-pycrypto
sudo apt-get remove python-apache-libcloud
```

Note that python-pycrypto will likely remove python-apache-libcloud, so the second command might not be necessary. These have been replaced by python-crypto and python-libcloud with ~bpo70+1 moniker.

Read Before Upgrading Debian 8 (Jessie) from Salt Versions Earlier than 2015.8.4

Salt systemd service files are missing the following statement in these versions:

```
[Service]
KillMode=process
```

This statement must be added to successfully upgrade on these earlier versions of Salt.

- **ISSUE #30472**: (sjorge) KeyError with schedule (refs: #30978)
- **PR #30978**: (garethgreenaway) fixes to state.py in 2015.8 @ 2016-02-08 18:49:05 UTC
  - de215bd0cd Merge pull request #30978 from garethgreenaway/30472_state_functions_no_default_retcode
  - e33b5140f6 removing extra spaces.
  - f668ccf1f7 removing duplicate code, just set the default in the _set_retcode function
  - 5f2f0f60c0 The functions in the state module that return a retcode when something goes wrong, eg. a 1 or a 2, do not return a 0 when things go the way they’re supposed to go. With the recent changes to the scheduler to ensure that the retcode is returned this is problematic and results in exceptions when a state function is run from the schedule. This simple fix ensures a default retcode of 0 exists, it is then override in the _set_retcode function if there is an issue with the run

31.2.100 Salt 2015.8.8.2 Release Notes

Version 2015.8.2 is a bugfix release for 2015.8.0.

Fixes to 2015.8.8

Salt 2015.8.8.2 includes fixes for the following known issues in 2015.8.8:

- Key master with value [...] has an invalid type of list Error (issue #32044)
- Failed to import module win_dacl Error (issue #32004)
- Wrong validation type for file_ignore_glob key (issue #32114)
- Fix file.managed for windows (issue #31969)

Important: issue #32183 prevents Salt Cloud from installing the Salt minion on new systems. To workaround this issue, call salt-cloud -u to update the bootstrap script to the latest version.

Important Post-Upgrade Instructions for Linux Mint

As a result of some upstream changes, the os grain on Mint Linux is now being detected as LinuxMint (issue #33295). Run the following command after you upgrade to 2015.8.9 to reset the os grain to Mint and the os_family grain to Debian:

```
salt -G 'os:LinuxMint' grains.setvals "{'os': 'Mint', 'os_family': 'Debian'}"
```

### 31.2.102 Salt 2015.5.0 Release Notes - Codename Lithium

The 2015.5.0 feature release of Salt is focused on hardening Salt and mostly on improving existing systems. A few major additions are present, primarily the new Beacon system. Most enhancements have been focused around improving existing features and interfaces.

As usual the release notes are not exhaustive and primarily include the most notable additions and improvements. Hundreds of bugs have been fixed and many modules have been substantially updated and added.
**Warning:** In order to fix potential shell injection vulnerabilities in salt modules, a change has been made to the various `cmd` module functions. These functions now default to `python_shell=False`, which means that the commands will not be sent to an actual shell.

The largest side effect of this change is that "shellisms", such as pipes, will not work by default. The modules shipped with salt have been audited to fix any issues that might have arisen from this change. Additionally, the `cmd.state` module has been unaffected, and use of `cmd.run` in jinja is also unaffected. `cmd.run` calls on the CLI will also allow shellisms.

However, custom execution modules which use shellisms in `cmd` calls will break, unless you pass `python_shell=True` to these calls.

As a temporary workaround, you can set `cmd_safe: False` in your minion and master configs. This will revert the default, but is also less secure, as it will allow shell injection vulnerabilities to be written in custom code. We recommend you only set this setting for as long as it takes to resolve these issues in your custom code, then remove the override.

**Note:** Starting in this version of salt, `pillar_opts` defaults to False instead of True. This means that master opts will not be present in minion pillar, and as a result, `config.get` calls will not include master opts.

We recommend pillar is used for configuration options which need to make it to the minion.

**Beacons**

The beacon system allows the minion to hook into system processes and continually translate external events into the salt event bus. The primary example of this is the `inotify` beacon. This beacon uses inotify to watch configured files or directories on the minion for changes, creation, deletion etc.

This allows for the changes to be sent up to the master where the reactor can respond to changes.

**Sudo Minion Settings**

It is now possible to run the minion as a non-root user and for the minion to execute commands via sudo. Simply add `sudo_user: root` to the minion config, run the minion as a non-root user and grant that user sudo rights to execute `salt-call`.

**Lazy Loader**

The Lazy Loader is a significant overhaul of Salt's module loader system. The Lazy Loader will lazily load modules on access instead of all on start. In addition to a major performance improvement, this "sandboxes" modules so a bad/broken import of a single module will only affect jobs that require accessing the broken module. (issue: 20274)
Enhanced Active Directory Support

The eauth system for LDAP has been extended to support Microsoft Active Directory out of the box. This includes Active Directory and LDAP group support for eauth.

Salt LXC Enhancements

The LXC systems have been overhauled to be more consistent and to fix many bugs. This overhaul makes using LXC with Salt much easier and substantially improves the underlying capabilities of Salt’s LXC integration.

Salt SSH

- Additional configuration options and command line flags have been added to configure the scan roster on the fly
- Added support for `state.single` in `salt-ssh`
- Added support for `publish.publish`, `publish.full_data`, and `publish.runner` in `salt-ssh`
- Added support for `mine.get` in `salt-ssh`

New Windows Installer

The new Windows installer changes how Salt is installed on Windows. The old installer used bbfreeze to create an isolated python environment to execute in. This made adding modules and python libraries difficult. The new installer sets up a more flexible python environment making it easy to manage the python install and add python modules.

Instead of frozen packages, a full python implementation resides in the bin directory (`C:\salt\bin`). By executing `pip` or `easy_install` from within the Scripts directory (`C:\salt\bin\Scripts`) you can install any additional python modules you may need for your custom environment.

The `.exe`'s that once resided at the root of the salt directory (`C:\salt`) have been replaced by `.bat` files and should function the same way as the `.exe`'s in previous versions.

The new Windows Installer will not replace the minion config file and key if they already exist on the target system. Only the salt program files will be replaced. `C:\salt\conf` and `C:\salt\var` will remain unchanged.

Removed Requests Dependency

The hard dependency on the requests library has been removed. Requests is still required by a number of cloud modules but is no longer required for normal Salt operations.

This removal fixes issues that were introduced with requests and salt-ssh, as well as issues users experienced from the many different packaging methods used by requests package maintainers.
Python 3 Updates

While Salt does not YET run on Python 3 it has been updated to INSTALL on Python 3, taking us one step closer. What remains is getting the test suite to the point where it can run on Python 3 so that we can verify compatibility.

RAET Additions

The RAET support continues to improve. RAET now supports multi-master and many bugs and performance issues have been fixed. RAET is much closer to being a first class citizen.

Modified File Detection

A number of functions have been added to the RPM-based package managers to detect and diff files that are modified from the original package installs. This can be found in the new pkg.modified functions.

Reactor Update

Fix an infinite recursion problem for runner/wheel reactor jobs by passing a "user" (Reactor) to all jobs that the reactor starts. The reactor skips all events created by that username -- thereby only reacting to events not caused by itself. Because of this, runner and wheel executions from the runner will have user "Reactor" in the job cache.

Misc Fixes/Additions

- SDB driver for etcd. (:issue: 22043)
- Add only_upgrade argument to apt-based pkg.install to only install a package version if the package is already installed. (Great for security updates!)
- Joyent now requires a keyname to be specified in the provider configuration. This change was necessitated upstream by the 7.0+ API.
- Add args argument to cmd.script_retcode to match cmd.script in the cmd module. (:issue: 21122)
- Fixed bug where TCP keepalive was not being sent on the defined interval on the return port (4506) from minion to master. (issue: 21465)
- LocalClient may now optionally raise SaltClientError exceptions. If using this class directly, checking for and handling this exception is recommended. (issue: 21501)
- The SAuth object is now a singleton, meaning authentication state is global (per master) on each minion. This reduces sign-ins of minions from 3->1 per startup.
- Nested outputter has been optimized, it is now much faster.
- Extensive fileserver backend updates.
Deprecations

- Removed parameter keyword argument from eselect.exec_action execution module.
- Removed runas parameter from the following pip ` execution module functions: install, uninstall, freeze, list, list_upgrades, upgrade_available, upgrade. Please migrate to user.
- Removed runas parameter from the following pip state module functions: installed, removed, upgrade_available, upgrade. Please migrate to user.
- Removed quiet option from all functions in cmdmod execution module. Please use output_loglevel=quiet instead.
- Removed parameter argument from eselect.set_state. Please migrate to module_parameter or action_parameter.
- The salt_events table schema has changed to include an additional field called master_id to distinguish between events flowing into a database from multiple masters. If event_return is enabled in the master config, the database schema must first be updated to add the master_id field. This alteration can be accomplished as follows:

  ALTER TABLE salt_events ADD master_id VARCHAR(255) NOT NULL;

Known Issues

- In multi-master mode, a minion may become temporarily unresponsive if modules or pillars are refreshed at the same time that one or more masters are down. This can be worked around by setting 'auth_timeout' and 'auth_tries' down to shorter periods.

31.2.103 Salt 2015.5.1 Release Notes

### 31.2.104 Salt 2015.5.10 Release Notes

release 2015-03-22

Version 2015.5.10 is a bugfix release for 2015.5.0.
Security Fix

CVE-2016-3176 Insecure configuration of PAM external authentication service

This issue affects all Salt versions prior to 2015.8.8/2015.5.10 when PAM external authentication is enabled. This issue involves passing an alternative PAM authentication service with a command that is sent to LocalClient, enabling the attacker to bypass the configured authentication service. Thank you to Dylan Frese <dmfrese@gmail.com> for bringing this issue to our attention.

This update defines the PAM eAuth service that users authenticate against in the Salt Master configuration.

No additional fixes are included in this release.

Read Before Upgrading Debian 8 (Jessie) from Salt Versions Earlier than 2015.5.9

Salt systemd service files are missing the following statement in these versions:

```
[Service]
KillMode=process
```

This statement must be added to successfully upgrade on these earlier versions of Salt.

Changelog for v2015.5.9..v2015.5.10

- 69ba1de71d Remove ability of authenticating user to specify pam service

31.2.105 Salt 2015.5.11 Release Notes

#### Bug Fixes

- The **cron.present** state now correctly defaults to state ID as identifier.

#### Salt-Cloud Changes

- When querying for VMs in the `digital_ocean_v2` cloud driver, the number of VMs to include in a page was changed from 20 (default) to 200 to reduce the number of API calls to Digital Ocean.
- The `vmware` salt-cloud driver was back-ported from the develop branch in order for installations of Salt that are older than 2015.8.0 to be able to use the `vmware` driver without stack-tracing on various deprecation paths that were implemented in the 2015.8.0 release.

Security Fixes

CVE-2015-6941 The Windows user module and salt-cloud display passwords in log when log level is set to debug or more verbose.

For the Windows user module, the password is now replaced with the string XXX-REDACTED-XXX.

For salt-cloud, debug logging no longer displays win_password and sudo_password authentication credentials.

CVE-2015-6918 Git state/execution modules log HTTPS auth credentials when log level is set to debug or more verbose.

These credentials are now replaced with REDACTED in the debug output. Thanks to Andreas Stieger <asteiger@suse.com> for bringing this to our attention.

Security Fix

CVE-2015-8034 Saving state.sls cache data to disk with insecure permissions

This affects users of the state.sls function. The state run cache on the minion was being created with incorrect permissions. This file could potentially contain sensitive data that was inserted via jinja into the state SLS files. The permissions for this file are now being set correctly. Thanks to zmalone for bringing this issue to our attention.

### 31.2.114 Salt 2014.7.0 Release Notes - Codename Helium

This release is the largest Salt release ever, with more features and commits then any previous release of Salt. Everything from the new RAET transport to major updates in Salt Cloud and the merging of Salt API into the main project.

**Important**: The Fedora/RHEL/CentOS salt-master package has been modified for this release. The following components of Salt have been broken out and placed into their own packages:

- salt-syndic
- salt-cloud
- salt-ssh
When the **salt-master** package is upgraded, these components will be removed, and they will need to be manually installed.

**Important:** Compound/pillar matching have been temporarily disabled for the **mine** and **publish** modules for this release due to the possibility of inferring pillar data using pillar glob matching. A proper fix is now in the 2014.7 branch and scheduled for the 2014.7.1 release, and compound matching and non-globbing pillar matching will be re-enabled at that point.

Compound and pillar matching for normal salt commands are unaffected.

### New Transport!

**RAET Transport Option**

This has been a HUGE amount of work, but the beta release of Salt with RAET is ready to go. RAET is a reliable queuing transport system that has been developed in partnership with a number of large enterprises to give Salt an alternative to ZeroMQ and a way to get Salt to scale well beyond tens of thousands of servers. Unlike ZeroMQ, RAET is completely asynchronous in every aspect of its operation and has been developed using the flow programming paradigm. This allows for many new capabilities to be added to Salt in the upcoming releases.

Please keep in mind that this is a beta release of RAET and we hope for bugs to be worked out, performance to be better realized and more in the 2015.5.0 release.

Simply stated, users running Salt with RAET should expect some hiccups as we hammer out the update. This is a BETA release of Salt RAET.

### Salt SSH Enhancements

Salt SSH has just entered a new league, with substantial updates and improvements to make salt-ssh more reliable and easier than ever! From new features like the ansible roster and filesnake backends to the new pypi salt-ssh installer to lowered deps and a swath of bugfixes, salt-ssh is basically reborn!

#### Install salt-ssh Using pip

Salt-ssh is now pip-installable!

https://pypi.org/project/salt-ssh/

Pip will bring in all of the required deps, and while some deps are compiled, they all include pure python implementations, meaning that any compile errors which may be seen can be safely ignored.

```
pip install salt-ssh
```
Fileservers Backend

Salt-ssh can now use the salt fileserver backend system. This allows for the gitfs, hgfs, s3, and many more ways to centrally store states to be easily used with salt-ssh. This also allows for a distributed team to easily use a centralized source.

Saltfile Support

The new saltfile system makes it easy to have a user specific custom extended configuration.

Ext Pillar

Salt-ssh can now use the external pillar system. Making it easier then ever to use salt-ssh with teams.

No More sshpass

Thanks to the enhancements in the salt vt system, salt-ssh no longer requires sshpass to send passwords to ssh. This also makes the manipulation of ssh calls substantially more flexible, allowing for intercepting ssh calls in a much more fluid way.

Pure Python Shim

The salt-ssh call originally used a shell script to discover what version of python to execute with and determine the state of the ssh code deployment. This shell script has been replaced with a pure python version making it easy to increase the capability of the code deployment without causing platform inconsistency issues with different shell interpreters.

Custom Module Delivery

Custom modules are now seamlessly delivered. This makes the deployment of custom grains, states, execution modules and returners a seamless process.

CP Module Support

Salt-ssh now makes simple file transfers easier then ever! The cp module allows for files to be conveniently sent from the salt fileserver system down to systems.

More Thin Directory Options

Salt ssh functions by copying a subset of the salt code, or salt thin down to the target system. In the past this was always transferred to /tmp/.salt and cached there for subsequent commands.

Now, salt thin can be sent to a random directory and removed when the call is complete with the -W option. The new -W option still uses a static location but will clean up that location when finished.

The default salt thin location is now user defined, allowing multiple users to cleanly access the same systems.
State System Enhancements

New Imperative State Keyword "Listen"

The new `listen` and `listen_in` keywords allow for completely imperative states by calling the `mod_watch()` routine after all states have run instead of re-ordering the states.

Mod Aggregate Runtime Manipulator

The new `mod_aggregate` system allows for the state system to rewrite the state data during execution. This allows for state definitions to be aggregated dynamically at runtime.

The best example is found in the `pkg` state. If `mod_aggregate` is turned on, then when the first `pkg` state is reached, the state system will scan all of the other running states for `pkg` states and take all other packages set for install and install them all at once in the first `pkg` state.

These runtime modifications make it easy to run groups of states together. In future versions, we hope to fill out the `mod_aggregate` system to build in more and more optimizations.

For more documentation on `mod_aggregate`, see the documentation.

New Requisites: onchanges and onfail

The new `onchanges` and `onchanges_in` requisites make a state apply only if there are changes in the required state. This is useful to execute post hooks after changes occur on a system.

The other new requisites, `onfail` and `onfail_in`, allow for a state to run in reaction to the failure of another state.

For more information about these new requisites, see the requisites documentation.

Global onlyif and unless

The `onlyif` and `unless` options can now be used for any state declaration.

Use names to expand and override values

The `names declaration` in Salt's state system can now override or add values to the expanded data structure. For example:

```yaml
my_users:
  user.present:
    - names:
      - larry
      - curly
      - moe:
        - shell: /bin/zsh
        - groups:
          - wheel
        - shell: /bin/bash
```
Major Features

Scheduler Additions

The Salt scheduler system has received MAJOR enhancements, allowing for cron-like scheduling and much more granular timing routines. See here for more info.

Red Hat 7 Family Support

All the needed additions have been made to run Salt on RHEL 7 and derived OSes like CentOS and Scientific.

Fileserver Backends in salt-call

Fileserver backends like gitfs can now be used without a salt master! Just add the fileserver backend configuration to the minion config and execute salt-call. This has been a much-requested feature and we are happy to finally bring it to our users.

Amazon Execution Modules

An entire family of execution modules further enhancing Salt's Amazon Cloud support. They include the following:

- **Autoscale Groups** (includes state support) -- related: Launch Control states
- **Cloud Watch** (includes state support)
- **Elastic Cache** (includes state support)
- **Elastic Load Balancer** (includes state support)
- **IAM Identity and Access Management** (includes state support)
- **Route53 DNS** (includes state support)
- **Security Groups** (includes state support)
- **Simple Queue Service** (includes state support)

LXC Runner Enhancements

BETA The Salt LXC management system has received a number of enhancements which make running an LXC cloud entirely from Salt an easy proposition.

Next Gen Docker Management

The Docker support in Salt has been increased at least ten fold. The Docker API is now completely exposed and Salt ships with Docker data tracking systems which make automating Docker deployments very easy.
Peer System Performance Improvements

The peer system communication routines have been refined to make the peer system substantially faster.

SDB

Encryption at rest for configs

GPG Renderer

Encrypted pillar at rest

OpenStack Expansion

Lots of new OpenStack stuff

Queues System

Ran change external queue systems into Salt events

Multi Master Failover Additions

Connecting to multiple masters is more dynamic then ever

Chef Execution Module

Managing Chef with Salt just got even easier!

salt-api Project Merge

The salt-api project has been merged into Salt core and is now available as part of the regular salt-master package install. No API changes were made, the salt-api script and init scripts remain intact.

salt-api has always provided Yet Another Pluggable Interface to Salt (TM) in the form of "netapi" modules. These are modules that bind to a port and start a service. Like many of Salt’s other module types, netapi modules often have library and configuration dependencies. See the documentation for each module for instructions.

See also:

The full list of netapi modules.
Synchronous and Asynchronous Execution of Runner and Wheel Modules

`salt.runner.RunnerClient` and `salt.wheel.WheelClient` have both gained complimentary `cmd_sync` and `cmd_async` methods allowing for synchronous and asynchronous execution of any Runner or Wheel module function, all protected using Salt's `external authentication` system. `salt-api` benefits from this addition as well.

**rest_cherrypy** Additions

The `rest_cherrypy` netapi module provides the main REST API for Salt.

**Web Hooks**

This release of course includes the Web Hook additions from the most recent `salt-api` release, which allows external services to signal actions within a Salt infrastructure. External services such as Amazon SNS, Travis-CI, or GitHub, as well as internal services that cannot or should not run a Salt minion daemon can be used as first-class components in Salt's rich orchestration capabilities.

The raw HTTP request body is now available in the event data. This is sometimes required information for checking an HMAC signature in order to verify a HTTP request. As an example, Amazon or GitHub requests are signed this way.

**Generating and Accepting Minion Keys**

The `/key` convenience URL generates a public and private key for a minion, automatically pre-accepts the public key on the Salt Master, and returns both keys as a tarball for download.

This allows for easily bootstrapping the key on a new minion with a single HTTP call, such as with a Kickstart script, all using regular shell tools.

```
curl -ss http://salt-api.example.com:8000/keys \
    -d mid=jerry \
    -d username=kickstart \
    -d password=kickstart \
    -d eauth=pam \
    -o jerry-salt-keys.tar
```

**Fileserver Backend Enhancements**

All of the fileserver backends have been overhauled to be faster, lighter, and more reliable. The VCS backends (`gitfs`, `hgfs`, and `svnfs`) have also received a lot of new features.

Additionally, most config parameters for the VCS backends can now be configured on a per-remote basis, allowing for global config parameters to be overridden for a specific gitfs/hgfs/svnfs remote.
New **gitfs** Features

**Pygit2 and Dulwich**

In addition to supporting GitPython, support for `pygit2` (0.20.3 and newer) and `dulwich` have been added. Provided a compatible version of `pygit2` is installed, it will now be the default provider. The config parameter `gitfs_provider` has been added to allow one to choose a specific provider for gitfs.

**Mountpoints**

Prior to this release, to serve a file from gitfs at a salt fileserver URL of `salt://foo/bar/baz.txt`, it was necessary to ensure that the parent directories existed in the repository. A new config parameter `gitfs_mountpoint` allows gitfs remotes to be exposed starting at a user-defined `salt://` URL.

**Environment Whitelisting/Blacklisting**

By default, gitfs will expose all branches and tags as Salt fileserver environments. Two new config parameters, `gitfs_env_whitelist` and `gitfs_env_blacklist`, allow more control over which branches and tags are exposed. More detailed information on how these two options work can be found in the *Gitfs Walkthrough*.

**Expanded Authentication Support**

As of `pygit2` 0.20.3, both http(s) and SSH key authentication are supported, and Salt now also supports both authentication methods when using `pygit2`. Keep in mind that `pygit2` 0.20.3 is not yet available on many platforms, so those who had been using authenticated git repositories with a passphraseless key should stick to GitPython if a new enough `pygit2` is not yet available for the platform on which the master is running.

A full explanation of how to use authentication can be found in the *Gitfs Walkthrough*.

New **hgfs** Features

**Mountpoints**

This feature works exactly like its gitfs counterpart. The new config parameter is called `hgfs_mountpoint`.

**Environment Whitelisting/Blacklisting**

This feature works exactly like its gitfs counterpart. The new config parameters are called `hgfs_env_whitelist` and `hgfs_env_blacklist`. 
New **svnfs** Features

**Mountpoints**

This feature works exactly like its **gitfs** counterpart. The new config parameter is called `svnfs_mountpoint`.

**Environment Whitelisting/Blacklisting**

This feature works exactly like its **gitfs** counterpart. The new config parameters are called `svnfs_env_whitelist` and `svnfs_env_blacklist`.

**Configurable Trunk/Branches/Tags Paths**

Prior to this release, the paths where trunk, branches, and tags were located could only be in directories named "trunk", "branches", and "tags" directly under the root of the repository. Three new config parameters (`svnfs_trunk`, `svnfs_branches`, and `svnfs_tags`) allow SVN repositories which are laid out differently to be used with svnfs.

New **minionfs** Features

**Mountpoint**

This feature works exactly like its **gitfs** counterpart. The new config parameter is called `minionfs_mountpoint`. The one major difference is that, as minionfs doesn’t use multiple remotes (it just serves up files pushed to the master using `cp.push`) there is no such thing as a per-remote configuration for `minionfs_mountpoint`.

**Changing the Saltenv from Which Files are Served**

A new config parameter (`minionfs_env`) allows minionfs files to be served from a Salt fileserver environment other than `base`.

**Minion Whitelisting/Blacklisting**

By default, minionfs will expose the pushed files from all minions. Two new config parameters, `minionfs_whitelist` and `minionfs_blacklist`, allow minionfs to be restricted to serve files from only the desired minions.

**Pyobjects Renderer**

Salt now ships with with the **Pyobjects Renderer** that allows for construction of States using pure Python with an idiomatic object interface.
New Modules

In addition to the Amazon modules mentioned above, there are also several other new execution modules:

- Oracle
- Random
- Redis
- Amazon Simple Queue Service
- Block Device Management
- CoreOS etcd
- Genesis
- InfluxDB
- Server Density
- Twilio Notifications
- Varnish
- ZNC IRC Bouncer
- SMTP

New Runners

- Map/Reduce Style
- Queue

New External Pillars

- CoreOS etcd

New Salt-Cloud Providers

- Aliyun ECS Cloud
- LXC Containers
- Proxmox (OpenVZ containers & KVM)

Salt Call Change

When used with a returner, salt-call now contacts a master if --local is not specified.
Deprecations

**salt.modules.virtualenv_mod**

- Removed deprecated `memoize` function from `salt/utils/__init__.py` (deprecated)
- Removed deprecated `no_site_packages` argument from `create` function (deprecated)
- Removed deprecated `check_dns` argument from `minion_config` and `apply_minion_config` functions (deprecated)
- Removed deprecated `OutputOptionsWithTextMixIn` class from `salt/utils/parsers.py` (deprecated)
- Removed the following deprecated functions from `salt/modules/ps.py`: - `physical_memory_usage` (deprecated) - `virtual_memory_usage` (deprecated) - `cached_physical_memory` (deprecated) - `physical_memory_buffers` (deprecated)
- Removed deprecated cloud arguments from `cloud_config` function in `salt/config.py`: - `vm_config` (deprecated) - `vm_config_path` (deprecated)
- Removed deprecated `libcloud_version` function from `salt/cloud/libcloudfuncs.py` (deprecated)
- Removed deprecated `CloudConfigMixIn` class from `salt/utils/parsers.py` (deprecated)

### 31.2.115 Salt 2014.7.1 Release Notes

**release** 2015-01-12

Version 2014.7.1 is a bugfix release for 2014.7.0.

The changes include:

- Fixed gitfs serving symlinks in `file.recurse` states ([issue #17700](#))
- Fixed holding of multiple packages (YUM) when combined with version pinning ([issue #18468](#))
- Fixed use of Jinja templates in masterless mode with non-roots fileserver backend ([issue #17963](#))
- Re-enabled pillar and compound matching for mine and publish calls. Note that pillar globbing is still disabled for those modes, for security reasons. ([issue #17194](#))
- Fix for `tty: True` in salt-ssh ([issue #16847](#))
- Fix for supervisord states when supervisor not installed to system python ([issue #18044](#))
- Fix for logging when `log_level='quiet'` for `cmd.run` ([issue #19479](#))

### 31.2.116 Salt 2014.7.2 Release Notes

**release** 2015-02-09

Version 2014.7.2 is a bugfix release for 2014.7.0.

The changes include:

- Fix erroneous warnings for systemd service enabled check ([issue #19606](#))
- Fix FreeBSD kernel module loading, listing, and persistence `kmod` ([issue #197151, issue #19682](#))
• Allow case-sensitive npm package names in the `npm state`. This may break behavior for people expecting the state to lowercase their npm package names for them. The `npm module` was never affected by mandatory lowercasing. ([issue #20329](https://github.com/saltstack/salt/issues/20329))

• Deprecate the activate parameter for pip.install for both the module and the state. If bin_env is given and points to a virtualenv, there is no need to activate that virtualenv in a shell for pip to install to the virtualenv.

• Fix a file-locking bug in gifs ([issue #18839](https://github.com/saltstack/salt/issues/18839))

• Deprecated `archive_user` in favor of standardized `user` parameter in state and added `group` parameter.

### 31.2.117 Salt 2014.7.3 Release Notes

release 2015-03-25

Version 2014.7.3 is a bugfix release for 2014.7.0.

Changes:

• Multi-master minions mode no longer route fileclient operations asymetrically. This fixes the source of many multi-master bugs where the minion would become unresponsive from one or more masters.

• Fix bug wherein network.iface could produce stack traces.

• net.arp will no longer be made available unless arp is installed on the system.

• Major performance improvements to Saltntado

• Allow KVM module to operate under KVM itself or VMware Fusion

• Various fixes to the Windows installation scripts

• Fix issue where the syndic would not correctly propagate loads to the master job cache.

• Improve error handling on invalid `/etc/network/interfaces` file in salt networking modules

• Fix bug where a response status was not checked for in fileclient.get_url

• Enable eauth when running salt in batch mode

• Increase timeout in Boto Route53 module

• Fix bugs with Salt’s ‘tar’ module option parsing

• Fix parsing of NTP servers on Windows

• Fix issue with blockdev tuning not reporting changes correctly

• Update to the latest Salt bootstrap script

• Update Linode salt-cloud driver to use either linode-python or apache-libcloud

• Fix for s3.query function to return correct headers

• Fix for s3.head returning None for files that exist

• Fix the disable function in win_service module so that the service is disabled correctly

• Fix race condition between master and minion when making a directory when both daemons are on the same host

• Fix an issue where file.recurse would fail at the root of an svn repo when the repo has a mountpoint

• Fix an issue where file.recurse would fail at the root of an hgf5 repo when the repo has a mountpoint
• Fix an issue where file.recurse would fail at the root of an gitfs repo when the repo has a mountpoint
• Add status.master capability for Windows.
• Various fixes to ssh_known_hosts
• Various fixes to states.network bonding for Debian
• The debian_ip.get_interfaces module no longer removes nameservers.
• Better integration between grains.virtual and systemd-detect-virt and virt-what
• Fix traceback in sysctl.present state output
• Fix for issue where mount.mounted would fail when superopts were not a part of mount.active (extended=True). Also mount.mounted various fixes for Solaris and FreeBSD.
• Fix error where datetimes were not correctly safeguarded before being passed into msgpack.
• Fix file.replace regressions. If the pattern is not found, and if dry run is False, and if backup is False, and if a pre-existing file exists with extension .bak, then that backup file will be overwritten. This backup behavior is a result of how fileinput works. Fixing it requires either passing through the file twice (the first time only to search for content and set a flag), or rewriting file.replace so it doesn’t use fileinput
• VCS filreserver fixes/optimizations
• Catch fileserver configuration errors on master start
• Raise errors on invalid gitfs configurations
• set_locale when locale file does not exist (Redhat family)
• Fix to correctly count active devices when created mdadm array with spares
• Fix to correctly target minions in batch mode
• Support ssh:// urls using the gitfs dulwhich backend
• New filesserver runner
• Fix various bugs with argument parsing to the publish module.
• Fix disk.usage for Synology OS
• Fix issue with tags occurring twice with docker.pulled
• Fix incorrect key error in SMTP returner
• Fix condition which would remount loopback filesystems on every state run
• Remove requisites from listeners after they are called in the state system
• Make system implementation of service.running aware of legacy service calls
• Fix issue where publish.publish would not handle duplicate responses gracefully.
• Accept Kali Linux for aptpkg salt execution module
• Fix bug where cmd.which could not handle a dirname as an argument
• Fix issue in ps.pgrep where exceptions were thrown on Windows.

Known issues:
• In multimaster mode, a minion may become temporarily unresponsive if modules or pillars are refreshed at the same time that one or more masters are down. This can be worked around by setting ‘auth_timeout’ and ‘auth_tries’ down to shorter periods.
31.2.118 Salt 2014.7.4 Release Notes

release 2015-03-30

Version 2014.7.4 is a bugfix release for 2014.7.0.

This is a security release. The security issues fixed have only been present since 2014.7.0, and only users of the two listed modules are vulnerable. The following CVEs have been resolved:

- CVE-2015-1838 SaltStack: insecure /tmp file handling in salt/modules/serverdensity_device.py
- CVE-2015-1839 SaltStack: insecure /tmp file handling in salt/modules/chef.py

Changes:

- Multi-master minions mode no longer route fileclient operations asymmetrically. This fixes the source of many multi-master bugs where the minion would become unresponsive from one or more masters.
- Fix bug wherein network.iface could produce stack traces.
- net.arp will no longer be made available unless arp is installed on the system.
- Major performance improvements to Saltnado
- Allow KVM module to operate under KVM itself or VMware Fusion
- Various fixes to the Windows installation scripts
- Fix issue where the syndic would not correctly propagate loads to the master job cache.
- Improve error handling on invalid /etc/network/interfaces file in salt networking modules
- Fix bug where a response status was not checked for in fileclient.get_url
- Enable eauth when running salt in batch mode
- Increase timeout in Boto Route53 module
- Fix bugs with Salt's `tar` module option parsing
- Fix parsing of NTP servers on Windows
- Fix issue with blockdev tuning not reporting changes correctly
- Update to the latest Salt bootstrap script
- Update Linode salt-cloud driver to use either linode-python or apache-libcloud
- Fix for s3.query function to return correct headers
- Fix for s3.head returning None for files that exist
- Fix the disable function in win_service module so that the service is disabled correctly
- Fix race condition between master and minion when making a directory when both daemons are on the same host
- Fix an issue where file.recurse would fail at the root of an svn repo when the repo has a mountpoint
- Fix an issue where file.recurse would fail at the root of an hgfs repo when the repo has a mountpoint
- Fix an issue where file.recurse would fail at the root of an gitfs repo when the repo has a mountpoint
- Add status.master capability for Windows.
- Various fixes to ssh_known_hosts
- Various fixes to states.network bonding for Debian
- The debian_ip.get_interfaces module no longer removes nameservers.
- Better integration between grains.virtual and systemd-detect-virt and virt-what
- Fix traceback in sysctl.present state output
- Fix for issue where mount.mounted would fail when superopts were not a part of mount.active (extended=True). Also mount.mounted various fixes for Solaris and FreeBSD.
- Fix error where datetimes were not correctly safeguarded before being passed into msgpack.
- Fix file.replace regressions. If the pattern is not found, and if dry run is False, and if backup is False, and if a pre-existing file exists with extension .bak, then that backup file will be overwritten. This backup behavior is a result of how fileinput works. Fixing it requires either passing through the file twice (the first time only to search for content and set a flag), or rewriting file.replace so it doesn’t use fileinput
- VCS filreserver fixes/optimizations
- Catch fileserver configuration errors on master start
- Raise errors on invalid gitfs configurations
- set_locale when locale file does not exist (Redhat family)
- Fix to correctly count active devices when created mdadm array with spares
- Fix to correctly target minions in batch mode
- Support ssh:// urls using the gitfs dulwhich backend
- New fileserver runner
- Fix various bugs with argument parsing to the publish module.
- Fix disk.usage for Synology OS
- Fix issue with tags occurring twice with docker.pulled
- Fix incorrect key error in SMTP returner
- Fix condition which would remount loopback file systems on every state run
- Remove requisites from listens after they are called in the state system
- Make system implementation of service.running aware of legacy service calls
- Fix issue where publish.publish would not handle duplicate responses gracefully.
- Accept Kali Linux for aptpkg salt execution module
- Fix bug where cmd.which could not handle a dirname as an argument
- Fix issue in ps.pgrep where exceptions were thrown on Windows.

Known issues:
- In multimaster mode, a minion may become temporarily unresponsive if modules or pillars are refreshed at the same time that one or more masters are down. This can be worked around by setting 'auth_timeout' and 'auth_tries' down to shorter periods.
- There are known issues with batch mode operating on the incorrect number of minions. This bug can be patched with the change in Pull Request #22464.
- The fun, state, and unless keywords are missing from the state internals, which can cause problems running some states. This bug can be patched with the change in Pull Request #22365.
31.2.119 Salt 2014.7.5 Release Notes

release 2015-04-16

Version 2014.7.5 is a bugfix release for 2014.7.0.

Changes:

- Fixed a key error bug in salt-cloud
- Updated man pages to better match documentation
- Fixed bug concerning high CPU usage with salt-ssh
- Fixed bugs with remounting cvfs and fuse filesystems
- Fixed bug with allowing requisite tracking of entire sls files
- Fixed bug with aptpkg.mod_repo returning OK even if apt-add-repository fails
- Increased frequency of ssh terminal output checking
- Fixed malformed locale string in localmod module
- Fixed checking of available version of package when accept_keywords were changed
- Fixed bug to make git.latest work with empty repositories
- Added **kwargs to service.mod_watch which removes warnings about enable and __reqs__ not being supported by the function
- Improved state comments to not grow so quickly on failed requisites
- Added force argument to service to trigger force_reload
- Fixed bug to andle pkgrepo keyids that have been converted to int
- Fixed module.portage_config bug with appending accept_keywords
- Fixed bug to correctly report disk usage on windows minion
- Added the ability to specify key prefix for S3 ext_pillar
- Fixed issues with batch mode operating on the incorrect number of minions
- Fixed a bug with the proxmox cloud provider stacktracing on disk definition
- Fixed a bug with the changes dictionary in the file state
- Fixed the TCP keep alive settings to work better with SREQ caching
- Fixed many bugs within the iptables state and module
- Fixed bug with states by adding fun, state, and unless to the state runtime internal keywords listing
- Added ability to eAuth against Active Directory
- Fixed some salt-ssh issues when running on Fedora 21
- Fixed grains.get_or_set_hash to work with multiple entries under same key
- Added better explanations and more examples of how the Reactor calls functions to docs
- Fixed bug to not pass ex_config_drive to libcloud unless it’s explicitly enabled
- Fixed bug with pip.install on windows
- Fixed bug where puppet.run always returns a 0 retcode
- Fixed race condition bug with minion scheduling via pillar
• Made efficiency improvements and bug fixes to the windows installer
• Updated environment variables to fix bug with pygit2 when running salt as non-root user
• Fixed cas behavior on data module -- data.cas was not saving changes
• Fixed GPG rendering error
• Fixed strace error in virt.query
• Fixed stacktrace when running chef-solo command
• Fixed possible bug wherein uncaught exceptions seem to make zmq3 tip over when threading is involved
• Fixed argument passing to the reactor
• Fixed glibc caching to prevent bug where salt-minion getaddrinfo in dns_check() never got updated name-servers

Known issues:
• In multimaster mode, a minion may become temporarily unresponsive if modules or pillars are refreshed at the same time that one or more masters are down. This can be worked around by setting 'auth_timeout' and 'auth_tries' down to shorter periods.

Security Fix

CVE-2015-4017 Certificates are not verified when connecting to server in the Aliyun and Proxmox modules

Only users of the Aliyun or Proxmox cloud modules are at risk. The vulnerability does not exist in the latest 2015.5.0 release of Salt.

### 31.2.124 Salt 2014.1.0 Release Notes - Codename Hydrogen

**Note:** Due to a change in master to minion communication, 2014.1.0 minions are not compatible with older-version masters. Please upgrade masters first. More info on backwards-compatibility policy [here](#), under the "Upgrading Salt" subheading.

**Note:** A change in the grammar in the state compiler makes `module.run` in requisites illegal syntax. Its use is replaced simply with the word `module`. In other words you will need to change requisites like this:

```yaml
require:
  module.run: some_module_name
```

to:

```yaml
require:
  module: some_module_name
```

This is a breaking change. We apologize for the inconvenience, we needed to do this to remove some ambiguity in parsing requisites.

**release** 2014-02-24

The 2014.1.0 release of Salt is a major release which not only increases stability but also brings new capabilities in virtualization, cloud integration, and more. This release brings a great focus on the expansion of testing making roughly double the coverage in the Salt tests, and comes with many new features.

2014.1.0 is the first release to follow the new date-based release naming system. See the version numbers page for more details.
Major Features

Salt Cloud Merged into Salt

Salt Cloud is a tool for provisioning salted minions across various cloud providers. Prior to this release, Salt Cloud was a separate project but this marks its full integration with the Salt distribution. A Getting Started guide and additional documentation for Salt Cloud can be found [here](#).

Google Compute Engine

Alongside Salt Cloud comes new support for the Google Compute Engine. Salt Stack can now deploy and control GCE virtual machines and the application stacks that they run.

For more information on Salt Stack and GCE, please see [this blog post](#).

Documentation for Salt and GCE can be found [here](#).

Salt Virt

Salt Virt is a cloud controller that supports virtual machine deployment, inspection, migration, and integration with many aspects of Salt.

Salt Virt has undergone a major overhaul with this release and now supports many more features and includes a number of critical improvements.

Docker Integration

Salt now ships with states and an execution module to manage Docker containers.

Substantial Testing Expansion

Salt continues to increase its unit/regression test coverage. This release includes over 300 new tests.

BSD Package Management

BSD package management has been entirely rewritten. FreeBSD 9 and older now default to using pkg_add, while FreeBSD 10 and newer will use pkgng. FreeBSD 9 can be forced to use pkgng, however, by specifying the following option in the minion config file:

```
providers:
    pkg: pkgng
```

In addition, support for installing software from the ports tree has been added. See the documentation for the ports state and execution module for more information.
Network Management for Debian/Ubuntu

Initial support for management of network interfaces on Debian-based distros has been added. See the documentation for the network state and the debian_ip for more information.

IPv6 Support for iptables State/Module

The iptables state and module now have IPv6 support. A new parameter family has been added to the states and execution functions, to distinguish between IPv4 and IPv6. The default value for this parameter is ipv4, specifying ipv6 will use ip6tables to manage firewall rules.

GitFS Improvements

Several performance improvements have been made to the Git fileserver backend. Additionally, file states can now use any SHA1 commit hash as a fileserver environment:

```
/etc/httpd/httpd.conf:
  file.managed:
    - source: salt://webserver/files/httpd.conf
    - saltenv: 45af879
```

This applies to the functions in the cp module as well:

```
salt '*' cp.get_file salt://readme.txt /tmp/readme.txt saltenv=45af879
```

MinionFS

This new fileserver backend allows files which have been pushed from the minion to the master (using cp.push) to be served up from the salt fileserver. The path for these files takes the following format:

```
salt://minion-id/path/to/file
```

minion-id is the id of the "source" minion, the one from which the files were pushed to the master. /path/to/file is the full path of the file.

The MinionFS Walkthrough contains a more thorough example of how to use this backend.

saltenv

To distinguish between fileserver environments and execution functions which deal with environment variables, fileserver environments are now specified using the saltenv parameter. env will continue to work, but is deprecated and will be removed in a future release.
Grains Caching

A caching layer has been added to the Grains system, which can help speed up minion startup. Disabled by default, it can be enabled by setting the minion config option `grains_cache`:

```
grains_cache: True
# Seconds before grains cache is considered to be stale.
grains_cache_expiration: 300
```

If set to `True`, the grains loader will read from/write to a msgpack-serialized file containing the grains data.

Additional command-line parameters have been added to salt-call, mainly for testing purposes:

- `--skip-grains` will completely bypass the grains loader when salt-call is invoked.
- `--refresh-grains-cache` will force the grains loader to bypass the grains cache and refresh the grains, writing a new grains cache file.

Improved Command Logging Control

When using the `cmd module`, either on the CLI or when developing Salt execution modules, a new keyword argument `output_loglevel` allows for greater control over how (or even if) the command and its output are logged. For example:

```
salt '*' cmd.run 'tail /var/log/messages' output_loglevel=debug
```

The package management modules (`apt`, `yumpkg`, etc.) have been updated to log the copious output generated from these commands at loglevel `debug`.

**Note:** To keep a command from being logged, `output_loglevel=quiet` can be used.

Prior to this release, this could be done using `quiet=True`. This argument is still supported, but will be removed in a future Salt release.

PagerDuty Support

Initial support for firing events via PagerDuty has been added. See the documentation for the `pagerduty` module.

Virtual Terminal

Sometimes the subprocess module is not good enough, and, in fact, not even `askpass` is. This virtual terminal is still in its infant childhood, needs quite some love, and was originally created to replace `askpass`, but, while developing it, it immediately proved that it could do so much more. It's currently used by salt-cloud when bootstrapping salt on clouds which require the use of a password.
Proxy Minions

Initial basic support for Proxy Minions is in this release. Documentation can be found [here](https://github.com/cro/salt-proxy-rest).

Proxy minions are a developing feature in Salt that enables control of devices that cannot run a minion. Examples include network gear like switches and routers that run a proprietary OS but offer an API, or “dumb” devices that just don't have the horsepower or ability to handle a Python VM.

Proxy minions can be difficult to write, so a simple REST-based example proxy is included. A Python bottle-based webservice can be found at [https://github.com/cro/salt-proxy-rest](https://github.com/cro/salt-proxy-rest) as an endpoint for this proxy.

This is an ALPHA-quality feature. There are a number of issues with it currently, mostly centering around process control, logging, and inability to work in a masterless configuration.

Additional Bugfixes (Release Candidate Period)

Below are many of the fixes that were implemented in Salt during the release candidate phase.

- Fix mount.mounted leaving conflicting entries in fstab ([issue #7079](https://github.com/saltstack/salt/issues/7079))
- Fix mysql.returner serialization to use json ([issue #9590](https://github.com/saltstack/salt/issues/9590))
- Fix `ZMQError: Operation cannot be accomplished in current state` errors ([issue #6306](https://github.com/saltstack/salt/issues/6306))
- Rbenv and ruby improvements
- Fix quoting issues with mysql port ([issue #9568](https://github.com/saltstack/salt/issues/9568))
- Update mount module/state to support multiple swap partitions ([issue #9520](https://github.com/saltstack/salt/issues/9520))
- Fix archive state to work with bsdtar
- Clarify logs for minion ID caching
- Add numeric revision support to git state ([issue #9718](https://github.com/saltstack/salt/issues/9718))
- Update master_uri with master_ip ([issue #9694](https://github.com/saltstack/salt/issues/9694))
- Add comment to Debian mod_repo ([issue #9923](https://github.com/saltstack/salt/issues/9923))
- Fix potential undefined loop variable in rabbitmq state ([issue #8703](https://github.com/saltstack/salt/issues/8703))
- Fix for salt-virt runner to delete key on VM deletion
- Fix for `salt-run -d` to limit results to specific runner or function ([issue #9975](https://github.com/saltstack/salt/issues/9975))
- Add tracebacks to jinja renderer when applicable ([issue #10010](https://github.com/saltstack/salt/issues/10010))
- Fix parsing in monit module ([issue #10041](https://github.com/saltstack/salt/issues/10041))
- Fix highstate output from syndic minions ([issue #9732](https://github.com/saltstack/salt/issues/9732))
- Quiet logging when dealing with passwords/hashes ([issue #10000](https://github.com/saltstack/salt/issues/10000))
- Fix for multiple remotes in git_pillar ([issue #9932](https://github.com/saltstack/salt/issues/9932))
- Fix npm installed command ([issue #10109](https://github.com/saltstack/salt/issues/10109))
- Add safeguards for utf8 errors in zcbuildout module
- Fix compound commands ([issue #9746](https://github.com/saltstack/salt/issues/9746))
- Add systemd notification when master is started
- Many doc improvements
31.2.125 Salt 2014.1.1 Release Notes

**release**  2014-03-18

Version 2014.1.1 is a bugfix release for 2014.1.0. The changes include:

- Various doc fixes, including up-to-date Salt Cloud installation documentation.
- Renamed state.sls runner to state.orchestrate, to reduce confusion with the state.sls execution function
- Fix various bugs in the dig module (issue #10367)
- Add retry for query on certain EC2 status codes (issue #10154)
- Fix various bugs in mongodb_user state module (issue #10430)
- Fix permissions on ~/.salt_token (issue #10422)
- Add PyObjects support
- Fix launchctl module crash with missing files
- Fix saltutil.find_job for Windows (issue #10581)
- Fix OS detection for OpenSolaris (issue #10601)
- Fix broken salt-ssh key_deploy
- Add support for multiline cron comments (issue #10721)
- Fix timezone module for Arch (issue #10789)
- Fix symlink support for file.recurse (issue #10809)
- Fix multi-master bugs (issue #10732 and issue #10969)
- Fix file.patch to error when source file is unavailable (issue #10380)
- Fix pkg to handle packages set as purge in pkg.installed (issue #10719)
- Add zmqversion grain
- Fix highstate summary for masterless minions (issue #10945)
- Fix saltutil.find_job for 2014.1 masters talking to 0.17 minions (issue #11020)
- Fix file.recurse states with trailing slashes in source (issue #11002)
- Fix pkg states to allow pkgname.x86_64 (issue #7306)
- Make iptables states set a default table for flush (issue #11037)
- Added iptables --reject-with after final iptables call in iptables states (issue:10757)
- Fix improper passing of “family” in iptables states (issue #10774)
- Fix traceback in iptables.insert states (issue #10988)
- Fix zombie processes (issue #10867 and others)
- Fix batch mode to obey --return settings (issue #9146)
- Fix localclient issue that was causing batch mode breakage (issue #11094, issue #10470, and others)
- Multiple salt-ssh fixes
- FreeBSD: look in /usr/local/etc/salt for configuration by default, if installed using pip --editable.
- Add a skip_suggestions parameter to pkg.installed states which allows pre-flight check to be skipped (issue #11106)
- Fixed tag-based gitfs fileserver environments regression ([issue #10956](https://github.com/saltstack/salt/issues/10956))
- Yum: fix cache of available pkgs not cleared when repos are changed ([issue #11001](https://github.com/saltstack/salt/issues/11001))
- Yum: fix for plugin-provided repositories (i.e. RHN/Spacewalk) ([issue #11145](https://github.com/saltstack/salt/issues/11145))
- Fix regression in `chocolatey.bootstrap` ([issue #10541](https://github.com/saltstack/salt/issues/10541))
- Fix fail on unknown target in `jobs runner` ([issue #11151](https://github.com/saltstack/salt/issues/11151))
- Don’t log errors for commands which are expected to sometimes exit with non-zero exit status ([issue #11154](https://github.com/saltstack/salt/issues/11154), [issue #11090](https://github.com/saltstack/salt/issues/11090))
- Fix `test=True` CLI override of config option ([issue #10877](https://github.com/saltstack/salt/issues/10877))
- Log sysctl key listing at loglevel TRACE ([issue #10931](https://github.com/saltstack/salt/issues/10931))

### 31.2.126 Salt 2014.1.10 Release Notes

**release** 2014-08-01

**Note:** Version 2014.1.9 contained a regression which caused inaccurate Salt version detection, and thus was never packaged for general release. This version contains the version detection fix, but is otherwise identical to 2014.1.9.

Version 2014.1.10 is another bugfix release for 2014.1.0. Changes include:

- Ensure salt-ssh will not continue if permissions on a temporary directory are not correct.
- Use the bootstrap script distributed with Salt instead of relying on an external resource
- Remove unused testing code
- Ensure salt states are placed into the `.salt` directory in salt-ssh
- Use a randomized path for temporary files in a salt-cloud deployment
- Clean any stale directories to ensure a fresh copy of salt-ssh during a deployment

Salt 2014.1.10 fixes security issues documented by CVE-2014-3563: "Insecure tmp-file creation in seed.py, salt-ssh, and salt-cloud." Upgrading is recommended.

### 31.2.127 Salt 2014.1.11 Release Notes

**release** 2014-08-29

Version 2014.1.11 is another bugfix release for 2014.1.0. Changes include:

- Fix for minion_id with byte-order mark (BOM) ([issue #12296](https://github.com/saltstack/salt/issues/12296))
- Fix `runas` deprecation in `at` module
- Fix trailing slash behvior for `file.makedirs_` ([issue #14019](https://github.com/saltstack/salt/issues/14019))
- Fix chocolatey path ([issue #13870](https://github.com/saltstack/salt/issues/13870))
- Fix `git_pillar` infinite loop issues ([issue #14671](https://github.com/saltstack/salt/issues/14671))
- Fix json outputter null case
- Fix for minion error if one of multiple masters are down ([issue #14099](https://github.com/saltstack/salt/issues/14099))
31.2.128 Salt 2014.1.12 Release Notes

release 2014-10-08

Version 2014.1.12 is another bugfix release for 2014.1.0. Changes include:

- Fix `scp_file` always failing (which broke salt-cloud) (issue #16437)
- Fix regression in pillar in masterless (issue #16210, issue #16416, issue #16428)

31.2.129 Salt 2014.1.13 Release Notes

release 2014-10-14

Version 2014.1.13 is another bugfix release for 2014.1.0. Changes include:

- Fix `sftp_file` by checking the exit status code of scp (which broke salt-cloud) (issue #16599)

31.2.130 Salt 2014.1.2 Release Notes

release 2014-04-15

Version 2014.1.2 is another bugfix release for 2014.1.0. The changes include:

- Fix username detection when su'ed to root on FreeBSD (issue #11628)
- Fix minionfs backend for file.recurse states
- Fix 32-bit packages of different arches than the CPU arch, on 32-bit RHEL/CentOS (issue #11822)
- Fix bug with specifying alternate home dir on user creation (FreeBSD) (issue #11790)
- Don’t reload `site` module on module refresh for MacOS
- Fix regression with running execution functions in Pillar SLS (issue #11453)
- Fix some modules missing from Windows installer
- Don’t log an error for yum commands that return nonzero exit status on non-failure (issue #11645)
- Fix bug in rabbitmq state (issue #8703)
- Fix missing ssh config options (issue #10604)
- Fix `top.sls` ordering (issue #10810 and issue #11691)
- Fix `salt-key --list all` (issue #10982)
- Fix `win_servermanager install/remove` function (issue #11038)
- Fix interaction with tokens when running commands as root (issue #11223)
- Fix overstate bug with `find_job` and `**kwargs` (issue #10503)
- Fix saltenv for `aptpkg.mod_repo` from `pkgrepo` state
- Fix environment issue causing file caching problems (issue #11189)
- Fix bug in `__parse_key` in registry state (issue #11408)
- Add minion auth retry on rejection (issue #10763)
- Fix `publish_session` updating the encryption key (issue #11493)
- Fix for bad `AssertionError` raised by GitPython (issue #11473)
• Fix debian_ip to allow disabling and enabling networking on Ubuntu (issue #11164)
• Fix potential memory leak caused by saved (and unused) events (issue #11582)
• Fix exception handling in the MySQL module (issue #11616)
• Fix environment-related error (issue #11534)
• Include psutil on Windows
• Add file.replace and file.search to Windows (issue #11471)
• Add additional file module helpers to Windows (issue #11235)
• Add pid to netstat output on Windows (issue #10782)
• Fix Windows not caching new versions of installers in winrepo (issue #10597)
• Fix hardcoded md5 hashing
• Fix kwargs in salt-ssh (issue #11609)
• Fix file backup timestamps (issue #11745)
• Fix stacktrace on sys.doc with invalid eauth (issue #11293)
• Fix git.latest with test=True (issue #11595)
• Fix file.check_perms hardcoded follow_symlinks (issue #11387)
• Fix certain pkg states for RHEL5/Cent5 machines (issue #11719)

31.2.131 Salt 2014.1.3 Release Notes

release 2014-04-15

Version 2014.1.3 is another bugfix release for 2014.1.0. It was created as a hotfix for a regression found in 2014.1.2, which was not distributed. The only change made was as follows:

• Fix regression that caused saltutil.find_job to fail, causing premature terminations of salt CLI commands.

Changes in the not-distributed 2014.1.2, also included in 2014.1.3:

• Fix username detection when su'ed to root on FreeBSD (issue #11628)
• Fix minionfs backend for file.recurse states
• Fix 32-bit packages of different arches than the CPU arch, on 32-bit RHEL/CentOS (issue #11822)
• Fix bug with specifying alternate home dir on user creation (FreeBSD) (issue #11790)
• Don’t reload site module on module refresh for MacOS
• Fix regression with running execution functions in Pillar SLS (issue #11453)
• Fix some modules missing from Windows installer
• Don’t log an error for yum commands that return nonzero exit status on non-failure (issue #11645)
• Fix bug in rabbitmq state (issue #8703)
• Fix missing ssh config options (issue #10604)
• Fix top.sls ordering (issue #10810 and issue #11691)
• Fix salt-key --list all (issue #10982)
• Fix win_servermanager install/remove function (issue #11038)
• Fix interaction with tokens when running commands as root (issue #11223)
• Fix overstate bug with find_job and **kwargs (issue #10503)
• Fix saltenv for aptpkg.mod_repo from pkgrepo state
• Fix environment issue causing file caching problems (issue #11189)
• Fix bug in __parse_key in registry state (issue #11408)
• Add minion auth retry on rejection (issue #10763)
• Fix publish_session updating the encryption key (issue #11493)
• Fix for bad AssertionError raised by GitPython (issue #11473)
• Fix debian_ip to allow disabling and enabling networking on Ubuntu (issue #11164)
• Fix potential memory leak caused by saved (and unused) events (issue #11582)
• Fix exception handling in the MySQL module (issue #11616)
• Fix environment-related error (issue #11534)
• Include psutil on Windows
• Add file.replace and file.search to Windows (issue #11471)
• Add additional file module helpers to Windows (issue #11235)
• Add pid to netstat output on Windows (issue #10782)
• Fix Windows not caching new versions of installers in winrepo (issue #10597)
• Fix hardcoded md5 hashing
• Fix kwargs in salt-ssh (issue #11609)
• Fix file backup timestamps (issue #11745)
• Fix stacktrace on sys.doc with invalid eauth (issue #11293)
• Fix git.latest with test=True (issue #11595)
• Fix file.check_perms hardcoded follow_symlinks (issue #11387)
• Fix certain pkg states for RHEL5/Cent5 machines (issue #11719)

31.2.132 Salt 2014.1.4 Release Notes

    release 2014-05-05

Version 2014.1.4 is another bugfix release for 2014.1.0. Changes include:
• Fix setup.py dependency issue (issue #12031)
• Fix handling for IOErrors under certain circumstances (issue #11783 and issue #11853)
• Fix fatal exception when /proc/1/cgroup is not readable (issue #11619)
• Fix os grains for OpenSolaris (issue #11907)
• Fix lvs.zero module argument pass-through (issue #9001)
• Fix bug in debian_ip interaction with network.system state (issue #11164)
• Remove bad binary package verification code (issue #12177)
• Fix traceback in solaris package installation (issue #12237)
- Fix `file.directory` state symlink handling (issue #12209)
- Remove external_ip grain
- Fix `file.managed` makedirs issues (issue #10446)
- Fix hang on non-existent Windows drive letter for `file` module (issue #9880)
- Fix salt minion caching all users on the server (issue #9743)
- Add strftime formatting for `ps.boot_time` (issue #12428)

### 31.2.133 Salt 2014.1.5 Release Notes

release 2014-06-11

Version 2014.1.5 is another bugfix release for 2014.1.0. Changes include:

- Add function for finding cached job on the minion
- Fix iptables save file location for Debian (issue #11730)
- Fix for minion caching jobs when master is down
- Bump default `syndic_wait` to 5 to fix syndic-related problems (issue #12262)
- Add OpenBSD, FreeBSD, and NetBSD support for `network.netstat` (issue #12121)
- Fix false positive error in logs for `makeconf` state (issue #9762)
- Fix for `yum fromrepo` package installs when repo is disabled by default (issue #12466)
- Fix for extra blank lines in `file.blockreplace` (issue #12422)
- Fix grain detection for OpenVZ guests (issue #11877)
- Fix `get_dns_servers` function for Windows `win_dns_client`
- Use system locale for ports package installations
- Use correct stop/restart procedure for Debian networking in `debian_ip` (issue #12614)
- Fix for `cmd_iter/cmd_iter_no_block` blocking issues (issue #12617)
- Fix traceback when syncing custom types (issue #12883)
- Fix cleaning directory symlinks in `file.directory`
- Add performance optimizations for `saltutil.sync_all` and `state.highstate`
- Fix possible error in `saltutil.running`
- Fix for kmod modules with dashes (issue #13239)
- Fix possible race condition for Windows minions in state module reloading (issue #12370)
- Fix bug with roster for `passwd` option that is loaded as a non-string object (issue #13249)
- Keep duplicate version numbers from showing up in `pkg.list_pkgs` output
- Fixes for Jinja renderer, timezone `module/state` (issue #12724)
- Fix `timedatectl` parsing for systemd>=210 (issue #12728)
- Fix `saltenv` being written to YUM repo config files (issue #12887)
- Removed the deprecated external nodes classifier (originally accessible by setting a value for `external_nodes` in the master configuration file). Note that this functionality has been marked deprecated for some time and was replaced by the more general `master_tops` system.
• More robust escaping of ldap filter strings.
• Fix trailing slash in `gitfs_root` causing files not to be available (issue #13185)

31.2.134 Salt 2014.1.6 Release Notes

Release 2014-07-08

Version 2014.1.6 is another bugfix release for 2014.1.0. Changes include:

• Fix extra `iptables --help` output (Sorry!) (issue #13648, issue #13507, issue #13527, issue #13607)
• Fix `mount.active` for Solaris
• Fix support for `allow-hotplug` statement in `debian_ip` network module
• Add sqlite3 to esky builds
• Fix `jobs.active` output (issue #9526)
• Fix the `virtual` grain for Xen (issue #13534)
• Fix `_ext_nodes` unavailable on master (issue #13535)
• Fix eauth for batch mode (issue #9605)
• Fix force-related issues with `tomcat` support (issue #12889)
• Fix `KeyError` when cloud mapping
• Fix salt-minion restart loop in Windows (issue #12086)
• Fix detection of `service` virtual module on Fedora minions
• Fix traceback with missing `ipv4` grain (issue #13838)
• Fix issue in `roots` backend with invalid data in `mtime_map` (issue #13836)
• Fix traceback in `jobs.active` (issue #11151)
• Fix `master_top` and `_ext_nodes` issue (issue #13535, issue #13673)

31.2.135 Salt 2014.1.7 Release Notes

Release 2014-07-09

Version 2014.1.7 is another bugfix release for 2014.1.0. Changes include:

• Fix batch mode regression (issue #14046)

This release was a hotfix release for the regression listed above which was present in the 2014.1.6 release. The changes included in 2014.1.6 are listed below:

• Fix extra `iptables --help` output (Sorry!) (issue #13648, issue #13507, issue #13527, issue #13607)
• Fix `mount.active` for Solaris
• Fix support for `allow-hotplug` statement in `debian_ip` network module
• Add sqlite3 to esky builds
• Fix `jobs.active` output (issue #9526)
• Fix the `virtual` grain for Xen (issue #13534)
• Fix eauth for batch mode (issue #9605)
- Fix force-related issues with tomcat support (issue #12889)
- Fix KeyError when cloud mapping
- Fix salt-minion restart loop in Windows (issue #12086)
- Fix detection of service virtual module on Fedora minions
- Fix traceback with missing ipv4 grain (issue #13838)
- Fix issue in roots backend with invalid data in mtime_map (issue #13836)
- Fix traceback in jobs.active (issue #11151)
- Fix master_tops and _ext_nodes issue (issue #13535, issue #13673)

31.2.136 Salt 2014.1.8 Release Notes

release 2014-07-30

Note: This release contained a regression which caused inaccurate Salt version detection, and thus was never packaged for general release. Please use version 2014.1.10 instead.

Version 2014.1.8 is another bugfix release for 2014.1.0. Changes include:
- Ensure salt-ssh will not continue if permissions on a temporary directory are not correct.
- Use the bootstrap script distributed with Salt instead of relying on an external resource
- Remove unused testing code
- Ensure salt states are placed into the .salt directory in salt-ssh
- Use a randomized path for temporary files in a salt-cloud deployment
- Clean any stale directories to ensure a fresh copy of salt-ssh during a deployment

31.2.137 Salt 2014.1.9 Release Notes

release 2014-07-31

Note: This release contained a regression which caused inaccurate Salt version detection, and thus was never packaged for general release. Please use version 2014.1.10 instead.

Note: Version 2014.1.8 contained a regression which caused inaccurate Salt version detection, and thus was never packaged for general release. This version contains the version detection fix, but is otherwise identical to 2014.1.8.

Version 2014.1.9 is another bugfix release for 2014.1.0. Changes include:

31.2.138 Salt 0.10.0 Release Notes

release 2012-06-16

0.10.0 has arrived! This release comes with MANY bug fixes, and new capabilities which greatly enhance performance and reliability. This release is primarily a bug fix release with many new tests and many repaired bugs. This release also introduces a few new key features which were brought in primarily to repair bugs and some limitations found in some of the components of the original architecture.

Major Features

Event System

The Salt Master now comes equipped with a new event system. This event system has replaced some of the back end of the Salt client and offers the beginning of a system which will make plugging external applications into Salt. The event system relies on a local ZeroMQ publish socket and other processes can connect to this socket and listen for events. The new events can be easily managed via Salt’s event library.

Unprivileged User Updates

Some enhancements have been added to Salt for running as a user other than root. These new additions should make switching the user that the Salt Master is running as very painless, simply change the user option in the master configuration and restart the master, Salt will take care of all of the particulars for you.

Peer Runner Execution

Salt has long had the peer communication system used to allow minions to send commands via the salt master. 0.10.0 adds a new capability here, now the master can be configured to allow for minions to execute Salt runners via the peer_run option in the salt master configuration.

YAML Parsing Updates

In the past the YAML parser for sls files would return the incorrect numbers when the file mode was set with a preceding 0. The YAML parser used in Salt has been modified to no longer convert these number into octal but to keep them as the correct value so that sls files can be a little cleaner to write.

State Call Data Files

It was requested that the minion keep a local cache of the most recent executed state run. This has been added and now with state runs the data is stored in a msgpack file in the minion’s cachedir.
Turning Off the Job Cache

A new option has been added to the master configuration file. In previous releases the Salt client would look over the Salt job cache to read in the minion return data. With the addition of the event system the Salt client can now watch for events directly from the master worker processes.

This means that the job cache is no longer a hard requirement. Keep in mind though, that turning off the job cache means that historic job execution data cannot be retrieved.

Test Updates

Minion Swarms Are Faster

To continue our efforts with testing Salt’s ability to scale the minionswarm script has been updated. The minionswarm can now start up minions much faster than it could before and comes with a new feature allowing modules to be disabled, thus lowering the minion’s footprint when making a swarm. These new updates have allows us to test

```
# python minionswarm.py -m 20 --master salt-master
```

Many Fixes

To get a good idea for the number of bugfixes this release offers take a look at the closed tickets for 0.10.0, this is a very substantial update:

Master and Minion Stability Fixes

As Salt deployments grow new ways to break Salt are discovered. 0.10.0 comes with a number of fixes for the minions and master greatly improving Salt stability.

```
release 2012-06-19
```

31.2.140 Salt 0.10.2 Release Notes

```
release 2012-07-30
```

0.10.2 is out! This release comes with enhancements to the pillar interface, cleaner ways to access the salt-call capabilities in the API, minion data caching and the event system has been added to salt minions.

There have also been updates to the ZeroMQ functions, many more tests (thanks to sponsors, the code sprint and many contributors) and a swath of bug fixes.
Major Features

Ext Pillar Modules

The ranks of available Salt modules directories sees a new member in 0.10.2. With the popularity of pillar a higher demand has arisen for ext_pillar interfaces to be more like regular Salt module additions. Now ext_pillar interfaces can be added in the same way as other modules, just drop it into the pillar directory in the salt source.

Minion Events

In 0.10.0 an event system was added to the Salt master. 0.10.2 adds the event system to the minions as well. Now event can be published on a local minion as well.

The minions can also send events back up to the master. This means that Salt is able to communicate individual events from the minions back up to the Master which are not associated with command.

Minion Data Caching

When pillar was introduced the landscape for available data was greatly enhanced. The minion's began sending grain data back to the master on a regular basis.

The new config option on the master called minion_data_cache instructs the Salt master to maintain a cache of the minion's grains and pillar data in the cachedir. This option is turned off by default to avoid hitting the disk more, but when enabled the cache is used to make grain matching from the salt command more powerful, since the minions that will match can be predetermined.

Backup Files

By default all files replaced by the file.managed and file.recurse states we simply deleted. 0.10.2 adds a new option. By setting the backup option to minion the files are backed up before they are replaced.

The backed up files are located in the cachedir under the file_backup directory. On a default system this will be at: /var/cache/salt/file_backup

Configuration files

salt-master and salt-minion automatically load additional configuration files from master.d/*.conf respective minion.d/*.conf where master.d/minion.d is a directory in the same directory as the main configuration file.

Salt Key Verification

A number of users complained that they had inadvertently deleted the wrong salt authentication keys. 0.10.2 now displays what keys are going to be deleted and verifies that they are the keys that are intended for deletion.
Key auto-signing

If `autosign_file` is specified in the configuration file incoming keys will be compared to the list of keynames in `autosign_file`. Regular expressions as well as globbing is supported.

The file must only be writable by the user otherwise the file will be ignored. To relax the permission and allow group write access set the `permissive_pki_access` option.

Module changes

Improved OpenBSD support

New modules for managing services and packages were provided by Joshua Elsasser to further improve the support for OpenBSD.

Existing modules like the `disk` module were also improved to support OpenBSD.

SQL Modules

The MySQL and PostgreSQL modules have both received a number of additions thanks to the work of Avi Marcus and Roman Imankulov.

ZFS Support on FreeBSD

A new ZFS module has been added by Kurtis Velarde for FreeBSD supporting various ZFS operations like creating, extending or removing zpools.

Augeas

A new Augeas module by Ulrich Dangel for editing and verifying config files.

Native Debian Service module

The support for the Debian was further improved with an new service module for Debian by Ahmad Khayyat supporting `disable` and `enable`.

Cassandra

Cassandra support has been added by Adam Garside. Currently only status and diagnostic information are supported.
Networking

The networking support for RHEL has been improved and supports bonding support as well as zeroconf configuration.

Monit

Basic monit support by Kurtis Velarde to control services via monit.

nzbget

Basic support for controlling nzbget by Joseph Hall

Bluetooth

Basic bluez support for managing and controlling Bluetooth devices. Supports scanning as well as pairing/unpairing by Joseph Hall.

Test Updates

Consistency Testing

Another testing script has been added. A bug was found in pillar when many minions generated pillar data at the same time. The new consist.py script is the tests directory was created to reproduce bugs where data should always be consistent.

Master and Minion Stability Fixes

As Salt deployments grow new ways to break Salt are discovered. 0.10.2 comes with a number of fixes for the minions and master greatly improving Salt stability.

31.2.141 Salt 0.10.3 Release Notes

release 2012-09-30

The latest taste of Salt has come, this release has many fixes and feature additions. Modifications have been made to make ZeroMQ connections more reliable, the beginning of the ACL system is in place, a new command line parsing system has been added, dynamic module distribution has become more environment aware, the new master_finger option and many more!
Major Features

ACL System

The new ACL system has been introduced. The ACL system allows for system users other than root to execute salt commands. Users can be allowed to execute specific commands in the same way that minions are opened up to the peer system.

The configuration value to open up the ACL system is called `client_acl` and is configured like so:

```
client_acl:
  fred:
    - test.*
    - pkg.list_pkgs
```

Where `fred` is allowed access to functions in the test module and to the `pkg.list_pkgs` function.

Master Finger Option

The `master_finger` option has been added to improve the security of minion provisioning. The `master_finger` option allows for the fingerprint of the master public key to be set in the configuration file to double verify that the master is valid. This option was added in response to a motivation to pre-authenticate the master when provisioning new minions to help prevent man in the middle attacks in some situations.

Salt Key Fingerprint Generation

The ability to generate fingerprints of keys used by Salt has been added to `salt-key`. The new option `finger` accepts the name of the key to generate and display a fingerprint for.

```
salt-key -F master
```

Will display the fingerprints for the master public and private keys.

Parsing System

Pedro Algavio, aka s0undt3ch, has added a substantial update to the command line parsing system that makes the help message output much cleaner and easier to search through. Salt parsers now have `--versions-report` besides usual `--version` info which you can provide when reporting any issues found.

Key Generation

We have reduced the requirements needed for `salt-key` to generate minion keys. You’re no longer required to have salt configured and its common directories created just to generate keys. This might prove useful if you’re batch creating keys to pre-load on minions.
Startup States

A few configuration options have been added which allow for states to be run when the minion daemon starts. This can be a great advantage when deploying with Salt because the minion can apply states right when it first runs. To use startup states set the `startup_states` configuration option on the minion to `highstate`.

New Exclude Declaration

Some users have asked about adding the ability to ensure that other sls files or ids are excluded from a state run. The `exclude` statement will delete all of the data loaded from the specified sls file or will delete the specified id:

```yaml
exclude:
  - sls: http
  - id: /etc/vimrc
```

Max Open Files

While we're currently unable to properly handle ZeroMQ's abort signals when the max open files is reached, due to the way that's handled on ZeroMQ's, we have minimized the chances of this happening without at least warning the user.

More State Output Options

Some major changes have been made to the state output system. In the past state return data was printed in a very verbose fashion and only states that failed or made changes were printed by default. Now two options can be passed to the master and minion configuration files to change the behavior of the state output. State output can be set to verbose (default) or non-verbose with the `state_verbose` option:

```yaml
state_verbose: False
```

It is noteworthy that the `state_verbose` option used to be set to `False` by default but has been changed to `True` by default in 0.10.3 due to many requests for the change.

The next option to be aware of new and called `state_output`. This option allows for the state output to be set to `full` (default) or `terse`.

The `full` output is the standard state output, but the new `terse` output will print only one line per state making the output much easier to follow when executing a large state system.

```yaml
state_output: terse
```

`state.file.append` Improvements

The salt `state.file.append()` tries not to append existing text. Previously the matching check was being made line by line. While this kind of check might be enough for most cases, if the text being appended was multi-line, the check would not work properly. This issue is now properly handled, the match is done as a whole ignoring any white space addition or removal except inside commas. For those thinking that, in order to properly match over multiple lines, salt will load the whole file into memory, that's not true. For most cases this is not important but an erroneous order to read a 4GB file, if not properly handled, like salt does, could make salt chew that amount of memory. Salt has a buffered file reader which will keep in memory a maximum of 256KB and iterates over the file in chunks of 32KB to test for the match, more than enough, if not, explain your usage on a ticket. With this change, also
`salt.modules.file.contains()`, `salt.modules.file.contains_regex()`, `salt.modules.file.contains_glob()` and `salt.utils.find` now do the searching and/or matching using the buffered chunks approach explained above.

Two new keyword arguments were also added, `makedirs` and `source`. The first, `makedirs` will create the necessary directories in order to append to the specified file, of course, it only applies if we're trying to append to a non-existing file on a non-existing directory:

```bash
/tmp/salttest/file-append-makedirs:
  file.append:
    text: foo
    makedirs: True
```

The second, `source`, allows one to append the contents of a file instead of specifying the text.

```bash
/tmp/salttest/file-append-source:
  file.append:
    - source: salt://testfile
```

Security Fix

A timing vulnerability was uncovered in the code which decrypts the AES messages sent over the network. This has been fixed and upgrading is strongly recommended.

31.2.142 Salt 0.10.4 Release Notes

**release** 2012-10-23

Salt 0.10.4 is a monumental release for the Salt team, with two new module systems, many additions to allow granular access to Salt, improved platform support and much more.

This release is also exciting because we have been able to shorten the release cycle back to under a month. We are working hard to keep up the aggressive pace and look forward to having releases happen more frequently!

This release also includes a serious security fix and all users are very strongly recommended to upgrade. As usual, upgrade the master first, and then the minion to ensure that the process is smooth.

**Major Features**

**External Authentication System**

The new external authentication system allows for Salt to pass through authentication to any authentication system to determine if a user has permission to execute a Salt command. The Unix PAM system is the first supported system with more to come!

The external authentication system allows for specific users to be granted access to execute specific functions on specific minions. Access is configured in the master configuration file, and uses the new access control system:

```yaml
external_auth:
  pam:
    thatch:
      - 'web*':
        - test.*
        - network.*
```
The configuration above allows the user *thatch* to execute functions in the test and network modules on minions that match the `web*` target.

**Access Control System**

All Salt systems can now be configured to grant access to non-administrative users in a granular way. The old configuration continues to work. Specific functions can be opened up to specific minions from specific users in the case of external auth and client ACLs, and for specific minions in the case of the peer system.

Access controls are configured like this:

```yaml
client_acl:
  fred:
    - web\*:
      - pkg.list_pkgs
      - test.*
      - apache.*
```

**Target by Network**

A new matcher has been added to the system which allows for minions to be targeted by network. This new matcher can be called with the `-S` flag on the command line and is available in all places that the matcher system is available. Using it is simple:

```
$ salt -S '192.168.1.0/24' test.ping
$ salt -S '192.168.1.100' test.ping
```

**Nodegroup Nesting**

Previously a nodegroup was limited by not being able to include another nodegroup, this restraint has been lifted and now nodegroups will be expanded within other nodegroups with the `N@` classifier.

**Salt Key Delete by Glob**

The ability to delete minion keys by glob has been added to `salt-key`. To delete all minion keys whose minion name starts with 'web':

```
$ salt-key -d 'web*'
```

**Master Tops System**

The `external_nodes` system has been upgraded to allow for modular subsystems to be used to generate the top file data for a highstate run.

The `external_nodes` option still works but will be deprecated in the future in favor of the new `master_tops` option.

Example of using `master_tops`:

```yaml
master_tops:
  ext_nodes: cobbler-external-nodes
```
Next Level Solaris Support

A lot of work has been put into improved Solaris support by Romeo Theriault. Packaging modules (pkgadd/pkgrm and pkgutil) and states, cron support and user and group management have all been added and improved upon. These additions along with SMF (Service Management Facility) service support and improved Solaris grain detection in 0.10.3 add up to Salt becoming a great tool to manage Solaris servers with.

Security

A vulnerability in the security handshake was found and has been repaired, old minions should be able to connect to a new master, so as usual, the master should be updated first and then the minions.

Pillar Updates

The pillar communication has been updated to add some extra levels of verification so that the intended minion is the only one allowed to gather the data. Once all minions and the master are updated to salt 0.10.4 please activate pillar 2 by changing the pillar_version in the master config to 2. This will be set to 2 by default in a future release.

31.2.143 Salt 0.10.5 Release Notes

Salt 0.10.5 is ready, and comes with some great new features. A few more interfaces have been modularized, like the outputter system. The job cache system has been made more powerful and can now store and retrieve jobs archived in external databases. The returner system has been extended to allow minions to easily retrieve data from a returner interface.

As usual, this is an exciting release, with many noteworthy additions!

Major Features

External Job Cache

The external job cache is a system which allows for a returner interface to also act as a job cache. This system is intended to allow users to store job information in a central location for longer periods of time and to make the act of looking up information from jobs executed on other minions easier.

Currently the external job cache is supported via the mongo and redis returners:

```
ext_job_cache: redis
redis.host: salt
```

Once the external job cache is turned on the new ret module can be used on the minions to retrieve return information from the job cache. This can be a great way for minions to respond and react to other minions.
OpenStack Additions

OpenStack integration with Salt has been moving forward at a blistering pace. The new nova, glance, and keystone modules represent the beginning of ongoing OpenStack integration.

The Salt team has had many conversations with core OpenStack developers and is working on linking to OpenStack in powerful new ways.

Wheel System

A new API was added to the Salt Master which allows the master to be managed via an external API. This new system allows Salt API to easily hook into the Salt Master and manage configs, modify the state tree, manage the pillar and more. The main motivation for the wheel system is to enable features needed in the upcoming web UI so users can manage the master just as easily as they manage minions.

The wheel system has also been hooked into the external auth system. This allows specific users to have granular access to manage components of the Salt Master.

Render Pipes

Jack Kuan has added a substantial new feature. The render pipes system allows Salt to treat the render system like unix pipes. This new system enables sls files to be passed through specific render engines. While the default renderer is still recommended, different engines can now be more easily merged. So to pipe the output of Mako used in YAML use this shebang line:

```
#!/mako|yaml
```

Salt Key Overhaul

The Salt Key system was originally developed as only a CLI interface, but as time went on it was pressed into becoming a clumsy API. This release marks a complete overhaul of Salt Key. Salt Key has been rewritten to function purely from an API and to use the outputter system. The benefit here is that the outputter system works much more cleanly with Salt Key now, and the internals of Salt Key can be used much more cleanly.

Modular Outputters

The outputter system is now loaded in a modular way. This means that output systems can be more easily added by dropping a python file down on the master that contains the function output.

Gzip from Fileserver

Gzip compression has been added as an option to the cp.get_file and cp.get_dir commands. This will make file transfers more efficient and faster, especially over slower network links.
Unified Module Configuration

In past releases of Salt, the minions needed to be configured for certain modules to function. This was difficult because it required pre-configuring the minions. 0.10.5 changes this by making all module configs on minions search the master config file for values.

Now if a single database server is needed, then it can be defined in the master config and all minions will become aware of the configuration value.

Salt Call Enhancements

The `salt-call` command has been updated in a few ways. Now, `salt-call` can take the `--return` option to send the data to a returner. Also, `salt-call` now reports executions in the minion proc system, this allows the master to be aware of the operation `salt-call` is running.

Death to `pub_refresh` and `sub_timeout`

The old configuration values `pub_refresh` and `sub_timeout` have been removed. These options were in place to alleviate problems found in earlier versions of ZeroMQ which have since been fixed. The continued use of these options has proven to cause problems with message passing and have been completely removed.

Git Revision Versions

When running Salt directly from git (for testing or development, of course) it has been difficult to know exactly what code is being executed. The new versioning system will detect the git revision when building and how many commits have been made since the last release. A release from git will look like this:

0.10.4-736-gec74d69

Svn Module Addition

Anthony Cornehl (twinshadow) contributed a module that adds Subversion support to Salt. This great addition helps round out Salt's VCS support.

Noteworthy Changes

Arch Linux Defaults to Systemd

Arch Linux recently changed to use systemd by default and discontinued support for init scripts. Salt has followed suit and defaults to systemd now for managing services in Arch.
Salt, Salt Cloud and Openstack

With the releases of Salt 0.10.5 and Salt Cloud 0.8.2, OpenStack becomes the first (non-OS) piece of software to include support both on the user level (with Salt Cloud) and the admin level (with Salt). We are excited to continue to extend support of other platforms at this level.

31.2.144 Salt 0.11.0 Release Notes

release 2012-12-14

Salt 0.11.0 is here, with some highly sought after and exciting features. These features include the new overstate system, the reactor system, a new state run scope component called __context__, the beginning of the search system (still needs a great deal of work), multiple package states, the MySQL returner and a better system to arbitrarily reference outputters.

It is also noteworthy that we are changing how we mark release numbers. For the life of the project we have been pushing every release with features and fixes as point releases. We will now be releasing point releases for only bug fixes on a more regular basis and major feature releases on a slightly less regular basis. This means that the next release will be a bugfix only release with a version number of 0.11.1. The next feature release will be named 0.12.0 and will mark the end of life for the 0.11 series.

Major Features

OverState

The overstate system is a simple way to manage rolling state executions across many minions. The overstate allows for a state to depend on the successful completion of another state.

Reactor System

The new reactor system allows for a reactive logic engine to be created which can respond to events within a salted environment. The reactor system uses sls files to match events fired on the master with actions, enabling Salt to react to problems in an infrastructure.

Your load-balanced group of webservers is under extra load? Spin up a new VM and add it to the group. Your fileserver is filling up? Send a notification to your sysadmin on call. The possibilities are endless!

Module Context

A new component has been added to the module loader system. The module context is a data structure that can hold objects for a given scope within the module.

This allows for components that are initialized to be stored in a persistent context which can greatly speed up ongoing connections. Right now the best example can be found in the cp execution module.
Multiple Package Management

A long desired feature has been added to package management. By definition Salt States have always installed packages one at a time. On most platforms this is not the fastest way to install packages. Erik Johnson, aka terminalmage, has modified the package modules for many providers and added new capabilities to install groups of packages. These package groups can be defined as a list of packages available in repository servers:

```yaml
python_pkgs:
  pkg.installed:
    - pkgs:
      - python-mako
      - whoosh
      - python-git
```

or specify based on the location of specific packages:

```yaml
python_pkgs:
  pkg.installed:
    - sources:
      - python-mako: http://some-rpms.org/python-mako.rpm
      - whoosh: salt://whoosh/whoosh.rpm
      - python-git: ftp://companyserver.net/python-git.rpm
```

Search System

The bones to the search system have been added. This is a very basic interface that allows for search backends to be added as search modules. The first supported search module is the whoosh search backend. Right now only the basic paths for the search system are in place, making this very experimental. Further development will involve improving the search routines and index routines for whoosh and other search backends.

The search system has been made to allow for searching through all of the state and pillar files, configuration files and all return data from minion executions.

Notable Changes

All previous versions of Salt have shared many directories between the master and minion. The default locations for keys, cached data and sockets has been shared by master and minion. This has created serious problems with running a master and a minion on the same systems. 0.11.0 changes the defaults to be separate directories. Salt will also attempt to migrate all of the old key data into the correct new directories, but if it is not successful it may need to be done manually. If your keys exhibit issues after updating make sure that they have been moved from `/etc/salt/pki` to `/etc/salt/pki/{master, minion}`.

The old setup will look like this:

```
/etc/salt/pki
|-- master.pem
|-- master.pub
|-- minions
 | `-- ragnarok.saltstack.net
 | `-- minions_pre
|-- minion.pem
|-- minion.pub
|-- minion_master.pub
|-- minions_pre
 `-- minions_rejected
```
With the accepted minion keys in `/etc/salt/pki/minions`, the new setup places the accepted minion keys in `/etc/salt/pki/master/minions`.

```
/etc/salt/pki
|-- master
| |-- master.pem
| |-- master.pub
| |-- minions
| | |-- ragnarok.saltstack.net
| | |-- minions_pre
| | |-- minions_rejected
| -- minion
| |-- minion.pem
| |-- minion.pub
| `-- minion_master.pub
```

31.2.145 Salt 0.11.1 Release Notes

release 2012-12-19

31.2.146 Salt 0.12.0 Release Notes

release 2013-01-15

Another feature release of Salt is here! Some exciting additions are included with more ways to make salt modular and even easier management of the salt file server.

**Major Features**

**Modular Fileserver Backend**

The new modular fileserver backend allows for any external system to be used as a salt file server. The main benefit here is that it is now possible to tell the master to directly use a git remote location, or many git remote locations, automatically mapping git branches and tags to salt environments.

**Windows is First Class!**

A new Salt Windows installer is now available! Much work has been put in to improve Windows support. With this much easier method of getting Salt on your Windows machines, we hope even more development and progress will occur. Please file bug reports on the Salt GitHub repo issue tracker so we can continue improving.

One thing that is missing on Windows that Salt uses extensively is a software package manager and a software package repository. The Salt pkg state allows sys admins to install software across their infrastructure and across operating systems. Software on Windows can now be managed in the same way. The SaltStack team built a package manager that interfaces with the standard Salt pkg module to allow for installing and removing software on Windows. In addition, a software package repository has been built on top of the Salt fileserver. A small YAML file provides the information necessary for the package manager to install and remove software.

An interesting feature of the new Salt Windows software package repository is that one or more remote git repositories can supplement the master's local repository. The repository can point to software on the master's fileserver or on an HTTP, HTTPS, or ftp server.
New Default Outputter

Salt displays data to the terminal via the outputter system. For a long time the default outputter for Salt has been the python pretty print library. While this has been a generally reasonable outputter, it did have many failings. The new default outputter is called "nested", it recursively scans return data structures and prints them out cleanly.

If the result of the new nested outputter is not desired any other outputter can be used via the --out option, or the output option can be set in the master and minion configs to change the default outputter.

Internal Scheduler

The internal Salt scheduler is a new capability which allows for functions to be executed at given intervals on the minion, and for runners to be executed at given intervals on the master. The scheduler allows for sequences such as executing state runs (locally on the minion or remotely via an overstate) or continually gathering system data to be run at given intervals.

The configuration is simple, add the schedule option to the master or minion config and specify jobs to run, this in the master config will execute the state.over runner every 60 minutes:

```
schedule:
  overstate:
    function: state.over
    minutes: 60
```

This example for the minion configuration will execute a highstate every 30 minutes:

```
schedule:
  highstate:
    function: state.highstate
    minutes: 30
```

Optional DSL for SLS Formulas

Jack Kuan, our renderer expert, has created something that is astonishing. Salt, now comes with an optional Python based DSL, this is a very powerful interface that makes writing SLS files in pure python easier than it was with the raw py renderer. As usual this can be used with the renderer shebang line, so a single sls can be written with the DSL if pure python power is needed while keeping other sls files simple with YAML.

Set Grains Remotely

A new execution function and state module have been added that allows for grains to be set on the minion. Now grains can be set via a remote execution or via states. Use the grains.present state or the grains.setval execution functions.
Gentoo Additions

Major additions to Gentoo specific components have been made. The encompasses executions modules and states ranging from supporting the make.conf file to tools like layman.

31.2.147 Salt 0.12.1 Release Notes

release 2013-01-21

31.2.148 Salt 0.13.0 Release Notes

release 2013-02-12

The lucky number 13 has turned the corner! From CLI notifications when quitting a salt command, to substantial improvements on Windows, Salt 0.13.0 has arrived!

Major Features

Improved file.recurse Performance

The file.recurse system has been deployed and used in a vast array of situations. Fixes to the file state and module have led towards opening up new ways of running file.recurse to make it faster. Now the file.recurse state will download fewer files and will run substantially faster.

Windows Improvements

Minion stability on Windows has improved. Many file operations, including file.recurse, have been fixed and improved. The network module works better, to include network.interfaces. Both 32bit and 64bit installers are now available.

Nodegroup Targeting in Peer System

In the past, nodegroups were not available for targeting via the peer system. This has been fixed, allowing the new nodegroup expr_form argument for the publish.publish function:

    salt-call publish.publish group1 test.ping expr_form=nodegroup

Blacklist Additions

Additions allowing more granular blacklisting are available in 0.13.0. The ability to blacklist users and functions in client_acl have been added, as well as the ability to exclude state formulas from the command line.
Salt Documentation, Release 3004.2

Command Line Pillar Embedding
Pillar data can now be embedded on the command line when calling state.sls and state.highstate. This
allows for on the fly changes or settings to pillar and makes parameterizing state formulas even easier. This is done
via the keyword argument:
salt '*' state.highstate pillar='{"cheese": "spam"}'

The above example will extend the existing pillar to hold the cheese key with a value of spam. If the cheese key
is already specified in the minion's pillar then it will be overwritten.
CLI Notifications
In the past hitting ctrl-C and quitting from the salt command would just drop to a shell prompt, this caused
confusion with users who expected the remote executions to also quit. Now a message is displayed showing what
command can be used to track the execution and what the job id is for the execution.
Version Specification in Multiple-Package States
Versions can now be specified within multiple-package pkg.installed states. An example can be found below:
mypkgs:
pkg.installed:
- pkgs:
- foo
- bar: 1.2.3-4
- baz

Noteworthy Changes
The configuration subsystem in Salt has been overhauled to make the opts dict used by Salt applications more
portable, the problem is that this is an incompatible change with salt-cloud, and salt-cloud will need to be updated
to the latest git to work with Salt 0.13.0. Salt Cloud 0.8.5 will also require Salt 0.13.0 or later to function.
The SaltStack team is sorry for the inconvenience here, we work hard to make sure these sorts of things do not
happen, but sometimes hard changes get in.

31.2.152 Salt 0.14.0 Release Notes

release 2013-03-23

Salt 0.14.0 is here! This release was held up primarily by PyCon, Scale, and illness, but has arrived! 0.14.0 comes with many new features and is breaking ground for Salt in the area of cloud management with the introduction of Salt providing basic cloud controller functionality.

Major Features

Salt - As a Cloud Controller

This is the first primitive inroad to using Salt as a cloud controller is available in 0.14.0. Be advised that this is alpha, only tested in a few very small environments.

The cloud controller is built using qemu and libvirt for the hypervisors. Hypervisors are autodetected as minions and only need to have libvirt running and kvm installed to function. The features of the Salt cloud controller are as follows:

- Basic vm discovery and reporting
- Creation of new virtual machines
- Seeding virtual machines with Salt via qemu-nbd or libguestfs
- Live migration (shared and non shared storage)
- Delete existing VMs

It is noteworthy that this feature is still Alpha, meaning that all rights are reserved to change the interface if needs be in future releases!

Libvirt State

One of the problems with libvirt is management of certificates needed for live migration and cross communication between hypervisors. The new libvirt state makes the Salt Master hold a CA and manage the signing and distribution of keys onto hypervisors, just add a call to the libvirt state in the sls formulas used to set up a hypervisor:

```
libvirt_keys:
    libvirt.keys
```
New get Functions

An easier way to manage data has been introduced. The pillar, grains, and config execution modules have been extended with the new get function. This function works much in the same way as the get method in a python dict, but with an enhancement, nested dict components can be extracted using a : delimiter.

If a structure like this is in pillar:

```
foo:
  bar:
    baz: quo
```

Extracting it from the raw pillar in an sls formula or file template is done this way:

```
{{ pillar['foo']['bar']['baz'] }}
```

Now with the new get function the data can be safely gathered and a default can be set allowing the template to fall back if the value is not available:

```
{{ salt['pillar.get']('foo:bar:baz', 'qux') }}
```

This makes handling nested structures much easier, and defaults can be cleanly set. This new function is being used extensively in the new formulae repository of salt sls formulas.

release 2013-04-13

31.2.154 Salt 0.15.0 Release Notes

release 2013-05-03

The many new features of Salt 0.15.0 have arrived! Salt 0.15.0 comes with many smaller features and a few larger ones.

These features range from better debugging tools to the new Salt Mine system.

Major Features

The Salt Mine

First there was the peer system, allowing for commands to be executed from a minion to other minions to gather data live. Then there was the external job cache for storing and accessing long term data. Now the middle ground is being filled in with the Salt Mine. The Salt Mine is a system used to execute functions on a regular basis on minions and then store only the most recent data from the functions on the master, then the data is looked up via targets.

The mine caches data that is public to all minions, so when a minion posts data to the mine all other minions can see it.
IPV6 Support

0.13.0 saw the addition of initial IPV6 support but errors were encountered and it needed to be stripped out. This time the code covers more cases and must be explicitly enabled. But the support is much more extensive than before.

Copy Files From Minions to the Master

Minions have long been able to copy files down from the master file server, but until now files could not be easily copied from the minion up to the master.

A new function called `cp.push` can push files from the minions up to the master server. The uploaded files are then cached on the master in the master cachedir for each minion.

Better Template Debugging

Template errors have long been a burden when writing states and pillar. 0.15.0 will now send the compiled template data to the debug log, this makes tracking down the intermittent stage templates much easier. So running `state.sls` or `state.highstate` with `-l debug` will now print out the rendered templates in the debug information.

State Event Firing

The state system is now more closely tied to the master's event bus. Now when a state fails the failure will be fired on the master event bus so that the reactor can respond to it.

Major Syndic Updates

The Syndic system has been basically re-written. Now it runs in a completely asynchronous way and functions primarily as an event broker. This means that the events fired on the syndic are now pushed up to the higher level master instead of the old method used which waited for the client libraries to return.

This makes the syndic much more accurate and powerful, it also means that all events fired on the syndic master make it up the pipe as well making a reactor on the higher level master able to react to minions further downstream.

Peer System Updates

The Peer System has been updated to run using the client libraries instead of firing directly over the publish bus. This makes the peer system much more consistent and reliable.

Minion Key Revocation

In the past when a minion was decommissioned the key needed to be manually deleted on the master, but now a function on the minion can be used to revoke the calling minion's key:

```
$ salt-call saltutil.revoke_auth
```
Function Return Codes

Functions can now be assigned numeric return codes to determine if the function executed successfully. While not all functions have been given return codes, many have and it is an ongoing effort to fill out all functions that might return a non-zero return code.

Functions in Overstate

The overstate system was originally created to just manage the execution of states, but with the addition of return codes to functions, requisite logic can now be used with respect to the overstate. This means that an overstate stage can now run single functions instead of just state executions.

Pillar Error Reporting

Previously if errors surfaced in pillar, then the pillar would consist of only an empty dict. Now all data that was successfully rendered stays in pillar and the render error is also made available. If errors are found in the pillar, states will refuse to run.

Using Cached State Data

Sometimes states are executed purely to maintain a specific state rather than to update states with new configs. This is grounds for the new cached state system. By adding `cache=True` to a state call the state will not be generated fresh from the master but the last state data to be generated will be used. If no previous state data is available then fresh data will be generated.

Monitoring States

The new monitoring states system has been started. This is very young but allows for states to be used to configure monitoring routines. So far only one monitoring state is available, the `disk.status` state. As more capabilities are added to Salt UI the monitoring capabilities of Salt will continue to be expanded.

31.2.155 Salt 0.15.1 Release Notes

release 2013-05-08

The 0.15.1 release has been posted, this release includes fixes to a number of bugs in 0.15.1 and a three security patches.

Security Updates

A number of security issues have been resolved via the 0.15.1 release.
Path Injection in Minion IDs

Salt masters did not properly validate the id of a connecting minion. This can lead to an attacker uploading files to the master in arbitrary locations. In particular this can be used to bypass the manual validation of new unknown minions. Exploiting this vulnerability does not require authentication.

This issue affects all known versions of Salt.

This issue was reported by Ronald Volgers.

Patch

The issue is fixed in Salt 0.15.1. Updated packages are available in the usual locations.

Specific commits:
https://github.com/saltstack/salt/commit/5427b9438e452a5a8910d9128c6aafb45d8fd5d3
https://github.com/saltstack/salt/commit/7560908ee62351769c3cd43b03d74c1ca772cc52
https://github.com/saltstack/salt/commit/e200b8a7ff53780124e08d2bdefde7587e52bfca

RSA Key Generation Fault

RSA key generation was done incorrectly, leading to very insecure keys. It is recommended to regenerate all RSA keys.

This issue can be used to impersonate Salt masters or minions, or decrypt any transferred data.

This issue can only be exploited by attackers who are able to observe or modify traffic between Salt minions and the legitimate Salt master.

A tool was included in 0.15.1 to assist in mass key regeneration, the manage.regen_keys runner.

This issue affects all known versions of Salt.

This issue was reported by Ronald Volgers.

Patch

The issue is fixed in Salt 0.15.1. Updated packages are available in the usual locations.

Specific commits:
https://github.com/saltstack/salt/commit/5dd304276ba5745ec21fc1e6686a0b28da29e6fc

Command Injection Via ext_pillar

Arbitrary shell commands could be executed on the master by an authenticated minion through options passed when requesting a pillar.

Ext pillar options have been restricted to only allow safe external pillars to be called when prompted by the minion.

This issue affects Salt versions from 0.14.0 to 0.15.0.

This issue was reported by Ronald Volgers.

release 2013-06-01

31.2.158 Salt 0.16.0 Release Notes

release 2013-07-01
The 0.16.0 release is an exciting one, with new features in master redundancy, and a new, powerful requisite.

Major Features

Multi-Master

This new capability allows for a minion to be actively connected to multiple salt masters at the same time. This allows for multiple masters to send out commands to minions and for minions to automatically reconnect to masters that have gone down. A tutorial is available to help get started here:

Multi Master Tutorial

Prereq, the New Requisite

The new prereq requisite is very powerful! It allows for states to execute based on a state that is expected to make changes in the future. This allows for a change on the system to be preempted by another execution. A good example is needing to shut down a service before modifying files associated with it, allowing, for instance, a webserver to be shut down allowing a load balancer to stop sending requests while server side code is updated. In this case, the prereq will only run if changes are expected to happen in the prerequired state, and the prerequired state will always run after the prereq state and only if the prereq state succeeds.
Peer System Improvements

The peer system has been revamped to make it more reliable, faster, and like the rest of Salt, async. The peer calls when an updated minion and master are used together will be much faster!

Relative Includes

The ability to include an sls relative to the defined sls has been added, the new syntax id documented here:

Includes

More State Output Options

The state_output option in the past only supported full and terse, 0.16.0 add the mixed and changes modes further refining how states are sent to users' eyes.

Improved Windows Support

Support for Salt on Windows continues to improve. Software management on Windows has become more seamless with Linux/UNIX/BSD software management. Installed software is now recognized by the short names defined in the repository SLS. This makes it possible to run salt '*' pkg.version firefox and get back results from Windows and non-Windows minions alike.

When templating files on Windows, Salt will now correctly use Windows appropriate line endings. This makes it much easier to edit and consume files on Windows.

When using the cmd state the shell option now allows for specifying Windows Powershell as an alternate shell to execute cmd.run and cmd.script. This opens up Salt to all the power of Windows Powershell and its advanced Windows management capabilities.

Several fixes and optimizations were added for the Windows networking modules, especially when working with IPv6.

A system module was added that makes it easy to restart and shutdown Windows minions.

The Salt Minion will now look for its config file in c:\salt\conf by default. This means that it's no longer necessary to specify the -c option to specify the location of the config file when starting the Salt Minion on Windows in a terminal.

Multiple Targets for pkg.removed, pkg.purged States

Both pkg.removed and pkg.purged now support the pkgs argument, which allow for multiple packages to be targeted in a single state. This, as in pkg.installed, helps speed up these states by reducing the number of times that the package management tools (apt, yum, etc.) need to be run.
Random Times in Cron States

The temporal parameters in `cron.present` states (minute, hour, etc.) can now be randomized by using `random` instead of a specific value. For example, by using the `random` keyword in the `minute` parameter of a cron state, the same cron job can be pushed to hundreds or thousands of hosts, and they would each use a randomly-generated minute. This can be helpful when the cron job accesses a network resource, and it is not desirable for all hosts to run the job concurrently.

```
/path/to/cron/script:
  cron.present:
    - user: root
    - minute: random
    - hour: 2
```

Since Salt assumes a value of `*` for unspecified temporal parameters, adding a parameter to the state and setting it to `random` will change that value from `*` to a randomized numeric value. However, if that field in the cron entry on the minion already contains a numeric value, then using the `random` keyword will not modify it.

Confirmation Prompt on Key Acceptance

When accepting new keys with `salt-key -a minion-id` or `salt-key -A`, there is now a prompt that will show the affected keys and ask for confirmation before proceeding. This prompt can be bypassed using the `-y` or `--yes` command line argument, as with other `salt-key` commands.

Support for Setting Password Hashes on BSD Minions

FreeBSD, NetBSD, and OpenBSD all now support setting passwords in `user.present` states.

### 31.2.159 Salt 0.16.1 Release Notes

**release** 2013-07-29

### 31.2.160 Salt 0.16.2 Release Notes

**release** 2013-08-01

Version 0.16.2 is a bugfix release for 0.16.0, and contains a number of fixes.

**Windows**

- Only allow Administrator's group and SYSTEM user access to C:salt. This eliminates a race condition where a non-admin user could modify a template or managed file before it is executed by the minion (which is running as an elevated user), thus avoiding a potential escalation of privileges. ([issue #6361](#))
Grains

- Fixed detection of virtual grain on OpenVZ hardware nodes
- Gracefully handle `lsb_release` data when it is enclosed in quotes
- LSB grains are now prefixed with `lsb_distrib_` instead of simply `lsb_`. The old naming is not preserved, so SLS may be affected.
- Improved grains detection on MacOS

Pillar

- Don’t try to load `git_pillar` if not enabled in master config (issue #6052)
- Functions `pillar.item` and `pillar.items` added for parity with `grains.item/grains.items`. The old function `pillar.data` is preserved for backwards compatibility.
- Fixed minion traceback when Pillar SLS is malformed (issue #5910)

Peer Publishing

- More gracefully handle improperly quoted publish commands (issue #5958)
- Fixed traceback when timeout specified via the CLI for `publish.publish, publish.full_data` (issue #5959)
- Fixed unintended change in output of `publish.publish` (issue #5928)

Minion

- Fixed salt-key usage in minionswarm script
- Quieted warning about `SALT_MINION_CONFIG` environment variable on minion startup and for CLI commands run via `salt-call` (issue #5956)
- Added minion config parameter `random_reauth_delay` to stagger re-auth attempts when the minion is waiting for the master to approve its public key. This helps prevent SYN flooding in larger environments.

User/Group Management

- Implement previously-ignored `unique` option for `user.present` states in FreeBSD
- Report in state output when a `group.present` state attempts to use a gid in use by another group
- Fixed regression that prevents a `user.present` state to set the password hash to the system default (i.e. an unset password)
- Fixed multiple `group.present` states with the same group (issue #6439)
File Management

- Fixed file.mkdir setting incorrect permissions ([issue #6033](https://github.com/saltstack/salt/pull/6033))
- Fixed cleanup of source files for templates when `/tmp` is in `file_roots` ([issue #6118](https://github.com/saltstack/salt/pull/6118))
- Fixed caching of zero-byte files when a non-empty file was previously cached at the same path
- Added HTTP authentication support to the `cp` module ([issue #5641](https://github.com/saltstack/salt/pull/5641))
- Diffs are now suppressed when binary files are changed

Package/Repository Management

- Fixed traceback when there is only one target for `pkg.latest` states
- Fixed regression in detection of virtual packages (apt)
- Limit number of pkg database refreshes to once per `state.sls/state.highstate`
- YUM: Allow 32-bit packages with arches other than i686 to be managed on 64-bit systems ([issue #6299](https://github.com/saltstack/salt/pull/6299))
- Fixed incorrect reporting in pkgrepo.managed states ([issue #5517](https://github.com/saltstack/salt/pull/5517))
- Fixed 32-bit binary package installs on 64-bit RHEL-based distros, and added proper support for 32-bit packages on 64-bit Debian-based distros ([issue #6303](https://github.com/saltstack/salt/pull/6303))
- Fixed issue where requisites were inadvertently being put into YUM repo files ([issue #6471](https://github.com/saltstack/salt/pull/6471))

Service Management

- Fixed inaccurate reporting of results in `service.running` states when the service fails to start ([issue #5894](https://github.com/saltstack/salt/pull/5894))
- Fixed handling of custom initscripts in RHEL-based distros so that they are immediately available, negating the need for a second state run to manage the service that the initscript controls

Networking

- Function `network.hwaddr` renamed to `network.hw_addr` to match `network.ip_addrs` and `network.ip_addrs6`. All three functions also now work without the underscore in the name, as well.
- Fixed traceback in `bridge.show` when interface is not present ([issue #6326](https://github.com/saltstack/salt/pull/6326))

SSH

- Fixed incorrect result reporting for some `ssh_known_hosts.present` states
- Fixed inaccurate reporting when `ssh_auth.present` states are run with `test=True`, when rsa/dss is used for the `enc` param instead of ssh-rsa/ssh-dss ([issue #5374](https://github.com/saltstack/salt/pull/5374))
pip

- Properly handle -f lines in pip freeze output
- Fixed regression in pip.installed states with specifying a requirements file (issue #6003)
- Fixed use of editable argument in pip.installed states (issue #6025)
- Deprecated runas parameter in execution function calls, in favor of user

MySQL

- Allow specification of MySQL connection arguments via the CLI, overriding/bypassing minion config params
- Allow mysql_user.present states to set a passwordless login (issue #5550)
- Fixed endless loop when mysql.processlist is run (issue #6297)

PostgreSQL

- Fixed traceback in postgres.user_list (issue #6352)

Miscellaneous

- Don’t allow npm states to be used if npm module is not available
- Fixed alternatives.install states for which the target is a symlink (issue #6162)
- Fixed traceback in sysbench module (issue #6175)
- Fixed traceback in job cache
- Fixed tempfile cleanup for windows
- Fixed issue where SLS files using the pydsl renderer were not being run
- Fixed issue where returners were being passed incorrect information (issue #5518)
- Fixed traceback when numeric args are passed to cmd.script states
- Fixed bug causing cp.get_dir to return more directories than expected (issue #6048)
- Fixed traceback when supervisord.running states are run with test=True (issue #6053)
- Fixed traceback when Salt encounters problems running rbenv (issue #5888)
- Only make the monit module available if monit binary is present (issue #5871)
- Fixed incorrect behavior of img.mount_image
- Fixed traceback in tomcat.deploy_war in Windows
- Don’t re-write /etc/fstab if mount fails
- Fixed tracebacks when Salt encounters problems running gem (issue #5886)
- Fixed incorrect behavior of selinux.boolean states (issue #5912)
- RabbitMQ: Quote passwords to avoid symbols being interpolated by the shell (issue #6338)
- Fixed tracebacks in extfs.mkfs and extfs.tune (issue #6462)
- Fixed a regression with the module.run state where the m_name and m_fun arguments were being ignored (issue #6464)
31.2.161 Salt 0.16.3 Release Notes

release 2013-08-09

Version 0.16.3 is another bugfix release for 0.16.0. The changes include:

- Various documentation fixes
- Fix proc directory regression (issue #6502)
- Properly detect Linaro Linux (issue #6496)
- Fix regressions in mount.mounted (issue #6522, issue #6545)
- Skip malformed state requisites (issue #6521)
- Fix regression in gits from bad import
- Fix for watching prereq states (including recursive requisite error) (issue #6057)
- Fix mod_watch not overriding prereq (issue #6520)
- Don't allow functions which compile states to be called within states (issue #5623)
- Return error for malformed top.sls (issue #6544)
- Fix traceback in mysql.query
- Fix regression in binary package installation for 64-bit packages on Debian-based Linux distros (issue #6563)
- Fix traceback caused by running cp.push without having set file_recv in the master config file
- Fix scheduler configuration in pillar (issue #6201)

31.2.162 Salt 0.16.4 Release Notes

release 2013-09-07

Version 0.16.4 is another bugfix release for 0.16.0, likely to be the last before 0.17.0 is released. The changes include:

- Multiple documentation improvements/additions
- Added the osfinger and osarch grains
- Properly handle 32-bit packages for debian32 on x86_64 (issue #6607)
- Fix regression in yum package installation in CentOS 5 (issue #6677)
- Fix bug in hg.latest state that would erroneously delete directories (issue #6661)
- Fix bug related to pid not existing for ps.top (issue #6679)
- Fix regression in MySQL returner (issue #6695)
- Fix IP addresses grains (IPv4 and IPv6) to include all addresses (issue #6656)
- Fix regression preventing authenticated FTP (issue #6733)
- Fix setting password for windows users (issue #6824)
- Fix file.contains on values YAML parses as non-string (issue #6817)
- Fix file.get_gid, file.get_uid, and file.chown for broken symlinks (issue #6826)
- Fix comment for service reloads in service state (issue #6851)
31.2.163 Salt 0.17.0 Release Notes

release 2013-09-26

The 0.17.0 release is a very exciting release of Salt, this brings to Salt some very powerful new features and advances. The advances range from the state system to the test suite, covering new transport capabilities and making states easier and more powerful, to extending Salt Virt and much more!

The 0.17.0 release will also be the last release of Salt to follow the old 0.XX.X numbering system, the next release of Salt will change the numbering to be date based following this format:

<Year>.<Month>.<Minor>

So if the release happens in November of 2013 the number will be 13.11.0, the first bugfix release will be 13.11.1 and so forth.

Major Features

Halite

The new Halite web GUI is now available on PyPI. A great deal of work has been put into Halite to make it fully event driven and amazingly fast. The Halite UI can be started from within the Salt Master (after being installed from PyPI), or standalone, and does not require an external database to run. It is very lightweight!

This initial release of Halite is primarily the framework for the UI and the communication systems, making it easy to extend and build the UI up. It presently supports watching the event bus and firing commands over Salt.

At this time, Halite is not available as a package, but installation documentation is available at: https://docs.saltproject.io/topics/tutorials/halite.html

Halite is, like the rest of Salt, Open Source!

Much more will be coming in the future of Halite!

Salt SSH

The new salt-ssh command has been added to Salt. This system allows for remote execution and states to be run over ssh. The benefit here being, that salt can run relying only on the ssh agent, rather than requiring a minion to be deployed.

The salt-ssh system runs states in a compatible way as Salt and states created and run with salt-ssh can be moved over to a standard salt deployment without modification.

Since this is the initial release of salt-ssh, there is plenty of room for improvement, but it is fully operational, not just a bootstrap tool.

Rosters

Salt is designed to have the minions be aware of the master and the master does not need to be aware of the location of the minions. The new salt roster system was created and designed to facilitate listing the targets for salt-ssh.

The roster system, like most of Salt, is a plugin system, allowing for the list of systems to target to be derived from any pluggable backend. The rosters shipping with 0.17.0 are flat and scan. Flat is a file which is read in via the salt render system and the scan roster does simple network scanning to discover ssh servers.
State Auto Order

This is a major change in how states are evaluated in Salt. State Auto Order is a new feature that makes states get evaluated and executed in the order in which they are defined in the sls file. This feature makes it very easy to see the finite order in which things will be executed, making Salt now, fully imperative AND fully declarative.

The requisite system still takes precedence over the order in which states are defined, so no existing states should break with this change. But this new feature can be turned off by setting state_auto_order: False in the master config, thus reverting to the old lexicographical order.

state.sls Runner

The state.sls runner has been created to allow for a more powerful system for orchestrating state runs and function calls across the salt minions. This new system uses the state system for organizing executions.

This allows for states to be defined that are executed on the master to call states on minions via salt-run state.sls.

Salt Thin

Salt Thin is an exciting new component of Salt, this is the ability to execute Salt routines without any transport mechanisms installed, it is a pure python subset of Salt.

Salt Thin does not have any networking capability, but can be dropped into any system with Python installed and then salt-call can be called directly. The Salt Thin system, is used by the salt-ssh command, but can still be used to just drop salt somewhere for easy use.

Event Namespacing

Events have been updated to be much more flexible. The tags in events have all been namespaced allowing easier tracking of event names.

Mercurial Fileserver Backend

The popular git fileserver backend has been joined by the mercurial fileserver backend, allowing the state tree to be managed entirely via mercurial.

External Logging Handlers

The external logging handler system allows for Salt to directly hook into any external logging system. Currently supported are sentry and logstash.
Jenkins Testing

The testing systems in Salt have been greatly enhanced, tests for salt are now executed, via jenkins.saltstack.com, across many supported platforms. Jenkins calls out to salt-cloud to create virtual machines on Rackspace, then the minion on the virtual machine checks into the master running on Jenkins where a state run is executed that sets up the minion to run tests and executes the test suite.

This now automates the sequence of running platform tests and allows for continuous destructive tests to be run.

Salt Testing Project

The testing libraries for salt have been moved out of the main salt code base and into a standalone codebase. This has been done to ease the use of the testing systems being used in salt based projects other than Salt itself.

StormPath External Authentication

The external auth system now supports the fantastic Stormpath cloud based authentication system.

LXC Support

Extensive additions have been added to Salt for LXC support. This included the backend libs for managing LXC containers. Addition into the salt-virt system is still in the works.

macOS User/Group Support

Salt is now able to manage users and groups on Minions running macOS. However, at this time user passwords cannot be managed.

Django ORM External Pillar

Pillar data can now be derived from Django managed databases.

Fixes from RC to release

• Multiple documentation fixes
• Add multiple source files + templating for file.append (issue #6905)
• Support sysctl configuration files in systemd>=207 (issue #7351)
• Add file.search and file.replace
• Fix cross-calling execution functions in provider overrides
• Fix locale override for postgres (issue #4543)
• Fix Raspbian identification for service/pkg support (issue #7371)
• Fix cp.push file corruption (issue #6495)
• Fix ALT Linux password hash specification (issue #3474)
• Multiple salt-ssh-related fixes and improvements
31.2.164 Salt 0.17.1 Release Notes

release 2013-10-17

Note: THIS RELEASE IS NOT COMPATIBLE WITH PREVIOUS VERSIONS. If you update your master to 0.17.1, you must update your minions as well. Sorry for the inconvenience -- this is a result of one of the security fixes listed below.

The 0.17.1 release comes with a number of improvements to salt-ssh, many bugfixes, and a number of security updates.

Salt SSH has been improved to be faster, more featureful and more secure. Since the original release of Salt SSH was primarily a proof of concept, it has been very exciting to see its rapid adoption. We appreciate the willingness of security experts to review Salt SSH and help discover oversights and ensure that security issues only exist for such a tiny window of time.

SSH Enhancements

Shell Improvements

Improvements to Salt SSH's communication have been added that improve routine execution regardless of the target system's login shell.

Performance

Deployment of routines is now faster and takes fewer commands to execute.

Security Updates

Be advised that these security issues all apply to a small subset of Salt users and mostly apply to Salt SSH.

Insufficient Argument Validation

This issue allowed for a user with limited privileges to embed executions inside of routines to execute routines that should be restricted. This applies to users using external auth or client ACL and opening up specific routines.

Be advised that these patches address the direct issue. Additional commits have been applied to help mitigate this issue from resurfacing.

MITM SSH attack in salt-ssh

SSH host keys were being accepted by default and not enforced on future SSH connections. These patches set SSH host key checking by default and can be overridden by passing the -i flag to salt-ssh.

Insecure Usage of /tmp in salt-ssh

The initial release of salt-ssh used the /tmp directory in an insecure way. These patches not only secure usage of files under /tmp in salt-ssh, but also add checksum validation for all packages sent into the now secure locations on target systems.

YAML Calling Unsafe Loading Routine

It has been argued that this is not a valid security issue, as the YAML loading that was happening was only being called after an initial gateway filter in Salt has already safely loaded the YAML and would fail if non-safe routines were embedded. Nonetheless, the CVE was filed and patches applied.

Fix Reference

Version 0.17.1 is the first bugfix release for 0.17.0. The changes include:

• Fix symbolic links in thin.tgz (issue #7482)
• Pass env through to file.patch state (issue #7452)
• Service provider fixes and reporting improvements (issue #7361)
• Add \--priv option for specifying salt-ssh private key
• Fix salt-thin's salt-call on setuptools installations (issue #7516)
• Fix salt-ssh to support passwords with spaces (issue #7480)
• Fix regression in wildcard includes (issue #7455)
• Fix salt-call outputter regression (issue #7456)
• Fix custom returner support for startup states (issue #7540)
• Fix value handling in augeas (issue #7605)
• Fix regression in apt (issue #7624)
• Fix minion ID guessing to use socket.getfqdn() first (issue #7558)
• Add minion ID caching (issue #7558)
• Fix salt-key race condition (issue #7304)
• Add \--include-all flag to salt-key (issue #7399)
• Fix custom grains in pillar (part of issue #5716, issue #6083)
• Fix race condition in salt-key (issue #7304)
• Fix regression in minion ID guessing, prioritize socket.getfqdn() (issue #7558)
• Cache minion ID on first guess (issue #7558)
• Allow trailing slash in file.directory state
• Fix reporting of file_roots in pillar return (issue #5449 and issue #5951)
• Remove pillar matching for mine.get (issue #7197)
• Sanitize args for multiple execution modules
• Fix yumpkg mod_repo functions to filter hidden args (issue #7656)
• Fix conflicting IDs in state includes (issue #7526)
• Fix mysql_grants.absent string formatting issue (issue #7827)
• Fix postgres.version so it won't return None (issue #7695)
• Fix for trailing slashes in mount.mounted state
• Fix rogue AttributErrors in the outputter system (issue #7845)
• Fix for incorrect ssh key encodings resulting in incorrect key added (issue #7718)
• Fix for pillar/grains naming regression in python renderer (issue #7693)
• Fix args/kwargvs handling in the scheduler (issue #7422)
• Fix logfile handling for file://, tcp://, and udp:// (issue #7754)
• Fix error handling in config file parsing (issue #6714)
• Fix RVM using sudo when running as non-root user (issue #2193)
• Fix client ACL and underlying logging bugs (issue #7706)
• Fix scheduler bug with returner (issue #7367)
• Fix user management bug related to default groups (issue #7690)
• Fix various salt-ssh bugs (issue #7528)
• Many various documentation fixes

31.2.165 Salt 0.17.2 Release Notes

release 2013-11-14

Version 0.17.2 is another bugfix release for 0.17.0. The changes include:

• Add ability to delete key with grains.delval (issue #7872)
• Fix possible state compiler stack trace (issue #5767)
• Fix architecture regression in yumpkg (issue #7813)
• Use correct ps on Debian to prevent truncating (issue #5646)
• Fix grains targeting for new grains (issue #5737)
• Fix bug with merging in git_pillar (issue #6992)
• Fix print_jobs duplicate results
• Fix apt version specification for pkg.install
• Fix possible KeyError from ext_job_cache missing option
• Fix auto_order for - names states (issue #7649)
• Fix regression in new gitfs installs (directory not found error)
• Fix escape pipe issue on Windows for file.recurse (issue #7967)
• Fix fileclient in case of master restart (issue #7987)
• Try to output warning if CLI command malformed (issue #6538)
• Fix --out=quiet to actually be quiet (issue #8000)
• Fix for state.sls in salt-ssh (issue #7991)
• Fix for MySQL grants ordering issue (issue #5817)
• Fix traceback for certain missing CLI args (issue #8016)
• Add ability to disable lspci queries on master (issue #4906)
• Fail if sls defined in topfile does not exist (issue #5998)
• Add ability to downgrade MySQL grants (issue #6606)
• Fix ssh_auth.absent traceback (issue #8043)
- Add upstart detection for Debian/Raspbian (issue #8039)
- Fix ID-related issues (issue #8052, issue #8050, and others)
- Fix for jinja rendering issues (issue #8066 and issue #8079)
- Fix argument parsing in salt-ssh (issue #7928)
- Fix some GPU detection instances (issue #6945)
- Fix bug preventing includes from other environments in SLS files
- Fix for kwargs with dashes (issue #8102)
- Fix salt.utils.which for windows '.exe' (issue #7904)
- Fix apache.adduser without apachectl (issue #8123)
- Fix issue with evaluating `test` kwarg in states (issue #7788)
- Fix regression in `salt.client.Caller()` (issue #8078)
- Fix apt-key silent failure
- Fix bug where cmd.script would try to run even if caching failed (issue #7601)
- Fix `apt pkg.latest` regression (issue #8067)
- Fix for mine data not being updated (issue #8144)
- Fix for noarch packages in yum
- Fix a Xen detection edge case (issue #7839)
- Fix windows `__opts__` dictionary persistence (issue #7714)
- Fix version generation for when it's part of another git repo (issue #8090)
- Fix `_handle_iorder` stacktrace so that the real syntax error is shown (issue #8114 and issue #7905)
- Fix `git.latest` state when a commit SHA is used (issue #8163)
- Fix various small bugs in yumpkg.py (issue #8201)
- Fix for specifying identify file in git.latest (issue #8094)
- Fix for `--output-file` CLI arg (issue #8205)
- Add ability to specify shutdown time for system.shutdown (issue #7833)
- Fix for salt version using non-salt git repo info (issue #8266)
- Add additional hints at impact of pkgrepo states when `test=True` (issue #8247)
- Fix for salt-ssh files not being owned by root (issue #8216)
- Fix retry logic and error handling in fileserver (related to issue #7755)
- Fix file.replace with `test=True` (issue #8279)
- Add flag for limiting file traversal in fileserver (issue #6928)
- Fix for extra mine processes (issue #5729)
- Fix for unloading custom modules (issue #7691)
- Fix for salt-ssh opts (issue #8005 and issue #8271)
- Fix compound matcher for grains (issue #7944)
- Improve error reporting in ebuild module (related to issue #5393)
• Add dir_mode to file.managed (issue #7860)
• Improve traceroute support for FreeBSD and macOS (issue #4927)
• Fix for matching minions under syndics (issue #7671)
• Improve exception handling for missing ID (issue #8259)
• Fix grain mismatch for ScientificLinux (issue #8338)
• Add configuration option for minion_id_caching
• Fix open mode auth errors (issue #8402)

31.2.166 Salt 0.17.3 Release Notes

release 2013-12-08

Note: 0.17.3 had some regressions which were promptly fixed in the 0.17.4 release. Please use 0.17.4 instead.

Version 0.17.3 is another bugfix release for 0.17.0. The changes include:

• Fix some jinja render errors (issue #8418)
• Fix file.replace state changing file ownership (issue #8399)
• Fix state ordering with the PyDSL renderer (issue #8446)
• Fix for new npm version (issue #8517)
• Fix for pip state requiring name even with requirements file (issue #8519)
• Fix yum logging to open terminals (issue #3855)
• Add sane maxrunning defaults for scheduler (issue #8563)
• Fix states duplicate key detection (issue #8053)
• Fix SUSE patch level reporting (issue #8428)
• Fix managed file creation umask (issue #8590)
• Fix logstash exception (issue #8635)
• Improve argument exception handling for salt command (issue #8016)
• Fix pecl success reporting (issue #8750)
• Fix launchctl module exceptions (issue #8759)
• Fix argument order in pw_user module
• Add warnings for failing grains (issue #8690)
• Fix hgfs problems caused by connections left open (issue #8811 and issue #8810)
• Add Debian iptables default for iptables-persistent package (issue #8889)
• Fix installation of packages with dots in pkg name (issue #8614)
• Fix noarch package installation on CentOS 6 (issue #8945)
• Fix portage_config.enforce_nice_config (issue #8252)
• Fix salt.util.copyfile umask usage (issue #8590)
• Fix rescheduling of failed jobs (issue #8941)
Salt Documentation, Release 3004.2

- Fix pkg on Amazon Linux (uses yumpkg5 now) (issue #8226)
- Fix conflicting options in postgres module (issue #8717)
- Fix ps modules for psutil >= 0.3.0 (issue #7432)
- Fix postgres module to return False on failure (issue #8778)
- Fix argument passing for args with pound signs (issue #8585)
- Fix pid of salt CLI command showing in status.pid output (issue #8720)
- Fix rvm to run gem as the correct user (issue #8951)
- Fix namespace issue in win_file module (issue #9060)
- Fix masterless state paths on windows (issue #9021)
- Fix timeout option in master config (issue #9040)

31.2.167 Salt 0.17.4 Release Notes

release 2013-12-10

Version 0.17.4 is another bugfix release for 0.17.0. The changes include:

- Fix file.replace bug when replacement str is numeric (issue #9101)
- Fix regression in file.managed (issue #9131)
- Prevent traceback when job is None. (issue #9145)

31.2.168 Salt 0.17.5 Release Notes

release 2014-01-27

Version 0.17.5 is another bugfix release for 0.17.0. The changes include:

- Fix user.present states with non-string fullname (issue #9085)
- Fix virt.init return value on failure (issue #6870)
- Fix reporting of file.blockreplace state when test=True
- Fix network.interfaces when used in cron (issue #7990)
- Fix bug in pkgrepo when switching to/from mirrorlist-based repo def (issue #9121)
- Fix infinite recursion when cache file is corrupted
- Add checking for rev and mirror/bare args in git.latest (issue #9107)
- Add cmd.watch alias (points to cmd.wait) (issue #8612)
- Fix stacktrace when prereq is not formed as a list (issue #8235)
- Fix stdin issue with lvdisplay command (issue #9128)
- Add pre-check function for range matcher (issue #9236)
- Add exception handling for psutil for processes that go missing (issue #9274)
- Allow _\ in requisites to match both on ID and name (issue #9061)
- Fix multiple client timeout issues (issue #7157 and issue #9302, probably others)
• Fix ZMQError: Operation cannot be accomplished in current state errors (issue #6306)
• Multiple optimization in minion auth routines
• Clarify logs for minion ID caching

31.2.169 Salt 0.6.0 release notes

The Salt remote execution manager has reached initial functionality! Salt is a management application which can be used to execute commands on remote sets of servers.

The whole idea behind Salt is to create a system where a group of servers can be remotely controlled from a single master, not only can commands be executed on remote systems, but salt can also be used to gather information about your server environment.

Unlike similar systems, like Func and MCollective, Salt is extremely simple to set up and use, the entire application is contained in a single package, and the master and minion daemons require no running dependencies in the way that Func requires Certmaster and MCollective requires activeMQ.

Salt also manages authentication and encryption. Rather than using SSL for encryption, salt manages encryption on a payload level, so the data sent across the network is encrypted with fast AES encryption, and authentication uses RSA keys. This means that Salt is fast, secure, and very efficient.

Messaging in Salt is executed with ZeroMQ, so the message passing interface is built into salt and does not require an external ZeroMQ server. This also adds speed to Salt since there is no additional bloat on the networking layer, and ZeroMQ has already proven itself as a very fast networking system.

The remote execution in Salt is "Lazy Execution", in that once the command is sent the requesting network connection is closed. This makes it easier to detach the execution from the calling process on the master, it also means that replies are cached, so that information gathered from historic commands can be queried in the future.

Salt also allows users to make execution modules in Python. Writers of these modules should also be pleased to know that they have access to the impressive information gathered from PuppetLabs’ Facter application, making Salt module more flexible. In the future I hope to also allow Salt to group servers based on Facter information as well.

All in all Salt is fast, efficient, and clean, can be used from a simple command line client or through an API, uses message queue technology to make network execution extremely fast, and encryption is handled in a very fast and efficient manner. Salt is also VERY easy to use and VERY easy to extend.

You can find the source code for Salt on my GitHub page, I have also set up a few wiki pages explaining how to use and set up Salt. If you are using Arch Linux there is a package available in the Arch Linux AUR.

GitHub page: https://github.com/saltstack/salt
Wiki: https://github.com/saltstack/salt/wiki
Arch Linux Package: https://aur.archlinux.org/packages/salt-git/

I am very open to contributions, for instance I need packages for more Linux distributions as well as BSD packages and testers.

Give Salt a try, this is the initial release and is not a 1.0 quality release, but it has been working well for me! I am eager to get your feedback!
31.2.170 Salt 0.7.0 release notes

I am pleased to announce the release of Salt 0.7.0!

This release marks what is the first stable release of salt, 0.7.0 should be suitable for general use.

0.7.0 Brings the following new features to Salt:

- Integration with Facter data from puppet labs
- Allow for matching minions from the salt client via Facter information
- Minion job threading, many jobs can be executed from the master at once
- Preview of master clustering support - Still experimental
- Introduce new minion modules for stats, virtualization, service management and more
- Add extensive logging to the master and minion daemons
- Add sys.reload_functions for dynamic function reloading
- Greatly improve authentication
- Introduce the saltkey command for managing public keys
- Begin backend development preparatory to introducing butter
- Addition of man pages for the core commands
- Extended and cleaned configuration

0.7.0 Fixes the following major bugs:

- Fix crash in minions when matching failed
- Fix configuration file lookups for the local client
- Repair communication bugs in encryption
- Numerous fixes in the minion modules

The next release of Salt should see the following features:

- Stabilize the cluster support
- Introduce a remote client for salt command tiers
- salt-ftp system for distributed file copies
- Initial support for “butter”

Coming up next is a higher level management framework for salt called Butter. I want salt to stay as a simple and effective communication framework, and allow for more complicated executions to be managed via Butter.

Right now Butter is being developed to act as a cloud controller using salt as the communication layer, but features like system monitoring and advanced configuration control (a puppet manager) are also in the pipe.

Special thanks to Joseph Hall for the status and network modules, and thanks to Matthias Teege for tracking down some configuration bugs!

Salt can be downloaded from the following locations;

Arch Linux Package:
https://aur.archlinux.org/packages/salt-git/

Please enjoy the latest Salt release!
Salt 0.8.0 is ready for general consumption! The source tarball is available on GitHub for download:

A lot of work has gone into salt since the last release just 2 weeks ago, and salt has improved a great deal. A swath of new features are here along with performance and threading improvements!

The main new features of salt 0.8.0 are:

Salt-cp
Cython minion modules
Dynamic returners
Faster return handling
Lowered required Python version to 2.6
Advanced minion threading
Configurable minion modules

**Salt-cp**

The salt-cp command introduces the ability to copy simple files via salt to targeted servers. Using salt-cp is very simple, just call salt-cp with a target specification, the source file(s) and where to copy the files on the minions. For instance:

```
# salt-cp '*' /etc/hosts /etc/hosts
```

Will copy the local /etc/hosts file to all of the minions.

Salt-cp is very young, in the future more advanced features will be added, and the functionality will much more closely resemble the cp command.

**Cython minion modules**

Cython is an amazing tool used to compile Python modules down to c. This is arguably the fastest way to run Python code, and since pyzmq requires cython, adding support to salt for cython adds no new dependencies.

Cython minion modules allow minion modules to be written in cython and therefore executed in compiled c. Simply write the salt module in cython and use the file extension ".pyx" and the minion module will be compiled when the minion is started. An example cython module is included in the main distribution called cytest.pyx:

https://github.com/saltstack/salt/blob/master/salt/modules/cytest.pyx

**Dynamic Returners**

By default salt returns command data back to the salt master, but now salt can return command data to any system. This is enabled via the new returners modules feature for salt. The returners modules take the return data and sends it to a specific module. The returner modules work like minion modules, so any returner can be added to the minions.

This means that a custom data returner can be added to communicate the return data so anything from MySQL, Redis, MongoDB, and more!

There are 2 simple stock returners in the returners directory:

https://github.com/saltstack/salt/blob/master/salt/returners
The documentation on writing returners will be added to the wiki shortly, and returners can be written in pure Python, or in cython.

**Configurable Minion Modules**

Minion modules may need to be configured, now the options passed to the minion configuration file can be accessed inside of the minion modules via the `__opt__` dict.

Information on how to use this simple addition has been added to the wiki: Writing modules

The test module has an example of using the `__opts__` dict, and how to set default options:

https://github.com/saltstack/salt/blob/master/salt/modules/test.py

**Advanced Minion Threading**

In 0.7.0 the minion would block after receiving a command from the master, now the minion will spawn a thread or multiprocess. By default Python threads are used because for general use they have proved to be faster, but the minion can now be configured to use the Python multiprocessing module instead. Using multiprocessing will cause executions that are CPU bound or would otherwise exploit the negative aspects of the Python GIL to run faster and more reliably, but simple calls will still be faster with Python threading. The configuration option can be found in the minion configuration file:

https://github.com/saltstack/salt/blob/master/conf/minion

**Lowered Supported Python to 2.6**

The requirement for Python 2.7 has been removed to support Python 2.6. I have received requests to take the minimum Python version back to 2.4, but unfortunately this will not be possible, since the ZeroMQ Python bindings do not support Python 2.4.

Salt 0.8.0 is a very major update, it also changes the network protocol slightly which makes communication with older salt daemons impossible, your master and minions need to be upgraded together!

I could use some help bringing salt to the people! Right now I only have packages for Arch Linux, Fedora 14 and Gentoo. We need packages for Debian and people willing to help test on more platforms. We also need help writing more minion modules and returner modules. If you want to contribute to salt please hop on the mailing list and send in patches, make a fork on GitHub and send in pull requests! If you want to help but are not sure where you can, please email me directly or post to the mailing list!

I hope you enjoy salt, while it is not yet 1.0 salt is completely viable and usable!

- Thomas S. Hatch

### 31.2.172 Salt 0.8.7 release notes

It has been a month since salt 0.8.0, and it has been a long month! But Salt is still coming along strong. 0.8.7 has a lot of changes and a lot of updates. This update makes Salt’s ZeroMQ back end better, strips Facter from the dependencies, and introduces interfaces to handle more capabilities.

Many of the major updates are in the background, but the changes should shine through to the surface. A number of the new features are still a little thin, but the back end to support expansion is in place.

I also recently gave a presentation to the Utah Python users group in Salt Lake City, the slides from this presentation are available here:
The video from this presentation will be available shortly.

The major new features and changes in Salt 0.8.7 are:

- Revamp ZeroMQ topology on the master for better scalability
- State enforcement
- Dynamic state enforcement managers
- Extract the module loader into salt.loader
- Make Job ids more granular
- Replace Facter functionality with the new salt grains interface
- Support for “virtual” salt modules
- Introduce the salt-call command
- Better debugging for minion modules

The new ZeroMQ topology allows for better scalability, this will be required by the need to execute massive file transfers to multiple machines in parallel and state management. The new ZeroMQ topology is available in the aforementioned presentation.

0.8.7 introduces the capability to declare states, this is similar to the capabilities of Puppet. States in salt are declared via state data structures. This system is very young, but the core feature set is available. Salt states work around rendering files which represent Salt high data. More on the Salt state system will be documented in the near future.

The system for loading salt modules has been pulled out of the minion class to be a standalone module, this has enabled more dynamic loading of Salt modules and enables many of the updates in 0.8.7 –

https://github.com/saltstack/salt/blob/master/salt/loader.py

Salt Job ids are now microsecond precise, this was needed to repair a race condition unveiled by the speed improvements in the new ZeroMQ topology.

The new grains interface replaces the functionality of Facter, the idea behind grains differs from Facter in that the grains are only used for static system data, dynamic data needs to be derived from a call to a salt module. This makes grains much faster to use, since the grains data is generated when the minion starts.

Virtual salt modules allows for a salt module to be presented as something other than its module name. The idea here is that based on information from the minion decisions about which module should be presented can be made. The best example is the pacman module. The pacman module will only load on Arch Linux minions, and will be called pkg. Similarly the yum module will be presented as pkg when the minion starts on a Fedora/RedHat system.

The new salt-call command allows for minion modules to be executed from the minion. This means that on the minion a salt module can be executed, this is a great tool for testing Salt modules. The salt-call command can also be used to view the grains data.

In previous releases when a minion module threw an exception very little data was returned to the master. Now the stack trace from the failure is returned making debugging of minion modules MUCH easier.

Salt is nearing the goal of 1.0, where the core feature set and capability is complete!

31.2.173 Salt 0.8.8 release notes

Salt 0.8.8 is here! This release adds a great deal of code and some serious new features.

Improved Documentation has been set up for salt using sphinx thanks to the efforts of Seth House. This new documentation system will act as the back end to the salt website which is still under heavy development. The new sphinx documentation system has also been used to greatly clean up the salt manpages. The salt 7 manpage in particular now contains extensive information which was previously only in the wiki. The new documentation can be found at: https://docs.saltproject.io/ We still have a lot to add, and when the domain is set up I will post another announcement.

More additions have been made to the ZeroMQ setup, particularly in the realm of file transfers. Salt 0.8.8 introduces a built in, stateless, encrypted file server which allows salt minions to download files from the salt master using the same encryption system used for all other salt communications. The main motivation for the salt file server has been to facilitate the new salt state system.

Much of the salt code has been cleaned up and a new cleaner logging system has been introduced thanks to the efforts of Pedro Algarvio. These additions will allow for much more flexible logging to be executed by salt, and fixed a great deal of my poor spelling in the salt docstrings! Pedro Algarvio has also cleaned up the API, making it easier to embed salt into another application.

The biggest addition to salt found in 0.8.8 is the new state system. The salt module system has received a new front end which allows salt to be used as a configuration management system. The configuration management system allows for system configuration to be defined in data structures. The configuration management system, or as it is called in salt, the “salt state system” supports many of the features found in other configuration managers, but allows for system states to be written in a far simpler format, executes at blazing speeds, and operates via the salt minion matching system. The state system also operates within the normal scope of salt, and requires no additional configuration to use.

The salt state system can enforce the following states with many more to come: Packages Files Services Executing commands Hosts

The system used to define the salt states is based on a data structure, the data structure used to define the salt states has been made to be as easy to use as possible. The data structure is defined by default using a YAML file rendered via a Jinja template. This means that the state definition language supports all of the data structures that YAML supports, and all of the programming constructs and logic that Jinja supports. If the user does not like YAML or Jinja the states can be defined in yaml-mako, json-jinja, or json-mako. The system used to render the states is completely dynamic, and any rendering system can be added to the capabilities of Salt, this means that a rendering system that renders XML data in a cheetah template, or whatever you can imagine, can be easily added to the capabilities of salt.

The salt state system also supports isolated environments, as well as matching code from several environments to a single salt minion.

The feature base for Salt has grown quite a bit since my last serious documentation push. As we approach 0.9.0 the goals are becoming very clear, and the documentation needs a lot of work. The main goals for 0.9.0 are to further refine the state system, fix any bugs we find, get Salt running on as many platforms as we can, and get the documentation filled out. There is a lot more to come as Salt moves forward to encapsulate a much larger scope, while maintaining supreme usability and simplicity.

If you would like a more complete overview of Salt please watch the Salt presentation: Slides:

31.2.174 Salt 0.8.9 Release Notes

Salt 0.8.9 has finally arrived! Unfortunately this is much later than I had hoped to release 0.8.9, life has been very crazy over the last month. But despite challenges, Salt has moved forward!

This release, as expected, adds few new features and many refinements. One of the most exciting aspect of this release is that the development community for salt has grown a great deal and much of the code is from contributors.

Also, I have filled out the documentation a great deal. So information on States is properly documented, and much of the documentation that was out of date has been filled in.

For instructions on how to set up Salt please see the Installation instructions.

New Features

Salt Run

A big feature is the addition of Salt run, the `salt-run` command allows for master side execution modules to be made that gather specific information or execute custom routines from the master.

Documentation for salt-run can be found here

Refined Outputters

One problem often complained about in salt was the fact that the output was so messy. Thanks to help from Jeff Schroeder a cleaner interface for the command output for the Salt CLI has been made. This new interface makes adding new printout formats easy and additions to the capabilities of minion modules makes it possible to set the printout mode or outputter for functions in minion modules.

Cross Calling Salt Modules

Salt modules can now call each other, the `__salt__` dict has been added to the predefined references in minion modules. This new feature is documented in the modules documentation.
Watch Option Added to Salt State System

Now in Salt states you can set the watch option, this will allow watch enabled states to change based on a change in the other defined states. This is similar to subscribe and notify statements in puppet.

Root Dir Option

Travis Cline has added the ability to define the option `root_dir` which allows the salt minion to operate in a subdir. This is a strong move in supporting the minion running as an unprivileged user.

Config Files Defined in Variables

Thanks again to Travis Cline, the master and minion configuration file locations can be defined in environment variables now.

New Modules

Quite a few new modules, states, returners, and runners have been made.

New Minion Modules

apt

Support for apt-get has been added, this adds greatly improved Debian and Ubuntu support to Salt!

useradd and groupadd

Support for manipulating users and groups on Unix-like systems.

moosefs

Initial support for reporting on aspects of the distributed file system, MooseFS. For more information on MooseFS please see: http://www.moosefs.org

Thanks to Joseph Hall for his work on MooseFS support.

mount

Manage mounts and the fstab.
puppet

Execute puppet on remote systems.

shadow

Manipulate and manage the user password file.

ssh

Interact with ssh keys.

New States

user and group

Support for managing users and groups in Salt States.

mount

Enforce mounts and the fstab.

New Returners

mongo_return

Send the return information to a MongoDB server.

New Runners

manage

Display minions that are up or down.

31.2.175  Salt 0.9.0 Release Notes

release  2011-08-27

Salt 0.9.0 is here. This is an exciting release, 0.9.0 includes the new network topology features allowing peer salt commands and masters of masters via the syndic interface.

0.9.0 also introduces many more modules, improvements to the API and improvements to the ZeroMQ systems.
Download!

The Salt source can be downloaded from PyPI:
https://pypi.python.org/packages/source/s/salt/salt-0.9.0.tar.gz

Here is the md5sum:
9a925da04981e65a0f237f2e77ddab37

For instructions on how to set up Salt please see the Installation instructions.

New Features

Salt Syndic

The new Syndic interface allows a master to be commanded via another higher level salt master. This is a powerful solution allowing a master control structure to exist, allowing salt to scale to much larger levels than before.

Peer Communication

0.9.0 introduces the capability for a minion to call a publication on the master and receive the return from another set of minions. This allows salt to act as a communication channel between minions and as a general infrastructure message bus.

Peer communication is turned off by default but can be enabled via the peer option in the master configuration file. Documentation on the new Peer interface.

Easily Extensible API

The minion and master classes have been redesigned to allow for specialized minion and master servers to be easily created. An example on how this is done for the master can be found in the master.py salt module:
https://github.com/saltstack/salt/blob/master/salt/master.py

The Master class extends the SMaster class and set up the main master server.

The minion functions can now also be easily added to another application via the SMinion class, this class can be found in the minion.py module:
https://github.com/saltstack/salt/blob/master/salt/minion.py

Cleaner Key Management

This release changes some of the key naming to allow for multiple master keys to be held based on the type of minion gathering the master key.

The -d option has also been added to the salt-key command allowing for easy removal of accepted public keys.

The --gen-keys option is now available as well for salt-key, this allows for a salt specific RSA key pair to be easily generated from the command line.
Improved 0MQ Master Workers

The 0MQ worker system has been further refined to be faster and more robust. This new system has been able to handle a much larger load than the previous setup. The new system uses the IPC protocol in 0MQ instead of TCP.

New Modules

Quite a few new modules have been made.

New Minion Modules

apache

Work directly with apache servers, great for managing balanced web servers

cron

Read out the contents of a systems crontabs

mdadm

Module to manage raid devices in Linux, appears as the raid module

mysql

Gather simple data from MySQL databases

ps

Extensive utilities for managing processes

publish

Used by the peer interface to allow minions to make publications

31.2.176 Salt 0.9.1 Release Notes

release 2011-08-29
31.2.177 Salt 0.9.2 Release Notes

release 2011-09-17

Salt 0.9.2 has arrived! 0.9.2 is primarily a bugfix release, the exciting component in 0.9.2 is greatly improved support for salt states. All of the salt states interfaces have been more thoroughly tested and the new salt-states git repo is growing with example of how to use states.

This release introduces salt states for early developers and testers to start helping us clean up the states interface and make it ready for the world!

0.9.2 also fixes a number of bugs found on Python 2.6.

Download!

The Salt source can be downloaded from PyPI:

https://pypi.python.org/packages/source/s/salt/salt-0.9.2.tar.gz

For instructions on how to set up Salt please see the Installation instructions.

New Features

Salt-Call Additions

The salt-call command has received an overhaul, it now hooks into the outputter system so command output looks clean, and the logging system has been hooked into salt-call, so the -l option allows the logging output from salt minion functions to be displayed.

The end result is that the salt-call command can execute the state system and return clean output:

```
# salt-call state.highstate
```

State System Fixes

The state system has been tested and better refined. As of this release the state system is ready for early testers to start playing with. If you are interested in working with the state system please check out the (still very small) salt-states GitHub repo:

https://github.com/SS-archive/salt-states

This git repo is the active development branch for determining how a clean salt-state database should look and act. Since the salt state system is still very young a lot of help is still needed here. Please fork the salt-states repo and help us develop a truly large and scalable system for configuration management!
Notable Bug Fixes

Python 2.6 String Formatting

Python 2.6 does not support format strings without an index identifier, all of them have been repaired.

Cython Loading Disabled by Default

Cython loading requires a development tool chain to be installed on the minion, requiring this by default can cause problems for most Salt deployments. If Cython auto loading is desired it will need to be turned on in the minion config.

31.2.178 Salt 0.9.3 Release Notes

release 2011-11-05

Salt 0.9.3 is finally arrived. This is another big step forward for Salt, new features range from proper FreeBSD support to fixing issues seen when attaching a minion to a master over the Internet.

The biggest improvements in 0.9.3 though can be found in the state system, it has progressed from something ready for early testers to a system ready to compete with platforms such as Puppet and Chef. The backbone of the state system has been greatly refined and many new features are available.

Download!

The Salt source can be downloaded from PyPI:
https://pypi.python.org/packages/source/s/salt/salt-0.9.3.tar.gz

For instructions on how to set up Salt please see the Installation instructions.

New Features

WAN Support

Recently more people have been testing Salt minions connecting to Salt Masters over the Internet. It was found that Minions would commonly loose their connection to the master when working over the internet. The minions can now detect if the connection has been lost and reconnect to the master, making WAN connections much more reliable.

State System Fixes

Substantial testing has gone into the state system and it is ready for real world usage. A great deal has been added to the documentation for states and the modules and functions available to states have been cleanly documented.

A number of State System bugs have also been founds and repaired, the output from the state system has also been refined to be extremely clear and concise.

Error reporting has also been introduced, issues found in sls files will now be clearly reported when executing Salt States.
Extend Declaration

The Salt States have also gained the extend declaration. This declaration allows for states to be cleanly modified in a post environment. Simply said, if there is an apache.sls file that declares the apache service, then another sls can include apache and then extend it:

```yaml
include:
  - apache
extend:
  apache:
    service:
      - require:
        - pkg: mod_python
  mod_python:
    pkg:
      - installed
```

The notable behavior with the extend functionality is that it literally extends or overwrites a declaration set up in another sls module. This means that Salt will behave as though the modifications were made directly to the apache sls. This ensures that the apache service in this example is directly tied to all requirements.

Highstate Structure Specification

This release comes with a clear specification of the Highstate data structure that is used to declare Salt States. This specification explains everything that can be declared in the Salt SLS modules.

The specification is extremely simple, and illustrates how Salt has been able to fulfill the requirements of a central configuration manager within a simple and easy to understand format and specification.

SheBang Renderer Switch

It came to our attention that having many renderers means that there may be a situation where more than one State Renderer should be available within a single State Tree.

The method chosen to accomplish this was something already familiar to developers and systems administrators, a SheBang. The Python State Renderer displays this new capability.

Python State Renderer

Until now Salt States could only be declared in yaml or json using Jinja or Mako. A new, very powerful, renderer has been added, making it possible to write Salt States in pure Python:

```python
#!py

def run():
    
    """
    Install the python-mako package
    """
    return {
        "include": ["python"],
        "python-mako": {
            "pkg": ["installed"]
        }
    }
```
This renderer is used by making a run function that returns the Highstate data structure. Any capabilities of Python can be used in pure Python sls modules.

This example of a pure Python sls module is the same as this example in yaml:

```yaml
include:
  - python

python-mako:
  pkg:
    - installed
```

**FreeBSD Support**

Additional support has been added for FreeBSD, this is Salt's first branch out of the Linux world and proves the viability of Salt on non-Linux platforms.

Salt remote execution already worked on FreeBSD, and should work without issue on any Unix-like platform. But this support comes in the form of package management and user support, so Salt States also work on FreeBSD now.

The new freebsdpkg module provides package management support for FreeBSD and the new pw_user and pw_group provide user and group management.

**Module and State Additions**

**Cron Support**

Support for managing the system crontab has been added, declaring a cron state can be done easily:

```plaintext
date > /tmp/datestamp:
  cron:
    - present
    - user: fred
    - minute: 5
    - hour: 3
```

**File State Additions**

The file state has been given a number of new features, primarily the directory, recurse, symlink, and absent functions.

`file.directory` Make sure that a directory exists and has the right permissions.

```plaintext
/srv/foo:
  file:
    - directory
    - user: root
    - group: root
    - mode: 1755
```

`file.symlink` Make a symlink.

```plaintext
/var/lib/www:
  file:
    - symlink
```

(continues on next page)
- **target**: /srv/www
- **force**: True

**file.recurse** The recurse state function will recursively download a directory on the master file server and place it on the minion. Any change in the files on the master will be pushed to the minion. The recurse function is very powerful and has been tested by pushing out the full Linux kernel source.

```yaml
/opt/code:
  file:
    - recurse
    - **source**: salt://linux
```

**file.absent** Make sure that the file is not on the system, recursively deletes directories, files, and symlinks.

```yaml
/etc/httpd/conf.d/somebogusfile.conf:
  file:
    - absent
```

**Sysctl Module and State**

The sysctl module and state allows for sysctl components in the kernel to be managed easily. The sysctl module contains the following functions:

- **sysctl.show** Return a list of sysctl parameters for this minion
- **sysctl.get** Return a single sysctl parameter for this minion
- **sysctl.assign** Assign a single sysctl parameter for this minion
- **sysctl.persist** Assign and persist a simple sysctl parameter for this minion

The sysctl state allows for sysctl parameters to be assigned:

```yaml
vm.swappiness:
  sysctl:
    - **present**
    - **value**: 20
```

**Kernel Module Management**

A module for managing Linux kernel modules has been added. The new functions are as follows:

- **kmod.available** Return a list of all available kernel modules
- **kmod.check_available** Check to see if the specified kernel module is available
- **kmod.lsmod** Return a dict containing information about currently loaded modules
- **kmod.load** Load the specified kernel module
- **kmod.remove** Unload the specified kernel module

The kmod state can enforce modules be either present or absent:

```yaml
kvm_intel:
  kmod:
    - present
```
Ssh Authorized Keys

The ssh_auth state can distribute ssh authorized keys out to minions. Ssh authorized keys can be present or absent.

```bash
AAAAB3NzaC1kc3MAAACBAL8sQ9fJ5bYTEyYv1RBS3dD0049CNfhlWHWXQRqul6rwL4KIuPrhY7hBw8tV7UNC7J91ZRN04iQod9C+O...

...7LB8Q26iK5mRZzNsGeGwG7yzNIMBekGYSrRdIcPvSdBIP/1M6fQDEsAXQ==:

```
  ssh_auth:

    - user: frank
    - enc: dsa
    - comment: 'Frank's key'
```

### 31.2.179 Salt 0.9.4 Release Notes

**release** 2011-11-27

Salt 0.9.4 has arrived. This is a critical update that repairs a number of key bugs found in 0.9.3. But this update is not without feature additions as well! 0.9.4 adds support for Gentoo portage to the pkg module and state system. Also there are 2 major new state additions, the failhard option and the ability to set up finite state ordering with the `order` option.

This release also sees our largest increase in community contributions. These contributors have and continue to be the life blood of the Salt project, and the team continues to grow. I want to put out a big thanks to our new and existing contributors.

**Download!**

The Salt source can be downloaded from PyPI:

https://pypi.python.org/packages/source/s/salt-0.9.4.tar.gz

For instructions on how to set up Salt please see the Installation instructions.

**New Features**

**Failhard State Option**

Normally, when a state fails Salt continues to execute the remainder of the defined states and will only refuse to execute states that require the failed state.

But the situation may exist, where you would want all state execution to stop if a single state execution fails. The capability to do this is called **failing hard**.
State Level Failhard

A single state can have a failhard set, this means that if this individual state fails that all state execution will immediately stop. This is a great thing to do if there is a state that sets up a critical config file and setting a require for each state that reads the config would be cumbersome. A good example of this would be setting up a package manager early on:

```
/etc/yum.repos.d/company.repo:
  file:
    - managed
    - source: salt://company/yumrepo.conf
    - user: root
    - group: root
    - mode: 644
    - order: 1
    - failhard: True
```

In this situation, the yum repo is going to be configured before other states, and if it fails to lay down the config file, than no other states will be executed.

Global Failhard

It may be desired to have failhard be applied to every state that is executed, if this is the case, then failhard can be set in the master configuration file. Setting failhard in the master configuration file will result in failing hard when any minion gathering states from the master have a state fail.

This is NOT the default behavior, normally Salt will only fail states that require a failed state.

Using the global failhard is generally not recommended, since it can result in states not being executed or even checked. It can also be confusing to see states failhard if an admin is not actively aware that the failhard has been set.

To use the global failhard set failhard: True in the master configuration

Finite Ordering of State Execution

When creating salt sls files, it is often important to ensure that they run in a specific order. While states will always execute in the same order, that order is not necessarily defined the way you want it.

A few tools exist in Salt to set up the correct state ordering, these tools consist of requisite declarations and order options.

The Order Option

Before using the order option, remember that the majority of state ordering should be done with requisite statements, and that a requisite statement will override an order option.

The order option is used by adding an order number to a state declaration with the option order:

```
vim:
  pkg:
    - installed
    - order: 1
```
By adding the order option to \textit{I} this ensures that the \texttt{vim} package will be installed in tandem with any other state declaration set to the order \textit{I}.

Any state declared without an order option will be executed after all states with order options are executed.

But this construct can only handle ordering states from the beginning. Sometimes you may want to send a state to the end of the line, to do this set the order to \texttt{last}:

\begin{verbatim}
vim:
  pkg:
    - installed
    - order: last
\end{verbatim}

Substantial testing has gone into the state system and it is ready for real world usage. A great deal has been added to the documentation for states and the modules and functions available to states have been cleanly documented.

A number of State System bugs have also been found and repaired, the output from the state system has also been refined to be extremely clear and concise.

Error reporting has also been introduced, issues found in sls files will now be clearly reported when executing Salt States.

\textbf{Gentoo Support}

Additional experimental support has been added for Gentoo. This is found in the contribution from Doug Renn, aka nestegg.

\textbf{31.2.180 Salt 0.9.5 Release Notes}

\texttt{release} 2012-01-15

Salt 0.9.5 is one of the largest steps forward in the development of Salt.

0.9.5 comes with many milestones, this release has seen the community of developers grow out to an international team of 46 code contributors and has many feature additions, feature enhancements, bug fixes and speed improvements.

\textbf{Warning:} Be sure to \texttt{read the upgrade instructions} about the switch to msgpack before upgrading!

\textbf{Community}

Nothing has proven to have more value to the development of Salt that the outstanding community that has been growing at such a great pace around Salt. This has proven not only that Salt has great value, but also the expandability of Salt is as exponential as I originally intended.

0.9.5 has received over 600 additional commits since 0.9.4 with a swath of new committers. The following individuals have contributed to the development of 0.9.5:

- Aaron Bull Schaefer
- Antti Kaihola
- Bas Tichelaar
- Brad Barden
This makes 21 new developers since 0.9.4 was released!

To keep up with the growing community follow Salt on Black Duck Open Hub (https://www.openhub.net/p/salt), to join the Salt development community, fork Salt on GitHub, and get coding (https://github.com/saltstack/salt)!

**Major Features**

**SPEED! Pickle to msgpack**

For a few months now we have been talking about moving away from Python pickles for network serialization, but a preferred serialization format had not yet been found. After an extensive performance testing period involving everything from JSON to protocol buffers, a clear winner emerged. Message Pack (https://msgpack.org/) proved to not only be the fastest and most compact, but also the most "salt like". Message Pack is simple, and the code involved is very small. The msgpack library for Python has been added directly to Salt.
This move introduces a few changes to Salt. First off, Salt is no longer a "noarch" package, since the msgpack lib is written in C. Salt 0.9.5 will also have compatibility issues with 0.9.4 with the default configuration.

We have gone through great lengths to avoid backwards compatibility issues with Salt, but changing the serialization medium was going to create issues regardless. Salt 0.9.5 is somewhat backwards compatible with earlier minions. A 0.9.5 master can command older minions, but only if the serial config value in the master is set to pickle. This will tell the master to publish messages in pickle format and will allow the master to receive messages in both msgpack and pickle formats.

Therefore the suggested methods for upgrading are either to just upgrade everything at once, or:

1. Upgrade the master to 0.9.5
2. Set serial to pickle in the master config
3. Upgrade the minions
4. Remove the serial option from the master config

Since pickles can be used as a security exploit the ability for a master to accept pickles from minions at all will be removed in a future release.

**C Bindings for YAML**

All of the YAML rendering is now done with the YAML C bindings. This speeds up all of the sls files when running states.

**Experimental Windows Support**

David Boucha has worked tirelessly to bring initial support to Salt for Microsoft Windows operating systems. Right now the Salt Minion can run as a native Windows service and accept commands.

In the weeks and months to come Windows will receive the full treatment and will have support for Salt States and more robust support for managing Windows systems. This is a big step forward for Salt to move entirely outside of the Unix world, and proves Salt is a viable cross platform solution. Big Thanks to Dave for his contribution here!

**Dynamic Module Distribution**

Many Salt users have expressed the desire to have Salt distribute in-house modules, states, renderers, returners, and grains. This support has been added in a number of ways:

**Modules via States**

Now when salt modules are deployed to a minion via the state system as a file, then the modules will be automatically loaded into the active running minion - no restart required - and into the active running state. So custom state modules can be deployed and used in the same state run.
Modules via Module Environment Directories

Under the file_roots each environment can now have directories that are used to deploy large groups of modules. These directories sync modules at the beginning of a state run on the minion, or can be manually synced via the Salt module `salt.modules.saltutil.sync_all`.

The directories are named:

- `_modules`
- `_states`
- `_grains`
- `_renderers`
- `_returners`

The modules are pushed to their respective scopes on the minions.

Module Reloading

Modules can now be reloaded without restarting the minion, this is done by calling the `salt.modules.sys.reload_modules` function.

But wait, there’s more! Now when a salt module of any type is added via states the modules will be automatically reloaded, allowing for modules to be laid down with states and then immediately used.

Finally, all modules are reloaded when modules are dynamically distributed from the salt master.

Enable / Disable Added to Service

A great deal of demand has existed for adding the capability to set services to be started at boot in the service module. This feature also comes with an overhaul of the service modules and initial systemd support.

This means that the `service state` can now accept `enable: True` to make sure a service is enabled at boot, and `enable: False` to make sure it is disabled.

Compound Target

A new target type has been added to the lineup, the compound target. In previous versions the desired minions could only be targeted via a single specific target type, but now many target specifications can be declared.

These targets can also be separated by and/or operators, so certain properties can be used to omit a node:

```
salt -C 'webserv* and G@os:Debian or E@db.*' test.ping
```

will match all minions with ids starting with webserv via a glob and minions matching the `os:Debian` grain. Or minions that match the `db.*` regular expression.
Node Groups

Often the convenience of having a predefined group of minions to execute targets on is desired. This can be accomplished with the new nodegroups feature. Nodegroups allow for predefined compound targets to be declared in the master configuration file:

```
nodegroups:
    group1: 'L@foo.domain.com,bar.domain.com,baz.domain.com and bl*.domain.com'
    group2: 'G@os:Debian and foo.domain.com'
```

And then used via the `-N` option:

```
salt -N group1 test.ping
```

Minion Side Data Store

The data module introduces the initial approach into storing persistent data on the minions, specific to the minions. This allows for data to be stored on minions that can be accessed from the master or from the minion.

The Minion datastore is young, and will eventually provide an interface similar to a more mature key/value pair server.

Major Grains Improvement

The Salt grains have been overhauled to include a massive amount of extra data. This includes hardware data, os data and salt specific data.

Salt -Q is Useful Now

In the past the salt query system, which would display the data from recent executions would be displayed in pure Python, and it was unreadable.

0.9.5 has added the outputter system to the `-Q` option, thus enabling the salt query system to return readable output.

Packaging Updates

Huge strides have been made in packaging Salt for distributions. These additions are thanks to our wonderful community where the work to set up packages has proceeded tirelessly.

FreeBSD

Salt on FreeBSD? There a port for that:

https://svnweb.freebsd.org/ports/head/sysutils/py-salt/

This port was developed and added by Christer Edwards. This also marks the first time Salt has been included in an upstream packaging system!
Fedora and Red Hat Enterprise

Salt packages have been prepared for inclusion in the Fedora Project and in EPEL for Red Hat Enterprise 5 and 6. These packages are the result of the efforts made by Clint Savage (herlo).

Debian/Ubuntu

A team of many contributors have assisted in developing packages for Debian and Ubuntu. Salt is still actively seeking inclusion in upstream Debian and Ubuntu and the package data that has been prepared is being pushed through the needed channels for inclusion.

These packages have been prepared with the help of:

- Corey
- Aaron Toponce
- and`

More to Come

We are actively seeking inclusion in more distributions. Primarily getting Salt into Gentoo, SUSE, OpenBSD, and preparing Solaris support are all turning into higher priorities.

Refinement

Salt continues to be refined into a faster, more stable and more usable application. 0.9.5 comes with more debug logging, more bug fixes and more complete support.

More Testing, More Bug Fixes

0.9.5 comes with more bug fixes due to more testing than any previous release. The growing community and the introduction a dedicated QA environment have unearthed many issues that were hiding under the covers. This has further refined and cleaned the state interface, taking care of things from minor visual issues to repairing misleading data.

Custom Exceptions

A custom exception module has been added to throw salt specific exceptions. This allows Salt to give much more granular error information.
New Modules

**data**

The new data module manages a persistent datastore on the minion. Big thanks to bastichelaar for his help refining this module

**freebsdkmod**

FreeBSD kernel modules can now be managed in the same way Salt handles Linux kernel modules.

This module was contributed thanks to the efforts of Christer Edwards

**gentoo_service**

Support has been added for managing services in Gentoo. Now Gentoo services can be started, stopped, restarted, enabled, disabled, and viewed.

**pip**

The pip module introduces management for pip installed applications. Thanks goes to whitinge for the addition of the pip module

**rh_service**

The rh_service module enables Red Hat and Fedora specific service management. Now Red Hat like systems come with extensive management of the classic init system used by Red Hat

**saltutil**

The saltutil module has been added as a place to hold functions used in the maintenance and management of salt itself. Saltutil is used to salt the salt minion. The saltutil module is presently used only to sync extension modules from the master server.

**systemd**

Systemd support has been added to Salt, now systems using this next generation init system are supported on systems running systemd.
**virtualenv**

The `virtualenv` module has been added to allow Salt to create virtual Python environments. Thanks goes to whitinge for the addition of the `virtualenv` module.

**win_disk**

Support for gathering disk information on Microsoft Windows minions. The `win_disk` module comes courtesy of Utah_Dave.

**win_service**

The `win_service` module adds service support to Salt for Microsoft Windows services.

**win_useradd**

Salt can now manage local users on Microsoft Windows Systems.

**yumpkg5**

The `yumpkg5` module introduces in 0.9.4 uses the yum API to interact with the yum package manager. Unfortunately, on Red Hat 5 systems Salt does not have access to the yum API because the yum API is running under Python 2.4 and Salt needs to run under Python 2.6.

The `yumpkg5` module bypasses this issue by shelling out to `yum` on systems where the yum API is not available.

**New States**

**mysql_database**

The new `mysql_database` state adds the ability to systems running a mysql server to manage the existence of mysql databases.

The `mysql_database` states are thanks to syphernl.

**mysql_user**

The `mysql_user` state enables mysql user management.
virtualenv

The virtualenv state can manage the state of Python virtual environments. Thanks to Whitinge for the virtualenv state.

New Returners

cassandra_returner

A returner allowing Salt to send data to a cassandra server. Thanks to Byron Clark for contributing this returner.

31.2.181 Salt 0.9.6 Release Notes

release 2012-01-21

Salt 0.9.6 is a release targeting a few bugs and changes. This is primarily targeting an issue found in the names declaration in the state system. But a few other bugs were also repaired, like missing support for grains in extmods. Due to a conflict in distribution packaging msgpack will no longer be bundled with Salt, and is required as a dependency.

New Features

HTTP and ftp support in files.managed

Now under the source option in the file.managed state a HTTP or ftp address can be used instead of a file located on the salt master.

Allow Multiple Returners

Now the returner interface can define multiple returners, and will also return data back to the master, making the process less ambiguous.

Minion Memory Improvements

A number of modules have been taken out of the minion if the underlying systems required by said modules are not present on the minion system. A number of other modules need to be stripped out in this same way which should continue to make the minion more efficient.

Minions Can Locally Cache Return Data

A new option, cache_jobs, has been added to the minion to allow for all of the historically run jobs to cache on the minion, allowing for looking up historic returns. By default cache_jobs is set to False.
Pure Python Template Support For file.managed

Templates in the file.managed state can now be defined in a Python script. This script needs to have a run function that returns the string that needs to be in the named file.

31.2.182 Salt 0.9.7 Release Notes

release 2012-02-15

Salt 0.9.7 is here! The latest iteration of Salt brings more features and many fixes. This release is a great refinement over 0.9.6, adding many conveniences under the hood, as well as some features that make working with Salt much better.

A few highlights include the new Job system, refinements to the requisite system in states, the mod_init interface for states, external node classification, search path to managed files in the file state, and refinements and additions to dynamic module loading.

0.9.7 also introduces the long developed (and oft changed) unit test framework and the initial unit tests.

Major Features

Salt Jobs Interface

The new jobs interface makes the management of running executions much cleaner and more transparent. Building on the existing execution framework the jobs system allows clear introspection into the active running state of the running Salt interface.

The Jobs interface is centered in the new minion side proc system. The minions now store msgpack serialized files under /var/cache/salt/proc. These files keep track of the active state of processes on the minion.

Functions in the saltutil Module

A number of functions have been added to the saltutil module to manage and view the jobs:

running - Returns the data of all running jobs that are found in the proc directory.
find_job - Returns specific data about a certain job based on job id.
signal_job - Allows for a given jid to be sent a signal.
term_job - Sends a termination signal (SIGTERM, 15) to the process controlling the specified job.
kill_job Sends a kill signal (SIGKILL, 9) to the process controlling the specified job.

The jobs Runner

A convenience runner front end and reporting system has been added as well. The jobs runner contains functions to make viewing data easier and cleaner.

The jobs runner contains a number of functions...
active

The active function runs `saltutil.running` on all minions and formats the return data about all running jobs in a much more usable and compact format. The active function will also compare jobs that have returned and jobs that are still running, making it easier to see what systems have completed a job and what systems are still being waited on.

lookup_jid

When jobs are executed the return data is sent back to the master and cached. By default is cached for 24 hours, but this can be configured via the `keep_jobs` option in the master configuration.

Using the `lookup_jid` runner will display the same return data that the initial job invocation with the salt command would display.

list_jobs

Before finding a historic job, it may be required to find the job id. `list_jobs` will parse the cached execution data and display all of the job data for jobs that have already, or partially returned.

External Node Classification

Salt can now use external node classifiers like Cobbler’s `cobbler-ext-nodes`.

Salt uses specific data from the external node classifier. In particular the classes value denotes which sls modules to run, and the environment value sets to another environment.

An external node classification can be set in the master configuration file via the `external_nodes` option: https://salt.readthedocs.io/en/latest/ref/configuration/master.html#external-nodes

External nodes are loaded in addition to the top files. If it is intended to only use external nodes, do not deploy any top files.

State Mod Init System

An issue arose with the pkg state. Every time a package was run Salt would need to refresh the package database. This made systems with slower package metadata refresh speeds much slower to work with. To alleviate this issue the `mod_init` interface has been added to salt states.

The `mod_init` interface is a function that can be added to a state file. This function is called with the first state called. In the case of the pkg state, the `mod_init` function sets up a tag which makes the package database only refresh on the first attempt to install a package.

In a nutshell, the `mod_init` interface allows a state to run any command that only needs to be run once, or can be used to set up an environment for working with the state.
Source File Search Path

The file state continues to be refined, adding speed and capabilities. This release adds the ability to pass a list to the source option. This list is then iterated over until the source file is found, and the first found file is used.

The new syntax looks like this:

```
/etc/httpd/conf/httpd.conf:
  file:
    - managed
  source:
    - salt://httpd/httpd.conf
    - http://myserver/httpd.conf: md5=8c1fe119e6f1fd96bc06614473509bf1
```

The source option can take sources in the list from the salt file server as well as an arbitrary web source. If using an arbitrary web source the checksum needs to be passed as well for file verification.

Refinements to the Requisite System

A few discrepancies were still lingering in the requisite system, in particular, it was not possible to have a `require` and a `watch` requisite declared in the same state declaration.

This issue has been alleviated, as well as making the requisite system run more quickly.

Initial Unit Testing Framework

Because of the module system, and the need to test real scenarios, the development of a viable unit testing system has been difficult, but unit testing has finally arrived. Only a small amount of unit testing coverage has been developed, much more coverage will be in place soon.

A huge thanks goes out to those who have helped with unit testing, and the contributions that have been made to get us where we are. Without these contributions unit tests would still be in the dark.

Compound Targets Expanded

Originally only support for `and` and `or` were available in the compound target. 0.9.7 adds the capability to negate compound targets with `not`.

Nodegroups in the Top File

Previously the nodegroups defined in the master configuration file could not be used to match nodes for states. The nodegroups support has been expanded and the nodegroups defined in the master configuration can now be used to match minions in the top file.
31.2.183 Salt 0.9.8 Release Notes

release 2012-03-21

Salt 0.9.8 is a big step forward, with many additions and enhancements, as well as a number of precursors to advanced future developments.

This version of Salt adds much more power to the command line, making the old hard timeout issues a thing of the past and adds keyword argument support. These additions are also available in the salt client API, making the available API tools much more powerful.

The new pillar system allows for data to be stored on the master and assigned to minions in a granular way similar to the state system. It also allows flexibility for users who want to keep data out of their state tree similar to 'external lookup' functionality in other tools.

A new way to extend requisites was added, the "requisite in" statement. This makes adding requires or watch statements to external state decs much easier.

Additions to requisites making them much more powerful have been added as well as improved error checking for sls files in the state system. A new provider system has been added to allow for redirecting what modules run in the background for individual states.

Support for openSUSE has been added and support for Solaris has begun serious development. Windows support has been significantly enhanced as well.

The matcher and target systems have received a great deal of attention. The default behavior of grain matching has changed slightly to reflect the rest of salt and the compound matcher system has been refined.

A number of impressive features with keyword arguments have been added to both the CLI and to the state system. This makes states much more powerful and flexible while maintaining the simple configuration everyone loves.

The new batch size capability allows for executions to be rolled through a group of targeted minions a percentage or specific number at a time. This was added to prevent the "thundering herd" problem when targeting large numbers of minions for things like service restarts or file downloads.

Upgrade Considerations

Upgrade Issues

There was a previously missed oversight which could cause a newer minion to crash an older master. That oversight has been resolved so the version incompatibility issue will no longer occur. When upgrading to 0.9.8 make sure to upgrade the master first, followed by the minions.

Debian/Ubuntu Packages

The original Debian/Ubuntu packages were called salt and included all salt applications. New packages in the ppa are split by function. If an old salt package is installed then it should be manually removed and the new split packages need to be freshly installed.

On the master:

```bash
# apt-get purge salt
# apt-get install salt-{master,minion}
```

On the minions:
# apt-get purge salt
# apt-get install salt-minion

And on any Syndics:

# apt-get install salt-syndic

The official Salt PPA for Ubuntu is located at: https://launchpad.net/~saltstack/+archive/ubuntu/salt

Major Features

Pillar

Pillar offers an interface to declare variable data on the master that is then assigned to the minions. The pillar data is made available to all modules, states, sls files etc. It is compiled on the master and is declared using the existing renderer system. This means that learning pillar should be fairly trivial to those already familiar with salt states.

CLI Additions

The `salt` command has received a serious overhaul and is more powerful than ever. Data is returned to the terminal as it is received, and the `salt` command will now wait for all running minions to return data before stopping. This makes adding very large `--timeout` arguments completely unnecessary and gets rid of long running operations returning empty `{}` when the timeout is exceeded.

When calling `salt` via `sudo`, the user originally running `salt` is saved to the log for auditing purposes. This makes it easy to see who ran what by just looking through the minion logs.

The `salt-key` command gained the `-D` and `--delete-all` arguments for removing all keys. Be careful with this one!

Running States Without a Master

The addition of running states without a salt-master has been added to 0.9.8. This feature allows for the unmodified salt state tree to be read locally from a minion. The result is that the UNMODIFIED state tree has just become portable, allowing minions to have a local copy of states or to manage states without a master entirely.

This is accomplished via the new file client interface in Salt that allows for the salt:// URI to be redirected to custom interfaces. This means that there are now two interfaces for the salt file server, calling the master or looking in a local, minion defined `file_roots`.

This new feature can be used by modifying the minion config to point to a local `file_roots` and setting the `file_client` option to `local`.

Keyword Arguments and States

State modules now accept the **kwargs argument. This results in all data in a sls file assigned to a state being made available to the state function.

This passes data in a transparent way back to the modules executing the logic. In particular, this allows adding arguments to the pkg.install module that enable more advanced and granular controls with respect to what the state is capable of.

An example of this along with the new debconf module for installing ldap client packages on Debian:
**ldap-client-packages:**

pkg:
- debconf: salt://debconf/ldap-client.ans
- installed
- names:
  - nslcd
  - libpam-ldapd
  - libnss-ldapd

---

**Keyword Arguments and the CLI**

In the past it was required that all arguments be passed in the proper order to the `salt` and `salt-call` commands. As of 0.9.8, keyword arguments can be passed in the form of `kwarg=argument`.

```bash
# salt -G 'type:dev' git.clone 
   repository=https://github.com/saltstack/salt.git cwd=/tmp/salt user=jeff
```

**Matcher Refinements and Changes**

A number of fixes and changes have been applied to the Matcher system. The most noteworthy is the change in the grain matcher. The grain matcher used to use a regular expression to match the passed data to a grain, but now defaults to a shell glob like the majority of match interfaces in Salt. A new option is available that still uses the old style regex matching to grain data called `grain-pcre`. To use regex matching in compound matches use the letter `P`.

For example, this would match any ArchLinux or Fedora minions:

```bash
# salt --grain-pcre 'os:(Arch:Fed).*' test.ping
```

And the associated compound matcher suitable for `top.sls` is `P`:

```
P@os:(Arch|Fed).*
```

**NOTE:** Changing the grains matcher from pcre to glob is backwards incompatible.

Support has been added for matching minions with Yahoo’s range library. This is handled by passing range syntax with `-R` or `--range` arguments to `salt`.

More information at: [https://github.com/ytoolshed/range/wiki/%22yamlfile%22-module-file-spec](https://github.com/ytoolshed/range/wiki/%22yamlfile%22-module-file-spec)

**Requisite "in"**

A new means to updating requisite statements has been added to make adding watchers and requires to external states easier. Before 0.9.8 the only way to extend the states that were watched by a state outside of the sls was to use an extend statement:

```yaml
include:
  - http
extend:
  apache:
    service:
      watch:
```

(continues on next page)
- pkg: tomcat

tomcat:
  pkg:
    - installed

But the new Requisite in statement allows for easier extends for requisites:

include:
  - http

tomcat:
  pkg:
    - installed
    - watch_in:
      - service: apache

Requisite in is part of the extend system, so still remember to always include the sls that is being extended!

Providers

Salt predetermines what modules should be mapped to what uses based on the properties of a system. These determinations are generally made for modules that provide things like package and service management. The apt module maps to pkg on Debian and the yum module maps to pkg on Fedora for instance.

Sometimes in states, it may be necessary for a non-default module to be used for the desired functionality. For instance, an Arch Linux system may have been set up with systemd support. Instead of using the default service module detected for Arch Linux, the systemd module can be used:

http:
  service:
    - running
    - enable: True
    - provider: systemd

Default providers can also be defined in the minion config file:

providers:
  service: systemd

When default providers are passed in the minion config, then those providers will be applied to all functionality in Salt, this means that the functions called by the minion will use these modules, as well as states.

Requisite Glob Matching

Requisites can now be defined with glob expansion. This means that if there are many requisites, they can be defined on a single line.

To watch all files in a directory:
This example will watch all defined files that match the glob `/etc/http/conf.d/*`

**Batch Size**

The new batch size option allows commands to be executed while maintaining that only so many hosts are executing the command at one time. This option can take a percentage or a finite number:

```
salt '*' -b 10 test.ping
salt -G 'os:RedHat' --batch-size 25% apache.signal restart
```

This will only run test.ping on 10 of the targeted minions at a time and then restart apache on 25% of the minions matching `os:RedHat` at a time and work through them all until the task is complete. This makes jobs like rolling web server restarts behind a load balancer or doing maintenance on BSD firewalls using carp much easier with salt.

**Module Updates**

This is a list of notable, but non-exhaustive updates with new and existing modules.

Windows support has seen a flurry of support this release cycle. We’ve gained all new `file`, `network`, and `shadow` modules. Please note that these are still a work in progress.

For our ruby users, new `rvm` and `gem` modules have been added along with the `associated states`.

The `virt` module gained basic Xen support.

The `yum` module gained Scientific Linux support.

The `pkg` module on Debian, Ubuntu, and derivatives force apt to run in a non-interactive mode. This prevents issues when package installation waits for confirmation.

A `pkg` module for OpenSUSE’s zypper was added.

The `service` module on Ubuntu natively supports upstart.

A new `debconf` module was contributed by our community for more advanced control over deb package deployments on Debian based distributions.

The `mysql.user` state and `mysql` module gained a `password_hash` argument.

The `cmd` module and state gained a `shell` keyword argument for specifying a shell other than `/bin/sh` on Linux/Unix systems.

New `git` and `mercurial` modules have been added for fans of distributed version control.
In Progress Development

Master Side State Compiling

While we feel strongly that the advantages gained with minion side state compiling are very critical, it does prevent certain features that may be desired. 0.9.8 has support for initial master side state compiling, but many more components still need to be developed, it is hoped that these can be finished for 0.9.9.

The goal is that states can be compiled on both the master and the minion allowing for compilation to be split between master and minion. Why will this be great? It will allow storing sensitive data on the master and sending it to some minions without all minions having access to it. This will be good for handling ssl certificates on front-end web servers for instance.

Solaris Support

Salt 0.9.8 sees the introduction of basic Solaris support. The daemon runs well, but grains and more of the modules need updating and testing.

Windows Support

Salt states on windows are now much more viable thanks to contributions from our community! States for file, service, local user, and local group management are more fully fleshed out along with network and disk modules. Windows users can also now manage registry entries using the new "reg" module.

31.2.184 Salt 0.9.9 Release Notes

release 2012-04-27

0.9.9 is out and comes with some serious bug fixes and even more serious features. This release is the last major feature release before 1.0.0 and could be considered the 1.0.0 release candidate.

A few updates include more advanced kwargs support, the ability for salt states to more safely configure a running salt minion, better job directory management and the new state test interface.

Many new tests have been added as well, including the new minion swarm test that allows for easier testing of Salt working with large groups of minions. This means that if you have experienced stability issues with Salt before, particularly in larger deployments, that these bugs have been tested for, found, and killed.

Major Features

State Test Interface

Until 0.9.9 the only option when running states to see what was going to be changed was to print out the highstate with state.show_highstate and manually look it over. But now states can be run to discover what is going to be changed.

Passing the option test=True to many of the state functions will now cause the salt state system to only check for what is going to be changed and report on those changes.

```
salt '*' state.highstate test=True
```

Now states that would have made changes report them back in yellow.
State Syntax Update

A shorthand syntax has been added to sls files, and it will be the default syntax in documentation going forward. The old syntax is still fully supported and will not be deprecated, but it is recommended to move to the new syntax in the future. This change moves the state function up into the state name using a dot notation. This is in-line with how state functions are generally referred to as well:

The new way:

```
/etc/sudoers:
  file.present:
    - source: salt://sudo/sudoers
    - user: root
    - mode: 400
```

Use and Use_in Requisites

Two new requisite statements are available in 0.9.9. The use and use_in requisite and requisite-in allow for the transparent duplication of data between states. When a state "uses" another state it copies the other state's arguments as defaults. This was created in direct response to the new network state, and allows for many network interfaces to be configured in the same way easily. A simple example:

```
root_file:
  file.absent:
    - name: /tmp/nothing
    - user: root
    - mode: 644
    - group: root
    - use_in:
      - file: /etc/vimrc

fred_file:
  file.absent:
    - name: /tmp/nothing
    - user: fred
    - group: marketing
    - mode: 660

/files/marketing/district7.rst:
  file.present:
    - source: salt://marketing/district7.rst
    - template: jinja
    - use:
      - file: fred_file

/etc/vimrc:
  file.present:
    - source: salt://edit/vimrc
```

This makes the 2 lower state decs inherit the options from their respectively "used" state decs.
Network State

The new network state allows for the configuration of network devices via salt states and the ip salt module. This addition has been given to the project by Jeff Hutchins and Bret Palsson from Jive Communications.

Currently the only network configuration backend available is for Red Hat based systems, like Red Hat Enterprise, CentOS, and Fedora.

Exponential Jobs

Originally the jobs executed were stored on the master in the format: `<cachedir>/jobs/jid/{minion ids}`. But this format restricted the number of jobs in the cache to the number of subdirectories allowed on the filesystem. Ext3 for instance limits subdirectories to 32000. To combat this the new format for 0.9.9 is: `<cachedir>/jobs/jid_hash[:2]/jid_hash[2:]/{minion ids}` so that now the number of maximum jobs that can be run before the cleanup cycle hits the job directory is substantially higher.

ssh_auth Additions

The original ssh_auth state was limited to accepting only arguments to apply to a public key, and the key itself. This was restrictive due to the way the we learned that many people were using the state, so the key section has been expanded to accept options and arguments to the key that over ride arguments passed in the state. This gives substantial power to using ssh_auth with names:

```
sshkeys:
  ssh_auth:
    - present
    - user: backup
    - enc: ssh-dss
    - options:
      - option1="value1"
      - option2="value2 flag2"
    - comment: backup
  names:
    - <KEY>==
    - <KEY>==
    - <KEY>==
    - override
  - ssh-rsa
    - <KEY>==
    - <KEY>==
    - <KEY>==
    - override
  - ssh-rsa
    - <KEY>==
    - <KEY>==
    - <KEY>==
    - override
  - ssh-rsa
    - <KEY>==
    - <KEY>==
    - <KEY>==
    - override
```

(continues on next page)
LocalClient Additions

To follow up the recent additions in 0.9.8 of additional kwargs support, 0.9.9 also adds the capability to send kwargs into commands via a dict. This addition to the LocalClient api can be used like so:

```python
import salt.client

client = salt.client.LocalClient("/etc/salt/master")
ret = client.cmd("*", "cmd.run", ["ls -l"], kwarg={"cwd": "/etc"})
```

This update has been added to all cmd methods in the LocalClient class.

Better Self Salting

One problem faced with running Salt states, is that it has been difficult to manage the Salt minion via states, this is due to the fact that if the minion is called to restart while a state run is happening then the state run would be killed. 0.9.9 slightly changes the process scope of the state runs, so now when salt is executing states it can safely restart the salt-minion daemon.

In addition to daemonizing the state run, the apt module also daemonizes. This update makes it possible to cleanly update the salt-minion package on Debian/Ubuntu systems without leaving apt in an inconsistent state or killing the active minion process mid-execution.

Wildcards for SLS Modules

Now, when including sls modules in include statements or in the top file, shell globs can be used. This can greatly simplify listing matched sls modules in the top file and include statements:

```yaml
base:
  '*':
    - files*
    - core*

include:
  - users.dev.*
  - apache.ser*
```
External Pillar

Since the pillar data is just, data, it does not need to come expressly from the pillar interface. The external pillar system allows for hooks to be added making it possible to extract pillar data from any arbitrary external interface. The external pillar interface is configured via the `ext_pillar` option. Currently interfaces exist to gather external pillar data via hiera or via a shell command that sends yaml data to the terminal:

```yaml
ext_pillar:
  - cmd_yaml: cat /etc/salt/ext.yaml
  - hiera: /etc/hirea.yaml
```

The initial external pillar interfaces and extra interfaces can be added to the file `salt/pillar.py`, it is planned to add more external pillar interfaces. If the need arises a new module loader interface will be created in the future to manage external pillar interfaces.

Single State Executions

The new `state.single` function allows for single states to be cleanly executed. This is a great tool for setting up a small group of states on a system or for testing out the behavior of single states:

```bash
salt '*' state.single user.present name=wade uid=2000
```

The test interface functions here as well, so changes can also be tested against as:

```bash
salt '*' state.single user.present name=wade uid=2000 test=True
```

New Tests

A few exciting new test interfaces have been added, the minion swarm allows not only testing of larger loads, but also allows users to see how Salt behaves with large groups of minions without having to create a large deployment.

Minion Swarm

The minion swarm test system allows for large groups of minions to be tested against easily without requiring large numbers of servers or virtual machines. The minion swarm creates as many minions as a system can handle and roots them in the /tmp directory and connects them to a master.

The benefit here is that we were able to replicate issues that happen only when there are large numbers of minions. A number of elusive bugs which were causing stability issues in masters and minions have since been hunted down. Bugs that used to take careful watch by users over several days can now be reliably replicated in minutes, and fixed in minutes.

Using the swarm is easy, make sure a master is up for the swarm to connect to, and then use the minionswarm.py script in the tests directory to spin up as many minions as you want. Remember, this is a fork bomb, don't spin up more than your hardware can handle!

```bash
python minionswarm.py -m 20 --master salt-master
```
Shell Tests

The new Shell testing system allows us to test the behavior of commands executed from a high level. This allows for the high level testing of salt runners and commands like salt-key.

Client Tests

Tests have been added to test the aspects of the client APIs and ensure that the client calls work, and that they manage passed data, in a desirable way.

31.3 Upcoming Release

31.3.1 Salt 3005 release notes - Codename Phosphorus

Salt 3005 is currently under development.

Python 3.5 and 3.6 deprecation

This will be the last release we will support Python versions 3.5 and 3.6. In Salt release 3006, we will only support Python versions 3.7 and higher. Going forward, our policy will be to align with Python's supported versions.

OS support end of life

Debian and Raspbian 9 are now EOL, therefore we will no longer be building packages for these platforms.

Raspberry Pi

We will no longer build the Raspberry Pi packages after the 3005 release but will provide open sources project links in an updated announcement later. Please see the announcement for more details: https://saltproject.io/salt-project-announces-the-open-sourcing-of-several-saltstack-native-minions/

New packages available

With the release of Salt 3005, we are pleased to announce the new onedir packages using pyinstaller are now out of beta and ready for production. These new packages make the installation process easier. Onedir packages install Salt with one directory that includes all the executables Salt needs to run effectively, including the version of Python and the required dependencies that Salt needs. These packages make it easier to use Salt out of the box without installing Python first.

Going forward, any new OS platforms supported by the Salt Project from version 3005 can only be installed using onedir packages. For this release, this includes Redhat 9, Ubuntu 22.04, and Photon OS 3. The Salt Project will phase out the old (“classic”) Salt package builds for currently supported operating systems by 3006. See Upgrade to onedir for more information.

On the day of the Phosphorus release, the onedir packages will be available on https://repo.saltproject.io for each platform. The instructions for installing onedir packages and the classic packages will be available on the new Salt Install Guide.

---

31.3. Upcoming Release

5843
If you want to test out the packages today, you can install them from https://repo.saltproject.io/salt-dev/py3/ using the correct directory for your platform. If you find any issues with the packages, please open an issue on this repo: https://gitlab.com/saltstack/open/salt-pkg

Classic, non-onedir packaging support

The classic, non-onedir packaging system previously used for Salt will also be provided for platforms supported in previous Salt versions. The classic packaging will only be available for the 3005 release. The 3006 release and all releases going forward will only provide the onedir packages.

Note that the onedir paths above will not be available until the day of the Phosphorus release.
How do I migrate to the onedir packages?

The migration path from the classic, non-onedir packages to the onedir packages will include:

- **Repo File:** You need to update your repo file to point to the new repo paths for your platform. After the repo file is updated, upgrade your Salt packages.

- **Pip packages:** You need to ensure any 3rd party pip packages are installed in the correct onedir path. This can be accomplished in two ways:
  - `salt-pip install <package name>`
  - Using the `pip.installed` Salt state.

To install python packages into the system python environment, users must now provide the `pip_bin` or `bin_env` to the pip state module.

For example:

```yaml
lib-foo:
  pip.installed:
    - pip_bin: /usr/bin/pip3
lib-bar:
  pip.installed:
    - bin_env: /usr/bin/python3
```

**Known issues**

To make use of Salt 3005 or later on a Salt master connected to SaltStack Config, you must use SaltStack Config version 8.9.0 or later.

The root cause of the issue is a breaking change to `AsyncClient._proc_function()` in Salt, which is the function that the raas-master uses to run `salt-run` commands. As this is a private API, there's no expectation that the API should remain backward-compatible.

It is recommended to upgrade SaltStack Config before upgrading your Salt masters. However, if a Salt master is upgraded to version 3005 before upgrading SaltStack Config, the upgrade can still be completed.

After upgrading SaltStack Config, including the SSC plugin on each Salt master, restart the Salt masters.

**Removed**

- Deprecated and removing `salt-unity`. (#56055)

- Removed support for macos mojave (#61130)

- Remove the grains.get_or_set_hash function. Please reference pillar and SDB documentation for secure ways to manage sensitive information. Grains are an insecure way to store secrets. (#61691)

- Removed the `telnet_port`, `serial_type` and `console` parameters in salt/modules/virt.py. Use the `serials` and `consoles` parameters instead. Use the `serials` parameter with a value like `{{{{'type': 'tcp', 'protocol': 'telnet', 'port': {}}}}} instead and a similar `consoles` parameter. (#61693)

- Remove remove_lock in zypperpkg.py in favor of unhold. Remove add_lock in zypperpkg.py in favor of hold. (#61694)
- Removed support for old-style Windows Group Policy names. Recommended policy names will be displayed in comments (#61696)

- Remove the feature flag feature.enable_slsvars_fixes and enable the fixes for sls_path, tpl_file, and tpldir by default. Enabling this behavior by default will fix the following:
  - tpldir: If your directory name and your SLS file name are the same tpldir used to return a ., now it returns the correct directory name.
  - slspath, slsdotpath, slscolonpath, sls_path: If an init.sls file is accessed by its explicit name path.to.init instead of path.to, init shows up as a directory for in various sls context parameters, now it will only show as a file.
  - tplfile: When using tplfile in a SLS file in the root directory of file roots it returns empty. Now it returns the filename. (#61697)

- Remove SaltMessageServer.shutdown in favor of close. Remove LoadBalancerWorker.stop in favor of close. (#61698)

**Deprecated**

- In etcd_util, the recursive kwarg in the read and delete methods has been deprecated in favor of recurse for both client versions. In etcd_util, the index kwarg in the watch method has been deprecated in favor of start_revision for both client versions. In etcd_util, the waitIndex kwarg in the read method has been deprecated in favor of start_revision for both client versions. The etcd API v2 implementation has been deprecated in favor of etcd API v3. (#60325)

- Deprecated transport kwarg inside salt.utils.event.get_event (#61275)

- Deprecated netmiko_conn and pyeapi_conn in napalm_mod.py as these function should not be called from the CLI (#61566)

- Deprecate all Azure cloud modules (#62183)

- Deprecated defaults and preserve_context for salt.utils.functools.namespaced_function. Additionally, the behavior when preserve_namespace=True was passed is now the default in order not to require duplicating imports on the modules that are namespacing functions. (#62272)

**Changed**

- alternatives: Do not access /var/lib/dpkg/alternatives directly (#58745)

- Enhance logging when there are errors at loading beacons (#60402)

- Updated mysql cache module to also store updated timestamp, making it consistent with default cache module. Users of mysql cache should ensure database size before updating, as ALTER TABLE will add the timestamp column. (#61081)

- Changed linux_shadow to test success of commands using cmd.retcode instead of cmd.run (#61932)

- zabbix.user_get returns full user info with groups and medias zabbix.user_addmedia returns error for Zabbix 4.0+ due to user.addmedia method removal zabbix.user_deletemedia returns error for Zabbix 4.0+ due to user.deletemedia method removal (#62012)

- "Sign before ending the testrun in x509.create_certificate" (#62100)
Fixed

- Fix salt-ssh using sudo with a password (#8882)
- Fix SSH password regex to not search for content after password:
  (#25721)
- Addressing a few issues when having keep_symlinks set to True with file.recurse. Also allow
  symlinks that are outside the salt fileserver root to be discoverable as symlinks when
  fileserver_followsymlinks is set to False. (#29562)
- serialize to JSON only non string objects. (#35215)
- Fix archive.extracted doesn’t set user/group ownership correctly (#38605)
- Make sys.argspec work on functions with annotations (#48735)
- Fixed pdbedit.list_users with Samba 4.8 (#49648)
- Fixes a scenario where ipv6 is enabled but the master is configured as an ipv4 IP address. (#49835)
- Ensure that NOTIFY_SOCKET is not passed to child processes created with cmdmod unless it’s set explicitly
  for such call. (#50851)
- remove escaping of dbname in mysql.alter_db function. (#51559)
- Fix runit module failing to find service if it is not symlinked. (#52759)
- Changed manage.versions to report minions offline if minion call fails. (#53513)
- Fixed events stream from /events endpoint not halting when auth token has expired. (#53742)
- Fixed user.present which was breaking when updating workphone,homephone, fullname and "other" fields in
  case int was passed instead of string (#53961)
- Fix error in webutil state module when attempting to grep a file that does not exist. (#53977)
- Fixed ability to modify the "Audit: Force audit policy subcategory settings..." policy (#54301)
- Fix timeout handling in netapi/saltntado. (#55394)
- Fixing REST auth so that we actually support using ACLs from the REST server like we said in the document-
  ation. (#55654)
- Salt now correctly handles macOS after Py3.8 where python defaults to spawn instead of fork. (#55847)
- Factor out sum and sorting of permissions into separate functions. Additionally, the same logic was applied
  to the rest_cherrypy netapi (#56495)
- Display packages that are marked NoRemove in pkg.list_pkgs for Windows platforms (#56864)
- Attempt to fix 56957 by detecting the broken recursion and stopping it. (#56957)
- Fixed bytes vs. text issue when using sqlite for sdb backend. (#57133)
- Ensure test is added to opts when using the state module with salt-ssh. (#57144)
- Fixed RuntimeError OrderedDict mutated in network.managed for Debian systems. (#57721)
- Improved the multiprocessing classes to better handle spawning platforms (#57742)
- Config options are enforced according to config type (#57873)
- fixed 57992 fix multi item kv v2 items read. (#57992)
- Fixed thread leak during FQDN lookup when DNS entries had malformed PTR records, or other similar issues.
  (#58141)
- Remove unnecessary dot in template that cause the bridge interface to fail on debian. Fixes #58195 (#58195)

31.3. Upcoming Release
• update salt.module.schedule to check the job_args and job_kwargs for valid formatting. (#58329)
• Allow use of roster in salt.function state when using the SSH client. (#58662)
• Detect new and legacy styles of calling module.run and support them both. (#58763)
• Clean repo uri before checking if it’s present, avoiding ghost change. (#58807)
• Fix error "__opts__" is not defined” when using the boto v2 modules (#58934)
• hgfs: fix bytes vs str issues within hgfs. (#58963)
• Fixes salt-ssh error when targetting IPs or hostnames directly. (#59033)
• Allow for multiple configuration entries with keyword strict_config=False on yum-based systems (#59090)
• Fixed error when running legacy code in winrepo.update_git_repos (#59101)
• Clarify the persist argument in the scheduler module. Adding code in the list function to indicate if the schedule job is saved or not. (#59102)
• Swap ret["retcode"] for ret.get("retcode") in the event that there is no retcode, eg. when a function is not passed with a module. (#59331)
• Fix race condition when caching vault tokens (#59361)
• The ssh module now accepts all ssh public key types as of openssh server version 8.7. (#59429)
• Set default transport and port settings for Napalm NXOS, if not set. (#59448)
• Use __salt_system_encoding__ when retrieving keystore certificate SHA1 str (#59503)
• Fix error being thrown on empty flags list given to file.replace (#59554)
• Update url for ez_setup.py script in virtualenv_mod.py (#59604)
• Changed yumpkg module to normalize versions to strings when they were ambiguously floats (example version=3005.0). (#59705)
• Fix pillar_roots.write on subdirectories broken after CVE-2021-25282 patch. (#59935)
• Improved performance of zfs.filesystem_present and zfs.volume_present. When applying these states, only query specified ZFS properties rather than all properties. (#59970)
• Fixed highstate outputter not displaying with salt.function in orchestration when module returns a dictionary. (#60029)
• Update docs where python-dateutil is required for schedule. (#60070)
• Send un-parsed username to LookupAccountName function (#60076)
• Fix ability to set propagation on a folder to “this_folder_only” (#60103)
• Fix name attribute access error in spm. (#60106)
• Fix zeromq stream.send exception message (#60228)
• Exit gracefully on ctrl+c. (#60242)
• Corrected import statement for redis_cache in cluster mode. (#60272)
• loader: Fix loading grains with annotations (#60285)
• fix docker_network.present when com.docker.network.bridge.name is being used as the unixes can not have a bridge of the same name (#60316)
• Fix exception in yumpkg.remove for not installed package on calling pkg.remove or pkg.removed (#60356)
• Batch runs now return proper retcodes in a tuple of the form (result, retcode) (#60361)
• Fixed issue with ansible roster __virtual__ when ansible is not installed. (#60370)
• Fixed error being thrown when None was passed as src/defaults or dest to defaults.update and defaults.merge (#60431)
• Allow for additional options for xmit hash policy in mode 4 NIC bonding on Redhat (#60583)
• Properly detect VMware grains on Windows Server 2019+ (#60593)
• Allow for minion failure to respond to job sent in batch mode (#60724)
• The mac assistive execution module no longer shells out to change the database. (#60819)
• Fix regression in win_timezone.get_zone which failed to resolve specific timezones that begin or end with d/s/t/o/f/_ characters (#60829)
• The TCP transport resets it's unpacker on stream disconnects (#60831)
• Moving the call to the validate function earlier to ensure that beacons are in the right format before we attempt to do anything to the configuration. Adding a generic validation to ensure the beacon configuration is in the wrong format when a validation function does not exist. (#60838)
• Update the mac installer welcome and conclusion page, add docs for the salt-config tool (#60858)
• Fixed external node classifier not callable due to wrong parameter (#60872)
• Adjust Debian/Ubuntu package use of name 'ifenslave-2.6' to 'ifenslave' (#60876)
• Clear and update the Pillar Cache when running saltutil.refresh_pillar. This only affects users that have pillar_cache set to True. If you do not want to clear the cache you can pass the kwarg clean_cache=False to saltutil.refresh_pillar. (#60897)
• Handle the situation when apt repo lines have or do not have trailing slashes properly. (#60907)
• Fixed Python 2 syntax for Python 3, allow for view objects returned by dictionary keys() function (#60909)
• Fix REST CherryPY append the default permissions every request (#60955)
• Do not consider "skipped" targets as failed for "ansible.playbooks" states (#60983)
• Fix behavior for internal "_netlink_tool_remote_on" to filter results based on requested end (#61017)
• schedule.job_status module: Convert datetime objects into formatted strings (#61043)
• virt: don't crash if console doesn't have service or type attribute (#61054)
• Fixed conflict between importlib_metada from Salt and importlib.metadata from Python 3.10 (#61062)
• sys.argspec now works with pillar.get, vault.read_secret, and vault.list_secrets (#61084)
• Set virtual grain on FreeBSD EC2 instances (#61094)
• Fixed v3004 windows minion failing to open log file at C:ProgramDataSalt ProjectSaltvarlogsaltminion (#61113)
• Correct returned result to False when an error exception occurs for pip.installed (#61117)
• fixed extend being too strict and wanting the system_type to exist when it is only needed for requisites. (#61121)
• Fixed bug where deserialization in script engine would throw an error after all output was read. (#61124)
• Adding missing import for salt.utils.beacons into beacons that were updated to use it. (#61135)
• added exception catch to salt.utils.vt.terminal.isalive(). (#61160)
• Re-factor transport to make them more plug-able (#61161)
• Remove max zeromq pinned version due to issues on FreeBSD (#61163)
- Fixing deltaproxy code to handle the situation where the control proxy is configured to control a proxy minion whose pillar data could not be loaded. (#61172)
- Prevent get_tops from performing a Set operation on a List (#61176)
- Make "state.highstate" to acts on concurrent flag. Simplify "transactional_update" module to not use SSH wrapper and allow more flexible execution (#61188)
- Fix a failure with salt.utils.vault.make_request when namespace is not defined in the connection. (#61191)
- Fix race condition in salt.utils.verify.verify_env and ignore directories starting with dot (#61192)
- LGPO: Search for policies in a case-sensitive manner first, then fall back to non case-sensitive names (#61198)
- Fixed state includes in dynamic environments (#61200)
- Minimize the number of network connections minions to the master (#61247)
- Fix salt-call event.event with pillar or grains (#61252)
- Fixed failing dcs.compile_config where a successful compile errored with AttributeError: 'list' object has no attribute 'get'. (#61261)
- Make the salt.utils.win_dacl.get_name() function include the "NT Security" prefix for Virtual Accounts. Virtual Accounts can only be added with the fully qualified name. (#61271)
- Fixed tracebacks and print helpful error message when proxy_return = True but no platform or primary_ip set in NetBox pillar. (#61277)
- Ensure opts is included in pack for minion.mods and config loads opts from the named_context. (#61297)
- Added prefix length info for IPv6 addresses in Windows (#61316)
- Handle MariaDB 10.5+ SLAVE MONITOR grant (#61331)
- Fix secondary ip addresses being added to ip4_interfaces and ip6_interfaces at the same time (#61370)
- Do not block the deltaproxy startup. Wrap the call to the individual proxy initialization functions in a try...except, catching the exception, logging an error and moving onto the next proxy minion. (#61377)
- show_instance of hetzner cloud provider should enforce an action like the other ones (#61392)
- Fix Hetzner Cloud config loading mechanism (#61399)
- Sets correctly the lvm grain even when lvm's command execution outputs a WARNING (#61412)
- Use net instead of sc in salt cloud when restarting the salt service (#61413)
- Fix use_etag support in fileclient by removing case sensitivity of expected header (#61440)
- Expand environment variables in the root_dir registry key (#61445)
- Use salt.utils.path.readlink everywhere instead of os.readlink (#61458)
- Fix state_aggregate minion option not respected (#61478)
- Fixed wua.installed and wua.uptodate to return all changes, failures, and supersedences (#61479)
- When running with test=True and there are no changes, don't show that there are changes. (#61483)
- Fix issue with certutil when there's a space in the path to the certificate (#61494)
- Fix cmdmod not respecting config for saltenv (#61507)
- Convert Py 2'isms to Python 3, and add tests for set_filesystems on AIX (#61509)
- Fix tracebacks caused by missing block device type and wrong mode used for gzip.open while calling inspector.export (#61530)
• win_wua: Titles no longer limited to 40 characters (#61533)
• Fixed error when using network module on RHEL 8 due to the name of the service changing from "network" to "NetworkManager". (#61538)
• Allow symlink to be created even if source is missing on Windows (#61544)
• Print jinja error context on `UndefinedError`. Previously `jinja2.exceptions.UndefinedError` resulted in a `SaltRenderError` without source file context, unlike all of the other Jinja exceptions handled in `salt/utils/templates.py`. (#61553)
• Fix uptime on AIX systems when less than 24 hours (#61557)
• Fix issue with state.show_state_usage when a saltenv is not referenced in any topfile (#61614)
• Making the retry state system feature available when parallel is set to True. (#61630)
• modules/apt/pkg.SourceEntry: fix parsing lines with arbitrary comments in case HAS_APT=False (#61632)
• Fix file.comment incorrectly reports changes in test mode (#61662)
• Fix improper master caching of file listing in multiple dynamic environments (#61738)
• When configured beacons are empty write an empty beacon configuration file. (#61741)
• Fix file.replace updating mtime with no changes (#61743)
• Fixed etcd_return being out of sync with the underlying etcd_util. (#61756)
• Fixing items, values, and keys functions in the data module. (#61812)
• Ensure that `salt://` URIs never contain backslashes, converting them to forward slashes instead. A specific situation to handle is caching files on Windows minions, where Jinja relative imports introduce a backslash into the path. (#61829)
• Do not raise a UnicodeDecodeError when pillar cache cannot decode binary data. (#61836)
• Don't rely on `importlib.metadata`, even on Py3.10, use `importlib_metadata` instead. (#61839)
• Fix the reporting of errors for file.directory in test mode (#61846)
• Update Markup and contextfunction imports for jinja versions >=3.1. (#61848)
• Update states.chef for version 16.x and 17.x Chef Infra Client output. (#61891)
• Fixed some whitespace and `pathlib.Path` issues when not using the system `aptsources` package. (#61936)
• fixed error when using backslash literal in file.replace (#61944)
• Fix an issue where under spawning platforms, one could exhaust the available multiprocessing semaphores. (#61945)
• Fix salt-cloud sync_after_install functionality (#61946)
• Ensure that `common_prefix` matching only occurs if a directory name is identified (in the `archive.list` execution module function, which affects the `archive.extracted` state). (#61968)
• When states are running in parallel, ensure that the total run time produced by the highstate outputter takes that into account. (#61999)
• Temporary logging is now shutdown when logging has been configured. (#62005)
• modules/lxd.FilesManager: fix memory leak through pylxd.modules.container.Container.FilesManager (#62006)
• util/jinja/SaltCacheLoader: fix leaking SaltCacheLoader through atexit.register (#62007)
• Fixed errors on calling `zabbix_user.admin_password_present` state, due to changed error message in Zabbix 6.0
• Fixed `zabbix.host_update` not mapping group ids list to list of dicts in format `[["groupid": groupid], ...]` Fixed `zabbix.user_update` not mapping usergroup id list to list of dicts in format `[["usrgrpid": usrgrpid], ...]` (#62012)

• `utils/yamlloader` and `yamlloader_old`: fix leaking DuplicateKeyWarning through a warnings module (#62021)
• Fix cache checking for Jinja templates (#62042)
• Fixed `salt.states.file.managed()` for follow_symlinks=True and test=True (#62066)
• Stop trigering the GLIBC race condition when parallelizing the resolution of the fqnds. (#62071)
• Fix useradd functions hard-coded relative command name (#62087)
• Fix #62092: Catch zmq.error.ZMQError to set HWM for zmq >= 3.
  Run `git show 0be0941` for more info. (#62092)
• Allow emitatstartup to work when delay option is setup. (#62095)
• Fix broken relative jinja includes in local mode bug introduced in #62043 (#62117)
• Fix broken file.comment functionality introduced in #62045 (#62121)
• Fixed an incompatibility preventing salt-cloud from deploying VMs on Proxmox VE 7 (#62154)
• Fix sysctl functions hard-coded relative command name (#62164)
• All of Salt's loaders now accept `loaded_base_name` as a keyword argument, allowing different namespac-
ing the loaded modules. (#62186)
• Only functions defined on the modules being loaded will be added to the lazy loader, functions imported from other modules, unless they are properly namespaced, are not included. (#62190)
• Fixes issue in postgresql privileges detection: privileges on views were never retrieved and always recreated. (#57690)
• Fix service.enabled error for unavailable service in test mode (#62258)
• Fix variable reuse causing requisite_in problems (#62264)
• Adding `-G` option to pkgdd cmd_prefix list when current_zone_only is True. (#62206)
• Don't expect `lsof` to be installed when trying check which minions are connected. (#62303)

Added

• Added ability to request VPC peering connections in different AWS regions (boto_vpc). (#50394)
• Added event return capability to Splunk returner (#50815)
• Added allow downgrades support to apt upgrade (#52977)
• added new grain for metadata to handle googles metadata differences (#53223)
• Added win_shortcut execution and state module that does not prepend the current working directory to paths. Use shortcut.create and shortcut.present instead of file.shortcut. (#53706)
• Add __env__ substitution inside file and pillar root paths (#55747)
• Added support cpu hot add/remove, memory hot add, and nested virtualization to VMware salt-cloud driver. (#56144)
• Add a consul state module with acl_present and acl_absent functions. (#58101)
• Added restconf module/states/proxy code for network device automation (#59006)
• Adds the ability to get version information from a file on Windows systems (#59702)
• Add aptkey=False kwarg option to the aptpkg.py module and pkgrepo state. Apt-key is on the path to be deprecated. This will allow users to not use apt-key to manage the repo keys. It will set aptkey=False automatically if it does not detect apt-key exists on the machine. (#59785)
• Added "Instant Clone" feature in the existing VMware Cloud module (#60004)
• Added support for etcd API v3 (#60325)
• Added pkg.held and pkg.unheld state functions for Zypper, YUM/DNF and APT. Improved zypperpkg.hold and zypperpkg.unhold functions. (#60432)
• Added suse_ip module allowing to manage network interfaces on SUSE based Linux systems (#60702)
• Support querying for JSON data in SQL external pillar (#60905)
• Added support for yum and dnf on AIX (#60912)
• Added percent success/failure of state runs in highstate summary output via new state_output_pct option (#60990)
• Add support for retrieve IP-address from qemu agent by Salt-cloud on Proxmox (#61146)
• Added new shortcut execution and state module to better handle UNC shortcuts and to test more thoroughly (#61170)
• added yamllint utils module and yaml execution modules (#61182)
• Add "--no-return-event" option to salt-call to prevent sending return event back to master. (#61188)
• Add Etag support for file.managed web sources (#61270)
• Adding the ability to add, delete, purge, and modify Salt scheduler jobs when the Salt minion is not running. (#61324)
• Added a force option to file.symlink to overwrite an existing symlink with the same name (#61326)
• gpg_decrypt_must_succeed config to prevent gpg renderer from failing silently (#61418)
• Do not load a private copy of __grains__ and __salt__ for the sentry log handler if it is disabled. (#61484)
• Add Jinja filters for itertools functions, flatten, and a state template workflow (#61502)
• Add feature to allow roll-up of duplicate IDs with different names in highstate output (#61549)
• Allow cp functions to derive saltenv from config if not explicitly set (#61562)
• Multiprocessing logging no longer uses multiprocessing queues which penalized performance.
  Instead, each new process configures the terminal and file logging, and also any external logging handlers configured. (#61629)
• Add a function to the freezer module for comparison of packages and repos in two frozen states (#61682)
• Add grains_refresh_pre_exec option to allow grains to be refreshed before any operation (#61708)
• Add possibility to pass extra parameters to salt-ssh pre flight script with ssh_pre_flight_args (#61715)
• Add Etag support for archive.extracted web sources (#61763)
• Add regex exclusions, full path matching, symlink following, and mtime/ctime comparison to file.tidied (#61823)
• Add better handling for unit abbreviations and large values to salt.utils.stringutils.human_to_bytes (#61831)
• Provide PyInstaller hooks that provide some runtime adjustments when Salt is running from a onedir (PyInstaller) bundled package. (#61864)
• Add configurable onedir pip pypath location (#61937)
• Add CNAME record support to the dig exec module (#61991)
• Added support for changed user object in Zabbix 5.4+ Added compatibility with Zabbix 4.0+ for zab-bix.user_getmedia method Added support for setting medias in zabbix.user_update for Zabbix 3.4+ (#62012)
• Add ignore_missing parameter to file.comment state (#62044)
• General improvements on the "ansiblegate" module: * Add "ansible.targets" method to gather Ansible inventory * Add "ansible.discover_playbooks" method to help collecting playbooks * Fix crash when running Ansible playbooks if ansible-playbook CLI output is not the expected JSON. * Fix issues when processing inventory and there are groups with no members. * Allow new types of targets for Ansible roster (#60056)
• Add sample and shuffle functions from random (#62225)

31.3.2 Salt 3006 release notes - Codename Sulfur

Salt 3006 is currently under development.

Onedir packaging

Going forward from the 3006 release, the Salt Project will only provide onedir packages to install or upgrade Salt. The classic, non-onedir packages will not be provided for supported operating systems. See Upgrade to onedir in the Salt Install Guide for information about upgrading from the classic packages to the onedir packages.

Dropping support for Python 3.5 and 3.6

Python 3.5 and 3.6 will no longer be supported by Salt since they are end of life. Going forward our policy will be to align with Python's supported versions. See Salt support for Python versions for more information.

How do I migrate to the onedir packages?

The migration path from the classic, non-onedir packages to the onedir packages will include:

• Repo File: You need to update your repo file to point to the new repo paths for your platform. After the repo file is updated, upgrade your Salt packages.
• Pip packages: You need to ensure any 3rd party pip packages are installed in the correct onedir path. This can be accomplished in two ways:
  - salt-pip install <package name>
  - Using the pip.installed Salt state.

To install python packages into the system python environment, user's must now provide the pip_bin or bin_env to the pip state module.

For example:

```
lib-foo:
  pip.installed:
    - pip_bin: /usr/bin/pip3
lib-bar:
  pip.installed:
    - bin_env: /usr/bin/python3
```

32.1 Introduction

First, you need to configure the master file. This is because all module functions require either a configured api_key (for Cloud) or a ttp_user with a tpp_password and a base_url (for Trust Platform).

For Venafi Cloud:

```yaml
venafi:
  api_key: abedef01-2345-6789-abcd-ef0123456789
  base_url: "https://cloud.venafi.example.com/" (optional)
```

If you don't have a Venafi Cloud account, you can sign up for one on the enrollment page.

For Venafi Platform:

```yaml
venafi:
  base_url: "https://tpp.example.com/
  tpp_user: admin
  tpp_password: "Str0ngPa$$w0rd"
  trust_bundle: "/opt/venafi/bundle.pem"
```

It is not common for the Venafi Platform's REST API (WebSDK) to be secured using a certificate issued by a publicly trusted CA, therefore establishing trust for that server certificate is a critical part of your configuration. Ideally this is done by obtaining the root CA certificate in the issuing chain in PEM format and copying that file to your Salt Master (e.g. /opt/venafi/bundle.pem). You then reference that file using the 'trust_bundle' parameter as shown above.

For the Venafi module to create keys and certificates it is necessary to enable external pillars. This is done by adding the following to the /etc/salt/master file:

```yaml
ext_pillar:
  - venafi: True
```

32.2 Runner Functions

32.2.1 request

This command is used to enroll a certificate from Venafi Cloud or Venafi Platform.

- **minion_id** ID of the minion for which the certificate is being issued. Required.
- **dns_name** DNS subject name for the certificate. Required if csr_path is not specified.
**csr_path** Full path name of certificate signing request file to enroll. Required if `dns_name` is not specified.

**zone** Venafi Cloud zone ID or Venafi Platform folder that specify key and certificate policy. Defaults to "Default". For Venafi Cloud, the Zone ID can be found in the Zone page for your Venafi Cloud project.

**org_unit** Business Unit, Department, etc. Do not specify if it does not apply.

**org** Exact legal name of your organization. Do not abbreviate.

**loc** City/locality where your organization is legally located.

**state** State or province where your organization is legally located. Must not be abbreviated.

**country** Country where your organization is legally located; two-letter ISO code.

**key_password** Password for encrypting the private key.

The syntax for requesting a new certificate with private key generation looks like this:

```
salt-run venafi.request minion.example.com dns_name=www.example.com \\
country=US state=California loc=Sacramento org="Company Name" org_unit=DevOps \\
zone=Internet key_password=SecretSauce
```

And the syntax for requesting a new certificate using a previously generated CSR looks like this:

```
salt-run venafi.request minion.example.com csr_path=/tmp/minion.req zone=Internet
```

### 32.2.2 show_cert

This command is used to show last issued certificate for domain.

**dns_name** DNS subject name of the certificate to look up.

```
salt-run venafi.show_cert www.example.com
```

### 32.2.3 list_domain_cache

This command lists domains that have been cached on this Salt Master.

```
salt-run venafi.list_domain_cache
```

### 32.2.4 del_cached_domain

This command deletes a domain from the Salt Master's cache.

**domains** A domain name, or a comma-separated list of domain names, to delete from this master's cache.

```
salt-run venafi.del_cached_domain www.example.com
```
32.3 Transfer certificate to a minion

To transfer a cached certificate to a minion, you can use Venafi pillar.

Example state (SLS) file:

```yaml
/etc/ssl/cert/www.example.com.crt:
  file.managed:
    - contents_pillar: venafi:www.example.com:cert
    - replace: True

/etc/ssl/cert/www.example.com.key:
  file.managed:
    - contents_pillar: venafi:www.example.com:pkey
    - replace: True

/etc/ssl/cert/www.example.com-chain.pem:
  file.managed:
    - contents_pillar: venafi:www.example.com:chain
    - replace: True
```
Auto-Order  The evaluation of states in the order that they are defined in a SLS file. See also: ordering.

Bootstrap  A stand-alone Salt project which can download and install a Salt master and/or a Salt minion onto a host. See also: salt-bootstrap.

Compound Matcher  A combination of many target definitions that can be combined with boolean operators. See also: targeting.

EAuth  Shorthand for ‘external authentication’. A system for calling to a system outside of Salt in order to authenticate users and determine if they are allowed to issue particular commands to Salt. See also: external auth.

Environment  A directory tree containing state files which can be applied to minions. See also: top file.

Execution Function  A Python function inside an Execution Module that may take arguments and performs specific system-management tasks. See also: the list of execution modules.

External Job Cache  An external data-store that can archive information about jobs that have been run. A default returner. See also: ext_job_cache, the list of returners.

Execution Module  A Python module that contains execution functions which directly perform various system-management tasks on a server. Salt ships with a number of execution modules but users can also write their own execution modules to perform specialized tasks. See also: the list of execution modules.

External Pillar  A module that accepts arbitrary arguments and returns a dictionary. The dictionary is automatically added to a pillar for a minion.

Event  A notice emitted onto an event bus. Events are often driven by requests for actions to occur on a minion or master and the results of those actions. See also: Salt Reactor.

File Server  A local or remote location for storing both Salt-specific files such as top files or SLS files as well as files that can be distributed to minions, such as system configuration files. See also: Salt’s file server.

Grain  A key-value pair which contains a fact about a system, such as its hostname, network addresses. See also: targeting with grains.

Highdata  The data structure in a SLS file the represents a set of state declarations. See also: state layers.

Highstate  The collection of states to be applied to a system. See also: state layers.

Idempotent  An action that ensures the system is in a well-known state regardless of the system’s state before the action is applied. A corollary to this is that applying the action multiple times results in no changes to the system. State module functions should be idempotent. Some state module functions, such as cmd.run are not idempotent by default but can be made idempotent with the proper use of requisites such as unless and onlyif. For more information, see wikipedia.

Jinja  A templating language which allows variables and simple logic to be dynamically inserted into static text files when they are rendered. See also: Salt’s Jinja documentation.
Job The complete set of tasks to be performed by the execution of a Salt command are a single job. See also: jobs runner.

Job Cache A storage location for job results, which may then be queried by a salt runner or an external system. May be local to a salt master or stored externally.

Job ID A unique identifier to represent a given job. This is often shortened to JID.

Low State The collection of processed states after requisites and order are evaluated. See also: state layers.

Master A central Salt daemon from which commands can be issued to listening minions.

Masterless A minion which does not require a Salt master to operate. All configuration is local. See also: file_client.

Master Tops A system for the master that allows hooks into external systems to generate top file data.

Mine A facility to collect arbitrary data from minions and store that data on the master. This data is then available to all other minions. (Sometimes referred to as Salt Mine.) See also: Salt Mine.

Minion A server running a Salt minion daemon which can listen to commands from a master and perform the requested tasks. Generally, minions are servers which are to be controlled using Salt.

Minion ID A globally unique identifier for a minion. See also: id.

Multi-Master The ability for a minion to be actively connected to multiple Salt masters at the same time in high-availability environments.

Node Group A pre-defined group of minions declared in the master configuration file. See also: targeting.

Outputter A formatter for defining the characteristics of output data from a Salt command. See also: list of outputters.

Peer Communication The ability for minions to communicate directly with other minions instead of brokering commands through the Salt master. See also: peer communication.

Pillar A simple key-value store for user-defined data to be made available to a minion. Often used to store and distribute sensitive data to minions. See also: Pillar, list of Pillar modules.

Proxy Minion A minion which can control devices that are unable to run a Salt minion locally, such as routers and switches.

PyDSL A Pythonic domain-specific-language used as a Salt renderer. PyDSL can be used in cases where adding pure Python into SLS files is beneficial. See also: PyDSL.

Reactor An interface for listening to events and defining actions that Salt should take upon receipt of given events. See also: Reactor.

Render Pipe Allows SLS files to be rendered by multiple renderers, with each renderer receiving the output of the previous. See also: composing renderers.

Renderer Responsible for translating a given data serialization format such as YAML or JSON into a Python data structure that can be consumed by Salt. See also: list of renderers.

Returner Allows for the results of a Salt command to be sent to a given data-store such as a database or log file for archival. See also: list of returners.

Roster A flat-file list of target hosts. (Currently only used by salt-ssh.)

Runner Module A module containing a set of runner functions. See also: list of runner modules.

Runner Function A function which is called by the salt-run command and executes on the master instead of on a minion. See also: Runner Module.

Salt Cloud A suite of tools used to create and deploy systems on many hosted cloud providers. See also: salt-cloud.
Salt SSH  A configuration management and remote orchestration system that does not require that any software besides SSH be installed on systems to be controlled.

Salt Thin  A subset of the normal Salt distribution that does not include any transport routines. A Salt Thin bundle can be dropped onto a host and used directly without any requirement that the host be connected to a network. Used by Salt SSH. See also: thin runner.

Salt Virt  Used to manage the creation and deployment of virtual machines onto a set of host machines. Often used to create and deploy private clouds. See also: virt runner.

SLS Module  Contains a set of state declarations.

State Compiler  Translates highdata into lowdata.

State Declaration  A data structure which contains a unique ID and describes one or more states of a system such as ensuring that a package is installed or a user is defined. See also: highstate structure.

State Function  A function contained inside a state module which can manages the application of a particular state to a system. State functions frequently call out to one or more execution modules to perform a given task.

State Module  A module which contains a set of state functions. See also: list of state modules.

State Run  The application of a set of states on a set of systems.

Syndic  A forwarder which can relay messages between tiered masters. See also: Syndic.

Target  Minion(s) to which a given salt command will apply. See also: targeting.

Top File  Determines which SLS files should be applied to various systems and organizes those groups of systems into environments. See also: top file, list of master top modules.

__virtual__  A function in a module that is called on module load to determine whether or not the module should be available to a minion. This function commonly contains logic to determine if all requirements for a module are available, such as external libraries.

Worker  A master process which can send notices and receive replies from minions. See also: worker_threads.
